

## **Cisco Nexus 9000 Series NX-OS VXLAN Configuration Guide, Release 10.1(x)**

**First Published:** 2021-02-16

### **Americas Headquarters**

Cisco Systems, Inc.  
170 West Tasman Drive  
San Jose, CA 95134-1706  
USA  
<http://www.cisco.com>  
Tel: 408 526-4000  
800 553-NETS (6387)  
Fax: 408 527-0883

THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS REFERENCED IN THIS DOCUMENTATION ARE SUBJECT TO CHANGE WITHOUT NOTICE. EXCEPT AS MAY OTHERWISE BE AGREED BY CISCO IN WRITING, ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS DOCUMENTATION ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED.

The Cisco End User License Agreement and any supplemental license terms govern your use of any Cisco software, including this product documentation, and are located at: <http://www.cisco.com/go/softwareterms>. Cisco product warranty information is available at <http://www.cisco.com/go/warranty>. US Federal Communications Commission Notices are found here <http://www.cisco.com/c/en/us/products/us-fcc-notice.html>.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Any products and features described herein as in development or available at a future date remain in varying stages of development and will be offered on a when-and if-available basis. Any such product or feature roadmaps are subject to change at the sole discretion of Cisco and Cisco will have no liability for delay in the delivery or failure to deliver any products or feature roadmap items that may be set forth in this document.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

The documentation set for this product strives to use bias-free language. For the purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on RFP documentation, or language that is used by a referenced third-party product.

Cisco and the Cisco logo are trademarks or registered trademarks of Cisco and/or its affiliates in the U.S. and other countries. To view a list of Cisco trademarks, go to this URL: [www.cisco.com go trademarks](http://www.cisco.com/go/trademarks). Third-party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company. (1721R)

## CONTENTS

---

### PREFACE

<b>Preface</b>	<b>xvii</b>
Audience	xvii
Document Conventions	xvii
Related Documentation for Cisco Nexus 9000 Series Switches	xviii
Documentation Feedback	xviii
Communications, Services, and Additional Information	xviii

---

### CHAPTER 1

<b>New and Changed Information</b>	<b>1</b>
New and Changed Information	1

---

### CHAPTER 2

<b>Overview</b>	<b>3</b>
Licensing Requirements	3
VXLAN Overview	3
Cisco Nexus 9000 as Hardware-Based VXLAN Gateway	4
VXLAN Encapsulation and Packet Format	4
VXLAN Tunnel	5
VXLAN Tunnel Endpoint	5
Underlay Network	5
Overlay Network	5
Distributed Anycast Gateway	5
Control Plane	6

---

### CHAPTER 3

<b>Configuring VXLAN</b>	<b>9</b>
Guidelines and Limitations for VXLAN	9
Considerations for VXLAN Deployment	15
vPC Considerations for VXLAN Deployment	18

Network Considerations for VXLAN Deployments	21
Considerations for the Transport Network	22
Considerations for Tunneling VXLAN	23
Configuring VXLAN	25
Enabling VXLANs	25
Mapping VLAN to VXLAN VNI	25
Creating and Configuring an NVE Interface and Associate VNIs	26
Configuring a VXLAN VTEP in vPC	26
Configuring Static MAC for VXLAN VTEP	29
Disabling VXLANs	30
Configuring BGP EVPN Ingress Replication	31
Configuring Static Ingress Replication	31
VXLAN and IP-in-IP Tunneling	32
Configuring VXLAN Static Tunnels	35
About VXLAN Static Tunnels	35
Guidelines and Limitations for VXLAN Static Tunnels	35
Enabling VXLAN Static Tunnels	36
Configuring VRF Overlay for Static Tunnels	37
Configuring a VRF for VXLAN Routing	38
Configuring the L3 VNI for Static Tunnels	38
Configuring the Tunnel Profile	39
Verifying VXLAN Static Tunnels	40
Example Configurations for VXLAN Static Tunnels	41
<hr/>	
<b>CHAPTER 4</b>	<b>Configuring VXLAN BGP EVPN 43</b>
Information About VXLAN BGP EVPN	43
About RD Auto	43
About Route-Target Auto	44
Guidelines and Limitations for VXLAN BGP EVPN	45
Information About VXLAN EVPN with Downstream VNI	48
Asymmetric VNIs	48
Shared Services VRFs	48
Multi-Site with Asymmetric VNIs	49
Guidelines and Limitations for VXLAN EVPN with Downstream VNI	50

Configuring VXLAN BGP EVPN	51
Enabling VXLAN	51
Configuring VLAN and VXLAN VNI	52
Configuring VRF for VXLAN Routing	53
Configuring SVI for Core-facing VXLAN Routing	54
Configuring SVI for Host-Facing VXLAN Routing	55
Configuring the NVE Interface and VNIs Using Multicast	56
Configuring VXLAN EVPN Ingress Replication	57
Configuring BGP on the VTEP	58
Configuring iBGP for EVPN on the Spine	59
Configuring eBGP for EVPN on the Spine	60
Suppressing ARP	62
Disabling VXLANs	63
Duplicate Detection for IP and MAC Addresses	63
Verifying the VXLAN BGP EVPN Configuration	65
Verifying the VXLAN EVPN with Downstream VNI Configuration	66
Example of VXLAN BGP EVPN (iBGP)	68
Example of VXLAN BGP EVPN (eBGP)	79
Example Show Commands	92

---

## CHAPTER 5

<b>Configuring VXLAN with IPv6 in the Underlay (VXLANv6)</b>	<b>95</b>
Information About Configuring VXLAN with IPv6 in the Underlay (VXLANv6)	95
Guidelines and Limitations for VXLAN with IPv6 in the Underlay (VXLANv6)	96
Information About vPC and VXLAN with IPv6 in the Underlay (VXLANv6)	98
Information About vPC Peer Keepalive and VXLAN with IPv6 in the Underlay (VXLANv6)	98
Configuring the VTEP IP Address	99
Configuring vPC for VXLAN with IPv6 in the Underlay (VXLANv6)	100
Example Configurations for VXLAN with IPv6 in the Underlay (VXLANv6)	101
Verifying VXLAN with IPv6 in the Underlay (VXLANv6)	103

---

## CHAPTER 6

<b>Configuring External VRF Connectivity and Route Leaking</b>	<b>113</b>
Configuring External VRF Connectivity	113
About External Layer-3 Connectivity for VXLAN BGP EVPN Fabrics	113
VXLAN BGP EVPN - VRF-lite brief	113

Guidelines and Limitations for External VRF Connectivity and Route Leaking	114
Configuring VXLAN BGP EVPN with eBGP for VRF-lite	114
VXLAN BGP EVPN - Default-Route, Route Filtering on External Connectivity	119
Configuring VXLAN BGP EVPN with OSPF for VRF-lite	126
Configuring Route Leaking	130
About Centralized VRF Route-Leaking for VXLAN BGP EVPN Fabrics	130
Guidelines and Limitations for Centralized VRF Route-Leaking	130
Centralized VRF Route-Leaking Brief - Specific Prefixes Between Custom VRF	130
Configuring Centralized VRF Route-Leaking - Specific Prefixes between Custom VRF	131
Configuring VRF Context on the Routing-Block VTEP	131
Configuring the BGP VRF instance on the Routing-Block	132
Example - Configuration Centralized VRF Route-Leaking - Specific Prefixes Between Custom VRF	133
Centralized VRF Route-Leaking Brief - Shared Internet with Custom VRF	134
Configuring Centralized VRF Route-Leaking - Shared Internet with Custom VRF	135
Configuring Internet VRF on Border Node	135
Configuring Shared Internet BGP Instance on the Border Node	136
Configuring Custom VRF on Border Node	137
Configuring Custom VRF Context on the Border Node - 1	138
Configuring Custom VRF Instance in BGP on the Border Node	139
Example - Configuration Centralized VRF Route-Leaking - Shared Internet with Custom VRF	139
Centralized VRF Route-Leaking Brief - Shared Internet with VRF Default	141
Configuring Centralized VRF Route-Leaking - Shared Internet with VRF Default	142
Configuring VRF Default on Border Node	142
Configuring BGP Instance for VRF Default on the Border Node	143
Configuring Custom VRF on Border Node	143
Configuring Filter for Permitted Prefixes from VRF Default on the Border Node	144
Configuring Custom VRF Context on the Border Node - 2	144
Configuring Custom VRF Instance in BGP on the Border Node	145
Example - Configuration Centralized VRF Route-Leaking - VRF Default with Custom VRF	146
 <b>CHAPTER 7</b>	
<b>Configuring BGP EVPN Filtering</b>	149
About BGP EVPN Filtering	149

Guidelines and Limitations for BGP EVPN Filtering	150
Configuring BGP EVPN Filtering	150
Configuring the Route Map with Match and Set Clauses	150
Matching Based on EVPN Route Type	151
Matching Based on MAC Address in the NLRI	151
Matching Based on RMAC Extended Community	152
Setting the RMAC Extended Community	153
Setting the EVPN Next-Hop IP Address	153
Setting the Gateway IP Address for Route Type-5	154
Applying the Route Map at the Inbound or Outbound Level	154
BGP EVPN Filtering Configuration Examples	155
Configuring a Table Map	164
Configuring a MAC List and a Route Map that Matches the MAC List	164
Applying the Table Map	165
Table Map Configuration Example	165
Verifying BGP EVPN Filtering	168

---

## CHAPTER 8

<b>Configuring VXLAN OAM</b>	<b>171</b>
VXLAN OAM Overview	171
Loopback (Ping) Message	172
Traceroute or Pathtrace Message	173
About VXLAN EVPN Loop Detection and Mitigation	175
Guidelines and Limitations for VXLAN NGOAM	176
Guidelines and Limitations for VXLAN EVPN Loop Detection and Mitigation	176
Configuring VXLAN OAM	177
Configuring NGOAM Profile	180
Configuring VXLAN EVPN Loop Detection and Mitigation	181
Detecting Loops and Bringing Up Ports On Demand	182
Configuration Examples for VXLAN EVPN Loop Detection and Mitigation	183

---

## CHAPTER 9

<b>Configuring vPC Multihoming</b>	<b>185</b>
Advertising Primary IP Address	185
BorderPE Switches in a vPC Setup	186
DHCP Configuration in a vPC Setup	186

IP Prefix Advertisement in vPC Setup	186
--------------------------------------	-----

---

**CHAPTER 10**
**Configuring Multi-Site 189**

About VXLAN EVPN Multi-Site	189
Dual RD Support for Multi-Site	190
Guidelines and Limitations for VXLAN EVPN Multi-Site	190
Enabling VXLAN EVPN Multi-Site	192
Configuring Dual RD Support for Multi-Site	194
Configuring VNI Dual Mode	195
Configuring Fabric/DCI Link Tracking	196
Configuring Fabric External Neighbors	197
Configuring VXLAN EVPN Multi-Site Storm Control	198
Multi-Site with vPC Support	199
About Multi-Site with vPC Support	199
Guidelines and Limitations for Multi-Site with vPC Support	199
Configuring Multi-Site with vPC Support	199
Configuring Peer Link as Transport in Case of Link Failure	203
Verifying the Multi-Site with vPC Support Configuration	204
Configuration Example for Multi-Site with Asymmetric VNIs	205
TRM with Multi-Site	206
Information About Configuring TRM with Multi-Site	207
Guidelines and Limitations for TRM with Multi-Site	209
Configuring TRM with Multi-Site	211
Verifying TRM with Multi-Site Configuration	212

---

**CHAPTER 11**
**Configuring Tenant Routed Multicast 213**

About Tenant Routed Multicast	213
About Tenant Routed Multicast Mixed Mode	215
Guidelines and Limitations for Tenant Routed Multicast	215
Guidelines and Limitations for Layer 3 Tenant Routed Multicast	216
Guidelines and Limitations for Layer 2/Layer 3 Tenant Routed Multicast (Mixed Mode)	217
Rendezvous Point for Tenant Routed Multicast	218
Configuring a Rendezvous Point for Tenant Routed Multicast	218
Configuring a Rendezvous Point Inside the VXLAN Fabric	219

Configuring an External Rendezvous Point	220
Configuring RP Everywhere with PIM Anycast	222
Configuring a TRM Leaf Node for RP Everywhere with PIM Anycast	223
Configuring a TRM Border Leaf Node for RP Everywhere with PIM Anycast	224
Configuring an External Router for RP Everywhere with PIM Anycast	226
Configuring RP Everywhere with MSDP Peering	228
Configuring a TRM Leaf Node for RP Everywhere with MSDP Peering	229
Configuring a TRM Border Leaf Node for RP Everywhere with MSDP Peering	230
Configuring an External Router for RP Everywhere with MSDP Peering	233
Configuring Layer 3 Tenant Routed Multicast	234
Configuring TRM on the VXLAN EVPN Spine	239
Configuring Tenant Routed Multicast in Layer 2/Layer 3 Mixed Mode	241
Configuring Layer 2 Tenant Routed Multicast	246
Configuring TRM with vPC Support	247
Configuring TRM with vPC Support (Cisco Nexus 9504-R and 9508-R)	249

## CHAPTER 12

<b>Configuring Cross Connect</b>	<b>255</b>
About VXLAN Cross Connect	255
Guidelines and Limitations for VXLAN Cross Connect	256
Configuring VXLAN Cross Connect	257
Verifying VXLAN Cross Connect Configuration	259
Configuring NGOAM for VXLAN Cross Connect	260
Verifying NGOAM for VXLAN Cross Connect	261
NGOAM Authentication	261
Guidelines and Limitations for Q-in-VNI	263
Configuring Q-in-VNI	265
Configuring Selective Q-in-VNI	265
Configuring Q-in-VNI with LACP Tunneling	268
Selective Q-in-VNI with Multiple Provider VLANs	270
About Selective Q-in-VNI with Multiple Provider VLANs	270
Guidelines and Limitations for Selective Q-in-VNI with Multiple Provider VLANs	270
Configuring Selective Q-in-VNI with Multiple Provider VLANs	271
Configuring QinQ-QinVNI	273
Overview for QinQ-QinVNI	273

Guidelines and Limitations for QinQ-QinVNI 274

Configuring QinQ-QinVNI 274

Removing a VNI 276

---

## CHAPTER 13

### Configuring Port VLAN Mapping 277

About Translating Incoming VLANs 277

Guidelines and Limitations for Port VLAN Mapping 278

Configuring Port VLAN Mapping on a Trunk Port 280

Configuring Inner VLAN and Outer VLAN Mapping on a Trunk Port 282

---

## CHAPTER 14

### Configuring IGMP Snooping 285

Configuring IGMP Snooping Over VXLAN 285

Overview of IGMP Snooping Over VXLAN 285

Guidelines and Limitations for IGMP Snooping Over VXLAN 285

Configuring IGMP Snooping Over VXLAN 285

---

## CHAPTER 15

### Configuring Private VLANs 287

About Private VLANs over VXLAN 287

Guidelines and Limitations for Private VLANs over VXLAN 288

Configuration Example for Private VLANs 288

---

## CHAPTER 16

### Configuring Policy-Based Redirect 291

About Policy-Based Redirect 291

Guidelines and Limitations for Policy-Based Redirect 292

Enabling the Policy-Based Redirect Feature 292

Configuring a Route Policy 293

Verifying the Policy-Based Redirect Configuration 294

Configuration Example for Policy-Based Redirect 295

---

## CHAPTER 17

### Configuring ACL 297

About Access Control Lists 297

Guidelines and Limitations for VXLAN ACLs 298

VXLAN Tunnel Encapsulation Switch 299

Port ACL on the Access Port on Ingress	299
VLAN ACL on the Server VLAN	301
Routed ACL on an SVI on Ingress	303
Routed ACL on the Uplink on Egress	305
VXLAN Tunnel Decapsulation Switch	305
Routed ACL on the Uplink on Ingress	305
Port ACL on the Access Port on Egress	305
VLAN ACL for the Layer 2 VNI Traffic	305
VLAN ACL for the Layer 3 VNI Traffic	307
Routed ACL on an SVI on Egress	309

---

## CHAPTER 18

### Configuring Secure VXLAN EVPN Multi-Site Using CloudSec 313

About Secure VXLAN EVPN Multi-Site Using CloudSec	313
Key Lifetime and Hitless Key Rollover	313
Guidelines and Limitations for Secure VXLAN EVPN Multi-Site Using CloudSec	314
Configuring Secure VXLAN EVPN Multi-Site Using CloudSec	315
Enabling CloudSec VXLAN EVPN Tunnel Encryption	315
Configuring a CloudSec Keychain and Keys	317
Configuring a CloudSec Policy	319
Configuring CloudSec Peers	320
Enabling Secure VXLAN EVPN Multi-Site Using CloudSec on DCI Uplinks	321
Verifying the Secure VXLAN EVPN Multi-Site Using CloudSec	322
Displaying Statistics for Secure VXLAN EVPN Multi-Site Using CloudSec	326
Configuration Examples for Secure VXLAN EVPN Multi-Site Using CloudSec	327
Migrating from Multi-Site with VIP to Multi-Site with PIP	328

---

## CHAPTER 19

### Configuring VXLAN QoS 331

Information About VXLAN QoS	331
VXLAN QoS Terminology	331
VXLAN QoS Features	333
Trust Boundaries	333
Classification	333
Marking	333
Policing	333

Queuing and Scheduling	334
Traffic Shaping	334
Network QoS	334
VXLAN Priority Tunneling	335
MQC CLI	335
VXLAN QoS Topology and Roles	335
Ingress VTEP and Encapsulation in the VXLAN Tunnel	335
Transport Through the VXLAN Tunnel	336
Egress VTEP and Decapsulation of the VXLAN Tunnel	336
Classification at the Ingress VTEP, Spine, and Egress VTEP	336
IP to VXLAN	337
Inside the VXLAN Tunnel	337
VXLAN to IP	338
Decapsulated Packet Priority Selection	338
Guidelines and Limitations for VXLAN QoS	339
Default Settings for VXLAN QoS	340
Configuring VXLAN QoS	341
Configuring Type QoS on the Egress VTEP	341
Verifying the VXLAN QoS Configuration	343
VXLAN QoS Configuration Examples	343

---

**CHAPTER 20**

<b>Configuring vPC Fabric Peering</b>	<b>345</b>
Information About vPC Fabric Peering	345
Guidelines and Limitations for vPC Fabric Peering	346
Configuring vPC Fabric Peering	347
Migrating from vPC to vPC Fabric Peering	350
Verifying vPC Fabric Peering Configuration	352

---

**CHAPTER 21**

<b>Configuring Seamless Integration of EVPN with L3VPN (MPLS LDP)</b>	<b>355</b>
Information About Configuring Seamless Integration of EVPN with L3VPN (MPLS LDP)	355
Guidelines and Limitations for Configuring Seamless Integration of EVPN with L3VPN (MPLS LDP)	355
Configuring Seamless Integration of EVPN with L3VPN (MPLS LDP)	356

<b>CHAPTER 22</b>	<b>Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)</b>	<b>361</b>
	Information About Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)	361
	Guidelines and Limitations for Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)	363
	Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)	364
	Example Configuration for Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)	368
<b>CHAPTER 23</b>	<b>Configuring Seamless Integration of EVPN with L3VPN SRv6</b>	<b>375</b>
	About Seamless Integration of EVPN with L3VPN SRv6 Handoff	375
	Guidelines and Limitations for EVPN to L3VPN SRv6 Handoff	376
	Importing L3VPN SRv6 Routes into EVPN VXLAN	377
	Importing EVPN VXLAN Routes into L3VPN SRv6	378
	Example Configuration for VXLAN EVPN to L3VPN SRv6 Handoff	379
<b>CHAPTER 24</b>	<b>Configuring Seamless Integration of EVPN (TRM) with MVPN</b>	<b>381</b>
	About Seamless Integration of EVPN (TRM) with MVPN (Draft Rosen)	381
	Supported RP Positions	382
	Guidelines and Limitations for Seamless Integration of EVPN (TRM) with MVPN	382
	Configuring the Handoff Node for Seamless Integration of EVPN (TRM) with MVPN	383
	PIM/IGMP Configuration for the Handoff Node	383
	BGP Configuration for the Handoff Node	384
	VXLAN Configuration for the Handoff Node	385
	MVPN Configuration for the Handoff Node	386
	CoPP Configuration for the Handoff Node	387
	Configuration Example for Seamless Integration of EVPN (TRM) with MVPN	388
<b>APPENDIX A</b>	<b>Configuring the Underlay</b>	<b>393</b>
	IP Fabric Underlay	393
	Underlay Considerations	393
	Unicast routing and IP addressing options	396
	OSPF Underlay IP Network	396
	IS-IS Underlay IP Network	401
	eBGP Underlay IP Network	407

## Multicast Routing in the VXLAN Underlay 412

### APPENDIX B

#### Configuring Bud Node 427

VXLAN Bud Node Over vPC Overview 427

VXLAN Bud Node Over vPC Topology Example 428

### APPENDIX C

#### DHCP Relay in VXLAN BGP EVPN 433

DHCP Relay in VXLAN BGP EVPN Overview 433

DHCP Relay in VXLAN BGP EVPN Example 434

DHCP Relay on VTEPs 435

Client on Tenant VRF and Server on Layer 3 Default VRF 435

Client on Tenant VRF (SVI X) and Server on the Same Tenant VRF (SVI Y) 438

Client on Tenant VRF (VRF X) and Server on Different Tenant VRF (VRF Y) 442

Client on Tenant VRF and Server on Non-Default Non-VXLAN VRF 445

Configuring vPC Peers Example 447

vPC VTEP DHCP Relay Configuration Example 449

### APPENDIX D

#### Configuring Layer 4 - Layer 7 Network Services Integration 451

About VXLAN Layer 4 - Layer 7 Services 451

Integrating Layer 3 Firewalls in VXLAN Fabrics 451

Single-Attached Firewall with Static Routing 452

Recursive Static Routes Distributed to the Rest of the Fabric 454

Redistribute Static Routes into BGP and Advertise to the Rest of the Fabric 454

Dual-Attached Firewall with Static Routing 454

Single-Attached Firewall with eBGP Routing 455

Dual-Attached Firewall with eBGP Routing 458

Per-VRF Peering via vPC Peer-Link 461

Single-Attached Firewall with OSPF 461

Redistribute OSPF Routes into BGP and Advertise to the Rest of the Fabric 462

Dual-Attached Firewall with OSPF 463

Redistribute OSPF Routes into BGP and Advertise to the Rest of the Fabric 465

Firewall as Default Gateway 465

Transparent Firewall Insertion 466

Overview of EVPN with Transparent Firewall Insertion 466

EVPN with Transparent Firewall Insertion Example	468
Show Command Examples	471

## APPENDIX E

<b>Configuring Multihoming</b>	<b>473</b>
VXLAN EVPN Multihoming Overview	473
Introduction to Multihoming	473
BGP EVPN Multihoming	473
BGP EVPN Multihoming Terminology	473
EVPN Multihoming Implementation	474
EVPN Multihoming Redundancy Group	475
Ethernet Segment Identifier	475
LACP Bundling	475
Guidelines and Limitations for VXLAN EVPN Multihoming	476
Configuring VXLAN EVPN Multihoming	477
Enabling EVPN Multihoming	477
VXLAN EVPN Multihoming Configuration Examples	478
Configuring Layer 2 Gateway STP	479
Layer 2 Gateway STP Overview	479
Guidelines for Moving to Layer 2 Gateway STP	480
Enabling Layer 2 Gateway STP on a Switch	481
Configuring VXLAN EVPN Multihoming Traffic Flows	484
EVPN Multihoming Local Traffic Flows	484
EVPN Multihoming Remote Traffic Flows	488
EVPN Multihoming BUM Flows	492
Configuring ESI ARP Suppression	495
Overview of ESI ARP Suppression	495
Limitations for ESI ARP Suppression	496
Configuring ESI ARP Suppression	496
Displaying Show Commands for ESI ARP Suppression	496
Configuring VLAN Consistency Checking	498
Overview of VLAN Consistency Checking	498
VLAN Consistency Checking Guidelines and Limitations	499
Configuring VLAN Consistency Checking	499
Displaying Show Command Output for VLAN Consistency Checking	499

---

**APPENDIX F**

<b>Configuring Proportional Multipath for VNF</b>	<b>501</b>
About Proportional Multipath for VNF	501
Proportional Multipath for VNF with Multi-Site	505
Prerequisites for Proportional Multipath for VNF	505
Guidelines and Limitations for Proportional Multipath for VNF	506
Configuring the Route Reflector	507
Configuring the ToR	508
Configuring the Border Leaf	513
Configuring the BGP Legacy Peer	519
Configuring a User-Defined Profile for Maintenance Mode	520
Configuring a User-Defined Profile for Normal Mode	520
Configuring a Default Route Map	521
Applying a Route Map to a Route Reflector	521
Verifying Proportional Multipath for VNF	522
Configuration Example for Proportional Multipath for VNF with Multi-Site	526

## Preface

This preface includes the following sections:

- [Audience, on page xvii](#)
- [Document Conventions, on page xvii](#)
- [Related Documentation for Cisco Nexus 9000 Series Switches, on page xviii](#)
- [Documentation Feedback, on page xviii](#)
- [Communications, Services, and Additional Information, on page xviii](#)

## Audience

This publication is for network administrators who install, configure, and maintain Cisco Nexus switches.

## Document Conventions

Command descriptions use the following conventions:

Convention	Description
<b>bold</b>	Bold text indicates the commands and keywords that you enter literally as shown.
<i>Italic</i>	Italic text indicates arguments for which you supply the values.
[x]	Square brackets enclose an optional element (keyword or argument).
[x   y]	Square brackets enclosing keywords or arguments that are separated by a vertical bar indicate an optional choice.
{x   y}	Braces enclosing keywords or arguments that are separated by a vertical bar indicate a required choice.
[x {y   z}]	Nested set of square brackets or braces indicate optional or required choices within optional or required elements. Braces and a vertical bar within square brackets indicate a required choice within an optional element.

Convention	Description
<code>variable</code>	Indicates a variable for which you supply values, in context where italics cannot be used.
<code>string</code>	A nonquoted set of characters. Do not use quotation marks around the string or the string includes the quotation marks.

Examples use the following conventions:

Convention	Description
<code>screen font</code>	Terminal sessions and information the switch displays are in screen font.
<b><code>boldface screen font</code></b>	Information that you must enter is in boldface screen font.
<i><code>italic screen font</code></i>	Arguments for which you supply values are in italic screen font.
<code>&lt;&gt;</code>	Nonprinting characters, such as passwords, are in angle brackets.
<code>[ ]</code>	Default responses to system prompts are in square brackets.
<code>!, #</code>	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

## Related Documentation for Cisco Nexus 9000 Series Switches

The entire Cisco Nexus 9000 Series switch documentation set is available at the following URL:

[http://www.cisco.com/en/US/products/ps13386/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/ps13386/tsd_products_support_series_home.html)

## Documentation Feedback

To provide technical feedback on this document, or to report an error or omission, please send your comments to [nexus9k-docfeedback@cisco.com](mailto:nexus9k-docfeedback@cisco.com). We appreciate your feedback.

## Communications, Services, and Additional Information

- To receive timely, relevant information from Cisco, sign up at [Cisco Profile Manager](#).

### Cisco Bug Search Tool

[Cisco Bug Search Tool](#) (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.

# CHAPTER 1

## New and Changed Information

This chapter provides release-specific information for each new and changed feature in the *Cisco Nexus 9000 Series NX-OS VXLAN Configuration Guide Release 10.1(x)*.

- [New and Changed Information, on page 1](#)

## New and Changed Information

Feature	Description	Changed in Release	Where Documented
ITD and ePBR over VXLAN	Added support for N9K-X9716D-GX TOR and N9K-C93180YC-FX3S platform switches.	10.1(1)	<a href="#">Guidelines and Limitations for VXLAN, on page 9</a>
VXLAN EVPN Loop Detection and Mitigation	Added support for Cisco Nexus 9300-FX3 and -GX platform switches.	10.1(1)	<a href="#">Guidelines and Limitations for VXLAN EVPN Loop Detection and Mitigation, on page 176</a>
VXLAN over Parent Interface that Carries Subinterfaces	Added support for Cisco Nexus 9300-FX3 platform switches.	10.1(1)	<a href="#">Guidelines and Limitations for VXLAN, on page 9</a>
VXLAN Static Tunnels	Added support for Cisco Nexus 9300-FX3 platform switches.	10.1(1)	<a href="#">Guidelines and Limitations for VXLAN Static Tunnels, on page 35</a>
Selective Q-in-VNI and VXLAN VLAN on Same Port	Added support for Cisco Nexus 9300-FX3 platform switches.	10.1(1)	<a href="#">Guidelines and Limitations for Q-in-VNI, on page 263</a>
Selective Q-in-VNI and Advertise PIP on a VTEP	Added support for Cisco Nexus 9300-FX3 platform switches.	10.1(1)	<a href="#">Configuring Selective Q-in-VNI, on page 265</a>
VXLAN Tunnel Encryption	Added support for Cisco Nexus 9300-FX3 platform switches.	10.1(1)	<a href="#">Guidelines and Limitations for Secure VXLAN EVPN Multi-Site Using CloudSec, on page 314</a>

Feature	Description	Changed in Release	Where Documented
vPC Fabric Peering and FEX Support	Added support for Cisco Nexus 9000-EX/FX/FX2/FX3/GX platform switches.	10.1(1)	<a href="#">Guidelines and Limitations for vPC Fabric Peering</a> , on page 346
VXLAN EVPN with Downstream VNI	Added support for Cisco Nexus 9300-FX3 platform switches and for N9K-C9316D-GX, N9K-C93600CD-GX, and N9K-C9364C-GX TOR switches.	10.1(1)	<a href="#">Guidelines and Limitations for VXLAN EVPN with Downstream VNI</a> , on page 50
VXLAN PBR	Added support for N9K-C9316D-GX, N9K-C93600CD-GX, and N9K-C9364C-GX TOR switches.	10.1(1)	<a href="#">Guidelines and Limitations for VXLAN</a> , on page 9
IPv6 Underlay	Added support for N9K-C9316D-GX, N9K-C93600CD-GX, and N9K-C9364C-GX TOR switches.	10.1(1)	<a href="#">Guidelines and Limitations for VXLAN with IPv6 in the Underlay (VXLANv6)</a> , on page 96
VXLAN Flood and Learn	Added support for N9K-C9316D-GX, N9K-C93600CD-GX, and N9K-C9364C-GX TOR switches.	10.1(1)	<a href="#">Guidelines and Limitations for VXLAN</a> , on page 9

## CHAPTER 2

# Overview

---

This chapter contains the following sections:

- [Licensing Requirements, on page 3](#)
- [VXLAN Overview, on page 3](#)
- [Cisco Nexus 9000 as Hardware-Based VXLAN Gateway, on page 4](#)
- [VXLAN Encapsulation and Packet Format, on page 4](#)
- [VXLAN Tunnel, on page 5](#)
- [VXLAN Tunnel Endpoint, on page 5](#)
- [Underlay Network, on page 5](#)
- [Overlay Network, on page 5](#)
- [Distributed Anycast Gateway, on page 5](#)
- [Control Plane, on page 6](#)

## Licensing Requirements

For a complete explanation of Cisco NX-OS licensing recommendations and how to obtain and apply licenses, see the [Cisco NX-OS Licensing Guide](#).

## VXLAN Overview

Virtual Extensible LAN (VXLAN) provides a way to extend Layer 2 networks across a Layer 3 infrastructure using MAC-in-UDP encapsulation and tunneling. This feature enables virtualized and multitenant data center fabric designs over a shared common physical infrastructure.

VXLAN has the following benefits:

- Flexible placement of workloads across the data center fabric.

It provides a way to extend Layer 2 segments over the underlying shared Layer 3 network infrastructure so that tenant workloads can be placed across physical pods in a single data center. Or even across several geographically diverse data centers.

- Higher scalability to allow more Layer 2 segments.

VXLAN uses a 24-bit segment ID, the VXLAN network identifier (VNID). This allows a maximum of 16 million VXLAN segments to coexist in the same administrative domain. In comparison, traditional VLANs use a 12-bit segment ID that can support a maximum of 4096 VLANs.

- Optimized utilization of available network paths in the underlying infrastructure.

VXLAN packets are transferred through the underlying network based on their Layer 3 headers. They use equal-cost multipath (ECMP) routing and link aggregation protocols to use all available paths. In contrast, a Layer 2 network might block valid forwarding paths in order to avoid loops.

## Cisco Nexus 9000 as Hardware-Based VXLAN Gateway

A Cisco Nexus 9000 Series switch can function as a hardware-based VXLAN gateway. It seamlessly connects VXLAN and VLAN segments as one forwarding domain across the Layer 3 boundary without sacrificing forwarding performance. The Cisco Nexus 9000 Series hardware-based VXLAN encapsulation and de-encapsulation provide line-rate performance for all frame sizes.

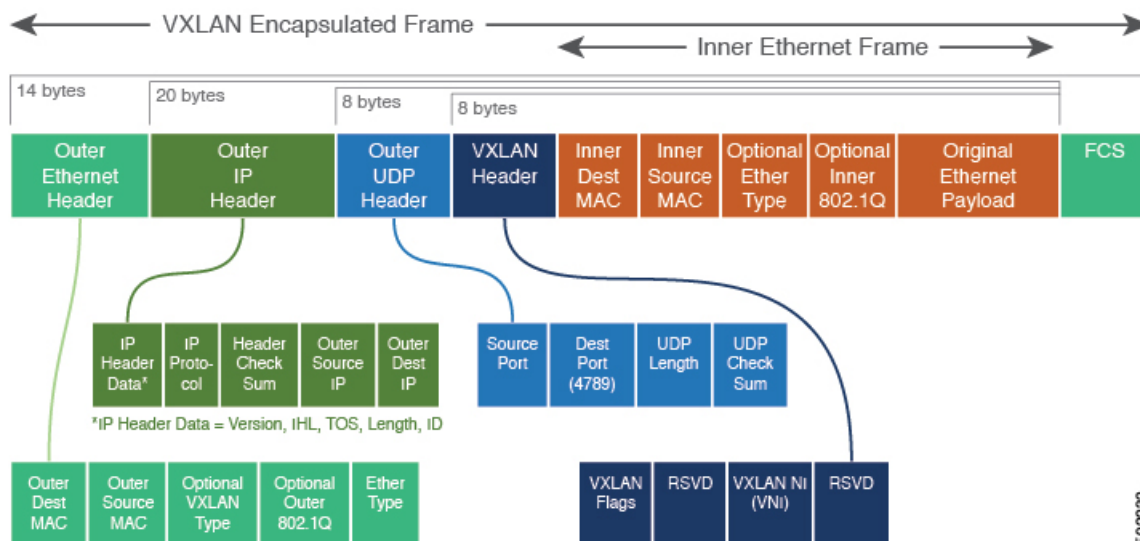

## VXLAN Encapsulation and Packet Format

VXLAN is a Layer 2 overlay scheme over a Layer 3 network. It uses a MAC Address-in-User Datagram Protocol (MAC-in-UDP) encapsulation to provide a means to extend Layer 2 segments across the data center network. VXLAN is a solution to support a flexible, large-scale multitenant environment over a shared common physical infrastructure. The transport protocol over the physical data center network is IP plus UDP.

VXLAN defines a MAC-in-UDP encapsulation scheme where the original Layer 2 frame has a VXLAN header added and is then placed in a UDP packet. With this MAC-in-UDP encapsulation, VXLAN tunnels Layer 2 network over Layer 3 network.

VXLAN uses an 8-byte VXLAN header that consists of a 24-bit VNID and a few reserved bits. The VXLAN header, together with the original Ethernet frame, go inside the UDP payload. The 24-bit VNID is used to identify Layer 2 segments and to maintain Layer 2 isolation between the segments. With all 24 bits in the VNID, VXLAN can support 16 million LAN segments.

Figure 1:

502232

# VXLAN Tunnel

A VXLAN encapsulated communication between two devices where they encapsulate and decapsulate an inner Ethernet frame, is called a VXLAN tunnel. VXLAN tunnels are stateless since they are UDP encapsulated.

## VXLAN Tunnel Endpoint

VXLAN tunnel endpoints (VTEPs) are devices that terminate VXLAN tunnels. They perform VXLAN encapsulation and de-encapsulation. Each VTEP has two interfaces. One is a Layer 2 interface on the local LAN segment to support a local endpoint communication through bridging. The other is a Layer 3 interface on the IP transport network.

The IP interface has a unique address that identifies the VTEP device in the transport network. The VTEP device uses this IP address to encapsulate Ethernet frames and transmit the packets on the transport network. A VTEP discovers other VTEP devices that share the same VNIs it has locally connected. It advertises the locally connected MAC addresses to its peers. It also learns remote MAC Address-to-VTEP mappings through its IP interface.

## Underlay Network

The VXLAN segments are independent of the underlying physical network topology. Conversely, the underlying IP network, often referred to as the underlay network, is independent of the VXLAN overlay. The underlay network forwards the VXLAN encapsulated packets based on the outer IP address header. The outer IP address header has the initiating VTEP's IP interface as the source IP address and the terminating VTEP's IP interface as the destination IP address.

The primary purpose of the underlay in the VXLAN fabric is to advertise the reachability of the Virtual Tunnel Endpoints (VTEPs). The underlay also provides a fast and reliable transport for the VXLAN traffic.

## Overlay Network

In broadcast terms, an overlay is a virtual network that is built on top of an underlay network infrastructure. In a VXLAN fabric, the overlay network is built of a control plane and the VXLAN tunnels. The control plane is used to advertise MAC address reachability. The VXLAN tunnels transport the Ethernet frames between the VTEPs.

## Distributed Anycast Gateway

Distributed Anycast Gateway refers to the use of default gateway addressing that uses the same IP and MAC address across all the leafs that are a part of a VNI. This ensures that every leaf can function as the default gateway for the workloads directly connected to it. The distributed Anycast Gateway functionality is used to facilitate flexible workload placement, and optimal traffic forwarding across the VXLAN fabric.

# Control Plane

There are two widely adopted control planes that are used with VXLAN:

## Flood and Learn Multicast-Based Learning Control Plane

Cisco Nexus 9000 Series switches support the flood and learn multicast-based control plane method.

- When configuring VXLAN with a multicast based control plane, every VTEP configured with a specific VXLAN VNI joins the same multicast group. Each VNI could have its own multicast group, or several VNIs can share the same group.
- The multicast group is used to forward broadcast, unknown unicast, and multicast (BUM) traffic for a VNI.
- The multicast configuration must support Any-Source Multicast (ASM) or PIM BiDir.
- Initially, the VTEPs only learn the MAC addresses of devices that are directly connected to them.
- Remote MAC address to VTEP mappings are learned via conversational learning.

## VXLAN MPBGP EVPN Control Plane

A Cisco Nexus 9000 Series switch can be configured to provide a Multiprotocol Border Gateway Protocol (MPBGP) ethernet VPN (EVPN) control plane. The control plane uses a distributed Anycast Gateway with Layer 2 and Layer 3 VXLAN overlay networks.

For a data center network, an MPBGP EVPN control plane provides:

- Flexible workload placement that is not restricted with physical topology of the data center network.
  - Place virtual machines anywhere in the data center fabric.
- Optimal East-West traffic between servers within and across data centers
  - East-West traffic between servers, or virtual machines, is achieved by most specific routing at the first hop router. First hop routing is done at the access layer. Host routes must be exchanged to ensure most specific routing to and from servers or hosts. Virtual machine (VM) mobility is supported by detecting new endpoint attachment when a new MAC address/IP address is seen directly connected to the local switch. When the local switch sees the new MAC/IP, it signals the new location to rest of the network.
- Eliminate or reduce flooding in the data center.
  - Flooding is reduced by distributing MAC reachability information via MP-BGP EVPN to optimize flooding relating to L2 unknown unicast traffic. Optimization of reducing broadcasts associated with ARP/IPv6 Neighbor solicitation is achieved by distributing the necessary information via MPBGP EVPN. The information is then cached at the access switches. Address solicitation requests can be responded locally without sending a broadcast to the rest of the fabric.
- A standards-based control plane that can be deployed independent of a specific fabric controller.
  - The MPBGP EVPN control plane approach provides:

- IP reachability information for the tunnel endpoints associated with a segment and the hosts behind a specific tunnel endpoint.
  - Distribution of host MAC reachability to reduce/eliminate unknown unicast flooding.
  - Distribution of host IP/MAC bindings to provide local ARP suppression.
  - Host mobility.
  - A single address family (MPBGPEVPN) to distribute both L2 and L3 route reachability information.
- Segmentation of Layer 2 and Layer 3 traffic
    - Traffic segmentation is achieved with using VXLAN encapsulation, where VNI acts as segment identifier.

# CHAPTER 3

## Configuring VXLAN

This chapter contains the following sections:

- [Guidelines and Limitations for VXLAN, on page 9](#)
- [Considerations for VXLAN Deployment, on page 15](#)
- [vPC Considerations for VXLAN Deployment, on page 18](#)
- [Network Considerations for VXLAN Deployments, on page 21](#)
- [Considerations for the Transport Network, on page 22](#)
- [Considerations for Tunneling VXLAN, on page 23](#)
- [Configuring VXLAN, on page 25](#)
- [VXLAN and IP-in-IP Tunneling, on page 32](#)
- [Configuring VXLAN Static Tunnels, on page 35](#)

## Guidelines and Limitations for VXLAN

VXLAN has the following guidelines and limitations:

**Table 1: ACL Options for VXLAN Traffic on Cisco Nexus 92300YC, 92160YC-X, 93120TX, 9332PQ, and 9348GC-FXP Switches**

ACL Direction	ACL Type	VTEP Type	Port Type	Flow Direction	Traffic Type	Supported
Ingress	PACL	Ingress VTEP	L2 port	Access to Network [GROUP:encap direction]	Native L2 traffic [GROUP:inner]	YES
	VACL	Ingress VTEP	VLAN	Access to Network [GROUP:encap direction]	Native L2 traffic [GROUP:inner]	YES
Ingress	RACL	Ingress VTEP	Tenant L3 SVI	Access to Network [GROUP:encap direction]	Native L3 traffic [GROUP:inner]	YES

ACL Direction	ACL Type	VTEP Type	Port Type	Flow Direction	Traffic Type	Supported
Egress	RACL	Ingress VTEP	Uplink L3/L3-PO/SVI	Access to Network [GROUP:encap direction]	VXLAN encap [GROUP:outer]	NO
Ingress	RACL	Egress VTEP	Uplink L3/L3-PO/SVI	Network to Access [GROUP:decap direction]	VXLAN encap [GROUP:outer]	NO
Egress	PACL	Egress VTEP	L2 port	Network to Access [GROUP:decap direction]	Native L2 traffic [GROUP:inner]	NO
	VACL	Egress VTEP	VLAN	Network to Access [GROUP:decap direction]	Native L2 traffic [GROUP:inner]	NO
Egress	RACL	Egress VTEP	Tenant L3 SVI	Network to Access [GROUP:decap direction]	Post-decap L3 traffic [GROUP:inner]	YES

- For scale environments, the VLAN IDs related to the VRF and Layer-3 VNI (L3VNI) must be reserved with the **system vlan nve-overlay id** command.
- NLB in the unicast, multicast, and IGMP multicast modes is not supported on Cisco Nexus 9000 switch VXLAN VTEPs. The work-around is to move the NLB cluster behind the intermediary device (which supports NLB in the respective mode) and inject the cluster IP address as an external prefix into the VXLAN fabric.
- Support added for MultiAuth Change of Authorization (CoA). For more information, see the [Cisco Nexus 9000 Series NX-OS Security Configuration Guide, Release 9.3\(x\)](#).
- The **lACP vpc-convergence** command can be configured in VXLAN and non-VXLAN environments that have vPC port channels to hosts that support LACP.
- PIM BiDir for VXLAN underlay with and without vPC is supported.

The following features are not supported when PIM BiDir for VXLAN underlay is configured:

- Flood and Learn VXLAN
- Tenant Routed Multicast (TRM)
- VXLAN EVPN Multi-Site
- VXLAN EVPN Multihoming
- vPC attached VTEPs

For redundant RPs, use Phantom RP.

For transitioning from PIM ASM to PIM BiDir or from PIM BiDir to PIM ASM underlay, we recommend that you use the following example procedure:

```
no ip pim rp-address 192.0.2.100 group-list 230.1.1.0/8
clear ip mroute *
clear ip mroute date-created *
clear ip pim route *
clear ip igmp groups *
clear ip igmp snooping groups * vlan all
```

Wait for all tables to clean up.

```
ip pim rp-address 192.0.2.100 group-list 230.1.1.0/8 bidir
```

- When entering the **no feature pim** command, NVE ownership on the route is not removed so the route stays and traffic continues to flow. Aging is done by PIM. PIM does not age out entries having a VXLAN encap flag.
- Fibre Channel over Ethernet (FCoE) N-port Virtualization (NPV) can coexist with VXLAN on different fabric uplinks but on the same or different front-panel ports on Cisco Nexus 93180YC-EX and 93180YC-FX switches.  
  
Fibre Channel N-port Virtualization (NPV) can coexist with VXLAN on different fabric uplinks but on the same or different front-panel ports on Cisco Nexus 93180YC-FX switches. VXLAN can exist only on the Ethernet front-panel ports and not on the FC front-panel ports.
- VXLAN is supported on the Cisco Nexus 9348GC-FXP switch.
- VXLAN is not supported on the Cisco Nexus 92348GC switch.
- When SVI is enabled on a VTEP (flood and learn, or EVPN), make sure that ARP-ETHER TCAM is carved using the **hardware access-list tcam region arp-ether 256** command. This requirement does not apply to Cisco Nexus 9200, 9300-EX, 9300-FX/FX2/FX3, and 9300-GX platform switches and Cisco 9500 Series switches with 9700-EX line cards.
- For information regarding the **load-share** keyword usage for PBR with VXLAN, see the [Guidelines and Limitations for Policy-Based Routing](#) section of the *Cisco Nexus 9000 Series NX-OS Unicast Routing Configuration Guide, Release 9.3(x)*.
- Beginning with Cisco NX-OS Release 9.3(3), ARP suppression is supported for Cisco Nexus 9300-GX platform switches.
- Beginning with Cisco NX-OS Release 9.3(5), ARP suppression is supported with reflective relay for Cisco Nexus 9364C, 9300-EX, 9300-FX/FX2/FXP, and 9300-GX platform switches. For information on reflective relay, see the *Cisco Nexus 9000 Series NX-OS Layer 2 Switching Configuration Guide*.
- Beginning with Cisco NX-OS Release 9.3(6), VXLAN flood and learn mode is supported for Cisco Nexus 9300-GX platform switches.
- Beginning with Cisco NX-OS Release 10.1(1), VXLAN flood and learn mode is supported for N9K-C9316D-GX, N9K-C93600CD-GX, and N9K-C9364C-GX TOR switches.
- For the Cisco Nexus 9504 and 9508 switches with -R line cards, VXLAN Layer 2 Gateway is supported on the 9636C-RX line card. VXLAN and MPLS cannot be enabled on the Cisco Nexus 9508 switch at the same time.

- For the Cisco Nexus 9504 and 9508 switches with -R line cards, if VXLAN is enabled, the Layer 2 Gateway cannot be enabled when there is any line card other than the 9636C-RX.
- For the Cisco Nexus 9504 and 9508 switches with -R line cards, PIM/ASM is supported in the underlay ports. PIM/Bidir is not supported. For more information, see the *Cisco Nexus 9000 Series NX\_OS Multicast Routing Configuration Guide, Release 9.3(x)*.
- For the Cisco Nexus 9504 and 9508 switches with -R line cards, IPv6 hosts routing in the overlay is supported.
- For the Cisco Nexus 9504 and 9508 switches with -R line cards, ARP suppression is supported.
- Beginning with Cisco NX-OS Release 10.1(1), ITD and ePBR over VXLAN feature is supported on N9K-X9716D-GX TOR and N9K-C93180YC-FX3S platform switches.
- Beginning with Cisco NX-OS Release 10.1(1), PBR over VXLAN feature is supported on N9K-C9316D-GX, N9K-C93600CD-GX, and N9K-C9364C-GX TOR switches.
- The **load-share** keyword has been added to the Configuring a Route Policy procedure for the PBR over VXLAN feature.

For more information, see the [Cisco Nexus 9000 Series NX\\_OS Unicast Routing Configuration Guide, Release 9.x](#).

- The **lacp vpc-convergence** command is added for better convergence of Layer 2 EVPN VXLAN:

```
interface port-channel10
  switchport
  switchport mode trunk
  switchport trunk allowed vlan 1001-1200
  spanning-tree port type edge trunk
  spanning-tree bpdupfilter enable
  lacp vpc-convergence
  vpc 10
```

```
interface Ethernet1/34 <- The port-channel member-port is configured with LACP-active
mode (for example, no changes are done at the member-port level.)
  switchport
  switchport mode trunk
  switchport trunk allowed vlan 1001-1200
  channel-group 10 mode active
  no shutdown
```

- Port-VLAN with VXLAN is supported on Cisco Nexus 9300-EX and 9500 Series switches with 9700-EX line cards with the following exceptions:
  - Only Layer 2 (no routing) is supported with port-VLAN with VXLAN on these switches.
  - No inner VLAN mapping is supported.
- The **system nve ipmc** CLI command is not applicable to the Cisco 9200 and 9300-EX platform switches and Cisco 9500 platform switches with 9700-EX line cards.
- Bind NVE to a loopback address that is separate from other loopback addresses that are required by Layer 3 protocols. A best practice is to use a dedicated loopback address for VXLAN. This best practice should be applied not only for the vPC VXLAN deployment, but for all VXLAN deployments.
- To remove configurations from an NVE interface, we recommend manually removing each configuration rather than using the **default interface nve** command.

- **show** commands with the **internal** keyword are not supported.
- FEX ports do not support IGMP snooping on VXLAN VLANs.
- VXLAN is supported for the Cisco Nexus 93108TC-EX and 93180YC-EX switches and for Cisco Nexus 9500 Series switches with the X9732C-EX line card.
- DHCP snooping (Dynamic Host Configuration Protocol snooping) is not supported on VXLAN VLANs.
- ACLs are not supported on Layer 3 uplinks for VXLAN traffic. Egress VACLs support is not available for de-capsulated packets in the network to access direction on the inner payload.

As a best practice, use PACLS/VACLs for the access to the network direction.

- The QoS buffer-boost feature is not applicable for VXLAN traffic.
- The following limitations apply to releases prior to Cisco NX-OS Release 9.3(5):
  - SVI and subinterfaces as uplinks are not supported.
  - VTEPs do not support VXLAN-encapsulated traffic over subinterfaces, regardless of VRF participation or IEEE 802.1Q encapsulation.
  - VTEPs do not support VXLAN-encapsulated traffic over parent interfaces if subinterfaces are configured, regardless of VRF participation.
  - Mixing subinterfaces for VXLAN and non-VXLAN VLANs is not supported.
- Beginning with Cisco NX-OS Release 10.1(1), VXLAN-encapsulated traffic over Parent Interface that Carries Subinterfaces is supported on Cisco Nexus 9300-FX3 platform switches.
- Beginning with Cisco NX-OS Release 9.3(5), VTEPs support VXLAN-encapsulated traffic over parent interfaces if subinterfaces are configured. This feature is supported for VXLAN flood and learn, VXLAN EVPN, VXLAN EVPN Multi-Site, and DCI. As shown in the following configuration example, VXLAN traffic is forwarded on the parent interface (eth1/1) in the default VRF, and L3 IP (non-VXLAN) traffic is forwarded on subinterfaces (eth1/1.10) in the tenant VRF.

```
interface ethernet 1/1
  description VXLAN carrying interface
  no switchport
  ip address 10.1.1.1/30

interface ethernet 1/1.10
  description NO VXLAN
  no switchport
  vrf member Tenant10
  encapsulation dot1q 10
  ip address 10.10.1.1/30
```

- Point-to-multipoint Layer 3 and SVI uplinks are not supported.
- A FEX HIF (FEX host interface port) is supported for a VLAN that is extended with VXLAN.
- In an ingress replication vPC setup, Layer 3 connectivity is needed between vPC peer devices.
- Rollback is not supported on VXLAN VLANs that are configured with the port VLAN mapping feature.
- The VXLAN UDP port number is used for VXLAN encapsulation. For Cisco Nexus NX-OS, the UDP port number is 4789. It complies with IETF standards and is not configurable.

- VXLAN is supported on Cisco Nexus 9500 platform switches with the following line cards:

- 9500-R
- 9564PX
- 9564TX
- 9536PQ
- 9700-EX
- 9700-FX

- Cisco Nexus 9300 Series switches with 100G uplinks only support VXLAN switching/bridging.

Cisco Nexus 9200, Cisco Nexus 9300-EX, and Cisco Nexus 9300-FX, and Cisco Nexus 9300-FX2 platform switches do not have this restriction.

---

**Note** For VXLAN routing support, a 40G uplink module is required.

---

- MDP is not supported for VXLAN configurations.
- Consistency checkers are not supported for VXLAN tables.
- ARP suppression is supported for a VNI only if the VTEP hosts the First-Hop Gateway (Distributed Anycast Gateway) for this VNI. The VTEP and SVI for this VLAN must be properly configured for the Distributed Anycast Gateway operation (for example, global anycast gateway MAC address configured and anycast gateway with the virtual IP address on the SVI).
- ARP suppression is a per-L2VNI fabric-wide setting in the VXLAN fabric. Enable or disable this feature consistently across all VTEPs in the fabric. Inconsistent ARP suppression configuration across VTEPs is not supported.
- The VXLAN network identifier (VNID) 16777215 is reserved and should not be configured explicitly.
- VXLAN supports In-Service Software Upgrades (ISSUs). However, VXLAN ISSU is not supported for Cisco Nexus 9300-GX platform switches.
- VXLAN does not support coexistence with the GRE tunnel feature or the MPLS (static or segment-routing) feature.
- VTEP connected to FEX host interface ports is not supported.
- If multiple VTEPs use the same multicast group address for underlay multicast but have different VNIs, the VTEPs should have at least one VNI in common. Doing so ensures that NVE peer discovery occurs and underlay multicast traffic is forwarded correctly. For example, leafs L1 and L4 could have VNI 10 and leafs L2 and L3 could have VNI 20, and both VNIs could share the same group address. When leaf L1 sends traffic to leaf L4, the traffic could pass through leaf L2 or L3. Because NVE peer L1 is not learned on leaf L2 or L3, the traffic is dropped. Therefore, VTEPs that share a group address need to have at least one VNI in common so that peer learning occurs and traffic is not dropped. This requirement applies to VXLAN bud-node topologies.
- VXLAN does not support coexistence with MVR and MPLS for Cisco Nexus 9504 and 9508 with -R line cards.

- Resilient hashing (port-channel load-balancing resiliency) and VXLAN configurations are not compatible with VTEPs using ALE uplink ports.

---

**Note** Resilient hashing is disabled by default.

---

- For Cisco Nexus 9504 and 9508 switches with -R line cards, the L3VNI's VLAN must be added on the vPC peer-link trunk's allowed VLAN list.
- Native VLANs for VXLAN are not supported. All traffic on VXLAN Layer 2 trunks needs to be tagged. This limitation applies to Cisco Nexus 9300 and 9500 switches with 95xx line cards. This limitation does not apply to Cisco Nexus 9200, 9300-EX, 9300-FX, and 9500 platform switches with -EX or -FX line cards.

## Considerations for VXLAN Deployment

- For scale environments, the VLAN IDs related to the VRF and Layer-3 VNI (L3VNI) must be reserved with the **system vlan nve-overlay id** command.

This is required to optimize the VXLAN resource allocation to scale the following platforms:

- Cisco Nexus 9300 platform switches
- Cisco Nexus 9500 platform switches with 9500 line cards

The following example shows how to reserve the VLAN IDs related to the VRF and the Layer-3 VNI:

```
system vlan nve-overlay id 2000

vlan 2000
  vn-segment 50000

interface Vlan2000
  vrf member MYVRF_50000
  ip forward
  ipv6 forward

vrf context MYVRF_50000
  vni 50000
```

---

**Note** The **system vlan nve-overlay id** command should be used for a VRF or a Layer-3 VNI (L3VNI) only. Do not use this command for regular VLANs or Layer-2 VNIs (L2VNI).

---

- When configuring VXLAN BGP EVPN, only the "System Routing Mode: Default" is applicable for the following hardware platforms:
  - Cisco Nexus 9200 platform switches
  - Cisco Nexus 9300 platform switches
  - Cisco Nexus 9300-EX platform switches

- Cisco Nexus 9300-FX/FX2/FX3 platform switches
- Cisco Nexus 9300-GX platform switches
- Cisco Nexus 9500 platform switches with X9500 line cards
- Cisco Nexus 9500 platform switches with X9700-EX/FX line cards
- The “System Routing Mode: template-vxlan-scale” is not applicable.
- When using VXLAN BGP EVPN in combination with Cisco NX-OS Release 7.0(3)I4(x) or NX-OS Release 7.0(3)I5(1), the “System Routing Mode: template-vxlan-scale” is required on the following hardware platforms:
  - Cisco Nexus 9300-EX Switches
  - Cisco Nexus 9500 Switches with X9700-EX line cards
- Changing the “System Routing Mode” requires a reload of the switch.
- A loopback address is required when using the **source-interface config** command. The loopback address represents the local VTEP IP.
- During boot-up of a switch, you can use the **source-interface hold-down-time** *hold-down-time* command to suppress advertisement of the NVE loopback address until the overlay has converged. The range for the *hold-down-time* is 0 - 2147483647 seconds. The default is 300 seconds.
- To establish IP multicast routing in the core, IP multicast configuration, PIM configuration, and RP configuration is required.
- VTEP to VTEP unicast reachability can be configured through any IGP protocol.
- In VXLAN flood and learn mode, the default gateway for VXLAN VLAN is recommended to be a centralized gateway on a pair of vPC devices with FHRP (First Hop Redundancy Protocol) running between them.

In BGP EVPN, it is recommended to use the anycast gateway feature on all VTEPs.

- For flood and learn mode, only a centralized Layer 3 gateway is supported. Anycast gateway is not supported. The recommended Layer 3 gateway design would be a pair of switches in vPC to be the Layer 3 centralized gateway with FHRP protocol running on the SVIs. The same SVI's cannot span across multiple VTEPs even with different IP addresses used in the same subnet.

**Note** When configuring SVI with flood and learn mode on the central gateway leaf, it is mandatory to configure **hardware access-list tcam region arp-ether size double-wide**. (You must decrease the size of an existing TCAM region before using this command.)

For example:

```
hardware access-list tcam region arp-ether 256 double-wide
```

---

**Note** Configuring the **hardware access-list tcam region arp-ether size double-wide** is not required on Cisco Nexus 9200 Series switches.

---

- When configuring ARP suppression with BGP-EVPN, use the **hardware access-list tcam region arp-ether size double-wide** command to accommodate ARP in this region. (You must decrease the size of an existing TCAM region before using this command.)

---

**Note** This step is required for Cisco Nexus 9300 switches (NFE/ALE) and Cisco Nexus 9500 switches with N9K-X9564PX, N9K-X9564TX, and N9K-X9536PQ line cards. This step is not needed with Cisco Nexus 9200 switches, Cisco Nexus 9300-EX switches, or Cisco Nexus 9500 switches with N9K-X9732C-EX line cards.

---

- VXLAN tunnels cannot have more than one underlay next hop on a given underlay port. For example, on a given output underlay port, only one destination MAC address can be derived as the outer MAC on a given output port.

This is a per-port limitation, not a per-tunnel limitation. This means that two tunnels that are reachable through the same underlay port cannot drive two different outer MAC addresses.

- When changing the IP address of a VTEP device, you must shut the NVE interface before changing the IP address.
- As a best practice, the RP for the multicast group should be configured only on the spine layer. Use the anycast RP for RP load balancing and redundancy.

The following is an example of an anycast RP configuration on spines:

```
ip pim rp-address 1.1.1.10 group-list 224.0.0.0/4
ip pim anycast-rp 1.1.1.10 1.1.1.1
ip pim anycast-rp 1.1.1.10 1.1.1.2
```

---

**Note**

- 1.1.1.10 is the anycast RP IP address that is configured on all RPs participating in the anycast RP set.
- 1.1.1.1 is the local RP IP.
- 1.1.1.2 is the peer RP IP.

---

- Static ingress replication and BGP EVPN ingress replication do not require any IP Multicast routing in the underlay.

## vPC Considerations for VXLAN Deployment

- As a best practice when feature vPC is added or removed from a VTEP, the NVE interfaces on both the vPC primary and the vPC secondary should be shut before the change is made.
- Bind NVE to a loopback address that is separate from other loopback addresses that are required by Layer 3 protocols. A best practice is to use a dedicated loopback address for VXLAN.
- On vPC VXLAN, it is recommended to increase the **delay restore interface-vlan** timer under the vPC configuration, if the number of SVIs are scaled up. For example, if there are 1000 VNIs with 1000 SVIs, we recommend to increase the **delay restore interface-vlan** timer to 45 seconds.

- If a ping is initiated to the attached hosts on VXLAN VLAN from a vPC VTEP node, the source IP address used by default is the anycast IP that is configured on the SVI. This ping can fail to get a response from the host in case the response is hashed to the vPC peer node. This issue can happen when a ping is initiated from a VXLAN vPC node to the attached hosts without using a unique source IP address. As a workaround for this situation, use VXLAN OAM or create a unique loopback on each vPC VTEP and route the unique address via a backdoor path.

- The loopback address used by NVE needs to be configured to have a primary IP address and a secondary IP address.

The secondary IP address is used for all VXLAN traffic that includes multicast and unicast encapsulated traffic.

- vPC peers must have identical configurations.
  - Consistent VLAN to vn-segment mapping.
  - Consistent NVE1 binding to the same loopback interface
    - Using the same secondary IP address.
    - Using different primary IP addresses.
  - Consistent VNI to group mapping.

- For multicast, the vPC node that receives the (S, G) join from the RP (rendezvous point) becomes the DF (designated forwarder). On the DF node, encaps routes are installed for multicast.

Decap routes are installed based on the election of a decapper from between the vPC primary node and the vPC secondary node. The winner of the decap election is the node with the least cost to the RP. However, if the cost to the RP is the same for both nodes, the vPC primary node is elected.

The winner of the decap election has the decap mroute installed. The other node does not have a decap route installed.

- On a vPC device, BUM traffic (broadcast, unknown-unicast, and multicast traffic) from hosts is replicated on the peer-link. A copy is made of every native packet and each native packet is sent across the peer-link to service orphan-ports connected to the peer vPC switch.

To prevent traffic loops in VXLAN networks, native packets ingressing the peer-link cannot be sent to an uplink. However, if the peer switch is the encapper, the copied packet traverses the peer-link and is sent to the uplink.

---

**Note** Each copied packet is sent on a special internal VLAN (VLAN 4041 or VLAN 4046).

---

- When the peer-link is shut, the loopback interface used by NVE on the vPC secondary is brought down and the status is **Admin Shut**. This is done so that the route to the loopback is withdrawn on the upstream and that the upstream can divert all traffic to the vPC primary.

---

**Note** Orphans connected to the vPC secondary will experience loss of traffic for the period that the peer-link is shut. This is similar to Layer 2 orphans in a vPC secondary of a traditional vPC setup.

---

- When peer-link is no-shut, the NVE loopback address is brought up again and the route is advertised upstream, attracting traffic.
- For vPC, the loopback interface has two IP addresses: the primary IP address and the secondary IP address.

The primary IP address is unique and is used by Layer 3 protocols.

The secondary IP address on loopback is necessary because the interface NVE uses it for the VTEP IP address. The secondary IP address must be same on both vPC peers.

- The vPC peer-gateway feature must be enabled on both peers to facilitate NVE RMAC/VMAC programming on both peers. For peer-gateway functionality, at least one backup routing SVI is required to be enabled across peer-link and also configured with PIM. This provides a backup routing path in the case when VTEP loses complete connectivity to the spine. Remote peer reachability is re-routed over peer-link in his case. In BUD node topologies, the backup SVI needs to be added as a static OIF for each underlay multicast group.

```
switch# sh ru int vlan 2

interface Vlan2
description backupl_svi_over_peer-link
no shutdown
ip address 30.2.1.1/30
ip router ospf 1 area 0.0.0.0
ip pim sparse-mode
ip igmp static-oif route-map match-mcast-groups

route-map match-mcast-groups permit 1
match ip multicast group 225.1.1.1/32
```

---

**Note** In BUD node topologies, the backup SVI needs to be added as a static OIF for each underlay multicast group.

---

The SVI must be configured on bot vPC peers and requires PIM to be enabled.

---

- When the NVE or loopback is shut in vPC configurations:
  - If the NVE or loopback is shut only on the primary vPC switch, the global VXLAN vPC consistency checker fails. Then the NVE, loopback, and vPCs are taken down on the secondary vPC switch.

- If the NVE or loopback is shut only on the secondary vPC switch, the global VXLAN vPC consistency checker fails. Then, the NVE, loopback, and secondary vPC are brought down on the secondary. Traffic continues to flow through the primary vPC switch.
- As a best practice, you should keep both the NVE and loopback up on both the primary and secondary vPC switches.
- Redundant anycast RPs configured in the network for multicast load-balancing and RP redundancy are supported on vPC VTEP topologies.
- As a best practice, when changing the secondary IP address of an anycast vPC VTEP, the NVE interfaces on both the vPC primary and the vPC secondary must be shut before the IP changes are made.
- When SVI is enabled on a VTEP (flood and learn, or EVPN) regardless of ARP suppression, make sure that ARP-ETHER TCAM is carved using the **hardware access-list tcam region arp-ether 256 double-wide** command. This requirement does not apply to Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2/FX3 and 9300-GX platform switches and Cisco Nexus 9500 platform switches with 9700-EX line cards.
- The **show** commands with the **internal** keyword are not supported.
- DHCP snooping (Dynamic Host Configuration Protocol snooping) is not supported on VXLAN VLANs.
- ACLs are not supported on Layer 3 uplinks for VXLAN traffic. Egress VACLs support is not available for de-capsulated packets in the network to access direction on the inner payload.

As a best practice, use PACLS/VACLs for the access to the network direction.

See the [Cisco Nexus 9000 Series NX-OS Security Configuration Guide, Release 9.3\(x\)](#) for other guidelines and limitations for the VXLAN ACL feature.

- QoS classification is not supported for VXLAN traffic in the network to access direction on the Layer 3 uplink interface.
- See the [Cisco Nexus 9000 Series NX-OS Quality of Service Configuration Guide, Release 9.3\(x\)](#) for other guidelines and limitations for the VXLAN QoS feature.
- The QoS buffer-boost feature is not applicable for VXLAN traffic.
- Beginning with Cisco NX-OS Release 9.3(5), VTEPs support VXLAN-encapsulated traffic over parent interfaces if subinterfaces are configured.
- VTEPs do not support VXLAN encapsulated traffic over subinterfaces. This is regardless of VRF participation or IEEE802.1Q encapsulation.
- Mixing subinterfaces for VXLAN and non-VXLAN VLANs is not supported.
- Point-to-multipoint Layer 3 and SVI uplinks are not supported.
- Using the **ip forward** command enables the VTEP to forward the VXLAN de-capsulated packet destined to its router IP to the SUP/CPU.
- Before configuring it as an SVI, the backup VLAN needs to be configured on Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2/FX3 and 9300-GX platform switches as an infra-VLAN with the **system nve infra-vlans** command.
- VXLAN is supported on Cisco Nexus 9500 platform switches with the following line cards:
  - 9564PX

- 9564TX
  - 9536PQ
  - 9732C-EX
- When Cisco Nexus 9500 platform switches are used as VTEPs, 100G line cards are not supported on Cisco Nexus 9500 platform switches. This limitation does not apply to a Cisco Nexus 9500 switch with 9700-EX or -FX line cards.
  - Cisco Nexus 9300 platform switches with 100G uplinks only support VXLAN switching/bridging. Cisco Nexus 9200 and Cisco Nexus 9300-EX/FX/FX2 platform switches do not have this restriction.

---

**Note** For VXLAN routing support, a 40 G uplink module is required.

---

- The VXLAN UDP port number is used for VXLAN encapsulation. For Cisco Nexus NX-OS, the UDP port number is 4789. It complies with IETF standards and is not configurable.
- For Cisco Nexus 9200 platform switches that have the Application Spine Engine (ASE2). There exists a Layer 3 VXLAN (SVI) throughput issue. There is a data loss for packets of sizes 99 - 122.
- The VXLAN network identifier (VNID) 16777215 is reserved and should not be configured explicitly.
- VXLAN supports In Service Software Upgrade (ISSU).
- VXLAN ISSU is not supported on the Cisco Nexus 9300-GX platform switches.
- VXLAN does not support coexistence with the GRE tunnel feature or the MPLS (static or segment routing) feature.
- VTEP connected to FEX host interface ports is not supported.
- Resilient hashing (port-channel load-balancing resiliency) and VXLAN configurations are not compatible with VTEPs using ALE uplink ports.

---

**Note** Resilient hashing is disabled by default.

---

- When ARP suppression is enabled or disabled in a vPC setup, a down time is required because the global VXLAN vPC consistency checker will fail and the VLANs will be suspended if ARP suppression is disabled or enabled on only one side.

---

**Note** For information about VXLAN BGP EVPN scalability, see the *Cisco Nexus 9000 Series NX-OS Verified Scalability Guide, Release 9.3(x)*.

---

## Network Considerations for VXLAN Deployments

- MTU Size in the Transport Network

Due to the MAC-to-UDP encapsulation, VXLAN introduces 50-byte overhead to the original frames. Therefore, the maximum transmission unit (MTU) in the transport network needs to be increased by 50 bytes. If the overlays use a 1500-byte MTU, the transport network needs to be configured to accommodate 1550-byte packets at a minimum. Jumbo-frame support in the transport network is required if the overlay applications tend to use larger frame sizes than 1500 bytes.

- **ECMP and LACP Hashing Algorithms in the Transport Network**

As described in a previous section, Cisco Nexus 9000 Series Switches introduce a level of entropy in the source UDP port for ECMP and LACP hashing in the transport network. As a way to augment this implementation, the transport network uses an ECMP or LACP hashing algorithm that takes the UDP source port as an input for hashing, which achieves the best load-sharing results for VXLAN encapsulated traffic.

- **Multicast Group Scaling**

The VXLAN implementation on Cisco Nexus 9000 Series Switches uses multicast tunnels for broadcast, unknown unicast, and multicast traffic forwarding. Ideally, one VXLAN segment mapping to one IP multicast group is the way to provide the optimal multicast forwarding. It is possible, however, to have multiple VXLAN segments share a single IP multicast group in the core network. VXLAN can support up to 16 million logical Layer 2 segments, using the 24-bit VNID field in the header. With one-to-one mapping between VXLAN segments and IP multicast groups, an increase in the number of VXLAN segments causes a parallel increase in the required multicast address space and the amount of forwarding states on the core network devices. At some point, multicast scalability in the transport network can become a concern. In this case, mapping multiple VXLAN segments to a single multicast group can help conserve multicast control plane resources on the core devices and achieve the desired VXLAN scalability. However, this mapping comes at the cost of suboptimal multicast forwarding. Packets forwarded to the multicast group for one tenant are now sent to the VTEPs of other tenants that are sharing the same multicast group. This causes inefficient utilization of multicast data plane resources. Therefore, this solution is a trade-off between control plane scalability and data plane efficiency.

Despite the suboptimal multicast replication and forwarding, having multiple-tenant VXLAN networks to share a multicast group does not bring any implications to the Layer 2 isolation between the tenant networks. After receiving an encapsulated packet from the multicast group, a VTEP checks and validates the VNID in the VXLAN header of the packet. The VTEP discards the packet if the VNID is unknown to it. Only when the VNID matches one of the VTEP's local VXLAN VNIDs, does it forward the packet to that VXLAN segment. Other tenant networks will not receive the packet. Thus, the segregation between VXLAN segments is not compromised.

## Considerations for the Transport Network

The following are considerations for the configuration of the transport network:

- On the VTEP device:
  - 
  - Create and configure a loopback interface with a /32 IP address.  
(For vPC VTEPs, you must configure primary and secondary /32 IP addresses.)
  - 
  - Advertise the loopback interface /32 addresses through the routing protocol (static route) that runs in the transport network.

- Throughout the transport network:

For Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2/FX3 and 9300-GX platform switches, the use of the **system nve infra-vlans** command is required. Otherwise, VXLAN traffic (IP/UDP 4789) is actively treated by the switch. The following scenarios are a non-exhaustive list but most commonly seen, where the need for a **system nve infra-vlans** definition is required.

Every VLAN that is not associated with a VNI (vn-segment) is required to be configured as a **system nve infra-vlans** in the following cases:

In the case of VXLAN flood and learn as well as VXLAN EVPN, the presence of non-VXLAN VLANs could be related to:

- An SVI related to a non-VXLAN VLAN is used for backup underlay routing between vPC peers via a vPC peer-link (backup routing).
- An SVI related to a non-VXLAN VLAN is required for connecting downstream routers (external connectivity, dynamic routing over vPC).
- An SVI related to a non-VXLAN VLAN is required for per Tenant-VRF peering (L3 route sync and traffic between vPC VTEPs in a Tenant VRF).
- An SVI related to a non-VXLAN VLAN is used for first-hop routing toward endpoints (Bud-Node).

In the case of VXLAN flood and learn, the presence of non-VXLAN VLANs could be related to:

- An SVI related to a non-VXLAN VLAN is used for an underlay uplink toward the spine (Core port).

The rule of defining VLANs as **system nve infra-vlans** can be relaxed for special cases such as:

- An SVI related to a non-VXLAN VLAN that does not transport VXLAN traffic (IP/UDP 4789).
- Non-VXLAN VLANs that are not associated with an SVI or not transporting VXLAN traffic (IP/UDP 4789).

**Note**

You must not configure certain combinations of infra-VLANs. For example, 2 and 514, 10 and 522, which are 512 apart. This is specifically but not exclusive to the “Core port” scenario that is described for VXLAN flood and learn.

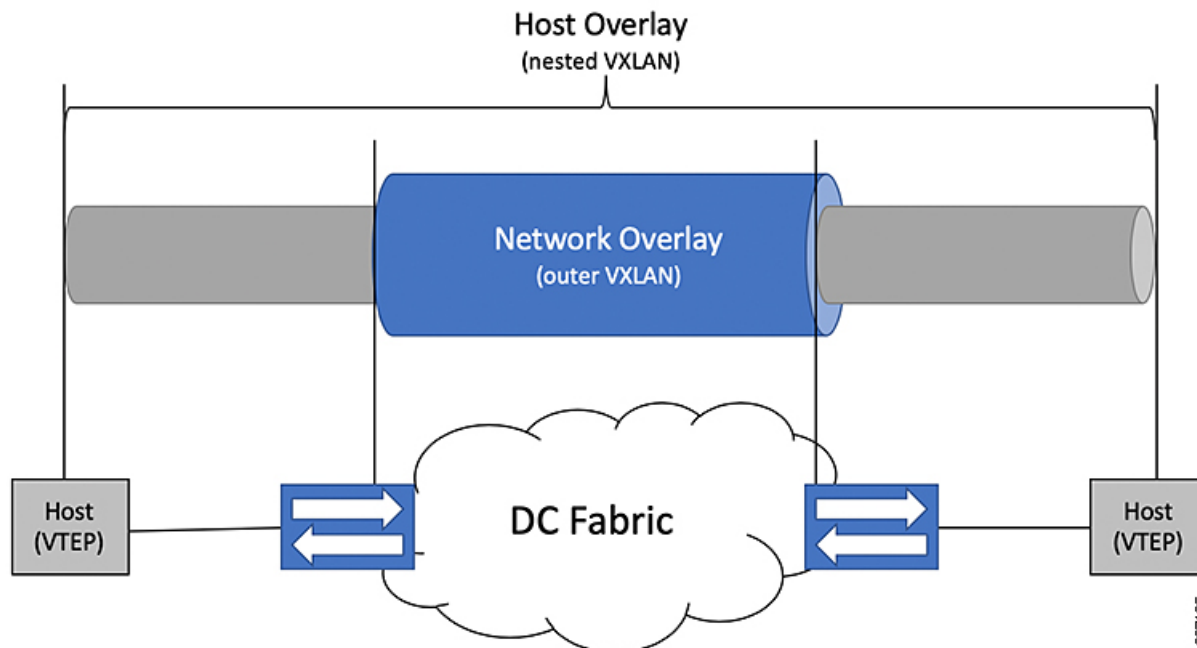

## Considerations for Tunneling VXLAN

DC Fabrics with VXLAN BGP EVPN are becoming the transport infrastructure for overlays. These overlays, often originated on the server (Host Overlay), require integration or transport over the top of the existing transport infrastructure (Network Overlay).

Nested VXLAN (Host Overlay over Network Overlay) support has been added starting with Cisco NX-OS Release 7.0(3)I7(4) and Cisco NX-OS Release 9.2(2) on the Cisco Nexus 9200, 9300-EX, 9300-FX, 9300-FX2,

9500-EX, 9500-FX platform switches. It is also supported for Cisco Nexus 9300-FX3 platform switches starting with Cisco NX-OS Release 9.3(5).

**Figure 2: Host Overlay**

To provide Nested VXLAN support, the switch hardware and software must differentiate between two different VXLAN profiles:

- VXLAN originated behind the Hardware VTEP for transport over VXLAN BGP EVPN (nested VXLAN)
- VXLAN originated behind the Hardware VTEP to integrated with VXLAN BGP EVPN (BUD Node)

The detection of the two different VXLAN profiles is automatic and no specific configuration is needed for nested VXLAN. As soon as VXLAN encapsulated traffic arrives in a VXLAN enabled VLAN, the traffic is transported over the VXLAN BGP EVPN enabled DC Fabric.

The following attachment modes are supported for Nested VXLAN:

- Untagged traffic (in native VLAN on a trunk port or on an access port)
- Tagged traffic (tagged VLAN on a IEEE 802.1Q trunk port)
- Untagged and tagged traffic that is attached to a vPC domain
- Untagged traffic on a Layer 3 interface of a Layer 3 port-channel interface

# Configuring VXLAN

## Enabling VXLANs

### SUMMARY STEPS

1. **configure terminal**
2. **[no] feature nv overlay**
3. **[no] feature vn-segment-vlan-based**
4. (Optional) **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>[no] feature nv overlay</b>	Enables the VXLAN feature.
<b>Step 3</b>	<b>[no] feature vn-segment-vlan-based</b>	Configures the global mode for all VXLAN bridge domains.
<b>Step 4</b>	(Optional) <b>copy running-config startup-config</b>	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

## Mapping VLAN to VXLAN VNI

### SUMMARY STEPS

1. **configure terminal**
2. **vlan *vlan-id***
3. **vn-segment *vnid***
4. **exit**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>vlan <i>vlan-id</i></b>	Specifies VLAN.
<b>Step 3</b>	<b>vn-segment <i>vnid</i></b>	Specifies VXLAN VNID (Virtual Network Identifier)
<b>Step 4</b>	<b>exit</b>	Exit configuration mode.

## Creating and Configuring an NVE Interface and Associate VNIs

An NVE interface is the overlay interface that terminates VXLAN tunnels.

You can create and configure an NVE (overlay) interface with the following:

### SUMMARY STEPS

1. **configure terminal**
2. **interface nve *x***
3. **source-interface *src-if***
4. **member vni *vni***
5. **mcast-group *start-address* [*end-address*]**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface nve <i>x</i></b>	Creates a VXLAN overlay interface that terminates VXLAN tunnels.  <b>Note</b> Only 1 NVE interface is allowed on the switch.
<b>Step 3</b>	<b>source-interface <i>src-if</i></b>	The source interface must be a loopback interface that is configured on the switch with a valid /32 IP address. This /32 IP address must be known by the transient devices in the transport network and the remote VTEPs. This is accomplished by advertising it through a dynamic routing protocol in the transport network.
<b>Step 4</b>	<b>member vni <i>vni</i></b>	Associate VXLAN VNIs (Virtual Network Identifiers) with the NVE interface.
<b>Step 5</b>	<b>mcast-group <i>start-address</i> [<i>end-address</i>]</b>	Assign a multicast group to the VNIs.  <b>Note</b> Used only for BUM traffic

## Configuring a VXLAN VTEP in vPC

You can configure a VXLAN VTEP in a vPC.

### SUMMARY STEPS

1. Enter global configuration mode.
2. Enable the vPC feature on the device.
3. Enable the interface VLAN feature on the device.
4. Enable the LACP feature on the device.
5. Enable the PIM feature on the device.
6. Enables the OSPF feature on the device.

7. Define a PIM RP address for the underlay multicast group range.
8. Define a non-VXLAN enabled VLAN as a backup routed path.
9. Create the VLAN to be used as an infra-VLAN.
10. Create the SVI used for the backup routed path over the vPC peer-link.
11. Create primary and secondary IP addresses.
12. Create a primary IP address for the data plane loopback interface.
13. Create a vPC domain.
14. Configure the IPv4 address for the remote end of the vPC peer-keepalive link.
15. Enable Peer-Gateway on the vPC domain.
16. Enable Peer-switch on the vPC domain.
17. Enable IP ARP synchronize under the vPC domain to facilitate faster ARP table population following device reload.
18. (Optional) Enable IPv6 nd synchronization under the vPC domain to facilitate faster nd table population following device reload.
19. Create the vPC peer-link port-channel interface and add two member interfaces.
20. Modify the STP hello-time, forward-time, and max-age time.
21. (Optional) Enable the delay restore timer for SVI's.

## DETAILED STEPS

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Enter global configuration mode.<br><br><code>switch# <b>configure terminal</b></code>  |
| <b>Step 2</b> | Enable the vPC feature on the device.<br><br><code>switch(config)# <b>feature vpc</b></code>  |
| <b>Step 3</b> | Enable the interface VLAN feature on the device.<br><br><code>switch(config)# <b>feature interface-vlan</b></code>  |
| <b>Step 4</b> | Enable the LACP feature on the device.<br><br><code>switch(config)# <b>feature lacp</b></code>  |
| <b>Step 5</b> | Enable the PIM feature on the device.<br><br><code>switch(config)# <b>feature pim</b></code>  |
| <b>Step 6</b> | Enables the OSPF feature on the device.<br><br><code>switch(config)# <b>feature ospf</b></code>   |
| <b>Step 7</b> | Define a PIM RP address for the underlay multicast group range.<br><br><code>switch(config)# <b>ip pim rp-address 192.168.100.1 group-list 224.0.0/4</b></code> |
| <b>Step 8</b> | Define a non-VXLAN enabled VLAN as a backup routed path.<br><br><code>switch(config)# <b>system nve infra-vlans 10</b></code>                                   |
| <b>Step 9</b> | Create the VLAN to be used as an infra-VLAN.<br><br><code>switch(config)# <b>vlan 10</b></code>   |

**Step 10** Create the SVI used for the backup routed path over the vPC peer-link.

```
switch(config)# interface vlan 10
switch(config-if)# ip address 10.10.10.1/30
switch(config-if)# ip router ospf UNDERLAY area 0
switch(config-if)# ip pim sparse-mode
switch(config-if)# no ip redirects
switch(config-if)# mtu 9216
(Optional) switch(config-if)# ip igmp static-oif route-map match-mcast-groups
switch(config-if)# no shutdown
(Optional) switch(config)# route-map match-mcast-groups permit 10
(Optional) switch(config-route-map)# match ip multicast group 225.1.1.1/32
```

**Step 11** Create primary and secondary IP addresses.

```
switch(config)# interface loopback 0
switch(config-if)# description Control_plane_Loopback
switch(config-if)# ip address x.x.x.x/32
switch(config-if)# ip address y.y.y.y/32 secondary
switch(config-if)# ip router ospf process tag area area id
switch(config-if)# ip pim sparse-mode
switch(config-if)# no shutdown
```

**Step 12** Create a primary IP address for the data plane loopback interface.

```
switch(config)# interface loopback 1
switch(config-if)# description Data_Plane_loopback
switch(config-if)# ip address z.z.z.z/32
switch(config-if)# ip router ospf process tag area area id
switch(config-if)# ip pim sparse-mode
switch(config-if)# no shutdown
```

**Step 13** Create a vPC domain.

```
switch(config)# vpc domain 5
```

**Step 14** Configure the IPv4 address for the remote end of the vPC peer-keepalive link.

```
switch(config-vpc-domain)# peer-keepalive destination 172.28.230.85
```

**Note** The system does not form the vPC peer link until you configure a vPC peer-keepalive link

The management ports and VRF are the defaults.

**Note** We recommend that you configure a separate VRF and use a Layer 3 port from each vPC peer device in that VRF for the vPC peer-keepalive link. For more information about creating and configuring VRFs, see the [Cisco Nexus 9000 Series NX-OS Unicast Routing Configuration Guide](#).

**Step 15** Enable Peer-Gateway on the vPC domain.

```
switch(config-vpc-domain)# peer-gateway
```

**Note** Disable IP redirects on all interface-vlans of this vPC domain for correct operation of this feature.

**Step 16** Enable Peer-switch on the vPC domain.

```
switch(config-vpc-domain)# peer-switch
```

**Note** Disable IP redirects on all interface-vlans of this vPC domain for correct operation of this feature.

- Step 17** Enable IP ARP synchronize under the vPC domain to facilitate faster ARP table population following device reload.

```
switch(config-vpc-domain) # ip arp synchronize
```

- Step 18** (Optional) Enable IPv6 nd synchronization under the vPC domain to facilitate faster nd table population following device reload.

```
switch(config-vpc-domain) # ipv6 nd synchronize
```

- Step 19** Create the vPC peer-link port-channel interface and add two member interfaces.

```
switch(config) # interface port-channel 1
switch(config-if) # switchport
switch(config-if) # switchport mode trunk
switch(config-if) # switchport trunk allowed vlan 1,10,100-200
switch(config-if) # mtu 9216
switch(config-if) # vpc peer-link
switch(config-if) # no shutdown
switch(config-if) # interface Ethernet 1/1 , 1/21
switch(config-if) # switchport
switch(config-if) # mtu 9216
switch(config-if) # channel-group 1 mode active
switch(config-if) # no shutdown
```

- Step 20** Modify the STP hello-time, forward-time, and max-age time.

As a best practice, we recommend changing the **hello-time** to four seconds to avoid unnecessary TCN generation when the vPC role change occurs. As a result of changing the **hello-time**, it is also recommended to change the **max-age** and **forward-time** accordingly.

```
switch(config) # spanning-tree vlan 1-3967 hello-time 4
switch(config) # spanning-tree vlan 1-3967 forward-time 30
switch(config) # spanning-tree vlan 1-3967 max-age 40
```

- Step 21** (Optional) Enable the delay restore timer for SVI's.

We recommend that you tune this value when the SVI or VNI scale is high. For example, when the SVI count is 1000, we recommended setting the delay restore for interface-vlan to 45 seconds.

```
switch(config-vpc-domain) # delay restore interface-vlan 45
```

## Configuring Static MAC for VXLAN VTEP

Static MAC for VXLAN VTEP is supported on Cisco Nexus 9300 Series switches with flood and learn. This feature enables the configuration of static MAC addresses behind a peer VTEP.

### Note

Static MAC cannot be configured for a control plane with a BGP EVPN-enabled VNI.

### SUMMARY STEPS

1. **configure terminal**
2. **mac address-table static *mac-address* vni *vni-id* interface nve *x* peer-ip *ip-address***
3. **exit**
4. (Optional) **copy running-config startup-config**

## 5. (Optional) show mac address-table static interface nve x

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>mac address-table static <i>mac-address</i> vni <i>vni-id</i> interface <i>nve x</i> peer-ip <i>ip-address</i></b>	Specifies the MAC address pointing to the remote VTEP.
<b>Step 3</b>	<b>exit</b>	Exits global configuration mode.
<b>Step 4</b>	(Optional) <b>copy running-config startup-config</b>	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.
<b>Step 5</b>	(Optional) <b>show mac address-table static interface nve <i>x</i></b>	Displays the static MAC addresses pointing to the remote VTEP.

### Example

The following example shows the output for a static MAC address configured for VXLAN VTEP:

```
switch# show mac address-table static interface nve 1
```

Legend:

\* - primary entry, G - Gateway MAC, (R) - Routed MAC, O - Overlay MAC  
age - seconds since last seen, + - primary entry using vPC Peer-Link,  
(T) - True, (F) - False

	VLAN	MAC Address	Type	age	Secure	NTFY	Ports
*	501	0047.1200.0000	static	-	F	F	nve1 (33.1.1.3)
*	601	0049.1200.0000	static	-	F	F	nve1 (33.1.1.4)

## Disabling VXLANs

### SUMMARY STEPS

1. **configure terminal**
2. **no feature vn-segment-vlan-based**
3. **no feature nv overlay**
4. (Optional) **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>no feature vn-segment-vlan-based</b>	Disables the global mode for all VXLAN bridge domains
<b>Step 3</b>	<b>no feature nv overlay</b>	Disables the VXLAN feature.

	Command or Action	Purpose
Step 4	(Optional) <code>copy running-config startup-config</code>	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

## Configuring BGP EVPN Ingress Replication

The following enables BGP EVPN with ingress replication for peers.

### SUMMARY STEPS

1. `configure terminal`
2. `interface nve x`
3. `source-interface src-if`
4. `member vni vni`
5. `ingress-replication protocol bgp`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>interface nve x</code>	Creates a VXLAN overlay interface that terminates VXLAN tunnels.  <b>Note</b> Only 1 NVE interface is allowed on the switch.
Step 3	<code>source-interface src-if</code>	The source interface must be a loopback interface that is configured on the switch with a valid /32 IP address. This /32 IP address must be known by the transient devices in the transport network and the remote VTEPs. This is accomplished by advertising it through a dynamic routing protocol in the transport network.
Step 4	<code>member vni vni</code>	Associate VXLAN VNIs (Virtual Network Identifiers) with the NVE interface.
Step 5	<code>ingress-replication protocol bgp</code>	Enables BGP EVPN with ingress replication for the VNI.

## Configuring Static Ingress Replication

The following enables static ingress replication for peers.

### SUMMARY STEPS

1. `configuration terminal`
2. `interface nve x`
3. `member vni [vni-id | vni-range]`

4. **ingress-replication protocol static**
5. **peer-ip** *n.n.n.n*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configuration terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface nve</b> <i>x</i>	Creates a VXLAN overlay interface that terminates VXLAN tunnels.  <b>Note</b> Only 1 NVE interface is allowed on the switch.
<b>Step 3</b>	<b>member vni</b> [ <i>vni-id</i>   <i>vni-range</i> ]	Maps VXLAN VNIs to the NVE interface.
<b>Step 4</b>	<b>ingress-replication protocol static</b>	Enables static ingress replication for the VNI.
<b>Step 5</b>	<b>peer-ip</b> <i>n.n.n.n</i>	Enables peer IP.

## VXLAN and IP-in-IP Tunneling

Cisco NX-OS Release 9.3(6) and later releases support the coexistence of VXLAN and IP-in-IP tunneling.

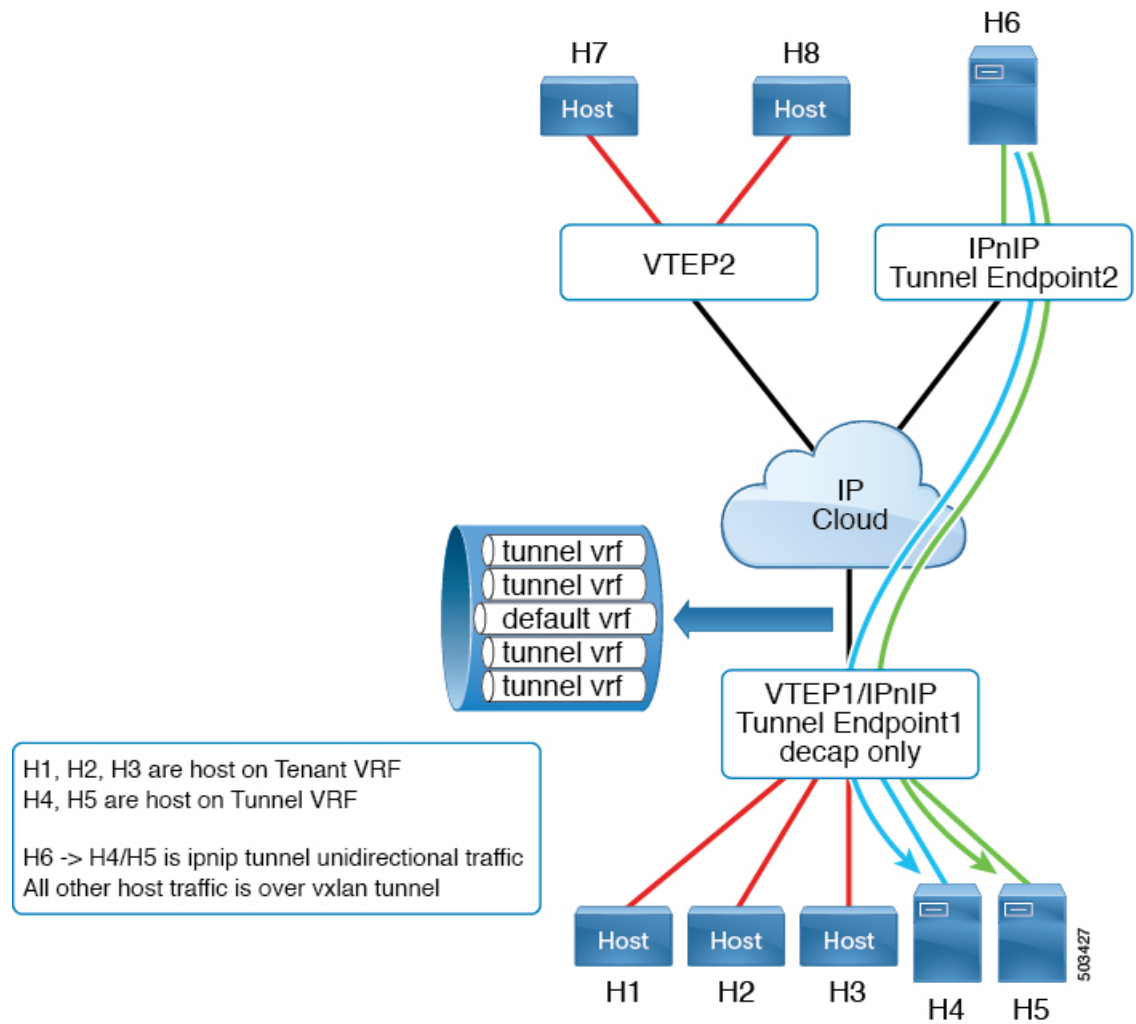

Coexistence of these features requires isolating IP-in-IP tunnels and VXLAN within their own VRFs. By isolating the VRFs, both VXLAN and the tunnels operate independently. VXLAN tunnel termination isn't reencapsulated as an IP-in-IP tunnel (or conversely) on the same or different VRFs.

By configuring subinterfaces under the interface to isolate VRFs, the same uplinks can be used to carry both VXLAN and IP-in-IP tunnel traffic. The parent port can be on the default VRF and subinterfaces on the non-default VRFs.

To terminate IP-in-IP encapsulated packets received on port-channel sub-interfaces, these sub-interfaces must be configured under the same non-default VRF as the tunnel interface, and can only be member of **\*one\*** non-default VRF.

Multiple port-channel sub interfaces from a different parent PC can still be configured under the same non-default VRF to terminate IP-in-IP encapsulation. The limitation only applies for sub-interfaces under one port-channel. This limitation is not applicable for L3 ports.

As the following example shows, VXLAN traffic is forwarded on the parent interface (eth1/1) in the default VRF, and IP-in-IP (non-VXLAN) traffic is forwarded on subinterfaces (eth1/1.10) in the tunnel VRF.

Cisco Nexus 9300-FX2 platform switches support the coexistence of VXLAN and IP-in-IP tunneling with the following limitations:

- VXLAN must be configured in the default VRF.
- Coexistence is supported on VXLAN with the EVPN control plane.
- IP-in-IP tunneling must be configured in the non-default VRF and is supported only in decapsulate-any mode.

**Note** If you try to enable VXLAN when a decapsulate-any tunnel is configured in the default VRF, an error message appears. It states that VXLAN and IP-in-IP tunneling can coexist only for a decapsulate-any tunnel in the non-default VRF and to remove the configuration.

- Point-to-point GRE tunnels are not supported. If you try to configure point-to-point tunnels, an error message appears indicating that VXLAN and IP-in-IP tunneling can coexist only for a decapsulate-any tunnel.

- Typically to configure a tunnel, you need to provide the two endpoints. However, decapsulate-any is a receive-only tunnel, so you need to provide only the source IP address or source interface name. The tunnel terminates on any IP interface in the same VRF.
- Tunnel statistics don't support egress counters.
- VXLAN and IP-in-IP tunnels can't share the same source loopback interface. Each tunnel must have its own source loopback interface.

The following example shows a sample configuration:

```
feature vn-segment-vlan-based
feature nv overlay
feature tunnel
nv overlay evpn

interface ethernet 1/1
  description VXLAN carrying interface
  no switchport
  ip address 10.1.1.1/30

interface ethernet 1/1.10
  description IPinIP carrying interface
  no switchport
  vrf member tunnel
  encapsulation dot1q 100
  ip address 10.10.1.1/30

interface loopback 0
  description VXLAN-loopback
  ip address 125.125.125.125/32

interface loopback 100
  description Tunnel_loopback
  vrf member tunnel
  ip address 5.5.5.5/32

interface Tunnel1
  vrf member tunnel
  ip address 55.55.55.1/24
  tunnel mode ipip decapsulate-any ip
  tunnel source loopback100
  tunnel use-vrf tunnel
  no shutdown

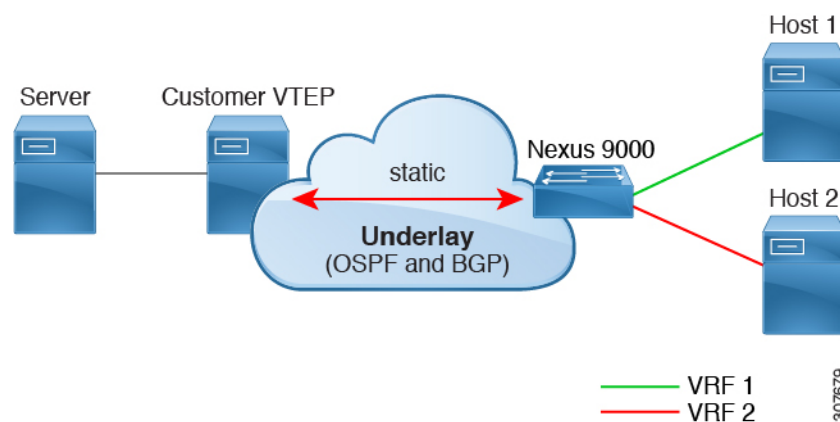

interface nve1
  host-reachability protocol bgp
  source-interface loopback0
  global mcast-group 224.1.1.1 L2
  global mcast-group 225.3.3.3 L3
  member vni 10000
  suppress-arp
  ingress-replication protocol bgp
  member vni 55500 associate-vrf
```

# Configuring VXLAN Static Tunnels

## About VXLAN Static Tunnels

Beginning with Cisco NX-OS Release 9.3(3), some Cisco Nexus switches can connect to a customer-provided software VTEP over static tunnels. Static tunnels are customer defined and support VXLAN-encapsulated traffic between hosts without requiring a control plane protocol such as BGP EVPN. You can configure static tunnels manually from the Nexus switch or programmatically, such as through a NETCONF client in the underlay.

**Figure 3: VXLAN Static Tunnel Connecting Software VTEP**

Static tunnels are supported per VRF. Each VRF can have a dedicated L3VNI to transport a packet with proper encapsulation and decapsulation on the switch and the software VTEP, the static peer. Typically, the static peer is a Cisco Nexus 1000V or bare-metal server with one or more VMs terminating one or more VNIs. However, a static peer can be any customer-developed device that complies with RFC 7348, *Virtual eXtensible Local Area Network (VXLAN): A Framework for Overlaying Virtualized Layer 2 Networks over Layer 3 Networks*. Because the customer provides the static peer and a control plane protocol is not present, you must ensure that the static peer forwards the VXLAN-related configuration and routes to the correct hosts.

Beginning with Cisco NX-OS Release 9.3(5), this feature supports the handling of packets coming in and going out of the tunnel. Specifically, it allows the Nexus switch to send packets to the hosts or other switches over the tunnel. In Cisco NX-OS Releases 9.3(3) and 9.3(4), VXLAN static tunnels support communication only from the local host to the remote host.

## Guidelines and Limitations for VXLAN Static Tunnels

The VXLAN static tunnels feature has the following guidelines and limitations:

- The Cisco Nexus 9332C, 9364C, 9300-EX, and 9300-FX/FX2/FX3, 9300-GX and 9300-FX3 platform switches support VXLAN static tunnels.
- Beginning with Cisco NX-OS Release 10.1(1), VXLAN Static Tunnels are supported on Cisco Nexus 9300-FX3 platform switches.
- The following guidelines apply to software VTEPs:

- The software VTEP must be configured as needed to determine how to forward traffic from the VNI.
- The software VTEP must be compliant with RFC 7348.
- The underlay can be OSPFv2, BGP, IS-IS, or IPv4.
- The overlay can be IPv4 only.
- Additional VXLAN features (such as TRM, Multi-Site, OAM, Cross Connect, and VXLAN QoS), IGMP snooping, MPLS handoff, static MPLS, SR, and SRv6 are not supported.
- Pings across the overlay from local tenant VRF loopback to a host behind the software VTEP is not supported.
- Static tunnels do not support ECMP configuration.
- Static tunnels cannot be configured in the same fabric as traditional flood and learn or BGP EVPN fabrics.
- Local hosts are not supported for VNI-enabled VLANs. Therefore, you cannot have a host in the same VLAN where you configured the VNI.
- Fabric forwarding is supported with static tunnels. When fabric forwarding is enabled, be aware that it affects how SVIs and MAC addresses are used. Consider the following example configuration.

```
feature fabric forwarding
fabric forwarding anycast-gateway-mac 0000.0a0a.0a0a

interface Vlan802
no shutdown
vrf member vrfvxlan5201
ip address 103.33.1.1/16
fabric forwarding mode anycast-gateway
```

When fabric forwarding is enabled:

- all SVIs where **fabric forwarding mode anycast-gateway** is configured (for example, Vlan802) are used.
- the MAC address configured with **fabric forwarding anycast-gateway-mac anycast-mac-address** (0000.0a0a.0a0a) is used.

## Enabling VXLAN Static Tunnels

Enable the following features to enable VXLAN Static Tunnels.

### SUMMARY STEPS

1. **config terminal**
2. **feature vn-segment**
3. **feature ofm**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>config terminal</b> <b>Example:</b> <pre>switch# configure terminal switch(config)#</pre>	Enter configuration mode.
<b>Step 2</b>	<b>feature vn-segment</b> <b>Example:</b> <pre>switch(config)# feature vn-segment switch(config)#</pre>	Enable VLAN-based VXLAN.
<b>Step 3</b>	<b>feature ofm</b> <b>Example:</b> <pre>switch(config)# feature ofm switch(config)#</pre>	Enable static VXLAN tunnels.

**What to do next**

Configure the VRF overlay VLAN for VXLAN routing over Static Tunnels.

## Configuring VRF Overlay for Static Tunnels

A VRF overlay must be configured for the VXLAN Static Tunnels.

## SUMMARY STEPS

1. **vlan** *number*
2. **vn-segment** *number*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>vlan</b> <i>number</i> <b>Example:</b> <pre>switch(config)# vlan 2001 switch(config-vlan)#</pre>	Specify the VLAN.
<b>Step 2</b>	<b>vn-segment</b> <i>number</i> <b>Example:</b> <pre>switch(config-vlan)# vn-segment 20001 switch(config-vlan)#</pre>	Specify the VN segment.

**What to do next**

Configure the VRF for VXLAN Routing over the Static Tunnel.

## Configuring a VRF for VXLAN Routing

Configure the tenant VRF.

### SUMMARY STEPS

1. **vrf context** *vrf-name*
2. **vni** *number*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>vrf context</b> <i>vrf-name</i>  <b>Example:</b> <pre>switch(config-vlan) # vrf context cust1 switch(config-vrf) #</pre>	Configure the tenant VRF.
<b>Step 2</b>	<b>vni</b> <i>number</i>  <b>Example:</b> <pre>switch(config-vrf) # vni 20001 switch(config-vrf) #</pre>	Specify the VNI for the tenant VRF.

### What to do next

Configure the L3 VNI for the host.

## Configuring the L3 VNI for Static Tunnels

Configure the L3 VNI for the VTEPs.

### Before you begin

The VLAN interface feature must be enabled. Use **feature interface-vlan** if needed.

### SUMMARY STEPS

1. **vlan** *number*
2. **interface** *vlan-number*
3. **vrf member** *vrf-name*
4. **ip forward**
5. **no shutdown**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>vlan</b> <i>number</i>  <b>Example:</b>	Specify the VLAN number

	Command or Action	Purpose
	<pre>switch(config-vrf)# <b>vlan 2001</b> switch(config-vlan)#</pre>	
<b>Step 2</b>	<b>interface</b> <i>vlan-number</i>  <b>Example:</b> <pre>switch(config)# <b>interface vlan2001</b> switch(config-if)#</pre>	Specify the VLAN interface.
<b>Step 3</b>	<b>vrf member</b> <i>vrf-name</i>  <b>Example:</b> <pre>switch(config-if)# <b>vrf member cust1</b> Warning: Deleted all L3 config on interface Vlan2001 switch(config-if)#</pre>	Assign the VLAN interface to the tenant VRF.
<b>Step 4</b>	<b>ip forward</b>  <b>Example:</b> <pre>switch(config-if)# <b>ip forward</b> switch(config-if)#</pre>	Enable IPv4 traffic on the interface.
<b>Step 5</b>	<b>no shutdown</b>  <b>Example:</b> <pre>switch(config-if)# <b>no shutdown</b> switch(config-if)#</pre>	Enables the interface.

**What to do next**

Configure the tunnel profile.

## Configuring the Tunnel Profile

To configure static tunnels, you create a tunnel profile that specifies the interface on the Nexus switch, the MAC address of the static peer, and the interface on the static peer.

**Before you begin**

To configure VXLAN static tunnels, the underlay must be completely configured and operating correctly.

**SUMMARY STEPS**

1. **tunnel-profile** *profile-name*
2. **encapsulation** {*VXLAN* / *VXLAN-GPE* / *SRv6*}
3. **source-interface loopback** *virtual-interface-number*
4. **route vrf** *tenant-vrf destination-host-prefix destination-vtep-ip-address next-hop-vrf destination-vtep-vrf vni-number dest-vtep-mac destination-vtep-mac-address*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>tunnel-profile</b> <i>profile-name</i> <b>Example:</b> <pre>switch(config)# tunnel-profile test switch(config-tnl-profile)#</pre>	Create and name the tunnel profile.
<b>Step 2</b>	<b>encapsulation</b> {VXLAN / VXLAN-GPE / SRv6} <b>Example:</b> <pre>switch(config-tnl-profile)# encapsulation vxlan switch(config-tnl-profile)#</pre>	Set the appropriate encapsulation type for the tunnel profile. <b>Note</b> In NX-OS release 9.3(3), only encapsulation type <b>vxlan</b> is supported.
<b>Step 3</b>	<b>source-interface loopback</b> <i>virtual-interface-number</i> <b>Example:</b> <pre>switch(config-tnl-profile)# source-interface loopback 1 switch(config-tnl-profile)#</pre>	Configure the loopback interface as the source interface for the tunnel profile, where the virtual interface number is from 0 to 1023.
<b>Step 4</b>	<b>route vrf</b> <i>tenant-vrf destination-host-prefix destination-vtep-ip-address next-hop-vrf destination-vtep-vrf vni vni-number dest-vtep-mac destination-vtep-mac-address</i> <b>Example:</b> <pre>switch(tunnel-profile)# route vrf cust1 101.1.1.2/32 7.7.7.1 next-hop-vrf default vni 20001 dest-vtep-mac f80f.6f43.036c switch(tunnel-profile)#</pre>	Create the tunnel route by specifying the destination software VTEP and entering the route information for the VNI and destination VTEP MAC address. <b>Note</b> The <b>route vrf</b> command accepts one <i>destination-vtep-mac-address</i> per <i>destination-vtep-ip-address</i> across all the routes. If you configure additional routes, they are cached as errored routes and a error syslog is generated for each.

## Verifying VXLAN Static Tunnels

VXLAN static tunnels remain configured if one end of the tunnel goes down. While one end of the tunnel is down, packets are dropped because that VTEP is unreachable. When the down VTEP comes back online, traffic can resume across the tunnel after the underlay relearns connectivity.

You can use **show** commands to check the state of the tunnel profile and tunnel route.

## Before you begin

## SUMMARY STEPS

1. **show tunnel-profile**
2. **show ip route** *tenant-vrf-name*
3. **show running-config ofm**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>show tunnel-profile</code>	Shows information about the tunnel profile for the software.
Step 2	<code>show ip route <i>tenant-vrf-name</i></code>	Shows route information for the VRF connecting to the software VTEP. For example, you can use this command when a <code>route unreachable</code> error occurs to verify that a route exists for a VRF's tunnel.
Step 3	<code>show running-config ofm</code>	Shows the running config for the OFM feature and static tunnels. You can use this command when a <code>route unreachable</code> error occurs to check whether the route information for the destination VTEP is present.

**What to do next**

In addition to VXLAN verification, you can use SPAN to check the ports and source VLANs for packets traversing the switch.

## Example Configurations for VXLAN Static Tunnels

The following configuration examples shows VXLAN static tunnel configurations through the supported methods.

**NX-OS CLI**

```

vlan 2001
vlan 2001
  vn-segment 20001

interface Vlan2001
  no shutdown
  vrf member vrf1601
  ip forward

vrf context cust1
  vni 20001

feature ofm

tunnel-profile test
  encapsulation vxlan
  source-interface loopback1
  route vrf cust1 101.1.1.2/32 7.7.7.1 next-hop-vrf default vni 20001 dest-vtep-mac
  f80f.6f43.036c

```

## CHAPTER 4

# Configuring VXLAN BGP EVPN

This chapter contains the following sections:

- [Information About VXLAN BGP EVPN, on page 43](#)
- [Guidelines and Limitations for VXLAN BGP EVPN, on page 45](#)
- [Information About VXLAN EVPN with Downstream VNI, on page 48](#)
- [Guidelines and Limitations for VXLAN EVPN with Downstream VNI, on page 50](#)
- [Configuring VXLAN BGP EVPN, on page 51](#)

## Information About VXLAN BGP EVPN

### About RD Auto

The auto-derived Route Distinguisher (rd auto) is based on the Type 1 encoding format as described in IETF RFC 4364 section 4.2 <https://tools.ietf.org/html/rfc4364#section-4.2>. The Type 1 encoding allows a 4-byte administrative field and a 2-byte numbering field. Within Cisco NX-OS, the auto derived RD is constructed with the IP address of the BGP Router ID as the 4-byte administrative field (RID) and the internal VRF identifier for the 2-byte numbering field (VRF ID).

The 2-byte numbering field is always derived from the VRF, but results in a different numbering scheme depending on its use for the IP-VRF or the MAC-VRF:

- The 2-byte numbering field for the IP-VRF uses the internal VRF ID starting at 1 and increments. VRF IDs 1 and 2 are reserved for the default VRF and the management VRF respectively. The first custom defined IP VRF uses VRF ID 3.
- The 2-byte numbering field for the MAC-VRF uses the VLAN ID + 32767, which results in 32768 for VLAN ID 1 and incrementing.

Example auto-derived Route Distinguisher (RD)

- IP-VRF with BGP Router ID 192.0.2.1 and VRF ID 6 - RD 192.0.2.1:6
- MAC-VRF with BGP Router ID 192.0.2.1 and VLAN 20 - RD 192.0.2.1:32787

## About Route-Target Auto

The auto-derived Route-Target (route-target import/export/both auto) is based on the Type 0 encoding format as described in IETF RFC 4364 section 4.2 (<https://tools.ietf.org/html/rfc4364#section-4.2>). IETF RFC 4364 section 4.2 describes the Route Distinguisher format and IETF RFC 4364 section 4.3.1 refers that it is desirable to use a similar format for the Route-Targets. The Type 0 encoding allows a 2-byte administrative field and a 4-byte numbering field. Within Cisco NX-OS, the auto derived Route-Target is constructed with the Autonomous System Number (ASN) as the 2-byte administrative field and the Service Identifier (VNI) for the 4-byte numbering field.

### 2-byte ASN

The Type 0 encoding allows a 2-byte administrative field and a 4-byte numbering field. Within Cisco NX-OS, the auto-derived Route-Target is constructed with the Autonomous System Number (ASN) as the 2-byte administrative field and the Service Identifier (VNI) for the 4-byte numbering field.

Examples of an auto derived Route-Target (RT):

- IP-VRF within ASN 65001 and L3VNI 50001 - Route-Target 65001:50001
- MAC-VRF within ASN 65001 and L2VNI 30001 - Route-Target 65001:30001

For Multi-AS environments, the Route-Targets must either be statically defined or rewritten to match the ASN portion of the Route-Targets.

[https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus9000/sw/7-x/command\\_references/configuration\\_commands/b\\_N9K\\_Config\\_Commands\\_703i7x/b\\_N9K\\_Config\\_Commands\\_703i7x\\_chapter\\_010010.html#wp4498893710](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus9000/sw/7-x/command_references/configuration_commands/b_N9K_Config_Commands_703i7x/b_N9K_Config_Commands_703i7x_chapter_010010.html#wp4498893710)

### 4-byte ASN

The Type 0 encoding allows a 2-byte administrative field and a 4-byte numbering field. Within Cisco NX-OS, the auto-derived Route-Target is constructed with the Autonomous System Number (ASN) as the 2-byte administrative field and the Service Identifier (VNI) for the 4-byte numbering field. With the ASN demand of 4-byte length and the VNI requiring 24-bit (3-bytes), the Sub-Field length within the Extended Community is exhausted (2-byte Type and 6-byte Sub-Field). As a result of the length and format constraint and the importance of the Service Identifiers (VNI) uniqueness, the 4-byte ASN is represented in a 2-byte ASN named AS\_TRANS, as described in IETF RFC 6793 section 9 (<https://tools.ietf.org/html/rfc6793#section-9>). The 2-byte ASN 23456 is registered by the IANA (<https://www.iana.org/assignments/iana-as-numbers-special-registry/iana-as-numbers-special-registry.xhtml>) as AS\_TRANS, a special purpose AS number that aliases 4-byte ASNs.

Example auto derived Route-Target (RT) with 4-byte ASN (AS\_TRANS):

- IP-VRF within ASN 65656 and L3VNI 50001 - Route-Target 23456:50001
- MAC-VRF within ASN 65656 and L2VNI 30001 - Route-Target 23456:30001

**Note**

Beginning with Cisco NX-OS Release 9.2(1), auto derived Route-Target for 4-byte ASN is supported.

# Guidelines and Limitations for VXLAN BGP EVPN

VXLAN BGP EVPN has the following guidelines and limitations:

- The following guidelines and limitations apply to VXLAN/VTEP using BGP EVPN:
  - SPAN source or destination is supported on any port.

For more information, see the [Cisco Nexus 9000 Series NX-OS System Management Configuration Guide, Release 9.3\(x\)](#).

- When SVI is enabled on a VTEP (flood and learn, or EVPN) regardless of ARP suppression, make sure that ARP-ETHER TCAM is carved using the **hardware access-list tcam region arp-ether 256 double-wide** command. This requirement does not apply to Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2/FX3 and 9300-GX platform switches and Cisco Nexus 9500 platform switches with 9700-EX/FX line cards.
- For the Cisco Nexus 9504 and 9508 with R-series line cards, VXLAN EVPN (Layer 2 and Layer 3) is only supported with the 9636C-RX and 96136YC-R line cards..
- You can configure EVPN over segment routing or MPLS. See the [Cisco Nexus 9000 Series NX-OS Label Switching Configuration Guide, Release 9.3\(x\)](#) for more information.
- You can use MPLS tunnel encapsulation using the new CLI encapsulation `mpls` command. You can configure the label allocation mode for the EVPN address family. See the [Cisco Nexus 9000 Series NX-OS Label Switching Configuration Guide, Release 9.3\(x\)](#) for more information.
- In a VXLAN EVPN setup that has 2K VNI scale configuration, the control plane down time may take more than 200 seconds. To avoid potential BGP flap, extend the graceful restart time to 300 seconds.
- Starting from Cisco NX-OS Release 9.3(5), new VXLAN uplink capabilities are introduced:
  - A physical interface in default VRF is supported as VXLAN uplink.
  - A parent interface in default VRF, carrying subinterfaces with VRF and dot1q tags, is supported as VXLAN uplink.
  - A subinterface in any VRF and/or with dot1q tag remains not supported as VXLAN uplink.
  - An SVI in any VRF remains not supported as VXLAN uplink.
  - In vPC with physical peer-link, a SVI can be leveraged as backup underlay, default VRF only between the vPC members (infra-VLAN, system nve infra-vlans).
  - FEX host interfaces remain not supported as VXLAN uplink and cannot have VTEPs connected (BUD node).
- In a VXLAN EVPN setup, border nodes must be configured with unique route distinguishers, preferably using the **auto rd** command. Not using unique route distinguishers across all border nodes is not supported. The use of unique route distinguishers is strongly recommended for all VTEPs of a fabric.
- ARP suppression is only supported for a VNI if the VTEP hosts the First-Hop Gateway (Distributed Anycast Gateway) for this VNI. The VTEP and the SVI for this VLAN have to be properly configured for the distributed Anycast Gateway operation, for example, global Anycast Gateway MAC address configured and Anycast Gateway feature with the virtual IP address on the SVI.

- DHCP snooping (Dynamic Host Configuration Protocol snooping) is not supported on VXLAN VLANs.
- ACLs are not supported on VXLAN uplink interfaces. VACLs are not supported on VXLAN de-capsulated traffic in egress direction; this applies for the inner traffic coming from network (VXLAN) towards the access (Ethernet).

As a best practice, always use ACLs/VACLs for the access (Ethernet) to the network (VXLAN) direction. See the [Cisco Nexus 9000 Series NX-OS Security Configuration Guide, Release 9.3\(x\)](#) for other guidelines and limitations for the VXLAN ACL feature.

- The Cisco Nexus 9000 QoS buffer-boost feature is not applicable for VXLAN traffic.
- For VXLAN BGP EVPN fabrics with EBGp, the following recommendations are applicable:
  - It is recommended to use loopbacks for the EBGp EVPN peering sessions (overlay control-plane).
  - It is a best practice to use the physical interfaces for EBGp IPv4/IPv6 peering sessions (underlay).
- Bind the NVE source-interface to a dedicated loopback interface and do not share this loopback with any function or peerings of Layer-3 protocols. A best practice is to use a dedicated loopback address for the VXLAN VTEP function.
- The NVE source-interface loopback is required to be present in the default VRF.
- Only EBGp peering between a VTEP and external nodes (Edge Router, Core Router or VNF) is supported.
  - EBGp peering from the VTEP to the external node using a physical interface or subinterfaces is recommended and it is a best practice (external connectivity).
  - The EBGp peering from the VTEP to the external node can be in the default VRF or in a tenant VRF (external connectivity).
  - The EBGp peering from the VTEP to a external node over VXLAN must be in a tenant VRF and must use the update-source of a loopback interface (peering over VXLAN).
  - Using an SVI for EBGp peering on a from the VTEP to the External Node requires the VLAN to be local (not VXLAN extended).
- When configuring VXLAN BGP EVPN, only the "System Routing Mode: Default" is applicable for the following hardware platforms:
  - Cisco Nexus 9200 platform switches
  - Cisco Nexus 9300 platform switches
  - Cisco Nexus 9300-EX platform switches
  - Cisco Nexus 9300-FX/FX2/FX3 platform switches
  - Cisco Nexus 9300-GX platform switches
  - Cisco Nexus 9500 platform switches with X9500 line cards
  - Cisco Nexus 9500 platform switches with X9700-EX and X9700-FX line cards
- Changing the "System Routing Mode" requires a reload of the switch.
- Cisco Nexus 9516 platform is not supported for VXLAN EVPN.

- VXLAN is supported on Cisco Nexus 9500 platform switches with the following line cards:
  - 9500-R
  - 9564PX
  - 9564TX
  - 9536PQ
  - 9700-EX
  - 9700-FX
- Cisco Nexus 9500 platform switches with 9700-EX or -FX line cards support 1G, 10G, 25G, 40G, 100G and 400G for VXLAN uplinks.
- Cisco Nexus 9200 and 9300-EX/FX/FX2/FX3 and -GX support 1G, 10G, 25G, 40G, 100G and 400G for VXLAN uplinks.
- The Cisco Nexus 9000 platform switches use standards conforming UDP port number 4789 for VXLAN encapsulation. This value is not configurable.
- The Cisco Nexus 9200 platform switches with Application Spine Engine (ASE2) have throughput constraints for packet sizes of 99-122 bytes; packet drops might be experienced.
- The VXLAN network identifier (VNID) 16777215 is reserved and should explicitly not be configured.
- Non-Disruptive In Service Software Upgrade (ND-ISSU) is supported on Nexus 9300 with VXLAN enabled. Exception is ND-ISSU support for Cisco Nexus 9300-FX3 and 9300-GX platform switch.
- Gateway functionality for VXLAN to MPLS (LDP), VXLAN to MPLS-SR (Segment Routing) and VXLAN to SRv6 can be operated on the same Cisco Nexus 9000 Series platform.
  - VXLAN to MPLS (LDP) Gateway is supported on the Cisco Nexus 3600-R and the Cisco Nexus 9500 with R-Series line cards.
  - VXLAN to MPLS-SR Gateway is supported on the Cisco Nexus 9300-FX2/FX3/GX and Cisco Nexus 9500 with R-Series line cards.
  - VXLAN to SRv6 is supported on the Cisco Nexus 9300-GX platform.
  - VXLAN and GRE co-existence remains not supported on Cisco Nexus 9300-EX/FX/FX2/FX3/GX and Cisco Nexus 9500 with 9700-EX and -FX line cards.
  - Multiple Tunnel Encapsulations (VXLAN, GRE and/or MPLS, static label or segment routing) can not co-exist on the same Cisco Nexus 9000 Series switch with Network Forwarding Engine (NFE).
- Resilient hashing is supported on the following switch platform with a VXLAN VTEP configured:
  - Cisco Nexus 9300-EX/FX/FX2/FX3/GX support ECMP resilient hashing.
  - Cisco Nexus 9300 with ALE uplink ports does not support resilient hashing.

---

**Note** Resilient hashing is disabled by default.

---

- It is recommended to use the **vpc orphan-ports suspend** command for single attached and/or routed devices on a Cisco Nexus 9000 platform switch acting as vPC VTEP.

**Note** For information about VXLAN BGP EVPN scalability, see the [Cisco Nexus 9000 Series NX-OS Verified Scalability Guide](#).

## Information About VXLAN EVPN with Downstream VNI

Cisco NX-OS Release 9.3(5) introduces VXLAN EVPN with downstream VNI. In earlier releases, the VNI configuration must be consistent across all nodes in the VXLAN EVPN network in order to enable communication between them.

VXLAN EVPN with downstream VNI provides the following solutions:

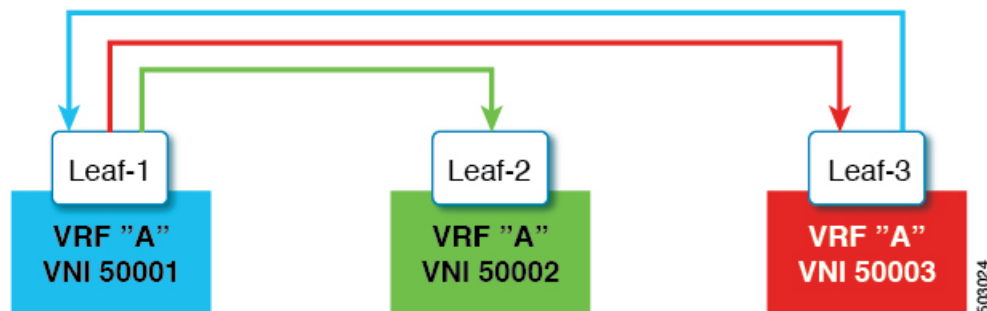

- Enables asymmetric VNI communication across nodes in a VXLAN EVPN network
- Provides customers access to a common shared service outside of their domain (tenant VRF)
- Supports communication between isolated VXLAN EVPN sites that have different sets of VNIs

### Asymmetric VNIs

VXLAN EVPN with downstream VNI supports asymmetric VNI allocation.

The following figure shows an example of asymmetric VNIs. All three VTEPs have different VNIs configured for the same IP VRF or MAC VRF.

**Figure 4: Asymmetric VNIs**

### Shared Services VRFs

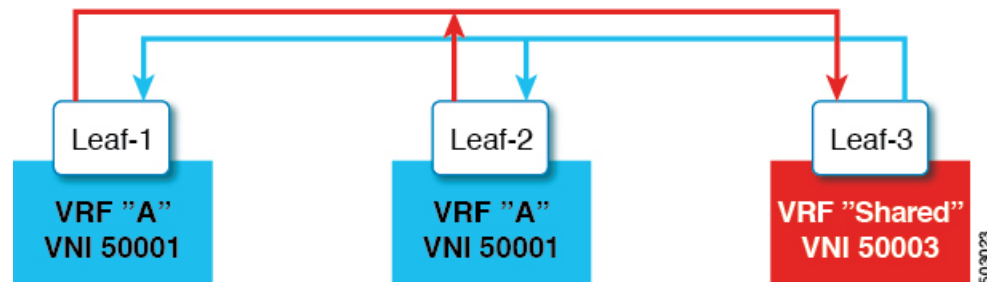

VXLAN EVPN with downstream VNI supports shared services VRFs. It does so by importing multiple L3VRFs into a single local L3VRF and supporting disparate values of downstream L3VNIs on a per-peer basis.

For example, a DNS server needs to serve multiple hosts in a data center regardless of the tenant VRFs on which the hosts sit. The DNS server is attached to a shared services VRF, which is attached to an L3VNI. To access this server from any of the tenant VRFs, the switches must import the routes from the shared services

VRF to the tenant VRF, even though the L3VNI associated to the shared services VRF is different from the L3VNI associated to the tenant VRF.

In the following figure, Tenant VRF A in Leaf-1 can communicate with Tenant VRF A in Leaf-2. However, Tenant VRF A requires access to a shared service sitting behind Leaf-3.

**Figure 5: Shared Services VRFs**

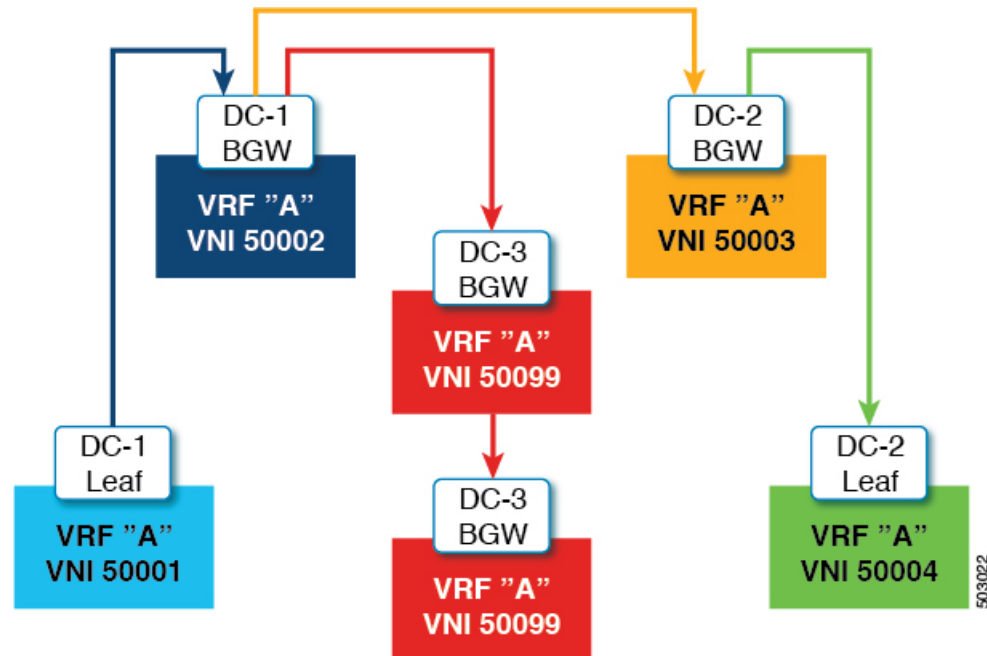

## Multi-Site with Asymmetric VNIs

VXLAN EVPN with downstream VNI allows communication between sites that have different sets of VNIs. It does so by stitching the asymmetric VNIs at the border gateways.

In the following figure, DC-1 and DC-2 are asymmetric sites, and DC-3 is a symmetric site. Each site uses different VNIs within its site to communicate.

**Figure 6: Multi-Site with Asymmetric VNIs**

# Guidelines and Limitations for VXLAN EVPN with Downstream VNI

VXLAN EVPN with downstream VNI has the following guidelines and limitations:

- Cisco Nexus 9332C, 9364C, 9300-EX, and 9300-FX/FX2/FXP platform switches and Cisco Nexus 9500 platform switches with -EX/FX line cards support VXLAN EVPN with downstream VNI.
- VXLAN EVPN with downstream VNI is supported only on the IPv4 underlay.
- Downstream VNI is configured based on route-target export and import. The following conditions must be met to leverage Downstream VNI:
  - Downstream VNI requires the usage of different VRF (MAC-VRF or IP-VRF), each VRF must have a different VNI (Asymmetric VNI).
  - In order to import routes of a foreign VRF (MAC-VRF or IP-VRF) the appropriate route-target for the import into the local VRF must be configured.
  - The configuration of only auto derived route-targets will not result in downstream VNI.
  - The export of VRF prefixes can be done by static or auto derived route-target configuration.
  - The import of a foreign VRFs auto derived route-target is supported.
  - The import of a foreign VRFs static configured route-target is supported.
- Downstream VNI is supported for the following underlay constellations:
  - For downstream VNI with Layer-3 VNI, the underlay can be ingress replication or multicast based.
  - For downstream VNI with Layer-2 VNI, the underlay must be in ingress replication. Multicast based underlay is not supported with downstream VNI of Layer-2 VNIs.
- Downstream VNI requires to have consistent configuration:
  - All multi-site Border Gateway (BGW) in a site must have a consistent configuration.
  - All vPC members in a vPC domain must have consistent configuration.
- The usage of downstream VNI with multi-site requires all BGW across all sites to run at least Cisco NX-OS Release 9.3(5).
- For existing centralized VRF route leaking deployments, a brief traffic loss might occur during ISSU to Cisco NX-OS Release 9.3(5) or later.
- For successful downgrade from Cisco NX-OS Release 9.3(5) to a prior release, ensure that the asymmetric VNI configuration has been removed. Downstream VNI is not supported prior to Cisco NX-OS Release 9.3(5) and hence traffic forwarding would be impacted.
- Layer-3 VNIs (IP-VRF) can flexibly mapped between VNIs per peer.
  - VNI 50001 on VTEP1 can perform symmetric VNI with VNI 50001 and asymmetric VNI with VNI 50002 on VTEP2 at the same time.

- VNI 50001 on VTEP1 can perform asymmetric VNI with VNI 50002 on VTEP2 and VNI 50003 on VTEP3.
- VNI 50001 on VTEP1 can perform asymmetric VNI with VNI 50002 and VNI 50003 on VTEP2 at the same time.
- Layer-2 VNIs (MAC-VRF) can only be mapped to one VNI per peer.
  - VNI 30001 on VTEP1 can perform asymmetric VNI with VNI 30002 on VTEP2 and VNI 30003 on VTEP3.
  - VNI 30001 on VTEP1 cannot perform asymmetric VNI with VNI 30002 and VNI 30003 on VTEP2 at the same time.
- BGP peering across VXLAN and Downstream VNI support the following constellations:
  - BGP peering between symmetric VNI is supported by using loopbacks.
  - BGP peering between asymmetric VNI is supported if the VNIs are in a 1:1 relationship. A loopback from VNI 50001 (on VTEP1) can peer with a loopback in VNI 50002 (on VTEP2).
  - BGP peering between asymmetric VNI is supported if the VNIs are in a 1:1 relationship but on different VTEPs. A loopback from VNI 50001 (on VTEP1) can peer with a loopback in VNI 50002 (on VTEP2 and VTEP3).
  - BGP peering between asymmetric VNI is not supported if the VNIs are in a 1:N relationship. A loopback in VNI 50001 (VTEP1) can't peer with a loopback in VNI 50002 (VTEP2) and VNI 50003 (VTEP3) at the same time.
- VXLAN consistency checker is not supported for VXLAN EVPN with downstream VNI.
- VXLAN EVPN with downstream VNI is currently not supported with the following feature combinations:
  - VXLAN static tunnels
  - TRM and TRM with Multi-Site
  - CloudSec VXLAN EVPN Tunnel Encryption
  - ESI-based multihoming
  - Seamless integration of EVPN with L3VPN (MPLS SR)
  - VXLAN policy-based routing (PBR)

## Configuring VXLAN BGP EVPN

### Enabling VXLAN

Enable VXLAN and the EVPN.

## SUMMARY STEPS

1. **feature vn-segment**
2. **feature nv overlay**
3. **vn-segment-vlan-based**
4. **interface vlan**
5. **nv overlay evpn**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>feature vn-segment</b>	Enable VLAN-based VXLAN
<b>Step 2</b>	<b>feature nv overlay</b>	Enable VXLAN
<b>Step 3</b>	<b>vn-segment-vlan-based</b>	Enable VN-Segment for VLANs.
<b>Step 4</b>	<b>interface vlan</b>	Enable Switch Virtual Interface (SVI).
<b>Step 5</b>	<b>nv overlay evpn</b>	Enable the EVPN control plane for VXLAN.

## Configuring VLAN and VXLAN VNI

**Note**

Step 3 to Step 6 are optional for configuring the VLAN for VXLAN VNI and are only necessary in case of a custom route distinguisher or route-target requirement (not using auto derivation).

## SUMMARY STEPS

1. **vlan *number***
2. **vn-segment *number***
3. **evpn**
4. **vni *number l2***
5. **rd auto**
6. **route-target both {auto | *rt*}**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>vlan <i>number</i></b>	Specify VLAN.
<b>Step 2</b>	<b>vn-segment <i>number</i></b>	Map VLAN to VXLAN VNI to configure Layer 2 VNI under VXLAN VLAN.
<b>Step 3</b>	<b>evpn</b>	Enter EVI (EVPN Virtual Instance) configuration mode.
<b>Step 4</b>	<b>vni <i>number l2</i></b>	Specify the Service Instance (VNI) for the EVI.

	Command or Action	Purpose
Step 5	<code>rd auto</code>	Specify the MAC-VRF's route distinguisher (RD).
Step 6	<code>route-target both {auto   rt}</code>	<p>Configure the route target (RT) for import and export of MAC prefixes. The RT is used for a per-MAC-VRF prefix import/export policy. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN.</p> <p><b>Note</b> Specifying the auto option is applicable only for IBGP.</p> <p>Manually configured route targets are required for EBGp and for asymmetric VNIs.</p>

## Configuring VRF for VXLAN Routing

Configure the tenant VRF.

**Note** Step 3 to step 6 are optional for configuring the VRF for VXLAN Routing and are only necessary in case of a custom route distinguisher or route-target requirement (not using auto derivation).

### SUMMARY STEPS

1. `vrf context vrf-name`
2. `vni number`
3. `rd auto`
4. `address-family {ipv4 | ipv6} unicast`
5. `route-target both {auto | rt}`
6. `route-target both {auto | rt} evpn`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>vrf context vrf-name</code>	Configure the VRF.
Step 2	<code>vni number</code>	Specify the VNI.
Step 3	<code>rd auto</code>	Specify the IP-VRF's route distinguisher (RD).
Step 4	<code>address-family {ipv4   ipv6} unicast</code>	Configure the IPv4 or IPv6 unicast address family.
Step 5	<code>route-target both {auto   rt}</code>	Configure the route target (RT) for import and export of IPv4 or IPv6 prefixes. The RT is used for a per-IP-VRF prefix import/export policy. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN.

	Command or Action	Purpose
		<p><b>Note</b> Specifying the <b>auto</b> option is applicable only for IBGP.</p> <p>Manually configured route targets are required for EBGP and for asymmetric VNIs.</p>
<b>Step 6</b>	<b>route-target both {auto   rt} evpn</b>	<p>Configure the route target (RT) for import and export of IPv4 or IPv6 prefixes. The RT is used for a per-VRF prefix import/export policy. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN.</p> <p><b>Note</b> Specifying the <b>auto</b> option is applicable only for IBGP.</p> <p>Manually configured route targets are required for EBGP and for asymmetric VNIs.</p>

## Configuring SVI for Core-facing VXLAN Routing

Configure the core-facing SVI VRF.

### SUMMARY STEPS

1. **vlan** *number*
2. **vn-segment** *number*
3. **interface** *vlan-number*
4. **mtu** *vlan-number*
5. **vrf member** *vrf-name*
6. **no {ip |ipv6} redirects**
7. **ip forward**
8. **ipv6 address use-link-local-only**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>vlan</b> <i>number</i>	Specify VLAN.
<b>Step 2</b>	<b>vn-segment</b> <i>number</i>	Map VLAN to VXLAN VNI to configure Layer 3 VNI under VXLAN VLAN.
<b>Step 3</b>	<b>interface</b> <i>vlan-number</i>	Specify VLAN interface.
<b>Step 4</b>	<b>mtu</b> <i>vlan-number</i>	MTU size in bytes <68-9216>.
<b>Step 5</b>	<b>vrf member</b> <i>vrf-name</i>	Assign to VRF.
<b>Step 6</b>	<b>no {ip  ipv6} redirects</b>	Disable sending IP redirect messages for IPv4 and IPv6.

	Command or Action	Purpose
Step 7	<code>ip forward</code>	Enable IPv4 based lookup even when the interface VLAN has no IP address defined.
Step 8	<code>ipv6 address use-link-local-only</code>	Enable IPv6 forwarding.  <b>Note</b> The IPv6 address use-link-local-only serves the same purpose as ip forward for IPv4. It enables the switch to perform an IP based lookup even when the interface VLAN has no IP address defined under it.

## Configuring SVI for Host-Facing VXLAN Routing

Configure the SVI for hosts, acting as Distributed Default Gateway.

### SUMMARY STEPS

1. `fabric forwarding anycast-gateway-mac address`
2. `vlan number`
3. `interface vlan-number`
4. `vn-segment number`
5. `interface vlan-number`
6. `vrf member vrf-name`
7. `ip address address`
8. `fabric forwarding mode anycast-gateway`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>fabric forwarding anycast-gateway-mac address</code>	Configure distributed gateway virtual MAC address.  <b>Note</b> One virtual MAC per VTEP.  <b>Note</b> All VTEPs should have the same virtual MAC address.
Step 2	<code>vlan number</code>	Specify VLAN.
Step 3	<code>interface vlan-number</code>	Specify VLAN interface.
Step 4	<code>vn-segment number</code>	Specify vn-segment.
Step 5	<code>interface vlan-number</code>	Specify VLAN interface.
Step 6	<code>vrf member vrf-name</code>	Assign to VRF.
Step 7	<code>ip address address</code>	Specify IP address.

	Command or Action	Purpose
<b>Step 8</b>	<b>fabric forwarding mode anycast-gateway</b>	Associate SVI with anycast gateway under VLAN configuration mode.

## Configuring the NVE Interface and VNIs Using Multicast

### SUMMARY STEPS

1. **interface** *nve-interface*
2. **host-reachability protocol** **bgp**
3. **global mcast-group** *ip-address* {L2 | L3}
4. **member vni** *vni*
5. **mcast-group** *ip address*
6. **member vni** *vni* **associate-vrf**
7. **mcast-group** *address*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>interface</b> <i>nve-interface</i>	Configure the NVE interface.
<b>Step 2</b>	<b>host-reachability protocol</b> <b>bgp</b>	This defines BGP as the mechanism for host reachability advertisement
<b>Step 3</b>	<b>global mcast-group</b> <i>ip-address</i> {L2   L3}	Configures the mcast group globally (for all VNI) on a per-NVE interface basis. This applies and gets inherited s to all Layer 2 or Layer 3 VNIs.  <b>Note</b> Layer3 macst group is only used for Tenant Routed Multicast (TRM).
<b>Step 4</b>	<b>member vni</b> <i>vni</i>	Add Layer 2 VNIs to the tunnel interface.
<b>Step 5</b>	<b>mcast-group</b> <i>ip address</i>	Configure the mcast group on a per-VNI basis. Add Layer 2 VNI specific mcast group and override the global set configuration.  <b>Note</b> Instead of a mcast group, ingress replication can be configured.
<b>Step 6</b>	<b>member vni</b> <i>vni</i> <b>associate-vrf</b>	Add Layer-3 VNIs, one per tenant VRF, to the overlay.  <b>Note</b> Required for VXLAN routing only.
<b>Step 7</b>	<b>mcast-group</b> <i>address</i>	Configure the mcast group on a per-VNI basis. Add Layer 3 VNI specific mcast group and override the global set configuration.

## Configuring VXLAN EVPN Ingress Replication

For VXLAN EVPN ingress replication, the VXLAN VTEP uses a list of IP addresses of other VTEPs in the network to send BUM (broadcast, unknown unicast and multicast) traffic. These IP addresses are exchanged between VTEPs through the BGP EVPN control plane.

**Note** VXLAN EVPN ingress replication is supported on:

- Cisco Nexus Series 9300 Series switches (7.0(3)I1(2) and later).
- Cisco Nexus Series 9500 Series switches (7.0(3)I2(1) and later).

**Before you begin:** The following are required before configuring VXLAN EVPN ingress replication (7.0(3)I1(2) and later):

- Enable VXLAN.
- Configure VLAN and VXLAN VNI.
- Configure BGP on the VTEP.
- Configure RD and Route Targets for VXLAN Bridging.

### SUMMARY STEPS

1. **interface** *nve-interface*
2. **host-reachability protocol bgp**
3. **global ingress-replication protocol bgp**
4. **member vni** *vni* **associate-vrf**
5. **member vni** *vni*
6. **ingress-replication protocol bgp**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>interface</b> <i>nve-interface</i>	Configure the NVE interface.
<b>Step 2</b>	<b>host-reachability protocol bgp</b>	This defines BGP as the mechanism for host reachability advertisement.
<b>Step 3</b>	<b>global ingress-replication protocol bgp</b>	Enables globally (for all VNI) the VTEP to exchange local and remote VTEP IP addresses on the VNI in order to create the ingress replication list. This enables sending and receiving BUM traffic for the VNI.  <b>Note</b> Using ingress-replication protocol bgp avoids the need for any multicast configurations that might have been required for configuring the underlay.

	Command or Action	Purpose
<b>Step 4</b>	<b>member vni</b> <i>vni</i> <b>associate-vrf</b>	Add Layer-3 VNIs, one per tenant VRF, to the overlay.  <b>Note</b> Required for VXLAN routing only.
<b>Step 5</b>	<b>member vni</b> <i>vni</i>	Add Layer 2 VNIs to the tunnel interface.
<b>Step 6</b>	<b>ingress-replication protocol bgp</b>	Enables the VTEP to exchange local and remote VTEP IP addresses on a per VNI basis in order to create the ingress replication list. This enables sending and receiving BUM traffic for the VNI and override the global configuration.  <b>Note</b> Instead of a ingress replication, mcast group can be configured.  <b>Note</b> Using <b>ingress-replication protocol bgp</b> avoids the need for any multicast configurations that might have been required for configuring the underlay.

## Configuring BGP on the VTEP

### SUMMARY STEPS

1. **router bgp** *number*
2. **router-id** *address*
3. **neighbor** *address* **remote-as** *number*
4. **address-family** *l2vpn evpn*
5. (Optional) **Allowas-in**
6. **send-community** *extended*
7. **vrf** *vrf-name*
8. **address-family** *ipv4 unicast*
9. **advertise** *l2vpn evpn*
10. **maximum-paths** *path {ibgp}*
11. **address-family** *ipv6 unicast*
12. **advertise** *l2vpn evpn*
13. **maximum-paths** *path {ibgp}*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>router bgp</b> <i>number</i>	Configure BGP.
<b>Step 2</b>	<b>router-id</b> <i>address</i>	Specify router address.
<b>Step 3</b>	<b>neighbor</b> <i>address</i> <b>remote-as</b> <i>number</i>	Define MPBGP neighbors. Under each neighbor define L2VPN EVPN.

	Command or Action	Purpose
Step 4	<b>address-family l2vpn evpn</b>	Configure address family Layer 2 VPN EVPN under the BGP neighbor.  <b>Note</b> Address-family IPv4 EVPN for VXLAN host-based routing
Step 5	(Optional) <b>Allowas-in</b>	Only for EBGp deployment cases: Allows duplicate autonomous system (AS) numbers in the AS path. Configure this parameter on the leaf for eBGP when all leafs are using the same AS, but the spines have a different AS than leafs.
Step 6	<b>send-community extended</b>	Configures community for BGP neighbors.
Step 7	<b>vrf vrf-name</b>	Specify VRF.
Step 8	<b>address-family ipv4 unicast</b>	Configure the address family for IPv4.
Step 9	<b>advertise l2vpn evpn</b>	Enable advertising EVPN routes.  <b>Note</b> Beginning with Cisco NX-OS Release 9.2(1), the <b>advertise l2vpn evpn</b> command no longer takes effect. To disable advertisement for a VRF toward the EVPN, disable the VNI in NVE by entering the <b>no member vni vni associate-vrf</b> command in interface nve1. The <i>vni</i> is the VNI associated with that particular VRF.
Step 10	<b>maximum-paths path {ibgp}</b>	Enable ECMP for EVPN transported IP Prefixes within the IPv6 address-family of the respective VRF.
Step 11	<b>address-family ipv6 unicast</b>	Configure the address family for IPv6.
Step 12	<b>advertise l2vpn evpn</b>	Enable advertising EVPN routes.  <b>Note</b> To disable advertisement for a VRF toward the EVPN, disable the VNI in NVE by entering the <b>no member vni vni associate-vrf</b> command in interface nve1. The <i>vni</i> is the VNI associated with that particular VRF.
Step 13	<b>maximum-paths path {ibgp}</b>	Enable ECMP for EVPN transported IP Prefixes within the IPv6 address-family of the respective VRF.

## Configuring iBGP for EVPN on the Spine

### SUMMARY STEPS

1. **router bgp** *autonomous system number*
2. **neighbor** *address* **remote-as** *number*

3. `address-family l2vpn evpn`
4. `send-community extended`
5. `route-reflector-client`
6. `retain route-target all`
7. `address-family l2vpn evpn`
8. `disable-peer-as-check`
9. `route-map permitall out`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<code>router bgp <i>autonomous system number</i></code>	Specify BGP.
<b>Step 2</b>	<code>neighbor <i>address</i> remote-as <i>number</i></code>	Define neighbor.
<b>Step 3</b>	<code>address-family l2vpn evpn</code>	Configure address family Layer 2 VPN EVPN under the BGP neighbor.
<b>Step 4</b>	<code>send-community extended</code>	Configures community for BGP neighbors.
<b>Step 5</b>	<code>route-reflector-client</code>	Enable Spine as Route Reflector.
<b>Step 6</b>	<code>retain route-target all</code>	Configure retain route-target all under address-family Layer 2 VPN EVPN [global].  <b>Note</b> Required for eBGP. Allows the spine to retain and advertise all EVPN routes when there are no local VNI configured with matching import route targets.
<b>Step 7</b>	<code>address-family l2vpn evpn</code>	Configure address family Layer 2 VPN EVPN under the BGP neighbor.
<b>Step 8</b>	<code>disable-peer-as-check</code>	Disables checking the peer AS number during route advertisement. Configure this parameter on the spine for eBGP when all leafs are using the same AS but the spines have a different AS than leafs.  <b>Note</b> Required for eBGP.
<b>Step 9</b>	<code>route-map permitall out</code>	Applies route-map to keep the next-hop unchanged.  <b>Note</b> Required for eBGP.

## Configuring eBGP for EVPN on the Spine

### SUMMARY STEPS

1. `route-map NEXT-HOP-UNCH permit 10`
2. `set ip next-hop unchanged`

3. **router bgp** *autonomous system number*
4. **address-family l2vpn evpn**
5. **retain route-target all**
6. **neighbor** *address* **remote-as** *number*
7. **address-family l2vpn evpn**
8. **disable-peer-as-check**
9. **send-community extended**
10. **route-map NEXT-HOP-UNCH out**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>route-map NEXT-HOP-UNCH permit 10</b>	Configure route-map to keep the next-hop unchanged for EVPN routes.
Step 2	<b>set ip next-hop unchanged</b>	<p>Set next-hop address.</p> <p><b>Note</b> When two next hops are enabled, next hop ordering is not maintained.</p> <p>If one of the next hops is a VXLAN next hop and the other next hop is local reachable via FIB/AM/Hmm, the local next hop reachable via FIB/AM/Hmm is always taken irrespective of the order.</p> <p>Directly/locally connected next hops are always given priority over remotely connected next hops.</p>
Step 3	<b>router bgp</b> <i>autonomous system number</i>	Specify BGP.
Step 4	<b>address-family l2vpn evpn</b>	Configure address family Layer 2 VPN EVPN under the BGP neighbor.
Step 5	<b>retain route-target all</b>	<p>Configure retain route-target all under address-family Layer 2 VPN EVPN [global].</p> <p><b>Note</b> Required for eBGP. Allows the spine to retain and advertise all EVPN routes when there are no local VNI configured with matching import route targets.</p>
Step 6	<b>neighbor</b> <i>address</i> <b>remote-as</b> <i>number</i>	Define neighbor.
Step 7	<b>address-family l2vpn evpn</b>	Configure address family Layer 2 VPN EVPN under the BGP neighbor.
Step 8	<b>disable-peer-as-check</b>	Disables checking the peer AS number during route advertisement. Configure this parameter on the spine for eBGP when all leaves are using the same AS but the spines have a different AS than leaves.

	Command or Action	Purpose
Step 9	<code>send-community extended</code>	Configures community for BGP neighbors.
Step 10	<code>route-map NEXT-HOP-UNCH out</code>	Applies route-map to keep the next-hop unchanged.

## Suppressing ARP

Suppressing ARP includes changing the size of the ACL ternary content addressable memory (TCAM) regions in the hardware.

**Note** For information on configuring ACL TCAM regions, see the *Configuring IP ACLs* chapter of the [Cisco Nexus 9000 Series NX-OS Security Configuration Guide](#).

### SUMMARY STEPS

1. `hardware access-list tcam region arp-ether size double-wide`
2. `interface nve 1`
3. `global suppress-arp`
4. `member vni vni-id`
5. `suppress-arp`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>hardware access-list tcam region arp-ether size double-wide</code>	<p>Configure TCAM region to suppress ARP.</p> <p><i>tcam-size</i> —TCAM size. The size has to be a multiple of 256. If the size is more than 256, it has to be a multiple of 512.</p> <p><b>Note</b> Reload is required for the TCAM configuration to be in effect.</p> <p><b>Note</b> Configuring the <b>hardware access-list tcam region arp-ether size double-wide</b> command is not required for Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2/FX3 and 9300-GX platform switches.</p>
Step 2	<code>interface nve 1</code>	Create the network virtualization endpoint (NVE) interface.
Step 3	<code>global suppress-arp</code>	Configure to suppress ARP globally for all Layer 2 VNI within the NVE interface.
Step 4	<code>member vni vni-id</code>	Specify VNI ID.

	Command or Action	Purpose
Step 5	<code>suppress-arp</code>	Configure to suppress ARP under Layer 2 VNI and overrides the global set default.

## Disabling VXLANs

### SUMMARY STEPS

1. `configure terminal`
2. `no nv overlay evpn`
3. `no feature vn-segment-vlan-based`
4. `no feature nv overlay`
5. (Optional) `copy running-config startup-config`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>configure terminal</code>	Enters configuration mode.
Step 2	<code>no nv overlay evpn</code>	Disables EVPN control plane.
Step 3	<code>no feature vn-segment-vlan-based</code>	Disables the global mode for all VXLAN bridge domains
Step 4	<code>no feature nv overlay</code>	Disables the VXLAN feature.
Step 5	(Optional) <code>copy running-config startup-config</code>	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

## Duplicate Detection for IP and MAC Addresses

Cisco NX-OS supports duplicate detection for IP and MAC addresses. This enables the detection of duplicate IP or MAC addresses based on the number of moves in a given time-interval (seconds).

The default is 5 moves in 180 seconds. (Default number of moves is 5 moves. Default time-interval is 180 seconds.)

- For IP addresses:
  - After the 5th move within 180 seconds, the switch starts a 30 second lock (hold down timer) before checking to see if the duplication still exists (an effort to prevent an increment of the sequence bit). This 30 second lock can occur 5 times within 24 hours (this means 5 moves in 180 seconds for 5 times) before the switch permanently locks or freezes the duplicate entry. (**`show fabric forwarding ip local-host-db vrf abc`**)
- For MAC addresses:
  - After the 5th move within 180 seconds, the switch starts a 30 second lock (hold down timer) before checking to see if the duplication still exists (an effort to prevent an increment of the sequence bit).

This 30 second lock can occur 3 times within 24 hours (this means 5 moves in 180 seconds for 3 times) before the switch permanently locks or freezes the duplicate entry. (**show l2rib internal permanently-frozen-list**)

- Wherever a MAC address is permanently frozen, a syslog message with written by L2RIB.

```
2017 Jul  5 10:27:34 leaf %$ VDC-1 %$ %USER-2-SYSTEM_MSG: Unfreeze limit (3) hit, MAC
0000.0033.3333in topo: 200 is permanently frozen - l2rib
2017 Jul  5 10:27:34 leaf %$ VDC-1 %$ %USER-2-SYSTEM_MSG: Detected duplicate host
0000.0033.3333, topology 200, during Local update, with host located at remote VTEP
1.2.3.4, VNI 2 - l2rib
2017 Jul  5 10:27:34 leaf %$ VDC-1 %$ %USER-2-SYSTEM_MSG: Unfreeze limit (3) hit, MAC
0000.0033.3334in topo: 200 is permanently frozen - l2rib
2017 Jul  5 10:27:34 leaf %$ VDC-1 %$ %USER-2-SYSTEM_MSG: Detected duplicate host
0000.0033.3334, topology 200, during Local update, with host 1
```

The following are example commands to help the configuration of the number of VM moves in a specific time interval (seconds) for duplicate IP-detection:

Command	Description
switch(config)# fabric forwarding ? anycast-gateway-mac dup-host-ip-addr-detection	Available sub-commands: <ul style="list-style-type: none"> <li>• Anycast gateway MAC of the switch.</li> <li>• To detect duplicate host addresses in n seconds.</li> </ul>
switch(config)# fabric forwarding dup-host-ip-addr-detection ? <1-1000>	The number of host moves allowed in n seconds. The range is 1 to 1000 moves; default is 5 moves.
switch(config)# fabric forwarding dup-host-ip-addr-detection 100 ? <2-36000>	The duplicate detection timeout in seconds for the number of host moves. The range is 2 to 36000 seconds; default is 180 seconds.
switch(config)# fabric forwarding dup-host-ip-addr-detection 100 10	Detects duplicate host addresses (limited to 100 moves) in a period of 10 seconds.

The following are example commands to help the configuration of the number of VM moves in a specific time interval (seconds) for duplicate MAC-detection:

Command	Description
switch(config)# l2rib dup-host-mac-detection ? <1-1000> default	Available sub-commands for L2RIB: <ul style="list-style-type: none"> <li>• The number of host moves allowed in n seconds. The range is 1 to 1000 moves.</li> <li>• Default setting (5 moves in 180 in seconds).</li> </ul>

<b>Command</b>	<b>Description</b>
<code>switch(config)# l2rib dup-host-mac-detection 100 ?                   &lt;2-36000&gt;</code>	The duplicate detection timeout in seconds for the number of host moves. The range is 2 to 36000 seconds; default is 180 seconds.
<code>switch(config)# l2rib dup-host-mac-detection 100 10</code>	Detects duplicate host addresses (limited to 100 moves) in a period of 10 seconds.

## Verifying the VXLAN BGP EVPN Configuration

To display the VXLAN BGP EVPN configuration information, enter one of the following commands:

Command	Purpose
<b>show nve vrf</b>	Displays VRFs and associated VNIs
<b>show bgp l2vpn evpn</b>	Displays routing table information.
<b>show ip arp suppression-cache</b> [detail   summary   vlan <i>vlan</i>   statistics ]	Displays ARP suppression information.
<b>show vxlan interface</b>	Displays VXLAN interface status.
<b>show vxlan interface   count</b>	Displays VXLAN VLAN logical port VP count.  <b>Note</b> A VP is allocated on a per-port per-VLAN basis. The sum of all VPs across all VXLAN-enabled Layer 2 ports gives the total logical port VP count. For example, if there are 10 Layer 2 trunk interfaces, each with 10 VXLAN VLANs, then the total VXLAN VLAN logical port VP count is 10*10 = 100.
<b>show l2route evpn mac</b> [all   evi <i>evi</i> [bgp   local   static   vxlan   arp]]	Displays Layer 2 route information.
<b>show l2route evpn fl all</b>	Displays all fl routes.
<b>show l2route evpn imet all</b>	Displays all imet routes.
<b>show l2route evpn mac-ip all</b> <b>show l2route evpn mac-ip all detail</b>	Displays all MAC IP routes.
<b>show l2route topology</b>	Displays Layer 2 route topology.

### Note

Although the **show ip bgp** command is available for verifying a BGP configuration, as a best practice, it is preferable to use the **show bgp** command instead.

## Verifying the VXLAN EVPN with Downstream VNI Configuration

To display the VXLAN EVPN with downstream VNI configuration information, enter one of the following commands:

Command	Purpose
<b>show bgp evi l2-evi</b>	Displays the VRF associated with an L2VNI.
<b>show forwarding adjacency nve platform</b>	Displays both symmetric and asymmetric NVE adjacencies with the corresponding DestInfoIndex.
<b>show forwarding route vrf vrf</b>	Displays the egress VNI or downstream VNI for each next-hop.
<b>show ip route detail vrf vrf</b>	Displays the egress VNI or downstream VNI for each next-hop.
<b>show l2route evpn mac-ip all detail</b>	Displays labeled next-hops that are present in the remote MAC routes.
<b>show l2route evpn imet all detail</b>	Displays the egress VNI associated with the remote peer.
<b>show nve peers control-plane-vni peer-ip ip-address</b>	Displays the egress VNI or downstream VNI for each NVE adjacency.

The following example shows sample output for the **show bgp evi l2-evi** command:

```
switch# show bgp evi 100
-----
L2VNI ID           : 100 (L2-100)
RD                 : 3.3.3.3:32867
Secondary RD       : 1:100
Prefixes (local/total) : 1/6
Created            : Jun 23 22:35:13.368170
Last Oper Up/Down  : Jun 23 22:35:13.369005 / never
Enabled            : Yes
Associated IP-VRF  : vni100
Active Export RT list :
    100:100
Active Import RT list :
    100:100
```

The following example shows sample output for the **show forwarding adjacency nve platform** command:

```
switch# show forwarding adjacency nve platform
slot 1
=====

        address-family l2vpn evpn
        send-community both
        route-reflector client

```

- Leaf (9396-A)

- Enable the EVPN control plane

```
nv overlay evpn
```

- Enable the relevant protocols

```

feature ospf
feature bgp
feature pim
feature interface-vlan

```

- Enable VXLAN with distributed anycast-gateway using BGP EVPN

```

feature vn-segment-vlan-based
feature nv overlay
fabric forwarding anycast-gateway-mac 0000.2222.3333

```

- Enabling OSPF for underlay routing

```
router ospf 1
```

- Configure Loopback for local Router ID, PIM, and BGP

```

interface loopback0
 ip address 30.1.1.1/32
 ip router ospf 1 area 0.0.0.0
 ip pim sparse-mode

```

- Configure Loopback for VTEP

```

interface loopback1
 ip address 33.1.1.1/32
 ip router ospf 1 area 0.0.0.0
 ip pim sparse-mode

```

- Configure interfaces for Spine-leaf interconnect

```

interface Ethernet2/2
 no switchport
 ip address 192.168.1.22/24
 ip router ospf 1 area 0.0.0.0
 ip pim sparse-mode
 no shutdown

interface Ethernet2/3
 no switchport
 ip address 192.168.3.23/24
 ip router ospf 1 area 0.0.0.0
 ip pim sparse-mode

```

```
shutdown
```

- Configure route-map to Redistribute Host-SVI (Silent Host)

```
route-map HOST-SVI permit 10
match tag 54321
```

- Configure PIM RP

```
ip pim rp-address 100.1.1.1 group-list 224.0.0.0/4
```

- Create VLANs

```
vlan 1001-1002
```

- Create overlay VRF VLAN and configure vn-segment

```
vlan 101
vn-segment 900001
```

- Create overlay VRF VLAN and configure vn-segment

```
vlan 101
vn-segment 900001
```

- Configure Core-facing SVI for VXLAN routing

```
interface vlan101
no shutdown
vrf member vxlan-900001
ip forward
no ip redirects
ipv6 address use-link-local-only
no ipv6 redirects
```

- Create VLAN and provide mapping to VXLAN

```
vlan 1001
vn-segment 2001001
vlan 1002
vn-segment 2001002
```

- Create VRF and configure VNI

```
vrf context vxlan-900001
vni 900001
rd auto
```

---

**Note** The **rd auto** and **route-target** commands are automatically configured unless one or more are entered as overrides.

---

```
\
address-family ipv4 unicast
  route-target both auto
  route-target both auto evpn
address-family ipv6 unicast
  route-target both auto
  route-target both auto evpn
```

- Create server facing SVI and enable distributed anycast-gateway.

```
interface vlan1001
  no shutdown
  vrf member vxlan-900001
  ip address 4.1.1.1/24 tag 54321
  ipv6 address 4:1:0:1::1/64 tag 54321
  fabric forwarding mode anycast-gateway

interface vlan1002
  no shutdown
  vrf member vxlan-900001
  ip address 4.2.2.1/24 tag 54321
  ipv6 address 4:2:0:1::1/64 tag 54321
  fabric forwarding mode anycast-gateway
```

- Configure ACL TCAM region for ARP suppression

---

**Note** The **hardware access-list tcam region arp-ether 256 double-wide** command is not needed for Cisco Nexus 9300-EX and 9300-FX/FX2/FX3 and 9300-GX platform switches.

---

```
hardware access-list tcam region arp-ether 256 double-wide
```

---

**Note** You can choose either of the following two options for creating the NVE interface. Use Option 1 for a small number of VNIs. Use Option 2 to leverage the simplified configuration mode.

---

Create the network virtualization endpoint (NVE) interface

#### Option 1

```
interface nve1
  no shutdown
  source-interface loopback1
  host-reachability protocol bgp
  member vni 900001 associate-vrf
  member vni 2001001
    mcast-group 239.0.0.1
  member vni 2001002
    mcast-group 239.0.0.1
```

#### Option 2

```

interface nve1
  source-interface loopback1
  host-reachability protocol bgp
  global mcast-group 239.0.0.1 L2
  member vni 2001001
  member vni 2001002
  member vni 2001007-2001010

```

- Configure interfaces for hosts/servers

```

interface Ethernet1/47
  switchport
  switchport access vlan 1002

interface Ethernet1/48
  switchport
  switchport access vlan 1001

```

- Configure BGP

```

router bgp 65535
  router-id 30.1.1.1
  neighbor 10.1.1.1 remote-as 65535
  update-source loopback0
  address-family l2vpn evpn
    send-community both
  neighbor 20.1.1.1 remote-as 65535
  update-source loopback0
  address-family l2vpn evpn
    send-community both
  vrf vxlan-900001
    address-family ipv4 unicast
    redistribute direct route-map HOST-SVI
    address-family ipv6 unicast
    redistribute direct route-map HOST-SVI

```

---

**Note** The following commands in EVPN mode do not need to be entered.

---

```

evpn
  vni 2001001 12
  vni 2001002 12

```

---

**Note** The **rd auto** and **route-target auto** commands are automatically configured unless one or more are entered as overrides.

---

```

rd auto
  route-target import auto
  route-target export auto

```

**Note** The **rd auto** and **route-target** commands are automatically configured unless you want to use them to override the **import** or **export** options.

**Note** The following commands in EVPN mode do not need to be entered.

```
evpn
vni 2001001 12
  rd auto
  route-target import auto
  route-target export auto
vni 2001002 12
  rd auto
  route-target import auto
  route-target export auto
```

- Leaf (9396-B)
  - Enable the EVPN control plane

```
nv overlay evpn
```

- Enable the relevant protocols

```
feature ospf
feature bgp
feature pim
feature interface-vlan
```

- Enable VxLAN with distributed anycast-gateway using BGP EVPN

```
feature vn-segment-vlan-based
feature nv overlay
fabric forwarding anycast-gateway-mac 0000.2222.3333
```

- Enabling OSPF for underlayrouting

```
router ospf 1
```

- Configure Loopback for local Router ID, PIM, and BGP

```
interface loopback0
ip address 40.1.1.1/32
ip router ospf 1 area 0.0.0.0
ip pim sparse-mode
```

- Configure Loopback for VTEP

```
interface loopback1
ip address 44.1.1.1/32
ip router ospf 1 area 0.0.0.0
ip pim sparse-mode
```

- Configure interfaces for Spine-leaf interconnect

```
interface Ethernet2/2
  no switchport
  ip address 192.168.3.22/24
  ip router ospf 1 area 0.0.0.0
  ip pim sparse-mode
  no shutdown

interface Ethernet2/3
  no switchport
  ip address 192.168.4.23/24
  ip router ospf 1 area 0.0.0.0
  ip pim sparse-mode
  shutdown
```

- Configure route-map to Redistribute Host-SVI (Silent Host)

```
route-map HOST-SVI permit 10
  match tag 54321
```

- Configure PIM RP

```
ip pim rp-address 100.1.1.1 group-list 224.0.0.0/4
```

- Create VLANs

```
vlan 1001-1002
```

- Create overlay VRF VLAN and configure vn-segment

```
vlan 101
  vn-segment 900001
```

- Configure Core-facing SVI for VXLAN routing

```
interface vlan101
  no shutdown
  vrf member vxlan-900001
  ip forward
  no ip redirects
  ipv6 address use-link-local-only
  no ipv6 redirects
```

- Create VLAN and provide mapping to VXLAN

```
vlan 1001
  vn-segment 2001001
vlan 1002
  vn-segment 2001002
```

- Create VRF and configure VNI

```
vrf context vxlan-900001
  vni 900001
  rd auto
```

**Note** The **rd auto** and **route-target** commands are automatically configured unless one or more are entered as overrides.

```
address-family ipv4 unicast
  route-target both auto
  route-target both auto evpn
address-family ipv6 unicast
  route-target both auto
  route-target both auto evpn
```

- Create server facing SVI and enable distributed anycast-gateway

```
interface vlan1001
  no shutdown
  vrf member vxlan-900001
  ip address 4.1.1.1/24
  ipv6 address 4:1:0:1::1/64
  fabric forwarding mode anycast-gateway

interface vlan1002
  no shutdown
  vrf member vxlan-900001
  ip address 4.2.2.1/24
  ipv6 address 4:2:0:1::1/64
  fabric forwarding mode anycast-gateway
```

- Configure ACL TCAM region for ARP suppression

**Note** The **hardware access-list tcam region arp-ether 256 double-wide** command is not needed for Cisco Nexus 9300-EX and 9300-FX/FX2/FX3 and 9300-GX platform switches.

```
hardware access-list tcam region arp-ether 256 double-wide
```

**Note** You can choose either of the following two command procedures for creating the NVE interfaces. Use Option 1 for a small number of VNIs. Use Option 2 to leverage the simplified configuration mode.

Create the network virtualization endpoint (NVE) interface

Option 1

```
interface nve1
  no shutdown
  source-interface loopback1
  host-reachability protocol bgp
  member vni 900001 associate-vrf
  member vni 2001001
  mcast-group 239.0.0.1
```

```
member vni 2001002
mcast-group 239.0.0.1
```

## Option 2

```
interface nve1
 interface nve1
 source-interface loopback1
 host-reachability protocol bgp
 global mcast-group 239.0.0.1 L2
 member vni 2001001
 member vni 2001002
 member vni 2001007-2001010
```

- Configure interfaces for hosts/servers

```
interface Ethernet1/47
 switchport
 switchport access vlan 1002

interface Ethernet1/48
 switchport
 switchport access vlan 1001
```

- Configure BGP

```
router bgp 65535
 router-id 40.1.1.1
 neighbor 10.1.1.1 remote-as 65535
 update-source loopback0
 address-family l2vpn evpn
 send-community both
 neighbor 20.1.1.1 remote-as 65535
 update-source loopback0
 address-family l2vpn evpn
 send-community both
 vrf vxlan-900001
 vrf vxlan-900001
 address-family ipv4 unicast
 redistribute direct route-map HOST-SVI
 address-family ipv6 unicast
 redistribute direct route-map HOST-SVI
```

---

**Note** The following commands in EVPN mode do not need to be entered.

```
evpn
 vni 2001001 12
 vni 2001002 12
```

---

**Note** The **rd auto** and **route-target** commands are automatically configured unless one or more are entered as overrides.

```
rd auto
  route-target import auto
  route-target export auto
```

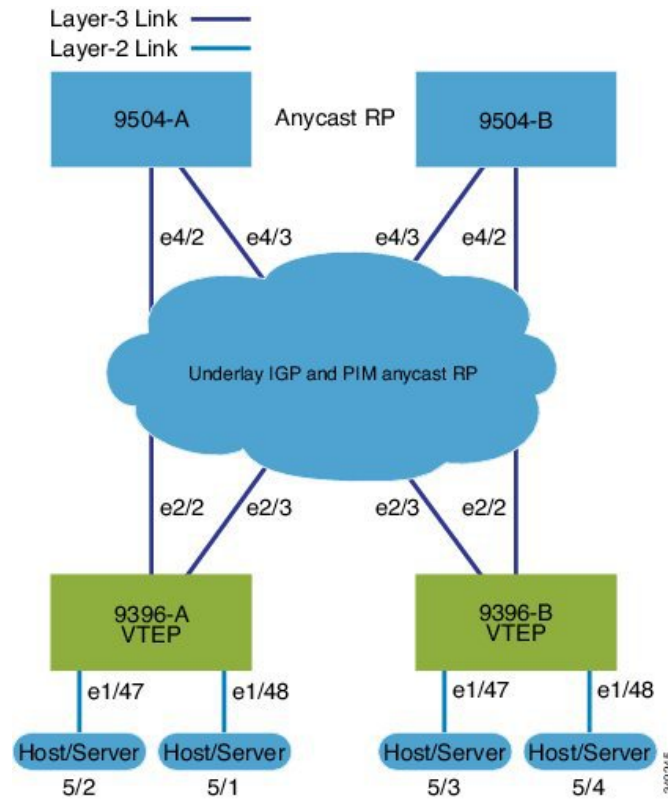

**Note** The following commands in EVPN mode do not need to be entered.

```
evpn
  vni 2001001 12
    rd auto
    route-target import auto
    route-target export auto
  vni 2001002 12
    rd auto
    route-target import auto
    route-target export auto
```

## Example of VXLAN BGP EVPN (EBGP)

An example of a VXLAN BGP EVPN (EBGP):

Figure 8: VXLAN BGP EVPN Topology (EBGP)

## EBGP between Spine and Leaf

## • Spine (9504-A)

- Enable the EVPN control plane

```
nv overlay evpn
```

- Enable the relevant protocols

```
feature bgp
feature pim
```

- Configure Loopback for local Router ID, PIM, and BGP

```
interface loopback0
 ip address 10.1.1.1/32 tag 12345
 ip pim sparse-mode
```

- Configure Loopback for Anycast RP

```
interface loopback1
 ip address 100.1.1.1/32 tag 12345
 ip pim sparse-mode
```

- Configure Anycast RP

```
ip pim rp-address 100.1.1.1 group-list 224.0.0.0/4
```

```
ip pim anycast-rp 100.1.1.1 10.1.1.1
ip pim anycast-rp 100.1.1.1 20.1.1.1
```

- Configure route-map used by EBGp for Spine

```
route-map NEXT-HOP-UNCH permit 10
  set ip next-hop unchanged
```

- Configure route-map to Redistribute Loopback

```
route-map LOOPBACK permit 10
  match tag 12345
```

- Configure interfaces for Spine-leaf interconnect

```
interface Ethernet4/2
  ip address 192.168.1.42/24
  ip pim sparse-mode
  no shutdown
```

```
interface Ethernet4/3
  ip address 192.168.2.43/24
  ip pim sparse-mode
  no shutdown
```

- Configure the BGP overlay for the EVPN address family.

```
router bgp 100
  router-id 10.1.1.1
  address-family l2vpn evpn
    nexthop route-map NEXT-HOP-UNCH
    retain route-target all
  neighbor 30.1.1.1 remote-as 200
  update-source loopback0
  ebgp-multihop 3
  address-family l2vpn evpn
    send-community both
    disable-peer-as-check
    route-map NEXT-HOP-UNCH out
  neighbor 40.1.1.1 remote-as 200
  update-source loopback0
  ebgp-multihop 3
  address-family l2vpn evpn
    send-community both
    disable-peer-as-check
    route-map NEXT-HOP-UNCH out
```

- Configure BGP underlay for the IPv4 unicast address family.

```
address-family ipv4 unicast
  redistribute direct route-map LOOPBACK
  neighbor 192.168.1.22 remote-as 200
  update-source ethernet4/2
  address-family ipv4 unicast
    allowas-in
    disable-peer-as-check
  neighbor 192.168.2.23 remote-as 200
  update-source ethernet4/3
  address-family ipv4 unicast
```

```
allowas-in
disable-peer-as-check
```

- Spine (9504-B)

- Enable the EVPN control plane

```
nv overlay evpn
```

- Enable the relevant protocols

```
feature bgp
feature pim
```

- Configure Loopback for local Router ID, PIM, and BGP

```
interface loopback0
 ip address 20.1.1.1/32 tag 12345
 ip pim sparse-mode
```

- Configure Loopback for AnycastRP

```
interface loopback1
 ip address 100.1.1.1/32 tag 12345
 ip pim sparse-mode
```

- Configure Anycast RP

```
ip pim rp-address 100.1.1.1 group-list 224.0.0.0/4
ip pim anycast-rp 100.1.1.1 10.1.1.1
ip pim anycast-rp 100.1.1.1 20.1.1.1
```

- Configure route-map used by EBGp for Spine

```
route-map NEXT-HOP-UNCH permit 10
 set ip next-hop unchanged
```

- Configure route-map to Redistribute Loopback

```
route-map LOOPBACK permit 10
 match tag 12345
```

- Configure interfaces for Spine-leaf interconnect

```
interface Ethernet4/2
 no switchport
 ip address 192.168.3.42/24
 ip router ospf 1 area 0.0.0.0
 ip pim sparse-mode
 no shutdown

interface Ethernet4/3
 no switchport
 ip address 192.168.4.43/24
 ip router ospf 1 area 0.0.0.0
```

```
ip pim sparse-mode
shutdown
```

- Configure BGP overlay for the EVPN address family

```
router bgp 100
router-id 20.1.1.1
address-family l2vpn evpn
  nexthop route-map NEXT-HOP-UNCH
  retain route-target all
neighbor 30.1.1.1 remote-as 200
  update-source loopback0
  ebgp-multihop 3
address-family l2vpn evpn
  send-community both
  disable-peer-as-check
  route-map NEXT-HOP-UNCH out
neighbor 40.1.1.1 remote-as 200
  update-source loopback0
  ebgp-multihop 3
address-family l2vpn evpn
  send-community both
  disable-peer-as-check
  route-map NEXT-HOP-UNCH out
```

- Configure the BGP underlay for the IPv4 unicast address family.

```
address-family ipv4 unicast
  redistribute direct route-map LOOPBACK
neighbor 192.168.3.22 remote-as 200
  update-source ethernet4/2
address-family ipv4 unicast
  allowas-in
  disable-peer-as-check
neighbor 192.168.4.43 remote-as 200
  update-source ethernet4/3
address-family ipv4 unicast
  allowas-in
  disable-peer-as-check
```

- Leaf (9396-A)

- Enable the EVPN control plane.

```
nv overlay evpn
```

- Enable the relevant protocols.

```
feature bgp
feature pim
feature interface-vlan
```

- Enable VXLAN with distributed anycast-gateway using BGP EVPN.

```
feature vn-segment-vlan-based
feature nv overlay
```

```
fabric forwarding anycast-gateway-mac 0000.2222.3333
```

- Enabling OSPF for underlay routing.

```
router ospf 1
```

- Configure Loopback for local Router ID, PIM, and BGP.

```
interface loopback0
 ip address 30.1.1.1/32
 ip pim sparse-mode
```

- Configure Loopback for VTEP.

```
interface loopback1
 ip address 33.1.1.1/32
 ip pim sparse-mode
```

- Configure interfaces for Spine-leaf interconnect.

```
interface Ethernet2/2
 no switchport
 ip address 192.168.1.22/24
 ip pim sparse-mode
 no shutdown
```

```
interface Ethernet2/3
 no switchport
 ip address 192.168.4.23/24
 ip pim sparse-mode
 shutdown
```

- Configure route-map to Redistribute Host-SVI (Silent Host).

```
route-map HOST-SVI permit 10
 match tag 54321
```

- Enable PIM RP.

```
ip pim rp-address 100.1.1.1 group-list 224.0.0.0/4
```

- Create VLANs.

```
vlan 1001-1002
```

- Create overlay VRF VLAN and configure vn-segment.

```
vlan 101
 vn-segment 900001
```

- Configure core-facing SVI for VXLAN routing.

```
interface vlan101
 no shutdown
 vrf member vxlan-900001
 ip forward
 no ip redirects
 ipv6 address use-link-local-only
 no ipv6 redirects
```

- Create VLAN and provide mapping to VXLAN.

```

vlan 1001
  vn-segment 2001001
vlan 1002
  vn-segment 2001002

```

- Create VRF and configure VNI

```

vrf context vxlan-900001
  vni 900001
  rd auto

```

---

**Note** The **rd auto** and **route-target** commands are automatically configured unless one or more are entered as overrides.

---

```

address-family ipv4 unicast
  route-target both auto
  route-target both auto evpn
address-family ipv6 unicast
  route-target both auto
  route-target both auto evpn

```

- Create server facing SVI and enable distributed anycast-gateway

```

interface vlan1001
  no shutdown
  vrf member vxlan-900001
  ip address 4.1.1.1/24 tag 54321
  ipv6 address 4:1:0:1::1/64 tag 54321
  fabric forwarding mode anycast-gateway

interface vlan1002
  no shutdown
  vrf member vxlan-900001
  ip address 4.2.2.1/24 tag 54321
  ipv6 address 4:2:0:1::1/64 tag 54321
  fabric forwarding mode anycast-gateway

```

- Configure ACL TCAM region for ARP suppression

---

**Note** The **hardware access-list tcam region arp-ether 256 double-wide** command is not needed for Cisco Nexus 9300-EX and 9300-FX/FX2/FX3 and 9300-GX platform switches.

---

```

hardware access-list tcam region arp-ether 256 double-wide

```

**Note** You can choose either of the following two options for creating the NVE interface. Use Option 1 for a small number of VNIs. Use Option 2 to leverage the simplified configuration mode.

Create the network virtualization endpoint (NVE) interface

#### Option 1

```
interface nve1
  no shutdown
  source-interface loopback1
  host-reachability protocol bgp
  member vni 900001 associate-vrf
  member vni 2001001
    mcast-group 239.0.0.1
  member vni 2001002
    mcast-group 239.0.0.1
```

#### Option 2

```
interface nve1
  source-interface loopback1
  host-reachability protocol bgp
  global mcast-group 239.0.0.1 L2
  member vni 2001001
  member vni 2001002
  member vni 2001007-2001010
```

- Configure interfaces for hosts/servers.

```
interface Ethernet1/47
  switchport
  switchport access vlan 1002

interface Ethernet1/48
  switchport
  switchport access vlan 1001
```

- Configure BGP underlay for the IPv4 unicast address family.

```
router bgp 200
  router-id 30.1.1.1
  address-family ipv4 unicast
    redistribute direct route-map LOOPBACK
  neighbor 192.168.1.42 remote-as 100
  update-source ethernet2/2
  address-family ipv4 unicast
    allowas-in
    disable-peer-as-check
```

```
neighbor 192.168.4.43 remote-as 100
update-source ethernet2/3
address-family ipv4 unicast
allowas-in
disable-peer-as-check
```

- Configure BGP overlay for the EVPN address family.

```
address-family l2vpn evpn
next-hop route-map NEXT-HOP-UNCH
retain route-target all
neighbor 10.1.1.1 remote-as 100
update-source loopback0
ebgp-multihop 3
address-family l2vpn evpn
send-community both
disable-peer-as-check
route-map NEXT-HOP-UNCH out
neighbor 20.1.1.1 remote-as 100
update-source loopback0
ebgp-multihop 3
address-family l2vpn evpn
send-community both
disable-peer-as-check
route-map NEXT-HOP-UNCH out
vrf vxlan-900001
```

**Note** The following commands in EVPN mode do not need to be entered.

```
evpn
vni 2001001 l2
vni 2001002 l2
```

**Note** The **rd auto** and **route-target auto** commands are automatically configured unless one or more are entered as overrides.

```
rd auto
route-target import auto
route-target export auto
```

**Note** The following commands in EVPN mode do not need to be entered.

```
evpn
vni 2001001 l2
rd auto
route-target import auto
route-target export auto
vni 2001002 l2
rd auto
route-target import auto
route-target export auto
```

- Leaf (9396-B)

- Enable the EVPN control plane.

```
nv overlay evpn
```

- Enable the relevant protocols.

```
feature bgp
feature pim
feature interface-vlan
```

- Enable VXLAN with distributed anycast-gateway using BGP EVPN.

```
feature vn-segment-vlan-based
feature nv overlay
fabric forwarding anycast-gateway-mac 0000.2222.3333
```

- Enabling OSPF for underlay routing.

```
router ospf 1
```

- Configure Loopback for local Router ID, PIM, and BGP.

```
interface loopback0
 ip address 40.1.1.1/32
 ip pim sparse-mode
```

- Configure Loopback for VTEP.

```
interface loopback1
 ip address 44.1.1.1/32
 ip pim sparse-mode
```

- Configure interfaces for Spine-leaf interconnect.

```
interface Ethernet2/2
 no switchport
 ip address 192.168.3.22/24
 ip pim sparse-mode
 no shutdown
```

```
interface Ethernet2/3
 no switchport
 ip address 192.168.2.23/24
 ip pim sparse-mode
 shutdown
```

- Configure route-map to Redistribute Host-SVI (Silent Host).

```
route-map HOST-SVI permit 10
 match tag 54321
```

- Enable PIM RP

```
ip pim rp-address 100.1.1.1 group-list 224.0.0.0/4
```

- Create VLANs

```
vlan 1001-1002
```

- Create overlay VRF VLAN and configure vn-segment.

```
vlan 101
  vn-segment 900001
```

- Configure core-facing SVI for VXLAN routing.

```
interface vlan101
  no shutdown
  vrf member vxlan-900001
  ip forward
  no ip redirects
  ipv6 address use-link-local-only
  no ipv6 redirects
```

- Create VLAN and provide mapping to VXLAN.

```
vlan 1001
  vn-segment 2001001
vlan 1002
  vn-segment 2001002
```

- Create VRF and configure VNI

```
vrf context vxlan-900001
  vni 900001
  rd auto
```

---

**Note** The following commands are automatically configured unless one or more are entered as overrides.

---

```
address-family ipv4 unicast
  route-target both auto
  route-target both auto evpn
address-family ipv6 unicast
  route-target both auto
  route-target both auto evpn
```

- Create server facing SVI and enable distributed anycast-gateway.

```
interface vlan1001
  no shutdown
  vrf member vxlan-900001
  ip address 4.1.1.1/24 tag 54321
  ipv6 address 4:1:0:1::1/64 tag 54321
  fabric forwarding mode anycast-gateway
```

```
interface vlan1002
  no shutdown
  vrf member vxlan-900001
  ip address 4.2.2.1/24 tag 54321
  ipv6 address 4:2:0:1::1/64 tag 54321
  fabric forwarding mode anycast-gateway
```

- Configure ACL TCAM region for ARP suppression

**Note** The **hardware access-list tcam region arp-ether 256 double-wide** command is not needed for Cisco Nexus 9300-EX and 9300-FX/FX2/FX3 and 9300-GX platform switches.

```
hardware access-list tcam region arp-ether 256 double-wide
```

**Note** You can choose either of the following two procedures for creating the NVE interface. Use Option 1 for a small number of VNIs. Use Option 2 to leverage the simplified configuration mode.

Create the network virtualization endpoint (NVE) interface.

#### Option 1

```
interface nve1
  no shutdown
  source-interface loopback1
  host-reachability protocol bgp
  member vni 900001 associate-vrf
  member vni 2001001
    mcast-group 239.0.0.1
  member vni 2001002
    mcast-group 239.0.0.1
```

#### Option 2

```
interface nve1
  source-interface loopback1
  host-reachability protocol bgp
  global mcast-group 239.0.0.1 L2
  member vni 2001001
  member vni 2001002
  member vni 2001007-2001010
```

#### • Configure interfaces for hosts/servers

```
interface Ethernet1/47
  switchport
  switchport access vlan 1002

interface Ethernet1/48
  switchport
  switchport access vlan 1001
```

- Configure BGP underlay for the IPv4 unicast address family.

```
router bgp 200
  router-id 40.1.1.1
  address-family ipv4 unicast
    redistribute direct route-map LOOPBACK
  neighbor 192.168.3.42 remote-as 100
    update-source ethernet2/2
    address-family ipv4 unicast
      allowas-in
      disable-peer-as-check
  neighbor 192.168.2.43 remote-as 100
    update-source ethernet2/3
    address-family ipv4 unicast
      allowas-in
      disable-peer-as-check
```

- Configure BGP overlay for the EVPN address family.

```
address-family l2vpn evpn

## CHAPTER 5

# Configuring VXLAN with IPv6 in the Underlay (VXLANv6)

---

This chapter contains the following sections:

- [Information About Configuring VXLAN with IPv6 in the Underlay \(VXLANv6\)](#) , on page 95
- [Guidelines and Limitations for VXLAN with IPv6 in the Underlay \(VXLANv6\)](#) , on page 96
- [Information About vPC and VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 98
- [Information About vPC Peer Keepalive and VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 98
- [Configuring the VTEP IP Address](#), on page 99
- [Configuring vPC for VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 100
- [Example Configurations for VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 101
- [Verifying VXLAN with IPv6 in the Underlay \(VXLANv6\)](#), on page 103

## Information About Configuring VXLAN with IPv6 in the Underlay (VXLANv6)

VXLAN BGP EVPN is deployed with IPv4 underlay and IPv4 VTEP. Hosts in the overlay can be IPv4 or IPv6. Support is added for VXLAN with IPv6 in the Underlay (VXLANv6) with an IPv6 VTEP. This requires IPv6 versions of the unicast routing protocols and utilizing ingress replication for multi-destination traffic (BUM) in the underlay.

This solution is targeted for green field deployments where the VTEP is IPv6 only and the underlay is IPv6. The BGP sessions between the leaf and spine are also IPv6. The overlay hosts can be either IPv4 or IPv6.

The following protocols are supported in the underlay:

- IS-IS
- OSPFv3
- eBGP

# Guidelines and Limitations for VXLAN with IPv6 in the Underlay (VXLANv6)

VXLAN with IPv6 in the Underlay (VXLANv6) has the following guidelines and limitations:

The following Cisco Nexus platforms are supported to provide the VTEP function (leaf and border). The BGP route reflector can be provided by any Cisco Nexus platform that supports the EVPN **address-family** command over an IPv6 MP-BGP peering.

- Cisco Nexus 9332C
- Cisco Nexus 9364C
- Cisco Nexus 9300-EX
- Cisco Nexus 9300-FX
- Cisco Nexus 9300-FX2
- Cisco Nexus 9300-FX3
- Cisco Nexus 9300-FXP
- Cisco Nexus 9300-GX

VXLAN with IPv6 in the Underlay (VXLANv6) supports the following features:

- Address Resolution Protocol (ARP) suppression in the overlay
- Access Control List (ACL) Quality of Service (QoS)
- Border Node with VRF-Lite
- Dynamic Host Configuration Protocol (DHCP)
- Guestshell support
- Internet Group Management Protocol (IGMP) Snooping in the overlay
- Virtual Extensible Local Area Network (VXLAN) Operation, Administration, and Maintenance (OAM)
- Storm Control for host ports (Access Side)
- Virtual Port Channel (vPC) with VIP and PIP support

Beginning with Cisco NX-OS Release 10.1(1) IPv6 Underlay is supported for N9K-C9316D-GX, N9K-C93600CD-GX, and N9K-C9364C-GX TOR switches.

VXLAN with IPv6 in the Underlay (VXLANv6) does not support the following features:

- Bidirectional Forwarding Detection (BFD)
- Centralized Route Leak
- Cisco Data Center Network Manager (DCNM) integration
- Cross Connect

- EVPN Multi-homing with Ethernet Segment (ES)
- Fabric Extender (FEX) attached to a VXLAN-enabled switch.
- VXLAN Flood and Learn
- MACsec
- Multiprotocol Label Switching (MPLS) and Locator/ID Separation Protocol (LISP) handoff
- Multicast underlay (PIM-BiDir, Protocol Independent Multicast (PIM) Any Source Multicast (ASM), Snooping)
- NetFlow
- Overlay IGMP Snooping
- **peer vtep** command
- Policy-Based Redirect (PBR)
- Sampled Flow (sFLOW)
- Static ingress replication (IR)
- Tenant Routed Multicast (TRM)
- Virtual Network Functions (VNF) Multipath
- vPC Fabric Peering
- VXLAN Access Features
  - 802.1x
  - Port security
  - Private VLAN (PVLAN)
  - PV translation (Switching/Routing)
  - Q-in-Q with QinVNI
  - QinVNI and SelQinVNI
- VXLAN Policy-Based Routing (PBR)
- VXLAN Multi-Site

Other guidelines and limitations:

- VXLAN/Fibre Channel co-existence

## Information About vPC and VXLAN with IPv6 in the Underlay (VXLANv6)

vPC VTEPs use vMAC (virtual MAC) with the VIP/PIP feature. vMAC is used with VIP and the system MAC is used with PIP.

In the IPv4 underlay, vMAC is derived from the IPv4 VIP address:

VMAC = 0x02 + 4 bytes IPv4 VIP address.

In the IPv6 underlay, VIP is IPv6 (128 bits) which cannot be used to generate a conflict free unique vMAC (48 bits). The default method is to autogenerate the vMAC by picking the last 48 bits from the IPv6 VIP:

Autogenerated vMAC = 0x06 + the last 4 bytes of the IPv6 VIP address.

If there are two vPC complexes which have different VIPs but the same last 4 bytes of IPv6 address in the VIP, both autogenerate the same vMAC. For a remote VTEP, it sees vMAC flopping between two different VIPs. This is not an issue for Cisco Nexus 9000 Series switches which support VXLAN IPv6.

For other vendor boxes, if this is an issue for interoperability reasons, the vMAC can be manually configured on Cisco Nexus 9000 Series switches to override the autogenerated vMAC. The default behavior for VXLAN with IPv6 in the Underlay (VXLANv6) is to autogenerate the VMAC. If a VMAC is configured manually, the manually configured VMAC takes precedence.

```
interface nve1
  virtual-rmac <48-bit mac address>
```

The VMAC must be managed by the administrator just like the VIP/PIP and must be unique in the fabric. All the preceding behavior is for VXLAN with IPv6 in the Underlay (VXLANv6) only and nothing changes about VMAC creation and advertisement for VXLAN IPv4 in the underlay.

The default behavior is that vMAC is autogenerated from the configured VIP and advertised. There is no need to use the **virtual-rmac** command as previously described except for interoperability cases. There is no need to use the existing **advertise virtual-rmac** command for VXLAN with IPv6 in the Underlay (VXLANv6).

## Information About vPC Peer Keepalive and VXLAN with IPv6 in the Underlay (VXLANv6)

The modification for vPC is to allow IPv6 addresses to be used for the peer-keepalive link. The link can be on the management interface or any other interface. The keepalive link becomes operational only when both peers are configured correctly either with the IPv4 or IPv6 address and those addresses are reachable from each peer. Peer-keepalive can be configured on in-band and out-of-band interfaces.

### Note

peer-keepalive must be a global unicast address.

The configuration command for **peer-keepalive** accepts an IPv6 address

```
vpc domain 1
peer-keepalive destination 001:002::003:004 source 001:002::003:005 vrf management
```

## Configuring the VTEP IP Address

### SUMMARY STEPS

1. **configure terminal**
2. **interface nve1**
3. **source-interface loopback *src-if***
4. **exit**
5. **interface loopback *loopback\_number***
6. **ipv6 address *ipv6\_format***
7. **exit**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> switch# <b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>interface nve1</b>  <b>Example:</b> switch(config)# <b>interface nve1</b>	Configure the NVE interface.
<b>Step 3</b>	<b>source-interface loopback <i>src-if</i></b>  <b>Example:</b> switch(config-if-nve)# <b>source interface loopback 1</b>	The source interface must be a loopback interface that is configured on the switch with a valid /128 IP address. This /128 IP address must be known by the intermediate devices in the transport network and the remote VTEPs. This is accomplished by advertising it through a dynamic routing protocol in the transport network.  <b>Note</b> The IPv6 address on <b>loopback1</b> must be a /128 address.  The VTEP IP address cannot be a link local IPv6 address.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> switch(config-if-nve)# <b>exit</b>	Exit configuration mode.
<b>Step 5</b>	<b>interface loopback <i>loopback_number</i></b>  <b>Example:</b> switch(config)# <b>interface loopback 1</b>	Configure the loopback interface.

	Command or Action	Purpose
<b>Step 6</b>	<b>ipv6 address</b> <i>ipv6_format</i> <b>Example:</b> <pre>switch(config-if) # ipv6 address 2001:db8:0:0:1:0:0:1/128</pre>	Configure IPv6 address on the interface.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> <pre>switch(config-if) # exit</pre>	Exit configuration mode.

## Configuring vPC for VXLAN with IPv6 in the Underlay (VXLANv6)

VXLAN with IPv4 in the underlay leveraged the concept of a secondary IP address (VIP) used in vPC. IPv6 does not have the concept of secondary addresses as does IPv4. However, multiple IPv6 global addresses can be configured on an interface, which are treated equally in priority.

The CLI for the VIP configuration has been extended to specify the loopback interface that carries the VIP if there is a VXLAN with IPv6 in the Underlay (VXLANv6) vPC. The IPv6 primary IP address (PIP) and VIP are in two separate loopback interfaces.

Similar to IPv4, if there are multiple IPv6 addresses specified on either loopback, the lowest IP is selected for each.

The following steps outline the configuration of a VTEP IP (VIP/PIP) required on a vPC setup.

### Note

The **anycast loopback** command is used only for VXLAN with IPv6 in the Underlay (VXLANv6).

### SUMMARY STEPS

1. **configure terminal**
2. **interface nve1**
3. **source-interface loopback** *src-if* **anycast loopback** *any-if*
4. **exit**
5. **interface loopback** *loopback\_number*
6. **ipv6 address** *ipv6\_format*
7. **exit**
8. **interface loopback** *loopback\_number*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>switch# configure terminal</pre>	Enter global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>interface nve1</b> <b>Example:</b> <code>switch(config)# interface nve1</code>	Configure the NVE interface.
<b>Step 3</b>	<b>source-interface loopback <i>src-if</i> anycast loopback <i>any-if</i></b> <b>Example:</b> <code>switch(config-if-nve)# source interface loopback 1 anycast loopback 2</code>	<p>The source interface must be a loopback interface that is configured on the switch with a valid /128 IP address. This /128 IP address must be known by the transient devices in the transport network and the remote VTEPs. This is accomplished by advertising it through a dynamic routing protocol in the transport network.</p> <p><b>Note</b> The IPv6 address on loopback1, the primary IP address (PIP), and loopback2, the secondary IP address (VIP), must be a /128 address.</p> <p>The VTEP IP address cannot be a link local IPv6 address.</p>
<b>Step 4</b>	<b>exit</b> <b>Example:</b> <code>switch(config-if-nve)# exit</code>	Exit configuration mode.
<b>Step 5</b>	<b>interface loopback <i>loopback_number</i></b> <b>Example:</b> <code>switch(config)# interface loopback 1</code>	Configure the loopback interface.
<b>Step 6</b>	<b>ipv6 address <i>ipv6_format</i></b> <b>Example:</b> <code>switch(config-if)# ipv6 address 2001:db8:0:0:1:0:0:1/128</code>	Configure IPv6 address on the interface.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> <code>switch(config-if-nve)# exit</code>	Exit configuration mode.
<b>Step 8</b>	<b>interface loopback <i>loopback_number</i></b> <b>Example:</b> <code>switch(config)# interface loopback 2</code>	Configure the loopback interface.

## Example Configurations for VXLAN with IPv6 in the Underlay (VXLANv6)

The following are configuration examples for VXLAN with IPv6 in the Underlay (VXLANv6):

With IPv6 address set/match in next-hop, BGP must set/match the IPv6 next-hop address in route type-2 (MAC-IP) and route type-5 (IP Prefix).

Under route-map:

```
set ipv6 next-hop <vtep address>
match ipv6 next-hop <vtep address>
```

### BGP Underlay

**Note** BGP IPv6 neighbor must support L2VPN EVPN address-family session.

**Note** The router ID in VXLAN with IPv6 in the Underlay (VXLANv6) must be an IPv4 address.

The BGP router ID is a 32-bit value that is often represented by an IPv4 address. By default, Cisco NX-OS sets the router ID to the IPv4 address of a loopback interface on the router. For VXLAN with IPv6 in the Underlay (VXLANv6), none of the loopbacks need to have an IPv4 address in which case the default selection of router ID does not happen correctly. You can configure the router ID manually to an IPv4 address.

BGP RD (Route distinguisher) which is 64 bits in length can be configured using the autonomous system number of the 4-byte IP address. For VXLAN with IPv6 in the Underlay (VXLANv6), when using an IP address for configuring RD, you must use IPv4 as in the case of VXLAN IPv4.

```
feature bgp
nv overlay evpn

router bgp 64496
  ! IPv4 router id
  router-id 35.35.35.35
  ! Redistribute the igp/bgp routes
  address-family ipv6 unicast
    redistribute direct route-map allow

  ! For IPv6 session, directly connected peer interface
  neighbor 2001:DB8:0:1::55
  remote-as 64496
  address-family ipv6 unicast
```

### OSPFv3 Underlay

```
feature ospfv3

router ospfv3 201
  router-id 290.0.2.1

interface ethernet 1/2
  ipv6 address 2001:0DB8::1/48
  ipv6 ospfv3 201 area 0.0.0.10
```

**IS-IS Underlay**

```

router isis Enterprise
is-type level-1
net 49.0001.0000.0000.0003.00

interface ethernet 2/1
ip address 192.0.2.1/24
isis circuit-type level-1
ip router isis Enterprise

```

## Verifying VXLAN with IPv6 in the Underlay (VXLANv6)

To display the status for the VXLAN with IPv6 in the Underlay (VXLANv6) configuration, enter one of the following commands:

**Table 2: VXLAN with IPv6 in the Underlay (VXLANv6) Verification Commands**

Command	Purpose
<b>show running-config interface nve 1</b>	Displays interface NVE 1 running configuration information.
<b>show nve interface 1 detail</b>	Displays NVE interface detail.
<b>show nve peers</b>	Displays the peering time and VNI information for VTEP peers.
<b>show nve vni ingress-replication</b>	Displays NVE VNI ingress replication information.
<b>show nve peers 2018:1015::abcd:1234:3 int nv1 counters</b>	Displays NVE peers counter information.
<b>show bgp l2vpn evpn 1012.0383.9600</b>	Displays BGP L2VPN information for route type 2.
<b>show bgp l2vpn evpn 303:304::1</b>	Displays BGP L2VPN EVPN for route type 3.
<b>show bgp l2vpn evpn 5.116.204.0</b>	Displays BGP L2VPN EVPN for route type 5.
<b>show l2route peerid</b>	Displays L2route peerid.
<b>show l2route topology detail</b>	Displays L2route topology detail.
<b>show l2route evpn imet all detail</b>	Displays L2route EVPN imet detail.
<b>show l2route fl all</b>	Display L2route flood list detail.
<b>show l2route mac all detail</b>	Displays L2route MAC detail.
<b>show l2route mac-ip all detail</b>	Displays MAC address and host IP address.
<b>show ip route 1.191.1.0 vrf vxlan-10101</b>	Displays route table for VRF.
<b>show forwarding ipv4 route 1.191.1.0 detail vrf vxlan-10101</b>	Displays forwarding information.

Command	Purpose
<b>show ipv6 route vrf vxlan-10101</b>	Displays IPv6 routing table.
<b>show bgp l2vpn evpn</b>	Displays BGP's updated routes.
<b>show bgp evi <i>evi-id</i></b>	Displays BGP EVI information.
<b>show forwarding distribution peer-id</b>	Displays forwarding information.
<b>show forwarding nve l2 ingress-replication-peers</b>	Displays forwarding information for ingress replication.
<b>show forwarding nve l3 peers</b>	Displays nv3 Layer 3 peers information.
<b>show forwarding ecmp platform</b>	Displays forwarding ECMP platform information.
<b>show forwarding ecmp platform</b>	Displays forwarding ECMP platform information.
<b>show forwarding nve l3 ecmp</b>	Displays forwarding NVE Layer 3 ECMP information.

Example of the **show running-config interface nve 1**

Command

```
switch# show running-config interface nve 1
interface nve1
  no shutdown
  source-interface loopback1 anycast loopback2
  host-reachability protocol bgp
  member vni 10011
    ingress-replication protocol bgp
  member vni 20011 associate-vrf
```

Example of the **show nve interface 1 detail**

Command

```
switch# show nve interface nve 1 detail
Interface: nve1, State: Up, encapsulation: VXLAN
VPC Capability: VPC-VIP-Only [notified]
Local Router MAC: a093.51cf.78f7
Host Learning Mode: Control-Plane
Source-Interface: loopback1 (primary: 30:3:1::2)
Anycast-Interface: loopback2 (secondary: 303:304::1)
Source Interface State: Up
Anycast Interface State: Up
Virtual RMAC Advertisement: Yes
NVE Flags:
Interface Handle: 0x49000001
Source Interface hold-down-time: 745
Source Interface hold-up-time: 30
Remaining hold-down time: 0 seconds
Virtual Router MAC: 0600.0000.0001
Interface state: nve-intf-add-complete
```

Example of the **show nve peers** Command

```
switch# show nve peers
Interface Peer-IP          State LearnType Uptime   Router-Mac
```

```
-----
```

Interface	VNI	Replication List	Source	Up Time
nve1	1:1::1:1	Up	CP	00:44:09 5087.89d4.6bb7

```
-----
```

Up

Example of the **show nve vni ingress-replication**

Command

```
switch# show nve vni ingress-replication
Interface VNI      Replication List  Source  Up Time
-----
nve1      10011      1:1::1:1          BGP-IMET  00:46:55
```

Example of the **show nve peers ipv6-address int nv1 counters** Command .

```
switch# show nve peers 2018:2015::abcd:1234:3 int nve 1 counters
Peer IP: 2018:1015::abcd:1234:3
TX
    0 unicast packets 0 unicast bytes
    0 multicast packets 0 multicast bytes
RX
    0 unicast packets 0 unicast bytes
    0 multicast packets 0 multicast bytes
```

Example of the **show bgp l2vpn evpn** Command for Route-Type 2.

```
switch# show bgp l2vpn evpn 1012.0383.9600
BGP routing table information for VRF default, address family L2VPN EVPN
Route Distinguisher: 30.3.1.1:34067 (L2VNI 2001300)

## CHAPTER 6

# Configuring External VRF Connectivity and Route Leaking

---

This chapter contains the following sections:

- [Configuring External VRF Connectivity, on page 113](#)
- [Configuring Route Leaking, on page 130](#)

## Configuring External VRF Connectivity

### About External Layer-3 Connectivity for VXLAN BGP EVPN Fabrics

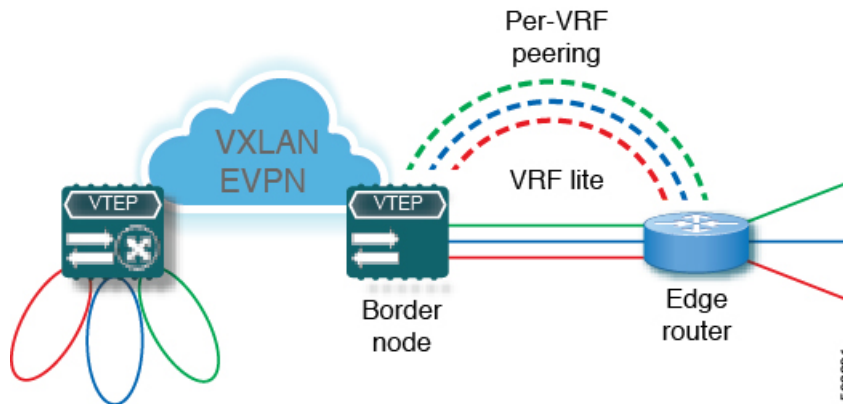

A VXLAN BGP EVPN fabric can be extended by using per-VRF IP routing to achieve external connectivity. The approach that is used for the Layer-3 extensions is commonly referred to as VRF Lite, while the functionality itself is more accurately defined as Inter-AS Option A or back-to-back VRF connectivity.

#### VXLAN BGP EVPN - VRF-lite brief

Some pointers are given below:

- The VXLAN BGP EVPN fabrics is depicted on the left in the following figure.
- Routes within the fabric are exchanged between all Edge-Devices (VTEPs) as well as Route-Reflectors; the control-plane used is MP-BGP with EVPN address-family.
- The Edge-Devices (VTEPs) acting as border nodes are configured to pass on prefixes to the external router (ER). This is achieved by exporting prefixes from MP-BGP EVPN to IPv4/IPv6 per-VRF peerings.
- Various routing protocols can be used for the per-VRF peering. While eBGP is the protocol of choice, IGP's like OSPF, IS-IS or EIGRP can be leveraged but require redistribution

Figure 9: External Layer-3 Connectivity - VRF-lite

## Guidelines and Limitations for External VRF Connectivity and Route Leaking

The following guidelines and limitations apply to external Layer 3 connectivity for VXLAN BGP EVPN fabrics:

- Support is added for Cisco Nexus 9504 and 9508 platform switches with Cisco Nexus 96136YC-R and 9636C-RX line cards.
- A physical Layer 3 interface (parent interface) can be used for external Layer 3 connectivity (that is, VRF default).
- The parent interface to multiple subinterfaces cannot be used for external Layer 3 connectivity (that is, Ethernet1/1 for a VRF default). You can use a subinterface instead.
- Beginning with Cisco NX-OS Release 9.3(5), VTEPs support VXLAN-encapsulated traffic over parent interfaces if subinterfaces are configured.
- VTEPs do not support VXLAN-encapsulated traffic over subinterfaces, regardless of VRF participation or IEEE 802.1Q encapsulation.
- Mixing subinterfaces for VXLAN and non-VXLAN VLANs is not supported.

## Configuring VXLAN BGP EVPN with eBGP for VRF-lite

### Configuring VRF for VXLAN Routing and External Connectivity using BGP

Configure the VRF on the border node.

#### SUMMARY STEPS

1. **configure terminal**
2. **vrf context** *vrf-name*
3. **vni** *number*
4. **rd** {**auto** | *rd*}
5. **address-family** {**ipv4** | **ipv6**} **unicast**
6. **route-target both** {**auto** | *rt*}
7. **route-target both** {**auto** | *rt*} **evpn**

8. Repeat Step 1 through Step 7 for every L3VNI.

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode.
Step 2	<b>vrf context</b> <i>vrf-name</i>	Configure the VRF.
Step 3	<b>vni</b> <i>number</i>	Specify the VNI. The VNI associated with the VRF is often referred to as a Layer 3 VNI, L3VNI, or L3VPN. The L3VNI is configured as the common identifier across the participating VTEPs.
Step 4	<b>rd</b> { <b>auto</b>   <i>rd</i> }	Specify the VRF's route distinguisher (RD). The RD uniquely identifies a VTEP within an L3VNI. If you enter an RD, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN.
Step 5	<b>address-family</b> { <b>ipv4</b>   <b>ipv6</b> } <b>unicast</b>	Configure the IPv4 or IPv6 unicast address family.
Step 6	<b>route-target both</b> { <b>auto</b>   <i>rt</i> }	Configure the route target (RT) for import and export of IPv4 prefixes. The RT is used for a per-VRF prefix import/export policy. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN. Manually configured RTs are required to support asymmetric VNIs.
Step 7	<b>route-target both</b> { <b>auto</b>   <i>rt</i> } <b>evpn</b>	Configure the route target (RT) for import and export of IPv4 prefixes. The RT is used for a per-VRF prefix import/export policy. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN. Manually configured RTs are required to support asymmetric VNIs.
Step 8	Repeat Step 1 through Step 7 for every L3VNI.	

## Configuring the L3VNI's Fabric Facing VLAN and SVI on the Border Node

### SUMMARY STEPS

1. **configure terminal**
2. **vlan** *number*
3. **vn-segment** *number*
4. **interface** *vlan-number*
5. **mtu** *value*
6. **vrf member** *vrf-name*
7. **ip forward**
8. **no ip redirects**
9. **ipv6** *ip-address*
10. **no ipv6 redirects**

11. Repeat Step 2 through Step 10 for every L3VNI.

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter configuration mode.
Step 2	<b>vlan</b> <i>number</i>	Specify the VLAN id that is used for the L3VNI.
Step 3	<b>vn-segment</b> <i>number</i>	Map the L3VNI to the VLAN for VXLAN EVPN routing.
Step 4	<b>interface</b> <i>vlan-number</i>	Specify the SVI (Switch Virtual Interface) for VXLAN EVPN routing.
Step 5	<b>mtu</b> <i>value</i>	Specify the MTU for the L3VNI.
Step 6	<b>vrf member</b> <i>vrf-name</i>	Map the SVI to the matching VRF context.
Step 7	<b>ip forward</b>	Enable IPv4 forwarding for the L3VNI.
Step 8	<b>no ip redirects</b>	Disable ICMP redirects
Step 9	<b>ipv6</b> <i>ip-address</i>	Enable IPv6 forwarding for the L3VNI.
Step 10	<b>no ipv6 redirects</b>	Disable ICMPv6 redirects.
Step 11	Repeat Step 2 through Step 10 for every L3VNI.	

#### Configuring the VTEP on the Border Node

#### SUMMARY STEPS

1. **configure terminal**
2. **interface nve1**
3. **member vni** *vni* **associate-vrf**
- 4.

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode.
Step 2	<b>interface nve1</b>	Configure the NVE interface.
Step 3	<b>member vni</b> <i>vni</i> <b>associate-vrf</b>	Add Layer-3 VNIs, one per tenant VRF, to the overlay.
Step 4		Repeat Step 3 for every L3VNI.

## Configuring the BGP VRF Instance on the Border Node for IPv4 per-VRF Peering

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *autonomous-system-number*
3. **vrf** *vrf-name*
4. **address-family ipv4 unicast**
5. **advertise l2vpn evpn**
6. **maximum-paths ibgp** *number*
7. **maximum-paths** *number*
8. **neighbor** *address* **remote-as** *number*
9. **update-source** *type/id*
10. **address-family ipv4 unicast**
11. Repeat Step 3 through Step 10 for every L3VNI that requires external connectivity for IPv4.

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>router bgp</b> <i>autonomous-system-number</i>	Configure BGP. The range of the <i>autonomous-system-number</i> is from 1 to 4294967295.
<b>Step 3</b>	<b>vrf</b> <i>vrf-name</i>	Specify the VRF.
<b>Step 4</b>	<b>address-family ipv4 unicast</b>	Configure address family for IPv4.
<b>Step 5</b>	<b>advertise l2vpn evpn</b>	Enable the advertisement of EVPN routes within IPv4 address-family.
<b>Step 6</b>	<b>maximum-paths ibgp</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for iBGP prefixes. The range for <i>number</i> is 1 to 64. The default is 1.
<b>Step 7</b>	<b>maximum-paths</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for eBGP prefixes.
<b>Step 8</b>	<b>neighbor</b> <i>address</i> <b>remote-as</b> <i>number</i>	Define eBGP neighbor IPv4 address and remote Autonomous-System (AS) number.
<b>Step 9</b>	<b>update-source</b> <i>type/id</i>	Define interface for eBGP peering.
<b>Step 10</b>	<b>address-family ipv4 unicast</b>	Activate the IPv4 address family for IPv4 prefix exchange.
<b>Step 11</b>	Repeat Step 3 through Step 10 for every L3VNI that requires external connectivity for IPv4.	

## Configuring the BGP VRF Instance on the Border Node for IPv6 per-VRF Peering

## SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *autonomous-system-number*
3. **vrf** *vrf-name*
4. **address-family ipv6 unicast**
5. **advertise l2vpn evpn**
6. **maximum-paths ibgp** *number*
7. **maximum-paths** *number*
8. **neighbor address remote-as** *number*
9. **update-source** *type/id*
10. **address-family ipv6 unicast**
11. Repeat Step 3 Through Step 10 for every L3VNI that requires external connectivity for IPv6.

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>router bgp</b> <i>autonomous-system-number</i>	Configure BGP.
<b>Step 3</b>	<b>vrf</b> <i>vrf-name</i>	Specify the VRF.
<b>Step 4</b>	<b>address-family ipv6 unicast</b>	Configure address family for IPv4.
<b>Step 5</b>	<b>advertise l2vpn evpn</b>	Enable the advertisement of EVPN routes within IPv6 address-family.
<b>Step 6</b>	<b>maximum-paths ibgp</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for iBGP prefixes.
<b>Step 7</b>	<b>maximum-paths</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for eBGP prefixes.
<b>Step 8</b>	<b>neighbor address remote-as</b> <i>number</i>	Define eBGP neighbor IPv6 address and remote Autonomous-System (AS) number.
<b>Step 9</b>	<b>update-source</b> <i>type/id</i>	Define interface for eBGP peering.
<b>Step 10</b>	<b>address-family ipv6 unicast</b>	Configure address family for IPv6.
<b>Step 11</b>	Repeat Step 3 Through Step 10 for every L3VNI that requires external connectivity for IPv6.	

## Configuring the Sub-Interface Instance on the Border Node for Per-VRF Peering - Version 1

## SUMMARY STEPS

1. **configure terminal**

2. `interface type/id`
3. `no switchport`
4. `no shutdown`
5. `exit`
6. `interface type/id`
7. `encapsulation dot1q number`
8. `vrf member vrf-name`
9. `ip address address`
10. `no shutdown`
11. Repeat Step 5 through Step 9 for every per-VRF peering.

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<code>interface type/id</code>	Configure parent interface.
<b>Step 3</b>	<code>no switchport</code>	Disable Layer-2 switching mode on interface.
<b>Step 4</b>	<code>no shutdown</code>	Bring up parent interface.
<b>Step 5</b>	<code>exit</code>	Exit interface configuration mode.
<b>Step 6</b>	<code>interface type/id</code>	Define the Sub-Interface instance.
<b>Step 7</b>	<code>encapsulation dot1q number</code>	Configure the VLAN ID for the sub-interface. The <i>number</i> argument can have a value from 1 to 3967.
<b>Step 8</b>	<code>vrf member vrf-name</code>	Map the Sub-Interface to the matching VRF context.
<b>Step 9</b>	<code>ip address address</code>	Configure the Sub-Interfaces IP address.
<b>Step 10</b>	<code>no shutdown</code>	Bring up Sub-Interface.
<b>Step 11</b>	Repeat Step 5 through Step 9 for every per-VRF peering.	

## VXLAN BGP EVPN - Default-Route, Route Filtering on External Connectivity

### About Configuring Default Routing for External Connectivity

For default-route advertisement into a VXLAN BGP EVPN fabric, we have to ensure that the default-route advertised into the fabric is at the same time not advertised outside of the fabric. For this case, it is necessary to have route filtering in place that prevents this eventuality.

### Configuring the Default Route in the Border Nodes VRF

## SUMMARY STEPS

1. `configure terminal`
2. `vrf context vrf-name`

3. **ip route 0.0.0.0/0 next-hop**
4. **ipv6 route 0::/0 next-hop**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>vrf context vrf-name</b>	Configure the VRF.
<b>Step 3</b>	<b>ip route 0.0.0.0/0 next-hop</b>	Configure the IPv4 default-route.
<b>Step 4</b>	<b>ipv6 route 0::/0 next-hop</b>	Configure the IPv6 default-route.

## Configuring the BGP VRF Instance on the Border Node for IPv4/IPv6 Default-Route Advertisement

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp autonomous-system-number**
3. **vrf vrf-name**
4. **address-family ipv4 unicast**
5. **network 0.0.0.0/0**
6. **address-family ipv6 unicast**
7. **network 0::/0**
8. **neighbor addressremote-as number**
9. **update-source type/id**
10. **address-family {ipv4 | ipv6} unicast**
11. **route-map name out**
12. Repeat Step 3 through Step 11 for every L3VNI that requires external connectivity with default-route filtering.

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>router bgp autonomous-system-number</b>	Configure BGP.
<b>Step 3</b>	<b>vrf vrf-name</b>	Specify the VRF.
<b>Step 4</b>	<b>address-family ipv4 unicast</b>	Configure the IPv4 Unicast address-family. Required for IPv6 over VXLAN with IPv4 underlay.
<b>Step 5</b>	<b>network 0.0.0.0/0</b>	Creating IPv4 default-route network statement.
<b>Step 6</b>	<b>address-family ipv6 unicast</b>	Configure the IPv6 unicast address-family.
<b>Step 7</b>	<b>network 0::/0</b>	Creating IPv6 default-route network statement.

	Command or Action	Purpose
<b>Step 8</b>	<b>neighbor</b> <i>address</i> <b>remote-as</b> <i>number</i>	Define eBGP neighbor IPv4 address and remote Autonomous-System (AS) number.
<b>Step 9</b>	<b>update-source</b> <i>type/id</i>	Define interface for eBGP peering
<b>Step 10</b>	<b>address-family</b> { <b>ipv4</b>   <b>ipv6</b> } <b>unicast</b>	Activate the IPv4 or IPv6 address family for IPv4/IPv6 prefix exchange.
<b>Step 11</b>	<b>route-map</b> <i>name</i> <b>out</b>	Attach route-map for egress route filtering.
<b>Step 12</b>	Repeat Step 3 through Step 11 for every L3VNI that requires external connectivity with default-route filtering.	

### Configuring Route Filtering for IPv4 Default-Route Advertisement

You can configure route filtering for IPv4 default-route advertisement.

#### SUMMARY STEPS

1. **configure terminal**
2. **ip prefix-list** *name* **seq 5 permit 0.0.0.0/0**
3. **route-map** *name* **deny 10**
4. **match ip address prefix-list** *name*
5. **route-map** *name* **permit 1000**

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ip prefix-list</b> <i>name</i> <b>seq 5 permit 0.0.0.0/0</b>	Configure IPv4 prefix-list for default-route filtering.
<b>Step 3</b>	<b>route-map</b> <i>name</i> <b>deny 10</b>	Create route-map with leading deny statement to prevent the default-route of being advertised via External Connectivity.
<b>Step 4</b>	<b>match ip address prefix-list</b> <i>name</i>	Match against the IPv4 prefix-list that contains the default-route.
<b>Step 5</b>	<b>route-map</b> <i>name</i> <b>permit 1000</b>	Create route-map with trailing allow statement to advertise non-matching routes via External Connectivity.

### Configuring Route Filtering for IPv6 Default-Route Advertisement

#### SUMMARY STEPS

1. **configure terminal**
2. **ipv6 prefix-list** *name* **seq 5 permit 0::/0**
3. **route-map** *name* **deny 10**
4. **match ipv6 address prefix-list** *name*

5. **route-map** *name* **permit 1000**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 prefix-list</b> <i>name</i> <b>seq 5 permit 0::/0</b>	Configure IPv6 prefix-list for default-route filtering.
<b>Step 3</b>	<b>route-map</b> <i>name</i> <b>deny 10</b>	Create route-map with leading deny statement to prevent the default-route of being advertised via External Connectivity.
<b>Step 4</b>	<b>match ipv6 address prefix-list</b> <i>name</i>	Match against the IPv6 prefix-list that contains the default-route.
<b>Step 5</b>	<b>route-map</b> <i>name</i> <b>permit 1000</b>	Create route-map with trailing allow statement to advertise non-matching routes via External Connectivity.

## About Configuring Default-Route Distribution and Host-Route Filter

Per-default, a VXLAN BGP EVPN fabric always advertises all known routes via the External Connectivity. As not in all circumstances it is beneficial to advertise IPv4 /32 or IPv6 /128 Host-Routes, a respective route filtering approach can become necessary.

## Configuring the BGP VRF Instance on the Border Node for IPv4/IPv6 Host-Route Filtering

## SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *autonomous-system-number*
3. **vrf** *vrf-name*
4. **neighbor** *address* **remote-as** *number*
5. **update-source** *type/id*
6. **address-family** {**ipv4** | **ipv6**} **unicast**
7. **route-map** *name* **out**
8. Repeat Step 3 through Step 7 for every L3VNI that requires external connectivity with host-route filtering.

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>router bgp</b> <i>autonomous-system-number</i>	Configure BGP.
<b>Step 3</b>	<b>vrf</b> <i>vrf-name</i>	Specify the VRF.
<b>Step 4</b>	<b>neighbor</b> <i>address</i> <b>remote-as</b> <i>number</i>	Define eBGP neighbor IPv4/IPv6 address and remote Autonomous-System (AS) number.
<b>Step 5</b>	<b>update-source</b> <i>type/id</i>	Define interface for eBGP peering.

	Command or Action	Purpose
<b>Step 6</b>	<b>address-family {ipv4   ipv6} unicast</b>	Activate the IPv4 or IPv6 address family for IPv4/IPv6 prefix exchange.
<b>Step 7</b>	<b>route-map <i>name</i> out</b>	Attach route-map for egress route filtering.
<b>Step 8</b>	Repeat Step 3 through Step 7 for every L3VNI that requires external connectivity with host-route filtering.	

## Configuring Route Filtering for IPv4 Host-Route Advertisement

### SUMMARY STEPS

1. **configure terminal**
2. **ip prefix-list *name* seq 5 permit 0.0.0.0/0 eq 32**
3. **route-map *name* deny 10**
4. **match ip address prefix-list *name***
5. **route-map *name* permit 1000**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ip prefix-list <i>name</i> seq 5 permit 0.0.0.0/0 eq 32</b>	Configure IPv4 prefix-list for host-route filtering.
<b>Step 3</b>	<b>route-map <i>name</i> deny 10</b>	Create route-map with leading deny statement to prevent the default-route of being advertised via External Connectivity.
<b>Step 4</b>	<b>match ip address prefix-list <i>name</i></b>	Match against the IPv4 prefix-list that contains the host-route.
<b>Step 5</b>	<b>route-map <i>name</i> permit 1000</b>	Create route-map with trailing allow statement to advertise non-matching routes via external connectivity.

## Configuring Route Filtering for IPv6 Host-Route Advertisement

### SUMMARY STEPS

1. **configure terminal**
2. **ipv6 prefix-list *name* seq 5 permit 0::/0 eq 128**
3. **route-map *name* deny 10**
4. **match ipv6 address prefix-list *name***
5. **route-map *name* permit 1000**

## Example - Configuring VXLAN BGP EVPN with eBGP for VRF-lite

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 prefix-list <i>name</i> seq 5 permit 0::/0 eq 128</b>	Configure IPv4 prefix-list for host-route filtering.
<b>Step 3</b>	<b>route-map <i>name</i> deny 10</b>	Create route-map with leading deny statement to prevent the default-route of being advertised via External Connectivity.
<b>Step 4</b>	<b>match ipv6 address prefix-list <i>name</i></b>	Match against the IPv4 prefix-list that contains the host-route.
<b>Step 5</b>	<b>route-map <i>name</i> permit 1000</b>	Create route-map with trailing allow statement to advertise non-matching routes via External Connectivity.

## Example - Configuring VXLAN BGP EVPN with eBGP for VRF-lite

An example of external connectivity from VXLAN BGP EVPN to an external router using VRF-lite.

## Configuring VXLAN BGP EVPN Border Node

The VXLAN BGP EVPN Border Node acts as neighbor device to the External Router. The VRF Name is purely localized and can be different to the VRF Name on the External Router, only significance is the L3VNI must be consistent across the VXLAN BGP EVPN fabric. For the ease of reading, the VRF and interface enumeration will be consistently used.

The configuration examples represents a IPv4 and IPv6 dual-stack approach; IPv4 or IPv6 can be substituted of each other.

```
vrf context myvrf_50001
  vni 50001
  rd auto
  address-family ipv4 unicast
    route-target both auto
    route-target both auto evpn
  address-family ipv6 unicast
    route-target both auto
    route-target both auto evpn
!
vlan 2000
  vn-segment 50001
!
interface Vlan2000
  no shutdown
  mtu 9216
  vrf member myvrf_50001
  no ip redirects
  ip forward
  ipv6 address use-link-local-only
  no ipv6 redirects
!
interface nve1
  no shutdown
  host-reachability protocol bgp
  source-interface loopback1
  member vni 50001 associate-vrf
!
```

```

router bgp 65002
  vrf myvrf_50001
    router-id 10.2.0.6
    address-family ipv4 unicast
      advertise l2vpn evpn
      maximum-paths ibgp 2
      maximum-paths 2
    address-family ipv6 unicast
      advertise l2vpn evpn
      maximum-paths ibgp 2
      maximum-paths 2
    neighbor 10.31.95.95
      remote-as 65099
    address-family ipv4 unicast
    neighbor 2001::95/64
      remote-as 65099
    address-family ipv4 unicast
  !
interface Ethernet1/3
  no switchport
  no shutdown
interface Ethernet1/3.2
  encapsulation dot1q 2
  vrf member myvrf_50001
  ip address 10.31.95.31/24
  ipv6 address 2001::31/64
  no shutdown

```

### Configuring Default-Route, Route Filtering on External Connectivity

The VXLAN BGP EVPN Border Node has the ability to advertise IPv4 and IPv6 default-route within the fabric. In cases where it is not beneficial to advertise the Host Routes from the VXLAN BGP EVPN fabric to the External Router, these IPv4 /32 and IPv6 /128 can be filtered at the External Connectivity peering configuration.

```

ip prefix-list default-route seq 5 permit 0.0.0.0/0 le 1
ipv6 prefix-list default-route-v6 seq 5 permit 0::/0
!
ip prefix-list host-route seq 5 permit 0.0.0.0/0 eq 32
ipv6 prefix-list host-route-v6 seq 5 permit 0::/0 eq 128
!
route-map extcon-rmap-filter deny 10
  match ip address prefix-list default-route
route-map extcon-rmap-filter deny 20
  match ip address prefix-list host-route
route-map extcon-rmap-filter permit 1000
!
route-map extcon-rmap-filter-v6 deny 10
  match ipv6 address prefix-list default-route-v6
route-map extcon-rmap-filter-v6 deny 20
  match ip address prefix-list host-route-v6
route-map extcon-rmap-filter-v6 permit 1000
!
vrf context myvrf_50001
  ip route 0.0.0.0/0 10.31.95.95
  ipv6 route 0::/0 2001::95/64
!
router bgp 65002
  vrf myvrf_50001
    address-family ipv4 unicast
      network 0.0.0.0/0
    address-family ipv6 unicast
      network 0::/0

```

```

neighbor 10.31.95.95
remote-as 65099
address-family ipv4 unicast
route-map extcon-rmap-filter out
neighbor 2001::95/64
remote-as 65099
address-family ipv4 unicast
route-map extcon-rmap-filter-v6 out

```

## Configuring External Router

The External Router performs as a neighbor device to the VXLAN BGP EVPN border node. The VRF Name is purely localized and can be different to the VRF Name on the VXLAN BGP EVPN Fabric. For the ease of reading, the VRF and interface enumeration will be consistently used.

The configuration examples represents a IPv4 and IPv6 dual-stack approach; IPv4 or IPv6 can be substituted of each other.

```

vrf context myvrf_50001
!
router bgp 65099
vrf myvrf_50001
address-family ipv4 unicast
maximum-paths 2
address-family ipv6 unicast
maximum-paths 2
neighbor 10.31.95.31
remote-as 65002
address-family ipv4 unicast
neighbor 2001::31/64
remote-as 65002
address-family ipv4 unicast
!
interface Ethernet1/3
no switchport
no shutdown
interface Ethernet1/3.2
encapsulation dot1q 2
vrf member myvrf_50001
ip address 10.31.95.95/24
Ipv6 address 2001::95/64
no shutdown

```

## Configuring VXLAN BGP EVPN with OSPF for VRF-lite

### Configuring VRF for VXLAN Routing and External Connectivity using OSPF

Configure the BGP VRF instance on the border node for OSPF per-VRF peering.

#### SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *autonomous-system-number*
3. **vrf** *vrf-name*
4. **address-family ipv4 unicast**
5. **advertise l2vpn evpn**
6. **maximum-paths ibgp** *number*
7. **redistribute ospf** *name* **route-map** *name*

8. Repeat Step 3 through Step 7 for every per-VRF peering.

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode.
Step 2	<b>router bgp</b> <i>autonomous-system-number</i>	Configure BGP.
Step 3	<b>vrf</b> <i>vrf-name</i>	Specify the VRF.
Step 4	<b>address-family ipv4 unicast</b>	Configure the IPv4 address family.
Step 5	<b>advertise l2vpn evpn</b>	Enable the advertisement of EVPN routes within the address family.
Step 6	<b>maximum-paths ibgp</b> <i>number</i>	Enabling equal-cost multipathing (ECMP) for iBGP prefixes.
Step 7	<b>redistribute ospf</b> <i>name</i> <b>route-map</b> <i>name</i>	Define redistribution from OSPF into BGP.
Step 8	Repeat Step 3 through Step 7 for every per-VRF peering.	

#### Configuring the Route-Map for BGP to OSPF Redistribution

##### SUMMARY STEPS

1. **configure terminal**
2. **route-map** *name* **permit 10**
3. **match route-type internal**

##### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode.
Step 2	<b>route-map</b> <i>name</i> <b>permit 10</b>	Create route-map for BGP to OSPF redistribution
Step 3	<b>match route-type internal</b>	Redistribution route-map must allow the matching of BGP internal route-types if iBGP is used in the VXLAN BGP EVPN fabric.

#### Configuring the OSPF on the Border Node for Per-VRF Peering

##### SUMMARY STEPS

1. **configure terminal**
2. **router ospf** *instance*
3. **vrf** *vrf-name*
4. **redistribute bgp** *autonomous-system-number* **route-map** *name*
5. Repeat Step 3 through Step 4 for every per-VRF peering.

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode.
Step 2	<b>router ospf</b> <i>instance</i>	Configure OSPF.
Step 3	<b>vrf</b> <i>vrf-name</i>	Specify the VRF.
Step 4	<b>redistribute bgp</b> <i>autonomous-system-number</i> <b>route-map</b> <i>name</i>	Define redistribution from BGP to OSPF.
Step 5	Repeat Step 3 through Step 4 for every per-VRF peering.	

## Configuring the Sub-Interface Instance on the Border Node for Per-VRF Peering - Version 2

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *type/id*
3. **no switchport**
4. **no shutdown**
5. **exit**
6. **interface** *type/id*
7. **encapsulation dot1q** *number*
8. **vrf member** *vrf-name*
9. **ip address** *address*
10. **ip ospf network point-to-point**
11. **ip router ospf** *name* **area** *area-id*
12. **no shutdown**
13. Repeat Step 5 through Step 12 for every per-VRF peering.

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>interface</b> <i>type/id</i>	Configure parent interface.
Step 3	<b>no switchport</b>	Disable Layer-2 switching mode on interface.
Step 4	<b>no shutdown</b>	Bring up parent interface.
Step 5	<b>exit</b>	Exit interface configuration mode.
Step 6	<b>interface</b> <i>type/id</i>	Define the Sub-Interface instance.
Step 7	<b>encapsulation dot1q</b> <i>number</i>	Configure the VLAN ID for the sub-interface. The range is from 2 to 4093.
Step 8	<b>vrf member</b> <i>vrf-name</i>	Map the Sub-Interface to the matching VRF context.

	Command or Action	Purpose
Step 9	<b>ip address</b> <i>address</i>	Configure the Sub-Interfaces IP address.
Step 10	<b>ip ospf network point-to-point</b>	Define OSPF network-type for sub-interface.
Step 11	<b>ip router ospf</b> <i>name</i> <b>area</b> <i>area-id</i>	Configure the OSPF instance.
Step 12	<b>no shutdown</b>	Bring up Sub-Interface.
Step 13	Repeat Step 5 through Step 12 for every per-VRF peering.	

### Example - Configuration VXLAN BGP EVPN with OSPF for VRF-lite

An example of external connectivity from VXLAN BGP EVPN to an External Router using VRF-lite.

#### Configuring VXLAN BGP EVPN Border Node with OSPF

The VXLAN BGP EVPN Border Node acts as neighbor device to the External Router. The VRF Name is purely localized and can be different to the VRF Name on the External Router, only significance is the L3VNI must be consistent across the VXLAN BGP EVPN fabric. For the ease of reading, the VRF and interface enumeration will be consistently used.

The configuration examples represents a IPv4 approach with OSPFv2.

```

route-map extcon-rmap-BGP-to-OSPF permit 10
    match route-type internal
route-map extcon-rmap-OSPF-to-BGP permit 10
!
vrf context myvrf_50001
    vni 50001
    rd auto
    address-family ipv4 unicast
        route-target both auto
        route-target both auto evpn
!
vlan 2000
    vn-segment 50001
!
interface Vlan2000
    no shutdown
    mtu 9216
    vrf member myvrf_50001
    no ip redirects
    ip forward
!
interface nve1
    no shutdown
    host-reachability protocol bgp
    source-interface loopback1
    member vni 50001 associate-vrf
!
router bgp 65002
    vrf myvrf_50001
        router-id 10.2.0.6
        address-family ipv4 unicast
            advertise l2vpn evpn
            maximum-paths ibgp 2
            maximum-paths 2
            redistribute ospf EXT route-map extcon-rmap-OSPF-to-BGP
!

```

```
router ospf EXT
  vrf myvrf_50001
    redistribute bgp 65002 route-map extcon-rmap-BGP-to-OSPF
  !
interface Ethernet1/3
  no switchport
  no shutdown
interface Ethernet1/3.2
  encapsulation dot1q 2
  vrf member myvrf_50001
  ip address 10.31.95.31/24
  ip ospf network point-to-point
  ip router ospf EXT area 0.0.0.0
  no shutdown
```

## Configuring Route Leaking

### About Centralized VRF Route-Leaking for VXLAN BGP EVPN Fabrics

VXLAN BGP EVPN uses MP-BGP and its route-policy concept to import and export prefixes. The ability of this very extensive route-policy model allows to leak routes from one VRF to another VRF and vice-versa; any combination of custom VRF or VRF default can be used. VRF route-leaking is a switch-local function at specific to a location in the network, the location where the cross-VRF route-target import/export configuration takes place (leaking point). The forwarding between the different VRFs follows the control-plane, the location of where the configuration for the route-leaking is performed - hence Centralized VRF route-leaking. With the addition of VXLAN BGP EVPN, the leaking point requires to advertise the cross-VRF imported/exported route and advertise them towards the remote VTEPs or External Routers.

The advantage of Centralized VRF route-leaking is that only the VTEP acting as leaking point requires the special capabilities needed, while all other VTEPs in the network are neutral to this function.

### Guidelines and Limitations for Centralized VRF Route-Leaking

The following are the guidelines and limitations for Centralized VRF Route-Leaking:

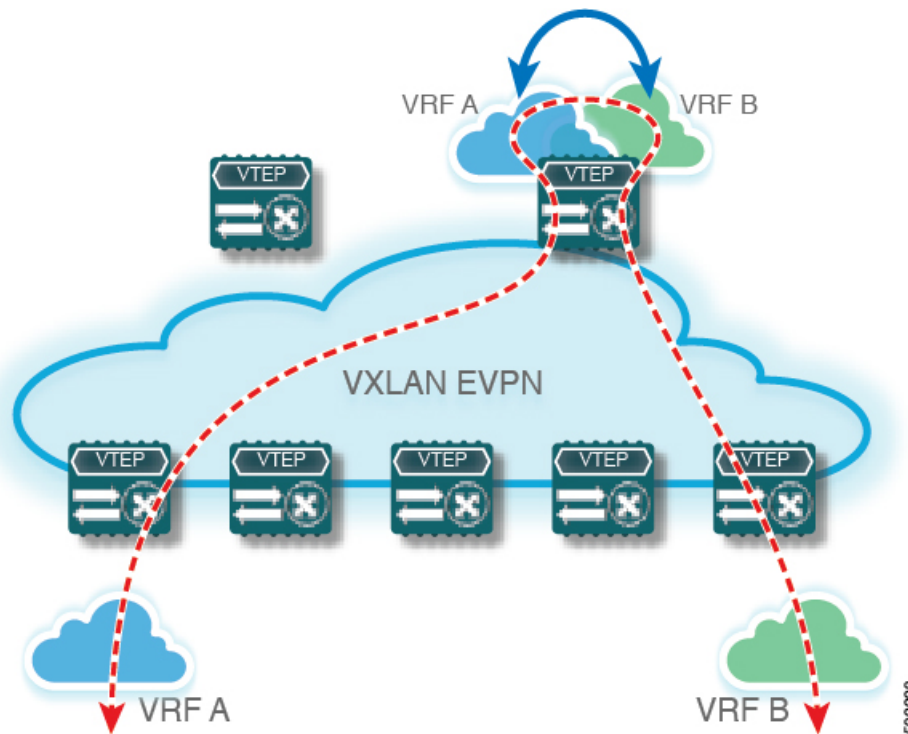

- Each prefix must be imported into each VRF for full cross-VRF reachability.
- The **feature bgp** command is required for the **export vrf default** command.
- If a VTEP has a less specific local prefix in its VRF, the VTEP might not be able to reach a more specific prefix in a different VRF.
- VXLAN routing in hardware and packet reencapsulation at VTEP is required for Centralized VRF Route-Leaking with BGP EVPN.
- Beginning with Cisco NX-OS Release 9.3(5), asymmetric VNIs are used to support Centralized VRF Route-Leaking. For more information, see [Information About VXLAN EVPN with Downstream VNI, on page 48](#).

### Centralized VRF Route-Leaking Brief - Specific Prefixes Between Custom VRF

Some pointers are given below:

- The Centralized VRF route-leaking for VXLAN BGP EVPN fabrics is depicted within Figure 2.
- BGP EVPN prefixes are cross-VRF leaked by exporting them from VRF Blue with an import into VRF Red and vice-versa. The Centralized VRF route-leaking is performed on the centralized Routing-Block (RBL) and could be any or multiple VTEPs.
- Configured less specific prefixes (aggregates) are advertised from the Routing-Block to the remaining VTEPs in the respective destination VRF.
- BGP EVPN does not export prefixes that were previously imported to prevent the occurrence of routing loops.

Figure 10: Centralized VRF Route-Leaking - Specific Prefixes with Custom VRF

## Configuring Centralized VRF Route-Leaking - Specific Prefixes between Custom VRF

### Configuring VRF Context on the Routing-Block VTEP

This procedure applies equally to IPv6.

#### SUMMARY STEPS

1. **configure terminal**
2. **vrf context** *vrf-name*
3. **vni** *number*
4. **rd auto**

5. **address-family ipv4 unicast**
6. **route-target both {auto | rt}**
7. **route-target both {auto | rt} evpn**
8. **route-target import rt-from-different-vrf**
9. **route-target import rt-from-different-vrf evpn**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>vrf context</b> <i>vrf-name</i>	Configure the VRF.
<b>Step 3</b>	<b>vni</b> <i>number</i>	Specify the VNI.  The VNI associated with the VRF is often referred to as Layer 3 VNI, L3VNI, or L3VPN. The L3VNI is configured as a common identifier across the participating VTEPs.
<b>Step 4</b>	<b>rd</b> <i>auto</i>	Specify the VRF's route distinguisher (RD). The RD uniquely identifies a VTEP within an L3VNI.
<b>Step 5</b>	<b>address-family ipv4 unicast</b>	Configure the IPv4 unicast address family.
<b>Step 6</b>	<b>route-target both {auto   rt}</b>	Configure the route target (RT) for import and export of IPv4 prefixes. The RT is used for a per-VRF prefix import/export policy. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN. Manually configured RTs are required to support asymmetric VNIs.
<b>Step 7</b>	<b>route-target both {auto   rt} evpn</b>	Configure the route target (RT) for import and export of IPv4 prefixes. The RT is used for a per-VRF prefix import/export policy. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN. Manually configured RTs are required to support asymmetric VNIs.
<b>Step 8</b>	<b>route-target import</b> <i>rt-from-different-vrf</i>	Configure the RT for importing IPv4 prefixes from the leaked-from VRF. The following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN.
<b>Step 9</b>	<b>route-target import</b> <i>rt-from-different-vrf evpn</i>	Configure the RT for importing IPv4 prefixes from the leaked-from VRF. The following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN.

## Configuring the BGP VRF instance on the Routing-Block

This procedure applies equally to IPv6.

## SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *autonomous-system number*
3. **vrf** *vrf-name*
4. **address-family ipv4 unicast**
5. **advertise l2vpn evpn**
6. **aggregate-address** *prefix/mask*
7. **maximum-paths ibgp** *number*
8. **maximum-paths** *number*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>router bgp</b> <i>autonomous-system number</i>	Configure BGP.
<b>Step 3</b>	<b>vrf</b> <i>vrf-name</i>	Specify the VRF.
<b>Step 4</b>	<b>address-family ipv4 unicast</b>	Configure address family for IPv4
<b>Step 5</b>	<b>advertise l2vpn evpn</b>	Enable the advertisement of EVPN routes within IPv4 address-family.
<b>Step 6</b>	<b>aggregate-address</b> <i>prefix/mask</i>	Create less specific prefix aggregate into the destination VRF.
<b>Step 7</b>	<b>maximum-paths ibgp</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for iBGP prefixes.
<b>Step 8</b>	<b>maximum-paths</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for eBGP prefixes

## Example - Configuration Centralized VRF Route-Leaking - Specific Prefixes Between Custom VRF

## Configuring VXLAN BGP EVPN Routing-Block

The VXLAN BGP EVPN Routing-Block acts as centralized route-leaking point. The leaking configuration is localized such that control-plane leaking and data-path forwarding follow the same path. Most significantly is the VRF configuration of the Routing-Block and the advertisement of the less specific prefixes (aggregates) into the respective destination VRFs.

```

vrf context Blue
  vni 51010
  rd auto
  address-family ipv4 unicast
    route-target both auto
    route-target both auto evpn
    route-target import 65002:51020
    route-target import 65002:51020 evpn
  !
vlan 2110

      Maximum-paths 2

```

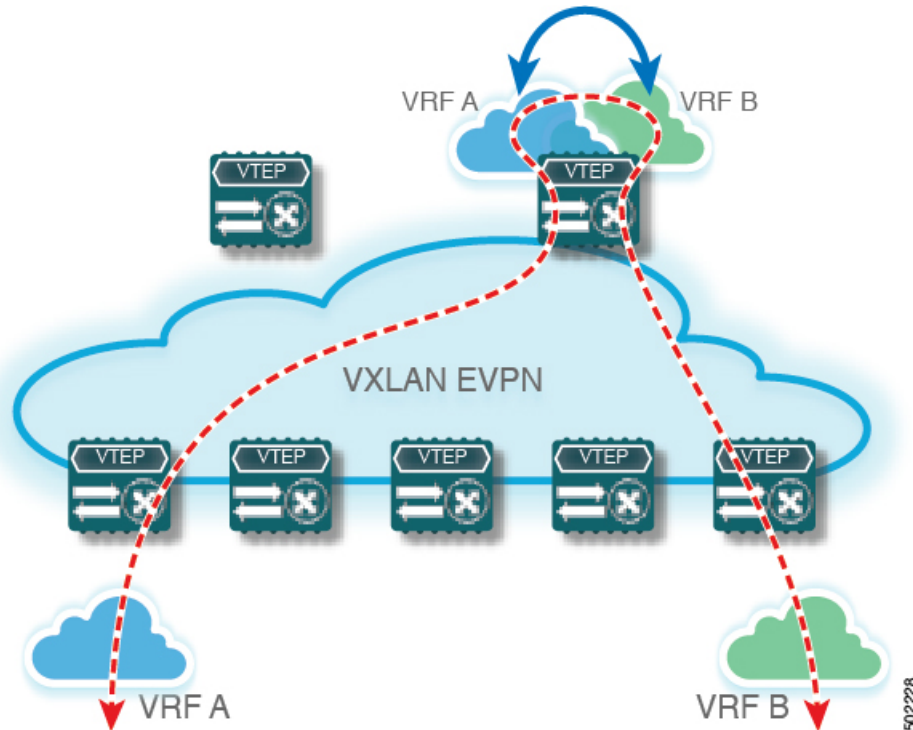

## Centralized VRF Route-Leaking Brief - Shared Internet with Custom VRF

Some pointers follow:

- The Shared Internet with VRF route-leaking for VXLAN BGP EVPN fabrics is depicted in the following figure.
- The default-route is made exported from the Shared Internet VRF and re-advertisement within VRF Blue and VRF Red on the Border Node.
- Ensure the default-route in VRF Blue and VRF Red is not leaked to the Shared Internet VRF.
- The less specific prefixes for VRF Blue and VRF Red are exported for the Shared Internet VRF and re-advertised as necessary.

- Configured less specific prefixes (aggregates) that are advertised from the Border Node to the remaining VTEPs to the destination VRF (Blue or Red).
- BGP EVPN does not export prefixes that were previously imported to prevent the occurrence of routing loops.

Figure 11: Centralized VRF Route-Leaking - Shared Internet with Custom VRF

## Configuring Centralized VRF Route-Leaking - Shared Internet with Custom VRF

### Configuring Internet VRF on Border Node

This procedure applies equally to IPv6.

#### SUMMARY STEPS

1. **configure terminal**
2. **vrf context** *vrf-name*
3. **vni** *number*
4. **ip route** *0.0.0.0/0 next-hop*
5. **rd auto**
6. **address-family ipv4 unicast**
7. **route-target both** {*auto* | *rt*}
8. **route-target both** *shared-vrf-rt evpn*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>vrf context</b> <i>vrf-name</i>	Configure the VRF.
<b>Step 3</b>	<b>vni</b> <i>number</i>	Specify the VNI.  The VNI associated with the VRF is often referred to as Layer 3 VNI, L3VNI, or L3VPN. The L3VNI is configured as a common identifier across the participating VTEPs.
<b>Step 4</b>	<b>ip route</b> <i>0.0.0.0/0 next-hop</i>	Configure the default route in the shared internet VRF to the external router.
<b>Step 5</b>	<b>rd</b> <i>auto</i>	Specify the VRF's route distinguisher (RD). The RD uniquely identifies a VTEP within an L3VNI.
<b>Step 6</b>	<b>address-family</b> <i>ipv4 unicast</i>	Configure the IPv4 unicast address family. This configuration is required for IPv4 over VXLAN with IPv4 underlay.
<b>Step 7</b>	<b>route-target</b> <i>both {auto   rt}</i>	Configure the route target (RT) for the import and export of EVPN and IPv4 prefixes. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN. Manually configured RTs are required to support asymmetric VNIs.
<b>Step 8</b>	<b>route-target</b> <i>both shared-vrf-rt evpn</i>	Configure a special route target (RT) for the import and export of the shared IPv4 prefixes. An additional import/export map for further qualification is supported.

## Configuring Shared Internet BGP Instance on the Border Node

This procedure applies equally to IPv6.

## SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *autonomous-system number*
3. **vrf** *vrf-name*
4. **address-family** *ipv4 unicast*
5. **advertise** *l2vpn evpn*
6. **aggregate-address** *prefix/mask*
7. **maximum-paths** *ibgp number*
8. **maximum-paths** *number*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>router bgp</b> <i>autonomous-system number</i>	Configure BGP.
Step 3	<b>vrf</b> <i>vrf-name</i>	Specify the VRF.
Step 4	<b>address-family ipv4 unicast</b>	Configure address family for IPv4
Step 5	<b>advertise l2vpn evpn</b>	Enable the advertisement of EVPN routes within IPv4 address-family.
Step 6	<b>aggregate-address</b> <i>prefix/mask</i>	Create less specific prefix aggregate into the destination VRF.
Step 7	<b>maximum-paths ibgp</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for iBGP prefixes.
Step 8	<b>maximum-paths</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for eBGP prefixes.

## Configuring Custom VRF on Border Node

This procedure applies equally to IPv6

## SUMMARY STEPS

1. **configure terminal**
2. **ip prefix-list** *name* **seq 5 permit 0.0.0.0/0**
3. **route-map** *name* **deny 10**
4. **match ip address prefix-list** *name*
5. **route-map** *name* **permit 20**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>ip prefix-list</b> <i>name</i> <b>seq 5 permit 0.0.0.0/0</b>	Configure IPv4 prefix-list for default-route filtering.
Step 3	<b>route-map</b> <i>name</i> <b>deny 10</b>	Create route-map with leading deny statement to prevent the default-route of being leaked.
Step 4	<b>match ip address prefix-list</b> <i>name</i>	Match against the IPv4 prefix-list that contains the default-route.
Step 5	<b>route-map</b> <i>name</i> <b>permit 20</b>	Create route-map with trailing allow statement to advertise non-matching routes via route-leaking.

## Configuring Custom VRF Context on the Border Node - 1

This procedure applies equally to IPv6.

### SUMMARY STEPS

1. **configure terminal**
2. **vrf context** *vrf-name*
3. **vni** *number*
4. **rd auto**
5. **ip route 0.0.0.0/0 Null0**
6. **address-family ipv4 unicast**
7. **route-target both** {*auto* | *rt*}
8. **route-target both** {*auto* | *rt*} **evpn**
9. **import map** *name*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>vrf context</b> <i>vrf-name</i>	Configure the VRF.
<b>Step 3</b>	<b>vni</b> <i>number</i>	Specify the VNI. The VNI associated with the VRF is often referred to as Layer 3 VNI, L3VNI, or L3VPN. The L3VNI is configured as the common identifier across the participating VTEPs.
<b>Step 4</b>	<b>rd auto</b>	Specify the VRF's route distinguisher (RD). The RD uniquely identifies a VTEP within an L3VNI.
<b>Step 5</b>	<b>ip route 0.0.0.0/0 Null0</b>	Configure default-route in common VRF to attract traffic towards Border Node with Shared Internet VRF.
<b>Step 6</b>	<b>address-family ipv4 unicast</b>	Configure the IPv4 address family. This configuration is required for IPv4 over VXLAN with IPv4 underlay.
<b>Step 7</b>	<b>route-target both</b> { <i>auto</i>   <i>rt</i> }	Configure the route target (RT) for the import and export of IPv4 prefixes within the IPv4 address family. The RT is used for a per-VRF prefix import/export policy. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN. Manually configured RTs are required to support asymmetric VNIs.
<b>Step 8</b>	<b>route-target both</b> { <i>auto</i>   <i>rt</i> } <b>evpn</b>	Configure the route target (RT) for the import and export of IPv4 prefixes within the IPv4 address family. The RT is used for a per-VRF prefix import/export policy. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN. Manually configured RTs are required to support asymmetric VNIs.

	Command or Action	Purpose
Step 9	<b>import map</b> <i>name</i>	Apply a route-map on routes being imported into this routing table.

## Configuring Custom VRF Instance in BGP on the Border Node

This procedure applies equally to IPv6.

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *autonomous-system-number*
3. **vrf** *vrf-name*
4. **address-family ipv4 unicast**
5. **advertise l2vpn evpn**
6. **network 0.0.0.0/0**
7. **maximum-paths ibgp** *number*
8. **maximum-paths** *number*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>router bgp</b> <i>autonomous-system-number</i>	Configure BGP.
Step 3	<b>vrf</b> <i>vrf-name</i>	Specify the VRF.
Step 4	<b>address-family ipv4 unicast</b>	Configure address family for IPv4.
Step 5	<b>advertise l2vpn evpn</b>	Enable the advertisement of EVPN routes within IPv4 address-family.
Step 6	<b>network 0.0.0.0/0</b>	Creating IPv4 default-route network statement.
Step 7	<b>maximum-paths ibgp</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for iBGP prefixes.
Step 8	<b>maximum-paths</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for eBGP prefixes.

## Example - Configuration Centralized VRF Route-Leaking - Shared Internet with Custom VRF

An example of Centralized VRF route-leaking with Shared Internet VRF

### Configuring VXLAN BGP EVPN Border Node for Shared Internet VRF

The VXLAN BGP EVPN Border Node provides a centralized Shared Internet VRF. The leaking configuration is localized such that control-plane leaking and data-path forwarding following the same path. Most significantly

## Example - Configuration Centralized VRF Route-Leaking - Shared Internet with Custom VRF

is the VRF configuration of the Border Node and the advertisement of the default-route and less specific prefixes (aggregates) into the respective destination VRFs.

```

## Centralized VRF Route-Leaking Brief - Shared Internet with VRF Default

Some pointers are given below:

- The Shared Internet with VRF route-leaking for VXLAN BGP EVPN fabrics is depicted within Figure 4.
- The default-route is made exported from VRF default and re-advertisement within VRF Blue and VRF Red on the Border Node.
- Ensure the default-route in VRF Blue and VRF Red is not leaked to the Shared Internet VRF
- The less specific prefixes for VRF Blue and VRF Red are exported to VRF default and re-advertised as necessary.
- Configured less specific prefixes (aggregates) that are advertised from the Border Node to the remaining VTEPs to the destination VRF (Blue or Red).
- BGP EVPN does not export prefixes that were previously imported to prevent the occurrence of routing loops.

Figure 12: Centralized VRF Route-Leaking - Shared Internet with VRF Default

## Configuring Centralized VRF Route-Leaking - Shared Internet with VRF Default

### Configuring VRF Default on Border Node

This procedure applies equally to IPv6.

#### SUMMARY STEPS

1. **configure terminal**
2. **ip route 0.0.0.0/0 next-hop**

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ip route 0.0.0.0/0 next-hop</b>	Configure default-route in VRF default to external router (example)

## Configuring BGP Instance for VRF Default on the Border Node

This procedure applies equally to IPv6.

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *autonomous-system number*
3. **address-family ipv4 unicast**
4. **aggregate-address** *prefix/mask*
5. **maximum-paths** *number*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>router bgp</b> <i>autonomous-system number</i>	Configure BGP.
<b>Step 3</b>	<b>address-family ipv4 unicast</b>	Configure address family for IPv4.
<b>Step 4</b>	<b>aggregate-address</b> <i>prefix/mask</i>	Create less specific prefix aggregate in VRF default.
<b>Step 5</b>	<b>maximum-paths</b> <i>number</i>	Enabling equal cost multipathing (ECMP) for eBGP prefixes.

## Configuring Custom VRF on Border Node

This procedure applies equally to IPv6

### SUMMARY STEPS

1. **configure terminal**
2. **ip prefix-list** *name* **seq 5 permit 0.0.0.0/0**
3. **route-map** *name* **deny 10**
4. **match ip address prefix-list** *name*
5. **route-map** *name* **permit 20**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ip prefix-list</b> <i>name</i> <b>seq 5 permit 0.0.0.0/0</b>	Configure IPv4 prefix-list for default-route filtering.
<b>Step 3</b>	<b>route-map</b> <i>name</i> <b>deny 10</b>	Create route-map with leading deny statement to prevent the default-route of being leaked.
<b>Step 4</b>	<b>match ip address prefix-list</b> <i>name</i>	Match against the IPv4 prefix-list that contains the default-route.

	Command or Action	Purpose
Step 5	<code>route-map <i>name</i> permit 20</code>	Create route-map with trailing allow statement to advertise non-matching routes via route-leaking.

## Configuring Filter for Permitted Prefixes from VRF Default on the Border Node

This procedure applies equally to IPv6.

### SUMMARY STEPS

1. `configure terminal`
2. `route-map name permit 10`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>route-map <i>name</i> permit 10</code>	Create route-map with allow statement to advertise routes via route-leaking to the customer VRF and subsequently remote VTEPs.

## Configuring Custom VRF Context on the Border Node - 2

This procedure applies equally to IPv6.

### SUMMARY STEPS

1. `configure terminal`
2. `vrf context vrf-name`
3. `vni number`
4. `rd auto`
5. `ip route 0.0.0.0/0 Null0`
6. `address-family ipv4 unicast`
7. `route-target both {auto | rt}`
8. `route-target both {auto | rt} evpn`
9. `route-target both shared-vrf-rt`
10. `route-target both shared-vrf-rt evpn`
11. `import vrf default map name`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>configure terminal</code>	Enter global configuration mode.
Step 2	<code>vrf context <i>vrf-name</i></code>	Configure the VRF.

	Command or Action	Purpose
Step 3	<b>vni</b> <i>number</i>	Specify the VNI. The VNI associated with the VRF is often referred to as Layer 3 VNI, L3VNI, or L3VPN. The L3VNI is configured as the common identifier across the participating VTEPs.
Step 4	<b>rd</b> <i>auto</i>	Specify the VRF's route distinguisher (RD). The RD uniquely identifies a VTEP within an L3VNI.
Step 5	<b>ip route 0.0.0.0/0 Null0</b>	Configure default-route in common VRF to attract traffic towards Border Node with Shared Internet VRF.
Step 6	<b>address-family ipv4 unicast</b>	Configure the IPv4 address family. This configuration is required for IPv4 over VXLAN with IPv4 underlay.
Step 7	<b>route-target both {auto   rt}</b>	Configure the route target (RT) for the import and export of EVPN and IPv4 prefixes within the IPv4 address family. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN. Manually configured RTs are required to support asymmetric VNIs.
Step 8	<b>route-target both {auto   rt} evpn</b>	Configure the route target (RT) for the import and export of EVPN and IPv4 prefixes within the IPv4 address family. If you enter an RT, the following formats are supported: ASN2:NN, ASN4:NN, or IPV4:NN. Manually configured RTs are required to support asymmetric VNIs.
Step 9	<b>route-target both shared-vrf-rt</b>	Configure a special route target (RT) for the import/export of the shared IPv4 prefixes. An additional import/export map for further qualification is supported.
Step 10	<b>route-target both shared-vrf-rt evpn</b>	Configure a special route target (RT) for the import/export of the shared IPv4 prefixes. An additional import/export map for further qualification is supported.
Step 11	<b>import vrf default map</b> <i>name</i>	Permits all routes, from VRF default, from being imported into the custom VRF according to the specific route-map.

## Configuring Custom VRF Instance in BGP on the Border Node

This procedure applies equally to IPv6.

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *autonomous-system-number*
3. **vrf** *vrf-name*
4. **address-family ipv4 unicast**
5. **advertise l2vpn evpn**
6. **network 0.0.0.0/0**
7. **maximum-paths ibgp** *number*

**8. maximum-paths *number*****DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>router bgp <i>autonomous-system-number</i></b>	Configure BGP.
<b>Step 3</b>	<b>vrf <i>vrf-name</i></b>	Specify the VRF.
<b>Step 4</b>	<b>address-family ipv4 unicast</b>	Configure address family for IPv4.
<b>Step 5</b>	<b>advertise l2vpn evpn</b>	Enable the advertisement of EVPN routes within IPv4 address-family.
<b>Step 6</b>	<b>network 0.0.0.0/0</b>	Creating IPv4 default-route network statement.
<b>Step 7</b>	<b>maximum-paths ibgp <i>number</i></b>	Enabling equal cost multipathing (ECMP) for iBGP prefixes.
<b>Step 8</b>	<b>maximum-paths <i>number</i></b>	Enabling equal cost multipathing (ECMP) for eBGP prefixes.

**Example - Configuration Centralized VRF Route-Leaking - VRF Default with Custom VRF**

An example of Centralized VRF route-leaking with VRF default

**Configuring VXLAN BGP EVPN Border Node for VRF Default**

The VXLAN BGP EVPN Border Node provides centralized access to VRF default. The leaking configuration is localized such that control-plane leaking and data-path forwarding following the same path. Most significantly is the VRF configuration of the Border Node and the advertisement of the default-route and less specific prefixes (aggregates) into the respective destination VRFs.

## CHAPTER 7

# Configuring BGP EVPN Filtering

This chapter contains the following sections:

- [About BGP EVPN Filtering, on page 149](#)
- [Guidelines and Limitations for BGP EVPN Filtering, on page 150](#)
- [Configuring BGP EVPN Filtering, on page 150](#)
- [Verifying BGP EVPN Filtering, on page 168](#)

## About BGP EVPN Filtering

This feature describes the requirements for route filtering and attributes handling, arising from the implementation of BGP NLRI of address family L2VPN EVPN.

EVPN routes are quite different from regular IPv4 and IPv6 routes in NLRI format. They contain many fields and carry attributes specific to EVPN. Using route maps, we can filter routes on the basis of these attributes. The following route-filtering options are available for the routes belonging to the EVPN address family:

- Matching based on the EVPN route type: Six types of NLRI are available in EVPN. Matching is based on the type specified in the route-map match statement.
- Matching based on the MAC address in the NLRI: This option is similar to matching based on the IP address embedded in the NLRI. EVPN type-2 routes contain a MAC address along with an IP address. This option can be used to filter such routes.
- Matching based on the RMAC extended community: EVPN type-2 and type-5 routes carry the router MAC (RMAC) extended community, which carries a MAC address. The RMAC is advertised as part of the update message to the neighbor along with other extended community information. It specifies the MAC address of the remote next hop of a route. This option allows matching against this RMAC extended community.
- Setting the RMAC extended community: This option allows you to change the RMAC extended community value of an EVPN NLRI.
- Setting the EVPN next-hop IP address: This option sets the next-hop IP address of the EVPN route once the match condition has been met. Setting the next-hop IP address for EVPN routes should be accompanied by setting the RMAC extended community to ensure correctness in forwarding.
- Setting the gateway IP address for route type-5: The gateway IP address encodes an overlay IP index for the IP prefixes that form the type-5 EVPN routes. It gets advertised as part of the EVPN NLRI in the

update message. The default value is 0.0.0.0. When it's set to any other value, the next hop on the route in the VRF context changes to the gateway IP address specified.

- Using table maps: You can configure table maps to filter MAC routes downloaded to the Layer 2 Routing Information Base (L2RIB).

The rest of this chapter provides information on configuring and applying these options.

## Guidelines and Limitations for BGP EVPN Filtering

The following are the guidelines and limitations for BGP EVPN filtering:

Cisco Nexus 9000 Series switches support BGP EVPN filtering.

The following match and set options are available for filtering an EVPN address family of routes:

- Matching based on the route type
- Matching based on the MAC address in the NLRI
- Matching based on the RMAC extended community
- Setting the RMAC extended community
- Setting the EVPN next-hop IP address—If more than one next-hop IP address is configured, only the first one is used and processed if using for EVPN. IPv4 and IPv6 can be used as next-hop addresses.
- Setting the gateway IP address for a route type-5—You can set an IPv4 gateway IP address using the **route-map** command.
- Using table maps—A table map for filtering MAC routes is downloaded to the Layer 2 Routing Information Base (L2RIB).

## Configuring BGP EVPN Filtering

To perform route filtering for the EVPN address-family routes, you can perform the following tasks:

- [Configuring the Route Map with Match and Set Clauses, on page 150](#)
- [Applying the Route Map at the Inbound or Outbound Level, on page 154](#)

To configure the table map, you can perform the following tasks:

- [Configuring a MAC List and a Route Map that Matches the MAC List, on page 164](#)
- [Applying the Table Map, on page 165](#)

## Configuring the Route Map with Match and Set Clauses

You can use the existing route-map configuration along with the match and set clauses to decide the kind of filtering that you need.

- [Matching Based on EVPN Route Type, on page 151](#)

- [Matching Based on MAC Address in the NLRI, on page 151](#)
- [Matching Based on RMAC Extended Community, on page 152](#)
- [Setting the RMAC Extended Community, on page 153](#)
- [Setting the EVPN Next-Hop IP Address, on page 153](#)
- [Setting the Gateway IP Address for Route Type-5, on page 154](#)

## Matching Based on EVPN Route Type

### SUMMARY STEPS

1. **configure terminal**
2. **route-map** *route-map-name*
3. **match evpn route-type** {1 | 2 | 2-mac-ip | 2-mac-only | 3 | 4 | 5 | 6}

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enter global configuration mode.
Step 2	<b>route-map</b> <i>route-map-name</i>  <b>Example:</b> <code>switch(config)# route-map ROUTE_MAP_1</code>	Create a route map.
Step 3	<b>match evpn route-type</b> {1   2   2-mac-ip   2-mac-only   3   4   5   6}  <b>Example:</b> <code>switch(config-route-map)# match evpn route-type 6</code>	Match BGP EVPN routes.

## Matching Based on MAC Address in the NLRI

### SUMMARY STEPS

1. **configure terminal**
2. **mac-list** *list-name* [**seq** *seq-number*] {**deny** | **permit**} *mac-address* [**mac-mask**]
3. **route-map** *route-map-name*
4. **match mac-list** *mac-list-name*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> switch# <b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>mac-list</b> <i>list-name</i> [ <b>seq</b> <i>seq-number</i> ] { <b>deny</b>   <b>permit</b> } <i>mac-address</i> [ <b>mac-mask</b> ]  <b>Example:</b> switch(config)# <b>mac-list</b> MAC_LIST_1 <b>permit</b> E:E:E	Build a MAC list.
<b>Step 3</b>	<b>route-map</b> <i>route-map-name</i>  <b>Example:</b> switch(config)# <b>route-map</b> ROUTE_MAP_1	Create a route map.
<b>Step 4</b>	<b>match mac-list</b> <i>mac-list-name</i>  <b>Example:</b> switch(config-route-map)# <b>match mac-list</b> MAC_LIST_1	Match entries of MAC lists. The maximum length is 63 characters.

## Matching Based on RMAC Extended Community

## SUMMARY STEPS

1. **configure terminal**
2. **ip extcommunity-list standard** *list-name* {**deny** | **permit**} **rmac** *mac-addr*
3. **route-map** *route-map-name*
4. **match extcommunity** *list-name*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> switch# <b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>ip extcommunity-list standard</b> <i>list-name</i> { <b>deny</b>   <b>permit</b> } <b>rmac</b> <i>mac-addr</i>  <b>Example:</b> switch(config)# <b>ip extcommunity-list standard</b> EXTCOMM_LIST_RMACE <b>permit</b> rmac a8b4.56e4.7edf	Add an extcommunity list entry. The <i>list-name</i> argument must not exceed 63 characters.
<b>Step 3</b>	<b>route-map</b> <i>route-map-name</i>  <b>Example:</b> switch(config)# <b>route-map</b> ROUTE_MAP_1	Create a route map.

	Command or Action	Purpose
<b>Step 4</b>	<b>match</b> <b>extcommunity</b> <i>list-name</i>  <b>Example:</b> <pre>switch(config-route-map)# match extcommunity EXTCOMM_LIST_RMACE</pre>	Match the extended community list name.

## Setting the RMAC Extended Community

### SUMMARY STEPS

1. **configure terminal**
2. **route-map** *route-map-name*
3. **set extcommunity evpn rmac** *mac-address*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal</pre>	Enter global configuration mode.
<b>Step 2</b>	<b>route-map</b> <i>route-map-name</i>  <b>Example:</b> <pre>switch(config)# route-map ROUTE_MAP_1</pre>	Create a route map.
<b>Step 3</b>	<b>set extcommunity evpn rmac</b> <i>mac-address</i>  <b>Example:</b> <pre>switch(config-route-map)# set extcommunity evpn rmac EEEE.EEEE.EEEE</pre>	Set the BGP RMAC extcommunity attribute.

## Setting the EVPN Next-Hop IP Address

### SUMMARY STEPS

1. **configure terminal**
2. **route-map** *route-map-name*
3. **set ip next-hop** *next-hop*
4. **set ipv6 next-hop** *next-hop*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal</pre>	Enter global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>route-map</b> <i>route-map-name</i> <b>Example:</b> switch(config) # <b>route-map</b> ROUTE_MAP_1	Create a route map.
<b>Step 3</b>	<b>set ip next-hop</b> <i>next-hop</i> <b>Example:</b> switch(config-route-map) # <b>set ip next-hop</b> 209.165.200.226	Set the IP address of the EVPN IP next hop.
<b>Step 4</b>	<b>set ipv6 next-hop</b> <i>next-hop</i> <b>Example:</b> switch(config-route-map) # <b>set ipv6 next-hop</b> 2001:0DB8::1	Set the IPv6 next-hop address.

## Setting the Gateway IP Address for Route Type-5

### SUMMARY STEPS

1. **configure terminal**
2. **route-map** *route-map-name*
3. **set evpn gateway-ip** *gw-ip-address*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> switch# <b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>route-map</b> <i>route-map-name</i> <b>Example:</b> switch(config) # <b>route-map</b> ROUTE_MAP_1	Create a route map.
<b>Step 3</b>	<b>set evpn gateway-ip</b> <i>gw-ip-address</i> <b>Example:</b> switch(config-route-map) # <b>set evpn gateway-ip</b> 209.165.200.227	Set the gateway IP address.

## Applying the Route Map at the Inbound or Outbound Level

Once you've configured the route map with match and set clauses based on your requirements, use this procedure to apply the route map at the inbound or outbound level.

## SUMMARY STEPS

1. **configure terminal**
2. **router bgp *as-num***
3. **neighbor *address***
4. **address-family l2vpn evpn**
5. **route-map *route-map* {in | out}**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enter global configuration mode.
Step 2	<b>router bgp <i>as-num</i></b>  <b>Example:</b> <code>switch(config)# router bgp 100</code>	Enables a routing process. The range of <i>as-num</i> is from 1 to 65535.
Step 3	<b>neighbor <i>address</i></b>  <b>Example:</b> <code>switch(config-router)# neighbor 1.1.1.1</code>	Configure a BGP neighbor.
Step 4	<b>address-family l2vpn evpn</b>  <b>Example:</b> <code>switch(config-router-neighbor)# address-family l2vpn evpn</code>	Configure the L2VPN address family.
Step 5	<b>route-map <i>route-map</i> {in   out}</b>  <b>Example:</b> <code>switch(config-router-neighbor-af)# route-map ROUTE_MAP_1 in</code>	Apply the route map to the neighbor.

## BGP EVPN Filtering Configuration Examples

This section provides example configurations for filtering EVPN routes.

**Example 1**

The following example shows how to filter EVPN type-2 routes and set the RMAC extended community as 52fc.c310.2e80.

1. The following output shows the routes in the EVPN table and a type-2 EVPN MAC route before the route map is applied.

```

leaf1(config)# show bgp l2vpn evpn
BGP routing table information for VRF default, address family L2VPN EVPN
BGP table version is 12, Local Router ID is 1.1.1.1

In a similar manner, you can use the other EVPN-specific match and set clauses with existing route-map options to filter EVPN routes as required.

### Example 2

The following example shows how EVPN route filtering can be used to redirect traffic to a different VTEP than the one from which the EVPN route was learned. It involves setting the next-hop IP address and the RMAC of the route to the one corresponding to the other VTEP.

This example demonstrates the following:

- Host 1 belongs to VRF evpn-tenant-0002 and VLAN 3002, and is connected to Leaf 1 and Leaf 2.
- Reachability to Host1 is advertised by Leaf 1 and Leaf 2 to BL1.

At BL1, both routes to 11.11.11.11/32 are received as follows:

- One from 1.1.1.1, which is Leaf 1
- One from 2.2.2.2, which is Leaf 2

#### 1. Initially the best path to reach 11.11.11.11 is through 1.1.1.1:

```

bl1(config)# show bgp 12 e 11.11.11.11
BGP routing table information for VRF default, address family L2VPN EVPN
Route Distinguisher: 1.1.1.1:3

```

After the next hop and RMAC value are set using the route map, the traffic that was earlier directed through 1.1.1.1 is now directed through 2.2.2.2.

## Configuring a Table Map

Perform these tasks to configure and apply a table map:

- [Configuring a MAC List and a Route Map that Matches the MAC List, on page 164](#)
- [Applying the Table Map, on page 165](#)

## Configuring a MAC List and a Route Map that Matches the MAC List

### SUMMARY STEPS

1. **configure terminal**
2. **mac-list** *list-name* [**seq** *seq-number*] {**deny** | **permit**} *mac-address* [**mac-mask**]
3. **route-map** *route-map-name*
4. **match mac-list** *mac-list-name*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> switch# <b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>mac-list</b> <i>list-name</i> [ <b>seq</b> <i>seq-number</i> ] { <b>deny</b>   <b>permit</b> } <i>mac-address</i> [ <b>mac-mask</b> ]  <b>Example:</b> switch(config)# <b>mac-list</b> MAC_LIST_1 <b>permit</b> E:E:E	Build a MAC list.
<b>Step 3</b>	<b>route-map</b> <i>route-map-name</i>  <b>Example:</b> switch(config)# <b>route-map</b> ROUTE_MAP_1	Create a route map.

	Command or Action	Purpose
<b>Step 4</b>	<b>match mac-list</b> <i>mac-list-name</i> <b>Example:</b> switch(config-route-map) # <b>match mac-list</b> MAC_LIST_1	Match entries of MAC lists. The maximum length is 63 characters.

## Applying the Table Map

### SUMMARY STEPS

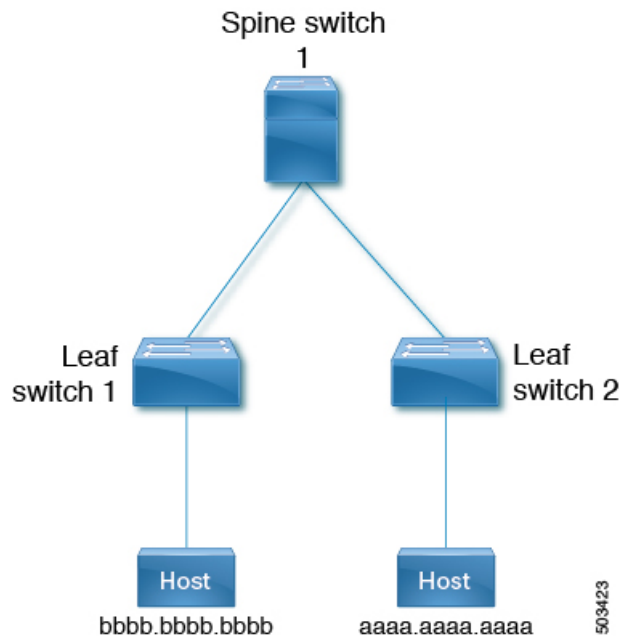

1. **configure terminal**
2. **evpn**
3. **vni vni-id l2**
4. **table-map route-map-name [filter]**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> switch# <b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>evpn</b> <b>Example:</b> switch(config) # <b>evpn</b>	Enter EVPN configuration mode.
<b>Step 3</b>	<b>vni vni-id l2</b> <b>Example:</b> switch(config-evpn) # <b>vni 101 12</b>	Configure the Ethernet VPN ID. The range of <i>vni-id</i> is from 1 to 16777214.
<b>Step 4</b>	<b>table-map route-map-name [filter]</b> <b>Example:</b> switch(config-evpn-evi) # <b>table-map ROUTE_MAP_1 filter</b>	Apply table maps at the EVPN VNI configuration level. If the <b>filter</b> option is specified, any route that gets denied by the route-map validation isn't downloaded into the L2RIB.

## Table Map Configuration Example

The following table-map configuration example shows how to filter MAC route aaaa.aaaa.aaaa from being downloaded into the L2RIB.

1. The following example shows the output for routes in the EVPN table and MAC routes in the L2RIB before the route map is applied.

```

leaf1(config)# show bgp l2vpn evpn

## Verifying BGP EVPN Filtering

To display the status of the BGP EVPN Filtering configuration, enter the following command:

**Table 3: Display BGP EVPN Filtering**

Command	Purpose
<b>show mac-list</b>	Displays MAC Lists.
<b>show route-map <i>name</i></b>	Displays information about a route map.
<b>show running-config bgp</b>	Displays the BGP configuration.
<b>show running-config rpm</b>	Displays all Route Policy Manager (RPM) information.
<b>show bgp l2vpn evpn</b>	Displays routes in BRIB.

Example of the **show mac-list** command:

```

switch(config)# show mac-list
mac-list list1: 5 entries
seq 5 deny 0000.836d.f8b7 ffff.ffff.ffff
seq 6 deny 0000.836d.f8b5 ffff.ffff.ffff
seq 7 permit 0000.0422.6811 ffff.ffff.ffff
seq 8 deny 0000.836d.f8b1 ffff.ffff.ffff

```

```

seq 10 permit 0000.0000.0000 0000.0000.0000
mac-list list2: 3 entries
seq 5 deny 0000.836e.f8b6 ffff.ffff.ffff
seq 8 deny 0000.0421.6818 ffff.ffff.ffff
seq 10 permit 0000.0000.0000 0000.0000.0000
mac-list list3: 2 entries
seq 5 deny 0000.836d.f8b6 ffff.ffff.ffff
seq 10 permit 0000.836d.f8b7 ffff.ffff.ffff

```

Example of the **show route-map** command:

```

switch# show route-map poll10
route-map poll10, permit, sequence 10
  Match clauses:
    mac-list: list2
  Set clauses:
    ip next-hop 6.6.6.1 3.3.3.10
    ipv6 next-hop 303:304::1

```

Example of the **show running-config bgp** command:

```

switch# show running-config bgp | beg "5000"
vni 5000 12
table-map poll filter
rd auto
route-target import auto
route-target export auto
vni 5001 12
rd auto
route-target import auto
route-target export auto

```

Example of the **show running-config rpm** command:

```

switch# show running-config rpm
!Running configuration last done at: Thu May 23 13:58:31 2019
!Time: Thu May 23 13:58:47 2019

version 9.3(1) Bios:version 07.65
feature pbr

mac-list list1 seq 5 permit 0001.0001.0001 ffff.ffff.ffff
mac-list mclist seq 5 permit 0001.0001.0001 ffff.ffff.ffff
route-map test permit 10
match evpn route-type 5
set evpn gateway-ip 1.1.1.2

```

Example of the **show bgp l2vpn evpn aaaa.aaaa.aaaa** command to view detailed information about EVPN route aaaa.aaaa.aaaa:

```

switch(config-evpn-evi)# show bgp 12 e aaaa.aaaa.aaaa

## CHAPTER 8

# Configuring VXLAN OAM

This chapter contains the following sections:

- [VXLAN OAM Overview, on page 171](#)
- [About VXLAN EVPN Loop Detection and Mitigation, on page 175](#)
- [Guidelines and Limitations for VXLAN NGOAM, on page 176](#)
- [Guidelines and Limitations for VXLAN EVPN Loop Detection and Mitigation, on page 176](#)
- [Configuring VXLAN OAM, on page 177](#)
- [Configuring NGOAM Profile, on page 180](#)
- [Configuring VXLAN EVPN Loop Detection and Mitigation, on page 181](#)
- [Detecting Loops and Bringing Up Ports On Demand, on page 182](#)
- [Configuration Examples for VXLAN EVPN Loop Detection and Mitigation, on page 183](#)

## VXLAN OAM Overview

The VXLAN operations, administration, and maintenance (OAM) protocol is a protocol for installing, monitoring, and troubleshooting Ethernet networks to enhance management in VXLAN based overlay networks.

Similar to ping, traceroute, or pathtrace utilities that allow quick determination of the problems in the IP networks, equivalent troubleshooting tools have been introduced to diagnose the problems in the VXLAN networks. The VXLAN OAM tools, for example, ping, pathtrace, and traceroute provide the reachability information to the hosts and the VTEPs in a VXLAN network. The OAM channel is used to identify the type of the VXLAN payload that is present in these OAM packets.

There are two types of payloads supported:

- Conventional ICMP packet to the destination to be tracked
- Special NVO3 draft Tissa OAM header that carries useful information

The ICMP channel helps to reach the traditional hosts or switches that do not support the new OAM packet formats. The NVO3 draft Tissa channels helps to reach the supported hosts or switches and carries the important diagnostic information. The VXLAN NVO3 draft Tissa OAM messages may be identified via the reserved OAM EtherType or by using a well-known reserved source MAC address in the OAM packets depending on the implementation on different platforms. This constitutes a signature for recognition of the VXLAN OAM packets. The VXLAN OAM tools are categorized as shown in table below.

Table 4: VXLAN OAM Tools

Category	Tools
Fault Verification	Loopback Message
Fault Isolation	Path Trace Message
Performance	Delay Measurement, Loss Measurement
Auxiliary	Address Binding Verification, IP End Station Locator, Error Notification, OAM Command Messages, and Diagnostic Payload Discovery for ECMP Coverage

## Loopback (Ping) Message

The loopback message (The ping and the loopback messages are the same and they are used interchangeably in this guide) is used for the fault verification. The loopback message utility is used to detect various errors and the path failures. Consider the topology in the following example where there are three core (spine) switches labeled Spine 1, Spine 2, and Spine 3 and five leaf switches connected in a Clos topology. The path of an example loopback message initiated from Leaf 1 for Leaf 5 is displayed when it traverses via Spine 3. When the loopback message initiated by Leaf 1 reaches Spine 3, it forwards it as VXLAN encapsulated data packet based on the outer header. The packet is not sent to the software on Spine 3. On Leaf 3, based on the appropriate loopback message signature, the packet is sent to the software VXLAN OAM module, that in turn, generates a loopback response that is sent back to the originator Leaf 1.

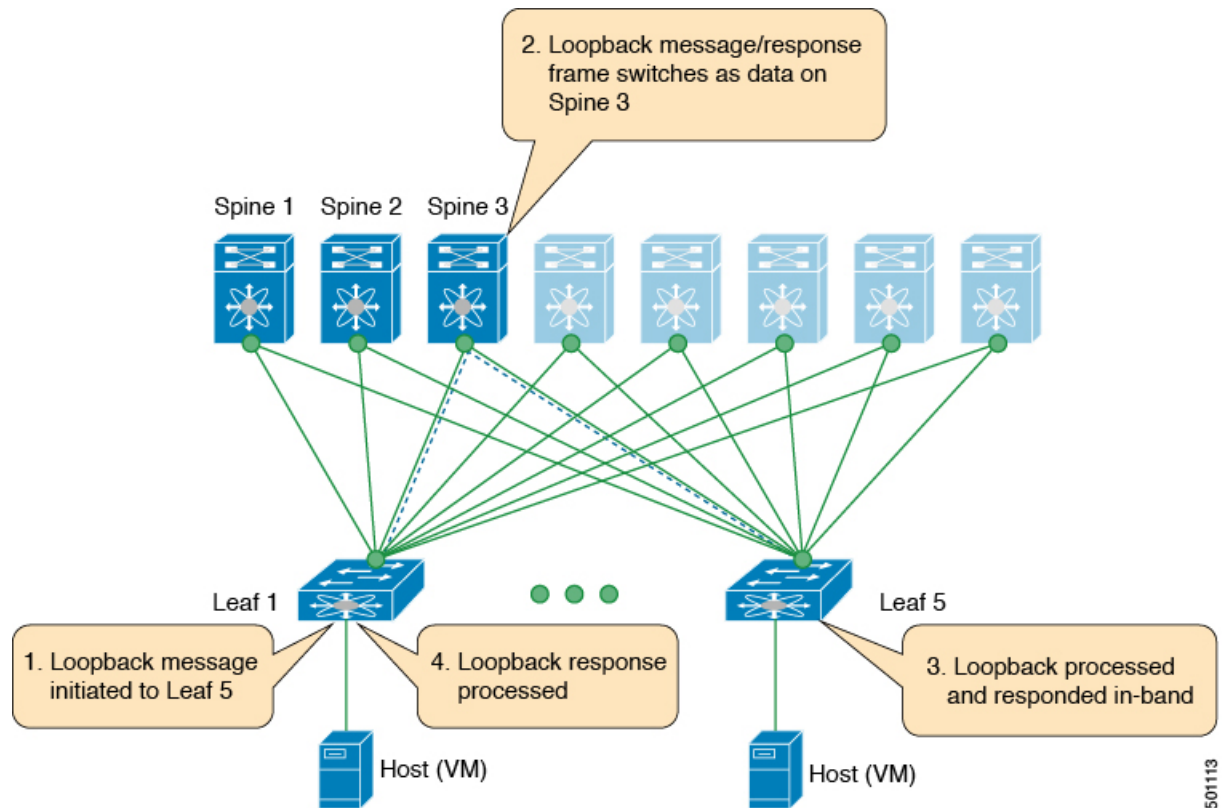

The loopback (ping) message can be destined to VM or to the (VTEP on) leaf switch. This ping message can use different OAM channels. If the ICMP channel is used, the loopback message can reach all the way to the VM if the VM's IP address is specified. If NVO3 draft Tissa channel is used, this loopback message is terminated on the leaf switch that is attached to the VM, as the VMs do not support the NVO3 draft Tissa headers in general. In that case, the leaf switch replies back to this message indicating the reachability of the VM. The ping message supports the following reachability options:

### Ping

Check the network reachability (**Ping** command):

- From Leaf 1 (VTEP 1) to Leaf 2 (VTEP 2) (ICMP or NVO3 draft Tissa channel)
- From Leaf 1 (VTEP 1) to VM 2 (host attached to another VTEP) (ICMP or NVO3 draft Tissa channel)

Figure 13: Loopback Message

501113

## Traceroute or Pathtrace Message

The traceroute or pathtrace message is used for the fault isolation. In a VXLAN network, it may be desirable to find the list of switches that are traversed by a frame to reach the destination. When the loopback test from a source switch to a destination switch fails, the next step is to find out the offending switch in the path. The operation of the path trace message begins with the source switch transmitting a VXLAN OAM frame with a TTL value of 1. The next hop switch receives this frame, decrements the TTL, and on finding that the TTL is 0, it transmits a TTL expiry message to the sender switch. The sender switch records this message as an indication of success from the first hop switch. Then the source switch increases the TTL value by one in the next path trace message to find the second hop. At each new transmission, the sequence number in the message is incremented. Each intermediate switch along the path decrements the TTL value by 1 as is the case with regular VXLAN forwarding.

This process continues until a response is received from the destination switch, or the path trace process timeout occurs, or the hop count reaches a maximum configured value. The payload in the VXLAN OAM frames is referred to as the flow entropy. The flow entropy can be populated so as to choose a particular path among multiple ECMP paths between a source and destination switch. The TTL expiry message may also be generated by the intermediate switches for the actual data frames. The same payload of the original path trace request is preserved for the payload of the response.

The traceroute and pathtrace messages are similar, except that traceroute uses the ICMP channel, whereas pathtrace uses the NVO3 draft Tissa channel. Pathtrace uses the NVO3 draft Tissa channel, carrying additional diagnostic information, for example, interface load and statistics of the hops taken by these messages. If an

intermediate device does not support the NVO3 draft Tissa channel, the pathtrace behaves as a simple traceroute and it provides only the hop information.

### Traceroute

Trace the path that is traversed by the packet in the VXLAN overlay using **Traceroute** command:

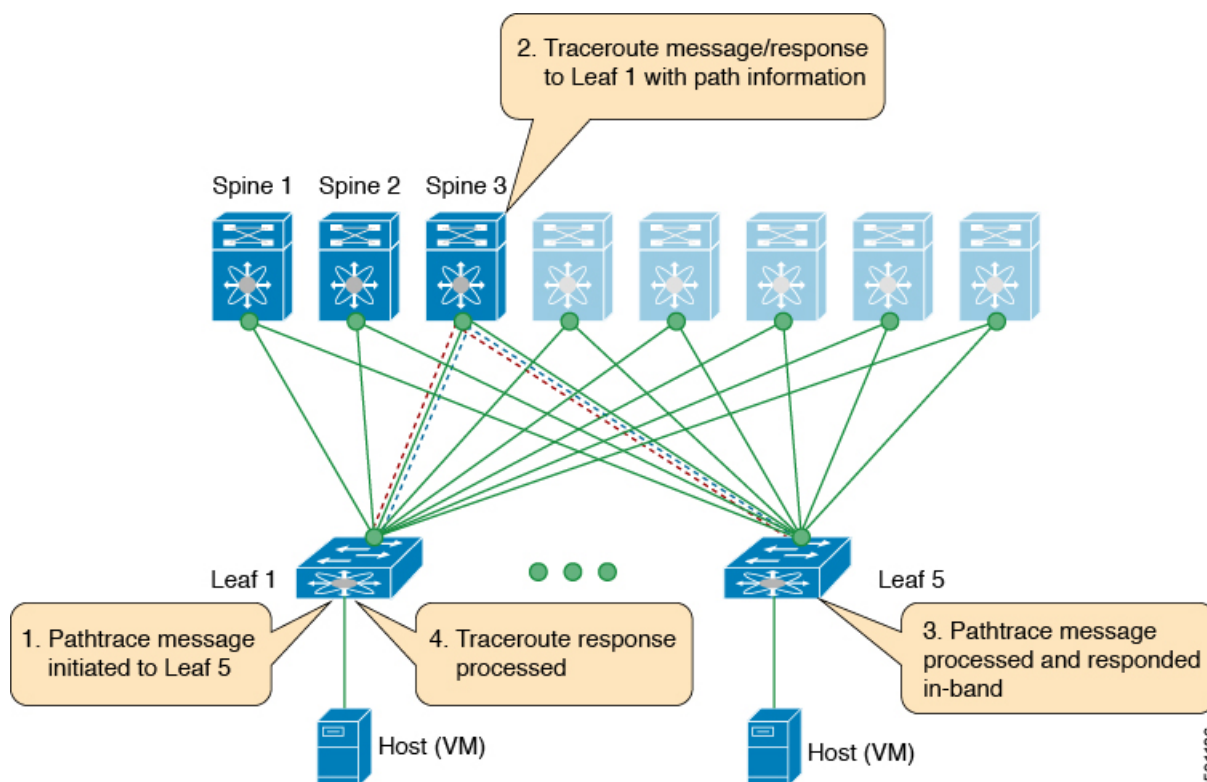

- Traceroute uses the ICMP packets (channel-1), encapsulated in the VXLAN encapsulation to reach the host

### Pathtrace

Trace the path that is traversed by the packet in the VXLAN overlay using the NVO3 draft Tissa channel with **Pathtrace** command:

- Pathtrace uses special control packets like NVO3 draft Tissa or TISSA (channel-2) to provide additional information regarding the path (for example, ingress interface and egress interface). These packets terminate at VTEP and they does not reach the host. Therefore, only the VTEP responds.
- Beginning with NX-OS release 9.3(3), the *Received* field of the **show ngoam pathtrace statistics summary** command indicates all pathtrace requests received by the node on which the command is executed regardless of whether the request was destined to that node.

Figure 14: Traceroute Message

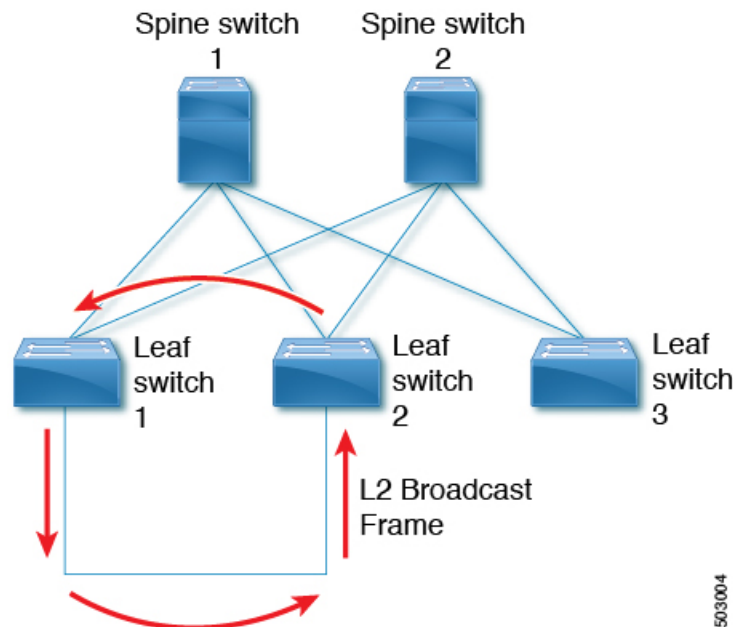

## About VXLAN EVPN Loop Detection and Mitigation

Loops usually occur in a VXLAN EVPN fabric due to incorrect cabling on the south side (access side) of the fabric. Once broadcast packets are injected into a network with a loop, the frame remains bridged in the loop. As more broadcast frames enter the loop, they accumulate and can cause a serious disruption of services.

Cisco NX-OS Release 9.3(5) introduces VXLAN EVPN loop detection and mitigation. This feature detects Layer 2 loops in a single VXLAN EVPN fabric or a Multi-Site environment. It operates at the port/VLAN level and disables the VLAN(s) on each port where a loop is detected. Administrators are also notified (via syslog) about the condition. In this way, the feature ensures that the network remains up and available.

The following figure shows an EVPN fabric in which two leaf devices (Leaf1 and Leaf2) are directly connected on the south side due to incorrect cabling. In this topology, Leaf3 forwards an L2 broadcast frame to Leaf1. Then the broadcast frame is repeatedly forwarded between Leaf1 and Leaf2 through the south side and the fabric. The forwarding continues until the incorrect cabling is fixed.

**Figure 15: Two Leaf Nodes Directly Connected**

This feature operates in three phases:

1. **Loop Detection:** Sends a loop detection probe under the following circumstances: when requested by a client, as part of a periodic probe task, and as soon as any port comes up.
2. **Loop Mitigation:** Blocks the VLANs on a port once a loop has been discovered and displays a syslog message similar to the following:

```
2020 Jan 14 09:58:44 Leaf1 %NGOAM-4-SLD_LOOP_DETECTED: Loop detected - Blocking vlan
1001 :: Eth1/3
```

Because loops can lead to incorrect local MAC address learning, this phase also flushes the local and remote MAC addresses. Doing so removes any MAC addresses that are incorrectly learned.

In the previous figure, MAC addresses can be incorrectly learned because packets from hosts sitting behind the remote leaf (Leaf3) can reach both Leaf1 and Leaf2 from the access side. As a result, the hosts incorrectly appear local to Leaf1 and Leaf2, which causes the leafs to learn their MAC addresses.

3. Loop Recovery: Once a loop is detected on a particular port or VLAN and the recovery interval has passed, recovery probes are sent to determine if the loop still exists. When NGOAM recovers from the loop, a syslog message similar to the following appears:

```
2020 Jan 14 09:59:38 Leaf1 %NGOAM-4-SLD_LOOP_GONE: Loop cleared - Enabling vlan 1001
:: Eth1/3
```

## Guidelines and Limitations for VXLAN NGOAM

VXLAN NGOAM has the following guidelines and limitations:

- Beginning with Cisco NX-OS Release 9.2(3), support is added for Cisco Nexus 9504 and 9508 switches with -R line cards.
- Beginning with Cisco NX-OS Release 9.3(3), support is added for the Cisco Nexus 9300-GX platform switches.
- Beginning with Cisco NX-OS Release 9.3(5), support is added for the Cisco Nexus 9300-FX3 platform switches.

## Guidelines and Limitations for VXLAN EVPN Loop Detection and Mitigation

VXLAN EVPN loop detection and mitigation has the following guidelines and limitations:

- VXLAN EVPN loop detection and mitigation is supported beginning with Cisco NX-OS Release 9.3(5).
- The following platforms support VXLAN EVPN loop detection and mitigation:
  - Cisco Nexus 9332C and 9364C platform switches
  - Cisco Nexus 9300-EX platform switches
  - Cisco Nexus 9300-FX/FX2/FXP platform switches
  - Cisco Nexus 9300-GX platform switches
  - Cisco Nexus 9500 platform switches with -EX/FX line cards
- Beginning with Cisco NX-OS Release 10.1(1) VXLAN EVPN loop detection and mitigation is supported on Cisco Nexus 9300-FX3 and -GX platform switches.
- VXLAN EVPN loop detection and mitigation is supported in both STP and STP-less environments.
- To be able to detect loops across sites for VXLAN EVPN Multi-Site deployments, the **ngoam loop-detection** command needs to be configured on all border gateways in the site where the feature is being deployed.
- VXLAN EVPN loop detection and mitigation isn't supported with the following features:

- Private VLANs
- VLAN translation
- ESI-based multihoming
- VXLAN Cross Connect
- Q-in-VNI
- EVPN segment routing (Layer 2)

**Note**

Ports or VLANs configured with these features must be excluded from VXLAN EVPN loop detection and mitigation. You can use the **disable** `{vlan vlan-range}` `[port port-range]` command to exclude them.

## Configuring VXLAN OAM

### Before you begin

As a prerequisite, ensure that the VXLAN configuration is complete.

### SUMMARY STEPS

1. switch# **configure terminal**
2. switch(config)# **feature ngoam**
3. switch(config)# **hardware access-list tcam region arp-ether 256 double-wide**
4. switch(config)# **ngoam install acl**
5. (Optional) **bcm-shell module 1 "fp show group 62"**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	switch(config)# <b>feature ngoam</b>	Enters the NGOAM feature.
<b>Step 3</b>	switch(config)# <b>hardware access-list tcam region arp-ether 256 double-wide</b>	For Cisco Nexus 9300 platform switches with Network Forwarding Engine (NFE), configure the TCAM region for ARP-ETHER using this command. This step is essential to program the ACL rule in the hardware and it is a prerequisite before installing the ACL rule.  <b>Note</b> Configuring the TCAM region requires the node to be rebooted.
<b>Step 4</b>	switch(config)# <b>ngoam install acl</b>	Installs the NGOAM Access Control List (ACL).

	Command or Action	Purpose
		<b>Note</b> This command is deprecated beginning with Cisco NX-OS Release 9.3(5) and is required only for earlier releases.
<b>Step 5</b>	(Optional) <b>bcm-shell module 1 "fp show group 62"</b>	For Cisco Nexus 9300 Series switches with Network Forwarding Engine (NFE), complete this verification step. After entering the command, perform a lookup for entry/eid with data=0x8902 under EtherType.

### Example

See the following examples of the configuration topology.

**Figure 16: VXLAN Network**

VXLAN OAM provides the visibility of the host at the switch level, that allows a leaf to ping the host using the **ping nve** command.

The following example displays how to ping from Leaf 1 to VM2 via Spine 1.

```
switch# ping nve ip 209.165.201.5 vrf vni-31000 source 1.1.1.1 verbose
```

```
Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'D' - Destination Unreachable, 'X' - unknown return code,
'm' - malformed request(parameter problem),
'c' - Corrupted Data/Test, '#' - Duplicate response
```

```
Sender handle: 34
! sport 40673 size 39,Reply from 209.165.201.5,time = 3 ms
! sport 40673 size 39,Reply from 209.165.201.5,time = 1 ms
! sport 40673 size 39,Reply from 209.165.201.5,time = 1 ms
```

```
! sport 40673 size 39,Reply from 209.165.201.5,time = 1 ms
! sport 40673 size 39,Reply from 209.165.201.5,time = 1 ms
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/4/18 ms
Total time elapsed 49 ms
```

**Note** The source ip-address 1.1.1.1 used in the above example is a loopback interface that is configured on Leaf 1 in the same VRF as the destination ip-address. For example, the VRF in this example is vni-31000.

The following example displays how to traceroute from Leaf 1 to VM 2 via Spine 1.

```
switch# traceroute nve ip 209.165.201.5 vrf vni-31000 source 1.1.1.1 verbose
```

```
Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'D' - Destination Unreachable, 'X' - unknown return code,
'm' - malformed request(parameter problem),
'c' - Corrupted Data/Test, '#' - Duplicate response
```

```
Traceroute request to peer ip 209.165.201.4 source ip 209.165.201.2
Sender handle: 36
 1 !Reply from 209.165.201.3,time = 1 ms
 2 !Reply from 209.165.201.4,time = 2 ms
 3 !Reply from 209.165.201.5,time = 1 ms
```

The following example displays how to pathtrace from Leaf 2 to Leaf 1.

```
switch# pathtrace nve ip 209.165.201.4 vni 31000 verbose
```

```
Path trace Request to peer ip 209.165.201.4 source ip 209.165.201.2
```

```
Sender handle: 42
TTL  Code  Reply                               IngressI/f      EgressI/f      State
=====
 1      !Reply from 209.165.201.3,  Eth5/5/1        Eth5/5/2        UP/UP
 2      !Reply from 209.165.201.4,  Eth1/3          Unknown         UP/DOWN
```

The following example displays how to MAC ping from Leaf 2 to Leaf 1 using NVO3 draft Tissa channel:

```
switch# ping nve mac 0050.569a.7418 2901 ethernet 1/51 profile 4 verbose
```

```
Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'D' - Destination Unreachable, 'X' - unknown return code,
'm' - malformed request(parameter problem),
'c' - Corrupted Data/Test, '#' - Duplicate response
```

```
Sender handle: 408
!!!!Success rate is 100 percent (5/5), round-trip min/avg/max = 4/4/5 ms
Total time elapsed 104 ms
```

```
switch# show run ngoam
feature ngoam
```

```
ngoam profile 4
oam-channel 2
ngoam install acl
```

The following example displays how to pathtrace based on a payload from Leaf 2 to Leaf 1:

```
switch# pathtrace nve ip unknown vrf vni-31000 payload mac-addr 0050.569a.d927 0050.569a.a4fa

```

## Configuring NGOAM Profile

Complete the following steps to configure NGOAM profile.

### SUMMARY STEPS

1. switch(config)# [no] feature ngoam
2. switch(config)# [no] ngoam profile <profile-id>
3. switch(config-ng-oam-profile)# ?

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	switch(config)# [no] feature ngoam	Enables or disables NGOAM feature
<b>Step 2</b>	switch(config)# [no] ngoam profile <profile-id>	Configures OAM profile. The range for the profile-id is <1 – 1023>. This command does not have a default value. Enters the <b>config-ngoam-profile submode</b> to configure NGOAM specific commands.  <b>Note</b> All profiles have default values and the <b>show run all</b> CLI command displays them. The default values are not visible through the <b>show run</b> CLI command.
<b>Step 3</b>	switch(config-ng-oam-profile)# ?  <b>Example:</b>  switch(config-ng-oam-profile)# ? description Configure description of the profile	Displays the options for configuring NGOAM profile.

	Command or Action	Purpose
	dot1q            Encapsulation dot1q/bd flow            Configure ngoam flow hop            Configure ngoam hop count interface      Configure ngoam egress interface no            Negate a command or set its defaults  oam-channel    Oam-channel used payload       Configure ngoam payload sport         Configure ngoam Udp source port range	

### Example

See the following examples for configuring an NGOAM profile and for configuring NGOAM flow.

```
switch(config)#
ngoam profile 1
oam-channel 1
flow forward
payload pad 0x2
sport 12345, 54321

switch(config-ngoam-profile)#flow {forward }
Enters config-ngoam-profile-flow submode to configure forward flow entropy specific
information
```

## Configuring VXLAN EVPN Loop Detection and Mitigation

Follow these steps to configure VXLAN loop detection and mitigation.

### Before you begin

Enable the NGOAM feature.

Use the following commands to create space for the TCAM ing-sup region:

```
hardware access-list tcam region ing-racl 0
hardware access-list tcam region ing-sup 768
```

**Note** Configuring the TCAM region requires the node to be rebooted.

### SUMMARY STEPS

1. switch# **configure terminal**
2. switch(config)# **[no] ngoam loop-detection**
3. (Optional) switch(config-ng-oam-loop-detection)# **[no] disable {vlan vlan-range} [port port-range]**

4. (Optional) switch(config-ng-oam-loop-detection)# **[no] periodic-probe-interval** *value*
5. (Optional) switch(config-ng-oam-loop-detection)# **[no] port-recovery-interval** *value*
6. (Optional) switch# **show ngoam loop-detection summary**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	switch(config)# <b>[no] ngoam loop-detection</b>	Enables VXLAN EVPN loop detection and mitigation for all VLANs or ports. This feature is disabled by default.
<b>Step 3</b>	(Optional) switch(config-ng-oam-loop-detection)# <b>[no] disable {vlan vlan-range} [port port-range]</b>	Disables VXLAN EVPN loop detection and mitigation for specific VLANs or ports and brings up any loop-detected ports. The <b>no</b> form of this command resumes active monitoring of these VLANs or ports.
<b>Step 4</b>	(Optional) switch(config-ng-oam-loop-detection)# <b>[no] periodic-probe-interval</b> <i>value</i>	Specifies how often periodic loop-detection probes are sent. The range is from 60 seconds to 3600 seconds (60 minutes). The default value is 300 seconds (5 minutes).
<b>Step 5</b>	(Optional) switch(config-ng-oam-loop-detection)# <b>[no] port-recovery-interval</b> <i>value</i>	Once a port or VLAN is shut down, specifies how often recovery probes are sent. The range is from 300 seconds to 3600 seconds (60 minutes). The default value is 600 seconds (10 minutes).
<b>Step 6</b>	(Optional) switch# <b>show ngoam loop-detection summary</b>	Displays the loop-detection configuration and current loop summary.

### What to do next

Configure a QoS policy on the spine. (For an example configuration, see [Configuration Examples for VXLAN EVPN Loop Detection and Mitigation](#), on page 183).

## Detecting Loops and Bringing Up Ports On Demand

Follow the steps in this section to detect loops or bring up blocked ports on demand.

### Before you begin

Enable VXLAN EVPN loop detection and mitigation.

## SUMMARY STEPS

1. (Optional) switch# **ngoam loop-detection probe {vlan vlan-range} [port port-range]**
2. (Optional) switch# **ngoam loop-detection bringup {vlan vlan-range} [port port-range]**
3. (Optional) switch# **show ngoam loop-detection status [history] [vlan vlan-range] [port port-range]**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	(Optional) switch# <b>ngoam loop-detection probe</b> {vlan <i>vlan-range</i> } [ <b>port</b> <i>port-range</i> ]	Sends a loop-detection probe on the specified VLAN or port and a notification as to whether the probe was successfully sent.
<b>Step 2</b>	(Optional) switch# <b>ngoam loop-detection bringup</b> {vlan <i>vlan-range</i> } [ <b>port</b> <i>port-range</i> ]	Brings up the VLANs or ports that were blocked earlier. This command also clears any entries stuck in the NGOAM.  <b>Note</b> It can take up to two port-recovery intervals for the ports to come up after a loop is cleared. You can speed up the recovery by manually overriding the timer with the <b>ngoam loop-detection bringup vlan</b> {vlan <i>vlan-range</i> } [ <b>port</b> <i>port-range</i> ] command.
<b>Step 3</b>	(Optional) switch# <b>show ngoam loop-detection status</b> [ <b>history</b> ] [vlan <i>vlan-range</i> ] [port <i>port-range</i> ]	Displays the loop-detection status for the VLAN or port. The status can be one of the following: <ul style="list-style-type: none"> <li>• <b>BLOCKED</b>—The VLAN or port is shut down because a loop has been detected.</li> <li>• <b>FORWARDING</b>—A loop has not been detected, and the VLAN or port is operational.</li> <li>• <b>RECOVERING</b>—Recovery probes are being sent to determine if a previously detected loop still exists.</li> </ul> The <b>history</b> option displays blocked, forwarding, and recovering ports. Without the <b>history</b> option, the command displays only blocked and recovering ports.

## Configuration Examples for VXLAN EVPN Loop Detection and Mitigation

The following example shows how to configure VXLAN EVPN loop detection and mitigation:

```
switch(config)# ngoam loop-detection
switch(config-ng-oam-loop-detection)# periodic-probe-interval 200
switch(config-ng-oam-loop-detection)# port-recovery-interval 300
```

The following example shows how to disable VXLAN EVPN loop detection and mitigation on specific VLANs or VLAN ports:

```
switch(config-ng-oam-loop-detection)# disable vlan 1200 port ethernet 1/1
switch(config-ng-oam-loop-detection)# disable vlan 1300
```

The following example shows how to configure a QoS policy on the spine and apply it to all of the spine interfaces to which the loop-detection-enabled leaf is connected:

```

class-map type qos match-any Spine-DSCP56
match dscp 56
policy-map type qos Spine-DSCP56
class Spine-DSCP56
set qos-group 7

interface Ethernet1/31
mtu 9216
no link dfe adaptive-tuning
service-policy type qos input Spine-DSCP5663
no ip redirects
ip address 27.4.1.2/24
ip router ospf 200 area 0.0.0.0
ip pim sparse-mode
no shutdown

```

The following sample output shows the loop-detection configuration and current loop summary:

```

switch# show ngoam loop-detection summary
Loop detection:enabled
Periodic probe interval: 200
Port recovery interval: 300
Number of vlans: 1
Number of ports: 1
Number of loops: 1
Number of ports blocked: 1
Number of vlans disabled: 0
Number of ports disabled: 0
Total number of probes sent: 214
Total number of probes received: 102
Next probe window start: Thu May 14 15:14:23 2020 (0 seconds)
Next recovery window start: Thu May 14 15:54:23 2020 (126 seconds)

```

The following sample output shows the loop-detection status for the specified VLANs or ports with and without the **history** option:

```

switch# show ngoam loop-detection status
VlanId Port   Status   NumLoops  Detection Time           ClearedTime
=====
100    Eth1/3  BLOCKED    1         Tue Apr 14 20:07:50.313 2020  Never

switch# show ngoam loop-detection status history
VlanId Port   Status   NumLoops  Detection Time           ClearedTime
=====
100    Eth1/3  BLOCKED    1         Tue Apr 14 20:07:50.313 2020  Never
200    Eth1/2  FORWARDING 1         Tue Apr 14 21:19:52.215 2020  May 11 21:30:54.830 2020

```

## CHAPTER 9

# Configuring vPC Multihoming

This chapter contains the following sections:

- [Advertising Primary IP Address, on page 185](#)
- [BorderPE Switches in a vPC Setup, on page 186](#)
- [DHCP Configuration in a vPC Setup, on page 186](#)
- [IP Prefix Advertisement in vPC Setup, on page 186](#)

## Advertising Primary IP Address

On a vPC enabled leaf or border leaf switch, by default all Layer-3 routes are advertised with the secondary IP address (VIP) of the leaf switch VTEP as the BGP next-hop IP address. Prefix routes and leaf switch generated routes are not synced between vPC leaf switches. Using the VIP as the BGP next-hop for these types of routes can cause traffic to be forwarded to the wrong vPC leaf or border leaf switch and black-holed. The provision to use the primary IP address (PIP) as the next-hop when advertising prefix routes or loopback interface routes in BGP on vPC enabled leaf or border leaf switches allows users to select the PIP as BGP next-hop when advertising these types of routes, so that traffic will always be forwarded to the right vPC enabled leaf or border leaf switch.

The configuration command for advertising the PIP is **advertise-pip**.

The following is a sample configuration:

```
switch(config)# router bgp 65536
  address-family 12vpn evpn
    advertise-pip
  interface nve 1
    advertise virtual-rmac
```

The **advertise-pip** command lets BGP use the PIP as next-hop when advertising prefix routes or leaf-generated routes if vPC is enabled.

VMAC (virtual-mac) is used with VIP and system MAC is used with PIP when the VIP/PIP feature is enabled.

With the **advertise-pip** and **advertise virtual-rmac** commands enabled, type 5 routes are advertised with PIP and type 2 routes are still advertised with VIP. In addition, VMAC will be used with VIP and system MAC will be used with PIP.

**Note**

The **advertise-pip** and **advertise-virtual-rmac** commands must be enabled and disabled together for this feature to work properly. If you enable or disable one and not the other, it is considered an invalid configuration.

For Cisco Nexus 9504 and 9508 switches with -R line cards, always configure **advertise virtual-rmac** without **advertise-pip**.

## BorderPE Switches in a vPC Setup

The two borderPE switches are configured as a vPC. In a VXLAN vPC deployment, a common, virtual VTEP IP address (secondary loopback IP address) is used for communication. The common, virtual VTEP uses a system specific router MAC address. The Layer-3 prefixes or default route from the borderPE switch is advertised with this common virtual VTEP IP (secondary IP) plus the system specific router MAC address as the next hop.

Entering the **advertise-pip** and **advertise virtual-rmac** commands cause the Layer 3 prefixes or default to be advertised with the primary IP and system-specific router MAC address, the MAC addresses to be advertised with the secondary IP, and a router MAC address derived from the secondary IP address.

## DHCP Configuration in a vPC Setup

When DHCP or DHCPv6 relay function is configured on leaf switches in a vPC setup, and the DHCP server is in the non default, non management VRF, then configure the **advertise-pip** command on the vPC leaf switches. This allows BGP EVPN to advertise Route-type 5 routes with the next-hop using the primary IP address of the VTEP interface.

The following is a sample configuration:

```
switch(config)# router bgp 100
  address-family 12vpn evpn
    advertise-pip
  interface nve 1
    advertise virtual-rmac
```

## IP Prefix Advertisement in vPC Setup

There are 3 types of Layer-3 routes that can be advertised by BGP EVPN. They are:

- Local host routes—These routes are learned from the attached servers or hosts.
- Prefix routes—These routes are learned via other routing protocol at the leaf, border leaf and border spine switches.
- Leaf switch generated routes—These routes include interface routes and static routes.

On a vPC enabled leaf or border leaf switch, by default all Layer-3 routes are advertised with the secondary IP address (VIP) of the leaf switch VTEP as the BGP next-hop IP address. Prefix routes and leaf switch generated routes are not synced between vPC leaf switches. Using the VIP as the BGP next-hop for these types of routes can cause traffic to be forwarded to the wrong vPC leaf or border leaf switch and black-holed.

The provision to use the primary IP address (PIP) as the next-hop when advertising prefix routes or loopback interface routes in BGP on vPC enabled leaf or border leaf switches allows users to select the PIP as BGP next-hop when advertising these types of routes, so that traffic is always forwarded to the right vPC enabled leaf or border leaf switch.

The configuration command for advertising the PIP is **advertise-pip**.

The following is a sample configuration:

```
switch(config)# router bgp 100
  address-family l2vpn evpn
    advertise-pip
  interface nve 1
    advertise virtual-rmac
```

The **advertise-pip** command lets BGP use the PIP as next-hop when advertising prefix routes or leaf generated routes if vPC is enabled.

## CHAPTER 10

# Configuring Multi-Site

This chapter contains the following sections:

- [About VXLAN EVPN Multi-Site, on page 189](#)
- [Dual RD Support for Multi-Site, on page 190](#)
- [Guidelines and Limitations for VXLAN EVPN Multi-Site, on page 190](#)
- [Enabling VXLAN EVPN Multi-Site, on page 192](#)
- [Configuring Dual RD Support for Multi-Site, on page 194](#)
- [Configuring VNI Dual Mode, on page 195](#)
- [Configuring Fabric/DCI Link Tracking, on page 196](#)
- [Configuring Fabric External Neighbors, on page 197](#)
- [Configuring VXLAN EVPN Multi-Site Storm Control, on page 198](#)
- [Multi-Site with vPC Support, on page 199](#)
- [Configuration Example for Multi-Site with Asymmetric VNIs, on page 205](#)
- [TRM with Multi-Site, on page 206](#)

## About VXLAN EVPN Multi-Site

The VXLAN EVPN Multi-Site solution interconnects two or more BGP-based Ethernet VPN (EVPN) sites/fabrics (overlay domains) in a scalable fashion over an IP-only network. This solution uses border gateways (BGWs) in anycast or vPC mode to terminate and interconnect two sites. The BGWs provide the network control boundary that is necessary for traffic enforcement and failure containment functionality.

In the BGP control plane for releases prior to Cisco NX-OS Release 9.3(5), BGP sessions between the BGWs rewrite the next hop information of EVPN routes and reoriginate them. Beginning with Cisco NX-OS Release 9.3(5), reorigination is always enabled (with either single or dual route distinguishers), and rewrite is not performed. For more information, see [Dual RD Support for Multi-Site, on page 190](#).

VXLAN Tunnel Endpoints (VTEPs) are only aware of their overlay domain internal neighbors, including the BGWs. All routes external to the fabric have a next hop on the BGWs for Layer 2 and Layer 3 traffic.

The BGW is the node that interacts with nodes within a site and with nodes that are external to the site. For example, in a leaf-spine data center fabric, it can be a leaf, a spine, or a separate device acting as a gateway to interconnect the sites.

The VXLAN EVPN Multi-Site feature can be conceptualized as multiple site-local EVPN control planes and IP forwarding domains interconnected via a single common EVPN control and IP forwarding domain. Every EVPN node is identified with a unique site-scope identifier. A site-local EVPN domain consists of EVPN

nodes with the same site identifier. BGWs on one hand are also part of the site-specific EVPN domain and on the other hand a part of a common EVPN domain to interconnect with BGWs from other sites. For a given site, these BGWs facilitate site-specific nodes to visualize all other sites to be reachable only via them. This means:

- Site-local bridging domains are interconnected only via BGWs with bridging domains from other sites.
- Site-local routing domains are interconnected only via BGWs with routing domains from other sites.
- Site-local flood domains are interconnected only via BGWs with flood domains from other sites.

Selective Advertisement is defined as the configuration of the per-tenant information on the BGW. Specifically, this means IP VRF or MAC VRF (EVPN instance). In cases where external connectivity (VRF-lite) and EVPN Multi-Site coexist on the same BGW, the advertisements are always enabled.

## Dual RD Support for Multi-Site

Beginning with Cisco NX-OS Release 9.3(5), VXLAN EVPN Multi-Site supports route reorigination with dual route distinguishers (RDs). This behavior is enabled automatically.

Each VRF or L2VNI tracks two RDs: a primary RD (which is unique) and a secondary RD (which is the same across BGWs). Reoriginated routes are advertised with the secondary type-0 RD (site-id:VNI). All other routes are advertised with the primary RD. The secondary RD is allocated automatically once the router is in Multi-Site BGW mode.

If the site ID is greater than 2 bytes, the secondary RD can't be generated automatically on the Multi-Site BGW, and the following message appears:

```
%BGP-4-DUAL_RD_GENERATION_FAILED: bgp- [12564] Unable to generate dual RD on EVPN multisite
border gateway. This may increase memory consumption on other BGP routers receiving
re-originated EVPN routes. Configure router bgp <asn> ; rd dual id <id> to avoid it.
```

In this case, you can either manually configure the secondary RD value or disable dual RDs. For more information, see [Configuring Dual RD Support for Multi-Site, on page 194](#).

## Guidelines and Limitations for VXLAN EVPN Multi-Site

VXLAN EVPN Multi-Site has the following configuration guidelines and limitations:

- The following switches support VXLAN EVPN Multi-Site:
  - Cisco Nexus 9300-EX and 9300-FX platform switches (except Cisco Nexus 9348GC-FXP platform switches)
  - Cisco Nexus 9336C-FX2 and 93240YC-FX2 platform switches
  - Cisco Nexus 9300-FX3 platform switches
  - Cisco Nexus 9300-GX platform switches
  - Cisco Nexus 9500 platform switches with -EX or -FX line cards

---

**Note** Cisco Nexus 9500 platform switches with -R/RX line cards don't support VXLAN EVPN Multi-Site.

---

- Cisco Nexus 9332C and 9364C platform switches can be BGWs.
- VXLAN EVPN Multi-Site and Tenant Routed Multicast (TRM) are supported between sources and receivers deployed across different sites.
- The Multi-Site BGW allows the coexistence of Multi-Site extensions (Layer 2 unicast/multicast and Layer 3 unicast) as well as Layer 3 unicast and multicast external connectivity.
- In TRM with Multi-Site deployments, all BGWs receive traffic from the fabric. However, only the designated forwarder (DF) BGW forwards the traffic. All other BGWs drop the traffic through a default drop ACL. This ACL is programmed in all DCI tracking ports. Don't remove the **evpn multisite dci-tracking** configuration from the DCI uplink ports. If you do, you remove the ACL, which creates a nondeterministic traffic flow in which packets can be dropped or duplicated instead of deterministically forwarded by only one BGW, the DF.
- Anycast mode can support up to six BGWs per site.
- BGWs in a vPC topology are supported.
- Multicast Flood Domain between intersite/fabric BGWs isn't supported.
- Multicast Underlay between sites isn't supported.
- iBGP EVPN Peering between BGWs of different fabrics/sites isn't supported.
- Anycast mode can support only Layer 3 services that are attached to local interfaces.
- In Anycast mode, BUM is replicated to each border leaf. DF election between the border leaves for a particular site determines which border leaf forwards the intersite traffic (fabric to DCI and conversely) for that site.
- In Anycast mode, all Layer 3 services are advertised in BGP via EVPN Type-5 routes with their physical IP as the next hop.
- vPC mode can support only two BGWs.
- vPC mode can support both Layer 2 hosts and Layer 3 services on local interfaces.
- In vPC mode, BUM is replicated to either of the BGWs for traffic coming from the external site. Hence, both BGWs are forwarders for site external to site internal (DCI to fabric) direction.
- In vPC mode, BUM is replicated to either of the BGWs for traffic coming from the local site leaf for a VLAN using Ingress Replication (IR) underlay. Both BGWs are forwarders for site internal to site external (fabric to DCI) direction for VLANs using the IR underlay.
- In vPC mode, BUM is replicated to both BGWs for traffic coming from the local site leaf for a VLAN using the multicast underlay. Therefore, a decapper/forwarder election happens, and the decapsulation winner/forwarder only forwards the site-local traffic to external site BGWs for VLANs using the multicast underlay.
- In vPC mode, all Layer 3 services/attachments are advertised in BGP via EVPN Type-5 routes with their virtual IP as next hop. If the VIP/PIP feature is configured, they are advertised with PIP as the next hop.

- If different Anycast Gateway MAC addresses are configured across sites, enable ARP suppression for all VLANs that have been extended.
- Bind NVE to a loopback address that is separate from loopback addresses that are required by Layer 3 protocols. A best practice is to use a dedicated loopback address for the NVE source interface (PIP VTEP) and Multi-Site source interface (anycast and virtual IP VTEP).
- PIM BiDir is not supported for fabric underlay multicast replication with VXLAN Multi-Site.
- FEX is not supported on a vPC BGW and Anycast BGW.
- Beginning with Cisco NX-OS Release 9.3(5), VTEPs support VXLAN-encapsulated traffic over parent interfaces if subinterfaces are configured. This feature is supported for VXLAN EVPN Multi-Site and DCI. DCI tracking can be enabled only on the parent interface.
- Beginning with Cisco NX-OS Release 9.3(5), VXLAN EVPN Multi-Site supports asymmetric VNIs. For more information, see Multi-Site with Asymmetric VNIs and [Configuration Example for Multi-Site with Asymmetric VNIs, on page 205](#).
- The following guidelines and limitations apply to dual RD support for Multi-Site:
  - Dual RDs are supported beginning with Cisco NX-OS Release 9.3(5).
  - Dual RDs are enabled automatically for Cisco Nexus 9332C, 9364C, 9300-EX, and 9300-FX/FX2/FXP platform switches and Cisco Nexus 9500 platform switches with -EX/FX line cards that have VXLAN EVPN Multi-Site enabled.
  - To use CloudSec or other features that require PIP advertisement for Multi-Site reoriginated routes, configure BGP additional paths on the route server if dual RDs are enabled on the BGW, or disable dual RDs.
  - Sending secondary RD additional paths at the BGW node isn't supported.
  - During an ISSU, the number of paths for the leaf nodes might double temporarily while all BGWs are being upgraded.
- Beginning with Cisco NX-OS Release 9.3(5), if you disable the **host-reachability protocol bgp** command under the NVE interface in a VXLAN EVPN Multi-Site topology, the NVE interface stays operationally down.

## Enabling VXLAN EVPN Multi-Site

This procedure enables the VXLAN EVPN Multi-Site feature. Multi-Site is enabled on the BGWs only. The site-id must be the same on all BGWs in the fabric/site.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> switch# <b>configure terminal</b>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>evpn multisite border-gateway <i>ms-id</i></b> <b>Example:</b> <pre>switch(config)# evpn multisite border-gateway 100</pre>	Configures the site ID for a site/fabric. The range of values for <i>ms-id</i> is 1 to 2,814,749,767,110,655. The <i>ms-id</i> must be the same in all BGWs within the same fabric/site.
<b>Step 3</b>	<b>interface nve 1</b> <b>Example:</b> <pre>switch(config-evpn-msite-bgw)# interface nve 1</pre>	<p>Creates a VXLAN overlay interface that terminates VXLAN tunnels.</p> <p><b>Note</b> Only one NVE interface is allowed on the switch.</p>
<b>Step 4</b>	<b>source-interface loopback <i>src-if</i></b> <b>Example:</b> <pre>switch(config-if-nve)# source-interface loopback 0</pre>	The source interface must be a loopback interface that is configured on the switch with a valid /32 IP address. This /32 IP address must be known by the transient devices in the transport network and the remote VTEPs. This requirement is accomplished by advertising it through a dynamic routing protocol in the transport network.
<b>Step 5</b>	<b>host-reachability protocol bgp</b> <b>Example:</b> <pre>switch(config-if-nve)# host-reachability protocol bgp</pre>	Defines BGP as the mechanism for host reachability advertisement.
<b>Step 6</b>	<b>multisite border-gateway interface loopback <i>vi-num</i></b> <b>Example:</b> <pre>switch(config-if-nve)# multisite border-gateway interface loopback 100</pre>	Defines the loopback interface used for the BGW virtual IP address (VIP). The border-gateway interface must be a loopback interface that is configured on the switch with a valid /32 IP address. This /32 IP address must be known by the transient devices in the transport network and the remote VTEPs. This requirement is accomplished by advertising it through a dynamic routing protocol in the transport network. This loopback must be different than the source interface loopback. The range of <i>vi-num</i> is from 0 to 1023.
<b>Step 7</b>	<b>no shutdown</b> <b>Example:</b> <pre>switch(config-if-nve)# no shutdown</pre>	Negates the <b>shutdown</b> command.
<b>Step 8</b>	<b>exit</b> <b>Example:</b> <pre>switch(config-if-nve)# exit</pre>	Exits the NVE configuration mode.
<b>Step 9</b>	<b>interface loopback <i>loopback-number</i></b> <b>Example:</b> <pre>switch(config)# interface loopback 0</pre>	Configures the loopback interface.
<b>Step 10</b>	<b>ip address <i>ip-address</i></b> <b>Example:</b>	Configures the IP address for the loopback interface.

	Command or Action	Purpose
	<code>switch(config-if) # ip address 198.0.2.0/32</code>	

## Configuring Dual RD Support for Multi-Site

Follow these steps if you need to manually configure the secondary RD value or disable dual RDs.

### Before you begin

Enable VXLAN EVPN Multi-Site.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code> <code>switch(config) #</code>	Enters global configuration mode.
<b>Step 2</b>	<b>router bgp as-num</b>  <b>Example:</b> <code>switch(config) # router bgp 100</code> <code>switch(config-router) #</code>	Configures the autonomous system number. The range for <i>as-num</i> is from 1 to 4,294,967,295.
<b>Step 3</b>	<b>[no] rd dual id [2-bytes]</b>  <b>Example:</b> <code>switch(config-router) # rd dual id 1</code>	Defines the first 2 bytes of the secondary RD. The ID must be the same across the Multi-Site BGWs. The range is from 1 to 65535.  <b>Note</b> If necessary, you can use the <b>no rd dual</b> command to disable dual RDs and fall back to a single RD.
<b>Step 4</b>	<b>(Optional) show bgp evi evi-id</b>  <b>Example:</b> <code>switch(config-router) # show bgp evi 100</code>	Displays the secondary RD configured as part of the <b>rd dual id [2-bytes]</b> command for the specified EVI.

### Example

The following example shows sample output for the **show bgp evi evi-id** command:

```
switch# show bgp evi 100
-----
L2VNI ID           : 100 (L2-100)
RD                 : 3.3.3.3:32867
Secondary RD       : 1:100
Prefixes (local/total) : 1/6
Created            : Jun 23 22:35:13.368170
Last Oper Up/Down  : Jun 23 22:35:13.369005 / never
```

```

Enabled                               : Yes
Associated IP-VRF                     : vni101
Active Export RT list                  :
    100:100
Active Import RT list                 :
    100:100

```

## Configuring VNI Dual Mode

This procedure describes the configuration of the BUM traffic domain for a given VLAN. Support exists for using multicast or ingress replication inside the fabric/site and ingress replication across different fabrics/sites.

**Note** In cases where only a Layer 3 extension is configured on the BGW, an additional loopback interface is required. The loopback interface must be present in the same VRF instance on all BGWs and with an individual IP address per BGW. Ensure that the loopback interface's IP address is redistributed into BGP EVPN, especially toward Site-External.

For more information about configuring multicast or ingress replication for a large number of VNIs, see [Example of VXLAN BGP EVPN \(EBGP\)](#), on page 79.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface nve 1</b> <b>Example:</b> <code>switch(config)# interface nve 1</code>	Creates a VXLAN overlay interface that terminates VXLAN tunnels. <b>Note</b> Only one NVE interface is allowed on the switch.
<b>Step 3</b>	<b>member vni vni-range</b> <b>Example:</b> <code>switch(config-if-nve)# member vni 200</code>	Configures the virtual network identifier (VNI). The range for <i>vni-range</i> is from 1 to 16,777,214. The value of <i>vni-range</i> can be a single value like 5000 or a range like 5001-5008. <b>Note</b> Enter one of the Step 4 or Step 5 commands.
<b>Step 4</b>	<b>mcast-group ip-addr</b> <b>Example:</b> <code>switch(config-if-nve-vni)# mcast-group 255.0.4.1</code>	Configures the NVE Multicast group IP prefix within the fabric.
<b>Step 5</b>	<b>ingress-replication protocol bgp</b> <b>Example:</b>	Enables BGP EVPN with ingress replication for the VNI within the fabric.

	Command or Action	Purpose
	<code>switch(config-if-nve-vni) # ingress-replication protocol bgp</code>	
<b>Step 6</b>	<b>multisite ingress-replication</b>  <b>Example:</b> <code>switch(config-if-nve-vni) # multisite ingress-replication</code>	Defines the Multi-Site BUM replication method for extending the Layer 2 VNI.

## Configuring Fabric/DCI Link Tracking

This procedure describes the configuration to track all DCI-facing interfaces and site internal/fabric facing interfaces. Tracking is mandatory and is used to disable reorigination of EVPN routes either from or to a site if all the DCI/fabric links go down.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface ethernet <i>port</i></b>  <b>Example:</b> <code>switch(config) # interface ethernet1/1</code>	Enters interface configuration mode for the DCI or fabric interface.  <b>Note</b> Enter one of the following commands in Step 3 or Step 4.
<b>Step 3</b>	<b>evpn multisite dci-tracking</b>  <b>Example:</b> <code>switch(config-if) # evpn multisite dci-tracking</code>	Configures DCI interface tracking.
<b>Step 4</b>	<b>evpn multisite fabric-tracking</b>  <b>Example:</b> <code>switch(config-if) # evpn multisite fabric-tracking</code>	Configures EVPN Multi-Site fabric tracking.
<b>Step 5</b>	<b>ip address <i>ip-addr</i></b>  <b>Example:</b> <code>switch(config-if) # ip address 192.1.1.1</code>	Configures the IP address.
<b>Step 6</b>	<b>no shutdown</b>  <b>Example:</b> <code>switch(config-if) # no shutdown</code>	Negates the <b>shutdown</b> command.

# Configuring Fabric External Neighbors

This procedure describes the configuration of fabric external/DCI neighbors for communication to other site/fabric BGWs.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>router bgp <i>as-num</i></b>  <b>Example:</b> <code>switch(config)# router bgp 100</code>	Configures the autonomous system number. The range for <i>as-num</i> is from 1 to 4,294,967,295.
<b>Step 3</b>	<b>neighbor <i>ip-addr</i></b>  <b>Example:</b> <code>switch(config-router)# neighbor 100.0.0.1</code>	Configures a BGP neighbor.
<b>Step 4</b>	<b>peer-type fabric-external</b>  <b>Example:</b> <code>switch(config-router-neighbor)# peer-type fabric-external</code>	Enables the next hop rewrite for Multi-Site. Defines site external BGP neighbors for EVPN exchange. The default for <b>peer-type</b> is <b>fabric-internal</b> .  <b>Note</b> The <b>peer-type fabric-external</b> command is required only for VXLAN Multi-Site BGWs. It is not required for pseudo BGWs.
<b>Step 5</b>	<b>address-family l2vpn evpn</b>  <b>Example:</b> <code>switch(config-router-neighbor)# address-family l2vpn evpn</code>	Configures the address family Layer 2 VPN EVPN under the BGP neighbor.
<b>Step 6</b>	<b>rewrite-evpn-rt-asn</b>  <b>Example:</b> <code>switch(config-router-neighbor)# rewrite-evpn-rt-asn</code>	Rewrites the route target (RT) information to simplify the MAC-VRF and IP-VRF configuration. BGP receives a route, and as it processes the RT attributes, it checks if the AS value matches the peer AS that is sending that route and replaces it. Specifically, this command changes the incoming route target's AS number to match the BGP-configured neighbor's remote AS number. You can see the modified RT value in the receiver router.

# Configuring VXLAN EVPN Multi-Site Storm Control

VXLAN EVPN Multi-Site Storm Control allows rate limiting of multidestination (BUM) traffic on Multi-Site BGWs. You can control BUM traffic sent over the DCI link using a policer on fabric links in the ingress direction.

Cisco NX-OS Release 9.3(6) and later releases optimize rate granularity and accuracy. Bandwidth is calculated based on the accumulated DCI uplink bandwidth, and only interfaces tagged with DCI tracking are considered. (Prior releases also include fabric-tagged interfaces.) In addition, granularity is enhanced by supporting two digits after the decimal point. These enhancements apply to the Cisco Nexus 9300-EX, 9300-FX/FXP/FX2/FX3, and 9300-GX platform switches.

## Note

For information on access port storm control, see the [Cisco Nexus 9000 Series NX-OS Layer 2 Configuration Guide](#).

## SUMMARY STEPS

1. **configure terminal**
2. **[no] evpn storm-control {broadcast | multicast | unicast} {level level}**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>[no] evpn storm-control {broadcast   multicast   unicast} {level level}</b>  <b>Example:</b> <pre>switch(config)# evpn storm-control unicast level 10</pre> <b>Example:</b> <pre>switch(config)# evpn storm-control unicast level 10.20</pre>	<p>Configures the storm suppression level as a number from 0–100.</p> <p>0 means that all traffic is dropped, and 100 means that all traffic is allowed. For any value in between, the unknown unicast traffic rate is restricted to a percentage of available bandwidth. For example, a value of 10 means that the traffic rate is restricted to 10% of the available bandwidth, and anything above that rate is dropped.</p> <p>Beginning with Cisco NX-OS Release 9.3(6), you can configure the level as a fractional value by adding two digits after the decimal point. For example, you can enter a value of 10.20.</p>

# Multi-Site with vPC Support

## About Multi-Site with vPC Support

The BGWs can be in a vPC complex. In this case, it is possible to support dually-attached directly-connected hosts that might be bridged or routed as well as dually-attached firewalls or service attachments. The vPC BGWs have vPC-specific multihoming techniques and do not rely on EVPN Type 4 routes for DF election or split horizon.

## Guidelines and Limitations for Multi-Site with vPC Support

Multi-Site with vPC support has the following configuration guidelines and limitations:

- 4000 VNIs for vPC are not supported.
- For BUM with continued VIP use, the MCT link is used as transport upon core isolation or fabric isolation, and for unicast traffic in fabric isolation.

## Configuring Multi-Site with vPC Support

This procedure describes the configuration of Multi-Site with vPC support:

- Configure vPC domain.
- Configure port channels.
- Configuring vPC Peer Link.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>feature vpc</b>  <b>Example:</b> <code>switch(config)# feature vpc</code>	Enables vPCs on the device.
<b>Step 3</b>	<b>feature interface-vlan</b>  <b>Example:</b> <code>switch(config)# feature interface-vlan</code>	Enables the interface VLAN feature on the device.
<b>Step 4</b>	<b>feature lacp</b>  <b>Example:</b> <code>switch(config)# feature lacp</code>	Enables the LACP feature on the device.

	Command or Action	Purpose
<b>Step 5</b>	<b>feature pim</b> <b>Example:</b> <code>switch(config)# <b>feature pim</b></code>	Enables the PIM feature on the device.
<b>Step 6</b>	<b>feature ospf</b> <b>Example:</b> <code>switch(config)# <b>feature ospf</b></code>	Enables the OSPF feature on the device.
<b>Step 7</b>	<b>ip pim rp-address address group-list range</b> <b>Example:</b> <code>switch(config)# <b>ip pim rp-address 100.100.100.1 group-list 224.0.0/4</b></code>	Defines a PIM RP address for the underlay multicast group range.
<b>Step 8</b>	<b>vpc domain domain-id</b> <b>Example:</b> <code>switch(config)# <b>vpc domain 1</b></code>	Creates a vPC domain on the device and enters vpn-domain configuration mode for configuration purposes. There is no default. The range is from 1 to 1000.
<b>Step 9</b>	<b>peer switch</b> <b>Example:</b> <code>switch(config-vpc-domain)# <b>peer switch</b></code>	Defines the peer switch.
<b>Step 10</b>	<b>peer gateway</b> <b>Example:</b> <code>switch(config-vpc-domain)# <b>peer gateway</b></code>	Enables Layer 3 forwarding for packets destined to the gateway MAC address of the vPC.
<b>Step 11</b>	<b>peer-keepalive destination ip-address</b> <b>Example:</b> <code>switch(config-vpc-domain)# <b>peer-keepalive destination 172.28.230.85</b></code>	Configures the IPv4 address for the remote end of the vPC peer-keepalive link.  <b>Note</b> The system does not form the vPC peer link until you configure a vPC peer-keepalive link.  The management ports and VRF are the defaults.
<b>Step 12</b>	<b>ip arp synchronize</b> <b>Example:</b> <code>switch(config-vpc-domain)# <b>ip arp synchronize</b></code>	Enables IP ARP synchronize under the vPC domain to facilitate faster ARP table population following device reload.
<b>Step 13</b>	<b>ipv6 nd synchronize</b> <b>Example:</b> <code>switch(config-vpc-domain)# <b>ipv6 nd synchronize</b></code>	Enables IPv6 ND synchronization under the vPC domain to facilitate faster ND table population following device reload.
<b>Step 14</b>	Create the vPC peer-link. <b>Example:</b> <code>switch(config)# <b>interface port-channel 1</b> switch(config)# <b>switchport</b> switch(config)# <b>switchport mode trunk</b> switch(config)# <b>switchport trunk allowed vlan</b></code>	Creates the vPC peer-link port-channel interface and adds two member interfaces to it.

	Command or Action	Purpose
	<pre>1,10,100-200 switch(config)# mtu 9216 switch(config)# vpc peer-link switch(config)# no shut  switch(config)# interface Ethernet 1/1, 1/21 switch(config)# switchport switch(config)# mtu 9216 switch(config)# channel-group 1 mode active switch(config)# no shutdown</pre>	
Step 15	<b>system nve infra-vlans</b> <i>range</i> <b>Example:</b> <pre>switch(config)# system nve infra-vlans 10</pre>	Defines a non-VXLAN-enabled VLAN as a backup routed path.
Step 16	<b>vlan</b> <i>number</i> <b>Example:</b> <pre>switch(config)# vlan 10</pre>	Creates the VLAN to be used as an infra-VLAN.
Step 17	Create the SVI. <b>Example:</b> <pre>switch(config)# interface vlan 10 switch(config)# ip address 10.10.10.1/30 switch(config)# ip router ospf process UNDERLAY area 0 switch(config)# ip pim sparse-mode switch(config)# no ip redirects switch(config)# mtu 9216 switch(config)# no shutdown</pre>	Creates the SVI used for the backup routed path over the vPC peer-link.
Step 18	(Optional) <b>delay restore interface-vlan</b> <i>seconds</i> <b>Example:</b> <pre>switch(config-vpc-domain)# delay restore interface-vlan 45</pre>	Enables the delay restore timer for SVIs. We recommend tuning this value when the SVI/VNI scale is high. For example, when the SCI count is 1000, we recommend that you set the delay restore to 45 seconds.
Step 19	<b>evpn multisite border-gateway</b> <i>ms-id</i> <b>Example:</b> <pre>switch(config)# evpn multisite border-gateway 100</pre>	Configures the site ID for a site/fabric. The range of values for <i>ms-id</i> is 1 to 281474976710655. The <i>ms-id</i> must be the same in all BGWs within the same fabric/site.
Step 20	<b>interface nve</b> 1 <b>Example:</b> <pre>switch(config-evpn-msite-bgw)# interface nve 1</pre>	Creates a VXLAN overlay interface that terminates VXLAN tunnels. <b>Note</b> Only one NVE interface is allowed on the switch.
Step 21	<b>source-interface loopback</b> <i>src-if</i> <b>Example:</b> <pre>switch(config-if-nve)# source-interface loopback 0</pre>	Defines the source interface, which must be a loopback interface with a valid /32 IP address. This /32 IP address must be known by the transient devices in the transport network and the remote VTEPs. This requirement is

	Command or Action	Purpose
		accomplished by advertising the address through a dynamic routing protocol in the transport network.
<b>Step 22</b>	<b>host-reachability protocol bgp</b> <b>Example:</b> <code>switch(config-if-nve)# host-reachability protocol bgp</code>	Defines BGP as the mechanism for host reachability advertisement.
<b>Step 23</b>	<b>multisite border-gateway interface loopback <i>vi-num</i></b> <b>Example:</b> <code>switch(config-if-nve)# multisite border-gateway interface loopback 100</code>	Defines the loopback interface used for the BGW virtual IP address (VIP). The BGW interface must be a loopback interface that is configured on the switch with a valid /32 IP address. This /32 IP address must be known by the transient devices in the transport network and the remote VTEPs. This requirement is accomplished by advertising the address through a dynamic routing protocol in the transport network. This loopback must be different than the source interface loopback. The range of <i>vi-num</i> is from 0 to 1023.
<b>Step 24</b>	<b>no shutdown</b> <b>Example:</b> <code>switch(config-if-nve)# no shutdown</code>	Negates the <b>shutdown</b> command.
<b>Step 25</b>	<b>exit</b> <b>Example:</b> <code>switch(config-if-nve)# exit</code>	Exits the NVE configuration mode.
<b>Step 26</b>	<b>interface loopback <i>loopback-number</i></b> <b>Example:</b> <code>switch(config)# interface loopback 0</code>	Configures the loopback interface.
<b>Step 27</b>	<b>ip address <i>ip-address</i></b> <b>Example:</b> <code>switch(config-if)# ip address 198.0.2.0/32</code>	Configures the primary IP address for the loopback interface.
<b>Step 28</b>	<b>ip address <i>ip-address</i> secondary</b> <b>Example:</b> <code>switch(config-if)# ip address 198.0.2.1/32 secondary</code>	Configures the secondary IP address for the loopback interface.
<b>Step 29</b>	<b>ip pim sparse-mode</b> <b>Example:</b> <code>switch(config-if)# ip pim sparse-mode</code>	Configures PIM sparse mode on the loopback interface.

## Configuring Peer Link as Transport in Case of Link Failure

This procedure describes the configuration of an SVI interface configured with a high IGP cost to ensure it is only used as a backup link.

**Note** This configuration is required to use the peer link as a backup link during fabric and/or DCI link failures.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>system nve infra-vlans <i>vlan-range</i></b> <b>Example:</b> <code>switch(config)# system nve infra-vlans 7</code>	Specifies VLANs used by all SVI interfaces for uplink and vPC peer-links in VXLAN as infra-VLANs. You should not configure certain combinations of infra-VLANs. For example, 2 and 514, 10 and 522, which are 512 apart.
<b>Step 3</b>	<b>interface <i>vlan-id</i></b> <b>Example:</b> <code>switch(config)# interface vlan7</code>	Configures the interface.
<b>Step 4</b>	<b>no shutdown</b> <b>Example:</b> <code>switch(config-if)# no shutdown</code>	Negates the <b>shutdown</b> command.
<b>Step 5</b>	<b>mtu <i>value</i></b> <b>Example:</b> <code>switch(config-if)# mtu 9216</code>	Sets the maximum transmission unit (MTU).
<b>Step 6</b>	<b>no ip redirects</b> <b>Example:</b> <code>switch(config-if)# no ip redirects</code>	Prevents the device from sending redirects.
<b>Step 7</b>	<b>ip address <i>ip-address/length</i></b> <b>Example:</b> <code>switch(config-if)# ip address 35.1.1.2/24</code>	Configures an IP address for this interface.
<b>Step 8</b>	<b>no ipv6 redirects</b> <b>Example:</b> <code>switch(config-if)# no ipv6 redirects</code>	Disables the ICMP redirect messages on BFD-enabled interfaces.
<b>Step 9</b>	<b>ip ospf cost <i>cost</i></b> <b>Example:</b>	Configures the OSPF cost metric for this interface.

	Command or Action	Purpose
	<code>switch(config-if)# ip ospf cost 100</code>	
<b>Step 10</b>	<b>ip ospf network point-to-point</b> <b>Example:</b> <code>switch(config-if)# ip ospf network point-to-point</code>	Specifies the OSPF point-to-point network.
<b>Step 11</b>	<b>ip router ospf instance area area-number</b> <b>Example:</b> <code>switch(config-if)# ip router ospf 1 area 0.0.0.0</code>	Configures the routing process for the IP on an interface and specifies an area.
<b>Step 12</b>	<b>ip pim sparse-mode</b> <b>Example:</b> <code>switch(config-if)# ip pim sparse-mode</code>	Configures sparse-mode PIM on an interface.

## Verifying the Multi-Site with vPC Support Configuration

To display Multi-Site with vPC support information, enter one of the following commands:

<b>show vpc brief</b>	Displays general vPC and CC status.
<b>show vpc consistency-parameters global</b>	Displays the status of those parameters that must be consistent across all vPC interfaces.
<b>show vpc consistency-parameters vni</b>	Displays configuration information for VNIs under the NVE interface that must be consistent across both vPC peers.

Output example for the **show vpc brief** command:

```
switch# show vpc brief
```

Legend:

(\*) - local vPC is down, forwarding via vPC peer-link

```
vPC domain id          : 1
Peer status            : peer adjacency formed ok      (<--- peer up)
vPC keep-alive status  : peer is alive
Configuration consistency status : success (<----- CC passed)
Per-vlan consistency status : success                  (<----- per-VNI CCpassed)
Type-2 consistency status : success
vPC role               : secondary
Number of vPCs configured : 1
Peer Gateway           : Enabled
Dual-active excluded VLANs : -
Graceful Consistency Check : Enabled
Auto-recovery status    : Enabled, timer is off.(timeout = 240s)
Delay-restore status     : Timer is off.(timeout = 30s)
Delay-restore SVI status : Timer is off.(timeout = 10s)
Operational Layer3 Peer-router : Disabled
[...]
```

Output example for the **show vpc consistency-parameters global** command:

```
switch# show vpc consistency-parameters global
```

Legend:

Type 1 : vPC will be suspended in case of mismatch

Name	Type	Local Value	Peer Value
[...]			
Nve1 Adm St, Src Adm St, Sec IP, Host Reach, VMAC Adv, SA,mcast l2, mcast l3, IR BGP,MS Adm St, Reo	1	Up, Up, 2.1.44.5, CP, TRUE, Disabled, 0.0.0.0, 0.0.0.0, Disabled, Up, 200.200.200.200	Up, Up, 2.1.44.5, CP, TRUE, Disabled, 0.0.0.0, 0.0.0.0, Disabled, Up, 200.200.200.200
[...]			

Output example for the **show vpc consistency-parameters vni** command:

```
switch(config-if-nve-vni)# show vpc consistency-parameters vni
```

Legend:

## Configuration Example for Multi-Site with Asymmetric VNIs

The following example shows how two sites with different sets of VNIs can connect to the same MAC VRF or IP VRF. One site uses VNI 200 internally, and the other site uses VNI 300 internally. Route-target auto no longer matches because the VNI values are different. Therefore, the route-target values must be manually configured. In this example, the value 222:333 stitches together the two VNIs from different sites.

The BGW of site 1 has L2VNI 200 and L3VNI 201.

The BGW of site 2 has L2VNI 300 and L3VNI 301.

### Note

This configuration example assumes that basic Multi-Site configurations are already in place.

### Note

You must have VLAN-to-VRF mapping on the BGW. This requirement is necessary to maintain L2VNI-to-L3VNI mapping, which is needed for reorigination of MAC-IP routes at BGWs.

### Layer 3 Configuration

In the BGW node of site 1, configure the common RT 201:301 for stitching the two sites using L3VNI 201 and L3VNI 301:

```
vrf context vni201
vni 201
address-family ipv4 unicast
```

```

route-target both auto evpn
route-target import 201:301 evpn
route-target export 201:301 evpn

```

In the BGW node of site 2, configure the common RT 201:301 for stitching the two sites using L3VNI 201 and L3VNI 301:

```

vrf context vni301
vni 301
address-family ipv4 unicast
route-target both auto evpn
route-target import 201:301 evpn
route-target export 201:301 evpn

```

## Layer 2 Configuration

In the BGW node of site 1, configure the common RT 222:333 for stitching the two sites using L2VNI 200 and L2VNI 300:

```

evpn
vni 200 l2
rd auto
route-target import auto
route-target import 222:333
route-target export auto
route-target export 222:333

```

For proper reorigination of L3 labels of MAC-IP routes, associate the VRF (L3VNI) to the L2VNI:

```

interface Vlan 200
vrf member vni201

```

In the BGW node of site 2, configure the common RT 222:333 for stitching the two sites using L2VNI 200 and L2VNI 300:

```

evpn
vni 300 l2
rd auto
route-target import auto
route-target import 222:333
route-target export auto
route-target export 222:333

```

For proper reorigination of L3 labels of MAC-IP routes, associate the VRF (L3VNI) to the L2VNI:

```

interface vlan 300
vrf member vni301

```

# TRM with Multi-Site

This section contains the following topics:

- [Information About Configuring TRM with Multi-Site, on page 207](#)
- [Guidelines and Limitations for TRM with Multi-Site, on page 209](#)
- [Configuring TRM with Multi-Site, on page 211](#)

- [Verifying TRM with Multi-Site Configuration, on page 212](#)

## Information About Configuring TRM with Multi-Site

Tenant Routed Multicast (TRM) with Multi-Site enables multicast forwarding across multiple VXLAN EVPN fabrics that are connected via Multi-Site. This feature provides Layer 3 multicast services across sites for sources and receivers across different sites. It addresses the requirement of East-West multicast traffic between sites.

Each TRM site is operating independently. Border gateways on each site allow stitching across the sites. There can be multiple border gateways for each site. Multicast source and receiver information across sites is propagated by BGP on the border gateways that are configured with TRM. The border gateway on each site receives the multicast packet and re-encapsulates the packet before sending it to the local site.

The border gateway that is elected as Designated Forwarder (DF) for the L3VNI forwards the traffic from fabric toward the core side. In the TRM Multicast-Anycast Gateway model, we use the VIP-R based model to send traffic toward remote sites. The IR destination IP is the VIP-R of the remote site. Each site that has the receiver gets only one copy from the source site.

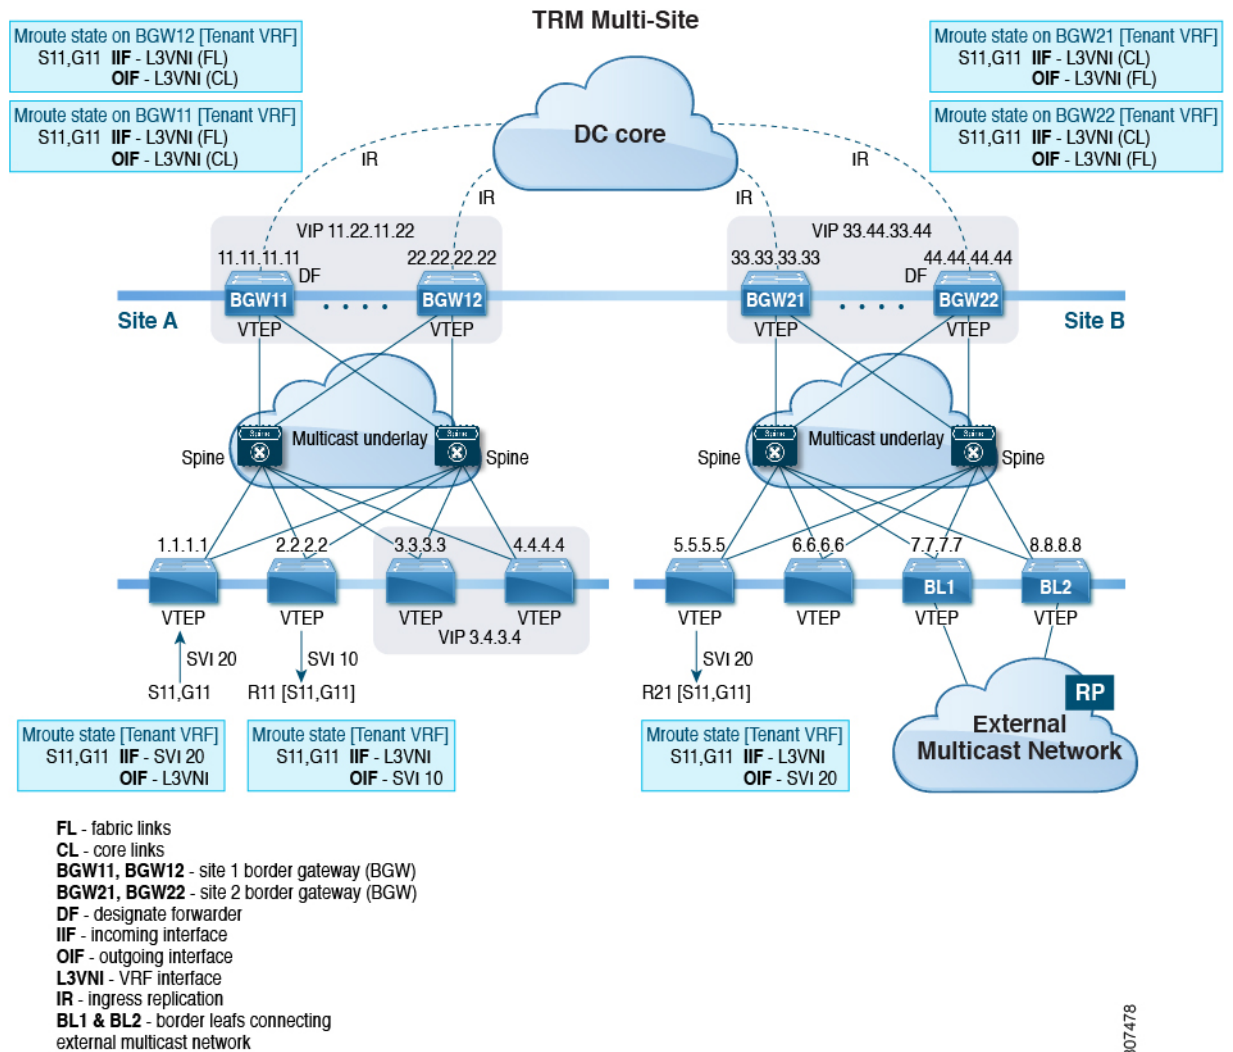

---

**Note** Only the DF sends the traffic toward remote sites.

---

On the remote site, the BGW that receives the inter-site multicast traffic from the core forwards the traffic toward the fabric side. The DF check is not done from the core to fabric direction because non-DF can also receive the VIP-R copy from the source site.

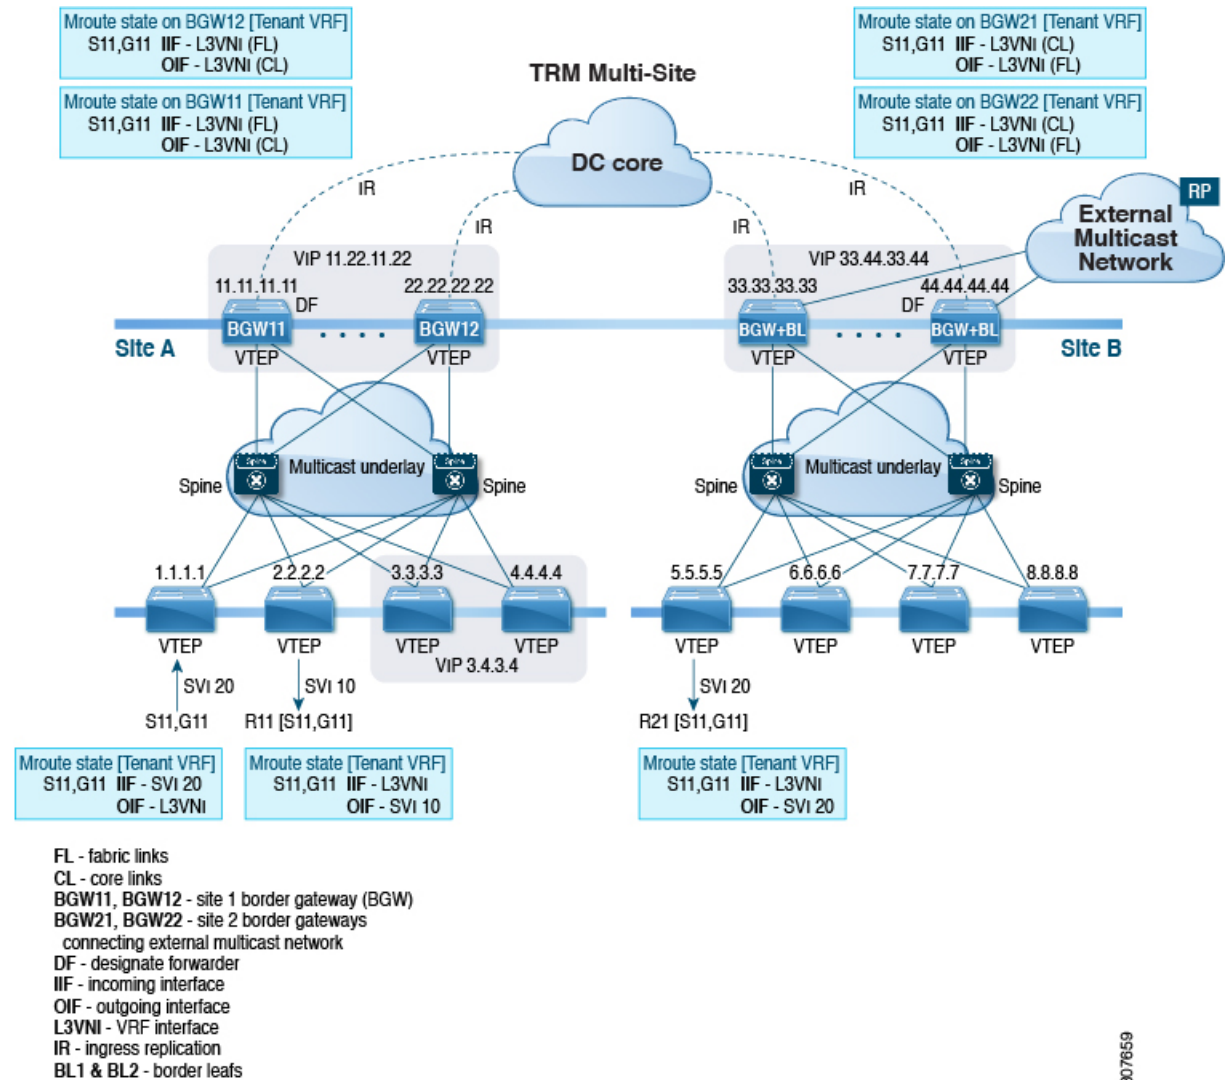

Figure 17: TRM with Multi-Site Topology, BL External Multicast Connectivity

Beginning with Cisco NX-OS Release 9.3(3), TRM with Multi-Site supports BGW connections to the external multicast network in addition to the BL connectivity, which is supported in previous releases. Forwarding occurs as documented in the previous example, except the exit point to the external multicast network can optionally be provided through the BGW.

307478

Figure 18: TRM with Multi-Site Topology, BGW External Multicast Connectivity

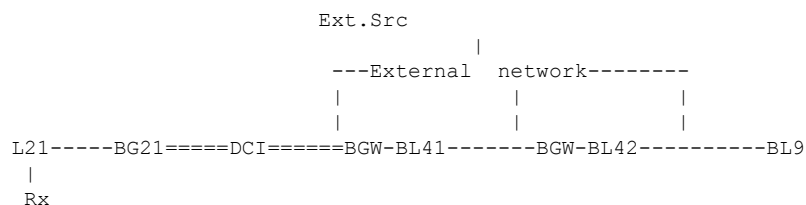

## Guidelines and Limitations for TRM with Multi-Site

TRM with Multi-Site has the following guidelines and limitations:

- The following platforms support TRM with Multi-Site:
  - Cisco Nexus 9300-EX platform switches
  - Cisco Nexus 9300-FX/FXP/FX2/FX3 platform switches
  - Cisco Nexus 9300-GX platform switches
  - Cisco Nexus 9500 platform switches with -EX/FX line cards
- TRM with Multi-Site supports the following features:

- PIM ASM multicast underlay in the VXLAN fabric
- TRM with Multi-Site Layer 3 mode only
- TRM with Multi-Site with Anycast Gateway
- Terminating VRF-lite at the border leaf
- The following RP models with TRM Multi-Site:
  - External RP
  - RP Everywhere
  - Internal RP
- Only ingress replication is supported between DCI peers across the core.
- Border routers reoriginate MVPN routes from fabric to core and from core to fabric.
- Only eBGP peering between border gateways of different sites is supported.
- Each site must have a local RP for the TRM underlay.
- Keep each site's underlay unicast routing isolated from another site's underlay unicast routing. This requirement also applies to Multi-Site.
- MVPN address family must be enabled between BGWs.
- When configuring BGW connections to the external multicast fabric, be aware of the following:
  - The multicast underlay must be configured between all BGWs on the fabric side even if the site doesn't have any leafs in the fabric site.
  - Sources and receivers that are Layer3-attached through VRF-Lite links to the BGW-BL nodes of a single site need to have reachability through the external Layer 3 network. If there's a Layer 3-attached source on BGBL-Node1 and a Layer 3-attached receiver on BGBL-Node2 for the same site, the traffic between these two endpoints flows through the external Layer 3 network and not through the fabric.
  - External multicast networks should be connected only through the BGW or BL. If a deployment requires external multicast network connectivity from both the BGW and BL at the same site, make sure that external routes that are learned from the BGW are preferred over the BL. To do so, the BGW must have a lower MED and a higher OSPF cost (on the external links) than the BL.

The following figure shows a site with external network connectivity through BGW-BLs and an internal leaf (BL). The path to the external source should be through BGW-BL41 or BGW-BL42 (rather than through BL9) to avoid duplication on the remote site receiver.

- MED is supported for iBGP only.

- vPC on Multi-Site border gateways isn't supported.
- Beginning with Cisco NX-OS Release 9.3(3), a border leaf and Multi-Site border gateway can coexist on the same node for multicast traffic.
- Beginning with Cisco NX-OS Release 9.3(3), all border gateways for a given site must run the same Cisco NX-OS 9.3(x) image.

## Configuring TRM with Multi-Site

### Before you begin

The following must be configured:

- VXLAN TRM
- VXLAN Multi-Site

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface nve1</b>  <b>Example:</b> <code>switch(config)# interface nve1</code>	Configures the NVE interface.
<b>Step 3</b>	<b>no shutdown</b>  <b>Example:</b> <code>switch(config-if-nve)# no shutdown</code>	Brings up the NVE interface.
<b>Step 4</b>	<b>host-reachability protocol bgp</b>  <b>Example:</b> <code>switch(config-if-nve)# host-reachability protocol bgp</code>	Defines BGP as the mechanism for host reachability advertisement.
<b>Step 5</b>	<b>source-interface loopback <i>src-if</i></b>  <b>Example:</b> <code>switch(config-if-nve)# source-interface loopback 0</code>	Defines the source interface, which must be a loopback interface with a valid /32 IP address. This /32 IP address must be known by the transient devices in the transport network and the remote VTEPs. This requirement is accomplished by advertising the address through a dynamic routing protocol in the transport network.
<b>Step 6</b>	<b>multisite border-gateway interface loopback <i>vi-num</i></b>  <b>Example:</b> <code>switch(config-if-nve)# multisite border-gateway interface loopback 1</code>	Defines the loopback interface used for the border gateway virtual IP address (VIP). The border-gateway interface must be a loopback interface that is configured on the switch with a valid /32 IP address. This /32 IP address must be known

	Command or Action	Purpose
		by the transient devices in the transport network and the remote VTEPs. This requirement is accomplished by advertising the address through a dynamic routing protocol in the transport network. This loopback must be different than the source interface loopback. The range of <i>vi-num</i> is from 0 to 1023.
<b>Step 7</b>	<b>member vni <i>vni-range</i> associate-vrf</b> <b>Example:</b> <pre>switch(config-if-nve)# member vni 10010 associate-vrf</pre>	Configures the virtual network identifier (VNI). The range for <i>vni-range</i> is from 1 to 16,777,214. The value of <i>vni-range</i> can be a single value like 5000 or a range like 5001-5008.
<b>Step 8</b>	<b>mcast-group <i>ip-addr</i></b> <b>Example:</b> <pre>switch(config-if-nve-vni)# mcast-group 225.0.0.1</pre>	Configures the NVE multicast group IP prefix within the fabric.
<b>Step 9</b>	<b>multisite ingress-replication optimized</b> <b>Example:</b> <pre>switch(config-if-nve-vni)# multisite ingress-replication optimized</pre>	Defines the Multi-Site BUM replication method for extending the Layer 2 VNI.

## Verifying TRM with Multi-Site Configuration

To display the status for the TRM with Multi-Site configuration, enter the following command:

Command	Purpose
<b>show nve vni <i>virtual-network-identifier</i></b>	Displays the L3VNI. <b>Note</b> For this feature, optimized IR is the default setting for the Multi-Site extended L3VNI. MS-IR flag inherently means that it's MS-IR optimized.

Example of the **show nve vni** command:

```
switch(config)# show nve vni 51001
Codes: CP - Control Plane      DP - Data Plane
       UC - Unconfigured      SA - Suppress ARP
       SU - Suppress Unknown Unicast
       Xconn - Crossconnect
       MS-IR - Multisite Ingress Replication
```

Interface	VNI	Multicast-group	State	Mode	Type [BD/VRF]	Flags
nve1	51001	226.0.0.1	Up	CP	L3 [cust_1]	MS-IR

## About Tenant Routed Multicast

Tenant Routed Multicast (TRM) enables multicast forwarding on the VXLAN fabric that uses a BGP-based EVPN control plane. TRM provides multi-tenancy aware multicast forwarding between senders and receivers within the same or different subnet local or across VTEPs.

This feature brings the efficiency of multicast delivery to VXLAN overlays. It is based on the standards-based next generation control plane (ngMVPN) described in IETF RFC 6513, 6514. TRM enables the delivery of customer IP multicast traffic in a multitenant fabric, and thus in an efficient and resilient manner. The delivery of TRM improves Layer-3 overlay multicast functionality in our networks.

While BGP EVPN provides the control plane for unicast routing, ngMVPN provides scalable multicast routing functionality. It follows an “always route” approach where every edge device (VTEP) with distributed IP Anycast Gateway for unicast becomes a Designated Router (DR) for Multicast. Bridged multicast forwarding is only present on the edge-devices (VTEP) where IGMP snooping optimizes the multicast forwarding to interested receivers. Every other multicast traffic beyond local delivery is efficiently routed.

Figure 19: VXLAN EVPN TRM

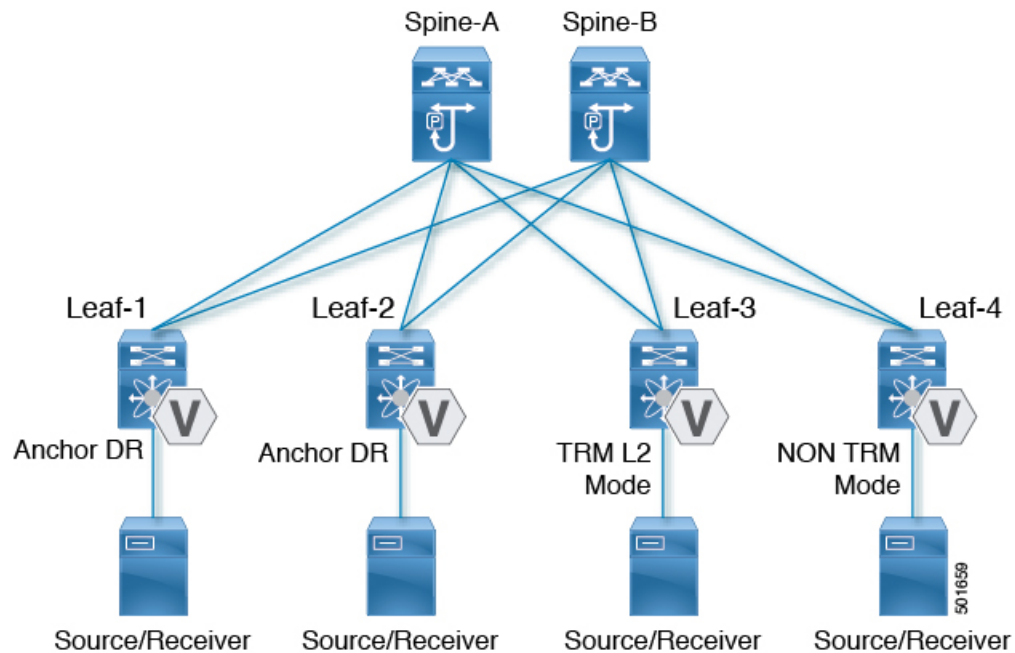

With TRM enabled, multicast forwarding in the underlay is leveraged to replicate VXLAN encapsulated routed multicast traffic. A Default Multicast Distribution Tree (Default-MDT) is built per-VRF. This is an addition to the existing multicast groups for Layer-2 VNI Broadcast, Unknown Unicast, and Layer-2 multicast replication group. The individual multicast group addresses in the overlay are mapped to the respective underlay multicast address for replication and transport. The advantage of using a BGP-based approach allows the VXLAN BGP EVPN fabric with TRM to operate as fully distributed Overlay Rendezvous-Point (RP), with the RP presence on every edge-device (VTEP).

A multicast-enabled data center fabric is typically part of an overall multicast network. Multicast sources, receivers, and multicast rendezvous points, might reside inside the data center but might also be inside the campus or externally reachable via the WAN. TRM allows a seamless integration with existing multicast networks. It can leverage multicast rendezvous points external to the fabric. Furthermore, TRM allows for tenant-aware external connectivity using Layer-3 physical interfaces or subinterfaces.

## About Tenant Routed Multicast Mixed Mode

Figure 20: TRM Layer 2/Layer 3 Mixed Mode

## Guidelines and Limitations for Tenant Routed Multicast

Tenant Routed Multicast (TRM) has the following guidelines and limitations:

- With Tenant Routed Multicast enabled, FEX is not supported.
- The Guidelines and Limitations for VXLAN also apply to TRM.
- With TRM enabled, SVI as a core link is not supported.
- If TRM is configured, ISSU is disruptive.
- TRM supports IPv4 multicast only.
- TRM requires an IPv4 multicast-based underlay using PIM Any Source Multicast (ASM) which is also known as sparse mode.
- TRM supports overlay PIM ASM and PIM SSM only. PIM BiDir is not supported in the overlay.
- RP has to be configured either internal or external to the fabric.
- The internal RP must be configured on all TRM-enabled VTEPs including the border nodes.
- The external RP must be external to the border nodes.
- The RP must be configured within the VRF pointing to the external RP IP address (static RP). This ensures that unicast and multicast routing is enabled to reach the external RP in the given VRF.

- TRM with Multi-Site is not supported on Cisco Nexus 9504-R platforms.
- TRM supports multiple border nodes. Reachability to an external RP/source via multiple border leaf switches is supported with ECMP and requires symmetric unicast routing.
- Both PIM and **ip igmp snooping vxlan** must be enabled on the L3 VNI's VLAN in a VXLAN vPC setup.
- For traffic streams with an internal source and external L3 receiver using an external RP, the external L3 receiver might send PIM S,G join requests to the internal source. Doing so triggers the recreation of S,G on the fabric FHR, and it can take up to 10 minutes for this S,G to be cleared.

## Guidelines and Limitations for Layer 3 Tenant Routed Multicast

Layer 3 Tenant Routed Multicast (TRM) has the following configuration guidelines and limitations:

- When upgrading from Cisco NX-OS Release 9.3(3) to Cisco NX-OS Release 9.3(6), if you do not retain configurations of the TRM enabled VRFs from Cisco NX-OS Release 9.3(3), or if you create new VRFs after the upgrade, the auto-generation of **ip multicast multipath s-g-hash next-hop-based** CLI, when **feature ngmvpn** is enabled, will not happen. You must enable the CLI manually for each TRM enabled VRF.
- Layer 3 TRM is supported for Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2/FX3/FXP and 9300-GX platform switches.
- Cisco Nexus 9300-GX platform switches do not support the combination of Layer 3 TRM and EVPN Multi-Site.
- Beginning with Cisco NX-OS Release 9.3(3), the Cisco Nexus 9504 and 9508 platform switches with -R/RX line cards support TRM in Layer 3 mode. This feature is supported on IPv4 overlays only. Layer 2 mode and L2/L3 mixed mode are not supported.

The Cisco Nexus 9504 and 9508 platform switches with -R/RX line cards can function as a border leaf for Layer 3 unicast traffic. For Anycast functionality, the RP can be internal, external, or RP everywhere.

- When configuring TRM VXLAN BGP EVPN, the following platforms are supported:
  - Cisco Nexus 9200, 9332C, 9364C, 9300-EX, and 9300-FX/FX2/FX3/FXP platform switches.
  - Cisco Nexus 9500 platform switches with 9700-EX line cards, 9700-FX line cards, or a combination of both line cards.
- Layer 3 TRM and VXLAN EVPN Multi-Site are supported on the same physical switch. For more information, see [Configuring Multi-Site](#).
- TRM Multi-Site functionality is not supported on Cisco Nexus 9504 platform switches with -R/RX line cards.
- If one or both VTEPs is a Cisco Nexus 9504 or 9508 platform switch with -R/RX line cards, the packet TTL is decremented twice, once for routing to the L3 VNI on the source leaf and once for forwarding from the destination L3 VNI to the destination VLAN on the destination leaf.
- TRM with vPC border leafs is supported only for Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2/FX3 platform switches and Cisco Nexus 9500 platform switches with -EX/FX or -R/RX line cards. The **advertise-pip** and **advertise virtual-rmac** commands must be enabled on the border leafs to support this functionality. For configuration information, see the "Configuring VIP/PIP" section.

- Well-known local scope multicast (224.0.0.0/24) is excluded from TRM and is bridged.
- When an interface NVE is brought down on the border leaf, the internal overlay RP per VRF must be brought down.

## Guidelines and Limitations for Layer 2/Layer 3 Tenant Routed Multicast (Mixed Mode)

Layer 2/Layer 3 Tenant Routed Multicast (TRM) has the following configuration guidelines and limitations:

- All TRM Layer 2/Layer 3 configured switches must be Anchor DR. This is because in TRM Layer 2/Layer 3, you can have switches configured with TRM Layer 2 mode that co-exist in the same topology. This mode is necessary if non-TRM and Layer 2 TRM mode edge devices (VTEPs) are present in the same topology.
- Anchor DR is required to be an RP in the overlay.
- An extra loopback is required for anchor DRs.
- Non-TRM and Layer 2 TRM mode edge devices (VTEPs) require an IGMP snooping querier configured per multicast-enabled VLAN. Every non-TRM and Layer 2 TRM mode edge device (VTEP) requires this IGMP snooping querier configuration because in TRM multicast control-packets are not forwarded over VXLAN.
- The IP address for the IGMP snooping querier can be re-used on non-TRM and Layer 2 TRM mode edge devices (VTEPs).
- The IP address of the IGMP snooping querier in a VPC domain must be different on each VPC member device.
- When interface NVE is brought down on the border leaf, the internal overlay RP per VRF should be brought down.
- Beginning with Cisco NX-OS Release 9.2(1), TRM with vPC border leafs is supported. Advertise-PIP and Advertise Virtual-Rmac need to be enabled on border leafs to support with functionality. For configuring advertise-pip and advertise virtual-rmac, see the "Configuring VIP/PIP" section.
- Anchor DR is supported only on the following hardware platforms:
  - Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2 platform switches
  - Cisco Nexus 9500 platform switches with 9700-EX line cards, 9700-FX line cards, or a combination of both line cards
- Layer 2/Layer 3 Tenant Routed Multicast (TRM) is not supported on Cisco Nexus 9300-FX3 platform switches.
- Layer 2/Layer 3 Tenant Routed Multicast (TRM) is not supported on Cisco Nexus 9300-GX platform switches.

## Rendezvous Point for Tenant Routed Multicast

With TRM enabled Internal and External RP is supported. The following table displays the first release in which RP positioning is or is not supported.

	RP Internal	RP External	PIM-Based RP Everywhere
TRM L2 Mode	N/A	N/A	N/A
TRM L3 Mode	7.0(3)I7(1), 9.2(x)	7.0(3)I7(4), 9.2(3)	<p>Supported in 7.0(3)I7(x) releases starting from 7.0(3)I7(5)</p> <p>Not supported in 9.2(x)</p> <p>Supported in NX-OS releases beginning with 9.3(1) for the following Nexus 9000 switches:</p> <ul style="list-style-type: none"> <li>• Cisco Nexus 9200 Series switches</li> <li>• Cisco Nexus 9364C platform switches</li> <li>• Cisco Nexus 9300-EX/FX/FX2 platform switches (excluding the Cisco Nexus 9300-FXP platform switch)</li> </ul> <p>Supported for Cisco Nexus 9300-FX3 platform switches beginning with Cisco NX-OS Release 9.3(5)</p>
TRM L2L3 Mode	7.0(3)I7(1), 9.2(x)	N/A	N/A

## Configuring a Rendezvous Point for Tenant Routed Multicast

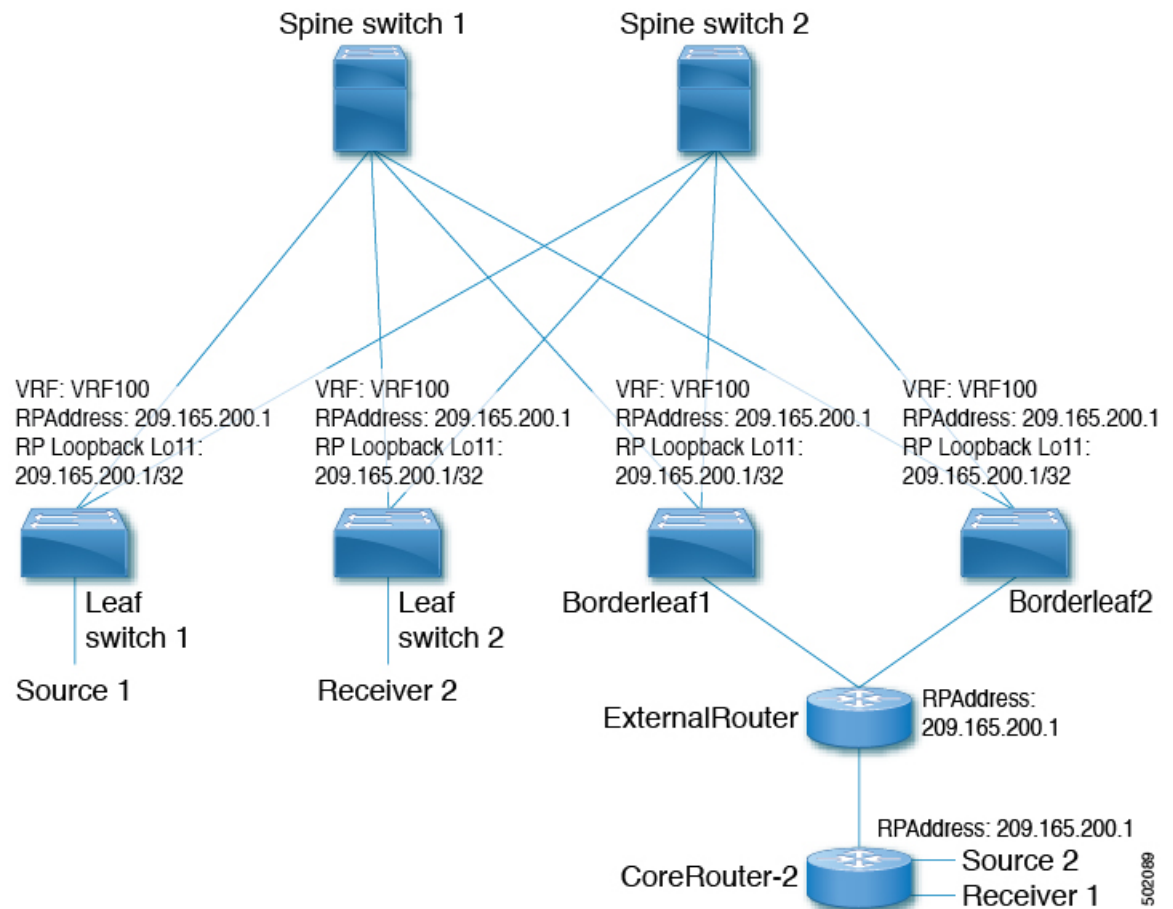

For Tenant Routed Multicast, the following rendezvous point options are supported:

- [Configuring a Rendezvous Point Inside the VXLAN Fabric, on page 219](#)
- [Configuring an External Rendezvous Point, on page 220](#)
- [Configuring RP Everywhere with PIM Anycast, on page 222](#)

- [Configuring RP Everywhere with MSDP Peering, on page 228](#)

## Configuring a Rendezvous Point Inside the VXLAN Fabric

Configure the loopback for the TRM VRFs with the following commands on all devices (VTEP). Ensure it is reachable within EVPN (advertise/redistribute).

### SUMMARY STEPS

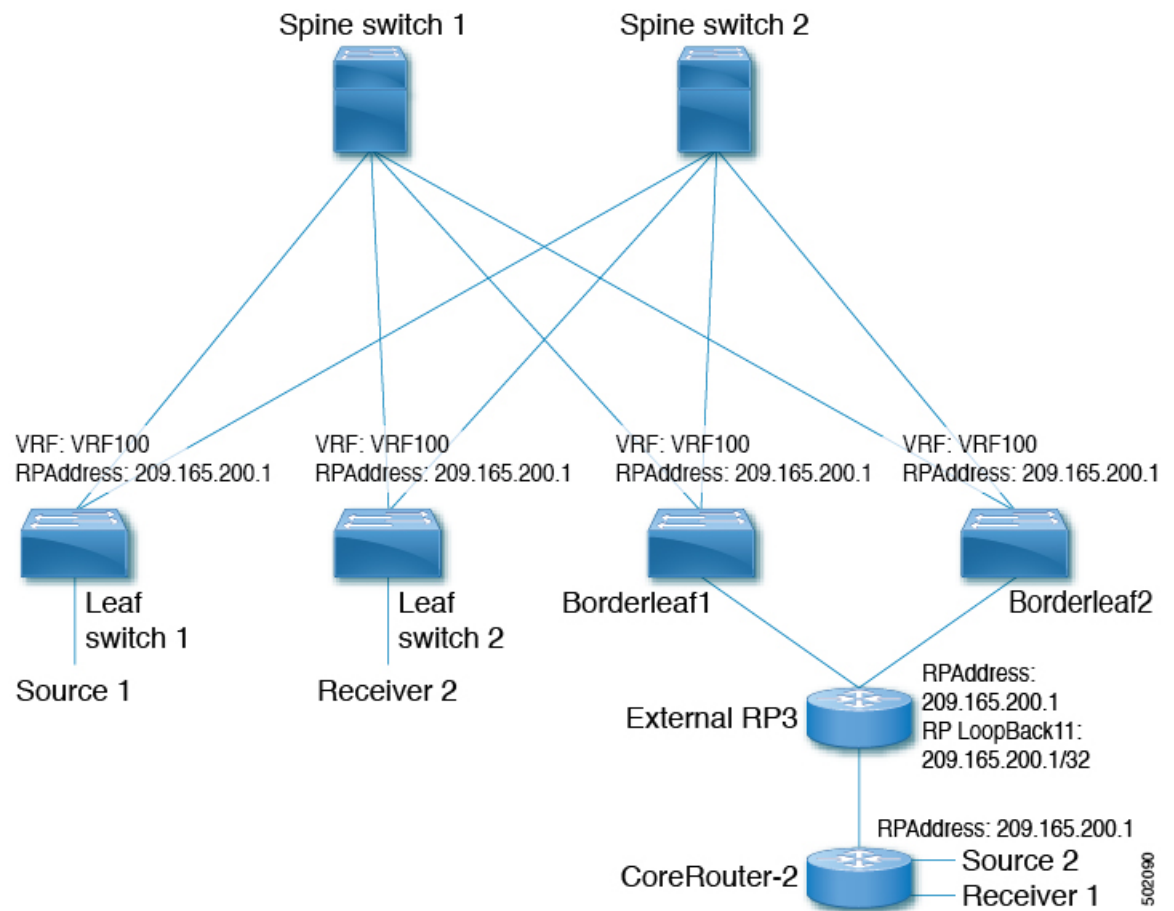

1. **configure terminal**
2. **interface loopback** *loopback\_number*
3. **vrf member** *vxlان-number*
4. **ip address** *ip-address*
5. **ip pim sparse-mode**
6. **vrf context** *vrf-name*
7. **ip pim rp-address** *ip-address-of-router group-list group-range-prefix*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface loopback <i>loopback_number</i></b>  <b>Example:</b> <code>switch(config)# interface loopback 11</code>	Configure the loopback interface on all TRM-enabled nodes. This enables the rendezvous point inside the fabric.
<b>Step 3</b>	<b>vrf member <i>vxlان-number</i></b>  <b>Example:</b> <code>switch(config-if)# vrf member vrf100</code>	Configure VRF name.
<b>Step 4</b>	<b>ip address <i>ip-address</i></b>  <b>Example:</b> <code>switch(config-if)# ip address 209.165.200.1/32</code>	Specify IP address.
<b>Step 5</b>	<b>ip pim sparse-mode</b>  <b>Example:</b> <code>switch(config-if)# ip pim sparse-mode</code>	Configure sparse-mode PIM on an interface.
<b>Step 6</b>	<b>vrf context <i>vrf-name</i></b>  <b>Example:</b> <code>switch(config-if)# vrf context vrf100</code>	Create a VXLAN tenant VRF.
<b>Step 7</b>	<b>ip pim rp-address <i>ip-address-of-router</i> <i>group-list</i> <i>group-range-prefix</i></b>  <b>Example:</b> <code>switch(config-vrf)# ip pim rp-address 209.165.200.1 group-list 224.0.0.0/4</code>	The value of the <i>ip-address-of-router</i> parameter is that of the RP. The same IP address must be on all the edge devices (VTEPs) for a fully distributed RP.

## Configuring an External Rendezvous Point

Configure the external rendezvous point (RP) IP address within the TRM VRFs on all devices (VTEP). In addition, ensure reachability of the external RP within the VRF via the border node.

## SUMMARY STEPS

1. **configure terminal**
2. **vrf context vrf100**
3. **ip pim rp-address *ip-address-of-router* group-list group-range-prefix**

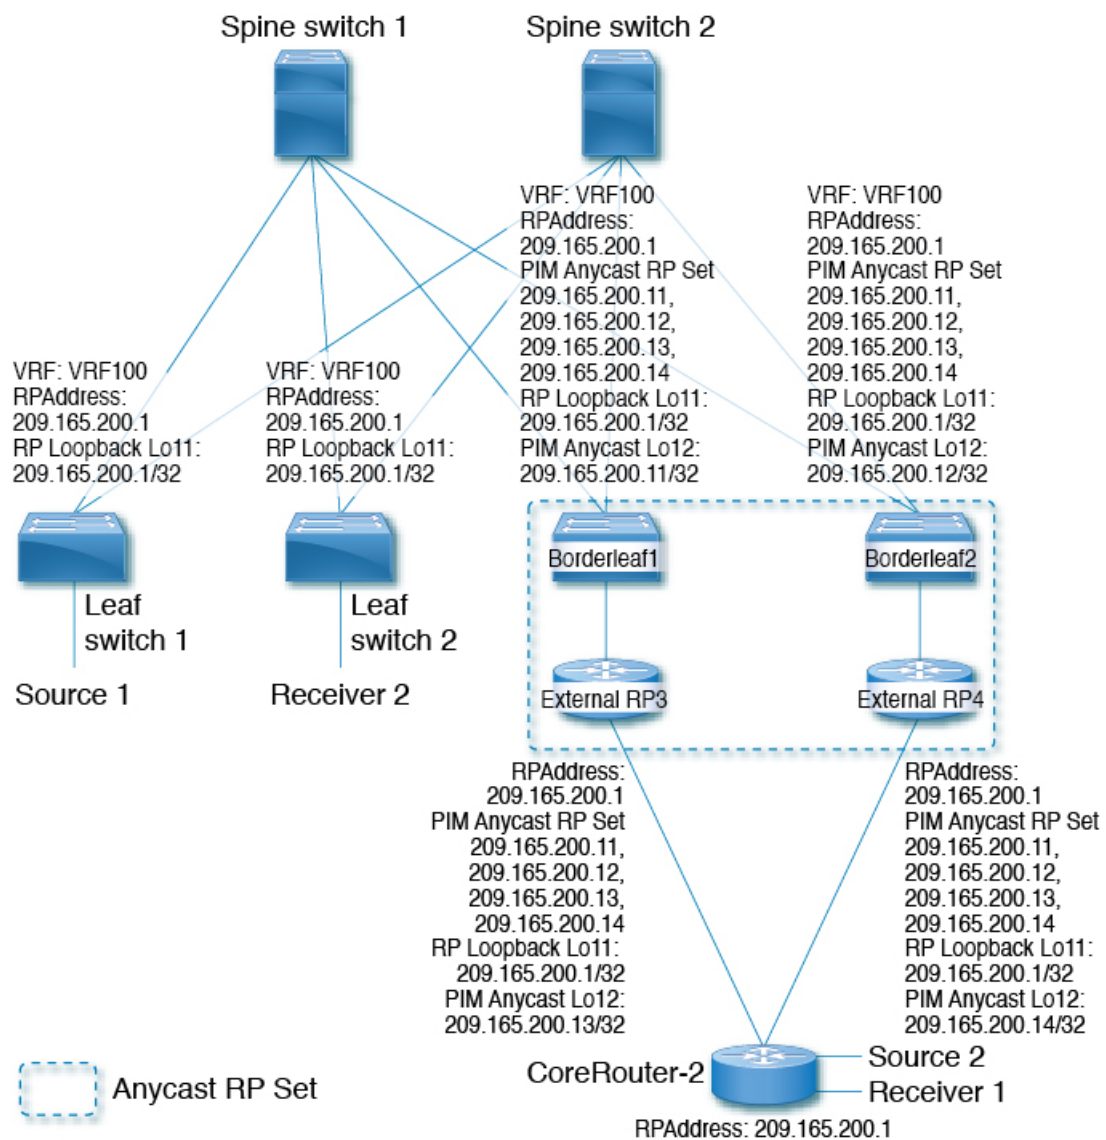

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> switch# <b>configure terminal</b>	Enter configuration mode.
Step 2	<b>vrf context vrf100</b>  <b>Example:</b> switch(config)# <b>vrf context vrf100</b>	Enter configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>ip pim rp-address <i>ip-address-of-router</i> group-list <i>group-range-prefix</i></b>  <b>Example:</b> <pre>switch(config-vrf)# ip pim rp-address 209.165.200.1 group-list 224.0.0.0/4</pre>	The value of the <i>ip-address-of-router</i> parameter is that of the RP. The same IP address must be on all of the edge devices (VTEPs) for a fully distributed RP.

## Configuring RP Everywhere with PIM Anycast

RP Everywhere configuration with PIM Anycast solution.

For information about configuring RP Everywhere with PIM Anycast, see:

- [Configuring a TRM Leaf Node for RP Everywhere with PIM Anycast, on page 223](#)
- [Configuring a TRM Border Leaf Node for RP Everywhere with PIM Anycast, on page 224](#)
- [Configuring an External Router for RP Everywhere with PIM Anycast, on page 226](#)

## Configuring a TRM Leaf Node for RP Everywhere with PIM Anycast

Configuration of Tenant Routed Multicast (TRM) leaf node for RP Everywhere.

### SUMMARY STEPS

1. **configure terminal**
2. **interface loopback** *loopback\_number*
3. **vrf member** *vrf-name*
4. **ip address** *ip-address*
5. **ip pim sparse-mode**
6. **vrf context** *vxlان*
7. **ip pim rp-address** *ip-address-of-router* **group-list** *group-range-prefix*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enter configuration mode.
Step 2	<b>interface loopback</b> <i>loopback_number</i>  <b>Example:</b> <code>switch(config)# interface loopback 11</code>	Configure the loopback interface on all VXLAN VTEP devices.
Step 3	<b>vrf member</b> <i>vrf-name</i>  <b>Example:</b> <code>switch(config-if)# vrf member vrf100</code>	Configure VRF name.
Step 4	<b>ip address</b> <i>ip-address</i>  <b>Example:</b> <code>switch(config-if)# ip address 209.165.200.1/32</code>	Specify IP address.
Step 5	<b>ip pim sparse-mode</b>  <b>Example:</b> <code>switch(config-if)# ip pim sparse-mode</code>	Configure sparse-mode PIM on an interface.
Step 6	<b>vrf context</b> <i>vxlان</i>  <b>Example:</b> <code>switch(config-if)# vrf context vrf100</code>	Create a VXLAN tenant VRF.

	Command or Action	Purpose
<b>Step 7</b>	<b>ip pim rp-address</b> <i>ip-address-of-router</i> <b>group-list</b> <i>group-range-prefix</i>  <b>Example:</b> <pre>switch(config-vrf)# ip pim rp-address 209.165.200.1 group-list 224.0.0.0/4</pre>	The value of the <i>ip-address-of-router</i> parameters is that of the RP. The same IP address must be on all the edge devices (VTEPs) for a fully distributed RP.

## Configuring a TRM Border Leaf Node for RP Everywhere with PIM Anycast

Configuring the TRM Border Leaf Node for RP Anywhere with PIM Anycast.

### SUMMARY STEPS

1. **configure terminal**
2. **ip pim evpn-border-leaf**
3. **interface loopback** *loopback\_number*
4. **vrf member** *vrf-name*
5. **ip address** *ip-address*
6. **ip pim sparse-mode**
7. **interface loopback** *loopback\_number*
8. **vrf member** *vxlan-number*
9. **ip address** *ip-address*
10. **ip pim sparse-mode**
11. **vrf context** *vrf-name*
12. **ip pim rp-address** *ip-address-of-router* **group-list** *group-range-prefix*
13. **ip pim anycast-rp** *anycast-rp-address* *address-of-rp*
14. **ip pim anycast-rp** *anycast-rp-address* *address-of-rp*
15. **ip pim anycast-rp** *anycast-rp-address* *address-of-rp*
16. **ip pim anycast-rp** *anycast-rp-address* *address-of-rp*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal</pre>	Enter configuration mode.
<b>Step 2</b>	<b>ip pim evpn-border-leaf</b>  <b>Example:</b> <pre>switch(config)# ip pim evpn-border-leaf</pre>	Configure VXLAN VTEP as TRM border leaf node,
<b>Step 3</b>	<b>interface loopback</b> <i>loopback_number</i>  <b>Example:</b> <pre>switch(config)# interface loopback 11</pre>	Configure the loopback interface on all VXLAN VTEP devices.

	Command or Action	Purpose
<b>Step 4</b>	<b>vrf member</b> <i>vrf-name</i> <b>Example:</b> switch(config-if) # <b>vrf member vrf100</b>	Configure VRF name.
<b>Step 5</b>	<b>ip address</b> <i>ip-address</i> <b>Example:</b> switch(config-if) # <b>ip address 209.165.200.1/32</b>	Specify IP address.
<b>Step 6</b>	<b>ip pim sparse-mode</b> <b>Example:</b> switch(config-if) # <b>ip pim sparse-mode</b>	Configure sparse-mode PIM on an interface.
<b>Step 7</b>	<b>interface loopback</b> <i>loopback_number</i> <b>Example:</b> switch(config) # <b>interface loopback 12</b>	Configure the PIM Anycast set RP loopback interface.
<b>Step 8</b>	<b>vrf member</b> <i>vxlan-number</i> <b>Example:</b> switch(config-if) # <b>vrf member vxlan-number</b>	Configure VRF name.
<b>Step 9</b>	<b>ip address</b> <i>ip-address</i> <b>Example:</b> switch(config-if) # <b>ip address 209.165.200.11/32</b>	Specify IP address.
<b>Step 10</b>	<b>ip pim sparse-mode</b> <b>Example:</b> switch(config-if) # <b>ip pim sparse-mode</b>	Configure sparse-mode PIM on an interface.
<b>Step 11</b>	<b>vrf context</b> <i>vrf-name</i> <b>Example:</b> switch(config-if) # <b>vrf context vrf100</b>	Create a VXLAN tenant VRF.
<b>Step 12</b>	<b>ip pim rp-address</b> <i>ip-address-of-router</i> <b>group-list</b> <i>group-range-prefix</i> <b>Example:</b> switch(config-vrf) # <b>ip pim rp-address 209.165.200.1 group-list 224.0.0.0/4</b>	The value of the <i>ip-address-of-router</i> parameters is that of the RP. The same IP address must be on all the edge devices (VTEPs) for a fully distributed RP.
<b>Step 13</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address</i> <i>address-of-rp</i> <b>Example:</b> switch(config-vrf) # <b>ip pim anycast-rp 209.165.200.1 209.165.200.11</b>	Configure PIM Anycast RP set.
<b>Step 14</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address</i> <i>address-of-rp</i> <b>Example:</b>	Configure PIM Anycast RP set.

	Command or Action	Purpose
	<code>switch(config-vrf)# ip pim anycast-rp 209.165.200.1 209.165.200.12</code>	
<b>Step 15</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address address-of-rp</i> <b>Example:</b> <code>switch(config-vrf)# ip pim anycast-rp 209.165.200.1 209.165.200.13</code>	Configure PIM Anycast RP set.
<b>Step 16</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address address-of-rp</i> <b>Example:</b> <code>switch(config-vrf)# ip pim anycast-rp 209.165.200.1 209.165.200.14</code>	Configure PIM Anycast RP set.

## Configuring an External Router for RP Everywhere with PIM Anycast

Use this procedure to configure an external router for RP Everywhere.

### SUMMARY STEPS

1. **configure terminal**
2. **interface loopback** *loopback\_number*
3. **vrf member** *vrf-name*
4. **ip address** *ip-address*
5. **ip pim sparse-mode**
6. **interface loopback** *loopback\_number*
7. **vrf member** *vxlan-number*
8. **ip address** *ip-address*
9. **ip pim sparse-mode**
10. **vrf context** *vxlan*
11. **ip pim rp-address** *ip-address-of-router group-list group-range-prefix*
12. **ip pim anycast-rp** *anycast-rp-address address-of-rp*
13. **ip pim anycast-rp** *anycast-rp-address address-of-rp*
14. **ip pim anycast-rp** *anycast-rp-address address-of-rp*
15. **ip pim anycast-rp** *anycast-rp-address address-of-rp*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enter configuration mode.
<b>Step 2</b>	<b>interface loopback</b> <i>loopback_number</i> <b>Example:</b>	Configure the loopback interface on all VXLAN VTEP devices.

	Command or Action	Purpose
	<code>switch(config)# interface loopback 11</code>	
<b>Step 3</b>	<b>vrf member</b> <i>vrf-name</i> <b>Example:</b> <code>switch(config-if)# vrf member vrf100</code>	Configure VRF name.
<b>Step 4</b>	<b>ip address</b> <i>ip-address</i> <b>Example:</b> <code>switch(config-if)# ip address 209.165.200.1/32</code>	Specify IP address.
<b>Step 5</b>	<b>ip pim sparse-mode</b> <b>Example:</b> <code>switch(config-if)# ip pim sparse-mode</code>	Configure sparse-mode PIM on an interface.
<b>Step 6</b>	<b>interface loopback</b> <i>loopback_number</i> <b>Example:</b> <code>switch(config)# interface loopback 12</code>	Configure the PIM Anycast set RP loopback interface.
<b>Step 7</b>	<b>vrf member</b> <i>vrf-name</i> <b>Example:</b> <code>switch(config-if)# vrf member vrf100</code>	Configure VRF name.
<b>Step 8</b>	<b>ip address</b> <i>ip-address</i> <b>Example:</b> <code>switch(config-if)# ip address 209.165.200.13/32</code>	Specify IP address.
<b>Step 9</b>	<b>ip pim sparse-mode</b> <b>Example:</b> <code>switch(config-if)# ip pim sparse-mode</code>	Configure sparse-mode PIM on an interface.
<b>Step 10</b>	<b>vrf context</b> <i>vrf-name</i> <b>Example:</b> <code>switch(config-if)# vrf context vrf100</code>	Create a VXLAN tenant VRF.
<b>Step 11</b>	<b>ip pim rp-address</b> <i>ip-address-of-router group-list group-range-prefix</i> <b>Example:</b> <code>switch(config-vrf)# ip pim rp-address 209.165.200.1 group-list 224.0.0.0/4</code>	The value of the <i>ip-address-of-router</i> parameters is that of the RP. The same IP address must be on all the edge devices (VTEPs) for a fully distributed RP.
<b>Step 12</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address address-of-rp</i> <b>Example:</b> <code>switch(config-vrf)# ip pim anycast-rp 209.165.200.1 209.165.200.11</code>	Configure PIM Anycast RP set.

	Command or Action	Purpose
<b>Step 13</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address address-of-rp</i> <b>Example:</b> <pre>switch(config-vrf)# ip pim anycast-rp 209.165.200.1 209.165.200.12</pre>	Configure PIM Anycast RP set.
<b>Step 14</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address address-of-rp</i> <b>Example:</b> <pre>switch(config-vrf)# ip pim anycast-rp 209.165.200.1 209.165.200.13</pre>	Configure PIM Anycast RP set.
<b>Step 15</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address address-of-rp</i> <b>Example:</b> <pre>switch(config-vrf)# ip pim anycast-rp 209.165.200.1 209.165.200.14</pre>	Configure PIM Anycast RP set.

## Configuring RP Everywhere with MSDP Peering

RP Everywhere configuration with MSDP RP solution.

For information about configuring RP Everywhere with MSDP Peering, see:

- [Configuring a TRM Leaf Node for RP Everywhere with MSDP Peering, on page 229](#)
- [Configuring a TRM Border Leaf Node for RP Everywhere with MSDP Peering, on page 230](#)
- [Configuring an External Router for RP Everywhere with MSDP Peering, on page 233](#)

## Configuring a TRM Leaf Node for RP Everywhere with MSDP Peering

Configuring a TRM leaf node for RP Everywhere with MSDP peering.

### SUMMARY STEPS

1. **configure terminal**
2. **interface loopback** *loopback\_number*
3. **vrf member** *vrf-name*
4. **ip address** *ip-address*

5. **ip pim sparse-mode**
6. **vrf context** *vrf-name*
7. **ip pim rp-address** *ip-address-of-router* **group-list** *group-range-prefix*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> switch# <b>configure terminal</b>	Enter configuration mode.
<b>Step 2</b>	<b>interface loopback</b> <i>loopback_number</i>  <b>Example:</b> switch(config)# <b>interface loopback 11</b>	Configure the loopback interface on all VXLAN VTEP devices.
<b>Step 3</b>	<b>vrf member</b> <i>vrf-name</i>  <b>Example:</b> switch(config-if)# <b>vrf member vrf100</b>	Configure VRF name.
<b>Step 4</b>	<b>ip address</b> <i>ip-address</i>  <b>Example:</b> switch(config-if)# <b>ip address 209.165.200.1/32</b>	Specify IP address.
<b>Step 5</b>	<b>ip pim sparse-mode</b>  <b>Example:</b> switch(config-if)# <b>ip pim sparse-mode</b>	Configure sparse-mode PIM on an interface.
<b>Step 6</b>	<b>vrf context</b> <i>vrf-name</i>  <b>Example:</b> switch(config-if)# <b>vrf context vrf100</b>	Create a VXLAN tenant VRF.
<b>Step 7</b>	<b>ip pim rp-address</b> <i>ip-address-of-router</i> <b>group-list</b> <i>group-range-prefix</i>  <b>Example:</b> switch(config-vrf)# <b>ip pim rp-address 209.165.200.1</b> <b>group-list 224.0.0.0/4</b>	The value of the <i>ip-address-of-router</i> parameters is that of the RP. The same IP address must be on all the edge devices (VTEPs) for a fully distributed RP.

## Configuring a TRM Border Leaf Node for RP Everywhere with MSDP Peering

Use this procedure to configure a TRM border leaf for RP Everywhere with PIM Anycast.

## SUMMARY STEPS

1. **configure terminal**
2. **feature msdp**
3. **ip pim evpn-border-leaf**

4. **interface loopback** *loopback\_number*
5. **vrf member** *vrf-name*
6. **ip address** *ip-address*
7. **ip pim sparse-mode**
8. **interface loopback** *loopback\_number*
9. **vrf member** *vrf-name*
10. **ip address** *ip-address*
11. **ip pim sparse-mode**
12. **vrf context** *vrf-name*
13. **ip pim rp-address** *ip-address-of-router* **group-list** *group-range-prefix*
14. **ip pim anycast-rp** *anycast-rp-address* *address-of-rp*
15. **ip pim anycast-rp** *anycast-rp-address* *address-of-rp*
16. **ip msdp originator-id** *loopback*
17. **ip msdp peer** *ip-address* **connect-source** *loopback*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enter configuration mode.
<b>Step 2</b>	<b>feature msdp</b>  <b>Example:</b> <code>switch(config)# feature msdp</code>	Enable feature MSDP.
<b>Step 3</b>	<b>ip pim evpn-border-leaf</b>  <b>Example:</b> <code>switch(config)# ip pim evpn-border-leaf</code>	Configure VXLAN VTEP as TRM border leaf node,
<b>Step 4</b>	<b>interface loopback</b> <i>loopback_number</i>  <b>Example:</b> <code>switch(config)# interface loopback 11</code>	Configure the loopback interface on all VXLAN VTEP devices.
<b>Step 5</b>	<b>vrf member</b> <i>vrf-name</i>  <b>Example:</b> <code>switch(config-if)# vrf member vrf100</code>	Configure VRF name.
<b>Step 6</b>	<b>ip address</b> <i>ip-address</i>  <b>Example:</b> <code>switch(config-if)# ip address 209.165.200.1/32</code>	Specify IP address.
<b>Step 7</b>	<b>ip pim sparse-mode</b>  <b>Example:</b> <code>switch(config-if)# ip pim sparse-mode</code>	Configure sparse-mode PIM on an interface.

	Command or Action	Purpose
<b>Step 8</b>	<b>interface loopback</b> <i>loopback_number</i> <b>Example:</b> switch(config)# <b>interface loopback 12</b>	Configure the PIM Anycast set RP loopback interface.
<b>Step 9</b>	<b>vrf member</b> <i>vrf-name</i> <b>Example:</b> switch(config-if)# <b>vrf member vrf100</b>	Configure VRF name.
<b>Step 10</b>	<b>ip address</b> <i>ip-address</i> <b>Example:</b> switch(config-if)# <b>ip address 209.165.200.11/32</b>	Specify IP address.
<b>Step 11</b>	<b>ip pim sparse-mode</b> <b>Example:</b> switch(config-if)# <b>ip pim sparse-mode</b>	Configure sparse-mode PIM on an interface.
<b>Step 12</b>	<b>vrf context</b> <i>vrf-name</i> <b>Example:</b> switch(config-if)# <b>vrf context vrf100</b>	Create a VXLAN tenant VRF.
<b>Step 13</b>	<b>ip pim rp-address</b> <i>ip-address-of-router</i> <b>group-list</b> <i>group-range-prefix</i> <b>Example:</b> switch(config-vrf)# <b>ip pim rp-address 209.165.200.1 group-list 224.0.0.0/4</b>	The value of the <i>ip-address-of-router</i> parameter is that of the RP. The same IP address must be on all the edge devices (VTEPs) for a fully distributed RP.
<b>Step 14</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address</i> <i>address-of-rp</i> <b>Example:</b> switch(config-vrf)# <b>ip pim anycast-rp 209.165.200.1 209.165.200.11</b>	Configure PIM Anycast RP set.
<b>Step 15</b>	<b>ip pim anycast-rp</b> <i>anycast-rp-address</i> <i>address-of-rp</i> <b>Example:</b> switch(config-vrf)# <b>ip pim anycast-rp 209.165.200.1 209.165.200.12</b>	Configure PIM Anycast RP set.
<b>Step 16</b>	<b>ip msdp originator-id</b> <i>loopback</i> <b>Example:</b> switch(config-vrf)# <b>ip msdp originator-id loopback12</b>	Configure MSDP originator ID.
<b>Step 17</b>	<b>ip msdp peer</b> <i>ip-address</i> <b>connect-source</b> <i>loopback</i> <b>Example:</b> switch(config-vrf)# <b>ip msdp peer 209.165.201.11 connect-source loopback12</b>	Configure MSDP peering between border node and external RP router.

# Configuring an External Router for RP Everywhere with MSDP Peering

## SUMMARY STEPS

1. **configure terminal**
2. **feature msdp**
3. **interface loopback** *loopback\_number*
4. **vrf member** *vrf-name*
5. **ip address** *ip-address*
6. **ip pim sparse-mode**
7. **interface loopback** *loopback\_number*
8. **vrf member** *vrf-name*
9. **ip address** *ip-address*
10. **ip pim sparse-mode**
11. **vrf context** *vrf-name*
12. **ip pim rp-address** *ip-address-of-router* **group-list** *group-range-prefix*
13. **ip msdp originator-id loopback12**
14. **ip msdp peer** *ip-address* **connect-source loopback12**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enter configuration mode.
<b>Step 2</b>	<b>feature msdp</b>  <b>Example:</b> <code>switch(config)# feature msdp</code>	Enable feature MSDP.
<b>Step 3</b>	<b>interface loopback</b> <i>loopback_number</i>  <b>Example:</b> <code>switch(config)# interface loopback 11</code>	Configure the loopback interface on all VXLAN VTEP devices.
<b>Step 4</b>	<b>vrf member</b> <i>vrf-name</i>  <b>Example:</b> <code>switch(config-if)# vrf member vrf100</code>	Configure VRF name.
<b>Step 5</b>	<b>ip address</b> <i>ip-address</i>  <b>Example:</b> <code>switch(config-if)# ip address 209.165.201.1/32</code>	Specify IP address.
<b>Step 6</b>	<b>ip pim sparse-mode</b>  <b>Example:</b> <code>switch(config-if)# ip pim sparse-mode</code>	Configure sparse-mode PIM on an interface.

	Command or Action	Purpose
<b>Step 7</b>	<b>interface loopback</b> <i>loopback_number</i> <b>Example:</b> switch(config)# <b>interface loopback 12</b>	Configure the PIM Anycast set RP loopback interface.
<b>Step 8</b>	<b>vrf member</b> <i>vrf-name</i> <b>Example:</b> switch(config-if)# <b>vrf member vrf100</b>	Configure VRF name.
<b>Step 9</b>	<b>ip address</b> <i>ip-address</i> <b>Example:</b> switch(config-if)# <b>ip address 209.165.201.11/32</b>	Specify IP address.
<b>Step 10</b>	<b>ip pim sparse-mode</b> <b>Example:</b> switch(config-if)# <b>ip pim sparse-mode</b>	Configure sparse-mode PIM on an interface.
<b>Step 11</b>	<b>vrf context</b> <i>vrf-name</i> <b>Example:</b> switch(config-if)# <b>vrf context vrf100</b>	Create a VXLAN tenant VRF.
<b>Step 12</b>	<b>ip pim rp-address</b> <i>ip-address-of-router</i> <b>group-list</b> <i>group-range-prefix</i> <b>Example:</b> switch(config-vrf)# <b>ip pim rp-address 209.165.201.1 group-list 224.0.0.0/4</b>	The value of the <i>ip-address-of-router</i> parameters is that of the RP. The same IP address must be on all the edge devices (VTEPs) for a fully distributed RP.
<b>Step 13</b>	<b>ip msdp originator-id</b> <b>loopback12</b> <b>Example:</b> switch(config-vrf)# <b>ip msdp originator-id loopback12</b>	Configure MSDP originator ID.
<b>Step 14</b>	<b>ip msdp peer</b> <i>ip-address</i> <b>connect-source</b> <b>loopback12</b> <b>Example:</b> switch(config-vrf)# <b>ip msdp peer 209.165.200.11 connect-source loopback12</b>	Configure MSDP peering between external RP router and all TRM border nodes.

## Configuring Layer 3 Tenant Routed Multicast

This procedure enables the Tenant Routed Multicast (TRM) feature. TRM operates primarily in the Layer 3 forwarding mode for IP multicast by using BGP MVPN signaling. TRM in Layer 3 mode is the main feature and the only requirement for TRM enabled VXLAN BGP EVPN fabrics. If non-TRM capable edge devices (VTEPs) are present, the Layer 2/Layer 3 mode and Layer 2 mode have to be considered for interop.

To forward multicast between senders and receivers on the Layer 3 cloud and the VXLAN fabric on TRM vPC border leafs, the VIP/PIP configuration must be enabled. For more information, see Configuring VIP/PIP.

**Note** TRM follows an always-route approach and hence decrements the Time to Live (TTL) of the transported IP multicast traffic.

### Before you begin

VXLAN EVPN feature **nv overlay** and **nv overlay evpn** must be configured.

The rendezvous point (RP) must be configured.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enter configuration mode.
<b>Step 2</b>	<b>feature ngmvpn</b>  <b>Example:</b> <code>switch(config)# feature ngmvpn</code>	Enables the Next-Generation Multicast VPN (ngMVPN) control plane. New address family commands become available in BGP.  You will get a syslog message when you enable this command. The message informs you that <b>ip multicast multipath s-g-hash next-hop-based</b> is the recommended multipath hashing algorithm and you need enable it for the TRM enabled VRFs.  The auto-generation of <b>ip multicast multipath s-g-hash next-hop-based</b> command does not happen after you enable the <b>feature ngmvpn</b> command. You need to configure <b>ip multicast multipath s-g-hash next-hop-based</b> as part of the VRF configuration.
<b>Step 3</b>	<b>ip igmp snooping vxlan</b>  <b>Example:</b> <code>switch(config)# ip igmp snooping vxlan</code>	Configure IGMP snooping for VXLAN VLANs.
<b>Step 4</b>	<b>interface nve1</b>  <b>Example:</b> <code>switch(config)# interface nve 1</code>	Configure the NVE interface.
<b>Step 5</b>	<b>member vni vni-range associate-vrf</b>  <b>Example:</b> <code>switch(config-if-nve)# member vni 200100 associate-vrf</code>	Configure the Layer 3 virtual network identifier. The range of <i>vni-range</i> is from 1 to 16,777,214.
<b>Step 6</b>	<b>mcast-group ip-prefix</b>  <b>Example:</b>	Builds the default multicast distribution tree for the VRF VNI (Layer 3 VNI).

	Command or Action	Purpose
	<pre>switch(config-if-nve-vni) # mcast-group 225.3.3.3</pre>	<p>The multicast group is used in the underlay (core) for all multicast routing within the associated Layer 3 VNI (VRF).</p> <p><b>Note</b> We recommend that underlay multicast groups for Layer 2 VNI, default MDT, and data MDT not be shared. Use separate, non-overlapping groups.</p>
<b>Step 7</b>	<pre>exit</pre> <p><b>Example:</b></p> <pre>switch(config-if-nve-vni) # exit</pre>	Exits command mode.
<b>Step 8</b>	<pre>exit</pre> <p><b>Example:</b></p> <pre>switch(config-if) # exit</pre>	Exits command mode.
<b>Step 9</b>	<pre>router bgp 100</pre> <p><b>Example:</b></p> <pre>switch(config) # router bgp 100</pre>	Set autonomous system number.
<b>Step 10</b>	<pre>exit</pre> <p><b>Example:</b></p> <pre>switch(config-router) # exit</pre>	Exits command mode.
<b>Step 11</b>	<pre>neighbor ip-addr</pre> <p><b>Example:</b></p> <pre>switch(config-router) # neighbor 1.1.1.1</pre>	Configure IP address of the neighbor.
<b>Step 12</b>	<pre>address-family ipv4 mvpn</pre> <p><b>Example:</b></p> <pre>switch(config-router-neighbor) # address-family ipv4 mvpn</pre>	Configure multicast VPN.
<b>Step 13</b>	<pre>send-community extended</pre> <p><b>Example:</b></p> <pre>switch(config-router-neighbor-af) # send-community extended</pre>	Enables ngMVPN for address family signalization. The <b>send community extended</b> command ensures that extended communities are exchanged for this address family.
<b>Step 14</b>	<pre>exit</pre> <p><b>Example:</b></p> <pre>switch(config-router-neighbor-af) # exit</pre>	Exits command mode.
<b>Step 15</b>	<pre>exit</pre> <p><b>Example:</b></p> <pre>switch(config-router) # exit</pre>	Exits command mode.

	Command or Action	Purpose
<b>Step 16</b>	<b>vrf context</b> <i>vrf_name</i> <b>Example:</b> <code>switch(config-router)#vrf context vrf100</code>	Configure VRF name.
<b>Step 17</b>	<b>ip multicast multipath s-g-hash next-hop-based</b> <b>Example:</b> <code>switch(config-vrf)# ip multicast multipath s-g-hash next-hop-based</code>	Configures multicast multipath and initiates S, G, nexthop hashing (rather than the default of S/RP, G-based hashing) to select the RPF interface.
<b>Step 18</b>	<b>ip pim rp-address</b> <i>ip-address-of-router</i> <b>group-list</b> <i>group-range-prefix</i> <b>Example:</b> <code>switch(config-vrf)# ip pim rp-address 209.165.201.1 group-list 226.0.0.0/8</code>	<p>The value of the <i>ip-address-of-router</i> parameter is that of the RP. The same IP address must be on all of the edge devices (VTEPs) for a fully distributed RP.</p> <p>For overlay RP placement options, see the <a href="#">Configuring a Rendezvous Point for Tenant Routed Multicast, on page 218</a> section.</p>
<b>Step 19</b>	<b>address-family ipv4 unicast</b> <b>Example:</b> <code>switch(config-vrf)# address-family ipv4 unicast</code>	Configure unicast address family.
<b>Step 20</b>	<b>route-target both auto mvpn</b> <b>Example:</b> <code>switch(config-vrf-af-ipv4)# route-target both auto mvpn</code>	<p>Defines the BGP route target that is added as an extended community attribute to the customer multicast (C_Multicast) routes (ngMVPN route type 6 and 7).</p> <p>Auto route targets are constructed by the 2-byte Autonomous System Number (ASN) and Layer 3 VNI.</p>
<b>Step 21</b>	<b>ip multicast overlay-spt-only</b> <b>Example:</b> <code>switch(config)# ip multicast overlay-spt-only</code>	Gratuitously originate (S,A) route when the source is locally connected. The <b>ip multicast overlay-spt-only</b> command is enabled by default on all MVPN-enabled Cisco Nexus 9000 Series switches (typically leaf node).
<b>Step 22</b>	<b>interface</b> <i>vlan_id</i> <b>Example:</b> <code>switch(config)# interface vlan11</code>	Configures the first-hop gateway (distributed anycast gateway for the Layer 2 VNI. No router PIM peering must ever happen with this interface.
<b>Step 23</b>	<b>no shutdown</b> <b>Example:</b> <code>switch(config-if)# no shutdown</code>	Disables an interface.
<b>Step 24</b>	<b>vrf member</b> <i>vrf-num</i> <b>Example:</b> <code>switch(config-if)# vrf member vrf100</code>	Configure VRF name.
<b>Step 25</b>	<b>ip address</b> <i>ip_address</i> <b>Example:</b> <code>switch(config-if)# ip address 11.1.1.1/24</code>	Configure IP address.

	Command or Action	Purpose
<b>Step 26</b>	<b>ip pim sparse-mode</b> <b>Example:</b> switch(config-if)# <b>ip pim sparse-mode</b>	Enables IGMP and PIM on the SVI. This is required if multicast sources and/or receivers exist in this VLAN.
<b>Step 27</b>	<b>fabric forwarding mode anycast-gateway</b> <b>Example:</b> switch(config-if)# <b>fabric forwarding mode anycast-gateway</b>	Configure Anycast Gateway Forwarding Mode.
<b>Step 28</b>	<b>ip pim neighbor-policy NONE*</b> <b>Example:</b> switch(config-if)# <b>ip pim neighbor-policy NONE*</b>	Creates an IP PIM neighbor policy to avoid PIM neighborship with PIM routers within the VLAN. The <b>none</b> keyword is a configured route map to deny any ipv4 addresses to avoid establishing PIM neighborship policy using anycase IP.  <b>Note</b> Do not use Distributed Anycast Gateway for PIM Peerings.
<b>Step 29</b>	<b>exit</b> <b>Example:</b> switch(config-if)# <b>exit</b>	Exits command mode.
<b>Step 30</b>	<b>interface vlan_id</b> <b>Example:</b> switch(config)# <b>interface vlan100</b>	Configure Layer 3 VNI.
<b>Step 31</b>	<b>no shutdown</b> <b>Example:</b> switch(config-if)# <b>no shutdown</b>	Disable an interface.
<b>Step 32</b>	<b>vrf member vrf100</b> <b>Example:</b> switch(config-if)# <b>vrf member vrf100</b>	Configure VRF name.
<b>Step 33</b>	<b>ip forward</b> <b>Example:</b> switch(config-if)# <b>ip forward</b>	Enable IP forwarding on interface.
<b>Step 34</b>	<b>ip pim sparse-mode</b> <b>Example:</b> switch(config-if)# <b>ip pim sparse-mode</b>	Configure sparse-mode PIM on interface. There is no PIM peering happening in the Layer-3 VNI, but this command must be present for forwarding.

# Configuring TRM on the VXLAN EVPN Spine

This procedure enables Tenant Routed Multicast (TRM) on a VXLAN EVPN spine switch.

## Before you begin

The VXLAN BGP EVPN spine must be configured. See [Configuring iBGP for EVPN on the Spine](#), on page 59.

## SUMMARY STEPS

1. `configure terminal`
2. `route-map permitall permit 10`
3. `set ip next-hop unchanged`
4. `exit`
5. `router bgp [autonomous system] number`
6. `address-family ipv4 mvpn`
7. `retain route-target all`
8. `neighbor ip-address [remote-as number]`
9. `address-family ipv4 mvpn`
10. `disable-peer-as-check`
11. `rewrite-rt-asn`
12. `send-community extended`
13. `route-reflector-client`
14. `route-map permitall out`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enter configuration mode.
Step 2	<b>route-map permitall permit 10</b>  <b>Example:</b> <code>switch(config)# route-map permitall permit 10</code>	Configure the route-map.  <b>Note</b> The route-map keeps the next-hop unchanged for EVPN routes <ul style="list-style-type: none"> <li>• Required for eBGP</li> <li>• Options for iBGP</li> </ul>
Step 3	<b>set ip next-hop unchanged</b>  <b>Example:</b>	Set next hop address.

	Command or Action	Purpose
	<pre>switch(config-route-map)# set ip next-hop unchanged</pre>	<p><b>Note</b> The route-map keeps the next-hop unchanged for EVPN routes</p> <ul style="list-style-type: none"> <li>• Required for eBGP</li> <li>• Options for iBGP</li> </ul>
<b>Step 4</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>switch(config-route-map)# exit</pre>	Return to exec mode.
<b>Step 5</b>	<p><b>router bgp [autonomous system] number</b></p> <p><b>Example:</b></p> <pre>switch(config)# router bgp 65002</pre>	Specify BGP.
<b>Step 6</b>	<p><b>address-family ipv4 mvpn</b></p> <p><b>Example:</b></p> <pre>switch(config-router)# address-family ipv4 mvpn</pre>	Configure the address family IPv4 MVPN under the BGP.
<b>Step 7</b>	<p><b>retain route-target all</b></p> <p><b>Example:</b></p> <pre>switch(config-router-af)# retain route-target all</pre>	<p>Configure retain route-target all under address-family IPv4 MVPN [global].</p> <p><b>Note</b> Required for eBGP. Allows the spine to retain and advertise all MVPN routes when there are no local VNIs configured with matching import route targets.</p>
<b>Step 8</b>	<p><b>neighbor ip-address [remote-as number]</b></p> <p><b>Example:</b></p> <pre>switch(config-router-af)# neighbor 100.100.100.1</pre>	Define neighbor.
<b>Step 9</b>	<p><b>address-family ipv4 mvpn</b></p> <p><b>Example:</b></p> <pre>switch(config-router-neighbor)# address-family ipv4 mvpn</pre>	Configure address family IPv4 MVPN under the BGP neighbor.
<b>Step 10</b>	<p><b>disable-peer-as-check</b></p> <p><b>Example:</b></p> <pre>switch(config-router-neighbor-af)# disable-peer-as-check</pre>	<p>Disables checking the peer AS number during route advertisement. Configure this parameter on the spine for eBGP when all leafs are using the same AS but the spines have a different AS than leafs.</p> <p><b>Note</b> Required for eBGP.</p>
<b>Step 11</b>	<p><b>rewrite-rt-asn</b></p> <p><b>Example:</b></p> <pre>switch(config-router-neighbor-af)# rewrite-rt-asn</pre>	Normalizes the outgoing route target's AS number to match the remote AS number. Uses the BGP configured neighbors remote AS. The <b>rewrite-rt-asn</b> command is required if

	Command or Action	Purpose
		the route target auto feature is being used to configure EVPN route targets.
<b>Step 12</b>	<b>send-community extended</b>  <b>Example:</b> <pre>switch(config-router-neighbor-af) # send-community extended</pre>	Configures community for BGP neighbors.
<b>Step 13</b>	<b>route-reflector-client</b>  <b>Example:</b> <pre>switch(config-router-neighbor-af) # route-reflector-client</pre>	Configure route reflector.  <b>Note</b> Required for iBGP with route-reflector.
<b>Step 14</b>	<b>route-map permitall out</b>  <b>Example:</b> <pre>switch(config-router-neighbor-af) # route-map permitall out</pre>	Applies route-map to keep the next-hop unchanged.  <b>Note</b> Required for eBGP.

## Configuring Tenant Routed Multicast in Layer 2/Layer 3 Mixed Mode

This procedure enables the Tenant Routed Multicast (TRM) feature. This enables both Layer 2 and Layer 3 multicast BGP signaling. This mode is only necessary if non-TRM edge devices (VTEPs) are present in the same such as Cisco Nexus 9000 Series switches (1st generation) or Cisco Nexus 7000 Series switches. Only the Cisco Nexus 9000-EX and 9000-FX switches can do Layer 2/Layer 3 mode (Anchor-DR).

To forward multicast between senders and receivers on the Layer 3 cloud and the VXLAN fabric on TRM vPC border leafs, the VIP/PIP configuration must be enabled. For more information, see Configuring VIP/PIP.

All Cisco Nexus 9300-EX and 9300-FX platform switches must be in Layer 2/Layer 3 mode.

### Before you begin

VXLAN EVPN must be configured.

The rendezvous point (RP) must be configured.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal</pre>	Enter configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>feature ngmvpn</b> <b>Example:</b> <code>switch(config)# feature ngmvpn</code>	Enables the Next-Generation Multicast VPN (ngMVPN) control plane. New address family commands become available in BGP.
<b>Step 3</b>	<b>advertise evpn multicast</b> <b>Example:</b> <code>switch(config)# advertise evpn multicast</code>	Advertises IMET and SMET routes into BGP EVPN towards non-TRM capable switches.
<b>Step 4</b>	<b>ip igmp snooping vxlan</b> <b>Example:</b> <code>switch(config)# ip igmp snooping vxlan</code>	Configure IGMP snooping for VXLAN VLANs.
<b>Step 5</b>	<b>ip multicast overlay-spt-only</b> <b>Example:</b> <code>switch(config)# ip multicast overlay-spt-only</code>	Gratuitously originate (S,A) route when source is locally connected. The <b>ip multicast overlay-spt-only</b> command is enabled by default on all MVPN-enabled Cisco Nexus 9000 Series switches (typically leaf nodes).
<b>Step 6</b>	<b>ip multicast overlay-distributed-dr</b> <b>Example:</b> <code>switch(config)# ip multicast overlay-distributed-dr</code>	Enables distributed anchor DR function on this VTEP.
<b>Step 7</b>	<b>interface nve1</b> <b>Example:</b> <code>switch(config)# interface nve 1</code>	Configure the NVE interface.
<b>Step 8</b>	<b>member vni vni-range associate-vrf</b> <b>Example:</b> <code>switch(config-if-nve)# member vni 200100 associate-vrf</code>	Configure the Layer 3 virtual network identifier. The range of <i>vni-range</i> is from 1 to 16,777,214.
<b>Step 9</b>	<b>mcast-group ip-prefix</b> <b>Example:</b> <code>switch(config-if-nve-vni)# mcast-group 225.3.3.3</code>	Configures the multicast group on distributed anchor DR.
<b>Step 10</b>	<b>exit</b> <b>Example:</b> <code>switch(config-if-nve-vni)# exit</code>	Exits command mode.
<b>Step 11</b>	<b>interface loopback loopback_number</b> <b>Example:</b> <code>switch(config-if-nve)# interface loopback 10</code>	Configure the loopback interface on all distributed anchor DR devices.
<b>Step 12</b>	<b>ip address ip_address</b> <b>Example:</b>	Configure IP address. This IP address is the same on all distributed anchor DR.

	Command or Action	Purpose
	<code>switch(config-if)# ip address 100.100.1.1/32</code>	
<b>Step 13</b>	<b>ip router ospf <i>process-tag</i> area <i>ospf-id</i></b> <b>Example:</b> <code>switch(config-if)# ip router ospf 100 area 0.0.0.0</code>	OSPF area ID in IP address format.
<b>Step 14</b>	<b>ip pim sparse-mode</b> <b>Example:</b> <code>switch(config-if)# ip pim sparse-mode</code>	Configure sparse-mode PIM on interface.
<b>Step 15</b>	<b>interface nve1</b> <b>Example:</b> <code>switch(config-if)# interface nve1</code>	Configure NVE interface.
<b>Step 16</b>	<b>shutdown</b> <b>Example:</b> <code>switch(config-if-nve)# shutdown</code>	Disable the interface.
<b>Step 17</b>	<b>mcast-routing override source-interface loopback <i>int-num</i></b> <b>Example:</b> <code>switch(config-if-nve)# mcast-routing override source-interface loopback 10</code>	<p>Enables that TRM is using a different loopback interface than the VTEPs default source-interface.</p> <p>The <i>loopback10</i> variable must be configured on every TRM-enabled VTEP (Anchor DR) in the underlay with the same IP address. This loopback and the respective <b>override</b> command are needed to serve TRM VTEPs in co-existence with non-TRM VTEPs.</p>
<b>Step 18</b>	<b>exit</b> <b>Example:</b> <code>switch(config-if-nve)# exit</code>	Exits command mode.
<b>Step 19</b>	<b>router bgp 100</b> <b>Example:</b> <code>switch(config)# router bgp 100</code>	Set autonomous system number.
<b>Step 20</b>	<b>neighbor <i>ip-addr</i></b> <b>Example:</b> <code>switch(config-router)# neighbor 1.1.1.1</code>	Configure IP address of the neighbor.
<b>Step 21</b>	<b>address-family ipv4 mvpn</b> <b>Example:</b> <code>switch(config-router-neighbor)# address-family ipv4 mvpn</code>	Configure multicast VPN.
<b>Step 22</b>	<b>send-community extended</b> <b>Example:</b>	Send community attribute.

	Command or Action	Purpose
	<code>switch(config-router-neighbor-af) # send-community extended</code>	
<b>Step 23</b>	<b>exit</b> <b>Example:</b> <code>switch(config-router-neighbor-af) # exit</code>	Exits command mode.
<b>Step 24</b>	<b>exit</b> <b>Example:</b> <code>switch(config-router) # exit</code>	Exits command mode.
<b>Step 25</b>	<b>vrf vrf_name vrf100</b> <b>Example:</b> <code>switch(config) # vrf context vrf100</code>	Configure VRF name.
<b>Step 26</b>	<b>ip pim rp-address ip-address-of-router group-list group-range-prefix</b> <b>Example:</b> <code>switch(config-vrf) # ip pim rp-address 209.165.201.1 group-list 226.0.0.0/8</code>	The value of the <i>ip-address-of-router</i> parameter is that of the RP. The same IP address must be on all of the edge devices (VTEPs) for a fully distributed RP.  For overlay RP placement options, see the <a href="#">Configuring a Rendezvous Point for Tenant Routed Multicast, on page 218</a> - Internal RP section.
<b>Step 27</b>	<b>address-family ipv4 unicast</b> <b>Example:</b> <code>switch(config-vrf) # address-family ipv4 unicast</code>	Configure unicast address family.
<b>Step 28</b>	<b>route-target both auto mvpn</b> <b>Example:</b> <code>switch(config-vrf-af-ipv4) # route-target both auto mvpn</code>	Specify target for mvpn routes.
<b>Step 29</b>	<b>exit</b> <b>Example:</b> <code>switch(config-vrf-af-ipv4) # exit</code>	Exits command mode.
<b>Step 30</b>	<b>exit</b> <b>Example:</b> <code>switch(config-vrf) # exit</code>	Exits command mode.
<b>Step 31</b>	<b>interface vlan_id</b> <b>Example:</b> <code>switch(config) # interface vlan11</code>	Configure Layer 2 VNI.
<b>Step 32</b>	<b>no shutdown</b> <b>Example:</b> <code>switch(config-if) # no shutdown</code>	Disable an interface.

	Command or Action	Purpose
<b>Step 33</b>	<b>vrf member vrf100</b> <b>Example:</b> switch(config-if)# <b>vrf member vrf100</b>	Configure VRF name.
<b>Step 34</b>	<b>ip address ip_address</b> <b>Example:</b> switch(config-if)# <b>ip address 11.1.1.1/24</b>	Configure IP address.
<b>Step 35</b>	<b>ip pim sparse-mode</b> <b>Example:</b> e switch(config-if)# <b>ip pim sparse-mode</b>	Configure sparse-mode PIM on the interface.
<b>Step 36</b>	<b>fabric forwarding mode anycast-gateway</b> <b>Example:</b> switch(config-if)# <b>fabric forwarding mode anycast-gateway</b>	Configure Anycast Gateway Forwarding Mode.
<b>Step 37</b>	<b>ip pim neighbor-policy NONE*</b> <b>Example:</b> switch(config-if)# <b>ip pim neighbor-policy NONE*</b>	The <b>none</b> keyword is a configured route map to deny any IPv4 addresses to avoid establishing a PIM neighborship policy using anycase IP.
<b>Step 38</b>	<b>exit</b> <b>Example:</b> switch(config-if)# <b>exit</b>	Exits command mode.
<b>Step 39</b>	<b>interface vlan_id</b> <b>Example:</b> switch(config)# <b>interface vlan100</b>	Configure Layer 3 VNI.
<b>Step 40</b>	<b>no shutdown</b> <b>Example:</b> switch(config-if)# <b>no shutdown</b>	Disable an interface.
<b>Step 41</b>	<b>vrf member vrf100</b> <b>Example:</b> switch(config-if)# <b>vrf member vrf100</b>	Configure VRF name.
<b>Step 42</b>	<b>ip forward</b> <b>Example:</b> switch(config-if)# <b>ip forward</b>	Enable IP forwarding on interface.
<b>Step 43</b>	<b>ip pim sparse-mode</b> <b>Example:</b>	Configure sparse-mode PIM on the interface.

	Command or Action	Purpose
	<code>switch(config-if)# ip pim sparse-mode</code>	

## Configuring Layer 2 Tenant Routed Multicast

This procedure enables the Tenant Routed Multicast (TRM) feature. This enables Layer 2 multicast BGP signaling.

IGMP Snooping Querier must be configured per multicast-enabled VXLAN VLAN on all Layer-2 TRM leaf switches.

### Before you begin

VXLAN EVPN must be configured.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enter configuration mode.
<b>Step 2</b>	<b>feature ngmvpn</b> <b>Example:</b> <code>switch(config)# feature ngmvpn</code>	Enables EVPN/MVPN feature.
<b>Step 3</b>	<b>advertise evpn multicast</b> <b>Example:</b> <code>switch(config)# advertise evpn multicast</code>	Advertise L2 multicast capability.
<b>Step 4</b>	<b>ip igmp snooping vxlan</b> <b>Example:</b> <code>switch(config)# ip igmp snooping vxlan</code>	Configure IGMP snooping for VXLANs.
<b>Step 5</b>	<b>vlan configuration <i>vlan-id</i></b> <b>Example:</b> <code>switch(config)# vlan configuration 101</code>	Enter configuration mode for VLAN 101.
<b>Step 6</b>	<b>ip igmp snooping querier <i>querier-ip-address</i></b> <b>Example:</b> <code>switch(config-vlan-config)# ip igmp snooping querier 2.2.2.2</code>	Configure IGMP snooping querier for each multicast-enabled VXLAN VLAN.

# Configuring TRM with vPC Support

## SUMMARY STEPS

1. **configure terminal**
2. **feature vpc**
3. **feature interface-vlan**
4. **feature lacp**
5. **feature pim**
6. **feature ospf**
7. **ip pim rp-address *address* group-list *range***
8. **vpc domain *domain-id***
9. **peer switch**
10. **peer gateway**
11. **peer-keepalive destination *ipaddress***
12. **ip arp synchronize**
13. **ipv6 nd synchronize**
14. Create vPC peer-link.
15. **system nve infra-vlans *range***
16. **vlan *number***
17. Create the SVI.
18. (Optional) **delay restore interface-vlan *seconds***

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal</pre>	Enter global configuration mode.
Step 2	<b>feature vpc</b>  <b>Example:</b> <pre>switch(config)# feature vpc</pre>	Enables vPCs on the device.
Step 3	<b>feature interface-vlan</b>  <b>Example:</b> <pre>switch(config)# feature interface-vlan</pre>	Enables the interface VLAN feature on the device.
Step 4	<b>feature lacp</b>  <b>Example:</b> <pre>switch(config)# feature lacp</pre>	Enables the LACP feature on the device.
Step 5	<b>feature pim</b>  <b>Example:</b>	Enables the PIM feature on the device.

	Command or Action	Purpose
	<code>switch(config) # <b>feature pim</b></code>	
<b>Step 6</b>	<b>feature ospf</b> <b>Example:</b> <code>switch(config) # <b>feature ospf</b></code>	Enables the OSPF feature on the device.
<b>Step 7</b>	<b>ip pim rp-address address group-list range</b> <b>Example:</b> <code>switch(config) # <b>ip pim rp-address 100.100.100.1 group-list 224.0.0/4</b></code>	Defines a PIM RP address for the underlay multicast group range.
<b>Step 8</b>	<b>vpc domain domain-id</b> <b>Example:</b> <code>switch(config) # <b>vpc domain 1</b></code>	Creates a vPC domain on the device and enters vpn-domain configuration mode for configuration purposes. There is no default. The range is from 1 to 1000.
<b>Step 9</b>	<b>peer switch</b> <b>Example:</b> <code>switch(config-vpc-domain) # <b>peer switch</b></code>	Defines the peer switch.
<b>Step 10</b>	<b>peer gateway</b> <b>Example:</b> <code>switch(config-vpc-domain) # <b>peer gateway</b></code>	To enable Layer 3 forwarding for packets destined to the gateway MAC address of the virtual port channel (vPC), use the <b>peer-gateway</b> command.
<b>Step 11</b>	<b>peer-keepalive destination ipaddress</b> <b>Example:</b> <code>switch(config-vpc-domain) # <b>peer-keepalive destination 172.28.230.85</b></code>	<p>Configures the IPv4 address for the remote end of the vPC peer-keepalive link.</p> <p><b>Note</b> The system does not form the vPC peer link until you configure a vPC peer-keepalive link.</p> <p>The management ports and VRF are the defaults.</p> <p><b>Note</b> We recommend that you configure a separate VRF and use a Layer 3 port from each vPC peer device in that VRF for the vPC peer-keepalive link.</p> <p>For more information about creating and configuring VRFs, see the <a href="#">Cisco Nexus 9000 NX-OS Series Unicast Routing Config Guide, 9.3(x)</a>.</p>
<b>Step 12</b>	<b>ip arp synchronize</b> <b>Example:</b> <code>switch(config-vpc-domain) # <b>ip arp synchronize</b></code>	Enables IP ARP synchronize under the vPC Domain to facilitate faster ARP table population following device reload.
<b>Step 13</b>	<b>ipv6 nd synchronize</b> <b>Example:</b> <code>switch(config-vpc-domain) # <b>ipv6 nd synchronize</b></code>	Enables IPv6 nd synchronization under the vPC domain to facilitate faster nd table population following device reload.

	Command or Action	Purpose
<b>Step 14</b>	<p>Create vPC peer-link.</p> <p><b>Example:</b></p> <pre> switch(config)# interface port-channel 1 switch(config)# switchport switch(config)# switchport mode trunk switch(config)# switchport trunk allowed vlan 1,10,100-200 switch(config)# mtu 9216 switch(config)# vpc peer-link switch(config)# no shut  switch(config)# interface Ethernet 1/1, 1/21 switch(config)# switchport switch(config)# mtu 9216 switch(config)# channel-group 1 mode active switch(config)# no shutdown </pre>	Creates the vPC peer-link port-channel interface and adds two member interfaces to it.
<b>Step 15</b>	<p><b>system nve infra-vlans</b> <i>range</i></p> <p><b>Example:</b></p> <pre> switch(config)# system nve infra-vlans 10 </pre>	Defines a non-VXLAN enabled VLAN as a backup routed path.
<b>Step 16</b>	<p><b>vlan</b> <i>number</i></p> <p><b>Example:</b></p> <pre> switch(config)# vlan 10 </pre>	Creates the VLAN to be used as an infra-VLAN.
<b>Step 17</b>	<p>Create the SVI.</p> <p><b>Example:</b></p> <pre> switch(config)# interface vlan 10 switch(config)# ip address 10.10.10.1/30 switch(config)# ip router ospf process UNDERLAY area 0 switch(config)# ip pim sparse-mode switch(config)# no ip redirects switch(config)# mtu 9216 switch(config)# no shutdown </pre>	Creates the SVI used for the backup routed path over the vPC peer-link.
<b>Step 18</b>	<p>(Optional) <b>delay restore interface-vlan</b> <i>seconds</i></p> <p><b>Example:</b></p> <pre> switch(config-vpc-domain)# delay restore interface-vlan 45 </pre>	Enables the delay restore timer for SVIs. We recommend tuning this value when the SVI/VNI scale is high. For example, when the SCI count is 1000, we recommend that you set the delay restore for <b>interface-vlan</b> to 45 seconds.

## Configuring TRM with vPC Support (Cisco Nexus 9504-R and 9508-R)

### SUMMARY STEPS

1. configure terminal

2. `feature vpc`
3. `feature interface-vlan`
4. `feature lacp`
5. `feature pim`
6. `feature ospf`
7. `ip pim rp-address address group-list range`
8. `vpc domain domain-id`
9. `hardware access-list tcam region mac-ifac`
10. `hardware access-list tcam region vxlan 10`
11. `reload`
12. `peer switch`
13. `peer gateway`
14. `peer-keepalive destination ipaddress`
15. `ip arp synchronize`
16. `ipv6 nd synchronize`
17. Create vPC peer-link.
18. `system nve infra-vlans range`
19. `vlan number`
20. Create the SVI.
21. (Optional) `delay restore interface-vlan seconds`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enter global configuration mode.
<b>Step 2</b>	<b>feature vpc</b> <b>Example:</b> <code>switch(config)# feature vpc</code>	Enables vPCs on the device.
<b>Step 3</b>	<b>feature interface-vlan</b> <b>Example:</b> <code>switch(config)# feature interface-vlan</code>	Enables the interface VLAN feature on the device.
<b>Step 4</b>	<b>feature lacp</b> <b>Example:</b> <code>switch(config)# feature lacp</code>	Enables the LACP feature on the device.
<b>Step 5</b>	<b>feature pim</b> <b>Example:</b> <code>switch(config)# feature pim</code>	Enables the PIM feature on the device.

	Command or Action	Purpose
<b>Step 6</b>	<b>feature ospf</b> <b>Example:</b> <pre>switch(config)# feature ospf</pre>	Enables the OSPF feature on the device.
<b>Step 7</b>	<b>ip pim rp-address <i>address</i> group-list <i>range</i></b> <b>Example:</b> <pre>switch(config)# ip pim rp-address 100.100.100.1 group-list 224.0.0/4</pre>	Defines a PIM RP address for the underlay multicast group range.
<b>Step 8</b>	<b>vpc domain <i>domain-id</i></b> <b>Example:</b> <pre>switch(config)# vpc domain 1</pre>	Creates a vPC domain on the device and enters vpn-domain configuration mode for configuration purposes. There is no default. The range is 1–1000.
<b>Step 9</b>	<b>hardware access-list tcam region mac-ifacl</b> <b>Example:</b> <pre>switch(config)# hardware access-list tcam region mac-ifacl 0</pre>	Carves the TCAM region for the ACL database.  <b>Note</b> This TCAM carving command is required to enable TRM forwarding for N9K-X9636C-RX line cards only. With no TCAM region carved for <b>mac-ifacl</b> , the TCAM resources are used for TRM instead.
<b>Step 10</b>	<b>hardware access-list tcam region vxlan 10</b> <b>Example:</b> <pre>switch(config)# hardware access-list tcam region vxlan 10</pre>	Assigns the the TCAM region for use by a VXLAN.  <b>Note</b> This TCAM carving command is required to enable TRM forwarding for N9K-X9636C-RX line cards only.
<b>Step 11</b>	<b>reload</b> <b>Example:</b> <pre>switch(config)# reload</pre>	Reloads the switch config for the TCAM assignments to become active.
<b>Step 12</b>	<b>peer switch</b> <b>Example:</b> <pre>switch(config-vpc-domain)# peer switch</pre>	Defines the peer switch.
<b>Step 13</b>	<b>peer gateway</b> <b>Example:</b> <pre>switch(config-vpc-domain)# peer gateway</pre>	To enable Layer 3 forwarding for packets that are destined to the gateway MAC address of the virtual port channel (vPC), use the <b>peer-gateway</b> command.
<b>Step 14</b>	<b>peer-keepalive destination <i>ipaddress</i></b> <b>Example:</b> <pre>switch(config-vpc-domain)# peer-keepalive destination 172.28.230.85</pre>	Configures the IPv4 address for the remote end of the vPC peer-keepalive link.  <b>Note</b> The system does not form the vPC peer link until you configure a vPC peer-keepalive link.  The management ports and VRF are the defaults.

	Command or Action	Purpose
		<p><b>Note</b> We recommend that you configure a separate VRF and use a Layer 3 port from each vPC peer device in that VRF for the vPC peer-keepalive link.</p> <p>For more information about creating and configuring VRFs, see the <a href="#">Cisco Nexus 9000 NX-OS Series Unicast Routing Config Guide, 9.3(x)</a>.</p>
<b>Step 15</b>	<b>ip arp synchronize</b> <b>Example:</b> <pre>switch(config-vpc-domain) # ip arp synchronize</pre>	Enables IP ARP synchronize under the vPC Domain to facilitate faster ARP table population following device reload.
<b>Step 16</b>	<b>ipv6 nd synchronize</b> <b>Example:</b> <pre>switch(config-vpc-domain) # ipv6 nd synchronize</pre>	Enables IPv6 and synchronization under the vPC domain to facilitate faster and table population following device reload.
<b>Step 17</b>	Create vPC peer-link. <b>Example:</b> <pre>switch(config) # interface port-channel 1 switch(config) # switchport switch(config) # switchport mode trunk switch(config) # switchport trunk allowed vlan 1,10,100-200 switch(config) # mtu 9216 switch(config) # vpc peer-link switch(config) # no shut  switch(config) # interface Ethernet 1/1, 1/21 switch(config) # switchport switch(config) # mtu 9216 switch(config) # channel-group 1 mode active switch(config) # no shutdown</pre>	Creates the vPC peer-link port-channel interface and adds two member interfaces to it.
<b>Step 18</b>	<b>system nve infra-vlans range</b> <b>Example:</b> <pre>switch(config) # system nve infra-vlans 10</pre>	Defines a non-VXLAN enabled VLAN as a backup routed path.
<b>Step 19</b>	<b>vlan number</b> <b>Example:</b> <pre>switch(config) # vlan 10</pre>	Creates the VLAN to be used as an infra-VLAN.
<b>Step 20</b>	Create the SVI. <b>Example:</b> <pre>switch(config) # interface vlan 10 switch(config) # ip address 10.10.10.1/30 switch(config) # ip router ospf process UNDERLAY area 0 switch(config) # ip pim sparse-mode</pre>	Creates the SVI used for the backup routed path over the vPC peer-link.

	Command or Action	Purpose
	<pre>switch(config)# no ip redirects switch(config)# mtu 9216 switch(config)# no shutdown</pre>	
<b>Step 21</b>	<p>(Optional) <b>delay restore interface-vlan</b> <i>seconds</i></p> <p><b>Example:</b></p> <pre>switch(config-vpc-domain)# delay restore interface-vlan 45</pre>	Enables the delay restore timer for SVIs. We recommend tuning this value when the SVI/VNI scale is high. For example, when the SCI count is 1000, we recommend that you set the delay restore for <b>interface-vlan</b> to 45 seconds.

## CHAPTER 12

# Configuring Cross Connect

This chapter contains the following sections:

- [About VXLAN Cross Connect, on page 255](#)

- [Configuring QinQ-QinVNI, on page 273](#)
- [Removing a VNI, on page 276](#)

## About VXLAN Cross Connect

This feature provides point-to-point tunneling of data and control packet from one VTEP to another. Every attachment circuit will be part of a unique provider VNI. BGP EVPN signaling will discover these end-points based on how the provider VNI is stretched in the fabric. All inner customer .1q tags will be preserved, as is, and packets will be encapsulated in the provider VNI at the encapsulation VTEP. On the decapsulation end-point, the provider VNI will forward the packet to its attachment circuit while preserving all customer .1q tags in the packets.

**Note** Cross Connect and xconnect are synonymous.

VXLAN Cross Connect supports vPC fabric peering.

VXLAN Cross Connect enables VXLAN point-to-point functionality on the following switches:

- Cisco Nexus 9332PQ
- Cisco Nexus 9336C-FX2

- Cisco Nexus 9372PX
- Cisco Nexus 9372PX-E
- Cisco Nexus 9372TX
- Cisco Nexus 9372TX-E
- Cisco Nexus 93120TX
- Cisco Nexus 93108TC-EX
- Cisco Nexus 93108TC-FX
- Cisco Nexus 93180LC-EX
- Cisco Nexus 93180YC-EX
- Cisco Nexus 93180YC-FX
- Cisco Nexus 93240YC-FX2
- Cisco Nexus N9K-C93180YC-FX3S
- Cisco Nexus 9316D-GX
- Cisco Nexus 9364C-GX
- Cisco Nexus 93600CD-GX

VXLAN Cross Connect enables tunneling of all control frames (CDP, LLDP, LACP, STP, BFD, and PAGP) and data across the VXLAN cloud.

## Guidelines and Limitations for VXLAN Cross Connect

VXLAN Cross Connect has the following guidelines and limitations:

- When an upgrade is performed non-disruptively from Cisco NX-OS Release 7.0(3)I7(4) to Cisco NX-OS Release 9.2(x) code, and if a VLAN is created and configured as xconnect, you must enter the **copy running-config startup-config** command and reload the switch. If the box was upgraded disruptively to Cisco NX-OS Release 9.2(x) code, a reload is not needed on configuring a VLAN as xconnect.
- MAC learning will be disabled on the xconnect VNIs and none of the host MAC will be learned on the tunnel access ports.
- Only supported on a BGP EVPN topology.
- LACP bundling of attachment circuits is not supported.
- Only one attachment circuit can be configured for a provider VNI on a given VTEP.
- A VNI can only be stretched in a point-to-point fashion. Point-to-multipoint is not supported.
- SVI on an xconnect VLAN is not supported.
- ARP suppression is not supported on an xconnect VLAN VNI. If ARP Suppression is enabled on a VLAN, and you enable xconnect on the VLAN, the xconnect feature takes precedence.
- Xconnect is not supported on the following switches:

- Cisco Nexus 9504
  - Cisco Nexus 9508
  - Cisco Nexus 9516
- 
- Scale of xconnect VLANs depends on the number of ports available on the switch. Every xconnect VLAN can tunnel all 4k customer VLANs.
  - Xconnect or Crossconnect feature on vpc-vtep needs backup-svi as native VLAN on the vPC peer-link.
  - Make sure that the NGOAM xconnect hb-interval is set to 5000 milliseconds on all VTEPs before attempting ISSU/patch activation to avoid link flaps.
  - Before activating the patch for the cfs process, you must move the NGOAM xconnect hb-interval to the maximum value of 5000 milliseconds. This prevents interface flaps during the patch activation.
  - The vPC orphan tunneled port per VNI should be either on the vPC primary switch or secondary switch, but not both.
  - Configuring a static MAC on xconnect tunnel interfaces is not supported.
  - xconnect is not supported on FEX ports.
  - On vpc-vtep, spanning tree must be disabled on both vPC peers for xconnect VLANs.
  - Xconnect access ports need to be flapped after disabling NGOAM on all the VTEPs.
  - After deleting and adding a VLAN, or removing xconnect from a VLAN, physical ports need to be flapped with NGOAM.
  - Beginning with Cisco NX-OS Release 9.3(3), support is added for the following switches:
    - Cisco Nexus C93600CD-GX
    - Cisco Nexus C9364C-GX
    - Cisco Nexus C9316D-GX

## Configuring VXLAN Cross Connect

This procedure describes how to configure the VXLAN Cross Connect feature.

### SUMMARY STEPS

1. **configure terminal**
2. **vlan** *vlan-id*
3. **vn-segment** *vnid*
4. **xconnect**
5. **exit**
6. **interface** *type port*
7. **switchport mode dot1q-tunnel**
8. **switchport access vlan** *vlan-id*
9. **exit**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> switch(config)# <b>vlan 10</b>	Specifies VLAN.
<b>Step 3</b>	<b>vn-segment <i>vnid</i></b> <b>Example:</b> switch(config-vlan)# <b>vn-segment 10010</b>	Specifies VXLAN VNID (Virtual Network Identifier).
<b>Step 4</b>	<b>xconnect</b> <b>Example:</b> switch(config-vlan)# <b>xconnect</b>	Defines the provider VLAN with the attached VNI to be in cross connect mode.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> switch(config-vlan)# <b>exit</b>	Exits command mode.
<b>Step 6</b>	<b>interface <i>type port</i></b> <b>Example:</b> switch(config)# <b>interface ethernet 1/1</b>	Enters interface configuration mode.
<b>Step 7</b>	<b>switchport mode dot1q-tunnel</b> <b>Example:</b> switch(config-if)# <b>switchport mode dot1q-tunnel</b>	Creates a 802.1q tunnel on the port. The port will do down and reinitialize (port flap) when the interface mode is changed. BPDU filtering is enabled and CDP is disabled on tunnel interfaces.
<b>Step 8</b>	<b>switchport access vlan <i>vlan-id</i></b> <b>Example:</b> switch(config-if)# <b>switchport access vlan 10</b>	Sets the interface access VLAN.
<b>Step 9</b>	<b>exit</b> <b>Example:</b> switch(config-vlan)# <b>exit</b>	Exits command mode.

**Example**

This example shows how to configure VXLAN Cross Connect.

```
switch# configure terminal
switch(config)# vlan 10
switch(config)# vn-segment 10010
```

```

switch(config)# xconnect
switch(config)# vlan 20
switch(config)# vn-segment 10020
switch(config)# xconnect
switch(config)# vlan 30
switch(config)# vn-segment 10030
switch(config)# xconnect

```

This example shows how to configure access ports:

```

switch# configure terminal
switch(config)# interface ethernet1/1
switch(config-if)# switchport mode dot1q-tunnel
switch(config-if)# switchport access vlan 10
switch(config-if)# exit
switch(config)# interface ethernet1/2
switch(config-if)# switchport mode dot1q-tunnel
switch(config-if)# switchport access vlan 20
switch(config-if)# exit
switch(config)# interface ethernet1/3
switch(config-if)# switchport mode dot1q-tunnel
switch(config-if)# switchport access vlan 30

```

## Verifying VXLAN Cross Connect Configuration

To display the status for the VXLAN Cross Connect configuration, enter one of the following commands:

**Table 5: Display VXLAN Cross Connect Information**

Command	Purpose
<b>show running-config vlan</b> <i>session-num</i>	Displays VLAN information.
<b>show nve vni</b>	Displays VXLAN VNI status.
<b>show nve vni</b> <i>session-num</i>	Displays VXLAN VNI status per VNI.

Example of the **show run vlan 503** command:

```

switch(config)# sh run vlan 503

!Command: show running-config vlan 503
!Running configuration last done at: Mon Jul  9 13:46:03 2018
!Time: Tue Jul 10 14:12:04 2018

version 9.2(1) Bios:version 07.64
vlan 503
vlan 503
    vn-segment 5503
    xconnect

```

Example of the **show nve vni 5503** command:

```

switch(config)# sh nve vni 5503
Codes: CP - Control Plane      DP - Data Plane
       UC - Unconfigured       SA - Suppress ARP

```

```

      SU - Suppress Unknown Unicast
Interface VNI      Multicast-group  State Mode Type [BD/VRF]      Flags
-----
nve1      5503      225.5.0.3        Up   CP   L2 [503]            SA      Xconn

```

Example of the **show nve vni** command:

```

switch(config)# sh nve vni
Codes: CP - Control Plane      DP - Data Plane
      UC - Unconfigured        SA - Suppress ARP
      SU - Suppress Unknown Unicast
Interface VNI      Multicast-group  State Mode Type [BD/VRF]      Flags
-----
nve1      5501      225.5.0.1        Up   CP   L2 [501]            SA
nve1      5502      225.5.0.2        Up   CP   L2 [502]            SA
nve1      5503      225.5.0.3        Up   CP   L2 [503]            SA      Xconn
nve1      5504      UnicastBGP       Up   CP   L2 [504]            SA      Xconn
nve1      5505      225.5.0.5        Up   CP   L2 [505]            SA      Xconn
nve1      5506      UnicastBGP       Up   CP   L2 [506]            SA      Xconn
nve1      5507      225.5.0.7        Up   CP   L2 [507]            SA      Xconn
nve1      5510      225.5.0.10       Up   CP   L2 [510]            SA      Xconn
nve1      5511      225.5.0.11       Up   CP   L2 [511]            SA      Xconn
nve1      5512      225.5.0.12       Up   CP   L2 [512]            SA      Xconn
nve1      5513      UnicastBGP       Up   CP   L2 [513]            SA      Xconn
nve1      5514      225.5.0.14       Up   CP   L2 [514]            SA      Xconn
nve1      5515      UnicastBGP       Up   CP   L2 [515]            SA      Xconn
nve1      5516      UnicastBGP       Up   CP   L2 [516]            SA      Xconn
nve1      5517      UnicastBGP       Up   CP   L2 [517]            SA      Xconn
nve1      5518      UnicastBGP       Up   CP   L2 [518]            SA      Xconn

```

## Configuring NGOAM for VXLAN Cross Connect

This procedure describes how to configure NGOAM for VXLAN Cross Connect.

### SUMMARY STEPS

1. **configure terminal**
2. **feature ngoam**
3. **ngoam install acl**
4. (Optional) **ngoam xconnect hb-interval *interval***

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>feature ngoam</b>  <b>Example:</b> switch(config)# <b>feature ngoam</b>	Enters the NGOAM feature.
<b>Step 3</b>	<b>ngoam install acl</b>  <b>Example:</b> switch(config)# <b>ngoam install acl</b>	Installs NGOAM Access Control List (ACL).

	Command or Action	Purpose
Step 4	(Optional) <b>ngoam xconnect hb-interval</b> <i>interval</i> <b>Example:</b> <code>switch(config)# ngoam xconnect hb-interval 5000</code>	Configures the heart beat interval. Range of <i>interval</i> is 150 to 5000. The default value is 190.

## Verifying NGOAM for VXLAN Cross Connect

To display the NGOAM status for the VXLAN Cross Connect configuration, enter one of the following commands:

**Table 6: Display VXLAN Cross Connect Information**

Command	Purpose
<b>show ngoam xconnect session all</b>	Displays the summary of xconnect sessions.
<b>show ngoam xconnect session</b> <i>session-num</i>	Displays detailed xconnect information for the session.

Example of the **show ngoam xconnect session all** command:

```
switch(config)# sh ngoam xconnect session all

States: LD = Local interface down, RD = Remote interface Down
        HB = Heartbeat lost, DB = Database/Routes not present
* - Showing Vpc-peer interface info
Vlan      Peer-ip/vni      XC-State      Local-if/State      Rmt-if/State
=====

508        7.7.7.7 / 5508      Active        Eth1/8 / UP         Eth1/5 / UP
509        7.7.7.7 / 5509      Active        Eth1/9 / UP         Eth1/9 / UP
510        6.6.6.6 / 5510      Active        Po303 / UP          Po103 / UP
513        6.6.6.6 / 5513      Active        Eth1/6 / UP         Eth1/8 / UP
```

Example of the **show ngoam xconnect session 507** command:

```
switch(config)# sh ngoam xconnect session 507
Vlan ID: 507
Peer IP: 6.6.6.6 VNI : 5507
State: Active
Last state update: 07/09/2018 13:47:03.849
Local interface: Eth1/7 State: UP
Local vpc interface Unknown State: DOWN
Remote interface: Eth1/5 State: UP
Remote vpc interface: Unknown State: DOWN
switch(config)#
```

## NGOAM Authentication

NGOAM provides the interface statistics in the pathtrace response. NGOAM authenticates the pathtrace requests to provide the statistics by using the HMAC MD5 authentication mechanism.

NGOAM authentication validates the pathtrace requests before providing the interface statistics. NGOAM authentication takes effect only for the pathtrace requests with **req-stats** option. All the other commands are not affected with the authentication configuration. If NGOAM authentication key is configured on the requesting node, NGOAM runs the MD5 algorithm using this key to generate the 16-bit MD5 digest. This digest is encoded as type-length-value (TLV) in the pathtrace request messages.

When the pathtrace request is received, NGOAM checks for the **req-stats** option and the local NGOAM authentication key. If the local NGOAM authentication key is present, it runs MD5 using the local key on the request to generate the MD5 digest. If both digests match, it includes the interface statistics. If both digests do not match, it sends only the interface names. If an NGOAM request comes with the MD5 digest but no local authentication key is configured, it ignores the digest and sends all the interface statistics. To secure an entire network, configure the authentication key on all nodes.

To configure the NGOAM authentication key, use the **ngoam authentication-key <key>** CLI command. Use the **show running-config ngoam** CLI command to display the authentication key.

```
switch# show running-config ngoam
!Time: Tue Mar 28 18:21:50 2017
version 7.0(3)I6(1)
feature ngoam
ngoam profile 1
  oam-channel 2
ngoam profile 3
ngoam install acl
ngoam authentication-key 987601ABCDEF
```

In the following example, the same authentication key is configured on the requesting switch and the responding switch.

```
switch# pathtrace nve ip 12.0.22.1 profile 1 vni 31000 req-stats ver

```

In the following example, an authentication key is not configured on the requesting switch. Therefore, the responding switch does not send any interface statistics. The intermediate node does not have any authentication key configured and it always replies with the interface statistics.

```

## Guidelines and Limitations for Q-in-VNI

Q-in-VNI has the following guidelines and limitations:

- Q-in-VNI and selective Q-in-VNI are supported with VXLAN Flood and Learn with Ingress Replication and VXLAN EVPN with Ingress Replication.
- Q-in-VNI, selective Q-in-VNI, and QinQ-QinVNI are not supported with the multicast underlay on Cisco Nexus 9000-EX platform switches.
- The **system dot1q-tunnel transit [vlan vlan-range]** command is required when running this feature on vPC VTEPs.
- Port VLAN mapping and Q-in-VNI cannot coexist on the same port.
- Port VLAN mapping and Q-in-VNI cannot coexist on a switch if the **system dot1q-tunnel transit** command is enabled. Beginning with Cisco NX-OS Release 9.3(5), port VLAN mapping and Q-in-VNI can coexist on the same switch but on different ports and different provider VLANs, which are configured using the **system dot1q-tunnel transit vlan vlan-range** command.
- Beginning with Cisco NX-OS Release 10.1(1), Selective Q-in-VNI and VXLAN VLAN on Same Port feature is supported on Cisco Nexus 9300-FX3 platform switches.
- For proper operation during L3 uplink failure scenarios on vPC VTEPs, configure a backup SVI and enter the **system nve infra-vlans backup-svi-vlan** command. On Cisco Nexus 9000-EX platform switches, the backup SVI VLAN needs to be the native VLAN on the peer-link.
- Q-in-VNI only supports VXLAN bridging. It does not support VXLAN routing.
- The dot1q tunnel mode does not support ALE ports on Cisco Nexus 9300 Series and Cisco Nexus 9500 platform switches.
- Q-in-VNI does not support FEX.
- When configuring access ports and trunk ports for Cisco Nexus 9000 Series switches with a Network Forwarding Engine (NFE) or a Leaf Spine Engine (LSE), you can have access ports, trunk ports, and dot1q ports on different interfaces on the same switch.
- You cannot have the same VLAN configured for both dot1q and trunk ports/access ports.
- Disable ARP suppression on the provider VNI for ARP traffic originated from a customer VLAN in order to flow.

```

switch(config)# interface nve 1
switch(config-if-nve)# member VNI 10000011
switch(config-if-nve-vni)# no suppress-arp

```

- Cisco Nexus 9300 platform switches support single tag. You can enable it by entering the **no overlay-encapsulation vxlan-with-tag** command for the NVE interface:

```

switch(config)# interface nve 1
switch(config-if-nve)# no overlay-encapsulation vxlan-with-tag
switch# show run int nve 1

```

```
!Command: show running-config interface nve1
!Time: Wed Jul 20 23:26:25 2016

version 7.0(3u)I4(2u)

interface nve1
  no shutdown
  source-interface loopback0
  host-reachability protocol bgp
  member vni 900001 associate-vrf
  member vni 2000980
  mcast-group 225.4.0.1
```

- Cisco Nexus 9500 platform switches do not support single tag. They support only double tag.
- Cisco Nexus 9300-EX platform switches do not support double tag. They support only single tag.
- Cisco Nexus 9300-EX platform switches do not support traffic between ports configured for Q-in-VNI and ports configured for trunk.
- Q-in-VNI cannot coexist with a VTEP that has Layer 3 subinterfaces configured. Beginning with Cisco NX-OS Release 9.3(5), this limitation no longer applies to Cisco Nexus 9332C, 9364C, 9300-FX/FX2, and 9300-GX platform switches.
- When VLAN1 is configured as the native VLAN with selective Q-in-VNI with the multiple provider tag, traffic on the native VLAN gets dropped. Do not configure VLAN1 as the native VLAN when the port is configured with selective Q-in-VNI. When VLAN1 is configured as a customer VLAN, the traffic on VLAN1 gets dropped.
- The base port mode must be a dot1q tunnel port with an access VLAN configured.
- VNI mapping is required for the access VLAN on the port.
- If you have Q-in-VNI on one Cisco Nexus 9300-EX Series switch VTEP and trunk on another Cisco Nexus 9300-EX Series switch VTEP, the bidirectional traffic will not be sent between the two ports.
- Cisco Nexus 9300-EX Series of switches performing VXLAN and Q-in-Q, a mix of provider interface and VXLAN uplinks is not considered. The VXLAN uplinks have to be separated from the Q-in-Q provider or customer interface.

For vPC use cases, the following considerations must be made when VXLAN and Q-in-Q are used on the same switch.

- The vPC peer-link has to be specifically configured as a provider interface to ensure orphan-to-orphan port communication. In these cases, the traffic is sent with two IEEE 802.1q tags (double dot1q tagging). The inner dot1q is the customer VLAN ID while the outer dot1q is the provider VLAN ID (access VLAN).
- The vPC peer-link is used as backup path for the VXLAN encapsulated traffic in the case of an uplink failure. In Q-in-Q, the vPC peer-link also acts as the provider interface (orphan-to-orphan port communication). In this combination, use the native VLAN as the backup VLAN for traffic to handle uplink failure scenarios. Also make sure the backup VLAN is configured as a system infra VLAN (system nve infra-vlans).
- Beginning with Cisco NX-OS Release 9.3(5), Q-in-VNI is supported on Cisco Nexus 9300-GX platform switches.

- Beginning with Cisco NX-OS Release 9.3(5), Q-in-VNI supports vPC Fabric Peering.

## Configuring Q-in-VNI

Using Q-in-VNI provides a way for you to segregate traffic by mapping to a specific port. In a multi-tenant environment, you can specify a port to a tenant and send/receive packets over the VXLAN overlay.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *type port*
3. **switchport mode dot1q-tunnel**
4. **switchport access vlan** *vlan-id*
5. **spanning-tree bpdupfilter enable**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>type port</i>	Enters interface configuration mode.
<b>Step 3</b>	<b>switchport mode dot1q-tunnel</b>	Creates a 802.1Q tunnel on the port.
<b>Step 4</b>	<b>switchport access vlan</b> <i>vlan-id</i>	Specifies the port assigned to a VLAN.
<b>Step 5</b>	<b>spanning-tree bpdupfilter enable</b>	Enables BPDU Filtering for the specified spanning tree edge interface. By default, BPDU Filtering is disabled.

### Example

The following is an example of configuring Q-in-VNI:

```
switch# config terminal
switch(config)# interface ethernet 1/4
switch(config-if)# switchport mode dot1q-tunnel
switch(config-if)# switchport access vlan 10
switch(config-if)# spanning-tree bpdupfilter enable
switch(config-if)#
```

## Configuring Selective Q-in-VNI

Selective Q-in-VNI is a VXLAN tunneling feature that allows a user specific range of customer VLANs on a port to be associated with one specific provider VLAN. Packets that come in with a VLAN tag that matches any of the configured customer VLANs on the port are tunneled across the VXLAN fabric using the properties of the service provider VNI. The VXLAN encapsulated packet carries the customer VLAN tag as part of the L2 header of the inner packet.

The packets that come in with a VLAN tag that is not present in the range of the configured customer VLANs on a selective Q-in-VNI configured port are dropped. This includes the packets that come in with a VLAN tag that matches the native VLAN on the port. Packets coming untagged or with a native VLAN tag are L3 routed using the native VLAN's SVI that is configured on the selective Q-in-VNI port (no VXLAN).

See the following guidelines for selective Q-in-VNI:

- Selective Q-in-VNI is supported on both vPC and non-vPC ports on Cisco Nexus 9300-EX and 9300-FX/FXP/FX2/FX3 and 9300-GX platform switches. This feature is not supported on Cisco Nexus 9200 and 9300 platform switches.
- Beginning with Cisco NX-OS Release 9.3(5), selective Q-in-VNI supports vPC Fabric Peering.
- Configuring selective Q-in-VNI on one VTEP and configuring plain Q-in-VNI on the VXLAN peer is supported. Configuring one port with selective Q-in-VNI and the other port with plain Q-in-VNI on the same switch is supported.
- Selective Q-in-VNI is an ingress VLAN tag-policing feature. Only ingress VLAN tag policing is performed with respect to the selective Q-in-VNI configured range.

For example, selective Q-in-VNI customer VLAN range of 100-200 is configured on VTEP1 and customer VLAN range of 200-300 is configured on VTEP2. When traffic with VLAN tag of 175 is sent from VTEP1 to VTEP2, the traffic is accepted on VTEP1, since the VLAN is in the configured range and it is forwarded to the VTEP2. On VTEP2, even though VLAN tag 175 is not part of the configured range, the packet egresses out of the selective Q-in-VNI port. If a packet is sent with VLAN tag 300 from VTEP1, it is dropped because 300 is not in VTEP1's selective Q-in-VNI configured range.

- Beginning with Cisco NX-OS Release 10.1(1), Selective Q-in-VNI and Advertise PIP on a VTEP feature is supported on Cisco Nexus 9300-FX3 platform switches.
- Beginning with Cisco NX-OS Release 9.3(5), the **advertise-pip** command is supported with selective Q-in-VNI on a VTEP.
- Port VLAN mapping and selective Q-in-VNI cannot coexist on the same port.
- Port VLAN mapping and selective Q-in-VNI cannot coexist on a switch if the **system dot1q-tunnel transit** command is enabled. Beginning with Cisco NX-OS Release 9.3(5), port VLAN mapping and Q-in-VNI can coexist on the same switch but on different ports and different provider VLANs, which are configured using the **system dot1q-tunnel transit vlan** *vlan-range* command.
- Configure the **system dot1q-tunnel transit [vlan** *vlan-id***]** command on vPC switches with selective Q-in-VNI configurations. This command is required to retain the inner Q-tag as the packet goes over the vPC peer link when one of the vPC peers has an orphan port. With this CLI configuration, the **vlan dot1Q tag native** functionality does not work. Prior to Cisco NX-OS Release 9.3(5), every VLAN created on the switch is a provider VLAN and cannot be used for any other purpose.

Beginning with Cisco NX-OS Release 9.3(5), selective Q-in-VNI and VXLAN VLANs can be supported on the same port. With the [**vlan** *vlan-range*] option, you can specify the provider VLANs and allow other VLANs to be used for regular VXLAN traffic. In the following example, the VXLAN VLAN is 50, the provider VLAN is 501, the customer VLANs are 31-40, and the native VLAN is 2400.

```
system dot1q-tunnel transit vlan 501
interface Ethernet1/1/2
  switchport
  switchport mode trunk
  switchport trunk native vlan 2400
  switchport vlan mapping 31-40 dot1q-tunnel 501
  switchport trunk allowed vlan 50,501,2400
```

```
spanning-tree port type edge trunk
mtu 9216
no shutdown
```

- The native VLAN configured on the selective Q-in-VNI port cannot be a part of the customer VLAN range. If the native VLAN is part of the customer VLAN range, the configuration is rejected.

The provider VLAN can overlap with the customer VLAN range. For example, **switchport vlan mapping 100-1000 dot1q-tunnel 200**.

- By default, the native VLAN on any port is VLAN 1. If VLAN 1 is configured as part of the customer VLAN range using the **switchport vlan mapping <range>dot1q-tunnel <sp-vlan>** CLI command, the traffic with customer VLAN 1 is not carried over as VLAN 1 is the native VLAN on the port. If customer wants VLAN 1 traffic to be carried over the VXLAN cloud, they should configure a dummy native VLAN on the port whose value is outside the customer VLAN range.
- To remove some VLANs or a range of VLANs from the configured switchport VLAN mapping range on the selective Q-in-VNI port, use the **no** form of the **switchport vlan mapping <range>dot1q-tunnel <sp-vlan>** command.

For example, VLAN 100-1000 is configured on the port. To remove VLAN 200-300 from the configured range, use the **no switchport vlan mapping <200-300> dot1q-tunnel <sp-vlan>** command.

```
interface Ethernet1/32
 switchport
 switchport mode trunk
 switchport trunk native vlan 4049
 switchport vlan mapping 100-1000 dot1q-tunnel 21
 switchport trunk allowed vlan 21,4049
 spanning-tree bpdupfilter enable
 no shutdown

switch(config-if)# no sw vlan mapp 200-300 dot1q-tunnel 21
switch(config-if)# sh run int e 1/32

version 7.0(3)I5(2)

interface Ethernet1/32
 switchport
 switchport mode trunk
 switchport trunk native vlan 4049
 switchport vlan mapping 100-199,301-1000 dot1q-tunnel 21
 switchport trunk allowed vlan 21,4049
 no shutdown
```

See the following configuration examples.

- See the following example for the provider VLAN configuration:

```
vlan 50
 vn-segment 10050
```

- See the following example for configuring VXLAN Flood and Learn with Ingress Replication:

```
member vni 10050
 ingress-replication protocol static
 peer-ip 100.1.1.3
 peer-ip 100.1.1.5
```

```
peer-ip 100.1.1.10
```

- See the following example for the interface nve configuration:

```
interface nve1
 no shutdown
 source-interface loopback0 member vni 10050
 mcast-group 230.1.1.1
```

- See the following example for configuring an SVI in the native VLAN to routed traffic.

```
vlan 150
interface vlan150
 no shutdown
 ip address 150.1.150.6/24
 ip pim sparse-mode
```

- See the following example for configuring selective Q-in-VNI on a port. In this example, native VLAN 150 is used for routing the untagged packets. Customer VLANs 200-700 are carried across the dot1q tunnel. The native VLAN 150 and the provider VLAN 50 are the only VLANs allowed.

```
switch# config terminal
switch(config)#interface Ethernet 1/31
switch(config-if)#switchport
switch(config-if)#switchport mode trunk
switch(config-if)#switchport trunk native vlan 150
switch(config-if)#switchport vlan mapping 200-700 dot1q-tunnel 50
switch(config-if)#switchport trunk allowed vlan 50,150
switch(config-if)#no shutdown
```

- Disable ARP suppression on the provider VNI for ARP traffic originated from a customer VLAN in order to flow.

```
switch(config)# interface nve 1
switch(config-if-nve)# member VNI 10000011
switch(config-if-nve-vni)# no suppress-arp
```

## Configuring Q-in-VNI with LACP Tunneling

Q-in-VNI can be configured to tunnel LACP packets.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *type port*
3. **switchport mode dot1q-tunnel**
4. **switchport access vlan** *vlan-id*
5. **interface nve** *x*

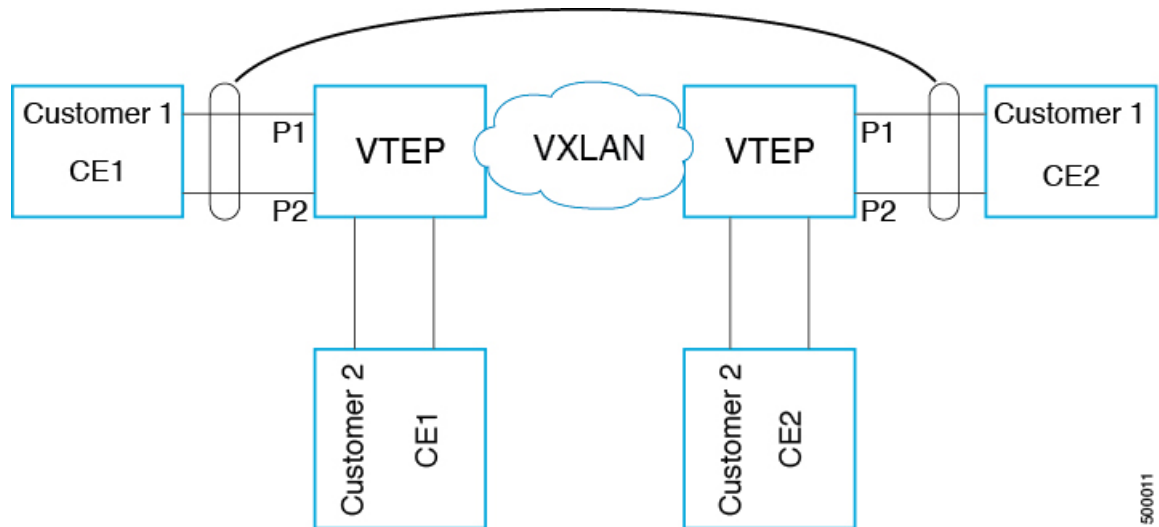

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<code>interface type port</code>	Enters interface configuration mode.
<b>Step 3</b>	<code>switchport mode dot1q-tunnel</code>	Enables dot1q-tunnel mode.
<b>Step 4</b>	<code>switchport access vlan vlan-id</code>	Specifies the port assigned to a VLAN.
<b>Step 5</b>	<code>interface nve x</code>	Creates a VXLAN overlay interface that terminates VXLAN tunnels.

## Example

- The following is an example topology that pins each port of a port-channel pair to a unique VM. The port-channel is stretched from the CE perspective. There is no port-channel on VTEP. The traffic on P1 of CE1 transits to P1 of CE2 using Q-in-VNI.

Figure 21: LACP Tunneling Over VXLAN P2P Tunnels

500011

**Note**

- Q-in-VNI can be configured to tunnel LACP packets. (Able to provide port-channel connectivity across data-centers.)
  - Gives impression of L1 connectivity and co-location across data-centers.
  - Exactly two sites. Traffic coming from P1 of CE1 goes out of P1 of CE2. If P1 of CE1 goes down, LACP provides coverage (over time) to redirect traffic to P2.
- Uses static ingress replication with VXLAN with flood and learn. Each port of the port channel is configured with Q-in-VNI. There are multiple VNIs for each member of a port-channel and each port is pinned to specific VNI.
  - To avoid saturating the MAC, you should turn off/disable learning of VLANs.
- Configuring Q-in-VNI to tunnel LACP packets is not supported for VXLAN EVPN.
- The number of port-channel members supported is the number of ports supported by the VTEP.

## Selective Q-in-VNI with Multiple Provider VLANs

### About Selective Q-in-VNI with Multiple Provider VLANs

Selective Q-in-VNI with multiple provider VLANs is a VXLAN tunneling feature. This feature allows a user specific range of customer VLANs on a port to be associated with one specific provider VLAN. It also enables you to have multiple customer-VLAN to provider-VLAN mappings on a port. Packets that come in with a VLAN tag which matches any of the configured customer VLANs on the port are tunneled across the VXLAN fabric using the properties of the service provider VNI. The VXLAN encapsulated packet carries the customer VLAN tag as part of the Layer 2 header of the inner packet.

### Guidelines and Limitations for Selective Q-in-VNI with Multiple Provider VLANs

Selective Q-in-VNI with multiple provider VLANs has the following guidelines and limitations:

- All the existing guidelines and limitations for [Selective Q-in-VNI](#) apply.
- This feature is supported with VXLAN BGP EVPN IR mode only.
- When enabling multiple provider VLANs on a vPC port channel, make sure that the configuration is consistent across the vPC peers.
- Port VLAN mapping and selective Q-in-VNI cannot coexist on the same port.
- Port VLAN mapping and selective Q-in-VNI cannot coexist on a switch if the **system dot1q-tunnel transit** command is enabled. Beginning with Cisco NX-OS Release 9.3(5), port VLAN mapping and selective Q-in-VNI can coexist on the same switch but on different ports and different provider VLANs, which are configured using the **system dot1q-tunnel transit vlan** *vlan-range* command.

- The **system dot1q-tunnel transit [vlan vlan-range]** command is required when using this feature on vPC VTEPs.
- For proper operation during Layer 3 uplink failure scenarios on vPC VTEPs, configure the backup SVI and enter the **system nve infra-vlans backup-svi-vlan** command. On Cisco Nexus 9000-EX platform switches, the backup SVI VLAN must be the native VLAN on the peer-link.
- As a best practice, do not allow provider VLANs on a regular trunk.
- We recommend not creating or allowing customer VLANs on the switch where customer-VLAN to provider-VLAN mapping is configured.
- We do not support specific native VLAN configuration when the **switchport vlan mapping all dot1q-tunnel** command is entered.
- Beginning with Cisco NX-OS Release 9.3(5), selective Q-in-VNI with a multiple provider tag supports vPC Fabric Peering.
- Disable ARP suppression on the provider VNI for ARP traffic originated from a customer VLAN in order to flow.

```
switch(config)# interface nve 1
switch(config-if-nve)# member VNI 10000011
switch(config-if-nve-vni)# no suppress-arp
```

- All incoming traffic should be tagged when the interface is configured with the **switchport vlan mapping all dot1q-tunnel** command.

## Configuring Selective Q-in-VNI with Multiple Provider VLANs

You can configure selective Q-in-VNI with multiple provider VLANs.

### Before you begin

You must configure provider VLANs and associate the VLAN to a vn-segment.

### SUMMARY STEPS

1. Enter global configuration mode.
2. Configure Layer 2 VLANs and associate them to a vn-segment.
3. Enter interface configuration mode where the traffic comes in with a dot1Q VLAN tag.

### DETAILED STEPS

**Step 1** Enter global configuration mode.

```
switch# configure terminal
```

**Step 2** Configure Layer 2 VLANs and associate them to a vn-segment.

```
switch(config)# vlan 10
vn-segment 10000010
switch(config)# vlan 20
vn-segment 10000020
```

**Step 3** Enter interface configuration mode where the traffic comes in with a dot1Q VLAN tag.

```

switch(config)# interf port-channel 10
switch(config-if)# switchport
switch(config-if)# switchport mode trunk
switch(config-if)# switchport trunk native vlan 3962
switch(config-if)# switchport vlan mapping 2-400 dot1q-tunnel 10
switch(config-if)# switchport vlan mapping 401-800 dot1q-tunnel 20
switch(config-if)# switchport vlan mapping 801-1200 dot1q-tunnel 30
switch(config-if)# switchport vlan mapping 1201-1600 dot1q-tunnel 40
switch(config-if)# switchport vlan mapping 1601-2000 dot1q-tunnel 50
switch(config-if)# switchport vlan mapping 2001-2400 dot1q-tunnel 60
switch(config-if)# switchport vlan mapping 2401-2800 dot1q-tunnel 70
switch(config-if)# switchport vlan mapping 2801-3200 dot1q-tunnel 80
switch(config-if)# switchport vlan mapping 3201-3600 dot1q-tunnel 90
switch(config-if)# switchport vlan mapping 3601-3960 dot1q-tunnel 100
switch(config-if)# switchport trunk allowed vlan 10,20,30,40,50,60,70,80,90,100,3961-3967

```

**Example**

This example shows how to configure Selective QinVni with multiple provider VLANs:

```

switch# show run vlan 121
vlan 121
vlan 121
    vn-segment 10000021

switch#
switch# sh run interf port-channel 5

interface port-channel5
    description VPC PO
    switchport
    switchport mode trunk
    switchport trunk native vlan 504
    switchport vlan mapping 11 dot1q-tunnel 111
    switchport vlan mapping 12 dot1q-tunnel 112
    switchport vlan mapping 13 dot1q-tunnel 113
    switchport vlan mapping 14 dot1q-tunnel 114
    switchport vlan mapping 15 dot1q-tunnel 115
    switchport vlan mapping 16 dot1q-tunnel 116
    switchport vlan mapping 17 dot1q-tunnel 117
    switchport vlan mapping 18 dot1q-tunnel 118
    switchport vlan mapping 19 dot1q-tunnel 119
    switchport vlan mapping 20 dot1q-tunnel 120
    switchport trunk allowed vlan 111-120,500-505
    vpc 5

## Configuring QinQ-QinVNI

### Overview for QinQ-QinVNI

- QinQ-QinVNI is a VXLAN tunneling feature that allows you to configure a trunk port as a multi-tag port to preserve the customer VLANs that are carried across the network.
- On a port that is configured as multi-tag, packets are expected with multiple-tags or at least one tag. When multi-tag packets ingress on this port, the outer-most or first tag is treated as provider-tag or provider-vlan. The remaining tags are treated as customer-tag or customer-vlan.
- This feature is supported on both vPC and non-vPC ports.
- Ensure that the **switchport trunk allow-multi-tag** command is configured on both of the vPC-peers. It is a type 1 consistency check.
- This feature is supported with VXLAN Flood and Learn and VXLAN EVPN.

## Guidelines and Limitations for QinQ-QinVNI

QinQ-QinVNI has the following guidelines and limitations:

- This feature is supported on the Cisco Nexus 9300-FX/FX2/FX3, and 9300-GX platform switches.
- This feature supports vPC Fabric Peering.
- On a multi-tag port, provider VLANs must be a part of the port. They are used to derive the VNI for that packet.
- Untagged packets are associated with the native VLAN. If the native VLAN is not configured, the packet is associated with the default VLAN (VLAN 1).
- Packets coming in with an outermost VLAN tag (provider-vlan), not present in the range of allowed VLANs on a multi-tag port, are dropped.
- Packets coming in with an outermost VLAN tag (provider-vlan) tag matching the native VLAN are routed or bridged in the native VLAN's domain.
- This feature supports VXLAN bridging but does not support VXLAN routing.
- Multicast data traffic with more than two Q-Tags is not supported when snooping is enabled on the VXLAN VLAN.
- You need at least one multi-tag trunk port allowing the provider VLANs in Up state on both vPC peers. Otherwise, traffic traversing via the peer-link for these provider VLANs will not carry all inner C-Tags.
- The **system dot1q-tunnel transit** [vlan *vlan-range*] command is required when running this feature on vPC VTEPs.

## Configuring QinQ-QinVNI

### Note

You can also carry native VLAN (untagged traffic) on the same multi-tag trunk port.

The native VLAN on a multi-tag port cannot be configured as a provider VLAN on another multi-tag port or a dot1q enabled port on the same switch.

The **allow-multi-tag** command is allowed only on a trunk port. It is not available on access or dot1q ports.

The **allow-multi-tag** command is not allowed on Peer Link ports. Port channel with multi-tag enabled must not be configured as a vPC peer-link.

### SUMMARY STEPS

1. **configure terminal**
2. **interface ethernet** *slot/port*
3. **switchport**
4. **switchport mode trunk**
5. **switchport trunk native vlan** *vlan-id*
6. **switchport trunk allowed vlan** *vlan-list*
7. **switchport trunk allow-multi-tag**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface ethernet <i>slot/port</i></b> <b>Example:</b> <code>switch(config)# interface ethernet1/7</code>	Specifies the interface that you are configuring.
<b>Step 3</b>	<b>switchport</b> <b>Example:</b> <code>switch(config-if)# switchport</code>	Configures it as a Layer 2 port.
<b>Step 4</b>	<b>switchport mode trunk</b> <b>Example:</b> <code>switch(config-if)# switchport mode trunk</code>	Sets the interface as a Layer 2 trunk port.
<b>Step 5</b>	<b>switchport trunk native vlan <i>vlan-id</i></b> <b>Example:</b> <code>switch(config-if)# switchport trunk native vlan 30</code>	Sets the native VLAN for the 802.1Q trunk. Valid values are from 1 to 4094. The default value is VLAN1.
<b>Step 6</b>	<b>switchport trunk allowed vlan <i>vlan-list</i></b> <b>Example:</b> <code>switch(config-if)# switchport trunk allowed vlan 10,20,30</code>	Sets the allowed VLANs for the trunk interface. The default is to allow all VLANs on the trunk interface: 1 to 3967 and 4048 to 4094. VLANs 3968 to 4047 are the default VLANs reserved for internal use by default.
<b>Step 7</b>	<b>switchport trunk allow-multi-tag</b> <b>Example:</b> <code>switch(config-if)# switchport trunk allow-multi-tag</code>	Sets the allowed VLANs as the provider VLANs excluding the native VLAN. In the following example, VLANs 10 and 20 are provider VLANs and can carry multiple Inner Q-tags. Native VLAN 30 will not carry inner Q-tags.

**Example**

```

interface Ethernet1/7
switchport
switchport mode trunk
switchport trunk native vlan 30
switchport trunk allow-multi-tag
switchport trunk allowed vlan 10,20,30
no shutdown

```

# Removing a VNI

Use this procedure to remove a VNI.

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Remove the VNI under NVE.  |
| <b>Step 2</b> | Remove the VRF from BGP (applicable when decommissioning for Layer 3 VNI). |
| <b>Step 3</b> | Delete the SVI.  |
| <b>Step 4</b> | Delete the VLAN and VNI.   |
-

## CHAPTER 13

# Configuring Port VLAN Mapping

This chapter contains the following sections:

- [About Translating Incoming VLANs, on page 277](#)
- [Guidelines and Limitations for Port VLAN Mapping, on page 278](#)
- [Configuring Port VLAN Mapping on a Trunk Port, on page 280](#)
- [Configuring Inner VLAN and Outer VLAN Mapping on a Trunk Port, on page 282](#)

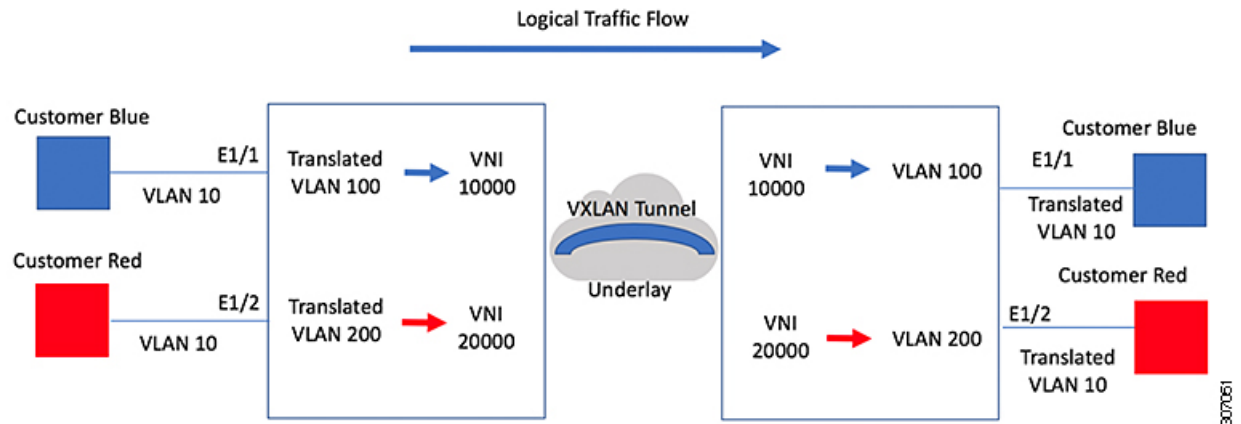

## About Translating Incoming VLANs

Sometimes a VLAN translation is required or desired. One such use case is when a service provider has multiple customers connecting to the same physical switch using the same VLAN encapsulation, but they are not and should not be on the same Layer 2 segment. In such cases translating the incoming VLAN to a unique VLAN that is then mapped to a VNI is the right way to extending the segment. In the figure below two customers, Blue and Red are both connecting to the leaf using VLAN 10 as their encapsulation.

Customers Blue and Red should not be on the same VNI. In this example VLAN 10 for Customer Blue (on interface E1/1) is mapped/translated to VLAN 100, and VLAN 10 for customer Red (on interface E1/2) is mapped to VLAN 200. In turn, VLAN 100 is mapped to VNI 10000 and VLAN 200 is mapped to VNI 20000.

On the other leaf, this mapping is applied in reverse. Incoming VXLAN encapsulated traffic on VNI 10000 is mapped to VLAN 100 which in turn is mapped to VLAN 10 on Interface E1/1. VXLAN encapsulated traffic on VNI 20000 is mapped to VLAN 200 which in turn is mapped to VLAN 10 on Interface E1/2.

Figure 22: Logical Traffic Flow

You can configure VLAN translation between the ingress (incoming) VLAN and a local (translated) VLAN on a port. For the traffic arriving on the interface where VLAN translation is enabled, the incoming VLAN is mapped to a translated VLAN that is VXLAN enabled.

On the underlay, this is mapped to a VNI, the inner dot1q is deleted, and switched over to the VXLAN network. On the egress switch, the VNI is mapped to a translated VLAN. On the outgoing interface, where VLAN translation is configured, the traffic is converted to the original VLAN and egressed out. Refer to the VLAN counters on the translated VLAN for the traffic counters and not on the ingress VLAN. Port VLAN (PV) mapping is an access side feature and is supported with both multicast and ingress replication for flood and learn and MP-BGP EVPN mode for VXLAN.

## Guidelines and Limitations for Port VLAN Mapping

The following are the guidelines and Limitations for Port VLAN Mapping:

- Support is added for vPC Fabric Peering.
- VLAN translation is supported only VXLAN enabled VLANs
- The ingress (incoming) VLAN does not need to be configured on the switch as a VLAN. The translated VLAN needs to be configured and a vn-segment mapping given to it. An NVE interface with VNI mapping is essential for the same.
- All Layer 2 source address learning and Layer 2 MAC destination lookup occurs on the translated VLAN. Refer to the VLAN counters on the translated VLAN and not on the ingress (incoming) VLAN.
- Port VLAN mapping is supported on Cisco Nexus 9300, 9300-EX, and 9300-FX3 platform switches.
- Cisco Nexus 9300 and 9500 switches support switching and routing on overlapped VLAN interfaces. Only VLAN-mapping switching is applicable for Cisco Nexus 9300-EX/FX/FX2/FX3 platform switches and Cisco Nexus 9500 with -EX/FX line cards.
- Port VLAN routing is supported on the following platforms:
  - Starting from Cisco NX-OS Release 7.x, this feature is supported on Cisco Nexus 9300-EX/FX/FX2 platform switches.

- Starting from Cisco NX-OS Release 9.2(x), this feature is supported on Cisco Nexus 9300-GX platform switches.
- Starting from Cisco NX-OS Release 9.3(x), this feature is supported on Cisco Nexus 9300-FX3 platform switches.
- Beginning with Cisco NX-OS Release 9.3(3), PV Translation is supported for Cisco Nexus 9300-GX platform switches.
- On Cisco Nexus 9300 Series switches with NFE ASIC, PV routing is not supported on 40 G ALE ports.
- PV routing supports configuring an SVI on the translated VLAN for flood and learn and BGP EVPN mode for VXLAN.
- VLAN translation (mapping) is supported on Cisco Nexus 9000 Series switches with a Network Forwarding Engine (NFE).
- When changing a property on a translated VLAN, the port that has a mapping configuration with that VLAN as the translated VLAN, must be flapped to ensure correct behavior.

```

Int eth 1/1
switchport vlan mapping 101 10
.
.
.

/****Deleting vn-segment from vlan 10.****/
/****Adding vn-segment back.****/
/****Flap Eth 1/1 to ensure correct behavior.****/

```

- The following example shows incoming VLAN 10 being mapped to local VLAN 100. Local VLAN 100 will be the one mapped to a VXLAN VNI.

```

interface ethernet1/1
switchport vlan mapping 10 100

```

- The following is an example of overlapping VLAN for PV translation. In the first statement, VLAN-102 is a translated VLAN with VNI mapping. In the second statement, VLAN-102 the VLAN where it is translated to VLAN-103 with VNI mapping.

```

interface ethernet1/1
switchport vlan mapping 101 102
switchport vlan mapping 102 103/

```

- When adding a member to an existing port channel using the force command, the "mapping enable" configuration must be consistent. For example:

```

Int po 101
switchport vlan mapping enable
switchport vlan mapping 101 10
switchport trunk allowed vlan 10

int eth 1/8
/****No configuration****/

```

- Port VLAN mapping is not supported on Cisco Nexus 9200 platform switches.
- VLAN mapping helps with VLAN localization to a port, scoping the VLANs per port. A typical use case is in the service provider environment where the service provider leaf switch has different customers with overlapping VLANs that come in on different ports. For example, customer A has VLAN 10 coming in on Eth 1/1 and customer B has VLAN 10 coming in on Eth 2/2.

In this scenario, you can map the customer VLAN to a provider VLAN and map that to a Layer 2 VNI. There is an operational benefit in terminating different customer VLANs and mapping them to the fabric-managed VLANs, L2 VNIs.

- An NVE interface with VNI mapping must be configured for Port VLAN translation to work.

## Configuring Port VLAN Mapping on a Trunk Port

### Before you begin

- Ensure that the physical or port channel on which you want to implement VLAN translation is configured as a Layer 2 trunk port.
- Ensure that the translated VLANs are created on the switch and are also added to the Layer 2 trunk ports trunk-allowed VLAN vlan-list.

**Note** As a best practice, do not add the ingress VLAN ID to the switchport allowed vlan-list under the interface.

- Ensure that all translated VLANs are VXLAN enabled.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *type/port*
3. **[no] switchport vlan mapping enable**
4. **[no] switchport vlan mapping** *vlan-id translated-vlan-id*
5. **[no] switchport vlan mapping all**
6. **copy running-config startup-config**
7. **show interface** [*if-identifier*] **vlan mapping**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>type/port</i>  <b>Example:</b> <code>switch(config) # interface Ethernet1/1</code>	Specifies the interface that you are configuring.
<b>Step 3</b>	<b>[no] switchport vlan mapping enable</b>  <b>Example:</b>	Enables VLAN translation on the switch port. VLAN translation is disabled by default.

	Command or Action	Purpose
	<code>switch(config-if)# [no] switchport vlan mapping enable</code>	<b>Note</b> Use the <b>no</b> form of this command to disable VLAN translation.
<b>Step 4</b>	<b>[no] switchport vlan mapping <i>vlan-id translated-vlan-id</i></b> <b>Example:</b> <code>switch(config-if)# switchport vlan mapping 10 100</code>	<p>Translates a VLAN to another VLAN.</p> <ul style="list-style-type: none"> <li>• The range for both the <i>vlan-id</i> and <i>translated-vlan-id</i> arguments are from 1 to 4094.</li> <li>• You can configure VLAN translation between the ingress (incoming) VLAN and a local (translated) VLAN on a port. For the traffic arriving on the interface where VLAN translation is enabled, the incoming VLAN is mapped to a translated VLAN that is VXLAN enabled.</li> </ul> <p>On the underlay, this is mapped to a VNI, the inner dot1q is deleted, and switched over to the VXLAN network. On the egress switch, the VNI is mapped to a local translated VLAN. On the outgoing interface, where VLAN translation is configured, the traffic is converted to the original VLAN and egresses out.</p> <p><b>Note</b> Use the <b>no</b> form of this command to clear the mappings between a pair of VLANs.</p>
<b>Step 5</b>	<b>[no] switchport vlan mapping all</b> <b>Example:</b> <code>switch(config-if)# switchport vlan mapping all</code>	Removes all VLAN mappings configured on the interface.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> <code>switch(config-if)# copy running-config startup-config</code>	<p>Copies the running configuration to the startup configuration.</p> <p><b>Note</b> The VLAN translation configuration does not become effective until the switch port becomes an operational trunk port.</p>
<b>Step 7</b>	<b>show interface [<i>if-identifier</i>] vlan mapping</b> <b>Example:</b> <code>switch# show interface ethernet1/1 vlan mapping</code>	Displays VLAN mapping information for a range of interfaces or for a specific interface.

### Example

This example shows how to configure VLAN translation between (the ingress) VLAN 10 and (the local) VLAN 100. The show vlan counters command output shows the statistic counters as translated VLAN instead of customer VLAN.

```
switch# configure terminal
switch(config)# interface ethernet1/1
switch(config-if)# switchport vlan mapping enable
switch(config-if)# switchport vlan mapping 10 100
```

```

switch(config-if)# switchport trunk allowed vlan 100
switch(config-if)# show interface ethernet1/1 vlan mapping
Interface eth1/1:
Original VLAN          Translated VLAN
-----
10                     100

switch(config-if)# show vlan counters
Vlan Id                :100
Unicast Octets In      :292442462
Unicast Packets In     :1950525
Multicast Octets In    :14619624
Multicast Packets In   :91088
Broadcast Octets In    :14619624
Broadcast Packets In   :91088
Unicast Octets Out     :304012656
Unicast Packets Out    :2061976
L3 Unicast Octets In   :0
L3 Unicast Packets In  :0

```

## Configuring Inner VLAN and Outer VLAN Mapping on a Trunk Port

You can configure VLAN translation from an inner VLAN and an outer VLAN to a local (translated) VLAN on a port. For the double tag VLAN traffic arriving on the interfaces where VLAN translation is enabled, the inner VLAN and outer VLAN are mapped to a translated VLAN that is VXLAN enabled.

Notes for configuring inner VLAN and outer VLAN mapping:

- Inner and outer VLAN cannot be on the trunk allowed list on a port where inner VLAN and outer VLAN is configured.

For example:

```

switchport vlan mapping 11 inner 12 111
switchport trunk allowed vlan 11-12,111 /***Not valid because 11 is outer VLAN and 12
is inner VLAN.***

```

- On the same port, no two mapping (translation) configurations can have the same outer (or original) or translated VLAN. Multiple inner VLAN and outer VLAN mapping configurations can have the same inner VLAN.

For example:

```

switchport vlan mapping 101 inner 102 1001
switchport vlan mapping 101 inner 103 1002 /***Not valid because 101 is already used
as an original VLAN.***
switchport vlan mapping 111 inner 104 1001 /***Not valid because 1001 is already used
as a translated VLAN.***
switchport vlan mapping 106 inner 102 1003 /***Valid because inner vlan can be the
same.***

```

- When a packet comes double-tagged on a port which is enabled with the inner option, only bridging is supported.
- VXLAN PV routing is not supported for double-tagged frames.

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *type port*
3. **[no] switchport mode trunk**
4. **switchport vlan mapping enable**
5. **switchport vlan mapping** *outer-vlan-id* **inner** *inner-vlan-id* *translated-vlan-id*
6. (Optional) **copy running-config startup-config**
7. (Optional) **show interface** [*if-identifier*] **vlan mapping**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>type port</i>	Enters interface configuration mode.
<b>Step 3</b>	<b>[no] switchport mode trunk</b>	Enters trunk configuration mode.
<b>Step 4</b>	<b>switchport vlan mapping enable</b>	Enables VLAN translation on the switch port. VLAN translation is disabled by default.  <b>Note</b> Use the <b>no</b> form of this command to disable VLAN translation.
<b>Step 5</b>	<b>switchport vlan mapping</b> <i>outer-vlan-id</i> <b>inner</b> <i>inner-vlan-id</i> <i>translated-vlan-id</i>	Translates inner VLAN and outer VLAN to another VLAN.
<b>Step 6</b>	(Optional) <b>copy running-config startup-config</b>	Copies the running configuration to the startup configuration.  <b>Note</b> The VLAN translation configuration does not become effective until the switch port becomes an operational trunk port
<b>Step 7</b>	(Optional) <b>show interface</b> [ <i>if-identifier</i> ] <b>vlan mapping</b>	Displays VLAN mapping information for a range of interfaces or for a specific interface.

## Example

This example shows how to configure translation of double tag VLAN traffic (inner VLAN 12; outer VLAN 11) to VLAN 111.

```
switch# configure terminal
switch(config)# interface ethernet1/1
switch(config-if)# switchport mode trunk
switch(config-if)# switchport vlan mapping enable
switch(config-if)# switchport vlan mapping 11 inner 12 111
switch(config-if)# switchport trunk allowed vlan 101-170
switch(config-if)# no shutdown

switch(config-if)# show mac address-table dynamic vlan 111
```

## Legend:

\* - primary entry, G - Gateway MAC, (R) - Routed MAC, O - Overlay MAC  
 age - seconds since last seen, + - primary entry using vPC Peer-Link,  
 (T) - True, (F) - False

VLAN	MAC Address	Type	age	Secure	NTFY	Ports
* 111	0000.0092.0001	dynamic	0	F	F	nve1(100.100.100.254)
* 111	0000.0940.0001	dynamic	0	F	F	Eth1/1

## CHAPTER 14

# Configuring IGMP Snooping

This chapter contains the following sections:

- [Configuring IGMP Snooping Over VXLAN, on page 285](#)

## Configuring IGMP Snooping Over VXLAN

### Overview of IGMP Snooping Over VXLAN

By default, multicast traffic over VXLAN is flooded in the VNI/VLAN like any broadcast and unknown unicast traffic. With IGMP snooping enabled, each VTEP can snoop IGMP reports and only forward multicast traffic towards interested receivers.

The configuration of IGMP snooping is the same in VXLAN as in the configuration of IGMP snooping in a regular VLAN domain. For more information on IGMP snooping, see the *Configuring IGMP Snooping* section in the [Cisco Nexus 9000 Series NX-OS Multicast Routing Configuration Guide, Release 7.x](#).

### Guidelines and Limitations for IGMP Snooping Over VXLAN

See the following guidelines and limitations for IGMP snooping over VXLAN:

- IGMP snooping over VXLAN is not supported on VLANs with FEX member ports.
- IGMP snooping over VXLAN is supported with both IR and multicast underlay.
- IGMP snooping over VXLAN is supported in BGP EVPN topologies, not flood and learn topologies.

## Configuring IGMP Snooping Over VXLAN

### SUMMARY STEPS

1. switch# **configure terminal**
2. switch(config)#**ip igmp snooping vxlan**
3. switch(config)#**ip igmp snooping disable-nve-static-router-port**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	switch(config)# <b>ip igmp snooping vxlan</b>	Enables IGMP snooping for VXLAN VLANs. You have to explicitly configure this command to enable snooping for VXLAN VLANs.
<b>Step 3</b>	switch(config)# <b>ip igmp snooping disable-nve-static-router-port</b>	Configures IGMP snooping over VXLAN to not include NVE as static mrouter port using this global CLI command. IGMP snooping over VXLAN has the NVE interface as mrouter port by default.

## CHAPTER 15

# Configuring Private VLANs

---

This chapter contains the following sections:

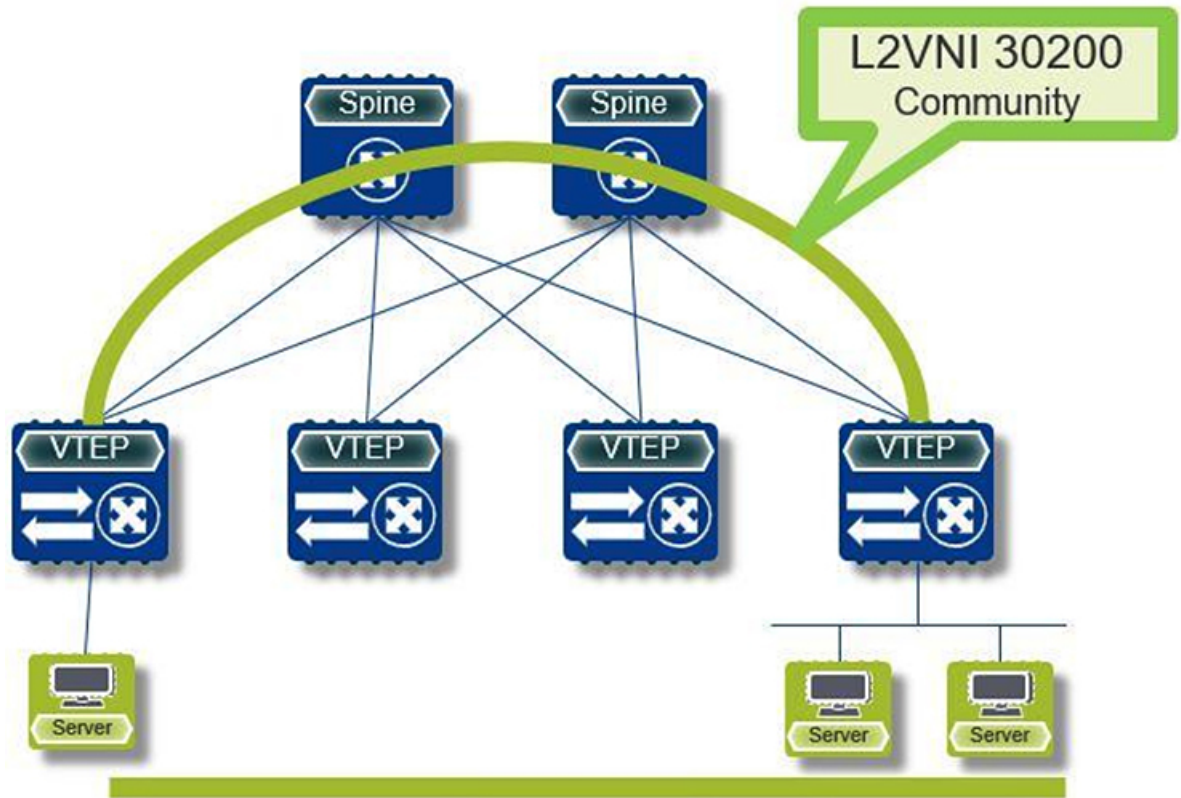

- [About Private VLANs over VXLAN, on page 287](#)
- [Guidelines and Limitations for Private VLANs over VXLAN, on page 288](#)
- [Configuration Example for Private VLANs, on page 288](#)

## About Private VLANs over VXLAN

The private VLAN feature allows segmenting the Layer 2 broadcast domain of a VLAN into subdomains. A subdomain is represented by a pair of private VLANs: a primary VLAN and a secondary VLAN. A private VLAN domain can have multiple private VLAN pairs, one pair for each subdomain. All VLAN pairs in a private VLAN domain share the same primary VLAN. The secondary VLAN ID differentiates one subdomain from another.

Private VLANs over VXLAN extends private VLAN across VXLAN. The secondary VLAN can exist on multiple VTEPs across VXLAN. MAC address learning happens over the primary VLAN and advertises via BGP EVPN. When traffic is encapsulated, the VNI used is that of the secondary VLAN. The feature also supports Anycast Gateway. Anycast Gateway must be defined using the primary VLAN.

Figure 23: L2VNI 30200 Community

307054

## Guidelines and Limitations for Private VLANs over VXLAN

Private VLANs over VXLAN has the following configuration guidelines and limitations:

- The following platforms support private VLANs over VXLAN:
  - Cisco Nexus 9300-EX platform switches
  - Cisco Nexus 9300-FX/FX2 platform switches
  - Cisco Nexus 9300-GX platform switches
- Flood and learn underlay is not supported.
- Fabric Extenders (FEX) VLAN cannot be mapped to a private VLAN.
- vPC Fabric Peering supports private VLANs.

## Configuration Example for Private VLANs

The following is a private VLAN configuration example:

```

vlan 500
  private-vlan primary
  private-vlan association 501-503
  vn-segment 5000
vlan 501
  private-vlan isolated
  vn-segment 5001
vlan 502
  private-vlan community
  vn-segment 5002
vlan 503
  private-vlan community
  vn-segment 5003

vlan 1001
  !L3 VNI for tenant VRF
  vn-segment 900001

interface Vlan500
  no shutdown
  private-vlan mapping 501-503
  vrf member vxlan-900001
  no ip redirects
  ip address 50.1.1.1/8
  ipv6 address 50::1:1:1/64
  no ipv6 redirects
  fabric forwarding mode anycast-gateway

interface Vlan1001
  no shutdown
  vrf member vxlan-900001
  no ip redirects
  ip forward
  ipv6 forward
  ipv6 address use-link-local-only
  no ipv6 redirects

interface nve 1
  no shutdown
  host-reachability protocol bgp
  source-interface loopback0
  member vni 5000
    mcast-group 225.5.0.1
  member vni 5001
    mcast-group 225.5.0.2
  member vni 5002
    ingress-replication protocol bgp
  member vni 5003
    mcast-group 225.5.0.4
  member vni 900001 associate-vrf

```

**Note** If you use an external gateway, the interface towards the external router must be configured as a PVLAN promiscuous port

```

interface ethernet 2/1
  switchport
  switchport mode private-vlan trunk promiscuous
  switchport private-vlan mapping trunk 500 199,200,201
  exit

```

## CHAPTER 16

# Configuring Policy-Based Redirect

This chapter contains the following sections:

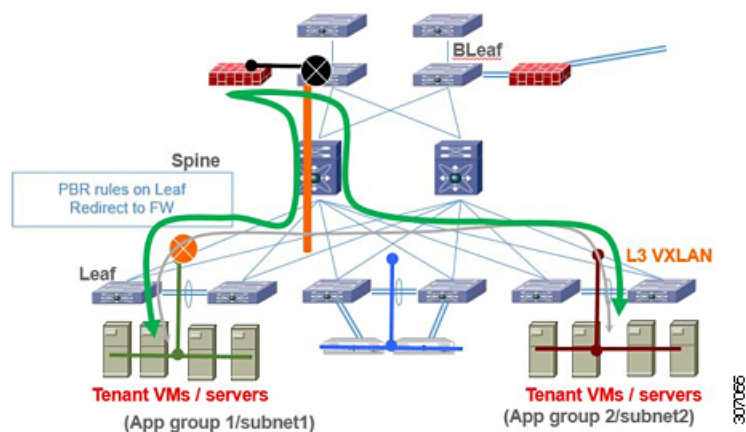

- [About Policy-Based Redirect, on page 291](#)
- [Guidelines and Limitations for Policy-Based Redirect, on page 292](#)
- [Enabling the Policy-Based Redirect Feature, on page 292](#)
- [Configuring a Route Policy, on page 293](#)
- [Verifying the Policy-Based Redirect Configuration, on page 294](#)
- [Configuration Example for Policy-Based Redirect, on page 295](#)

## About Policy-Based Redirect

Policy-based redirect (PBR) provides a mechanism to bypass a routing table lookup and redirect traffic to a next-hop IP reachable over VXLAN. The feature enables service redirection to Layer 4-Layer 7 devices such as firewalls and load balancers.

PBR involves configuring a route-map with rules that dictate where traffic must be forwarded. The route map is applied on the tenant SVI to influence traffic coming from the host-facing interfaces to a next hop reachable via the fabric.

In scenarios where traffic is coming to a VTEP from the overlay and needs to be redirected to another next hop, the PBR policy must be applied on the fabric facing L3VNI SVI.

In the previous figure, communication between App group 1 and App group 2 takes place via inter-VLAN/VNI routing in the tenant VRF by default. If there is a requirement where traffic from App group 1 to App group 2 has to go through a firewall, a PBR policy can be used to redirect traffic. The following configuration snippet provides the necessary configuration that redirects the traffic flow

For more information on PBR, see [PBR on NX-OS](#).

## Guidelines and Limitations for Policy-Based Redirect

The following guidelines and limitations apply to PBR over VXLAN.

- The following platforms support PBR over VXLAN:
  - Cisco Nexus 9332C and 9364C platform switches
  - Cisco Nexus 9300-EX platform switches
  - Cisco Nexus 9300-FX/FX2/FX3 platform switches
  - Cisco Nexus 9300-GX platform switches
  - Cisco Nexus 9504 and 9508 platform switches with -EX/FX line cards
- PBR over VXLAN doesn't support the following features: IP SLAs, VTEP ECMP, and the **load-share** keyword in the **set {ip | ipv6} next-hop ip-address** command.

## Enabling the Policy-Based Redirect Feature

### Before you begin

Enable the policy-based redirect feature before you can configure a route policy.

### SUMMARY STEPS

1. **configure terminal**
2. **[no] feature pbr**
3. (Optional) **show feature**
4. (Optional) **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal</pre>	Enters global configuration mode.
Step 2	<b>[no] feature pbr</b>  <b>Example:</b> <pre>switch(config)# feature pbr</pre>	Enables the policy-based routing feature.

	Command or Action	Purpose
<b>Step 3</b>	(Optional) <b>show feature</b>  <b>Example:</b> <code>switch(config)# show feature</code>	Displays enabled and disabled features.
<b>Step 4</b>	(Optional) <b>copy running-config startup-config</b>  <b>Example:</b> <code>switch(config)# copy running-config startup-config</code>	Saves this configuration change.

## Configuring a Route Policy

You can use route maps in policy-based routing to assign routing policies to the inbound interface. Cisco NX-OS routes the packets when it finds a next hop and an interface.

**Note** The switch has a RACL TCAM region by default for IPv4 traffic.

### Before you begin

Configure the RACL TCAM region (using TCAM carving) before you apply the policy-based routing policy. For instructions, see the “Configuring ACL TCAM Region Sizes” section in the [Cisco Nexus 9000 Series NX-OS Security Configuration Guide, Release 9.2\(x\)](#).

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *type slot/port*
3. **{ip | ipv6} policy route-map** *map-name*
4. **route-map** *map-name* [**permit** | **deny**] [*seq*]
5. **match {ip | ipv6} address access-list-name** *name* [*name...*]
6. **set ip next-hop** *address1*
7. **set ipv6 next-hop** *address1*
8. (Optional) **set interface null0**
9. (Optional) **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>type slot/port</i>  <b>Example:</b>	Enters interface configuration mode.

	Command or Action	Purpose
	<code>switch(config) # interface ethernet 1/2</code>	
<b>Step 3</b>	<b>{ip   ipv6} policy route-map <i>map-name</i></b> <b>Example:</b> <code>switch(config-inf) # ip policy route-map Testmap</code>	Assigns a route map for IPv4 or IPv6 policy-based routing to the interface.
<b>Step 4</b>	<b>route-map <i>map-name</i> [permit   deny] [seq]</b> <b>Example:</b> <code>switch(config-inf) # route-map Testmap</code>	Creates a route map or enters route-map configuration mode for an existing route map. Use <i>seq</i> to order the entries in a route map.
<b>Step 5</b>	<b>match {ip   ipv6} address access-list-name <i>name</i> [<i>name...</i>]</b> <b>Example:</b> <code>switch(config-route-map) # match ip address access-list-name ACL1</code>	Matches an IPv4 or IPv6 address against one or more IPv4 or IPv6 access control lists (ACLs). This command is used for policy-based routing and is ignored by route filtering or redistribution.
<b>Step 6</b>	<b>set ip next-hop <i>address1</i></b> <b>Example:</b> <code>switch(config-route-map) # set ip next-hop 192.0.2.1</code>	Sets the IPv4 next-hop address for policy-based routing.
<b>Step 7</b>	<b>set ipv6 next-hop <i>address1</i></b> <b>Example:</b> <code>switch(config-route-map) # set ipv6 next-hop 2001:0DB8::1</code>	Sets the IPv6 next-hop address for policy-based routing.
<b>Step 8</b>	(Optional) <b>set interface null0</b> <b>Example:</b> <code>switch(config-route-map) # set interface null0</code>	Sets the interface that is used for routing. Use the <b>null0</b> interface to drop packets.
<b>Step 9</b>	(Optional) <b>copy running-config startup-config</b> <b>Example:</b> <code>switch(config-route-map) # copy running-config startup-config</code>	Saves this configuration change.

## Verifying the Policy-Based Redirect Configuration

To display the policy-based redirect configuration information, perform one of the following tasks:

Command	Purpose
<b>show [ip   ipv6] policy [<i>name</i>]</b>	Displays information about an IPv4 or IPv6 policy.
<b>show route-map [<i>name</i>] pbr-statistics</b>	Displays policy statistics.

Use the **route-map *map-name* pbr-statistics** command to enable policy statistics. Use the **clear route-map *map-name* pbr-statistics** command to clear these policy statistics.

# Configuration Example for Policy-Based Redirect

Perform the following configuration on all tenant VTEPs, excluding the service VTEP.

```
feature pbr

ipv6 access-list IPV6_App_group_1
10 permit ipv6 any 2001:10:1:1::0/64

ip access-list IPV4_App_group_1
10 permit ip any 10.1.1.0/24

ipv6 access-list IPV6_App_group_2
10 permit ipv6 any 2001:20:1:1::0/64

ip access-list IPV4_App_group_2
10 permit ip any 20.1.1.0/24

route-map IPV6_PBR_Appgroup1 permit 10
  match ipv6 address IPV6_App_group_2
  set ipv6 next-hop 2001:100:1:1::20 (next hop is that of the firewall)

route-map IPV4_PBR_Appgroup1 permit 10
  match ip address IPV4_App_group_2
  set ip next-hop 10.100.1.20 (next hop is that of the firewall)

route-map IPV6_PBR_Appgroup2 permit 10
  match ipv6 address IPV6_App_group1
  set ipv6 next-hop 2001:100:1:1::20 (next hop is that of the firewall)

route-map IPV4_PBR_Appgroup2 permit 10
  match ip address IPV4_App_group_1
  set ip next-hop 10.100.1.20 (next hop is that of the firewall)

interface Vlan10
! tenant SVI appgroup 1
vrf member appgroup
  ip address 10.1.1.1/24
  no ip redirect
  ipv6 address 2001:10:1:1::1/64
  no ipv6 redirects
  fabric forwarding mode anycast-gateway
ip policy route-map IPV4_PBR_Appgroup1
ipv6 policy route-map IPV6_PBR_Appgroup1
interface Vlan20
! tenant SVI appgroup 2
vrf member appgroup
  ip address 20.1.1.1/24
  no ip redirect
  ipv6 address 2001:20:1:1::1/64
  no ipv6 redirects
  fabric forwarding mode anycast-gateway
ip policy route-map IPV4_PBR_Appgroup2
ipv6 policy route-map IPV6_PBR_Appgroup2

On the service VTEP, the PBR policy is applied on the tenant VRF SVI. This ensures the
traffic post decapsulation will be redirected to firewall.
feature pbr

ipv6 access-list IPV6_App_group_1
10 permit ipv6 any 2001:10:1:1::0/64
```

```
ip access-list IPV4_App_group_1
10 permit ip any 10.1.1.0/24

ipv6 access-list IPV6_App_group_2
10 permit ipv6 any 2001:20:1:1::0/64

ip access-list IPV4_App_group_2
10 permit ip any 20.1.1.0/24

route-map IPV6_PBR_Appgroup1 permit 10
  match ipv6 address IPV6_App_group_2
  set ipv6 next-hop 2001:100:1:1::20 (next hop is that of the firewall)

route-map IPV6_PBR_Appgroup permit 20
  match ipv6 address IPV6_App_group1
  set ipv6 next-hop 2001:100:1:1::20 (next hop is that of the firewall)

route-map IPV4_PBR_Appgroup permit 10
  match ip address IPV4_App_group_2
  set ip next-hop 10.100.1.20 (next hop is that of the firewall)

route-map IPV4_PBR_Appgroup permit 20
  match ip address IPV4_App_group_1
  set ip next-hop 10.100.1.20 (next hop is that of the firewall)

interface vlan1000
!L3VNI SVI for Tenant VRF
vrf member appgroup
ip forward
ipv6 forward
ipv6 ipv6 address use-link-local-only
ip policy route-map IPV4_PBR_Appgroup
ipv6 policy route-map IPV6_PBR_Appgroup
```

# CHAPTER 17

## Configuring ACL

This chapter contains the following sections:

- [About Access Control Lists, on page 297](#)
- [Guidelines and Limitations for VXLAN ACLs, on page 298](#)
- [VXLAN Tunnel Encapsulation Switch, on page 299](#)
- [VXLAN Tunnel Decapsulation Switch, on page 305](#)

## About Access Control Lists

**Table 7: ACL Options That Can Be Used for VXLAN Traffic on Cisco Nexus 92300YC, 92160YC-X, 93120TX, 9332PQ, and 9348GC-FXP Switches**

Scenario	ACL Direction	ACL Type	VTEP Type	Port Type	Flow Direction	Traffic Type	Supported
1	Ingress	PACL	Ingress VTEP	L2 port	Access to Network [GROUPencap direction]	Native L2 traffic [GROUPinner]	YES
2		VACL	Ingress VTEP	VLAN	Access to Network [GROUPencap direction]	Native L2 traffic [GROUPinner]	YES
3	Ingress	RACL	Ingress VTEP	Tenant L3 SVI	Access to Network [GROUPencap direction]	Native L3 traffic [GROUPinner]	YES
4	Egress	RACL	Ingress VTEP	uplink L3/L3-PO/SVI	Access to Network [GROUPencap direction]	VXLAN encap [GROUPouter]	NO

Scenario	ACL Direction	ACL Type	VTEP Type	Port Type	Flow Direction	Traffic Type	Supported
5	Ingress	RACL	Egress VTEP	Uplink L3/L3-PO/SVI	Network to Access [GROUP:decap direction]	VXLAN encaps [GROUP:outer]	NO
6	Egress	PACL	Egress VTEP	L2 port	Network to Access [GROUP:decap direction]	Native L2 traffic [GROUP:inner]	NO
7a		VACL	Egress VTEP	VLAN	Network to Access [GROUP:decap direction]	Native L2 traffic [GROUP:inner]	YES
7b		VACL	Egress VTEP	Destination VLAN	Network to Access [GROUP:decap direction]	Native L3 traffic [GROUP:inner]	YES
8	Egress	RACL	Egress VTEP	Tenant L3 SVI	Network to Access [GROUP:decap direction]	Post-decap L3 traffic [GROUP:inner]	YES

ACL implementation for VXLAN is the same as regular IP traffic. The host traffic is not encapsulated in the ingress direction at the encapsulation switch. The implementation is a bit different for the VXLAN encapsulated traffic at the decapsulation switch as the ACL classification is based on the inner payload. The supported ACL scenarios for VXLAN are explained in the following topics and the unsupported cases are also covered for both encapsulation and decapsulation switches.

All scenarios that are mentioned in the previous table are explained with the following host details:

- Host-1: 10.1.1.1/24 VLAN-10
- Host-2: 10.1.1.2/24 VLAN-10
- Host-3: 20.1.1.1/24 VLAN-20
- Case 1: Layer 2 traffic/L2 VNI that flows between Host-1 and Host-2 on VLAN-10.
- Case 2: Layer 3 traffic/L3 VNI that flows between Host-1 and Host-3 on VLAN-10 and VLAN-20.

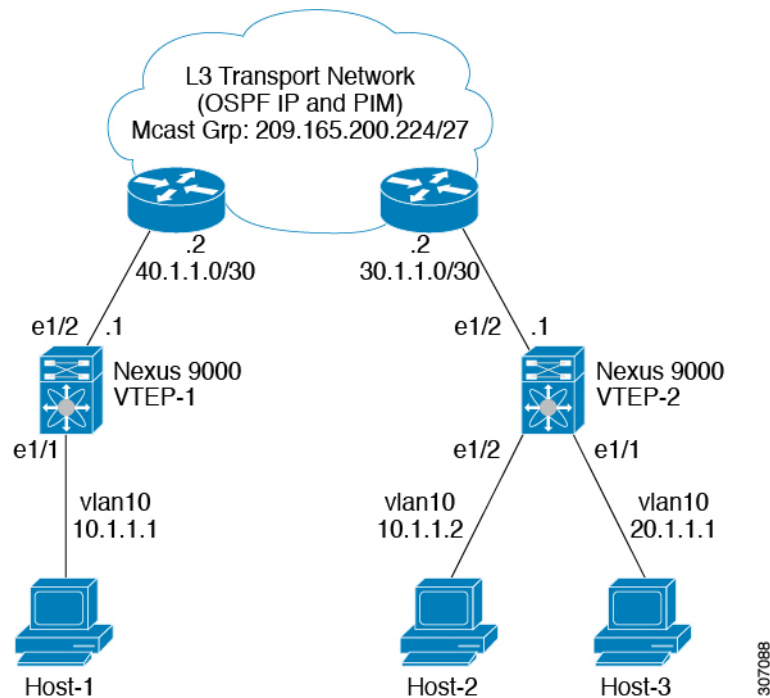

## Guidelines and Limitations for VXLAN ACLs

VXLAN ACLs have the following guidelines and limitations:

- A router ACL (RACL) on an SVI of the incoming VLAN-10 and the uplink port(eth1/2) does not support filtering the encapsulated VXLAN traffic with outer or inner headers in an egress direction. The limitation also applies to the Layer 3 port-channel uplink interfaces.

- A router ACL (RACL) on an SVI and the Layer 3 uplink ports is not supported to filter the encapsulated VXLAN traffic with outer or inner headers in an ingress direction. This limitation also applies to the Layer 3 port-channel uplink interfaces.
- A port ACL (PACL) cannot be applied on the Layer 2 port to which a host is connected. Cisco NX-OS does not support a PACL in the egress direction.

Figure 24: Port ACL on VXLAN Encap Switch

## VXLAN Tunnel Encapsulation Switch

### Port ACL on the Access Port on Ingress

You can apply a port ACL (PACL) on the Layer 2 trunk or access port that a host is connected on the encapsulating switch. As the incoming traffic from access to the network is normal IP traffic. The ACL that is being applied on the Layer 2 port can filter it as it does for any IP traffic in the non-VXLAN environment.

The **ing-ifacl** TCAM region must be carved as follows:

#### SUMMARY STEPS

1. **configure terminal**
2. **hardware access-list tcam region ing-ifacl 256**
3. **ip access-list name**
4. **sequence-number permit ip source-address destination-address**
5. **exit**

6. **interface ethernet** *slot/port*
7. **ip port access-group** *pacl-name***in**
8. **switchport**
9. **switchport mode trunk**
10. **switchport trunk allowed vlan** *vlan-list*
11. **no shutdown**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>hardware access-list tcam region ing-ifacl 256</b> <b>Example:</b> <code>switch(config)# hardware access-list tcam region ing-ifacl 256</code>	Attaches the UDFs to the <b>ing-ifacl</b> TCAM region, which applies to IPv4 or IPv6 port ACLs.
<b>Step 3</b>	<b>ip access-list</b> <i>name</i> <b>Example:</b> <code>switch(config)# ip access list PACL_On_Host_Port</code>	Creates an IPv4 ACL and enters IP ACL configuration mode. The name arguments can be up to 64 characters.
<b>Step 4</b>	<i>sequence-number</i> <b>permit ip</b> <i>source-address destination-address</i> <b>Example:</b> <code>switch(config-acl)# 10 permit ip 10.1.1.1/32 10.1.1.2/32</code>	Creates an ACL rule that permits or denies IPv4 traffic matching its condition.  The <i>source-address destination-address</i> arguments can be the IP address with a network wildcard, the IP address and variable-length subnet mask, the host address, and <b>any</b> to designate any address.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> <code>switch(config-acl)# exit</code>	Exits IP ACL configuration mode.
<b>Step 6</b>	<b>interface ethernet</b> <i>slot/port</i> <b>Example:</b> <code>switch(config)# interface ethernet1/1</code>	Enters interface configuration mode.
<b>Step 7</b>	<b>ip port access-group</b> <i>pacl-name</i> <b>in</b> <b>Example:</b> <code>switch(config-if)# ip port access-group PACL_On_Host_Port in</code>	Applies a Layer 2 PACL to the interface. Only inbound filtering is supported with port ACLs. You can apply one port ACL to an interface.
<b>Step 8</b>	<b>switchport</b> <b>Example:</b> <code>switch(config-if)# switchport</code>	Configures the interface as a Layer 2 interface.

	Command or Action	Purpose
<b>Step 9</b>	<b>switchport mode trunk</b>  <b>Example:</b> switch(config-if) # <b>switchport mode trunk</b>	Configures the interface as a Layer 2 trunk port.
<b>Step 10</b>	<b>switchport trunk allowed vlan vlan-list</b>  <b>Example:</b> switch(config-if) # <b>switchport trunk allowed vlan 10,20</b>	Sets the allowed VLANs for the trunk interface. The default is to allow all VLANs on the trunk interface, 1 through 3967 and 4048 through 4094. VLANs 3968 through 4047 are the default VLANs reserved for internal use.
<b>Step 11</b>	<b>no shutdown</b>  <b>Example:</b> switch(config-if) # <b>no shutdown</b>	Negates the <b>shutdown</b> command.

## VLAN ACL on the Server VLAN

A VLAN ACL (VACL) can be applied on the incoming VLAN-10 that the host is connected to on the encap switch. As the incoming traffic from access to network is normal IP traffic, the ACL that is being applied to VLAN-10 can filter it as it does for any IP traffic in the non-VXLAN environment.

Figure 25: VLAN ACL on VXLAN Encap Switch

### SUMMARY STEPS

1. configure terminal

2. **ip access-list** *name*
3. *sequence-number* **permit ip** *source-address destination-address*
4. **vlan access-map** *map-name* [*sequence-number*]
5. **match ip address** *ip-access-list*
6. **action forward**
7. **vlan access-map** *name*

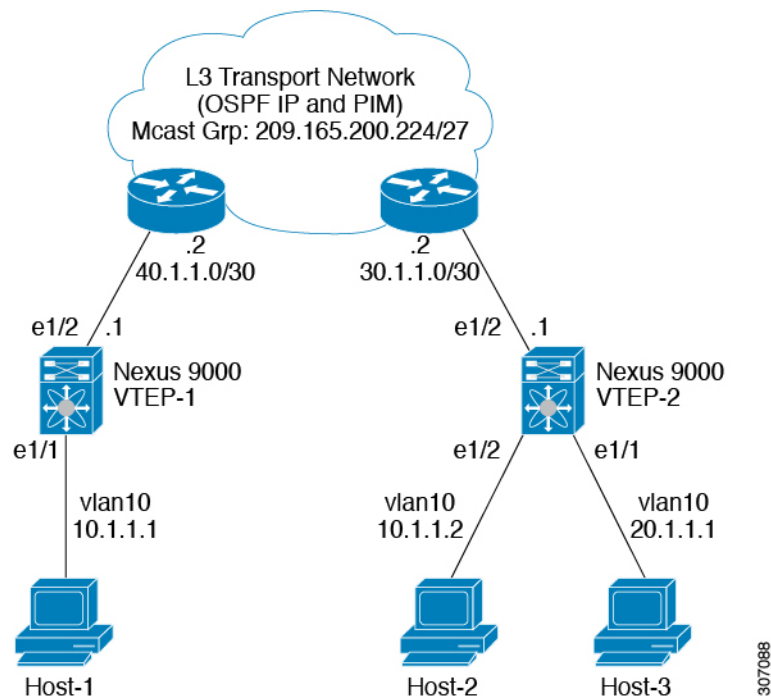

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ip access-list</b> <i>name</i>  <b>Example:</b> <code>switch(config)# ip access list VACL_On_Source_VLAN</code>	Creates an IPv4 ACL and enters IP ACL configuration mode. The name arguments can be up to 64 characters.
<b>Step 3</b>	<i>sequence-number</i> <b>permit ip</b> <i>source-address destination-address</i>  <b>Example:</b> <code>switch(config-acl)# 10 permit ip 10.1.1.1 10.1.1.2</code>	Creates an ACL rule that permits or denies IPv4 traffic matching its condition.  The <i>source-address destination-address</i> arguments can be the IP address with a network wildcard, the IP address and variable-length subnet mask, the host address, and <b>any</b> to designate any address.
<b>Step 4</b>	<b>vlan access-map</b> <i>map-name</i> [ <i>sequence-number</i> ]  <b>Example:</b> <code>switch(config-acl)# vlan access-map VACL_on_Source_Vlan 10</code>	Enters VLAN access-map configuration mode for the VLAN access map specified. If the VLAN access map does not exist, the device creates it.  If you do not specify a sequence number, the device creates a new entry whose sequence number is 10 greater than the last sequence number in the access map.
<b>Step 5</b>	<b>match ip address</b> <i>ip-access-list</i>  <b>Example:</b> <code>switch(config-acl)# match ip address VACL_on_Source_Vlan</code>	Specifies an ACL for the access-map entry.
<b>Step 6</b>	<b>action forward</b>  <b>Example:</b> <code>switch(config-acl)# action forward</code>	Specifies the action that the device applies to traffic that matches the ACL.
<b>Step 7</b>	<b>vlan access-map</b> <i>name</i>  <b>Example:</b> <code>switch(config-acl)# vlan access map VACL_on_Source_Vlan</code>	Enters VLAN access-map configuration mode for the VLAN access map specified.

## Routed ACL on an SVI on Ingress

A router ACL (RACL) in the ingress direction can be applied on an SVI of the incoming VLAN-10 that the host that connects to the encapsulating switch. As the incoming traffic from access to network is normal IP traffic, the ACL that is being applied on SVI 10 can filter it as it does for any IP traffic in the non-VXLAN environment.

**Figure 26: Routed ACL on an SVI on Ingress at VXLAN Encap Switch**

The **ing-racl** TCAM region must be carved as follows:

### SUMMARY STEPS

1. **configure terminal**
2. **hardware access-list tcam region ing-ifacl 256**
3. **ip access-list *name***
4. *sequence-number permit ip source-address destination-address*
5. **exit**
6. **interface ethernet *slot/port***
7. **no shutdown**
8. **ip access-group *pacl-name* in**
9. **vrf member *vlan-number***
10. **no ip redirects**
11. **ip address *ip-address***
12. **no ipv6 redirects**
13. **fabric forwarding mode anycast-gateway**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>hardware access-list tcam region ing-ifacl 256</b> <b>Example:</b> switch(config)# <b>hardware access-list tcam region ing-ifacl 256</b>	Attaches the UDFs to the <b>ing-racl</b> TCAM region, which applies to IPv4 or IPv6 port ACLs.
<b>Step 3</b>	<b>ip access-list name</b> <b>Example:</b> switch(config)# <b>ip access list PACL_On_Host_Port</b>	Creates an IPv4 ACL and enters IP ACL configuration mode. The name arguments can be up to 64 characters.
<b>Step 4</b>	<b>sequence-number permit ip source-address destination-address</b> <b>Example:</b> switch(config-acl)# <b>10 permit ip 10.1.1.1/32 10.1.1.2/32</b>	Creates an ACL rule that permits or denies IPv4 traffic matching its condition.  The <i>source-address destination-address</i> arguments can be the IP address with a network wildcard, the IP address and variable-length subnet mask, the host address, and <b>any</b> to designate any address.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> switch(config-acl)# <b>exit</b>	Exits IP ACL configuration mode.
<b>Step 6</b>	<b>interface ethernet slot/port</b> <b>Example:</b> switch(config)# <b>interface ethernet1/1</b>	Enters interface configuration mode.
<b>Step 7</b>	<b>no shutdown</b> <b>Example:</b> switch(config-if)# <b>no shutdown</b>	Negates <b>shutdown</b> command.
<b>Step 8</b>	<b>ip access-group pacl-name in</b> <b>Example:</b> switch(config-if)# <b>ip port access-group Racl_On_Source_Vlan_SVI in</b>	Applies a Layer 2 PACL to the interface. Only inbound filtering is supported with port ACLs. You can apply one port ACL to an interface.
<b>Step 9</b>	<b>vrf member vxlan-number</b> <b>Example:</b> switch(config-if)# <b>vrf member Cust-A</b>	Configure SVI for host.
<b>Step 10</b>	<b>no ip redirects</b> <b>Example:</b> switch(config-if)# <b>no ip redirects</b>	Prevents the device from sending redirects.

	Command or Action	Purpose
<b>Step 11</b>	<b>ip address <i>ip-address</i></b> <b>Example:</b> <code>switch(config-if)# ip address 10.1.1.10</code>	Configures an IP address for this interface.
<b>Step 12</b>	<b>no ipv6 redirects</b> <b>Example:</b> <code>switch(config-if)# no ipv6 redirects</code>	Disables the ICMP redirect messages on BFD-enabled interfaces.
<b>Step 13</b>	<b>fabric forwarding mode anycast-gateway</b> <b>Example:</b> <code>switch(config-if)# fabric forwarding mode anycast-gateway</code>	Configure Anycast Gateway Forwarding Mode.

## Routed ACL on the Uplink on Egress

A RACL on an SVI of the incoming VLAN-10 and the uplink port (eth1/2) is not supported to filter the encapsulated VXLAN traffic with an outer or inner header in an egress direction. This limitation also applies to the Layer 3 port-channel uplink interfaces.

## VXLAN Tunnel Decapsulation Switch

### Routed ACL on the Uplink on Ingress

A RACL on a SVI and the Layer 3 uplink ports is not supported to filter the encapsulated VXLAN traffic with outer or inner header in an ingress direction. This limitation also applies to the Layer 3 port-channel uplink interfaces.

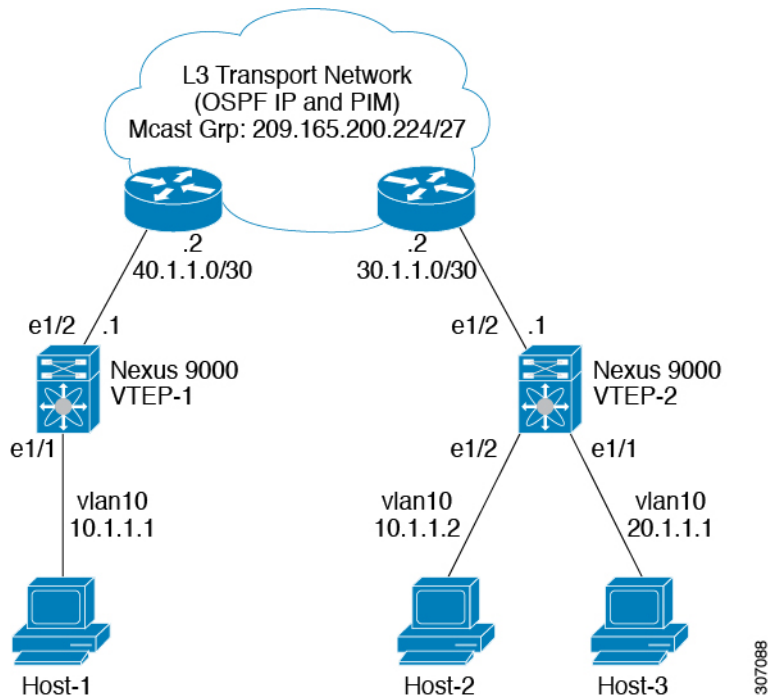

### Port ACL on the Access Port on Egress

Do not apply a PACL on the Layer 2 port to which a host is connected. Cisco Nexus 9000 Series switches do not support a PACL in the egress direction.

### VLAN ACL for the Layer 2 VNI Traffic

A VLAN ACL (VACL) can be applied on VLAN-10 to filter with the inner header when the Layer 2 VNI traffic is flowing from Host-1 to Host-2.

Figure 27: VLAN ACL for the Layer 2 VNI on the VXLAN Decap Switch

The VACL TCAM region must be carved as follows:

## SUMMARY STEPS

1. **configure terminal**
2. **hardware access-list tcam region vACL 256**
3. **ip access-list** *name*
4. **statistics per-entry**
5. *sequence-number* **permit ip** *source-address destination-address*
6. *sequence-number* **permit protocol** *source-address destination-address*
7. **exit**
8. **vlan access-map** *map-name* [*sequence-number*]
9. **match ip address** *list-name*

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> switch# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>hardware access-list tcam region vACL 256</b>  <b>Example:</b>	Changes the ACL TCAM region size.

	Command or Action	Purpose
	<code>switch(config)# hardware access-list tcam region vACL 256</code>	
<b>Step 3</b>	<b>ip access-list <i>name</i></b>  <b>Example:</b> <code>switch(config)# ip access list VXLAN-L2-VNI</code>	Creates an IPv4 ACL and enters IP ACL configuration mode. The name arguments can be up to 64 characters.
<b>Step 4</b>	<b>statistics per-entry</b>  <b>Example:</b> <code>switch(config-acl)# statistics per-entry</code>	Specifies that the device maintains global statistics for packets that match the rules in the VACL.
<b>Step 5</b>	<b>sequence-number permit ip <i>source-address</i> <i>destination-address</i></b>  <b>Example:</b> <code>switch(config-acl)# 10 permit ip 10.1.1.1/32 10.1.1.2/32</code>	Creates an ACL rule that permits or denies IPv4 traffic matching its condition.  The <i>source-address destination-address</i> arguments can be the IP address with a network wildcard, the IP address and variable-length subnet mask, the host address, and <b>any</b> to designate any address.
<b>Step 6</b>	<b>sequence-number permit protocol <i>source-address</i> <i>destination-address</i></b>  <b>Example:</b> <code>switch(config-acl)# 20 permit tcp 10.1.1.2/32 10.1.1.1/32</code>	Creates an ACL rule that permits or denies IPv4 traffic matching its condition.  The <i>source-address destination-address</i> arguments can be the IP address with a network wildcard, the IP address and variable-length subnet mask, the host address, and <b>any</b> to designate any address.
<b>Step 7</b>	<b>exit</b>  <b>Example:</b> <code>switch(config-acl)# exit</code>	Exit ACL configuration mode.
<b>Step 8</b>	<b>vlan access-map <i>map-name</i> [<i>sequence-number</i>]</b>  <b>Example:</b> <code>switch(config)# vlan access-map VXLAN-L2-VNI 10</code>	Enters VLAN access-map configuration mode for the VLAN access map specified. If the VLAN access map does not exist, the device creates it.  If you do not specify a sequence number, the device creates a new entry whose sequence number is 10 greater than the last sequence number in the access map.
<b>Step 9</b>	<b>match ip address <i>list-name</i></b>  <b>Example:</b> <code>switch(config-access-map)# match ip VXLAN-L2-VNI</code>	Configure the IP list name.

## VLAN ACL for the Layer 3 VNI Traffic

A VLAN ACL (VACL) can be applied on the destination VLAN-20 to filter with the inner header when the Layer 3 VNI traffic is flowing from Host-1 to Host-3. It slightly differs from the previous case as the VACL for the Layer 3 traffic is accounted on the egress on the system. The keyword **output** must be used while dumping the VACL entries for the Layer 3 VNI traffic.

Figure 28: VLAN ACL for the Layer 3 VNI on the VXLAN Decap Switch

The VACL TCAM region must be carved as follows.

## SUMMARY STEPS

1. **configure terminal**
2. **hardware access-list tcam region vACL 256**
3. **ip access-list name**
4. **statistics per-entry**
5. **sequence-number permit ip source-address destination-address**
6. **sequence-number permit protocol source-address destination-address**
7. **vlan access-map map-name [sequence-number]**
8. **action forward**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>hardware access-list tcam region vACL 256</b> <b>Example:</b> <pre>switch(config)# hardware access-list tcam region vACL 256</pre>	Changes the ACL TCAM region size.

	Command or Action	Purpose
<b>Step 3</b>	<b>ip access-list</b> <i>name</i> <b>Example:</b> <code>switch(config)# ip access list VXLAN-L3-VNI</code>	Creates an IPv4 ACL and enters IP ACL configuration mode. The name arguments can be up to 64 characters.
<b>Step 4</b>	<b>statistics per-entry</b> <b>Example:</b> <code>switch(config)# statistics per-entry</code>	Specifies that the device maintains global statistics for packets that match the rules in the VACL.
<b>Step 5</b>	<i>sequence-number</i> <b>permit ip</b> <i>source-address</i> <i>destination-address</i> <b>Example:</b> <code>switch(config-acl)# 10 permit ip 10.1.1.1/32 20.1.1.1/32</code>	<p>Creates an ACL rule that permits or denies IPv4 traffic matching its condition.</p> <p>The <i>source-address</i> <i>destination-address</i> arguments can be the IP address with a network wildcard, the IP address and variable-length subnet mask, the host address, and <b>any</b> to designate any address.</p>
<b>Step 6</b>	<i>sequence-number</i> <b>permit protocol</b> <i>source-address</i> <i>destination-address</i> <b>Example:</b> <code>switch(config-acl)# 20 permit tcp 20.1.1.1/32 10.1.1.1/32</code>	Configures the ACL to redirect-specific HTTP methods to a server.
<b>Step 7</b>	<b>vlan access-map</b> <i>map-name</i> [ <i>sequence-number</i> ] <b>Example:</b> <code>switch(config-acl)# vlan access-map VXLAN-L3-VNI 10</code>	<p>Enters VLAN access-map configuration mode for the VLAN access map specified. If the VLAN access map does not exist, the device creates it.</p> <p>If you do not specify a sequence number, the device creates a new entry whose sequence number is 10 greater than the last sequence number in the access map.</p>
<b>Step 8</b>	<b>action forward</b> <b>Example:</b> <code>switch(config-acl)# action forward</code>	Specifies the action that the device applies to traffic that matches the ACL.

## Routed ACL on an SVI on Egress

A router ACL (RACL) on the egress direction can be applied on an SVI of the destination VLAN-20 that Host-3 is connected to on the decap switch to filter with the inner header for traffic flows from the network to access which is normal post-decapsulated IP traffic post. The ACL that is being applied on SVI 20 can filter it as it does for any IP traffic in the non-VXLAN environment.

Figure 29: Routed ACL on an SVI on Egress at the VXLAN Decap Switch

The egr-racl TCAM region must be carved as follows:

## SUMMARY STEPS

1. **configure terminal**
2. **hardware access-list tcam region egr-racl 256**
3. **ip access-list *name***
4. ***sequence-number* permit ip *source-address* *destination-address***
5. **interface vlan *vlan-id***
6. **no shutdown**
7. **ip access-group *access-list* out**
8. **vrf member *vxlان-number***
9. **no ip redirects**
10. **ip address *ip-address/length***
11. **no ipv6 redirects**
12. **fabric forwarding mode anycast-gateway**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> switch# <b>configure terminal</b>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>hardware access-list tcam region egr-racl 256</b>  <b>Example:</b> <pre>switch(config)# hardware access-list tcam region egr-racl 256</pre>	Changes the ACL TCAM region size.
<b>Step 3</b>	<b>ip access-list name</b>  <b>Example:</b> <pre>switch(config)# ip access-list Racl_On_Source_Vlan_SVI</pre>	Creates an IPv4 ACL and enters IP ACL configuration mode. The name arguments can be up to 64 characters.
<b>Step 4</b>	<b>sequence-number permit ip source-address destination-address</b>  <b>Example:</b> <pre>switch(config-acl)# 10 permit ip 10.1.1.1/32 20.1.1.1/32</pre>	<p>Creates an ACL rule that permits or denies IPv4 traffic matching its condition.</p> <p>The <i>source-address destination-address</i> arguments can be the IP address with a network wildcard, the IP address and variable-length subnet mask, the host address, and <b>any</b> to designate any address.</p>
<b>Step 5</b>	<b>interface vlan vlan-id</b>  <b>Example:</b> <pre>switch(config-acl)# interface vlan vlan20</pre>	Enters interface configuration mode, where <i>vlan-id</i> is the ID of the VLAN that you want to configure with a DHCP server IP address.
<b>Step 6</b>	<b>no shutdown</b>  <b>Example:</b> <pre>switch(config-if)# no shutdown</pre>	Negate the shutdown command.
<b>Step 7</b>	<b>ip access-group access-list out</b>  <b>Example:</b> <pre>switch(config-if)# ip access-group Racl_On_Destination_Vlan_SVI out</pre>	Applies an IPv4 or IPv6 ACL to the Layer 3 interfaces for traffic flowing in the direction specified. You can apply one router ACL per direction.
<b>Step 8</b>	<b>vrf member vxlan-number</b>  <b>Example:</b> <pre>switch(config-if)# vrf member Cust-A</pre>	Configure SVI for host.
<b>Step 9</b>	<b>no ip redirects</b>  <b>Example:</b> <pre>switch(config-if)# no ip redirects</pre>	Prevents the device from sending redirects.
<b>Step 10</b>	<b>ip address ip-address/length</b>  <b>Example:</b> <pre>switch(config-if)# ip address 20.1.1.10/24</pre>	Configures an IP address for this interface.
<b>Step 11</b>	<b>no ipv6 redirects</b>  <b>Example:</b> <pre>switch(config-if)# no ipv6 redirects</pre>	Disables the ICMP redirect messages on BFD-enabled interfaces.

	Command or Action	Purpose
Step 12	<b>fabric forwarding mode anycast-gateway</b>  <b>Example:</b> <code>switch(config-if)# fabric forwarding mode anycast-gateway</code>	Configure Anycast Gateway Forwarding Mode.

## CHAPTER 18

# Configuring Secure VXLAN EVPN Multi-Site Using CloudSec

This chapter contains the following sections:

- [About Secure VXLAN EVPN Multi-Site Using CloudSec, on page 313](#)
- [Guidelines and Limitations for Secure VXLAN EVPN Multi-Site Using CloudSec, on page 314](#)
- [Configuring Secure VXLAN EVPN Multi-Site Using CloudSec, on page 315](#)
- [Verifying the Secure VXLAN EVPN Multi-Site Using CloudSec, on page 322](#)
- [Displaying Statistics for Secure VXLAN EVPN Multi-Site Using CloudSec, on page 326](#)
- [Configuration Examples for Secure VXLAN EVPN Multi-Site Using CloudSec, on page 327](#)
- [Migrating from Multi-Site with VIP to Multi-Site with PIP, on page 328](#)

## About Secure VXLAN EVPN Multi-Site Using CloudSec

Secure VXLAN EVPN Multi-Site using CloudSec ensures data security and data integrity for VXLAN-based Multi-Site fabrics. Using the cryptographic machinery of IEEE MACsec for UDP packets, this feature provides a secure tunnel between authorized VXLAN EVPN endpoints.

The CloudSec session is point to point over DCI between border gateways (BGWs) on two different sites. All communication between sites uses Multi-Site PIP instead of VIP. For migration information, see [Migrating from Multi-Site with VIP to Multi-Site with PIP, on page 328](#).

Secure VXLAN EVPN Multi-Site using CloudSec is enabled on a per-peer basis. Peers that do not support CloudSec can operate with peers that do support CloudSec, but the traffic is unencrypted. We recommend allowing unencrypted traffic only during migration from non-CloudSec-enabled sites to CloudSec-enabled sites.

CloudSec key exchange uses BGP while MACsec uses the MACsec Key Agreement (MKA). The CloudSec control plane uses the IPv4 address family for the BGP session.

## Key Lifetime and Hitless Key Rollover

A CloudSec keychain can have multiple pre-shared keys (PSKs), each configured with a key ID and an optional lifetime. Pre-shared keys are seed keys used to derive further keys for traffic encryption and integrity validation. A list of pre-shared keys can be configured in a keychain with different lifetimes.

A key lifetime specifies when the key expires. CloudSec rolls over to the next configured pre-shared key in the keychain after the lifetime expires. The time zone of the key can be local or UTC. The default time zone is UTC. In the absence of a lifetime configuration, the default lifetime is unlimited.

To configure the CloudSec keychain, see [Configuring a CloudSec Keychain and Keys, on page 317](#).

When the lifetime of the first key expires, it automatically rolls over to the next key in the list. If the same key is configured on both sides of the link at the same time, the key rollover is hitless. That is, the key rolls over without traffic interruption. The lifetime of the keys must be overlapped in order to achieve hitless key rollover.

## Guidelines and Limitations for Secure VXLAN EVPN Multi-Site Using CloudSec

Secure VXLAN EVPN Multi-Site using CloudSec has the following guidelines and limitations:

- Secure VXLAN EVPN Multi-Site using CloudSec is supported beginning with Cisco NX-OS Release 9.3(5).
- Only Cisco Nexus 9300-FX2 platform switches support Secure VXLAN EVPN Multi-Site using CloudSec.
- L3 interfaces and L3 port channels are supported as DCI links.
- CloudSec traffic that is destined for the switch must enter the switch through the DCI uplinks.
- Secure VXLAN EVPN Multi-Site using CloudSec is supported for sites that are connected through a route server or sites that are connected using full mesh (without a route server). For sites that are connected through a route server, upgrade the server to Cisco NX-OS Release 9.3(5) or a later release and follow the instructions in [Enabling CloudSec VXLAN EVPN Tunnel Encryption, on page 315](#).
- Beginning with Cisco NX-OS Release 10.1(1), VXLAN Tunnel Encryption feature is supported on Cisco Nexus 9300-FX3 platform switches.
- All of the BGWs on the same site should be configured for Secure VXLAN EVPN Multi-Site using CloudSec.
- Secure VXLAN EVPN Multi-Site using CloudSec on DCI links and MACsec on the internal fabric can coexist. However, they can't be enabled simultaneously on the same port or port group (MAC ID).
- Secure VXLAN EVPN Multi-Site using CloudSec peers must have the same keychain configuration in order to decrypt the secure traffic between them.
- In order to keep a session alive when all keys with an active timer expire, configure no more than one key per keychain without a lifetime. As a best practice, we recommend configuring a lifetime for each key.
- Secure VXLAN EVPN Multi-Site using CloudSec doesn't support the following:
  - Directly connected L2 hosts on border gateways
  - IP unnumbered configurations on the DCI interface
  - Multicast underlay
  - OAM pathtrace

- TRM
- VIP-only model on border gateways
- vPC on border gateways
- VXLAN EVPN with downstream VNI

## Configuring Secure VXLAN EVPN Multi-Site Using CloudSec

Follow these procedures to configure Secure VXLAN EVPN Multi-Site using CloudSec:

- [Enabling CloudSec VXLAN EVPN Tunnel Encryption, on page 315](#)
- [Configuring a CloudSec Keychain and Keys, on page 317](#)
- [Configuring a CloudSec Policy, on page 319](#)
- [Configuring CloudSec Peers, on page 320](#)
- [Enabling Secure VXLAN EVPN Multi-Site Using CloudSec on DCI Uplinks, on page 321](#)

## Enabling CloudSec VXLAN EVPN Tunnel Encryption

Follow these steps to enable CloudSec VXLAN EVPN Tunnel Encryption.

### Before you begin

Configure BGP peers in the IPv4 unicast address family. Make sure that the IPv4 prefix is propagated with the tunnel community attribute that carries CloudSec keys.

Configure VXLAN EVPN Multi-Site and use the following commands to ensure that peer IP addresses are advertised for CloudSec VXLAN EVPN Tunnel Encryption:

```
evpn multisite border-gateway ms-id  
dci-advertise-pip
```

### Caution

Configuring VXLAN EVPN Multi-Site without **dci-advertise-pip** reverts border gateways to VIP-only mode, which is not supported for CloudSec VXLAN EVPN Tunnel Encryption.

You have two options for sites that are connected through a route server:

- Keep dual RDs enabled – This default behavior ensures that the memory scale remains the same from previous releases in order to handle leaf devices with limited memory. All same-site BGWs use the same RD value for reoriginated routes while advertising EVPN routes to the remote BGW.
- Disable dual RDs – If you don't have memory limitations on leaf devices, you can configure the **no dual rd** command on the BGW. Different RD values are used for reoriginated routes on the same BGWs while advertising EVPN routes to the remote BGW.

Perform one of the following actions, depending on whether dual RDs are enabled on the BGW:

- If dual RDs are configured on the BGWs, follow these steps:

1. Apply BGP additional paths on the BGW.

```
router bgp as-num
  address-family l2vpn evpn
    maximum-paths number
  additional-paths send
  additional-paths receive
```

2. Configure multipath for each L3VNI VRF on the BGW.

```
vrf evpn-tenant-00001
  address-family ipv4 unicast
    maximum-paths 64
  address-family ipv6 unicast
    maximum-paths 64
```

3. Apply BGP additional paths on the route server.

```
router bgp as-num
  address-family l2vpn evpn
    retain route-target all
    additional-paths send
    additional-paths receive
    additional-paths selection route-map name

route-map name permit 10
  set path-selection all advertise
```

- If **no dual rd** is configured on the BGWs or full mesh is configured, follow these steps:

1. Configure the address family and maximum paths on the BGW.

```
router bgp as-num
  address-family l2vpn evpn
    maximum-paths number
```

2. Configure multipath for each L3VNI VRF on the BGW.

```
vrf evpn-tenant-00001
  address-family ipv4 unicast
    maximum-paths 64
  address-family ipv6 unicast
    maximum-paths 64
```

---

**Note** BGP additional paths are not required on the route server.

---

## SUMMARY STEPS

1. **configure terminal**
2. **[no] feature tunnel-encryption**
3. **[no] tunnel-encryption source-interface loopback *number***
4. (Optional) **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>[no] feature tunnel-encryption</b>  <b>Example:</b> <pre>switch(config)# feature tunnel-encryption</pre>	Enables CloudSec VXLAN EVPN Tunnel Encryption.
<b>Step 3</b>	<b>[no] tunnel-encryption source-interface loopback <i>number</i></b>  <b>Example:</b> <pre>switch(config)# tunnel-encryption source-interface loopback 2</pre>	<p>Specifies the BGP loopback as the tunnel-encryption source interface. The IP address of the configured source interface is used as the prefix to announce CloudSec VXLAN EVPN Tunnel Encryption key routes.</p> <p><b>Note</b> Enter the BGP loopback interface and not the NVE source interface.</p>
<b>Step 4</b>	<b>(Optional) copy running-config startup-config</b>  <b>Example:</b> <pre>switch(config)# copy running-config startup-config</pre>	Copies the running configuration to the startup configuration.

## What to do next

[Configuring a CloudSec Keychain and Keys.](#)

## Configuring a CloudSec Keychain and Keys

You can create a CloudSec keychain and keys on the device.

## Before you begin

Make sure that Secure VXLAN EVPN Multi-Site using CloudSec is enabled.

## SUMMARY STEPS

1. **configure terminal**
2. **[no] key chain *name* tunnel-encryption**
3. **[no] key *key-id***
4. **[no] key-octet-string *octet-string* cryptographic-algorithm {AES\_128\_CMAC | AES\_256\_CMAC}**
5. **[no] send-lifetime *start-time* duration *duration***
6. (Optional) **show key chain *name***
7. (Optional) **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>[no] key chain <i>name</i> tunnel-encryption</b> <b>Example:</b> <pre>switch(config)# key chain kcl tunnel-encryption switch(config-tunnelencryptkeychain)#</pre>	Creates a CloudSec keychain to hold a set of CloudSec keys and enters tunnel-encryption keychain configuration mode.
<b>Step 3</b>	<b>[no] key <i>key-id</i></b> <b>Example:</b> <pre>switch(config-tunnelencryptkeychain)# key 2000 switch(config-tunnelencryptkeychain-tunnelencryptkey)#</pre>	Creates a CloudSec key and enters tunnel-encryption key configuration mode. The range is from 1 to 32 octets, and the maximum size is 64. <b>Note</b> The key must consist of an even number of characters.
<b>Step 4</b>	<b>[no] key-octet-string <i>octet-string</i> cryptographic-algorithm {AES_128_CMAC   AES_256_CMAC}</b> <b>Example:</b> <pre>switch(config-tunnelencryptkeychain-tunnelencryptkey)# key-octet-string abcdef0123456789abcdef0123456789 abcdef0123456789abcdef0123456789 cryptographic-algorithm AES_256_CMAC</pre>	Configures the octet string for the key. The <i>octet-string</i> argument can contain up to 64 hexadecimal characters. The octet key is encoded internally, so the key in clear text does not appear in the output of the <b>show running-config tunnel-encryption</b> command.
<b>Step 5</b>	<b>[no] send-lifetime <i>start-time</i> <i>duration</i> <i>duration</i></b> <b>Example:</b> <pre>switch(config-tunnelencryptkeychain-tunnelencryptkey)# send-lifetime 00:00:00 May 06 2020 duration 100000</pre>	Configures a send lifetime for the key. By default, the device treats the start time as UTC. The <i>start-time</i> argument is the time of day and date that the key becomes active. The <i>duration</i> argument is the length of the lifetime in seconds. The range is from 1800 seconds to 2147483646 seconds (approximately 68 years).
<b>Step 6</b>	<b>(Optional) show key chain <i>name</i></b> <b>Example:</b> <pre>switch(config-tunnelencryptkeychain-tunnelencryptkey)# show key chain kcl</pre>	Displays the keychain configuration.
<b>Step 7</b>	<b>(Optional) copy running-config startup-config</b> <b>Example:</b> <pre>switch(config-tunnelencryptkeychain-tunnelencryptkey)# copy running-config startup-config</pre>	Copies the running configuration to the startup configuration.

## What to do next

[Configuring a CloudSec Policy.](#)

## Configuring a CloudSec Policy

You can create multiple CloudSec policies with different parameters. However, only one policy can be active on an interface.

### Before you begin

Make sure that Secure VXLAN EVPN Multi-Site using CloudSec is enabled.

### SUMMARY STEPS

1. **configure terminal**
2. (Optional) **[no] tunnel-encryption must-secure-policy**
3. **[no] tunnel-encryption policy** *name*
4. (Optional) **[no] cipher-suite** *name*
5. (Optional) **[no] window-size** *number*
6. (Optional) **[no] sak-rekey-time** *time*
7. (Optional) **show tunnel-encryption policy**
8. (Optional) **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
<b>Step 2</b>	(Optional) <b>[no] tunnel-encryption must-secure-policy</b>  <b>Example:</b> <pre>switch(config)# tunnel-encryption must-secure-policy</pre>	Ensures that no unencrypted packets are sent over the wire for the session. Packets that are not carrying CloudSec headers are dropped.  The <b>no</b> form of this command allows unencrypted traffic. We recommend allowing unencrypted traffic only during migration from non-CloudSec-enabled sites to CloudSec-enabled sites. By default, Secure VXLAN EVPN Multi-Site using CloudSec operates in "should secure" mode.
<b>Step 3</b>	<b>[no] tunnel-encryption policy</b> <i>name</i>  <b>Example:</b> <pre>switch(config)# tunnel-encryption policy p1 switch(config-tunenc-policy)#</pre>	Creates a CloudSec policy.
<b>Step 4</b>	(Optional) <b>[no] cipher-suite</b> <i>name</i>  <b>Example:</b> <pre>switch(config-tunenc-policy)# cipher-suite GCM-AES-XPB-256</pre>	Configures one of the following ciphers: GCM-AES-XPB-128 or GCM-AES-XPB-256. The default value is GCM-AES-XPB-256.

	Command or Action	Purpose
<b>Step 5</b>	(Optional) <b>[no] window-size</b> <i>number</i>  <b>Example:</b> switch(config-tunenc-policy)# window-size 134217728	Configures the replay protection window such that the interface will not accept any packet that is less than the configured window size. The range is from 134217728 to 1073741823 IP packets. The default value is 268435456.
<b>Step 6</b>	(Optional) <b>[no] sak-rekey-time</b> <i>time</i>  <b>Example:</b> switch(config-tunenc-policy)# sak-rekey-time 1800	Configures the time in seconds to force an SAK rekey. This command can be used to change the session key to a predictable time interval. The range is from 1800 to 2592000 seconds. There is not a default value. We recommend using the same rekey value for all the peers.
<b>Step 7</b>	(Optional) <b>show tunnel-encryption policy</b>  <b>Example:</b> switch(config-tunenc-policy)# show tunnel-encryption policy	Displays the CloudSec policy configuration.
<b>Step 8</b>	(Optional) <b>copy running-config startup-config</b>  <b>Example:</b> switch(config-tunenc-policy)# copy running-config startup-config	Copies the running configuration to the startup configuration.

**What to do next**

[Configuring CloudSec Peers.](#)

## Configuring CloudSec Peers

You can configure the CloudSec peers.

**Before you begin**

Enable Secure VXLAN EVPN Multi-Site using CloudSec.

**SUMMARY STEPS**

1. **configure terminal**
2. **[no] tunnel-encryption peer-ip** *peer-ip-address*
3. **[no] keychain** *name* **policy** *name*

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> switch# <b>configure terminal</b> switch(config)#	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>[no] tunnel-encryption peer-ip</b> <i>peer-ip-address</i> <b>Example:</b> <pre>switch(config)# tunnel-encryption peer-ip 33.1.33.33</pre>	Specifies the IP address of the NVE source interface on the peer.
<b>Step 3</b>	<b>[no] keychain</b> <i>name</i> <b>policy</b> <i>name</i> <b>Example:</b> <pre>switch(config)# keychain kcl policy pl</pre>	Attaches a policy to a CloudSec peer.

**What to do next**

[Enabling Secure VXLAN EVPN Multi-Site Using CloudSec on DCI Uplinks.](#)

## Enabling Secure VXLAN EVPN Multi-Site Using CloudSec on DCI Uplinks

Follow these steps to enable Secure VXLAN EVPN Multi-Site using CloudSec on all DCI uplinks.

**Note**

This configuration cannot be applied on Layer 2 ports.

**Before you begin**

Make sure that Secure VXLAN EVPN Multi-Site using CloudSec is enabled.

**SUMMARY STEPS**

1. **configure terminal**
2. **[no] interface ethernet** *port/slot*
3. **[no] tunnel-encryption**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>[no] interface ethernet</b> <i>port/slot</i> <b>Example:</b> <pre>switch(config)# interface ethernet 1/1 switch(config-if)#</pre>	Enters interface configuration mode.
<b>Step 3</b>	<b>[no] tunnel-encryption</b> <b>Example:</b>	Enables Secure VXLAN EVPN Multi-Site using CloudSec on the specified interface.

Command or Action	Purpose
switch(config-if)# <b>tunnel-encryption</b>	

## Verifying the Secure VXLAN EVPN Multi-Site Using CloudSec

To display Secure VXLAN EVPN Multi-Site using CloudSec configuration information, perform one of the following tasks:

Command	Purpose
<b>show tunnel-encryption info global</b>	Displays configuration information for Secure VXLAN EVPN Multi-Site using CloudSec.
<b>show tunnel-encryption policy</b> <i>[policy-name]</i>	Displays the configuration for a specific CloudSec policy or for all CloudSec policies.
<b>show tunnel-encryption session</b> <i>[peer-ip peer-ip-address]</i> <b>[detail]</b>	Displays information about CloudSec sessions, including whether sessions are secure between endpoints.
<b>show running-config tunnel-encryption</b>	Displays the running configuration information for Secure VXLAN EVPN Multi-Site using CloudSec.
<b>show bgp ipv4 unicast</b> <i>ip-address</i>	Displays the tunnel encryption information for BGP routes.
<b>show bgp l2vpn evpn</b>	Displays the Layer 2 VPN EVPN address family and routing table information.
<b>show ip route</b> <i>ip-address</i> <b>vrf</b> <i>vrf</i>	Displays the VRF routes.
<b>show l2route evpn mac</b> <i>evi evi</i>	Displays Layer 2 route information.
<b>show nve interface</b> <i>interface</i> <b>detail</b>	Displays the NVE interface detail.
<b>show running-config rpm</b>	Displays the key text in the running configuration.  <b>Note</b> If you enter the <b>key-chain tunnelencrypt-psk no-show</b> command prior to running this command, the key text is hidden (with asterisks) in the running configuration. If you enter the <b>reload ascii</b> command, the key text is omitted from the running configuration.

The following example displays configuration information for Secure VXLAN EVPN Multi-Site using CloudSec:

```
switch# show tunnel-encryption info global
Global Policy Mode: Must-Secure
SCI list: 0000.0000.0001.0002 0000.0000.0001.0004
No. of Active Peers      : 1
```

The following example displays all configured CloudSec policies. The output shows the cipher, window size, and SAK retry time for each policy.

```
switch# show tunnel-encryption policy
Tunnel-Encryption Policy Cipher Window SAK Rekey time
-----
cloudsec GCM-AES-XPB-256 134217728 1800
p1 GCM-AES-XPB-256 1073741823
system-default-tunenc-policy GCM-AES-XPB-256 268435456
```

The following example displays information about CloudSec sessions. The output shows the peer IP address and policy, the keychain available, and whether the sessions are secure.

```
switch# show tunnel-encryption session
Tunnel-Encryption Peer Policy Keychain RxStatus TxStatus
-----
33.1.33.33 p1 kc1 Secure (AN: 0) Secure (AN: 2)
33.2.33.33 p1 kc1 Secure (AN: 0) Secure (AN: 2)
33.3.33.33 p1 kc1 Secure (AN: 0) Secure (AN: 2)
44.1.44.44 p1 kc1 Secure (AN: 0) Secure (AN: 0)
44.2.44.44 p1 kc1 Secure (AN: 0) Secure (AN: 0)
```

The following example shows the tunnel encryption information for BGP routes:

```
switch# show bgp ipv4 unicast 199.199.199.199 □ Source-loopback configured on peer BGW for CloudSec
BGP routing table information for VRF default, address family IPv4 Unicast
BGP routing table entry for 199.199.199.199/32, version 109
Paths: (1 available, best #1)
Flags: (0x8008001a) (high32 0x000200) on xmit-list, is in urib, is best urib route, is in HW
Multipath: eBGP

Advertised path-id 1
Path type: external, path is valid, is best path, no labeled nexthop, in rib
AS-Path: 1000 200 , path sourced external to AS
89.89.89.89 (metric 0) from 89.89.89.89 (89.89.89.89)
Origin IGP, MED not set, localpref 100, weight 0
Tunnel Encapsulation attribute: Length 120

Path-id 1 advertised to peers:
2.2.2.2
```

The following example shows if the MAC is attached with the virtual ESI:

```
switch(config)# show bgp l2vpn evpn 0012.0100.000a
BGP routing table information for VRF default, address family L2VPN EVPN
Route Distinguisher: 110.110.110.110:32876

## Displaying Statistics for Secure VXLAN EVPN Multi-Site Using CloudSec

You can display or clear Secure VXLAN EVPN Multi-Site using CloudSec statistics using the following commands:

Command	Purpose
<b>show tunnel-encryption statistics</b> [peer-ip peer-ip-address]	Displays statistics for Secure VXLAN EVPN Multi-Site using CloudSec.
<b>clear tunnel-encryption statistics</b> [peer-ip peer-ip-address]	Clears statistics for Secure VXLAN EVPN Multi-Site using CloudSec.

The following example shows sample statistics for Secure VXLAN EVPN Multi-Site using CloudSec:

```

switch# show tunnel-encryption statistics
Peer 16.16.16.16 SecY Statistics:

SAK Rx Statistics for AN [0]:

## Migrating from Multi-Site with VIP to Multi-Site with PIP

Follow these steps for a smooth migration from Multi-Site with VIP to Multi-Site with PIP. The migration needs to be done one site at a time. You can expect minimal traffic loss during the migration.

1. Upgrade all BGWs on all sites to Cisco NX-OS Release 9.3(5) or a later release.
2. Configure BGP maximum paths on all BGWs. Doing so is required for ESI-based MAC multipath and BGP to download all of the next-hops for EVPN Type-2 and Type-5 routes.
3. Pick one site at a time for the migration.
4. Shut down the same-site BGWs except for one BGW. You can use the NVE **shutdown** command to shut down the BGWs.
5. To avoid traffic loss, wait a few minutes before enabling Multi-Site with PIP on the active BGW. Doing so allows the same-site shutdown BGWs to withdraw EVPN routes so remote BGWs send traffic to only the active BGW.
6. Enable Multi-Site with PIP on the active BGW by configuring the **dci-advertise-pip** command.

The Multi-Site with PIP-enabled BGW advertises the EVPN EAD-per-ES route for the virtual ESI.

The Multi-Site with PIP-enabled BGW advertises EVPN Type-2 and Type-5 routes with virtual ESI, next-hop as the PIP address, and PIP interface MAC as the RMAC (if applicable) toward DCI. There is no change with respect to advertising EVPN Type-2 and Type-5 routes toward the fabric.

The remote BGW performs ESI-based MAC multipathing as MAC routes are received with ESI.

7. Unshut the same-site BGWs one at a time and enable Multi-Site with PIP by entering the **dci-advertise-pip** command.

The remote BGW performs ESI-based MAC multipathing for MAC routes as ESI is the same from all same-site BGWs.

On the remote BGW, BGP selects paths as multipath and downloads all next-hops for EVPN Type-5 routes.

## CHAPTER 19

# Configuring VXLAN QoS

---

This chapter contains the following sections:

- [Information About VXLAN QoS, on page 331](#)
- [Guidelines and Limitations for VXLAN QoS, on page 339](#)
- [Default Settings for VXLAN QoS, on page 340](#)
- [Configuring VXLAN QoS, on page 341](#)
- [Verifying the VXLAN QoS Configuration, on page 343](#)
- [VXLAN QoS Configuration Examples, on page 343](#)

## Information About VXLAN QoS

VXLAN QoS enables you to provide Quality of Service (QoS) capabilities to traffic that is tunneled in VXLAN.

Traffic in the VXLAN overlay can be assigned to different QoS properties:

- Classification traffic to assign different properties.
- Including traffic marking with different priorities.
- Queuing traffic to enable priority for the protected traffic.
- Policing for misbehaving traffic.
- Shaping for traffic that limits speed per interface.
- Properties traffic sensitive to traffic drops.

---

**Note**

QoS allows you to classify the network traffic, police and prioritize the traffic flow, and provide congestion avoidance. For more information about QoS, see the [Cisco Nexus 9000 Series NX-OS Quality of Service Configuration Guide, Release 9.2\(x\)](#).

---

This section contains the following topics:

## VXLAN QoS Terminology

This section defines VXLAN QoS terminology.

Table 8: VXLAN QoS Terminology

Term	Definition
Frames	Carries traffic at Layer 2. Layer 2 frames carry Layer 3 packets.
Packets	Carries traffic at Layer 3.
VXLAN packet	Carries original frame, encapsulated in VXLAN IP/UDP header.
Original frame	A Layer 2 or Layer 2 frame that carries the Layer 3 packet before encapsulation in a VXLAN header.
Decapsulated frame	A Layer 2 or a Layer 2 frame that carries a Layer 3 packet after the VXLAN header is decapsulated.
Ingress VTEP	The point where traffic is encapsulated in the VXLAN header and enters the VXLAN tunnel.
Egress VTEP	The point where traffic is decapsulated from the VXLAN header and exits the VXLAN tunnel.
Class of Service (CoS)	Refers to the three bits in an 802.1Q header that are used to indicate the priority of the Ethernet frame as it passes through a switched network. The CoS bits in the 802.1Q header are commonly referred to as the 802.1p bits. 802.1Q is discarded prior to frame encapsulation in a VXLAN header, where CoS value is not present in VXLAN tunnel. To maintain QoS when a packet enters the VXLAN tunnel, the type of service (ToS) and CoS values map to each other.
IP precedence	The 3 most significant bits of the ToS byte in the IP header.
Differentiated Services Code Point (DSCP)	The first six bits of the ToS byte in the IP header. DSCP is only present in an IP packet.
Explicit Congestion Notification (ECN)	The last two bits of the ToS byte in the IP header. ECN is only present in an IP packet.
QoS tags	Prioritization values carried in Layer 3 packets and Layer 2 frames. A Layer 2 CoS label can have a value ranging between zero for low priority and seven for high priority. A Layer 3 IP precedence label can have a value ranging between zero for low priority and seven for high priority. IP precedence values are defined by the three most significant bits of the 1-byte ToS byte. A Layer 3 DSCP label can have a value between 0 and 63. DSCP values are defined by the six most significant bits of the 1-byte IP ToS field.

Term	Definition
Classification	The process used for selecting traffic for QoS
Marking	The process of setting: a Layer 2 COS value in a frame, Layer 3 DSCP value in a packet, and Layer 3 ECN value in a packet. Marking is also the process of choosing different values for the CoS, DSCP, ECN field to mark packets so that they have the priority that they require during periods of congestion.
Policing	Limiting bandwidth used by a flow of traffic. Policing can mark or drop traffic.
MQC	The Cisco Modular QoS command line interface (MQC) framework, which is a modular and highly extensible framework for deploying QoS.

## VXLAN QoS Features

The following topics describe the VXLAN QoS features that are supported in a VXLAN network:

### Trust Boundaries

The trust boundary forms a perimeter on your network. Your network trusts (and does not override) the markings on your switch. The existing ToS values are trusted when received on in the VXLAN fabric.

### Classification

You use classification to partition traffic into classes. You classify the traffic based on the port characteristics or the packet header fields that include IP precedence, differentiated services code point (DSCP), Layer 3 to Layer 4 parameters, and the packet length.

The values used to classify traffic are called match criteria. When you define a traffic class, you can specify multiple match criteria, you can choose to not match on a particular criterion, or you can determine the traffic class by matching any or all criteria.

Traffic that fails to match any class is assigned to a default class of traffic called class-default.

### Marking

Marking is the setting of QoS information that is related to a packet. Packet marking allows you to partition your network into multiple priority levels or classes of service. You can set the value of a standard QoS field for COS, IP precedence, and DSCP. You can also set the QoS field for internal labels (such as QoS groups) that can be used in subsequent actions. Marking QoS groups is used to identify the traffic type for queuing and scheduling traffic.

### Policing

Policing causes traffic that exceeds the configured rate to be discarded or marked down to a higher drop precedence.

Single-rate policers monitor the specified committed information rate (CIR) of traffic. Dual-rate policers monitor both CIR and peak information rate (PIR) of traffic.

## Queuing and Scheduling

The queuing and scheduling process allows you to control the queue usage and the bandwidth that is allocated to traffic classes. You can then achieve the desired trade-off between throughput and latency.

You can limit the size of the queues for a particular class of traffic by applying either static or dynamic limits.

You can apply weighted random early detection (WRED) to a class of traffic, which allows packets to be dropped based on the QoS group. The WRED algorithm allows you to perform proactive queue management to avoid traffic congestion.

ECN can be enabled along with WRED on a particular class of traffic to mark the congestion state instead of dropping the packets. ECN marking in the VXLAN tunnel is performed in the outer header, and at the Egress VTEP is copied to decapsulated frame.

## Traffic Shaping

You can shape traffic by imposing a maximum data rate on a class of traffic so that excess packets are retained in a queue to smooth (constrain) the output rate. In addition, minimum bandwidth shaping can be configured to provide a minimum guaranteed bandwidth for a class of traffic.

Traffic shaping regulates and smooths out the packet flow by imposing a maximum traffic rate for each port's egress queue. Packets that exceed the threshold are placed in the queue and are transmitted later. Traffic shaping is similar to Traffic Policing, but the packets are not dropped. Because packets are buffered, traffic shaping minimizes packet loss (based on the queue length), which provides better traffic behavior for TCP traffic.

By using traffic shaping, you can control the following:

- Access to available bandwidth.
- Ensure that traffic conforms to the policies established for it.
- Regulate the flow of traffic to avoid congestion that can occur when the egress traffic exceeds the access speed of its remote, target interface.

For example, you can control access to the bandwidth when the policy dictates that the rate of a given interface must not, on average, exceed a certain rate. Despite the access rate exceeding the speed.

## Network QoS

The network QoS policy defines the characteristics of each CoS value, which are applicable network wide across switches. With a network QoS policy, you can configure the following:

- Pause behavior—You can decide whether a CoS requires the lossless behavior which is provided by using a priority flow control (PFC) mechanism that prevents packet loss during congestion) or not. You can configure drop (frames with this CoS value can be dropped) and no drop (frames with this CoS value cannot be dropped). For the drop and no drop configuration, you must also enable PFC per port. For more information about PFC, see “Configuring Priority Flow Control”.

Pause behavior can be achieved in the VXLAN tunnel for a specific queue-group.

## VXLAN Priority Tunneling

In the VXLAN tunnel, DSCP values in the outer header are used to provide QoS transparency in end-to-end of the tunnel. The outer header DSCP value is derived from the DSCP value with Layer 3 packets or the CoS value for Layer 2 frames. At the VXLAN tunnel egress point, the priority of the decapsulated traffic is chosen based on the mode. For more information, see [Decapsulated Packet Priority Selection](#), on page 338.

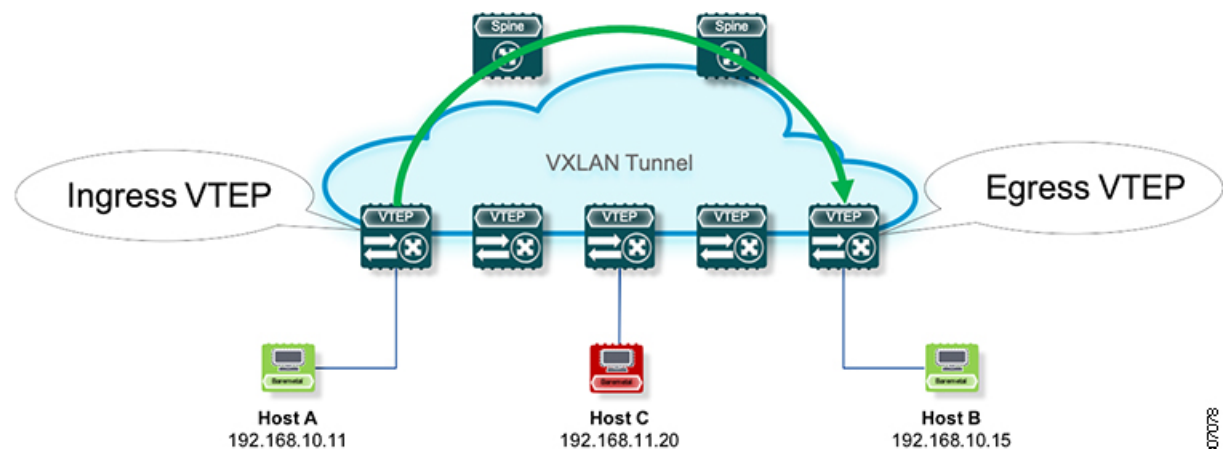

## MQC CLI

All available QoS features for VXLAN QoS are managed from the modular QoS command-line interface (CLI). The Modular QoS CLI (MQC) allows you to define traffic classes (class maps), create and configure traffic policies (policy maps), and perform actions that are defined in the policy maps to interface (service policy).

## VXLAN QoS Topology and Roles

This section describes the roles of network devices in implementing VXLAN QoS.

**Figure 30: VXLAN Network**

The network is bidirectional, but in the previous image, traffic is moving left to right.

In the VXLAN network, points of interest are ingress VTEPs where the original traffic is encapsulated in a VXLAN header. Spines are transporting hops that connect ingress and egress VTEPs. An egress VTEP is the point where VXLAN encapsulated traffic is decapsulated and egresses the VTEP as classical Ethernet traffic.

**Note** Ingress and egress VTEPs are the boundary between the VXLAN tunnel and the IP network.

This section contains the following topics:

### Ingress VTEP and Encapsulation in the VXLAN Tunnel

At the ingress VTEP, the VTEP processes packets as follows:

- 
- Step 1** Layer 2 or Layer 3 traffic enters the edge of the VXLAN network.
  - Step 2** The switch receives the traffic from the input interface and uses the 802.1p bits or the DSCP value to perform any classification, marking, and policing. It also derives the outer DSCP value in the VXLAN header. For classification of incoming IP packets, the input service policy can also use access control lists (ACLs).
  - Step 3** For each incoming packet, the switch performs a lookup of the IP address to determine the next hop.
  - Step 4** The packet is encapsulated in the VXLAN header. The encapsulated packet's VXLAN header is assigned a DSCP value that is based on QoS rules.
  - Step 5** The switch forwards the encapsulated packets to the appropriate output interface for processing.
  - Step 6** The encapsulated packets, marked by the DSCP value, are sent to the VXLAN tunnel output interface.
- 

## Transport Through the VXLAN Tunnel

In the transport through a VXLAN tunnel, the switch processes the VXLAN packets as follows:

- 
- Step 1** The VXLAN encapsulated packets are received on an input interface of a transport switch. The switch uses the outer header to perform classification, marking, and policing.
  - Step 2** The switch performs a lookup on the IP address in the outer header to determine the next hop.
  - Step 3** The switch forwards the encapsulated packets to the appropriate output interface for processing.
  - Step 4** VXLAN sends encapsulated packets through the output interface.
- 

## Egress VTEP and Decapsulation of the VXLAN Tunnel

At the egress VTEP boundary of the VXLAN tunnel, the VTEP processes packets as follows:

- 
- Step 1** Packets encapsulated in VXLAN are received at the NVE interface of an egress VTEP, where the switch uses the inner header DSCP value to perform classification, marking, and policing.
  - Step 2** The switch removes the VXLAN header from the packet, and does a lookup that is based on the decapsulated packet's headers.
  - Step 3** The switch forwards the decapsulated packets to the appropriate output interface for processing.
  - Step 4** Before the packet is sent out, a DSCP value is assigned to a Layer 3 packet based on the decapsulation priority or based on marking Layer 2 frames.
  - Step 5** The decapsulated packets are sent through the outgoing interface to the IP network.
- 

## Classification at the Ingress VTEP, Spine, and Egress VTEP

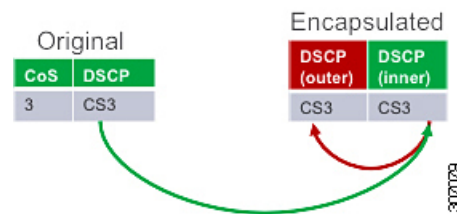

This section includes the following topics:

## IP to VXLAN

At the ingress VTEP, the ingress point of the VXLAN tunnel, traffic is encapsulated in the VXLAN header. Traffic on an ingress VTEP is classified based on the priority in the original header. Classification can be performed by matching the CoS, DSCP, and IP precedence values or by matching traffic with the ACL based on the original frame data.

When traffic is encapsulated in the VXLAN, the Layer 3 packet's DSCP value is copied from the original header to the outer header of the VXLAN encapsulated packet. This behavior is illustrated in the following figure:

**Figure 31: Copy of Priority from Layer-3 Packet to VXLAN Outer Header**

For Layer 2 frames without the IP header, the DSCP value of the outer header is derived from the CoS-to-DSCP mapping present in the hardware illustrated in [Default Settings for VXLAN QoS, on page 340](#). In this way, the original QoS attributes are preserved in the VXLAN tunnel. This behavior is illustrated in the following figure:

**Figure 32: Copy of Priority from Layer-2 Frame to VXLAN Outer Header**

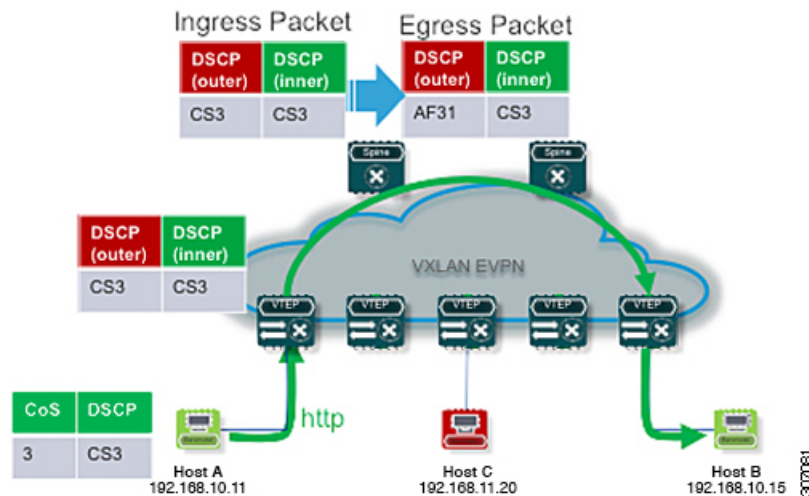

A Layer 2 frame, does not have a DSCP value present because the IP header is not present in the frame. After a Layer 2 frame is encapsulated, the original CoS value is not preserved in the VXLAN tunnel.

## Inside the VXLAN Tunnel

Inside the VXLAN tunnel, traffic classification is based on the outer header DSCP value. Classification can be done matching the DSCP value or using ACLs for classification.

If VXLAN encapsulated traffic is crossing the trust boundary, marking can be changed in the packet to match QoS behavior in the tunnel. Marking can be performed inside of the VXLAN tunnel, where a new DSCP value is applied only on the outer header. The new DSCP value can influence different QoS behaviors inside the VXLAN tunnel. The original DSCP value is preserved in the inner header.

Figure 33: Marking Inside of the VXLAN Tunnel

## VXLAN to IP

Classification at the egress VTEP is performed for traffic leaving the VXLAN tunnel. For classification at the egress VTEP, the inner header values are used. The inner DSCP value is used for priority-based classification. Classification can be performed using ACLs.

Classification is performed on the NVE interface for all VXLAN tunneled traffic.

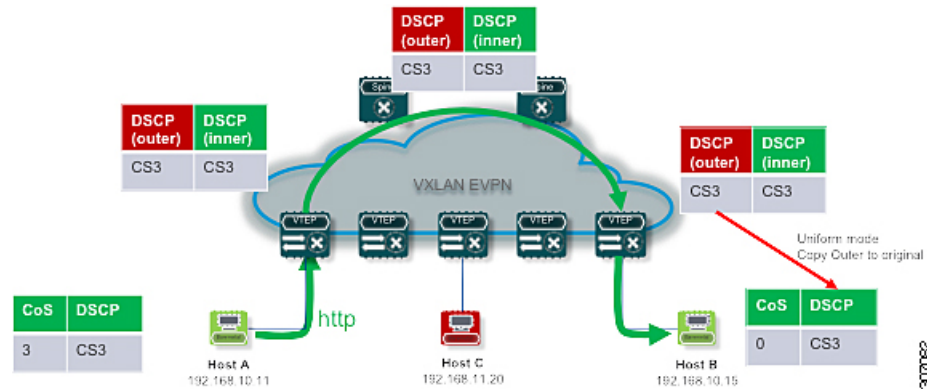

Marking and policing can be performed on the NVE interface for tunneled traffic. If marking is configured, newly marked values are present in the decapsulated packet. Because the original CoS value is not preserved in the encapsulated packet, marking can be performed for decapsulated packets for any devices that expect an 802.1p field for QoS in the rest of the network.

## Decapsulated Packet Priority Selection

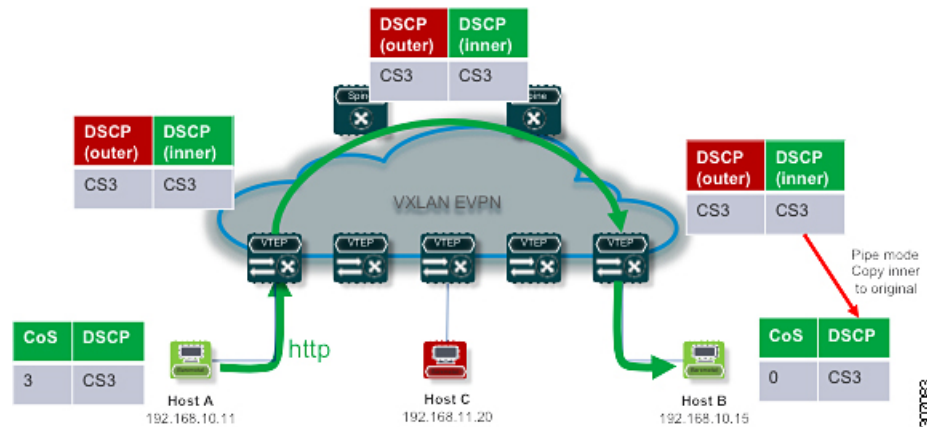

At the egress VTEP, the VXLAN header is removed from the packet and the decapsulated packet egresses the switch with the DSCP value. The switch assigns the DSCP value of the decapsulated packet based on two modes:

- Uniform mode – the DSCP value from the outer header of the VXLAN packet is copied to the decapsulated packet. Any change of the DSCP value in the VXLAN tunnel is preserved and present in the decapsulated packet. Uniform mode is the default mode of decapsulated packet priority selection.
- Pipe mode – the original DSCP value is preserved at the VXLAN tunnel end. At the egress VTEP, the system copies the inner DSCP value to the decapsulated packet DSCP value. In this way, the original DSCP value is preserved at the end of the VXLAN tunnel.

**Figure 34: Uniform Mode Outer DSCP Value is Copied to Decapsulated Packet DSCP Value for a Layer-3 Packet**

**Figure 35: Pipe Mode Inner DSCP Value is Copied to Decapsulated Packet DSCP Value for Layer-3 Packet**

## Guidelines and Limitations for VXLAN QoS

**Note** The QoS policy must be configured end-to-end for this feature to work as designed.

VXLAN QoS has the following configuration guidelines and limitations:

- Cisco Nexus 9364C, 9300-EX, and 9300-FX/FX2/FX3 platform switches and Cisco Nexus 9500 platform switches with -EX/FX or -R/RX line cards support VXLAN QoS.
- Beginning with Cisco NX-OS Release 9.3(3), Cisco Nexus 9300-GX platform switches support VXLAN QoS in default mode.
- The following features are supported on Cisco Nexus 9504 and 9508 platform switches with -R/RX line cards:
  - Physical interface level queuing should work as normal L2/L3 queuing/QoS
  - IPv4 bridged case works in terms of copying inner ToS to outer VXLAN ToS

- The following features are not supported on Cisco Nexus 9504 and 9508 platform switches with -R and -RX line cards:
  - Policies on the NVE interface
  - IPv6 type of service (ToS) from inner to VXLAN outer copying
  - IPv4 routed cases for QoS. ToS from inner is not copied to outer VXLAN header
- For Cisco Nexus 9504 and 9508 platform switches with -RX line cards, the default mode is pipe for VXLAN decapsulation (inner packet DSCP not modified based on outer IP header DSCP value). This is a difference in behavior from other line cards types. If -RX line cards and other line cards are used in the same network, the **qos-mode pipe** command can be used in switches where non-RX line cards are present in order to have the same behavior. For details on the configuration command, see [Configuring Type QoS on the Egress VTEP, on page 341](#).
- VXLAN QoS is supported in the EVPN fabric.
- The original IEEE 802.1Q header is not preserved in the VXLAN tunnel. The CoS value is not present in the inner header of the VXLAN-encapsulated packet.
- Statistics (counters) are present for the NVE interface.
- Entering the **policy-map type qos** command in the output direction for egress policing is not supported in the ingress VTEP.
- In a vPC, configure the change of the decapsulated packet priority selection on both peers.
- The service policy on an NVE interface can attach only in the input direction.
- If DSCP marking is present on the NVE interface, traffic to the BUD node preserves marking in the inner and outer headers. If a marking action is configured on the NVE interface, BUM traffic is marked with a new DSCP value on Cisco Nexus 9364C and 9300-EX platform switches.
- A classification policy applied to an NVE interface applies only on VXLAN-encapsulated traffic. For all other traffic, the classification policy must be applied on the incoming interface.
- To mark the decapsulated packet with a CoS value, a marking policy must be attached to the NVE interface to mark the CoS value to packets where the VLAN header is present.
- The following guidelines and limitations apply to VXLAN QoS configuration on the DCI handoff node:
  - Beginning with Cisco NX-OS Release 9.3(5), Cisco Nexus 9300-GX platform switches support VXLAN QoS configuration on the DCI handoff node.
  - VXLAN QoS configuration on the DCI handoff node does not support end-to-end priority flow control (PFC) for Cisco Nexus 9336C-FX2, 93240YC-FX2, and 9300-GX platform switches.
  - Microburst, dynamic packet prioritization (DPP), and approximate fair-drop (AFD) are supported on VXLAN-encapsulated packets.

## Default Settings for VXLAN QoS

The following table lists the default CoS-to-DSCP mapping in the ingress VTEP for Layer 2 frames:

Table 9: Default CoS-to-DSCP Mapping

CoS of Original Layer 2 Frame	DSCP of Outer VXLAN Header
0	0
1	8
2	16
3	26
4	32
5	46
6	48
7	56

## Configuring VXLAN QoS

Configuration of VXLAN QoS is done using the MQC model. The same configuration that is used for the QoS configuration applies to VXLAN QoS. For more information about configuring QoS, see the [Cisco Nexus 9000 Series NX-OS Quality of Service Configuration Guide, Release 9.2\(x\)](#).

VXLAN QoS introduces a new service-policy attachment point which is NVE – Network Virtual Interface. At the egress VTEP, the NVE interface is the point where traffic is decapsulated. To account for all VLXAN traffic, the service policy must be attached to an NVE interface.

The next section describes the configuration of the classification at the egress VTEP, and **service-policy type qos** attachment to an NVE interface.

## Configuring Type QoS on the Egress VTEP

Configuration of VXLAN QoS is done by using the MQC model. The same configuration is used for QoS configuration for VXLAN QoS. For more information about configuring QoS, see the [Cisco Nexus 9000 Series NX-OS Quality of Service Configuration Guide, Release 9.2\(x\)](#).

VLXAN QoS introduces a new service-policy attachment point which is the Network Virtual Interface (NVE). At the egress VTEP, the NVE interface points where traffic is decapsulated. To account for all VLXAN traffic, the service policy must be attached to an NVE interface.

This procedure describes the configuration of classification at the egress VTEP, and **service-policy type qos** attachment to an NVE interface.

### Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	switch# <b>configure terminal</b>	
<b>Step 2</b>	<b>[no] class-map [type qos] [match-all] [match-any] class-map-name</b>  <b>Example:</b> switch(config)# <b>class-map type qos class1</b>	Creates or accesses the class map <i>class-map-name</i> and enters <b>class-map</b> mode. The <i>class-map-name</i> argument can contain alphabetic, hyphen, or underscore characters, and can be up to 40 characters. (match-any is the default when the <b>no</b> option is selected and multiple match statements are entered.)
<b>Step 3</b>	<b>[no] match [access-group   cos   dscp   precedence] {name   0-7   0-63   0-7}</b>  <b>Example:</b> switch(config-cmap-qos)# <b>match dscp 26</b>	Configures the traffic class by matching packets based on access-list, <b>cos</b> value, <b>dscp</b> values, or IP <b>precedence</b> value
<b>Step 4</b>	<b>[no] policy-map type qos policy-map-name</b>  <b>Example:</b> switch(config-cmap-qos)# <b>policy-map type qos policy</b>	Creates or accesses the policy map that is named <i>policy-map-name</i> and then enters policy-map mode. The policy-map name can contain alphabetic, hyphen, or underscore characters, is case sensitive, and can be up to 40 characters.
<b>Step 5</b>	<b>[no] class class-name</b>  <b>Example:</b> switch(config-pmap-qos)# <b>class class1</b>	Creates a reference to class-name and enters policy-map class configuration mode. The class is added to the end of the policy map unless insert-before is used to specify the class to insert before. Use the class-default keyword to select all traffic that is not currently matched by classes in the policy map.
<b>Step 6</b>	<b>[no] set qos-group qos-group-value</b>  <b>Example:</b> switch(config-pmap-c-qos)# <b>set qos-group 1</b>	Sets the QoS group value to <i>qos-group-value</i> . The value can range from 1 through 126. The <b>qos-group</b> is referenced in type queuing and type network-qos as matching criteria.
<b>Step 7</b>	<b>exit</b>  <b>Example:</b> switch(config-pmap-c-qos)# <b>exit</b>	Exits class-map mode.
<b>Step 8</b>	<b>[no] interface nve nve-interface-number</b>  <b>Example:</b> switch(config)# <b>interface nve 1</b>	Enters interface mode to configure the NVE interface.
<b>Step 9</b>	<b>[no] service-policy type qos input policy-map-name</b>  <b>Example:</b> switch(config-if-nve)# <b>service-policy type qos input policy1</b>	Adds a service-policy <i>policy-map-name</i> to the interface in the input direction. You can attach only one input policy to an NVE interface.
<b>Step 10</b>	(Optional) <b>[no] qos-mode [pipe]</b>  <b>Example:</b> switch(config-if-nve)# <b>qos-mode pipe</b>	Selecting decapsulated packet priority selection and using pipe mode. Entering the <b>no</b> form of this command negates pipe mode and defaults to uniform mode.

# Verifying the VXLAN QoS Configuration

Table 10: VXLAN QoS Verification Commands

Command	Purpose
<b>show class map</b>	Displays information about all configured class maps.
<b>show policy-map</b>	Displays information about all configured policy maps.
<b>show running ipqos</b>	Displays configured QoS configuration on the switch.

## VXLAN QoS Configuration Examples

### Ingress VTEP Classification and Marking

This example shows how to configure the **class-map type qos** command for classification matching traffic with an ACL. Enter the **policy-map type qos** command to put traffic in qos-group 1 and set the DSCP value. Enter the **service-policy type qos** command to attach to the ingress interface in the input direction to classify traffic matching the ACL.

```
access-list ACL_QOS_DSCP_CS3 permit ip any any eq 80

class-map type qos CM_QOS_DSCP_CS3
 match access-group name ACL_QOS_DSCP_CS3

policy-map type qos PM_QOS_MARKING
 class CM_QOS_DSCP_CS3
  set qos-group 1
  set dscp 24

interface ethernet1/1
 service-policy type qos input PM_QOS_MARKING
```

### Transit Switch – Spine Classification

This example shows how to configure the **class-map type qos** command for classification matching DSCP 24 set on the ingress VTEP. Enter the **policy-map type qos** command to put traffic in qos-group 1. Enter the **service-policy type qos** command to attach to the ingress interface in the input direction to classify traffic matching criteria.

```
class-map type qos CM_QOS_DSCP_CS3
 match dscp 24

policy-map type qos PM_QOS_CLASS
 class CM_QOS_DSCP_CS3
  set qos-group 1

interface Ethernet 1/1
 service-policy type qos input PM_QOS_CLASS
```

### Egress VTEP Classification and Marking

This example shows how to configure the **class-map type qos** command for classification matching traffic by DSCP value. Enter the **policy-map type qos** to place traffic in qos-group 1 and mark CoS value in outgoing frames. The **service-policy type qos** command is applied to the NVE interface in the input direction to classify traffic coming out of the VXLAN tunnel.

```
class-map type qos CM_QOS_DSCP_CS3
  match dscp 24

policy-map type qos PM_QOS_MARKING
  class CM_QOS_DSCP_CS3
    set qos-group 1
    set cos 3

interface nve 1
  service-policy type qos input PM_QOS_MARKING
```

### Queuing

This example shows how to configure the **policy-map type queueing** command for traffic in qos-group 1. Assigning 50% of the available bandwidth to q1 mapped to qos-group 1 and attaching policy in the output direction to all ports using the **system qos** command.

```
policy-map type queueing PM_QUEUEING
class type queueing c-out-8q-q7
  priority level 1
class type queueing c-out-8q-q6
  bandwidth remaining percent 0
class type queueing c-out-8q-q5
  bandwidth remaining percent 0
class type queueing c-out-8q-q4
  bandwidth remaining percent 0
class type queueing c-out-8q-q3
  bandwidth remaining percent 0
class type queueing c-out-8q-q2
  bandwidth remaining percent 0
class type queueing c-out-8q-q1
  bandwidth remaining percent 50
class type queueing c-out-8q-q-default
  bandwidth remaining percent 50

system qos
  service-policy type queueing output PM_QUEUEING
```

## CHAPTER 20

# Configuring vPC Fabric Peering

This chapter contains the following sections:

- [Information About vPC Fabric Peering, on page 345](#)
- [Guidelines and Limitations for vPC Fabric Peering , on page 346](#)
- [Configuring vPC Fabric Peering, on page 347](#)
- [Migrating from vPC to vPC Fabric Peering, on page 350](#)
- [Verifying vPC Fabric Peering Configuration, on page 352](#)

## Information About vPC Fabric Peering

vPC Fabric Peering provides an enhanced dual-homing access solution without the overhead of wasting physical ports for vPC Peer Link. This feature preserves all the characteristics of a traditional vPC.

The following lists the vPC Fabric Peering solution:

- vPC Fabric Peering port-channel with virtual members (tunnels).
- vPC Fabric Peering (tunnel) with removal of the physical peer link requirement.
- vPC Fabric Peering up/down events are triggered based on route updates and fabric up/down.
- Uplink tracking for extended failure coverage.
- vPC Fabric Peering reachability via the routed network, such as the spine.
- Increased resiliency of the vPC control plane over TCP-IP (CFSolP).
- Data plane traffic over the VXLAN tunnel.
- Communication between vPC member switches uses VXLAN encapsulation.
- Failure of all uplinks on a node result in vPC ports going down on that switch. In that scenario, vPC peer takes up the primary role and forwards the traffic.
- Uplink tracking with state dependency and up/down signalization for vPCs.
- Positive uplink state tracking drives vPC primary role election.
- For border leafs and spines, there is no need for per-VRF peering since network communication uses the fabric.
- Enhance forwarding to orphans hosts by extending the VIP/PIP feature to Type-2 routes.

**Note** The vPC Fabric Peering counts as three VTEPs unlike a normal vPC which counts as one VTEP.

## Guidelines and Limitations for vPC Fabric Peering

The following are the vPC Fabric Peering guidelines and limitations:

- Cisco Nexus 9332C, 9364C, 9300-EX, and 9300-FX/FXP/FX2/FX3 and 9300-GX platform switches support vPC Fabric Peering. Cisco Nexus 9200 and 9500 platform switches do not support vPC Fabric Peering.

**Note** For Cisco Nexus 9300-EX switches, mixed-mode multicast and ingress replication are not supported. VNIs must be configured with either multicast or IR underlay, but not both.

- vPC Fabric Peering requires TCAM carving of region ing-flow-redirect. TCAM carving requires saving the configuration and reloading the switch prior to using the feature. (This requirement does not apply to Cisco Nexus 9300-GX platform switches.)
- Prior to reconfiguring the vPC Fabric Peering source and destination IP, the vPC domain must be shut down. Once the vPC Fabric Peering source and destination IP have been adjusted, the vPC domain can be enabled (**no shutdown**).
- The vPC Fabric Peering peer-link is established over the transport network (the spine layer of the fabric). As communication between vPC peers occurs in this manner, control plane information CFS messages used to synchronize port state information, VLAN information, VLAN-to-VNI mapping, host MAC addresses, and IGMP snooping groups are transmitted over the fabric. CFS messages are marked with the appropriate DSCP value, which should be protected in the transport network. The following example shows a sample QoS configuration on the spine layer of Cisco Nexus 9000 Series switches.

Classify traffic by matching the DSCP value (DSCP 56 is the default value):

```
class-map type qos match-all CFS
  match dscp 56
```

Set traffic to the qos-group that corresponds with the strict priority queue for the appropriate spine switch. In this example, the switch sends traffic to qos-group 7, which corresponds to the strict priority queue (Queue 7). Note that different Cisco Nexus platforms might have a different queueing structure.

```
policy-map type qos CFS
  class CFS
    Set qos-group 7
```

Assign a classification service policy to all interfaces toward the VTEP (the leaf layer of the network):

```
interface Ethernet 1/1
  service-policy type qos input CFS
```

- The vPC Fabric Peering domain does not support attaching FEX to it.

- Beginning with Cisco NX-OS Release 10.1(1), vPC Fabric Peering supports FEX in Straight Through and Active-Active (dual home) modes in N9K-C9336C-FX2-E, N9K-C93108TC-EX, N9K-C93108TC-FX, N9K-C93180YC-EX, N9K-C93180YC-FX, N9K-C93216TC-FX2, N9K-C93240YC-FX2, N9K-C9332C, N9K-C93360YC-FX2, N9K-C9336C-FX2, N9K-C9364C, N9K-C93180YC-FX3S, and -GX platform switches.

Refer to *Cisco Nexus 2000 Series NX-OS Fabric Extender Configuration Guide for Cisco Nexus 9000 Series Switches* for details on FEX (Straight Through and Active-Active modes).

- The vPC Fabric Peering domain is not supported in the role of a Multi-Site vPC BGW.
- Enhance forwarding to orphan hosts by extending the VIP/PIP feature to Type-2 routes.
- Layer 3 Tenant Routed Multicast (TRM) is supported. Layer 2/Layer 3 TRM (Mixed Mode) is not supported.
- If Type-5 routes are used with this feature, the **advertise-pip** command is a mandatory configuration.
- VTEPs behind vPC ports are not supported. This means that virtual peer-link peers cannot act as a transit node for the VTEPs behind the vPC ports.
- SVI and sub-interface uplinks are not supported.
- An orphan Type-2 host is advertised using PIP. A vPC Type-2 host is advertised using VIP. This is the default behavior for a Type-2 host.

To advertise an orphan Type-5 route using PIP, you need to advertise PIP under BGP.

- Traffic from remote VTEP to orphan hosts would land on the actual node which has the orphans. Bouncing of the traffic is avoided.

---

**Note** When the vPC leg is down, vPC hosts are still advertised with the VIP IP.

---

- Non-disruptive ISSU is not supported for Cisco Nexus 93108TC-EX and 93180YC-EX switches.

## Configuring vPC Fabric Peering

Ensure the vPC Fabric Peering DSCP value is consistent on both vPC member switches. Ensure that the corresponding QoS policy matches the vPC Fabric Peering DSCP marking.

All VLANs that require communication traversing the vPC Fabric Peering must have a VXLAN enabled (vn-segment); this includes the native VLAN.

---

**Note** For MSTP, VLAN 1 must be extended across vPC Fabric Peering if the peer-link and vPC legs have the default native VLAN configuration. This behavior can be achieved by extending VLAN 1 over VXLAN (vn-segment). If the peer-link and vPC legs have non-default native VLANs, those VLANs must be extended across vPC Fabric Peering by associating the VLANs with VXLAN (vn-segment).

---

Use the **show vpc virtual-peerlink vlan consistency** command for verification of the existing VLAN-to-VXLAN mapping used for vPC Fabric Peering.

peer-keepalive for vPC Fabric Peering is supported with one of the following configurations:

- mgmt interface
- dedicated Layer 3 link in default or non-default VRF
- loopback interface reachable via the spine.

### Configuring Features

Example uses OSPF as the underlay routing protocol.

```
configure terminal
nv overlay evpn
feature ospf
feature bgp
feature pim
feature interface-vlan
feature vn-segment-vlan-based
feature vpc
feature ptp
feature nv overlay
```

### vPC Configuration

#### Note

To change the vPC Fabric Peering source or destination IP, the vPC domain must be shutdown prior to modification. The vPC domain can be returned to operation after the modifying by using the **no shutdown** command.

### Configuring TCAM Carving

```
hardware access-list tcam region ing-flow-redirect 512
```

### Configuring the vPC Domain

```
vpc domain 100
peer-keepalive destination 192.0.2.1
virtual peer-link destination 192.0.2.100 source 192.0.2.20/32 [dscp <dscp-value>]
Warning: Appropriate TCAM carving must be configured for virtual peer-link vPC
peer-switch
peer-gateway
ip arp synchronize
ipv6 nd synchronize
exit
```

#### Note

The **dscp** keyword is optional. Range is 1 to 63. The default value is 56.

### Configuring vPC Fabric Peering Port Channel

No need to configure members for the following port channel.

```
interface port-channel 10
switchport
switchport mode trunk
vpc peer-link
```

```
interface loopback0
```

**Note** This loopback is not the NVE source-interface loopback (interface used for the VTEP IP address).

```
ip address 192.0.2.20/32
ip router ospf 1 area 0.0.0.0
```

**Note** You can use the loopback for BGP peering or a dedicated loopback. This loopback must be different than the loopback for peer keep alive.

### Configuring the Underlay Interfaces

Both L3 physical and L3 port channels are supported. SVI and sub-interfaces are not supported.

```
router ospf 1
interface Ethernet1/16
ip address 192.0.2.2/24
ip router ospf 1 area 0.0.0.0
no shutdown
interface Ethernet1/17
port-type fabric
ip address 192.0.2.3/24
ip router ospf 1 area 0.0.0.0
no shutdown
interface Ethernet1/40
port-type fabric
ip address 192.0.2.4/24
ip router ospf 1 area 0.0.0.0
no shutdown
interface Ethernet1/41
port-type fabric
ip address 192.0.2.5/24
ip router ospf 1 area 0.0.0.0
no shutdown
```

**Note** All ports connected to spines must be port-type fabric.

### VXLAN Configuration

**Note** Configuring **advertise virtual-rmac** (NVE) and **advertise-pip** (BGP) are required steps. For more information, see the [Configuring vPC Multihoming, on page 185](#) chapter.

### Configuring VLANs and SVI

```
vlan 10
vn-segment 10010
vlan 101
vn-segment 10101
interface Vlan101
```

```
no shutdown
mtu 9216
vrf member vxlan-10101
no ip redirects
ip forward
ipv6 address use-link-local-only
no ipv6 redirects
interface vlan10
no shutdown
mtu 9216
vrf member vxlan-10101
no ip redirects
ip address 192.0.2.102/24
ipv6 address 2001:DB8:0:1::1/64
no ipv6 redirects
fabric forwarding mode anycast-gateway
```

### Configuring Virtual Port Channel

```
interface Ethernet1/3
switchport
switchport mode trunk
channel-group 100
no shutdown
exit
interface Ethernet1/39
switchport
switchport mode trunk
channel-group 101
no shutdown
interface Ethernet1/46
switchport
switchport mode trunk
channel-group 102
no shutdown
interface port-channel100
vpc 100
interface port-channel101
vpc 101
interface port-channel102
vpc 102
exit
```

## Migrating from vPC to vPC Fabric Peering

This procedure contains the steps to migration from a regular vPC to vPC Fabric Peering.

Any direct Layer 3 link between vPC peers should be used only for peer-keep alive. This link should not be used to advertise paths for vPC Fabric Peering loopbacks.

**Note**

This migration is disruptive.

### Before you begin

We recommend that you shut all physical Layer 2 links between the vPC peers before migration. We also recommend that you map VLANs with vn-segment before or after migration.

### SUMMARY STEPS

1. **configure terminal**
2. **show vpc**
3. **show port-channel summary**
4. **interface ethernet *slot/port***
5. **no channel-group**
6. Repeat steps 4 and 5 for each interface.
7. **show running-config vpc**
8. **vpc domain *domain-id***
9. **virtual peer-link destination *dest-ip* source *source-ip***
10. **hardware access-list team region ing-flow-redirect *tcam-size***
11. **copy running-config startup-config**
12. **reload**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>show vpc</b>  <b>Example:</b> <code>switch(config)# show vpc</code>	Determine the number of members in the port channel.
<b>Step 3</b>	<b>show port-channel summary</b>  <b>Example:</b> <code>switch(config)# show port-channel summary</code>	Determine the number of members.
<b>Step 4</b>	<b>interface ethernet <i>slot/port</i></b>  <b>Example:</b> <code>switch(config)# interface ethernet 1/4</code>	Specifies the interface you are configuring.  <b>Note</b> This is the peer link port channel.
<b>Step 5</b>	<b>no channel-group</b>  <b>Example:</b> <code>switch(config-if)# no channel-group</code>	Remove vPC peer-link port-channel members.  <b>Note</b> Disruption occurs following this step.
<b>Step 6</b>	Repeat steps 4 and 5 for each interface.  <b>Example:</b>	

	Command or Action	Purpose
<b>Step 7</b>	<b>show running-config vpc</b>  <b>Example:</b> switch(config-if) # <b>show running-config vpc</b>	Determine the vPC domain.
<b>Step 8</b>	<b>vpc domain <i>domain-id</i></b>  <b>Example:</b> switch(config-if) # <b>vpc domain 100</b>	Enter vPC domain configuration mode.
<b>Step 9</b>	<b>virtual peer-link destination <i>dest-ip</i> source <i>source-ip</i></b>  <b>Example:</b> switch(config-vpc-domain) # <b>virtual peer-link destination 192.0.2.1 source 192.0.2.100</b>	Specify the destination and source IP addresses for vPC fabric peering.
<b>Step 10</b>	<b>hardware access-list tcam region ing-flow-redirect <i>tcam-size</i></b>  <b>Example:</b> switch(config-vpc-domain) # <b>hardware access-list tcam region ing-flow-redirect 512</b>	Perform TCAM carving.
<b>Step 11</b>	<b>copy running-config startup-config</b>  <b>Example:</b> switch(config-vpc-domain) # <b>copy running-config startup-config</b>	Copies the running configuration to the startup configuration.
<b>Step 12</b>	<b>reload</b>  <b>Example:</b> switch(config-vpc-domain) # <b>reload</b>	Reboots the switch.

## Verifying vPC Fabric Peering Configuration

To display the status for the vPC Fabric Peering configuration, enter one of the following commands:

**Table 11: vPC Fabric Peering Verification Commands**

Command	Purpose
<b>show vpc fabric-ports</b>	Displays the fabric ports state.
<b>show vpc</b>	Displays information about vPC Fabric Peering mode.
<b>show vpc virtual-peerlink vlan consistency</b>	Displays the VLANs which are not associated with vn-segment.

**Example of the show vpc fabric-ports Command**

```
switch# show vpc fabric-ports
Number of Fabric port : 9
Number of Fabric port active : 9

Fabric Ports State
-----
Ethernet1/9 UP
Ethernet1/19/1 ( port-channel151 ) UP
Ethernet1/19/2 ( port-channel151 ) UP
Ethernet1/19/3 UP
Ethernet1/19/4 UP
Ethernet1/20/1 UP
Ethernet1/20/2 ( port-channel152 ) UP
Ethernet1/20/3 ( port-channel152 ) UP
Ethernet1/20/4 ( port-channel152 ) UP
```

**Example of the show vpc Command**

```
switch# show vpc
Legend:
(*) - local vPC is down, forwarding via vPC peer-link

vPC domain id          : 3
Peer status             : peer adjacency formed ok
vPC keep-alive status   : peer is alive
Configuration consistency status : success
Per-vlan consistency status : success
Type-2 consistency status : success
vPC role                : primary
Number of vPCs configured : 1

## CHAPTER 21

# Configuring Seamless Integration of EVPN with L3VPN (MPLS LDP)

---

This chapter contains the following sections:

- [Information About Configuring Seamless Integration of EVPN with L3VPN \(MPLS LDP\)](#), on page 355
- [Guidelines and Limitations for Configuring Seamless Integration of EVPN with L3VPN \(MPLS LDP\)](#), on page 355
- [Configuring Seamless Integration of EVPN with L3VPN \(MPLS LDP\)](#), on page 356

## Information About Configuring Seamless Integration of EVPN with L3VPN (MPLS LDP)

Data center deployments have adopted VXLAN EVPN for its benefits like EVPN control-plane learning, multitenancy, seamless mobility, redundancy, and easier POD additions. Similarly, the Core is either an LDP-based MPLS L3VPN network or transitioning from traditional an MPLS L3VPN LDP-based underlay to a more sophisticated solution like segment routing (SR). Segment routing is adopted for its benefits like unified IGP and MPLS control planes, simpler traffic engineering methods, easier configuration, and SDN adoption.

With two different technologies, one within the data center and one in the Core, it is natural to handoff from VXLAN to an MPLS-based core at the DCI nodes. These nodes which sit on the edge of the DC domain, interfacing with the Core edge router.

## Guidelines and Limitations for Configuring Seamless Integration of EVPN with L3VPN (MPLS LDP)

The following are the guidelines and limitations for Configuring Seamless Integration of EVPN with L3VPN (MPLS LDP):

The following features are supported:

- Cisco Nexus 9504 and 9508 switches with -R and -RX line cards.
- Layer 3 orphans

- 256 peers/nodes within a VXLAN DC domain
- By default, MPLS extended ECMP is enabled.
- 24,000 ECMP routes by default on -RX line cards.

---

**Note** If you enter the **no hardware profile mpls extended-ecmp** command, the mode is switched to 4 K ECMP routes. This is applicable only when the line card is -RX and the ECMP group has exactly 2 paths.

---

The following features are not supported:

- Subnet stretches across the DC domain
- vPC
- SVI/Subinterfaces

## Configuring Seamless Integration of EVPN with L3VPN (MPLS LDP)

These configuration steps are required on a DCI switch to import and re-originate the routes from a VXLAN domain to an MPLS domain and back to a VXLAN domain.

### SUMMARY STEPS

1. **configure terminal**
2. **feature mpls l3vpn**
3. **feature mpls ldp**
4. **nv overlay evpn**
5. **router bgp *number***
6. **address-family ipv4 unicast**
7. **redistribute direct route-map *route-map-name***
8. **exit**
9. **address-family l2vpn evpn**
10. **exit**
11. **neighbor *address* remote-as *number***
12. **update-source *type/id***
13. **ebgp-multihop *tth-value***
14. **address-family ipv4 unicast**
15. **send-community extended**
16. **exit**
17. **address-family vpv4 unicast**
18. **send-community extended**
19. **import l2vpn evpn reoriginate**

20. **neighbor** *address* **remote-as** *number*
21. **address-family** **ipv4** **unicast**
22. **send-community** **extended**
23. **address-family** **ipv6** **unicast**
24. **send-community** **extended**
25. **address-family** **l2vpn** **evpn**
26. **send-community** **extended**
27. **import** **vpn** **unicast** **reoriginate**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
Step 2	<b>feature mpls l3vpn</b> <b>Example:</b> <code>switch# feature mpls l3vpn</code>	Enables the MPLS Layer 3 VPN feature.
Step 3	<b>feature mpls ldp</b> <b>Example:</b> <code>switch# feature mpls ldp</code>	Enables the MPLS Label Distribution Protocol (LDP).
Step 4	<b>nv overlay evpn</b> <b>Example:</b> <code>switch(config)# nv overlay evpn</code>	Enables the EVPN control plane for VXLAN.
Step 5	<b>router bgp</b> <i>number</i> <b>Example:</b> <code>switch(config)# router bgp 100</code>	Configures BGP. The value of the <i>number</i> argument is from 1 to 4294967295.
Step 6	<b>address-family ipv4 unicast</b> <b>Example:</b> <code>switch(config-router)# address-family ipv4 unicast</code>	Configures the address family for IPv4.
Step 7	<b>redistribute direct route-map</b> <i>route-map-name</i> <b>Example:</b> <code>switch(config-router-af)# redistribute direct route-map passall</code>	Configures the directly connected route map.
Step 8	<b>exit</b> <b>Example:</b> <code>switch(config-router-af)# exit</code>	Exits command mode.

	Command or Action	Purpose
<b>Step 9</b>	<b>address-family l2vpn evpn</b> <b>Example:</b> switch(config-router)# <b>address-family l2vpn evpn</b>	Configures the L2VPN address family.
<b>Step 10</b>	<b>exit</b> <b>Example:</b> switch(config-router-af)# <b>exit</b>	Exits command mode.
<b>Step 11</b>	<b>neighbor address remote-as number</b> <b>Example:</b> switch(config-router)# <b>neighbor 108.108.108.108 remote-as 22</b>	Configures a BGP neighbor. The range of the <i>number</i> argument is from 1 to 65535.
<b>Step 12</b>	<b>update-source type/id</b> <b>Example:</b> switch(config-router-neighbor)# <b>update-source loopback100</b>	Specifies the source of the BGP session and updates.
<b>Step 13</b>	<b>ebgp-multihop ttl-value</b> <b>Example:</b> switch(config-router-neighbor)# <b>ebgp-multihop 10</b>	Specifies the multihop TTL for the remote peer. The range of <i>ttl-value</i> is from 2 to 255.
<b>Step 14</b>	<b>address-family ipv4 unicast</b> <b>Example:</b> switch(config-router-neighbor)# <b>address-family ipv4 unicast</b>	Configures the unicast sub-address family.
<b>Step 15</b>	<b>send-community extended</b> <b>Example:</b> switch(config-router-neighbor-af)# <b>send-community extended</b>	Configures the community attribute for this neighbor.
<b>Step 16</b>	<b>exit</b> <b>Example:</b> switch(config-router-neighbor-af)# <b>exit</b>	Exits command mode.
<b>Step 17</b>	<b>address-family vpnv4 unicast</b> <b>Example:</b> switch(config-router-neighbor)# <b>address-family vpnv4 unicast</b>	Configures the address family for IPv4.
<b>Step 18</b>	<b>send-community extended</b> <b>Example:</b> switch(config-router)# <b>send-community extended</b>	Sends the extended community attribute.

	Command or Action	Purpose
<b>Step 19</b>	<b>import l2vpn evpn reoriginate</b> <b>Example:</b> <pre>switch(config-router)# import l2vpn evpn reoriginate</pre>	Reoriginates the route with a new RT.
<b>Step 20</b>	<b>neighbor address remote-as number</b> <b>Example:</b> <pre>switch(config-router)# neighbor 175.175.175.2 remote-as 1</pre>	Defines the neighbor.
<b>Step 21</b>	<b>address-family ipv4 unicast</b> <b>Example:</b> <pre>switch(config-router)# address-family ipv4 unicast</pre>	Configures the address family for IPv4.
<b>Step 22</b>	<b>send-community extended</b> <b>Example:</b> <pre>switch(config-router)# send-community extended</pre>	Configures the community for BGP neighbors.
<b>Step 23</b>	<b>address-family ipv6 unicast</b> <b>Example:</b> <pre>switch(config-router)# address-family ipv6 unicast</pre>	Configures the IPv6 unicast address family. This is required for IPv6 over VXLAN with an IPv4 underlay.
<b>Step 24</b>	<b>send-community extended</b> <b>Example:</b> <pre>switch(config-router)# send-community extended</pre>	Configures the community for BGP neighbors.
<b>Step 25</b>	<b>address-family l2vpn evpn</b> <b>Example:</b> <pre>switch(config-router)# address-family l2vpn evpn</pre>	Configures the L2VPN address family.
<b>Step 26</b>	<b>send-community extended</b> <b>Example:</b> <pre>switch(config-router)# send-community extended</pre>	Configures the community for BGP neighbors.
<b>Step 27</b>	<b>import vpn unicast reoriginate</b> <b>Example:</b> <pre>switch(config-router)# import vpn unicast reoriginate</pre>	Reoriginates the route with a new RT.

## CHAPTER 22

# Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)

---

This chapter contains the following sections:

- [Information About Configuring Seamless Integration of EVPN with L3VPN \(MPLS SR\)](#), on page 361
- [Guidelines and Limitations for Configuring Seamless Integration of EVPN with L3VPN \(MPLS SR\)](#), on page 363
- [Configuring Seamless Integration of EVPN with L3VPN \(MPLS SR\)](#), on page 364
- [Example Configuration for Configuring Seamless Integration of EVPN with L3VPN \(MPLS SR\)](#), on page 368

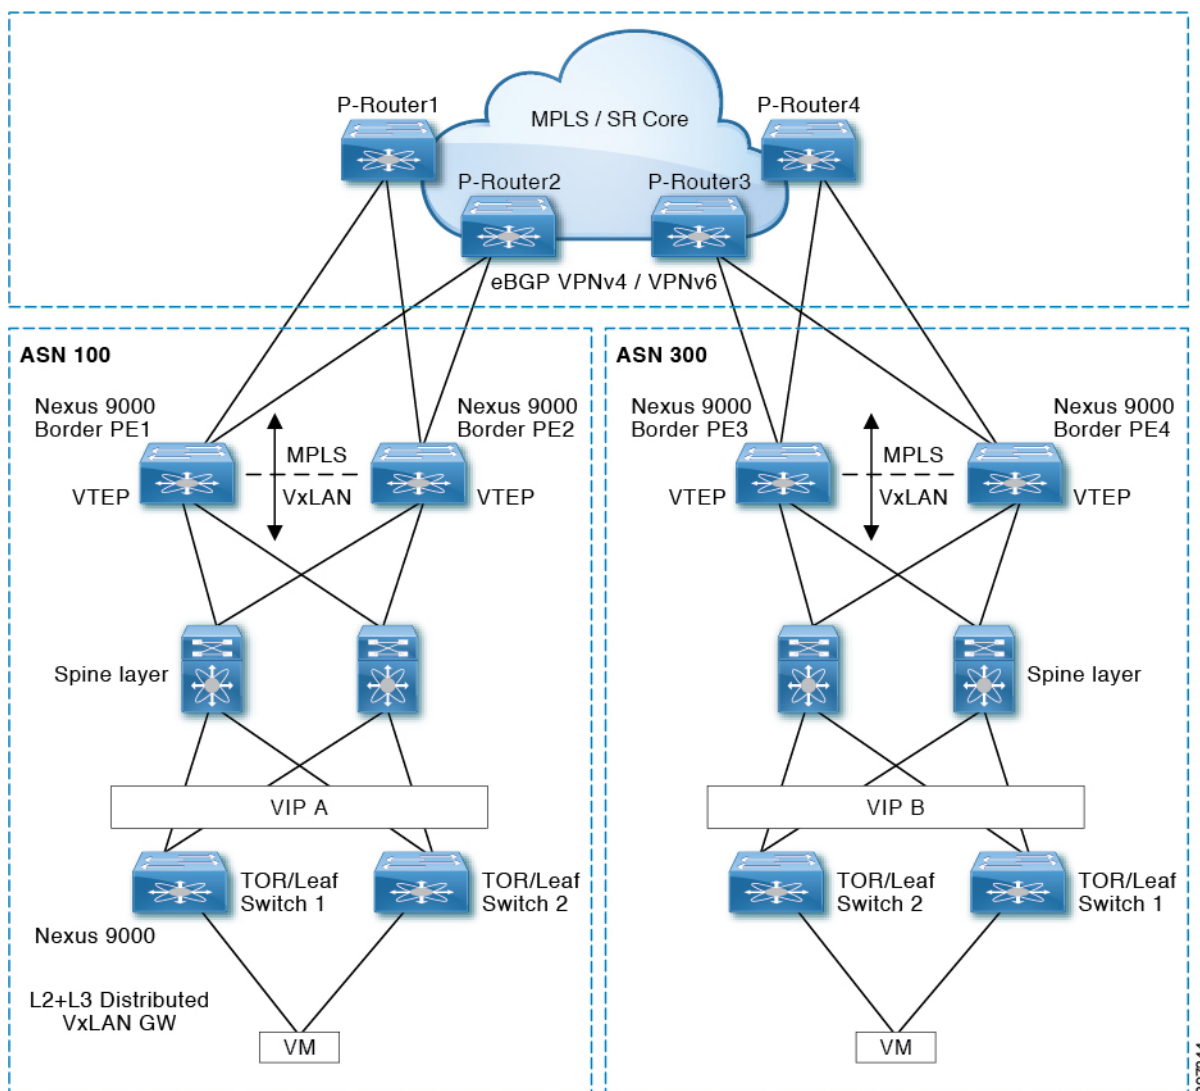

## Information About Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)

Data Center (DC) deployments have adopted VXLAN EVPN for its benefits such as EVPN control-plane learning, multitenancy, seamless mobility, redundancy, and easier POD additions. Similarly, the CORE is either an Label Distribution Protocol (LDP)-based MPLS L3VPN network or transitioning from the traditional MPLS L3VPN LDP-based underlay to a more sophisticated solution like Segment Routing (SR). Segment Routing is adopted for its benefits such as:

- Unified IGP and MPLS control planes
- Simpler traffic engineering methods
- Easier configuration
- SDN adoption

With two different technologies, one within the data center (DC) and one in the CORE, there is a natural necessity to handoff from VXLAN to an MPLS-based core at the DCI nodes, which sit on the edge of the DC domain, interfacing with the Core edge router.

Figure 36: Topology Overview

In the previous diagram, two DC pods, each running VXLAN, are being Layer 3 extended over a WAN/Core running MPLS/SR. Another method is classical MPLS L3VPN using LDP. The edge devices in the DC domain (border PE1, PE2, PE3, and PE4) are the DCI nodes doing the handoff between VXLAN and the MPLS-based Core network.

For additional information on MPLS SR, see the *Cisco Nexus 9000 Series NX-OS Label Switching Configuration Guide*.

## Guidelines and Limitations for Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)

Feature	Cisco Nexus 9300-FX2/FX3 and 9300-GX Platform Switches	Cisco Nexus 9504 and 9508 switches with -R Line Cards	Comments
VXLAN EVPN to SR-L3VPN	Yes	Yes	Extend Layer 3 connectivity between different DC pods Underlay IGP/BGP with SR extensions.
VXLAN EVPN to SR-L3VPN	Yes	Yes	Extend Layer 3 connectivity between DC POD running VXLAN and any domain (DC or CORE) running SR.
VXLAN EVPN to MPLS L3VPN (LDP)	No	Yes	Underlay is LDP.

The following Cisco Nexus platform switches support seamless integration of EVPN with L3VPN (MPLS SR):

- 9336C-FX2 switches
- 93240YC-FX2 switches
- 9300-FX3 platform switches
- 9300-GX platform switches
- 9504 and 9508 platform switches with 96136YC-R and 9636C-RX line cards (The 9636C-R and 9636Q-R line cards are not supported.)

The following features are supported with seamless integration of EVPN with L3VPN (MPLS SR):

- Layer 3 orphans
- Layer 3 hand-off
- Layer 3 physical interfaces for core-facing ports
- Per-VRF labels
- VPN label statistics
- End-to-End Time to Live (TTL) and Explicit Congestion Notification (ECN) (We support only pipe mode for TTL on a handoff scenario.)
- Segment routing and LDP, for Cisco Nexus 9504 and 9508 platform switches with 96136YC-R and 9636C-RX line cards (However, these features cannot coexist.)

The VXLAN-to-SR handoff QoS value is preserved during handoff and propagated from VXLAN tunnel packets to SR-tunneled packets for Cisco Nexus 9336C-FX2, 93240YC-FX2, 9300-FX3, and 9300-GX platform switches.

The following features are not supported with seamless integration of EVPN with L3VPN (MPLS SR):

- vPC for redundancy
- Subnet stretches across the DC domain
- SVI/Subinterfaces configured MAC addresses
- BGW (VXLAN Multi-Site) and DCI functionalities on the same switch
- SVI toward the MPLS core
- No-drop for VXLAN/SR and SR/VXLAN handoff, for Cisco Nexus 9336C-FX2, 93240YC-FX2, and 9300-FX3 platform switches
- Statistics, for Cisco Nexus 9504 and 9508 platform switches with 96136YC-R and 9636C-RX line cards
- Priority flow control (PFC), for Cisco Nexus 9336C-FX2, 93240YC-FX2, 9300-FX3, and 9300-GX platform switches

## Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)

The following procedure imports and reoriginates the routes from the VXLAN domain to the MPLS domain and in the other direction.

### SUMMARY STEPS

1. **configure terminal**
2. **feature-set mpls**
3. **nv overlay evpn**
4. **feature bgp**
5. **feature mpls l3vpn**
6. **feature mpls segment-routing**
7. **feature interface-vlan**
8. **feature vn-segment-vlan-based**
9. **feature nv overlay**
10. **router bgp** *autonomous-system-number*
11. **address-family ipv4 unicast**
12. **redistribute direct route-map** *route-map-name*
13. **network** *address*
14. **exit**
15. **address-family l2vpn evpn**
16. **neighbor** *address* **remote-as** *number*
17. **update-source** *type/id*
18. **ebgp-multihop** *number*

19. `address-family ipv4 unicast`
20. `send-community extended`
21. `exit`
22. `address-family vpnv4 unicast`
23. `send-community extended`
24. `import l2vpn evpn reoriginate`
25. `neighbor address remote-as number`
26. `address-family ipv4 unicast`
27. `send-community extended`
28. `exit`
29. `address-family ipv6 unicast`
30. `send-community extended`
31. `exit`
32. `address-family l2vpn evpn`
33. `send-community extended`
34. `exit`
35. `import vpn unicast reoriginate`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>feature-set mpls</b> <b>Example:</b> <code>switch(config)# feature-set mpls</code>	Enables the MPLS feature set.
<b>Step 3</b>	<b>nv overlay evpn</b> <b>Example:</b> <code>switch(config)# nv overlay evpn</code>	Enables VXLAN.
<b>Step 4</b>	<b>feature bgp</b> <b>Example:</b> <code>switch(config)# feature bgp</code>	Enables BGP.
<b>Step 5</b>	<b>feature mpls l3vpn</b> <b>Example:</b> <code>switch(config)# feature mpls l3vpn</code>	Enables Layer 3 VPN.
<b>Step 6</b>	<b>feature mpls segment-routing</b> <b>Example:</b> <code>switch(config)# feature mpls segment-routing</code>	Enables Segment Routing.

	Command or Action	Purpose
<b>Step 7</b>	<b>feature interface-vlan</b> <b>Example:</b> <code>switch(config)# feature interface-vlan</code>	Enables the interface VLAN.
<b>Step 8</b>	<b>feature vn-segment-vlan-based</b> <b>Example:</b> <code>switch(config)# feature vn-segment-vlan-based</code>	Enables the VLAN-based VN segment.
<b>Step 9</b>	<b>feature nv overlay</b> <b>Example:</b> <code>switch(config)# feature nv overlay</code>	Enables VXLAN.
<b>Step 10</b>	<b>router bgp <i>autonomous-system-number</i></b> <b>Example:</b> <code>switch(config)# router bgp 1</code>	Configures BGP. The value of <i>autonomous-system-number</i> is from 1 to 4294967295.
<b>Step 11</b>	<b>address-family ipv4 unicast</b> <b>Example:</b> <code>switch(config-router)# address-family ipv4 unicast</code>	Configures the address family for IPv4.
<b>Step 12</b>	<b>redistribute direct route-map <i>route-map-name</i></b> <b>Example:</b> <code>switch(config-router-af)# redistribute direct route-map passall</code>	Configures redistribution.
<b>Step 13</b>	<b>network <i>address</i></b> <b>Example:</b> <code>switch(config-router-af)# network 0.0.0.0/0</code>	Injects prefixes into handoff BGP along with redistribution.
<b>Step 14</b>	<b>exit</b> <b>Example:</b> <code>switch(config-router-af)# exit</code>	Exits command mode.
<b>Step 15</b>	<b>address-family l2vpn evpn</b> <b>Example:</b> <code>switch(config-router)# address-family l2vpn evpn</code>	Configures the L2VPN address family.
<b>Step 16</b>	<b>neighbor <i>address</i> remote-as <i>number</i></b> <b>Example:</b> <code>switch(config-router)# neighbor 108.108.108.108 remote-as 65535</code>	Defines the eBGP neighbor IPv4 address and remote Autonomous-System (AS) number.
<b>Step 17</b>	<b>update-source <i>type/id</i></b> <b>Example:</b>	Defines the interface for eBGP peering.

	Command or Action	Purpose
	<code>switch(config-router-af) # update-source loopback100</code>	
<b>Step 18</b>	<b>ebgp-multihop</b> <i>number</i> <b>Example:</b> <code>switch(config-router) # ebgp-multihop 10</code>	Specifies multihop TTL for the remote peer. The range of <i>number</i> is from 2 to 255.
<b>Step 19</b>	<b>address-family ipv4 unicast</b> <b>Example:</b> <code>switch(config-router) # address-family ipv4 unicast</code>	Configures the address family for IPv4.
<b>Step 20</b>	<b>send-community extended</b> <b>Example:</b> <code>switch(config-router-af) # send-community extended</code>	Configures the community for BGP neighbors.
<b>Step 21</b>	<b>exit</b> <b>Example:</b> <code>switch(config-router-af) # exit</code>	Exits command mode.
<b>Step 22</b>	<b>address-family vpnv4 unicast</b> <b>Example:</b> <code>switch(config-router) # address-family vpnv4 unicast</code>	Configures the address family for IPv4.
<b>Step 23</b>	<b>send-community extended</b> <b>Example:</b> <code>switch(config-router-af) # send-community extended</code>	Configures the community for BGP neighbors.
<b>Step 24</b>	<b>import l2vpn evpn reoriginate</b> <b>Example:</b> <code>switch(config-router) # import l2vpn evpn reoriginate</code>	Reoriginates the route with a new RT. It can be extended to use an optional route-map.
<b>Step 25</b>	<b>neighbor</b> <i>address</i> <b>remote-as</b> <i>number</i> <b>Example:</b> <code>switch(config-router) # neighbor 175.175.175.2 remote-as 65535</code>	Defines the eBGP neighbor IPv4 address and remote Autonomous-System (AS) number.
<b>Step 26</b>	<b>address-family ipv4 unicast</b> <b>Example:</b> <code>switch(config-router) # address-family ipv4 unicast</code>	Configures the address family for IPv4.
<b>Step 27</b>	<b>send-community extended</b> <b>Example:</b> <code>switch(config-router-af) # send-community extended</code>	Configures the community for BGP neighbors.

## Example Configuration for Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)

	Command or Action	Purpose
<b>Step 28</b>	<b>exit</b>  <b>Example:</b> switch(config-router-af) # <b>exit</b>	Exits command mode.
<b>Step 29</b>	<b>address-family ipv6 unicast</b>  <b>Example:</b> switch(config-router) # <b>address-family ipv6 unicast</b>	Configures the IPv6 unicast address family. This is required for IPv6 over VXLAN with an IPv4 underlay.
<b>Step 30</b>	<b>send-community extended</b>  <b>Example:</b> switch(config-router-af) # <b>send-community extended</b>	Configures the community for BGP neighbors.
<b>Step 31</b>	<b>exit</b>  <b>Example:</b> switch(config-router-af) # <b>exit</b>	Exits command mode.
<b>Step 32</b>	<b>address-family l2vpn evpn</b>  <b>Example:</b> switch(config-router) # <b>address-family l2vpn evpn</b>	Configures the L2VPN address family.
<b>Step 33</b>	<b>send-community extended</b>  <b>Example:</b> switch(config-router-af) # <b>send-community extended</b>	Configures the community for BGP neighbors.
<b>Step 34</b>	<b>exit</b>  <b>Example:</b> switch(config-router-af) # <b>exit</b>	Exits command mode.
<b>Step 35</b>	<b>import vpn unicast reoriginate</b>  <b>Example:</b> switch(config-router) # <b>import vpn unicast reoriginate</b>	Reoriginates the route with a new RT. It can be extended to use an optional route-map.

## Example Configuration for Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)

The following is a sample CLI configuration that is required to import and reoriginate the routes from the VXLAN domain to the MPLS domain and in the reverse direction.

```
switch# sh running-config

!Command: show running-config
!Running configuration last done at: Sat Mar 17 10:00:40 2001
!Time: Sat Mar 17 12:50:12 2001

**Example Configuration for Configuring Seamless Integration of EVPN with L3VPN (MPLS SR)**

## CHAPTER 23

# Configuring Seamless Integration of EVPN with L3VPN SRv6

---

This chapter contains the following sections:

- [About Seamless Integration of EVPN with L3VPN SRv6 Handoff, on page 375](#)
- [Guidelines and Limitations for EVPN to L3VPN SRv6 Handoff, on page 376](#)
- [Importing L3VPN SRv6 Routes into EVPN VXLAN, on page 377](#)
- [Importing EVPN VXLAN Routes into L3VPN SRv6, on page 378](#)
- [Example Configuration for VXLAN EVPN to L3VPN SRv6 Handoff, on page 379](#)

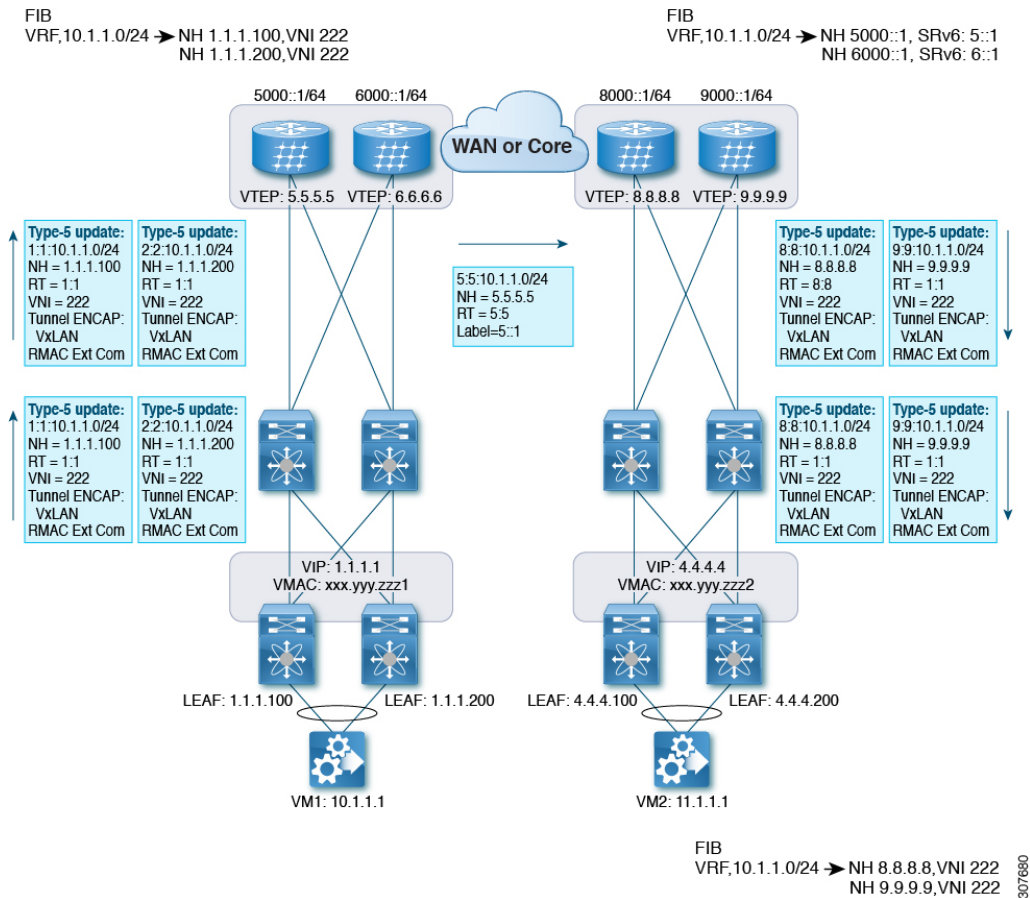

## About Seamless Integration of EVPN with L3VPN SRv6 Handoff

Data Center (DC) deployments have adopted VXLAN EVPN for its benefits such as EVPN control-plane learning, multitenancy, seamless mobility, redundancy, and easier POD additions. Similarly, the CORE is either an IP-based L3VPN SRv6 network or transitioning from the IPv6-based L3VPN underlay to a more sophisticated solution like IPv6 Segment Routing (SRv6) for IPv6. SRv6 is adopted for its benefits such as:

- Simpler traffic engineering (TE) methods
- Easier configuration
- SDN adoption

With two different technologies, one within the data center (DC) and one in the Core, there is traffic handoff from VXLAN to an SRv6 core that becomes a necessity at the DCI nodes, which sit at the edge of the DC domain and interface with the Core edge router.

Figure 37: BGP EVPN VXLAN to L3VPN SRv6 Handoff

For traffic ingressing the EVPN-VxLAN fabric, the BGP EVPN routes get imported into a local VRF which contains the RD of the VRF. The bestpath is calculated and installed in the VRF's RIB, then inserted into the L3VPN SRv6 table. Along with the bestpath, the VRF's RD and per-VRF SRv6 SID are included. The L3VPN SRv6 route target is sent with the route, which is advertised to the L3VPN SRv6 peer.

For traffic egressing the EVPN VxLAN fabric, the BGP L3VPN SRv6 routes get imported into a local VRF which contains the RD of the VRF. The bestpath is calculated and installed in the VRF's RIB, then inserted into the EVPN table. Along with the bestpath, the VRF's RD and VNI are included. The EVPN-VXLAN route target is sent with the route, which is advertised to the EVPN-VxLAN peer.

## Guidelines and Limitations for EVPN to L3VPN SRv6 Handoff

This feature has the following guidelines and limitations:

- The same RD import is supported for L3VPN SRv6 fabrics.
- The same RD import is not supported for EVPN VxLAN fabrics.
- On a handoff device, do not use the same RD import on the EVPN VXLAN side.
- Beginning with Cisco NX-OS Release 9.3(3), support is added for the following switches:

•  
•  
•

## Importing L3VPN SRv6 Routes into EVPN VXLAN

The process of handing off routes from the L3VPN SRv6 domain to the EVPN VXLAN fabric requires configuring the import condition for L3VPN SRv6 routes. Routes can be either IPv4 or IPv6. This task configures unidirectional route advertisement into the EVPN VXLAN fabric. For bidirectional advertisement, you must explicitly configure the import condition for the L3VPN SRv6 domain.

### Before you begin

Make sure you have a fully configured L3VPN SRv6 fabric. For more information, see "Configuring Layer 3 VPN over SRv6" in the *Cisco Nexus 9000 Series NX-OS SRv6 Configuration Guide*.

### SUMMARY STEPS

1. **config terminal**
2. **router bgp** *as-number*
3. **neighbor bgp** *ipv6-address* **remote-as** *as-number*
4. **address family vpnv4 unicast** or **address family vpnv6 unicast**
5. **import l2vpn evpn route-map** *name* [reoriginate]

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>config terminal</b>  <b>Example:</b> <pre>switch-1# config terminal Enter configuration commands, one per line. End with CNTL/Z. switch-1(config)#</pre>	Enter configuration mode.
<b>Step 2</b>	<b>router bgp</b> <i>as-number</i>  <b>Example:</b> <pre>switch-1(config)# router bgp 100 switch-1(config-router)#</pre>	Enter BGP router configuration mode.
<b>Step 3</b>	<b>neighbor bgp</b> <i>ipv6-address</i> <b>remote-as</b> <i>as-number</i>  <b>Example:</b> <pre>switch-1(config-router)# neighbor 1234::1 remote-as 200 switch-1(config-router-neighbor)#</pre>	Enter BGP router configuration mode.
<b>Step 4</b>	<b>address family vpnv4 unicast</b> or <b>address family vpnv6 unicast</b>  <b>Example:</b>	Configure the IPv4 or IPv6 address family for unicast traffic that the EVPN VXLAN will handoff to L3VPN SRv6.

	Command or Action	Purpose
	<pre>switch-1(config-router-neighbor) # address-family vpnv4 unicast switch-1(config-router-neighbor-af) #</pre> <p><b>Example:</b></p> <pre>switch-1(config-router-neighbor) # address-family vpnv6 unicast switch-1(config-router-neighbor-af) #</pre>	
<b>Step 5</b>	<p><b>import l2vpn evpn route-map <i>name</i> [reoriginate]</b></p> <p><b>Example:</b></p> <pre>switch-1(config-router-neighbor-af) # import l2vpn evpn route-map test reoriginate switch-1(config-router-neighbor-af) #</pre>	Configure the IPv4 or IPv6 address family for unicast traffic that EVPN VXLAN will handoff to L3VPN SRv6. This command enables routes learned from L3VPN SRv6 domain to be advertised to the EVPN VXLAN domain. Using the optional <b>reoriginate</b> keyword advertises only domain-specific RTs.

**What to do next**

For bidirectional route advertisement, configure importing EVPN VXLAN routes into the L3VPN SRv6 domain.

## Importing EVPN VXLAN Routes into L3VPN SRv6

The process of handing off routes from the EVPN VXLAN fabric to the L3VPN SRv6 domain requires configuring the import condition for EVPN VXLAN routes. Routes can be either IPv4 or IPv6. This task configures unidirectional route advertisement into the L3VPN SRv6 fabric. For bidirectional advertisement, you must explicitly configure the import condition for the EVPN VXLAN domain.

**Before you begin**

Make sure you have a fully configured L3VPN SRv6 fabric. For more information, see "Configuring Layer 3 VPN over SRv6" in the *Cisco Nexus 9000 Series NX-OS SRv6 Configuration Guide*.

**SUMMARY STEPS**

1. **config terminal**
2. **router bgp *as-number***
3. **neighbor *ipv6-address* remote-as *as-number***
4. **address-family l2vpn evpn**
5. **import vpn unicast route-map *name* [reoriginate]**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<p><b>config terminal</b></p> <p><b>Example:</b></p> <pre>switch-1# config terminal</pre> <p>Enter configuration commands, one per line. End</p>	Enter configuration mode.

	Command or Action	Purpose
	with CNTL/Z. switch-1(config)#	
Step 2	<b>router bgp <i>as-number</i></b>  <b>Example:</b> switch-1(config)# <b>router bgp 200</b> switch-1(config-router)#	Enter BGP router configuration mode.
Step 3	<b>neighbor <i>ipv6-address</i> remote-as <i>as-number</i></b>  <b>Example:</b> switch-1(config-router)# <b>neighbor 1234::1 remote-as 100</b> switch-1(config-router-neighbor)#	Enter BGP router configuration mode.
Step 4	<b>address-family <i>l2vpn evpn</i></b>  <b>Example:</b> switch(config-router-neighbor)# <b>address-family l2vpn evpn</b> switch(config-router-neighbor-af)#	Configure the address family for unicast traffic that EVPN VXLAN will handoff to L3VPN SRv6.
Step 5	<b>import vpn unicast route-map <i>name</i> [reoriginate]</b>  <b>Example:</b> switch-1(config-router-neighbor-af)# <b>import vpn unicast route-map test reoriginate</b> switch-1(config-router-neighbor-af)#	Configure the IPv4 or IPv6 address family for unicast traffic that EVPN VXLAN will handoff to L3VPN SRv6. This command enables routes learned from the EVPN VXLAN domain to be advertised to the L3VPN SRv6 domain. Using the optional <b>reoriginate</b> keyword advertises only domain-specific RTs.

### What to do next

For bidirectional route advertisement, configure importing L3VPN SRv6 routes into the EVPN VXLAN fabric.

## CHAPTER 24

# Configuring Seamless Integration of EVPN (TRM) with MVPN

This chapter contains the following sections:

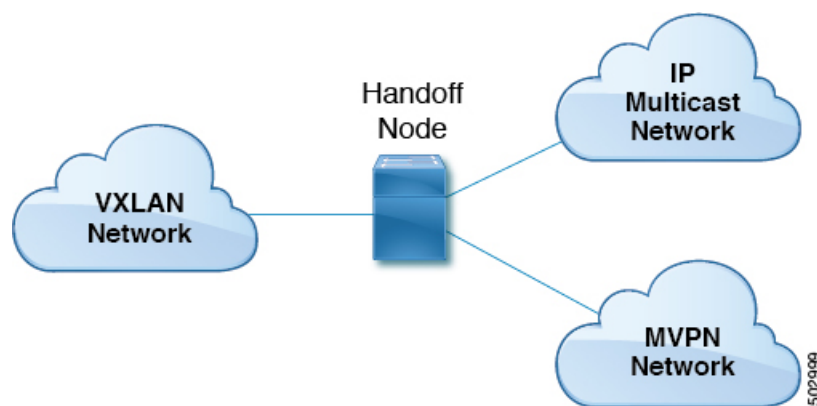

- [About Seamless Integration of EVPN \(TRM\) with MVPN \(Draft Rosen\), on page 381](#)
- [Guidelines and Limitations for Seamless Integration of EVPN \(TRM\) with MVPN , on page 382](#)
- [Configuring the Handoff Node for Seamless Integration of EVPN \(TRM\) with MVPN, on page 383](#)
- [Configuration Example for Seamless Integration of EVPN \(TRM\) with MVPN , on page 388](#)

## About Seamless Integration of EVPN (TRM) with MVPN (Draft Rosen)

Seamless integration of EVPN (TRM) with MVPN (draft rosen) enables packets to be handed off between a VXLAN network (TRM or TRM Multi-Site) and an MVPN network. To support this feature, VXLAN TRM and MVPN must be supported on a Cisco Nexus device node, the handoff node.

The handoff node is the PE for the MVPN network and the VTEP for the VXLAN network. It connects to the VXLAN, MVPN, and IP multicast networks, as shown in the following figure.

**Figure 38: VXLAN - MVPN Handoff Network**

Sources and receivers can be in any of the three networks (VXLAN, MVPN, or IP multicast).

All multicast traffic (that is, the tenant traffic from the VXLAN, MVPN, or multicast network) is routed from one domain to another domain. The handoff node acts as the central node. It performs the necessary packet forwarding, encapsulation, and decapsulation to send the traffic to the respective receivers.

## Supported RP Positions

The rendezvous point (RP) for the customer (overlay) network can be in any of the three networks (VXLAN, MVPN, or IP multicast).

**Table 12: Supported RP Locations**

RP Locations	Description
RP in IP network	<ul style="list-style-type: none"> <li>• The RP can be connected only to the MVPN PE and not to the handoff nodes.</li> <li>• The RP can be connected only to the VXLAN handoff nodes.</li> <li>• The RP can be connected to both the MVPN PE and VXLAN.</li> </ul>
RP internal to VXLAN fabric	All VTEPs are RPs inside the VXLAN fabric. All MVPN PEs use the RP configured on the VXLAN fabric.
RP on VXLAN MVPN handoff node	The RP is the VXLAN MVPN handoff node.
RP in MVPN network	The RP is external to the VXLAN network. It's configured on one of the nodes in the MPLS cloud, other than the handoff node.
RP Everywhere (PIM Anycast RP or MSDP-based Anycast RP)	The Anycast RP can be configured on the VXLAN leaf. The RP set can be configured on the handoff node or any MVPN PE.

## Guidelines and Limitations for Seamless Integration of EVPN (TRM) with MVPN

This feature has the following guidelines and limitations:

- Only Cisco Nexus 9504 and 9508 platform switches with the N9K-X9636C-RX line card support seamless integration of EVPN (TRM) with MVPN. Other -R Series line cards can't function as the handoff node.
- The handoff node can have local (directly connected) multicast sources or receivers for the customer network.
- Any existing underlay properties, such as ASM/SSM for MVPN or ASM for TRM, are supported on the handoff node.
- The handoff node supports PIM SSM and ASM for the overlay.

- Inter-AS option A is supported on the handoff node toward the IP multicast network.
- If the number of MDT source loopback IP addresses and NVE loopback IP addresses exceeds the maximum limit, traffic drops might occur.
- The following functionality isn't supported for seamless integration of EVPN (TRM) with MVPN:
  - vPC on the handoff node
  - VXLAN ingress replication
  - SVIs and subinterfaces as core-facing interfaces for MVPN
  - Inter-AS options B and C on MVPN nodes
  - PIM SSM as a VXLAN underlay
  - Bidirectional PIM as an underlay or overlay
  - ECMP with a mix of MPLS and IP paths
- Any existing limitations for VXLAN, TRM, and MVPN also apply to seamless integration of EVPN (TRM) with MVPN.

## Configuring the Handoff Node for Seamless Integration of EVPN (TRM) with MVPN

This section documents the configurations that are required on the handoff node. Configurations for other nodes (such as VXLAN leafs and spines, MVPN PE, and RS/RR) are the same as in previous releases.

### PIM/IGMP Configuration for the Handoff Node

Follow these guidelines when configuring PIM/IGMP for the handoff node:

- Make sure that the Rendezvous Point (RP) is different for TRM and the MVPN underlay, as shown in the following example.

```
ip pim rp-address 90.1.1.100 group-list 225.0.0.0/8 --- TRM Underlay
ip pim rp-address 91.1.1.100 group-list 233.0.0.0/8 --- MVPN Underlay
```

- Use a common RP for overlay multicast traffic.
- The RP can be in static, PIM Anycast, or PIM MSDP mode. The following example shows the RP configuration inside the VRF:

```
vrf context vrfVxLAN5001
vni 5001
ip pim rp-address 111.1.1.1 group-list 226.0.0.0/8
ip pim rp-address 112.2.1.1 group-list 227.0.0.0/8
```

- Enable IGMP snooping for VXLAN traffic using the **ip igmp snooping vxlan** command.
- Enable PIM sparse mode on all source interfaces and interfaces required to carry PIM traffic.

## BGP Configuration for the Handoff Node

Follow these guidelines when configuring BGP for the handoff node:

- Add all VXLAN leafs as L2EVPN and TRM neighbors; include the redundant handoff node. If a route reflector is used, add only RR as a neighbor.
- Add all MVPN PEs as VPN neighbors. In MDT mode, add the MVPN PEs as MDT neighbors.
- Import configuration to advertise unicast routes from L2EVPN neighbors to VPN neighbors and vice versa.
- The BGP source identifier can be different or the same as the source interfaces used for the VTEP identifier (configured under the NVE interface)/MVPN PE identifier.

```
feature bgp
address-family ipv4 mdt
address-family ipv4 mvpn

neighbor 2.1.1.1
  address-family ipv4 mvpn
  send-community extended
  address-family l2vpn evpn
  send-community extended
  import vpn unicast reoriginate

neighbor 30.30.30.30
  address-family vpnv4 unicast
  send-community
  send-community extended
  next-hop-self
  import l2vpn evpn reoriginate
  address-family ipv4 mdt
  send-community extended
  no next-hop-third-party
```

- Never use Inter-AS option B between MVPN peers. Instead, configure the **no allocate-label option-b** command under the VPNv4 unicast address family.

```
address-family vpnv4 unicast
  no allocate-label option-b
```

- Set maximum paths should be set in EBGp mode.

```
address-family l2vpn evpn
  maximum-paths 8
vrf vrfVxLAN5001
  address-family ipv4 unicast
    maximum-paths 8
```

- If handoff nodes are deployed in dual mode, use the **route-map** command to avoid advertising prefixes associated with orphan hosts under the VPN address family.

```
ip prefix-list ROUTES_CONNECTED_NON_LOCAL seq 2 permit 15.14.0.15/32

route-map ROUTES_CONNECTED_NON_LOCAL deny
  match ip address prefix-list ROUTES_CONNECTED_NON_LOCAL

neighbor 8.8.8.8
  remote-as 100
```

```

update-source loopback1
address-family vpnv4 unicast
  send-community
  send-community extended
route-map ROUTES_CONNECTED_NON_LOCAL out

```

## VXLAN Configuration for the Handoff Node

Follow these guidelines when configuring VXLAN for the handoff node:

- Enable the following features:

```

feature nv overlay
feature ngmvpn
feature interface-vlan
feature vn-segment-vlan-based

```

- Configure the required L3 VNI:

```

L3VNIs are mapped to tenant VRF.
vlan 2501
  vn-segment 5001 <-- Associate VNI to a VLAN.

```

- Configure the NVE interface:

```

interface nve1
  no shutdown
  host-reachability protocol bgp
  source-interface loopback1 <-- This interface should not be the same as the MVPN
source interface.
  global suppress-arp
member vni 5001 associate-vrf <-- L3VNI
  mcast-group 233.1.1.1 <-- The underlay multicast group for VXLAN should be different
from the MVPN default/data MDT.

```

- Configure the tenant VRF:

```

vrf context vrfVxLAN5001
  vni 5001 <-- Associate VNI to VRF.
  rd auto
address-family ipv4 unicast
  route-target both auto
  route-target both auto mvpn
  route-target both auto evpn

interface Vlan2501 <-- SVI interface associated with the L3VNI
  no shutdown
  mtu 9216 <-- The overlay header requires 58 bytes, so the max tenant traffic is
(Configured MTU - 58).
  vrf member vrfVxLAN5001
  no ip redirects
  ip forward
  ipv6 forward
  no ipv6 redirects
  ip pim sparse-mode <-- PIM is enabled.

interface Vlan2 <-- SVI interface associated with L2 VNI
  no shutdown
  vrf member vrfVxLAN5001

```

```

no ip redirects
ip address 100.1.1.1/16
no ipv6 redirects
ip pim sparse-mode <-- PIM enabled on L2VNI
fabric forwarding mode anycast-gateway

```

## MVPN Configuration for the Handoff Node

Follow these guidelines when configuring MVPN for the handoff node:

- Enable the following features:

```

install feature-set mpls
allow feature-set mpls
feature-set mpls
feature mpls l3vpn
feature mvpn
feature mpls ldp

```

- MPLS LDP Configuration:

- Enable MPLS LDP (**mpls ip**) on all interfaces that are MPLS links.
- Do not advertise loopback interfaces used for VXLAN as MPLS prefixes.
  - Configure a prefix list that contains IP addresses that identify the MVPN PE node.

```

ip prefix-list LDP-LOOPBACK seq 51 permit 9.1.1.10/32
ip prefix-list LDP-LOOPBACK seq 52 permit 9.1.2.10/32

```

- Configure label allocation only for MVPN PE identifiers.

```

mpls ldp configuration
explicit-null
advertise-labels for LDP-LOOPBACK
label allocate global prefix-list LDP-LOOPBACK

```

- Tenant VRF Configuration:

- For the default MDT mode, make the underlay multicast group the same for all tenant multicast traffic under the VRF.

```

vrf context vrfVxLAN5001
vni 5001
mdt default 225.1.100.1
mdt source loopback100 <-- If the source interface is not configured, the BGP
identifier is used as the source interface.
mdt asm-use-shared-tree <-- If the underlay is configured in ASM mode
no mdt enforce-bgp-mdt-safi <-- Enabled by default but should be negated if BGP
MDT should not be used for discovery.
mdt mtu <mtu-value> <-- Overlay ENCAP Max MTU value

```

- For the data MDT mode, configure a unique multicast group-set for a subset of or all tenant multicast traffic.

```

mdt data 229.1.100.2/32 immediate-switch
mdt data 232.1.10.4/24 immediate-switch

```

```
route-map DATA_MDT_MAP permit 10
  match ip multicast group 237.1.1.1/32
mdt data 235.1.1.1/32 immediate-switch route-map DATA_MDT_MAP
```

- Enable MVPN tunnel statistics.

```
hardware profile mvpn-stats module all
```

## CoPP Configuration for the Handoff Node

Both TRM and MVPN are heavily dependent on the control plane. Make sure to set the CoPP policy bandwidth as per the topology.

The following CoPP classes are used for TRM and MVPN traffic:

- **copp-system-p-class-multicast-router** (The default bandwidth is 3000 pps.)
- **copp-system-p-class-l3mc-data** (The default bandwidth is 3000 pps.)
- **copp-system-p-class-l2-default** (The default bandwidth is 50 pps.)
- **copp-class-normal-igmp** (The default bandwidth is 6000 pps.)

The following configuration example shows CoPP policies that can be configured to avoid control packet drops with multicast route scale.

### Note

The policer values in this example are approximations and might not be optimal for all topologies or traffic patterns. Configure the CoPP policies according to the MVPN/TRM traffic pattern.

```
copp copy profile strict prefix custom
  policy-map type control-plane custom-copp-policy-strict
    class custom-copp-class-normal-igmp
      police cir 6000 pps bc 512 packets conform transmit violate drop
    control-plane
  service-policy input custom-copp-policy-strict

copp copy profile strict prefix custom
  policy-map type control-plane custom-copp-policy-strict
    class custom-copp-class-multicast-router
      police cir 6000 pps bc 512 packets conform transmit violate drop
    control-plane
  service-policy input custom-copp-policy-strict

copp copy profile strict prefix custom
  policy-map type control-plane custom-copp-policy-strict
    class copp-system-p-class-l3mc-data
      police cir 3000 pps bc 512 packets conform transmit violate drop
    control-plane
  service-policy input custom-copp-policy-strict

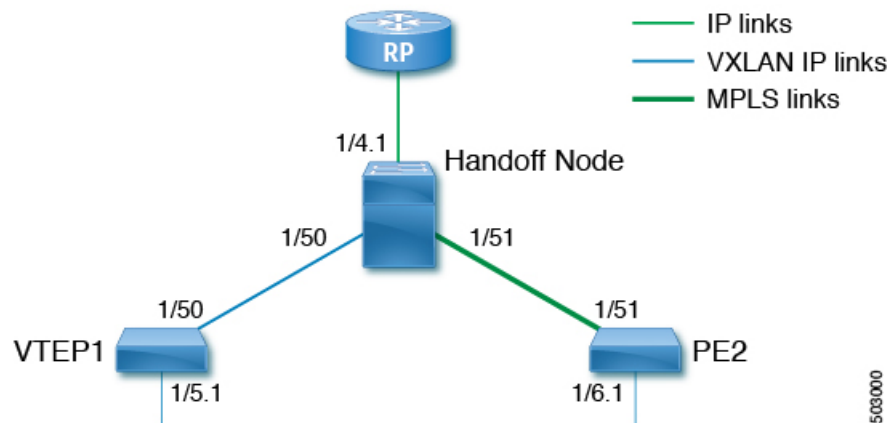

copp copy profile strict prefix custom
  policy-map type control-plane custom-copp-policy-strict
    class custom-copp-class-l2-default
      police cir 9000 pps bc 512 packets conform transmit violate drop
    control-plane
```

```
service-policy input custom-copp-policy-strict
```

## Configuration Example for Seamless Integration of EVPN (TRM) with MVPN

The following figure shows a sample topology with a VXLAN network on the left, an MVPN network on the right, and a centralized handoff node.

**Figure 39: Sample Topology for Seamless Integration of EVPN (TRM) with MVPN**

The following example show sample configurations for the VTEP, handoff node, and PE in this topology.

### Configuration on VTEP1:

```
feature ngmvpn
feature interface-vlan
feature vn-segment-vlan-based
feature nv overlay
feature pim
nv overlay evpn
ip pim rp-address 90.1.1.100 group-list 225.0.0.0/8
ip pim ssm range 232.0.0.0/8

vlan 555
  vn-segment 55500

route-map ALL_ROUTES permit 10
interface nve1
  no shutdown
  host-reachability protocol bgp
  source-interface loopback2
  member vni 55500 associate-vrf
  mcast-group 225.3.3.3

interface loopback1
  ip address 196.196.196.196/32

interface loopback2

## APPENDIX **A**

# Configuring the Underlay

---

This chapter contains the following sections:

- [IP Fabric Underlay, on page 393](#)

## IP Fabric Underlay

### Underlay Considerations

#### Unicast underlay:

The primary purpose of the underlay in the VXLAN EVPN fabric is to advertise the reachability of Virtual Tunnel End Points (VTEPs) and BGP peering addresses. The primary criterion for choosing an underlay protocol is fast convergence in the event of node failures. Other criteria are:

- Simplicity of configuration.
- Ability to delay the introduction of a node into the network on boot up.

This document will detail the two primary protocols supported and tested by Cisco, IS-IS and OSPF. It will also illustrate the use of eBGP protocol as an underlay for the VXLAN EVPN fabric.

From an underlay/overlay perspective, the packet flow from a server to another over the Virtual Extensible LAN (VXLAN) fabric comprises of these steps:

1. Server sends traffic to source VXLAN tunnel endpoint (VTEP). The VTEP performs Layer-2 or Layer-3 communication based on the destination MAC and derives the nexthop (destination VTEP).

#### Note

When a packet is bridged, the target end host's MAC address is stamped in the DMAC field of the inner frame. When a packet is routed, the default gateway's MAC address is stamped in the DMAC field of the inner frame.

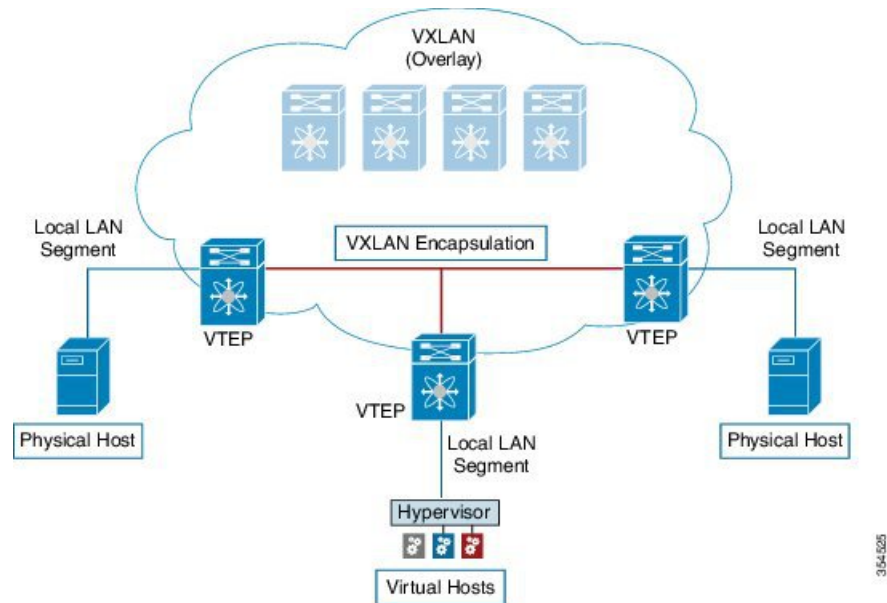

2. The VTEP encapsulates the traffic (frames) into VXLAN packets (overlay function – see Figure 1) and signals the underlay IP network.
3. Based on the underlay routing protocol, the packet is sent from the source VTEP to destination VTEP through the IP network (underlay function – see *Underlay Overview* figure).

4. The destination VTEP removes the VXLAN encapsulation (overlay function) and sends traffic to the intended server.

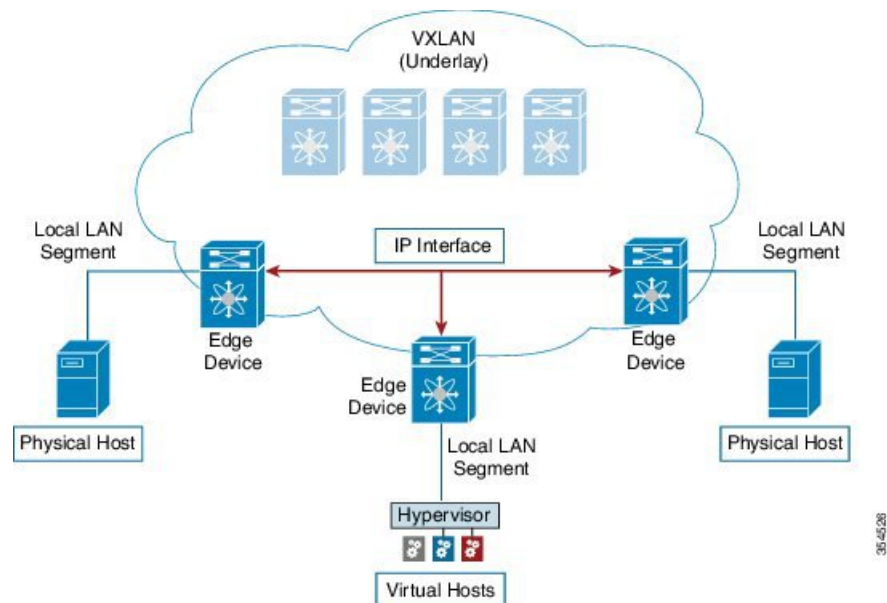

The VTEPs are a part of the underlay network as well since VTEPs need to be reachable to each other to send VXLAN encapsulated traffic across the IP underlay network.

The *Overlay Overview* and *Underlay Overview* images (below) depict the broad difference between an overlay and underlay. Since the focus is on the VTEPs, the spine switches are only depicted in the background. Note that, in real time, the packet flow from VTEP to VTEP traverses through the spine switches.

**Figure 40: Overlay Overview**

**Figure 41: Underlay Overview**

*Deployment considerations for an underlay IP network in a VXLAN EVPN Programmable Fabric*

The deployment considerations for an underlay IP network in a VXLAN EVPN Programmable Fabric are given below:

- Maximum transmission unit (MTU) – Due to VXLAN encapsulation, the MTU requirement is larger and we need to avoid potential fragmentation.
  - An MTU of 9216 bytes on each interface on the path between the VTEPs accommodates maximum server MTU + VXLAN overhead. Most datacenter server NICs support up to 9000 bytes. So, no fragmentation is needed for VXLAN traffic.

Cisco Nexus 5600 series switches use a 24 byte internal header for switching packets between ASICs, reducing the MTU size of the interface to 9192.

---

**Note** If the fabric only contains Cisco Nexus 9000 and 7000 series switches, then the MTU should be set to 9216.

---

- The VXLAN IP fabric underlay supports IPv4 address family.
- Unicast routing - Any unicast routing protocol can be used for the VXLAN IP underlay. You can implement OSPF, IS-IS, or eBGP to route between the VTEPs.

---

**Note** As a best practice, use a simple IGP (OSPF or IS-IS) for underlay reachability between VTEPs with iBGP for overlay information exchange.

---

- IP addressing – Point-to-point (P2P) or IP unnumbered links. For each point-to-point link, as example between the leaf switch nodes and spine switch nodes, typically a /30 IP mask should be assigned. Optionally a /31 mask or IP unnumbered links can be assigned. The IP unnumbered approach is leaner from an addressing perspective and consumes fewer IP addresses. The IP unnumbered option for the OSPF or IS-IS protocol underlay will minimize the use of IP addresses.

/31 network - An OSPF or IS-IS point-to-point numbered network is only between two switch (interfaces), and there is no need for a broadcast or network address. So, a /31 network will suffice for this network. Neighbors on this network establish adjacency and there is no designated router (DR) for the network.

---

**Note** IP Unnumbered for VXLAN underlay is supported starting with Cisco NX-OS Release 7.0(3)I7(2).

---

- Multicast protocol for multi destination (BUM) traffic – Though VXLAN has the BGP EVPN control plane, the VXLAN fabric still requires a technology for Broadcast/Unknown unicast/Multicast (BUM) traffic to be forwarded. For Cisco Nexus 5600 Series switches and Cisco Nexus 7000/7700 Series switches, it is mandatory to implement a multicast protocol for BUM packet communication.

While Cisco Nexus 5600 Series switches support Protocol Independent Multicast (PIM) Bidirectional shared trees (BiDiR), Cisco Nexus 7000/7700 Series switches (with F3 cards) support PIM Any Source Multicast (ASM) and PIM BiDir options.

- PIM BiDir is supported for Cisco Nexus 9300-EX, 9300-FX/FX2/FX3 and Cisco Nexus 9300-GX platform switches.
- vPC configuration — This is documented in Chapter 3. For comprehensive information on vPCs, refer to the respective Cisco Nexus 5600, 7000, or 9000 Series vPC design/configuration guide.

## Unicast routing and IP addressing options

Each unicast routing protocol option (OSPF, IS-IS, and eBGP) and sample configurations are given below. Use an option to suit your setup's requirements.

### Important

All routing configuration samples are from an IP underlay perspective and are not comprehensive. For complete configuration information including routing process, authentication, Bidirectional Forwarding Detection (BFD) information, and so on, refer to the respective routing configuration guide (for example, *Cisco Nexus 5600 Series NX-OS Unicast Routing Configuration Guide*, *Cisco Nexus 7000 Series NX-OS Unicast Routing Configuration Guide*, and *Cisco Nexus 9000 Series NX-OS Unicast Routing Configuration Guide*).

## OSPF Underlay IP Network

Some considerations are given below:

- For IP addressing, use P2P links. Since only two switches are directly connected, you can avoid a Designated Router/Backup Designated Router (DR/BDR) election.
- Use the *point-to-point* network type option. It is ideal for routed interfaces or ports, and is optimal from a Link State Advertisements (LSA) perspective.
- Do not use the broadcast type network. It is suboptimal from an LSA database perspective (LSA type 1 – Router LSA and LSA type 2 – Network LSA) and necessitates a DR/BDR election, thereby creating an additional election and database overhead.

### Note

You can divide OSPF networks into areas when the size of the routing domain contains a high number of routers and/or IP prefixes. The same general well known OSPF best practice rules in regards of scale and configuration are applicable for the VXLAN underlay too. For example, LSA type 1 and type 2 are never flooded outside of an area. With multiple areas, the size of the OSPF LSA databases can be reduced to optimize CPU and memory consumption.

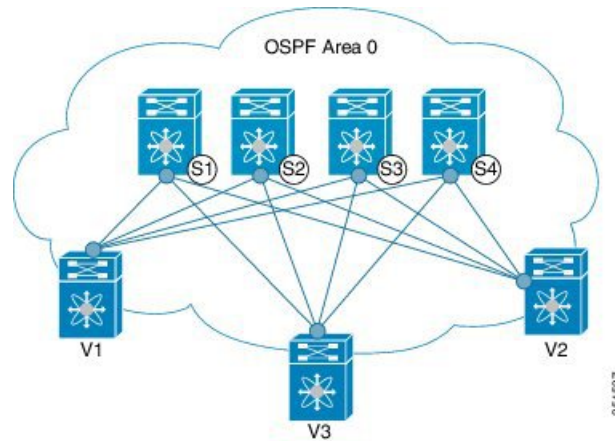

### Note

- For ease of use, the configuration mode from which you need to start configuring a task is mentioned at the beginning of each configuration.
- Configuration tasks and corresponding show command output are displayed for a part of the topology in the image. For example, if the sample configuration is shown for a leaf switch and connected spine switch, the show command output for the configuration displays corresponding configuration.

## OSPF configuration sample – P2P and IP unnumbered network scenarios

Figure 42: OSPF as the underlay routing protocol

### OSPF – P2P link scenario with /31 mask

In the above image, the leaf switches (V1, V2, and V3) are at the bottom of the image. They are connected to the 4 spine switches (S1, S2, S3, and S4) that are depicted at the top of the image. For P2P connections between a leaf switch (also having VTEP function) and each spine, leaf switches V1, V2, and V3 should each be connected to each spine switch.

For V1, we should configure a P2P interface to connect to each spine switch.

A sample P2P configuration between a leaf switch (V1) interface and a spine switch (S1) interface is given below:

### OSPF global configuration on leaf switch V1

(config) #

```
feature ospf
router ospf UNDERLAY
router-id 10.1.1.54
```

### OSPF leaf switch V1 P2P interface configuration

(config) #

```
interface Ethernet 1/41
description Link to Spine S1
no switchport
ip address 198.51.100.1/31
mtu 9192
ip router ospf UNDERLAY area 0.0.0.0
ip ospf network point-to-point
```

The **ip ospf network point-to-point** command configures the OSPF network as a point-to-point network

The OSPF instance is tagged as UNDERLAY for better recall.

### OSPF loopback interface configuration (leaf switch V1)

Configure a loopback interface so that it can be used as the OSPF router ID of leaf switch V1.

(config) #

```
interface loopback 0
  ip address 10.1.1.54/32
  ip router ospf UNDERLAY area 0.0.0.0
```

The interface will be associated with the OSPF instance UNDERLAY and OSPF area 0.0.0.0

### OSPF global configuration on spine switch S1

(config) #

```
feature ospf
router ospf UNDERLAY
  router-id 10.1.1.53
```

### (Corresponding) OSPF spine switch S1 P2P interface configuration

(config) #

```
interface Ethernet 1/41
  description Link to VTEP V1
  ip address 198.51.100.2/31
  mtu 9192
  ip router ospf UNDERLAY area 0.0.0.0
  ip ospf network point-to-point
  no shutdown
```

Use an MTU of 9192 for Cisco Nexus 5600 series switches.

#### Note

MTU size of both ends of the link should be configured identically.

### OSPF loopback Interface Configuration (spine switch S1)

Configure a loopback interface so that it can be used as the OSPF router ID of spine switch S1.

(config) #

```
interface loopback 0
  ip address 10.1.1.53/32
  ip router ospf UNDERLAY area 0.0.0.0
```

The interface will be associated with the OSPF instance UNDERLAY and OSPF area 0.0.0.0

.

.

*To complete OSPF topology configuration for the ‘OSPF as the underlay routing protocol’ image, configure the following*

- 3 more V1 interfaces (or 3 more P2P links) to the remaining 3 spine switches.

- Repeat the procedure to connect P2P links between V2,V3 and V4 and the spine switches.

### OSPF - IP unnumbered scenario

A sample OSPF IP unnumbered configuration is given below:

#### OSPF leaf switch V1 configuration

##### OSPF global configuration on leaf switch V1

(config) #

```
feature ospf
router ospf UNDERLAY
  router-id 10.1.1.54
```

The OSPF instance is tagged as UNDERLAY for better recall.

##### OSPF leaf switch V1 P2P interface configuration

(config) #

```
interface Ethernet1/41
  description Link to Spine S1
  mtu 9192
  ip ospf network point-to-point
  ip unnumbered loopback0
  ip router ospf UNDERLAY area 0.0.0.0
```

Use an MTU of 9192 for Cisco Nexus 5600 series switches.

The **ip ospf network point-to-point** command configures the OSPF network as a point-to-point network.

##### OSPF loopback interface configuration

Configure a loopback interface so that it can be used as the OSPF router ID of leaf switch V1.

(config) #

```
interface loopback0
  ip address 10.1.1.54/32
  ip router ospf UNDERLAY area 0.0.0.0
```

The interface will be associated with the OSPF instance UNDERLAY and OSPF area 0.0.0.0

##### OSPF spine switch S1 configuration:

##### OSPF global configuration on spine switch S1

(config) #

```
feature ospf
router ospf UNDERLAY
  router-id 10.1.1.53
```

##### (Corresponding) OSPF spine switch S1 P2P interface configuration

(config) #

```
interface Ethernet1/41
  description Link to VTEP V1
  mtu 9192
  ip ospf network point-to-point
  ip unnumbered loopback0
  ip router ospf UNDERLAY area 0.0.0.0
```

Use an MTU of 9192 for Cisco Nexus 5600 series switches.

### OSPF loopback interface configuration (spine switch S1)

Configure a loopback interface so that it can be used as the OSPF router ID of spine switch S1.

(config) #

```
interface loopback0
  ip address 10.1.1.53/32
  ip router ospf UNDERLAY area 0.0.0.0
```

The interface will be associated with the OSPF instance UNDERLAY and OSPF area 0.0.0.0

.

.

To complete OSPF topology configuration for the ‘OSPF as the underlay routing protocol’ image, configure the following:

- 3 more VTEP V1 interfaces (or 3 more IP unnumbered links) to the remaining 3 spine switches.
- Repeat the procedure to connect IP unnumbered links between VTEPs V2,V3 and V4 and the spine switches.

### OSPF Verification

Use the following commands for verifying OSPF configuration:

Leaf-Switch-V1# **show ip ospf**

```
Routing Process UNDERLAY with ID 10.1.1.54 VRF default
Routing Process Instance Number 1
Stateful High Availability enabled
Graceful-restart is configured
  Grace period: 60 state: Inactive
  Last graceful restart exit status: None
Supports only single TOS(TOS0) routes
Supports opaque LSA
Administrative distance 110
Reference Bandwidth is 40000 Mbps
SPF throttling delay time of 200.000 msec,
  SPF throttling hold time of 1000.000 msec,
  SPF throttling maximum wait time of 5000.000 msec
LSA throttling start time of 0.000 msec,
  LSA throttling hold interval of 5000.000 msec,
  LSA throttling maximum wait time of 5000.000 msec
Minimum LSA arrival 1000.000 msec
LSA group pacing timer 10 secs
Maximum paths to destination 8
Number of external LSAs 0, checksum sum 0
```

```

Number of opaque AS LSAs 0, checksum sum 0
Number of areas is 1, 1 normal, 0 stub, 0 nssa
Number of active areas is 1, 1 normal, 0 stub, 0 nssa
Install discard route for summarized external routes.
Install discard route for summarized internal routes.
Area BACKBONE(0.0.0.0)
Area has existed for 03:12:54
Interfaces in this area: 2 Active interfaces: 2
Passive interfaces: 0 Loopback interfaces: 1
No authentication available
SPF calculation has run 5 times
Last SPF ran for 0.000195s
Area ranges are
Number of LSAs: 3, checksum sum 0x196c2

Leaf-Switch-V1# show ip ospf interface

loopback0 is up, line protocol is up
IP address 10.1.1.54/32
Process ID UNDERLAY VRF default, area 0.0.0.0
Enabled by interface configuration
State LOOPBACK, Network type LOOPBACK, cost 1
Index 1
Ethernet1/41 is up, line protocol is up
Unnumbered interface using IP address of loopback0 (10.1.1.54)
Process ID UNDERLAY VRF default, area 0.0.0.0
Enabled by interface configuration
State P2P, Network type P2P, cost 4
Index 2, Transmit delay 1 sec
1 Neighbors, flooding to 1, adjacent with 1
Timer intervals: Hello 10, Dead 40, Wait 40, Retransmit 5
Hello timer due in 00:00:07
No authentication
Number of opaque link LSAs: 0, checksum sum 0

```

```

Leaf-Switch-V1# show ip ospf neighbors

OSPF Process ID UNDERLAY VRF default
Total number of neighbors: 1
Neighbor ID      Pri State           Up Time  Address      Interface
10.1.1.53        1 FULL/ -         06:18:32 10.1.1.53    Eth1/41

```

For a detailed list of commands, refer to the Configuration and Command Reference guides.

## IS-IS Underlay IP Network

Some considerations are given below:

- Because IS-IS uses Connectionless Network Service (CLNS) and is independent of the IP, full SPF calculation is avoided when a link changes.
- **Net ID** - Each IS-IS instance has an associated network entity title (NET) ID that uniquely identifies the IS-IS instance in the area. The NET ID is comprised of the IS-IS system ID, which uniquely identifies this IS-IS instance in the area, and the area ID. For example, if the NET ID is 49.0001.0010.0100.1074.00, the system ID is 0010.0100.1074 and the area ID is 49.0001.

**Important**

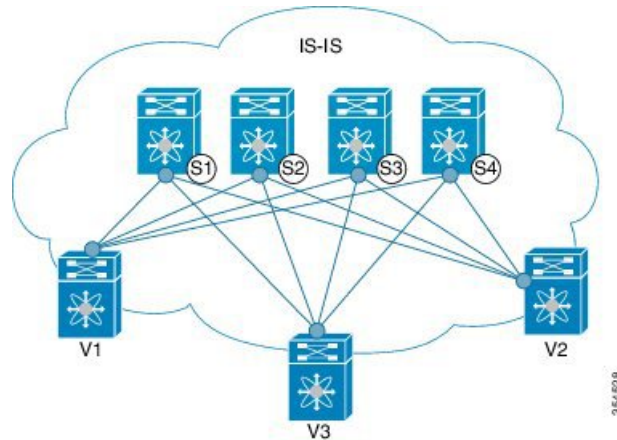

**Level 1 IS-IS in the Fabric**—Cisco has validated the use of IS-IS Level 1 only and IS-IS Level 2 only configuration on all nodes in the programmable fabric. The fabric is considered a stub network where every node needs an optimal path to every other node in the fabric. Cisco NX-OS IS-IS implementation scales well to support a number of nodes in a fabric. Hence, there is no anticipation of having to break up the fabric into multiple IS-IS domains.

**Note**

- For ease of use, the configuration mode from which you need to start configuring a task is mentioned at the beginning of each configuration.
- Configuration tasks and corresponding show command output are displayed for a part of the topology in the image. For example, if the sample configuration is shown for a leaf switch and connected spine switch, the show command output for the configuration displays corresponding configuration.

### IS-IS configuration sample - P2P and IP unnumbered network scenarios

*Figure 43: IS-IS as the underlay routing protocol*

In the above image, the leaf switches (V1, V2, and V3, having the VTEP function) are at the bottom of the image. They are connected to the 4 spine switches (S1, S2, S3, and S4) that are depicted at the top of the image.

#### IS-IS – P2P link scenario with /31 mask

A sample P2P configuration between V1 and spine switch S1 is given below:

For P2P connections between a leaf switch and each spine switch, V1, V2, and V3 should each be connected to each spine switch.

For V1, we must configure a loopback interface and a P2P interface configuration to connect to S1. A sample P2P configuration between a leaf switch (V1) interface and a spine switch (S1) interface is given below:

#### IS-IS configuration on leaf switch V1

##### IS-IS global configuration

```
(config) #
```

```
feature isis
router isis UNDERLAY
  net 49.0001.0010.0100.1074.00
  is-type level-1
  set-overload-bit on-startup 60
```

**Setting the overload bit** - You can configure a Cisco Nexus switch to signal other devices not to use the switch as an intermediate hop in their shortest path first (SPF) calculations. You can optionally configure the overload bit temporarily on startup. In the above example, the **set-overload-bit** command is used to set the overload bit on startup to 60 seconds.

### IS-IS P2P interface configuration (leaf switch V1)

(config) #

```
interface Ethernet 1/41
  description Link to Spine S1
  mtu 9192
  ip address 209.165.201.1/31
  ip router isis UNDERLAY
```

Use an MTU of 9192 for Cisco Nexus 5600 series switches.

### IS-IS loopback interface configuration (leaf switch V1)

Configure a loopback interface so that it can be used as the IS-IS router ID of leaf switch V1.

(config) #

```
interface loopback 0
  ip address 10.1.1.74/32
  ip router isis UNDERLAY
```

The IS-IS instance is tagged as UNDERLAY for better recall.

### (Corresponding) IS-IS spine switch S1 configuration

#### IS-IS global configuration

(config) #

```
feature isis
router isis UNDERLAY
  net 49.0001.0010.0100.1053.00
  is-type level-1
  set-overload-bit on-startup 60
```

### IS-IS P2P interface configuration (spine switch S1)

(config) #

```
interface Ethernet 1/1
  description Link to VTEP V1
  ip address 209.165.201.2/31
  mtu 9192
```

```
ip router isis UNDERLAY
```

Use an MTU of 9192 for Cisco Nexus 5600 series switches.

### IS-IS loopback interface configuration (spine switch S1)

(config) #

```
interface loopback 0
  ip address 10.1.1.53/32
  ip router isis UNDERLAY
.
.
```

To complete IS-IS topology configuration for the above image, configure the following:

- 3 more leaf switch V1's interfaces (or 3 more P2P links) to the remaining 3 spine switches.
- Repeat the procedure to connect P2P links between leaf switches V2, V3 and V4 and the spine switches.

### IS-IS - IP unnumbered scenario

#### IS-IS configuration on leaf switch V1

#### IS-IS global configuration

(config)#

```
feature isis
router isis UNDERLAY
  net 49.0001.0010.0100.1074.00
  is-type level-1
  set-overload-bit on-startup 60
```

#### IS-IS interface configuration (leaf switch V1)

(config) #

```
interface Ethernet1/41
  description Link to Spine S1
  mtu 9192
  medium p2p
  ip unnumbered loopback0
  ip router isis UNDERLAY
```

Use an MTU of 9192 for Cisco Nexus 5600 series switches.

#### IS-IS loopback interface configuration (leaf switch V1)

(config)

```
interface loopback0
  ip address 10.1.1.74/32
  ip router isis UNDERLAY
```

#### IS-IS configuration on the spine switch S1

### IS-IS global configuration

(config)#

```
feature isis
router isis UNDERLAY
  net 49.0001.0010.0100.1053.00
  is-type level-1
  set-overload-bit on-startup 60
```

### IS-IS interface configuration (spine switch S1)

(config)#

```
interface Ethernet1/41
  description Link to V1
  mtu 9192
  medium p2p
  ip unnumbered loopback0
  ip router isis UNDERLAY
```

Use an MTU of 9192 for Cisco Nexus 5600 series switches.

### IS-IS loopback interface configuration (spine switch S1)

(config)#

```
interface loopback0
  ip address 10.1.1.53/32
  ip router isis UNDERLAY
```

### IS-IS Verification

Use the following commands for verifying IS-IS configuration on leaf switch V1:

Leaf-Switch-V1# **show isis**

```

For a detailed list of commands, refer to the Configuration and Command Reference guides.

## eBGP Underlay IP Network

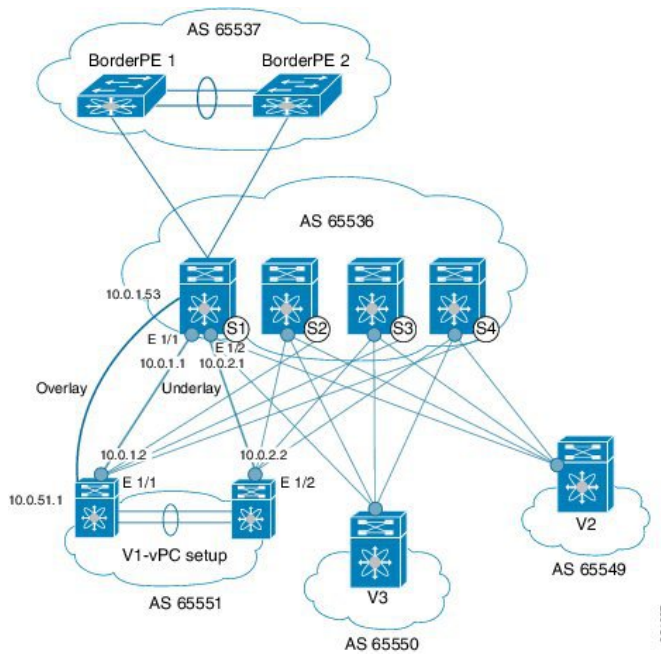

Some customers would like to have the same protocol in the underlay and overlay in order to contain the number of protocols that need support in their network.

There are various ways to configure the eBGP based underlay. The configurations given in this section have been validated for function and convergence. The IP underlay based on eBGP can be built with these configurations detailed below. (For reference, see image below)

- The design below is following the multi AS model.
- eBGP underlay requires numbered interfaces between leaf and spine nodes. Numbered interfaces are used for the underlay BGP sessions as there is no other protocol to distribute peer reachability.
- The overlay sessions are configured on loopback addresses. This is to increase the resiliency in presence of link or node failures.
- BGP speakers on spine layer configure all leaf node eBGP neighbors individually. This is different from IBGP based peering which can be covered by dynamic BGP.
- Pointers for Multiple AS numbers in a fabric are given below:
  - All spine nodes configured as BGP speakers are in one AS.
  - All leaf nodes will have a unique AS number that is different than the BGP speakers in spine layer.
  - A pair of vPC leaf switch nodes, have the same AS number.
  - If a globally unique AS number is required to represent the fabric, then that can be configured on the border leaf or borderPE switches. All other nodes can use the private AS number range.

- BGP Confederation has not been leveraged.

Figure 44: eBGP as underlay

### eBGP configuration sample

Sample configurations for a spine switch and leaf switch are given below. The complete configuration is given for providing context, and the configurations added specifically for eBGP underlay are highlighted and further explained.

There is one BGP session per neighbor to set up the underlay. This is done within the global IPv4 address family. The session is used to distribute the loopback addresses for VTEP, Rendezvous Point (RP) and the eBGP peer address for the overlay eBGP session.

**Spine switch S1 configuration**—On the spine switch (S1 in this example), all leaf nodes are configured as eBGP neighbors.

(config) #

```
router bgp 65536
  router-id 10.1.1.53
  address-family ipv4 unicast
  redistribute direct route-map DIRECT-ROUTES-MAP
```

The **redistribute direct** command is used to advertise the loopback addresses for BGP and VTEP peering. It can be used to advertise any other direct routes in the global address space. The route map can filter the advertisement to include only eBGP peering and VTEP loopback addresses.

```
maximum-paths 2
address-family l2vpn evpn
  retain route-target all
```

Spine switch BGP speakers don't have any VRF configuration. Hence, the **retain route-target all** command is needed to retain the routes and send them to leaf switch VTEPs. The **maximum-paths** command is used for ECMP path in the underlay.

**Underlay session towards leaf switch V1 (vPC set up)**—As mentioned above, the underlay sessions are configured on the numbered interfaces between spine and leaf switch nodes.

(config) #

```
neighbor 10.0.1.2 remote-as 65551
  address-family ipv4 unicast
    disable-peer-as-check
    send-community both
```

The vPC pair of switches has the same AS number. The **disable-peer-as-check** command is added to allow route propagation between the vPC switches as they are configured with the same AS, for example, for route type 5 routes. If the vPC switches have different AS numbers, this command is not required.

**Underlay session towards the border leaf switch**—The underlay configurations towards leaf and border leaf switches are the same, barring the changes in IP address and AS values.

**Overlay session on the spine switch S1 towards the leaf switch V1**

(config) #

```
route-map UNCHANGED permit 10
  set ip next-hop unchanged
```

#### Note

The route-map UNCHANGED is user defined whereas the keyword **unchanged** is an option within the **set ip next-hop** command. In eBGP, the next hop is changed to self when sending a route from one eBGP neighbor to another. The route map UNCHANGED is added to make sure that, for overlay routes, the originating leaf switch is set as next hop and not the spine switch. This ensures that VTEPs are next hops, and not spine switch nodes. The **unchanged** keyword ensures that the next-hop attribute in the BGP update to the eBGP peer is unmodified.

The overlay sessions are configured on loopback addresses.

(config) #

```
neighbor 10.0.51.1 remote-as 65551
  update-source loopback0
  ebgp-multihop 2
  address-family l2vpn evpn
    rewrite-evpn-rt-asn
    disable-peer-as-check
    send-community both
    route-map UNCHANGED out
```

The spine switch configuration concludes here. The *Route Target auto* feature configuration is given below for reference purposes:

(config) #

```
vrf context coke
  vni 50000
  rd auto
  address-family ipv4 unicast
    route-target both auto
    route-target both auto evpn
  address-family ipv6 unicast
    route-target both auto
    route-target both auto evpn
```

The **rewrite-evpn-rt-asn** command is required if the *Route Target auto* feature is being used to configure EVPN RTs.

*Route target auto* is derived from the Local AS number configured on the switch and the Layer-3 VNID of the VRF i.e. Local AS:VNID. In Multi-AS topology, as illustrated in this guide, each leaf node is represented as a different local AS, and the route target generated for the same VRF will be different on every switch. The command **rewrite-evpn-rt-asn** replaces the ASN portion of the route target in the BGP update message with the local AS number. For example, if VTEP V1 has a Local AS 65551, VTEP V2 has a Local AS 65549, and spine switch S1 has a Local AS 65536, then the route targets for V1, V2 and S1 are as follows:

- V1—65551:50000
- V2—65549:50000
- S1—65536:50000

In this scenario, V2 advertises the route with RT 65549:50000, the spine switch S1 replaces it with RT 65536:50000, and finally when V1 gets the update, it replaces the route target in the update with 65551:50000. This matches the locally configured RT on V1. This command requires that it be configured on all BGP speakers in the fabric.

If the *Route Target auto* feature is not being used, i.e., matching RTs are required to be manually configured on all switches, then this command is not necessary.

**Leaf switch VTEP V1 configuration**—In the sample configuration below, VTEP V1's interfaces are designated as BGP neighbors. All leaf switch VTEPs including border leaf switch nodes have the following configurations towards spine switch neighbor nodes:

(config) #

```
router bgp 65551
  router-id 10.1.1.54
  address-family ipv4 unicast
    maximum-paths 2
  address-family l2vpn evpn
```

The **maximum-paths** command is used for ECMP path in the underlay.

#### Underlay session on leaf switch VTEP V1 towards spine switch S1

(config) #

```
neighbor 10.0.1.1 remote-as 65536
  address-family ipv4 unicast
    allowas-in
```

```
send-community both
```

The **allowas-in** command is needed if leaf switch nodes have the same AS. In particular, the Cisco validated topology had a vPC pair of switches share an AS number.

### Overlay session towards spine switch S1

(config) #

```
neighbor 10.1.1.53 remote-as 65536
  update-source loopback0
  ebgp-multihop 2
  address-family l2vpn evpn
  rewrite-evpn-rt-asn
  allowas-in
  send-community both
```

The **ebgp-multihop 2** command is needed as the peering for the overlay is on the loopback address. NX-OS considers that as multi hop even if the neighbor is one hop away.

### vPC backup session

(config) #

```
route-map SET-PEER-AS-NEXTHOP permit 10
  set ip next-hop peer-address

neighbor 192.168.0.1 remote-as 65551
  update-source Vlan3801
  address-family ipv4 unicast
  send-community both
  route-map SET-PEER-AS-NEXTHOP out
```

---

**Note** This session is configured on the backup SVI between the vPC leaf switch nodes.

---

*To complete configurations for the above image, configure the following:*

- *VI as a BGP neighbor to other spine switches.*
- *Repeat the procedure for other leaf switches.*

### BGP Verification

Use the following commands for verifying BGP configuration:

```
show bgp all
show bgp ipv4 unicast neighbors
show ip route bgp
```

For a detailed list of commands, refer to the Configuration and Command Reference guides.

## Multicast Routing in the VXLAN Underlay

The VXLAN EVPN Programmable Fabric supports multicast routing for transporting BUM (broadcast, unknown unicast and multicast) traffic.

Refer the table below to know the multicast protocol(s) your Cisco Nexus switches support:

Cisco Nexus Series Switch(es) Combination	Multicast Routing Option
Cisco Nexus 7000/7700 Series switches with Cisco Nexus 5600 Series switches	PIM BiDir
Cisco Nexus 7000/7700 Series switches with Cisco Nexus 9000 Series switches	PIM ASM (Sparse Mode)
Cisco Nexus 9000 Series	<p>PIM ASM (Sparse Mode) <i>or</i> PIM BiDir</p> <p><b>Note</b> PIM BiDir is supported on Cisco Nexus 9300-EX and 9300-FX/FX2/FX3 platform switches.</p> <p>PIM BiDir is not supported on Cisco Nexus 9300-GX platform switches.</p>
Cisco Nexus 7000/7700 Series switches	PIM ASM (Sparse Mode) <i>or</i> PIM BiDir
Cisco Nexus 5600 Series switches	PIM BiDir

**Note** For Cisco Nexus 7000/7700 Series switches, an F3 or M3 card is required to support Cisco Programmable Fabric.

You can transport BUM traffic without multicast, through *ingress replication*. Ingress replication is currently available on Cisco Nexus 9000 Series switches.

### PIM ASM and PIM BiDir Underlay IP Network

Some multicast topology design pointers are given below:

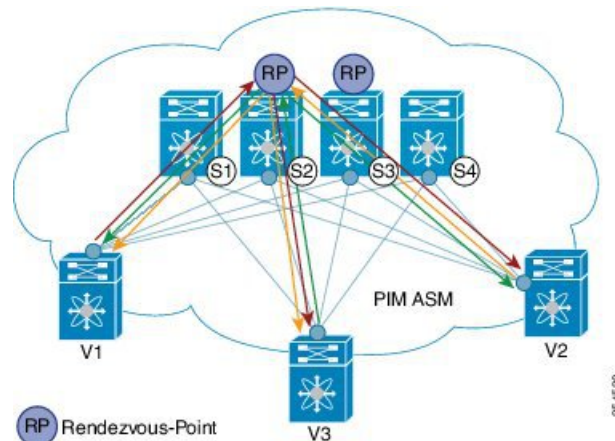

- Use spine/aggregation switches as Rendezvous-Point locations.
- Reserve a range of multicast groups (destination groups/DGroups) to service the overlay and optimize for diverse VNIs.
- In a spine-leaf topology with a lean spine,
  - Use multiple Rendezvous-Points across multiple spine switches.
  - Use redundant Rendezvous-Points.
  - Map different VNIs to different multicast groups, which are mapped to different Rendezvous-Points for load balancing.

**Important**

The following configuration samples are from an IP underlay perspective and are not comprehensive. Functions such as PIM authentication, BFD for PIM, etc, are not shown here. Refer to the respective Cisco Nexus Series switch multicast configuration guide for complete information.

### PIM Sparse-Mode (Any-Source Multicast [ASM])

**Figure 45: PIM ASM as the IP multicast routing protocol**

PIM ASM is supported on the Nexus 7000 and Nexus 9000 series as the underlay multicast protocol. (Nexus 7000 also supports bidirectional PIM as the underlay multicast protocol).

In the above image, the leaf switches (V1, V2, and V3 having VTEP configuration) are at the bottom of the image. They are connected to the 4 spine switches (S1, S2, S3, and S4) that are depicted at the top of the image.

Two multicast Rendezvous-Points (S2 and S3) are configured. The second Rendezvous-Point is added for load sharing and redundancy purposes. *Anycast RP is represented in the PIM ASM topology image.* Anycast RP ensures redundancy and load sharing between the two Rendezvous-Points. To use Anycast RP, multiple spines serving as RPs will share the same IP address (the Anycast RP address). Meanwhile, each RP has its unique IP address added in the RP set for RPs to sync information with respect to sources between all spines which act as RPs.

The shared multicast tree is unidirectional, and uses the Rendezvous-Point for forwarding packets.

*PIM ASM at a glance* - 1 source tree per multicast group per leaf switch.

Programmable Fabric specific pointers are:

- All VTEPs that serve a VNI join a shared multicast tree. VTEPs V1, V2, and V3 have hosts attached from a single tenant (say x) and these VTEPs form a separate multicast (source, group) tree.
- A VTEP (say V1) might have hosts belonging to other tenants too. Each tenant may have different multicast groups associated with. A source tree is created for each tenant residing on the VTEP, if the tenants do not share a multicast group.

### PIM ASM Configuration

The PIM ASM examples are for the Cisco Nexus 7000 and 9000 Series switches.

**Note** For ease of use, the configuration mode from which you need to start configuring a task is mentioned at the beginning of each configuration.

Configuration tasks and corresponding show command output are displayed for a part of the topology in the image. For example, if the sample configuration is shown for a leaf switch and connected spine switch, the show command output for the configuration only displays corresponding configuration.

**Leaf switch V1 Configuration** — Configure RP reachability on the leaf switch.

#### **PIM Anycast Rendezvous-Point association on leaf switch V1**

(config) #

```
feature pim
ip pim rp-address 198.51.100.220 group-list 224.1.1.1
```

198.51.100.220 is the Anycast Rendezvous-Point IP address.

#### **Loopback interface PIM configuration on leaf switch V1**

(config) #

```
interface loopback 0
 ip address 209.165.201.20/32
 ip pim sparse-mode
```

#### **Point-2-Point (P2P) interface PIM configuration for leaf switch V1 to spine switch S2 connectivity**

(config) #

```
interface Ethernet 1/1
 no switchport
 ip address 209.165.201.14/31
 mtu 9216
 ip pim sparse-mode
.
```

*Repeat the above configuration for a P2P link between V1 and the spine switch (S3) acting as the redundant Anycast Rendezvous-Point.*

The VTEP also needs to be connected with spine switches (S1 and S4) that are not rendezvous points. A sample configuration is given below:

#### **Point-2-Point (P2P) interface configuration for leaf switch V1 to non-rendezvous point spine switch (S1) connectivity**

(config) #

```
interface Ethernet 2/2
 no switchport
 ip address 209.165.201.10/31
 mtu 9216
```

```
ip pim sparse-mode
```

*Repeat the above configuration for all P2P links between V1 and non- rendezvous point spine switches.*

*Repeat the complete procedure given above to configure all other leaf switches.*

### **Rendezvous Point Configuration on the spine switches**

#### **PIM configuration on spine switch S2**

(config) #

```
feature pim
```

#### **Loopback Interface Configuration (RP)**

(config) #

```
interface loopback 0
 ip address 10.10.100.100/32
 ip pim sparse-mode
```

#### **Loopback interface configuration (Anycast RP)**

(config) #

```
interface loopback 1
 ip address 198.51.100.220/32
 ip pim sparse-mode
```

#### **Anycast-RP configuration on spine switch S2**

Configure a spine switch as a Rendezvous Point and associate it with the loopback IP addresses of switches S2 and S3 for redundancy.

(config) #

```
feature pim
ip pim rp-address 198.51.100.220 group-list 224.1.1.1
ip pim anycast-rp 198.51.100.220 10.10.100.100
ip pim anycast-rp 198.51.100.220 10.10.20.100
.
.
```

**Note** The above configurations should also be implemented on the other spine switch (S3) performing the role of RP.

### Non-RP Spine Switch Configuration

You also need to configure PIM ASM on spine switches that are not designated as rendezvous points, namely S1 and S4.

Earlier, leaf switch (VTEP) V1 has been configured for a P2P link to a non RP spine switch. A sample configuration on the non RP spine switch is given below.

### PIM ASM global configuration on spine switch S1 (non RP)

(config) #

```
feature pim
ip pim rp-address 198.51.100.220 group-list 224.1.1.1
```

### Loopback interface configuration (non RP)

(config) #

```
interface loopback 0
 ip address 10.10.100.103/32
 ip pim sparse-mode
```

### Point-2-Point (P2P) interface configuration for spine switch S1 to leaf switch V1 connectivity

(config) #

```
interface Ethernet 2/2
 no switchport
 ip address 209.165.201.15/31
 mtu 9216
 ip pim sparse-mode
.
.
```

*Repeat the above configuration for all P2P links between the non- rendezvous point spine switches and other leaf switches (VTEPs).*

### PIM ASM Verification

Use the following commands for verifying PIM ASM configuration:

```
Leaf-Switch-V1# show ip mroute 224.1.1.1

IP Multicast Routing Table for VRF "default"

(*, 224.1.1.1/32), uptime: 02:21:20, nve ip pim
```

```

Leaf-Switch-V1# **show ip pim neighbor**

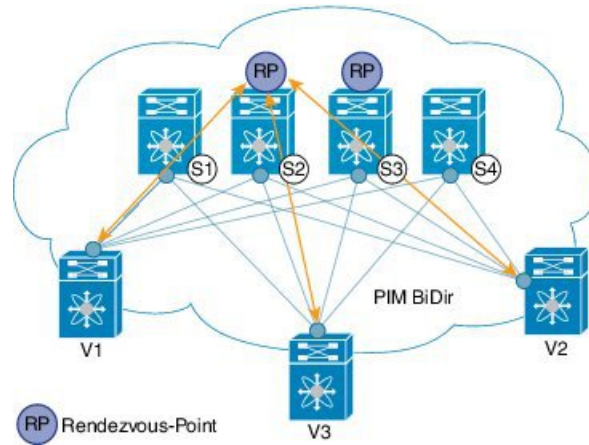

PIM Neighbor Status for VRF "default"

Neighbor	Interface	Uptime	Expires	DR Priority	Bidir- Capable	BFD State
10.10.100.100	Ethernet1/1	1w1d	00:01:33	1	yes	n/a

For a detailed list of commands, refer to the Configuration and Command Reference guides.

### PIM Bidirectional (BiDir)

**Figure 46: PIM BiDir as the IP multicast routing protocol**

Bidirectional PIM is supported on the Nexus 5600 and Nexus 7000 series as the underlay multicast protocol. Some multicast topology design pointers are given below:

VXLAN BiDir underlay is supported on Cisco Nexus 9300-EX and 9300-FX/FX2/FX3 platform switches.

In the above image, the leaf switches (V1, V2, and V3) are at the bottom of the image. They are connected to the 4 spine switches (S1, S2, S3, and S4) that are depicted at the top of the image. The two PIM Rendezvous-Points using phantom RP mechanism are used for load sharing and redundancy purposes.

**Note** Load sharing happens only via different multicast groups, for the respective, different VNI.

With bidirectional PIM, one bidirectional, shared tree rooted at the RP is built for each multicast group. Source specific state are not maintained within the fabric which provides a more scalable solution.

Programmable Fabric specific pointers are:

- The 3 VTEPs share the same VNI and multicast group mapping to form a single multicast group tree.

PIM BiDir at a glance — *One shared tree per multicast group.*

### PIM BiDir Configuration

The following is a configuration example of having two spine switches S2 and S3 serving as RPs using phantom RP for redundancy and loadsharing. Here S2 is the primary RP for group-list 227.2.2.0/26 and secondary for group-list 227.2.2.64/26. S3 is the primary RP for group-list 227.2.2.64/26 and secondary RP for group-list 227.2.2.0/26.

**Note** Phantom RP is used in a PIM BiDir environment where RP redundancy is designed using loopback networks with different mask lengths in the primary and secondary routers. These loopback interfaces are in the same subnet as the RP address, but with different IP addresses from the RP address. (Since the IP address advertised as RP address is not defined on any routers, the term phantom is used). The subnet of the loopback is advertised in the Interior Gateway Protocol (IGP). To maintain RP reachability, it is only necessary to ensure that a route to the RP exists.

Unicast routing longest match algorithms are used to pick the primary over the secondary router.

The primary router announces a longest match route (say, a /30 route for the RP address) and is preferred over the less specific route announced by the secondary router (a /29 route for the same RP address). The primary router advertises the /30 route of the RP, while the secondary router advertises the /29 route. The latter is only chosen when the primary router goes offline. We will be able to switch from the primary to the secondary RP at the speed of convergence of the routing protocol.

**Note** For ease of use, the configuration mode from which you need to start configuring a task is mentioned at the beginning of each configuration.

Configuration tasks and corresponding show command output are displayed for a part of the topology in the image. For example, if the sample configuration is shown for a leaf switch and connected spine switch, the show command output for the configuration only displays corresponding configuration.

### Leaf switch V1 configuration

#### Phantom Rendezvous-Point association on leaf switch V1

(config) #

```
feature pim
ip pim rp-address 10.254.254.1 group-list 227.2.2.0/26 bidir
ip pim rp-address 10.254.254.65 group-list 227.2.2.64/26 bidir
```

#### Loopback interface PIM configuration on leaf switch V1

(config) #

```
interface loopback 0
 ip address 10.1.1.54/32
 ip pim sparse-mode
```

#### IP unnumbered P2P interface configuration on leaf switch V1

(config) #

```
interface Ethernet 1/1
 no switchport
```

```
mtu 9192
medium p2p
ip unnumbered loopback 0
ip pim sparse-mode

interface Ethernet 2/2
no switchport
mtu 9192
medium p2p
ip unnumbered loopback 0
ip pim sparse-mode
```

Use an MTU of 9192 for Cisco Nexus 5600 series switches.

### **Rendezvous Point configuration (on the two spine switches S2 and S3 acting as RPs)**

#### **Using phantom RP on spine switch S2**

(config) #

```
feature pim
ip pim rp-address 10.254.254.1 group-list 227.2.2.0/26 bidir
ip pim rp-address 10.254.254.65 group-list 227.2.2.64/26 bidir
```

#### **Loopback interface PIM configuration (RP) on spine switch S2/RP1**

(config) #

```
interface loopback 0
ip address 10.1.1.53/32
ip pim sparse-mode
```

#### **IP unnumbered P2P interface configuration on spine switch S2/RP1 to leaf switch V1**

(config) #

```
interface Ethernet 1/1
no switchport
mtu 9192
medium p2p
ip unnumbered loopback 0
ip pim sparse-mode
```

#### **Loopback interface PIM configuration (for phantom RP) on spine switch S2/RP1**

(config) #

```
interface loopback 1
ip address 10.254.254.2/30
ip pim sparse-mode
```

(config) #

```
interface loopback 2
 ip address 10.254.254.66/29
 ip pim sparse-mode
```

### Using phantom RP on spine switch S3

(config) #

```
feature pim
ip pim rp-address 10.254.254.1 group-list 227.2.2.0/26 bidir
ip pim rp-address 10.254.254.65 group-list 227.2.2.64/26 bidir
```

### Loopback interface PIM configuration (RP) on spine switch S3/RP2

(config) #

```
interface loopback 0
 ip address 10.10.50.100/32
 ip pim sparse-mode
```

### IP unnumbered P2P interface configuration on spine switch S3/RP2 to leaf switch V1

(config) #

```
interface Ethernet 2/2
 no switchport
 mtu 9192
 medium p2p
 ip unnumbered loopback 0
 ip pim sparse-mode
```

### Loopback interface PIM configuration (for phantom RP) on spine switch S3/RP2

(config) #

```
interface loopback 1
 ip address 10.254.254.66/30
 ip pim sparse-mode
```

```
interface loopback 2
 ip address 10.254.254.2/29
 ip pim sparse-mode
```

### PIM BiDir Verification

Use the following commands for verifying PIM BiDir configuration:

```
Leaf-Switch-V1# show ip mroute
```

```
IP Multicast Routing Table for VRF "default"
```

```
(*, 227.2.2.0/26), bidir, uptime: 4d08h, pim ip
 Incoming interface: Ethernet1/1, RPF nbr: 10.1.1.53
 Outgoing interface list: (count: 1)
```

```

Ethernet1/1, uptime: 4d08h, pim, (RPF)

(*, 227.2.2.0/32), bidir, uptime: 4d08h, nve ip pim
Incoming interface: Ethernet1/1, RPF nbr: 10.1.1.53
Outgoing interface list: (count: 2)
Ethernet1/1, uptime: 4d08h, pim, (RPF)
nve1, uptime: 4d08h, nve

(*, 227.2.2.64/26), bidir, uptime: 4d08h, pim ip
Incoming interface: Ethernet1/5, RPF nbr: 10.10.50.100/32
Outgoing interface list: (count: 1)
Ethernet1/5, uptime: 4d08h, pim, (RPF)

(*, 232.0.0.0/8), uptime: 4d08h, pim ip
Incoming interface: Null, RPF nbr: 0.0.0.0
Outgoing interface list: (count: 0)

```

Leaf-Switch-V1# **show ip pim rp**

```

PIM RP Status Information for VRF "default"
BSR disabled
Auto-RP disabled
BSR RP Candidate policy: None
BSR RP policy: None
Auto-RP Announce policy: None
Auto-RP Discovery policy: None

```

```

RP: 10.254.254.1, (1),

```

For a detailed list of commands, refer to the Configuration and Command Reference guides.

**Underlay deployment without multicast (Ingress replication)**

Ingress replication is supported on Cisco Nexus 9000 Series switches and not supported on Cisco Nexus 5600 and Cisco Nexus 7000 Series switches.

Beginning in NX-OS release 9.3(3), Ingress replication is supported on Cisco Nexus 9300-GX switches.

## APPENDIX **B**

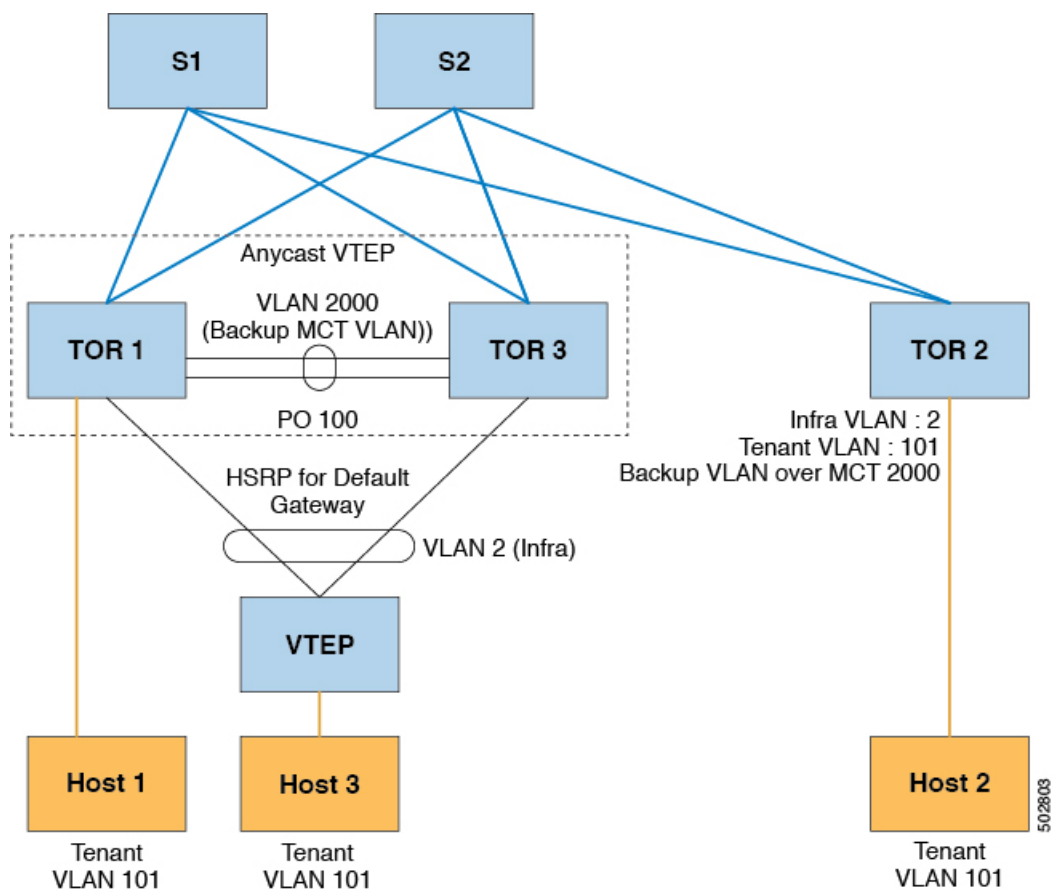

# Configuring Bud Node

This chapter contains the following sections:

- [VXLAN Bud Node Over vPC Overview, on page 427](#)
- [VXLAN Bud Node Over vPC Topology Example, on page 428](#)

## VXLAN Bud Node Over vPC Overview

*Figure 47: Underlay Network Based on PIM-SM and OSPF*

**Note** For bud-node topologies, the source IP of the VTEP behind vPC must be in the same subnet as the infra VLAN. This SVI should have proxy ARP enabled. For example:

```
Interface Vlan2
ip proxy-arp
```

**Note** The **system nve infra-vlans** command specifies VLANs used for all SVI interfaces, for uplink interfaces with respect to bud-node topologies, and vPC peer-links in VXLAN as infra-VLANs. You must not configure certain combinations of infra-VLANs. For example, 2 and 514, 10 and 522, which are 512 apart.

For Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2/FX3 and 9300-GX platform switches, use the **system nve infra-vlans** command to configure any VLANs that are used as infra-VLANs.

## VXLAN Bud Node Over vPC Topology Example

- Enable the required features:

```
feature ospf
feature pim
feature interface-vlan
feature vn-segment-vlan-based
feature hsrp
feature lacp
feature vpc
feature nv overlay
```

- Configuration for PIM anycast RP.

In this example, 1.1.1.1 is the anycast RP address.

```
ip pim rp-address 1.1.1.1 group-list 225.0.0.0/8
```

- VLAN configuration

In this example, tenant VLANs 101-103 are mapped to vn-segments.

```
vlan 1-4,101-103,2000
vlan 101
  vn-segment 10001
vlan 102
  vn-segment 10002
vlan 103
  vn-segment 10003
```

- vPC configuration

```
vpc domain 1
 peer-switch
 peer-keepalive destination 172.31.144.213
 delay restore 180
 peer-gateway
 ipv6 nd synchronize
 ip arp synchronize
```

- Infra VLAN SVI configuration

```
interface Vlan2
 no shutdown
 no ip redirects
 ip proxy-arp
 ip address 10.200.1.252/24
 no ipv6 redirects
 ip router ospf 1 area 0.0.0.0
 ip pim sparse-mode
 hsrp version 2
 hsrp 1
 ip 10.200.1.254
```

- Route-maps for matching multicast groups

Each VXLAN multicast group needs to have a static OIF on the backup SVI MCT.

```
route-map match-mcast-groups permit 1
 match ip multicast group 225.1.1.1/32
```

- Backup SVI over MCT configuration

- Configuration Option 1:

```
interface Vlan2000
 no shutdown
 ip address 20.20.20.1/24
 ip router ospf 1 area 0.0.0.0
 ip pim sparse-mode
 ip igmp static-oif route-map match-mcast-groups
```

- Configuration Option 2:

```
interface Vlan2000
 no shutdown
 ip address 20.20.20.1/24
 ip router ospf 1 area 0.0.0.0
 ip pim sparse-mode
 ip igmp static-oif 225.1.1.1
```

- vPC interface configuration that carries the infra VLAN

```
interface port-channel1
  switchport mode trunk
  switchport trunk allowed vlan 2
  vpc 1
```

- MCT configuration

```
interface port-channel100
  switchport mode trunk
  spanning-tree port type network
  vpc peer-link
```

---

**Note** You can choose either of the following two command procedures for creating the NVE interfaces. Use the first one for a small number of VNIs. Use the second procedure to configure a large number of VNIs.

---

#### NVE configuration

##### Option 1

```
interface nve1
  no shutdown
  source-interface loopback0
  member vni 10001 mcast-group 225.1.1.1
  member vni 10002 mcast-group 225.1.1.1
  member vni 10003 mcast-group 225.1.1.1
```

##### Option 2

```
interface nve1
  no shutdown
  source-interface loopback0
  global mcast-group 225.1.1.1
  member vni 10001
  member vni 10002
  member vni 10003
```

- Loopback interface configuration

```
interface loopback0
  ip address 101.101.101.101/32
  ip address 99.99.99.99/32 secondary
  ip router ospf 1 area 0.0.0.0
  ip pim sparse-mode
```

- Show commands

```

# DHCP Relay in VXLAN BGP EVPN

This chapter contains the following sections:

- [DHCP Relay in VXLAN BGP EVPN Overview, on page 433](#)
- [DHCP Relay in VXLAN BGP EVPN Example, on page 434](#)
- [DHCP Relay on VTEPs, on page 435](#)
- [Client on Tenant VRF and Server on Layer 3 Default VRF, on page 435](#)
- [Client on Tenant VRF \(SVI X\) and Server on the Same Tenant VRF \(SVI Y\), on page 438](#)
- [Client on Tenant VRF \(VRF X\) and Server on Different Tenant VRF \(VRF Y\), on page 442](#)
- [Client on Tenant VRF and Server on Non-Default Non-VXLAN VRF, on page 445](#)
- [Configuring vPC Peers Example, on page 447](#)
- [vPC VTEP DHCP Relay Configuration Example, on page 449](#)

## DHCP Relay in VXLAN BGP EVPN Overview

DHCP relay is utilized to forward DHCP packets between the hosts and DHCP server. The VXLAN VTEP can act as a relay agent, providing DHCP relay services in a multi-tenant VXLAN environment.

With DHCP Relay, DHCP messages require to be sent through the same Switch in both directions. GiAddr (Gateway IP Address) for DHCP Relay is commonly used for Scope Selection and DHCP response messages. In any VXLAN fabric with Distributed IP Anycast Gateway, DHCP messages can be returned to ANY Switch hosting the respective Gateway IP Address (GiAddr).

Solution requires a different way of Scope Selection and Unique IP Address for each Switch. Unique Loopback Interface per Switch will become GiAddr for responding to correct Switch. Option 82 (dhcp option vpn) will be used for Scope Selection based on L2VNI.

In a multi-tenant EVPN environment, DHCP relay uses the following sub-options of Option 82:

- Sub-option 151(0x97) - Virtual Subnet Selection (Defined in RFC#6607)

Used to convey VRF related information to the DHCP server in an MPLS-VPN and VXLAN EVPN multi-tenant environment.

- Sub-option 11(0xb) - Server ID Override (Defined in RFC#5107)

The server identifier (server ID) override sub-option allows the DHCP relay agent to specify a new value for the server ID option, which is inserted by the DHCP server in the reply packet. This sub-option allows the DHCP relay agent to act as the actual DHCP server such that the renew requests will come to the relay agent rather than the DHCP server directly. The server ID override sub-option contains the incoming

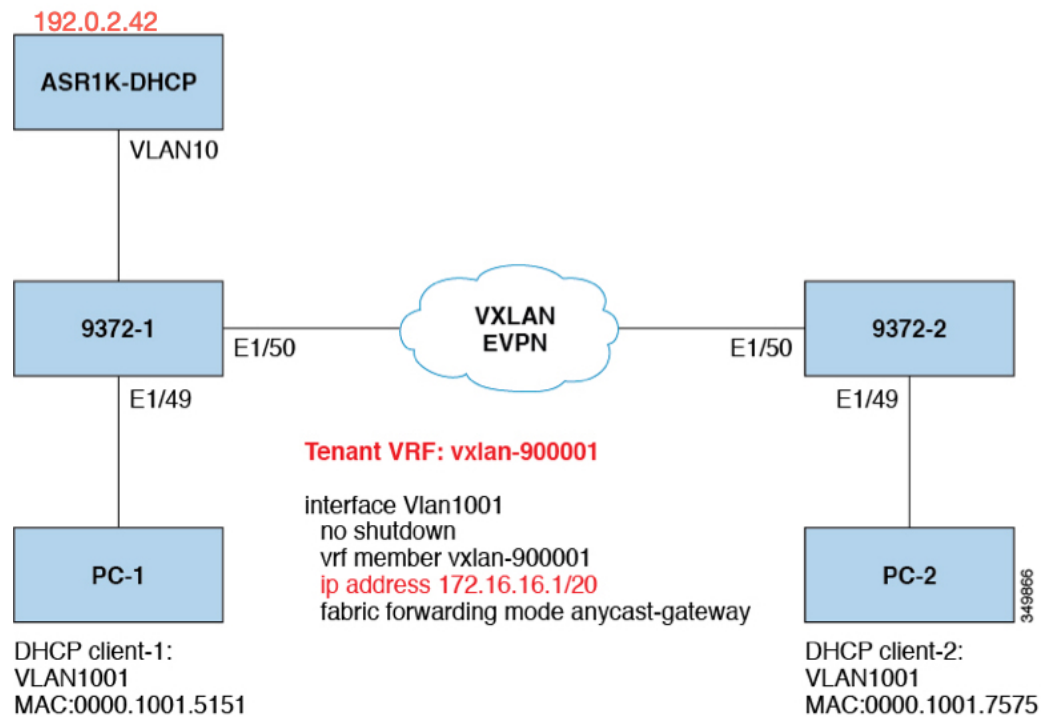

interface IP address, which is the IP address on the relay agent that is accessible from the client. Using this information, the DHCP client sends all renew and release request packets to the relay agent. The relay agent adds all of the appropriate sub-options and then forwards the renew and release request packets to the original DHCP server. For this function, Cisco's proprietary implementation is sub-option 152(0x98). You can use the **ip dhcp relay sub-option type cisco** command to manage the function.

- Sub-option 5(0x5) - Link Selection (Defined in RFC#3527)

The link selection sub-option provides a mechanism to separate the subnet/link on which the DHCP client resides from the gateway address (giaddr), which can be used to communicate with the relay agent by the DHCP server. The relay agent will set the sub-option to the correct subscriber subnet and the DHCP server will use that value to assign an IP address rather than the giaddr value. The relay agent will set the giaddr to its own IP address so that DHCP messages are able to be forwarded over the network. For this function, Cisco's proprietary implementation is sub-option 150(0x96). You can use the **ip dhcp relay sub-option type cisco** command to manage the function.

## DHCP Relay in VXLAN BGP EVPN Example

Figure 48: Example Topology

Topology characteristics:

- Switches 9372-1 and 9372-2 are VTEPs connected to the VXLAN fabric.
- Client1 and client2 are DHCP clients in vlan1001. They belong to tenant VRF vxlan-900001.
- The DHCP server is ASR1K, a router that sits in vlan10.
- DHCP server configuration

```

ip vrf vxlan900001
ip dhcp excluded-address vrf vxlan900001 172.16.16.1 172.16.16.9
ip dhcp pool one
vrf vxlan900001
network 172.16.16.0 255.240.0.0
defaultrouter 172.16.16.1

```

## DHCP Relay on VTEPs

The following are common deployment scenarios:

- Client on tenant VRF and server on Layer 3 default VRF.
- Client on tenant VRF (SVI X) and server on the same tenant VRF (SVI Y).
- Client on tenant VRF (VRF X) and server on different tenant VRF (VRF Y).
- Client on tenant VRF and server on non-default non-VXLAN VRF.

The following sections below move vlan10 to different VRFs to depict different scenarios.

## Client on Tenant VRF and Server on Layer 3 Default VRF

Put DHCP server (192.0.2.42) into the default VRF and make sure it is reachable from both 9372-1 and 9372-2 through the default VRF.

```

9372-1# sh run int vl 10

!Command: show running-config interface Vlan10
!Time: Mon Aug 24 07:51:16 2018

version 7.0(3)I1(3)

interface Vlan10
 no shutdown
 ip address 192.0.2.25/24
 ip router ospf 1 area 0.0.0.0

9372-1# ping 192.0.2.42 cou 1

PING 192.0.2.42 (192.0.2.42): 56 data bytes
64 bytes from 192.0.2.42: icmp_seq=0 ttl=254 time=0.593 ms
- 192.0.2.42 ping statistics -
1 packets transmitted, 1 packets received, 0.00% packet loss
roundtrip min/avg/max = 0.593/0.592/0.593 ms

9372-2# ping 192.0.2.42 cou 1
PING 192.0.2.42 (192.0.2.42): 56 data bytes
64 bytes from 192.0.2.42: icmp_seq=0 ttl=252 time=0.609 ms
- 192.0.2.42 ping statistics -
1 packets transmitted, 1 packets received, 0.00% packet loss
round-trip min/avg/max = 0.609/0.608/0.609 ms

```

## DHCP Relay Configuration

### • 9372-1

```
9372-1# sh run dhcp

!Command: show running-config dhcp
!Time: Mon Aug 24 08:26:00 2018

round-trip min/avg/max = 0.874/0.873/0.874 ms

```

## Client on Tenant VRF (SVI X) and Server on the Same Tenant VRF (SVI Y)

Put DHCP server (192.0.2.42) into VRF of vxlan-900001 and make sure it is reachable from both 9372-1 and 9372-2 through VRF of vxlan-900001.

```

9372-1# sh run int vl 10

!Command: show running-config interface Vlan10
!Time: Mon Aug 24 09:10:26 2018

version 7.0(3)I1(3)

interface Vlan10
  no shutdown
  vrf member vxlan-900001
  ip address 192.0.2.25/24

```

Because 172.16.16.1 is an anycast address for vlan1001 configured on all the VTEPs, we need to pick up a unique address as the DHCP relay packet's source address to make sure the DHCP server can deliver a response to the original DHCP Relay agent. In this scenario, we use loopback1 and we need to make sure loopback1 is reachable from everywhere of VRF vxlan-900001.

```

9372-1# sh run int lo1

!Command: show running-config interface loopback1
!Time: Mon Aug 24 09:18:53 2018

version 7.0(3)I1(3)

interface loopback1
  vrf member vxlan-900001
  ip address 10.11.11.11/8

9372-1# ping 192.0.2.42 vrf vxlan900001 source 10.11.11.11 cou 1
PING 192.0.2.42 (192.0.2.42) from 10.11.11.11: 56 data bytes
64 bytes from 192.0.2.42: icmp_seq=0 ttl=254 time=0.575 ms
- 192.0.2.42 ping statistics -
1 packets transmitted, 1 packets received, 0.00% packet loss
round-trip min/avg/max = 0.575/0.574/0.575 ms

9372-2# sh run int lo1

!Command: show running-config interface loopback1
!Time: Mon Aug 24 09:19:30 2018

version 7.0(3)I1(3)

interface loopback1
  vrf member vxlan900001
  ip address 10.22.22.22/8

9372-2# ping 192.0.2.42 vrf vxlan-900001 source 10.22.22.22 cou 1
PING 192.0.2.42 (192.0.2.42) from 10.22.22.22: 56 data bytes
64 bytes from 192.0.2.42: icmp_seq=0 ttl=253 time=0.662 ms
- 192.0.2.42 ping statistics -
1 packets transmitted, 1 packets received, 0.00% packet loss
round-trip min/avg/max = 0.662/0.662/0.662 ms

```

## DHCP Relay Configuration

- 9372-1

```

## Client on Tenant VRF (VRF X) and Server on Different Tenant VRF (VRF Y)

The DHCP server is placed into another tenant VRF vxlan-900002 so that DHCP response packets can access the original relay agent. We use loopback2 to avoid any anycast ip address that is used as the source address for the DHCP relay packets.

```

9372-1# sh run int vl 10

## Configuring vPC Peers Example

The following is an example of how to configure routing between vPC peers in the overlay VLAN for a DHCP relay configuration.

- Enable DHCP service.

```
service dhcp
```

- Configure DHCP relay.

```
ip dhcp relay
ip dhcp relay information option
ip dhcp relay sub-option type cisco
ip dhcp relay information option vpn
```

- Create loopback under VRF where you need DHCP relay service.

```
interface loopback601
 vrf member evpn-tenant-kk1
 ip address 192.0.2.36/24
 ip router ospf 1 area 0 /* Only required for vPC VTEP. */
```

- Advertise LoX into the Layer 3 VRF BGP.

```
Router bgp 2
 vrf X
 network 10.1.1.42/8
```

- Configure DHCP relay on the SVI under the VRF.

```
interface Vlan1601
  vrf member evpn-tenant-kk1
  ip address 10.160.1.254/8
  fabric forwarding mode anycast-gateway
  ip dhcp relay address 10.160.2.201
  ip dhcp relay source-interface loopback601
```

- Configure Layer 3 VNI SVI with **ip forward**.

```
interface Vlan1600
  vrf member evpn-tenant-kk1
  ip forward
```

- Create the routing VLAN/SVI for the vPC VRF.

---

**Note** Only required for vPC VTEP

---

```
Vlan 1605
interface Vlan1605
  vrf member evpn-tenant-kk1
  ip address 10.160.5.43/8
  ip router ospf 1 area 10.10.10.41
```

- Create the VRF routing.

---

**Note** Only required for vPC VTEP.

---

```
router ospf 1
vrf evpn-tenant-kk1
  router-id 10.160.5.43
```

## vPC VTEP DHCP Relay Configuration Example

To address a need to configure a VLAN that is allowed across the MCT/peer-link, such as a vPC VLAN, an SVI can be associated to the VLAN and is created within the tenant VRF. This becomes an underlay peering, with the underlay protocol, such as OSPF, that needs the tenant VRF instantiated under the routing process.

Alternatively, instead of placing the SVI within the routing protocol and instantiate the Tenant-VRF under the routing process, you can use the static routes between the vPC peers across the MCT. This approach ensures that the reply from the server returns to the correct place and each VTEP uses a different loopback interface for the GiAddr.

The following are examples of these configurations:

- Configuration of SVI within underlay routing:

```
/* vPC Peer-1 */

router ospf UNDERLAY
vrf tenant-vrf

interface Vlan2000
  no shutdown
  mtu 9216
  vrf member tenant-vrf
  ip address 192.168.1.1/16
  ip router ospf UNDERLAY area 0.0.0.0

/* vPC Peer-2 */

router ospf UNDERLAY
vrf tenant-vrf

interface Vlan2000
  no shutdown
  mtu 9216
  vrf member tenant-vrf
  ip address 192.168.1.2/16
  ip router ospf UNDERLAY area 0.0.0.0
```

- Configuration of SVI using static routes between vPC peers across the MCT:

```
/* vPC Peer-1 */

interface Vlan2000
  no shutdown
  mtu 9216
  vrf member tenant-vrf
  ip address 192.168.1.1/16

vrf context tenant-vrf
ip route 192.168.1.2/16 192.168.1.1

/* vPC Peer-2 */

interface Vlan2000
  no shutdown
  mtu 9216
  vrf member tenant-vrf
  ip address 192.168.1.2/16

vrf context tenant-vrf
ip route 192.168.1.1/16 192.168.1.2
```

## APPENDIX **D**

# Configuring Layer 4 - Layer 7 Network Services Integration

---

This chapter contains the following sections:

- [About VXLAN Layer 4 - Layer 7 Services, on page 451](#)
- [Integrating Layer 3 Firewalls in VXLAN Fabrics, on page 451](#)
- [Firewall as Default Gateway, on page 465](#)
- [Transparent Firewall Insertion, on page 466](#)
- [Show Command Examples, on page 471](#)

## About VXLAN Layer 4 - Layer 7 Services

This chapter covers insertion of Layer 4 – Layer 7 network services (firewall, load balancer, and so on) in a VXLAN fabric.

As opposed to traditional 3-tier network topologies, in which L4-L7 services are connected to the switches hosting the default gateway (aggregation/distribution), L4-L7 services in VXLAN fabrics are typically connected to the leaf or border switches, often referred to as *services leafs*.

You can attach a L4-L7 services device to a VXLAN fabric in various ways. This chapter addresses the considerations you must take depending on how the L4-L7 services device is attached and the requirements of the device and the network.

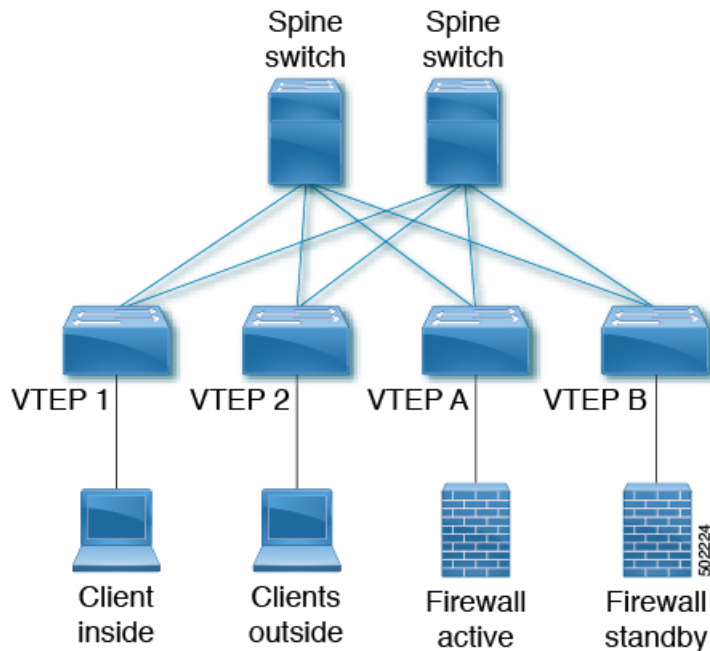

## Integrating Layer 3 Firewalls in VXLAN Fabrics

This section provides details on how to integrate a firewall within a VXLAN EVPN fabric. A Layer-3 firewall involves separating different security zones.

When integrating a Layer-3 firewall in a VXLAN EVPN fabric with a distributed Anycast Gateway, each of these zones must correspond to a VRF/tenant on the fabric. The traffic within a tenant is routed by the fabric. Traffic between the tenants is routed by the firewall. This scenario often refers to an inter-tenant or tenant edge firewall.

Consider two zones: an inside zone and an outside zone. This scenario requires a VRF definition on the fabric. You can call the VRFs the inside VRF and the outside VRF. Traffic between subnets within the same VRF is routed on the VXLAN fabric using the distributed gateway. Traffic between VRFs is routed by the firewall where the rules are applied.

Figure 49: Topology Overview with Firewall Attachment

## Single-Attached Firewall with Static Routing

If the firewall does not support running a routing protocol, you must have static routes on each VTEP pointing to the firewall as the next hop. The firewall also has static routes pointing to the Anycast Gateway IP as the next hop. The challenge with a static route is that the VTEP with an active firewall must be the one advertising the routes to the fabric. One way to accomplish this is to track the active firewall reachability via HMM and use this tracking to advertise routes into the fabric. When the active firewall is connected to VTEP A, VTEP A has a static route that tracks where the route is advertised if the firewall IP is learned as the HMM route. When the firewall fails and the standby firewall takes over, VTEP A learns the firewall IP using BGP, and VTEP B learns the firewall IP using HMM. VTEP A withdraws the route, and VTEP B advertises the route into the fabric. See the following example.

### VTEP A and VTEP B:

```
Vlan 10
  Name inside
  Vn-segment 10010

Vlan 20
  Name outside
  Vn-segment 10020

Interface VLAN 10
  Description inside_vlan
  VRF member INSIDE
  IP address 10.1.1.254/24
  fabric forwarding mode anycast-gateway

Interface VLAN 20
  Description outside_vlan
  VRF member OUTSIDE
```

```
IP address 20.1.1.254/24
fabric forwarding mode anycast-gateway

interface nve1
  no shutdown
  host-reachability protocol bgp
  source-interface loopback1
  member vni 10010
    mcastgroup 239.1.1.1
  member vni 10020
    mcastgroup 239.1.1.1
  member vni 1001000 associate-vrf
  member vni 1002000 associate-vrf

track 10 ip route 10.1.1.1/32 reachability hmm
  vrf member INSIDE
!
VRF context INSIDE
  Vni 1001000
  IP route 20.1.1.0/24 10.1.1.1 track 10

track 20 ip route 20.1.1.1/32 reachability hmm
  vrf member OUTSIDE
!
VRF context OUTSIDE
  Vni 1001000
  IP route 10.1.1.0/24 20.1.1.1 track 20

VTEPA# show track 10 Track 10
IP Route 20.1.1.1/32 Reachability Reachability is UP

VTEPA# show ip route 20.1.1.0/24 vrf INSIDE
IP Route Table for VRF "INSIDE"
'*' denotes best ucast next-hop
'***' denotes best mcast next-hop
'[x/y]' denotes [preference/metric]
'%<string>' in via output denotes VRF <string>

20.1.1.0/24, ubest/mbest: 1/0
  *via 10.1.1.1 [1/0], 00:00:08, static

Firewall Failure on VTEP A caused the track to go down causing VTEP A to withdraw the static
route.

VTEPA# show track 20 Track 20
IP Route 20.1.1.1/32 Reachability Reachability is DOWN

VTEPA# show ip route 20.1.1.0/24 vrf INSIDE
IP Route Table for VRF "RED"
'*' denotes best ucast next-hop
'***' denotes best mcast next-hop
'[x/y]' denotes [preference/metric]
'%<string>' in via output denotes VRF <string>

Route not found
```

## Recursive Static Routes Distributed to the Rest of the Fabric

With this approach, the static routes are configured wherever the inside or outside VRF exists. As the next-hop is reachable through host routes (EVPN Route-Type2), the change of the active firewall to standby and vice versa is only seen locally and doesn't introduce any churn to the other VXLAN fabric. This approach can help to better scale and improve convergence.

### Any VTEP:

```
VRF context OUTSIDE
Vni 1002000
IP route 10.1.1.0/24 20.1.1.1
! static route on VTEP pointing to Firewall next hop
! firewall VIP 20.1.1.1

VRF context INSIDE
Vni 1001000
IP route 20.1.1.0/24 10.1.1.1
! static route on VTEP pointing to Firewall next hop
! firewall VIP 10.1.1.1
```

## Redistribute Static Routes into BGP and Advertise to the Rest of the Fabric

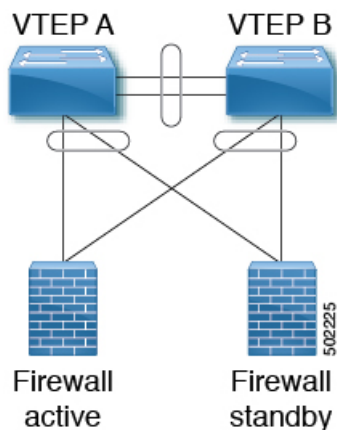

Through redistribution, we make the route toward the active firewall shown to the VTEP where it resides. The route is seen as a prefix route (EVPN Route-Type5), and as such, only the route toward the VTEP with the active firewall is seen. In the case of a firewall active/standby change, the tracking needs to detect the change and inform all of the remote VTEPs of this change. This behavior is equal to a route "delete" followed by an "add." This approach needs to notify all VTEPs with the VRF, and hence a wider churn can be seen.

### VTEP A and VTEP B:

```
router bgp 65000
vrf OUTSIDE
address-family ipv4 unicast
redistribute static route-map Static-to-BGP
```

## Dual-Attached Firewall with Static Routing

```

## Single-Attached Firewall with eBGP Routing

If the firewall supports BGP, one option is to use BGP as a protocol between the firewall and the service VTEP. Peering using the anycast IP is not supported. The recommended design is to use dedicated loopback IPs on each VTEP and peer using the loopback. As long as the loopback interfaces are not advertised via

EVPN, the same IP address could be used on all of the belonging VTEPs. We recommend using individual IP addresses on a per-VTEP basis.

Reachability to the loopback from the firewall can be configured using a static route on the firewall, pointing to the Anycast Gateway IP on the VTEPs.

In the following example, an eBGP peering is established from the VTEPs, which are in AS 65000, and the firewall in AS 65002. The BGP peering with iBGP is not supported.

**Note** Do not use Anycast Gateway for BGP peerings.

#### VTEP A:

      local-as 65052 no-prepend replace-as
```

With the VXLAN fabric generally being in a single BGP Autonomous System (AS), the AS of the inside VRF and the outside VRF is the same. BGP does not install routes that are received from its own AS. Therefore, we need to adjust the AS-path to override this rule. Various approaches exist, including disabling the rule that BGP drops routes from its own AS, which has further implications to the network. To keep all of the BGP protection mechanics in place, the “local-as” approach allows you to mimic routes being originated from a different AS. We recommend inserting the “local-as #ASN# no-prepend replace-as” on each firewall peering with different “local-as” per VRF.

Figure 51: eBGP AS-Path Check

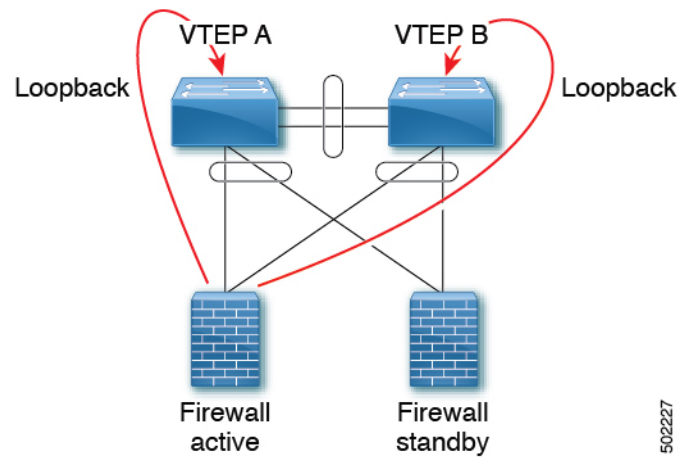

## Dual-Attached Firewall with eBGP Routing

If the firewall supports BGP, one option is to use BGP as a protocol between the firewall and the service VTEP. Peering using the anycast IP is not supported. The recommended design is to use dedicated loopback IPs on each VTEP and peer using the loopback. As long as the loopback interfaces are not advertised via EVPN, the same IP address could be used on all of the belonging VTEPs. We recommend using individual IP addresses on a per-VTEP basis. For vPC environments, it is required.

Reachability to the loopback from the firewall can be configured using a static route on the firewall, pointing to the Anycast Gateway IP on the VTEPs.

In vPC deployments, you must have a per-VRF peering via a vPC peer-link. In addition to the per-VRF peering, you can enable the advertisement of prefix routes (EVPN Route-Type 5) using the **advertise-pip** command. For vPC with fabric peering, the per-VRF peering is not necessary, and the advertisement of prefix routes (EVPN Route-Type5) is required.

In the following example, an eBGP peering is established from the VTEPs, which are in AS 65000, and the firewall in AS 65002. The BGP peering with iBGP is not supported.

**Figure 52: Dual-Attached Firewall with eBGP**

**Note** Do not use Anycast Gateway for BGP peerings.

      local-as 65052 no-prepend replace-as

```

## Per-VRF Peering via vPC Peer-Link

### VTEP A and VTEP B:

```

vlan 3966
! vlan use for peering between the vPC VTEPS

vlan 3967
! vlan use for peering between the vPC VTEPS

system nve infra-vlans 3966,3967

interface vlan 3966
vrf memner INSIDE
ip address 100.1.1.1/31

interface vlan 3967
vrf memner OUTSIDE
ip address 100.1.2.1/31

router bgp 65000
vrf INSIDE
neighbor 100.1.1.0 remote-as 65000
update-source vlan 3966
next-hop self
address-family ipv4 unicast

vrf OUTSIDE
neighbor 100.1.2.0 remote-as 65000
update-source vlan 3967
next-hop self
address-family ipv4 unicast

```

The routes learned in each VRF are advertised to the rest of the fabric via BGP EVPN updates.

## Single-Attached Firewall with OSPF

The following example shows a configuration snippet from VTEP A running OSPF peering with the firewall.

SVIs are defined on the VTEP for both inside and outside VRFs. The VTEP peers with the firewall on each of these VRFs dynamically learn routing information to go from one VRF to the other.

### VTEP A and VTEP B:

```

vlan 10
name inside
vn-segment 10010

vlan 20
name outside
vn-segment 10020

interface VLAN 10
Description inside_vlan
VRF member INSIDE
IP address 10.1.1.254/24
IP router ospf 1 area 0
fabric forwarding mode anycast-gateway

Interface VLAN 20
Description outside_vlan
VRF member OUTSIDE

```

```

IP address 20.1.1.254/24
IP router ospf 1 area 0
fabric forwarding mode anycast-gateway

interface nve1
no shutdown
host-reachability protocol bgp
source-interface loopback1
member vni 10010
  mcastgroup 239.1.1.1
member vni 10020
  mcastgroup 239.1.1.1
member vni 1001000 associate-vrf
member vni 1002000 associate-vrf

router ospf 1
router-id 192.168.1.1
vrf INSIDE
VRF OUTSIDE

VTEPA# show ip route ospf-1 vrf OUTSIDE
IP Route Table for VRF "OUTSIDE"
'*' denotes best ucast next-hop
***' denotes best mcast next-hop
'[x/y]' denotes [preference/metric]
'%<string>' in via output denotes VRF <string>

10.1.1.0/24, ubest/mbest: 1/0
  *via 20.1.1.1 Vlan20, [110/41], 1w5d, ospf-1, intra

VTEPA# show ip route ospf-1 vrf INSIDE
IP Route Table for VRF "INSIDE"
'*' denotes best ucast next-hop
***' denotes best mcast next-hop
'[x/y]' denotes [preference/metric]
'%<string>' in via output denotes VRF <string>

20.1.1.0/24, ubest/mbest: 1/0
  *via 10.1.1.1 Vlan10, [110/41], 1w5d, ospf-1, intra

```

This route is then redistributed into BGP and advertised through the EVPN fabric so that all other VTEPs have all routes in each VRF pointing to VTEP A as the next hop.

## Redistribute OSPF Routes into BGP and Advertise to the Rest of the Fabric

### VTEP A and VTEP B:

```

router bgp 65000
vrf OUTSIDE
  address-family ipv4 unicast
    redistribute ospf 1 route-map OUTSIDEOSPF-to-BGP
vrf INSIDE
  address-family ipv4 unicast
    redistribute ospf 1 route-map INSIDEOSPF-to-BGP

VTEPA# show ip route 10.1.1.0/24 vrf OUTSIDE

10.1.1.0/24 ubest/mbest: 1/0
  *via 10.1.1.18%default, [200/41], 1w1d, bgp-65000, internal, tag 65000 (evpn) segid:
200100 tunnelid: 0xa010112 encap: VXLAN

```

Traffic is VXLAN encapsulated from VTEP to services VTEP and decapsulated and sent to the firewall. The firewall enforces the rules and sends the traffic to the services VTEP on the inside VRF. This traffic is then VXLAN encapsulated and sent to the destination VTEP where traffic is decapsulated and sent to the end client.

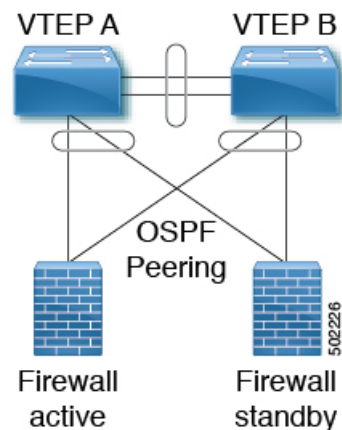

### Firewall Failover

When the active firewall fails and the standby firewall takes over, routes are withdrawn from service VTEP A and advertised to the fabric by service VTEP B.

## Dual-Attached Firewall with OSPF

Cisco NX-OS supports dynamic OSPF peering over vPC using Layer 3, which enables firewall connectivity using vPC and establishes OSPF peering over this link. The VLAN used to establish peering between the Cisco Nexus 9000 switches and the firewall must be a non-VXLAN-enabled VLAN.

**Figure 53: Dual-Attached Firewall with OSPF**

**Note** Do not use Anycast Gateway for OSPF adjacencies.

### VTEP A:

```

## Redistribute OSPF Routes into BGP and Advertise to the Rest of the Fabric

### VTEP A and VTEP B:

```
router bgp 65000
vrf OUTSIDE
  address-family ipv4 unicast
    redistribute ospf 1 route-map OUTSIDEOSPF-to-BGP
vrf INSIDE
  address-family ipv4 unicast
    redistribute ospf 1 route-map INSIDEOSPF-to-BGP
```

## Firewall as Default Gateway

In this deployment model, the VXLAN fabric is a Layer 2 fabric, and the default gateway resides on the firewall.

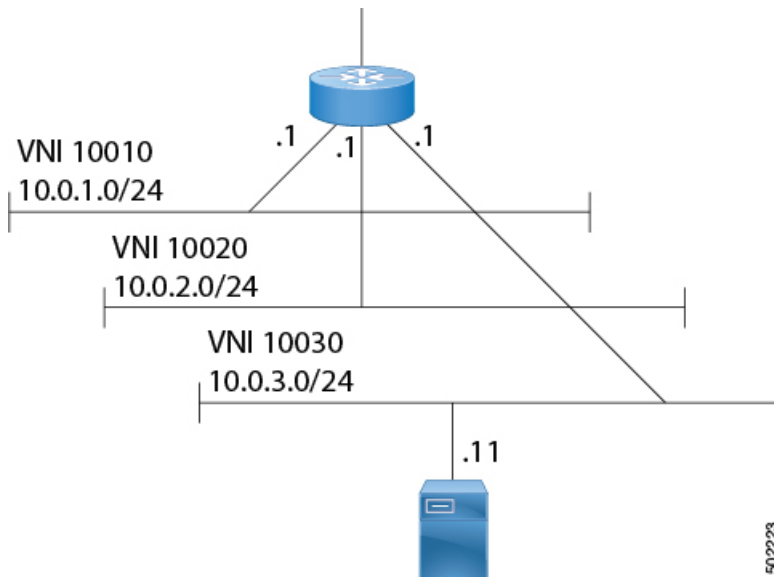

For example:

```
vlan 10
  name WEB
  vn-segment 10010
vlan 20
  name APPLICATION
  vn-segment 10020
vlan 30
  name DATABASE
  vn-segment 10030

interface nve1
  no shutdown
  host-reachability protocol bgp
  source-interface loopback1
  member vni 10010
    mcastgroup 239.1.1.1
  member vni 10020
    mcastgroup 239.1.1.1
  member vni 10030
    mcastgroup 239.1.1.1
```

The firewall has a logical interface in each VNI and is the default gateway for all endpoints. Every inter-VNI communication flows through the firewall. Take special care with the sizing of the firewall so that it does not become a bottleneck. Therefore, use this design in environments with low-bandwidth requirements.

Figure 54: Firewall as Default Gateway with a Layer-2 VXLAN Fabric

## Transparent Firewall Insertion

Transparent firewalls or Layer 2 firewalls (including IPS/IDS) typically bridge between an inside VLAN and outside VLAN and inspect traffic as it traverses through them. VLAN stitching is done by placing the default gateway for the service on the inside VLAN. The Layer 2 reachability to this gateway is done on the outside VLAN.

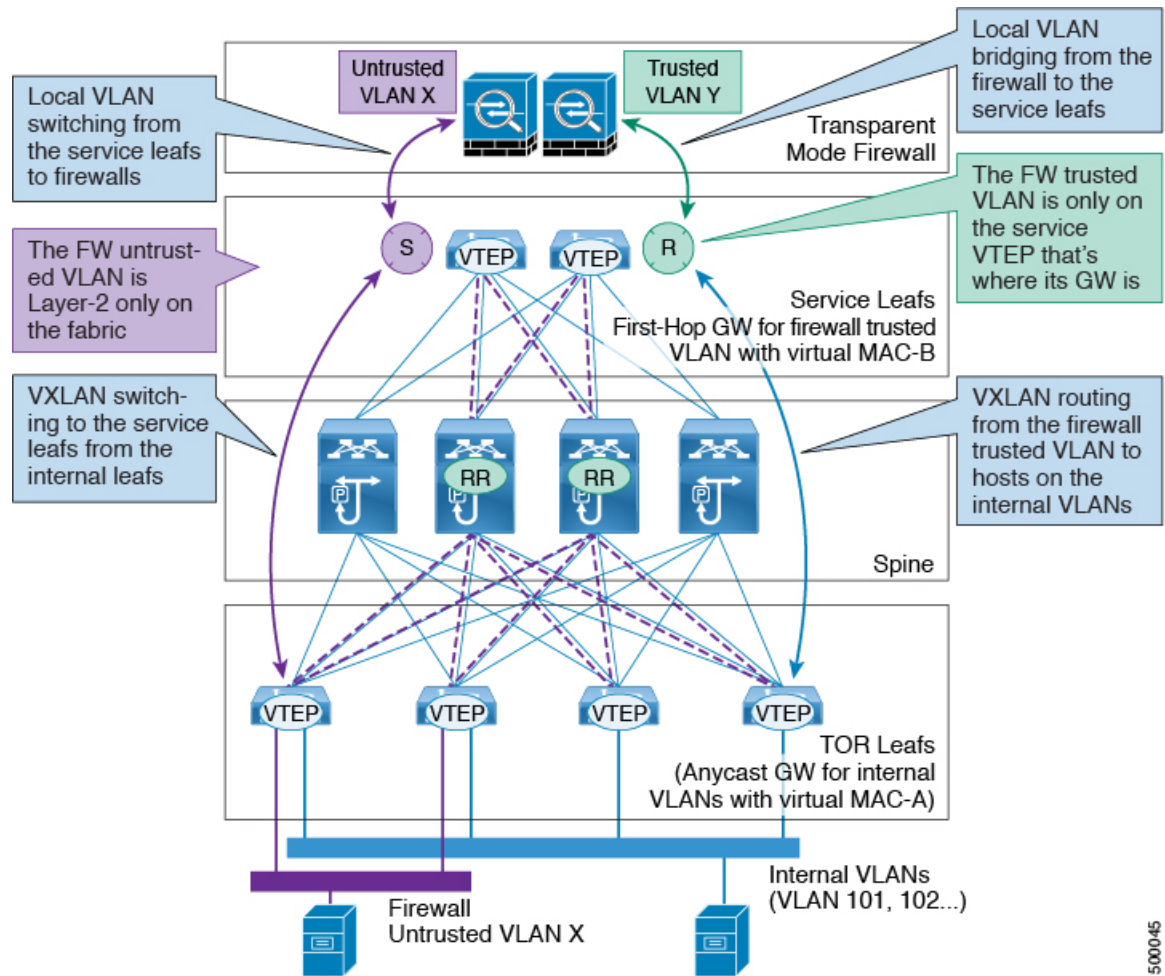

## Overview of EVPN with Transparent Firewall Insertion

The topology contains the following types of VLANs:

- Internal VLAN (a regular VXLAN on ToR leafs with Anycast Gateway)
- Firewall untrusted VLAN X
- Firewall trusted VLAN Y

In this topology, the traffic that goes from VLAN X to other VLANs must go through a transparent Layer 2 firewall that is attached to the service leafs. This topology utilizes an approach of an untrusted VLAN X and a trusted VLAN Y. All ToR leafs have a Layer 2 VNI VLAN X. There is no SVI for VLAN X. The service leafs that are connected to the firewall have Layer 2 VNI VLAN X, non-VXLAN VLAN Y, and SVI Y with an HSRP gateway.

## Overview of EVPN with Transparent Firewall Insertion

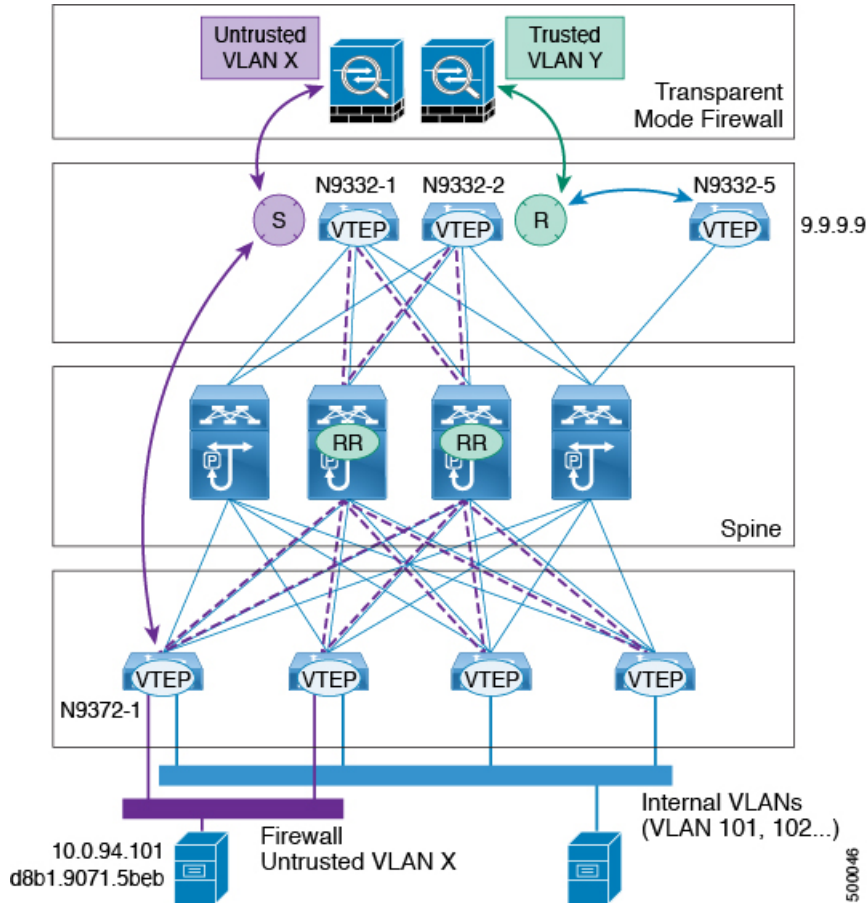

500045

**Note**

For VXLAN EVPN, we recommend using the distributed Anycast Gateway with transparent firewall insertion. Doing so allows all VLANs to be VXLAN enabled. When using an HSRP/VRRP-based First-Hop Gateway, the VLAN for the SVI can't be VXLAN enabled and should reside on a vPC pair for redundancy.

## EVPN with Transparent Firewall Insertion Example

Example of EVPN with Transparent Firewall Insertion

- Host in VLAN X: 10.1.94.101
- ToR leaf: N9372-1
- Service leaf in vPC: N9332-1 and N9332-2
- Border leaf: N9332-5

### ToR Leaf Configuration

## APPENDIX E

# Configuring Multihoming

This chapter contains the following sections:

- [VXLAN EVPN Multihoming Overview, on page 473](#)
- [Configuring VXLAN EVPN Multihoming, on page 477](#)
- [Configuring Layer 2 Gateway STP, on page 479](#)
- [Configuring VXLAN EVPN Multihoming Traffic Flows, on page 484](#)
- [Configuring ESI ARP Suppression, on page 495](#)
- [Configuring VLAN Consistency Checking, on page 498](#)

## VXLAN EVPN Multihoming Overview

### Introduction to Multihoming

Cisco Nexus platforms support vPC-based multihoming, where a pair of switches act as a single device for redundancy and both switches function in an active mode. With Cisco Nexus 9000 Series switches in VXLAN BGP EVPN environment, there are two solutions to support Layer 2 multihoming; the solutions are based on the Traditional vPC (emulated or virtual IP address) and the BGP EVPN techniques.

Traditional vPC utilizes a consistency check that is a mechanism used by the two switches that are configured as a vPC pair to exchange and verify their configuration compatibility. The BGP EVPN technique does not have the consistency check mechanism, but it uses LACP to detect the misconfigurations. It also eliminates the MCT link that is traditionally used by vPC and it offers more flexibility as each VTEP can be a part of one or more redundancy groups. It can potentially support many VTEPs in a given group.

### BGP EVPN Multihoming

When using BGP EVPN control plane, each switch can use its own local IP address as the VTEP IP address and it still provides an active/active redundancy. BGP EVPN based multihoming further provides fast convergence during certain failure scenarios, that otherwise cannot be achieved without a control protocol (data plane flood and learn).

### BGP EVPN Multihoming Terminology

See this section for the terminology used in BGP EVPN multihoming:

- EVI: EVPN instance represented by the VNI.
- MAC-VRF: A container to house virtual forwarding table for MAC addresses. A unique route distinguisher and import/export target can be configured per MAC-VRF.
- ES: Ethernet Segment that can constitute a set of bundled links.
- ESI: Ethernet Segment Identifier to represent each ES uniquely across the network.

## EVPN Multihoming Implementation

The EVPN overlay draft specifies adaptations to the BGP MPLS based EVPN solution to enable it to be applied as a network virtualization overlay with VXLAN encapsulation. The Provider Edge (PE) node role in BGP MPLS EVPN is equivalent to VTEP/Network Virtualization Edge device (NVE), where VTEPs use control plane learning and distribution via BGP for remote addresses instead of data plane learning.

There are 5 different route types currently defined:

- Ethernet Auto-Discovery (EAD) Route
- MAC advertisement Route
- Inclusive Multicast Route
- Ethernet Segment Route
- IP Prefix Route

BGP EVPN running on Cisco NX-OS uses route type-2 to advertise MAC and IP (host) information, route type-3 to carry VTEP information (specifically for ingress replication), and the EVPN route type-5 allows advertisements of IPv4 or IPv6 prefixes in an Network Layer Reachability Information (NLRI) with no MAC addresses in the route key.

With the introduction of EVPN multihoming, Cisco NX-OS software utilizes Ethernet Auto-discovery (EAD) route, where Ethernet Segment Identifier and the Ethernet Tag ID are considered to be part of the prefix in the NLRI. Since the end points reachability is learned via the BGP control plane, the network convergence time is a function of the number of MAC/IP routes that must be withdrawn by the VTEP in case of a failure scenario. To deal with such condition, each VTEP advertises a set of one or more Ethernet Auto-Discovery per ES routes for each locally attached Ethernet Segment and upon a failure condition to the attached segment, the VTEP withdraws the corresponding set of Ethernet Auto-Discovery per ES routes.

Ethernet Segment Route is the other route type that is being used by Cisco NX-OS software with EVPN multihoming, mainly for Designated Forwarder (DF) election for the BUM traffic. If the Ethernet Segment is multihomed, the presence of multiple DFs could result in forwarding the loops in addition to the potential packet duplication. Therefore, the Ethernet Segment Route (Type 4) is used to elect the Designated Forwarder and to apply Split Horizon Filtering. All VTEPs/PEs that are configured with an Ethernet Segment originate this route.

To summarize the new implementation concepts for the EVPN multihoming:

- EAD/ES: Ethernet Auto Discovery Route per ES that is also referred to as type-1 route. This route is used to converge the traffic faster during access failure scenarios. This route has Ethernet Tag of 0xFFFFFFFF.

- EAD/EVI: Ethernet Auto Discovery Route per EVI that is also referred to as type-1 route. This route is used for aliasing and load balancing when the traffic only hashes to one of the switches. This route cannot have Ethernet Tag value of 0xFFFFFFFF to differentiate it from the EAD/ES route.
- ES: Ethernet Segment route that is also referred to as type-4 route. This route is used for DF election for BUM traffic.
- Aliasing: It is used for load balancing the traffic to all the connected switches for a given Ethernet Segment using the type-1 EAD/EVI route. This is done irrespective of the switch where the hosts are actually learned.
- Mass Withdrawal: It is used for fast convergence during the access failure scenarios using the type-1 EAD/ES route.
- DF Election: It is used to prevent forwarding of the loops and the duplicates as only a single switch is allowed to decap and forward the traffic for a given Ethernet Segment.
- Split Horizon: It is used to prevent forwarding of the loops and the duplicates for the BUM traffic. Only the BUM traffic that originates from a remote site is allowed to be forwarded to a local site.

## EVPN Multihoming Redundancy Group

Consider the dually homed topology, where switches L1 and L2 are distributed anycast VXLAN gateways that perform Integrated Routing and Bridging (IRB). Host H2 is connected to an access switch that is dually homed to both L1 and L2.

The access switch is connected to L1 and L2 via a bundled pair of physical links. The switch is not aware that the bundle is configured on two different devices on the other side. However, both L1 and L2 must be aware that they are a part of the same bundle.

Note that there is no Multichassis EtherChannel Trunk (MCT) link between L1 and L2 switches and each switch can have similar multiple bundle links that are shared with the same set of neighbors.

To make the switches L1 and L2 aware that they are a part of the same bundle link, the NX-OS software utilizes the Ethernet Segment Identifier (ESI) and the system MAC address (system-mac) that is configured under the interface (PO).

## Ethernet Segment Identifier

EVPN introduces the concept of Ethernet Segment Identifier (ESI). Each switch is configured with a 10 byte ESI value under the bundled link that they share with the multihomed neighbor. The ESI value can be manually configured or auto-derived.

## LACP Bundling

LACP can be turned ON for detecting ESI misconfigurations on the multihomed port channel bundle as LACP sends the ESI configured MAC address value to the access switch. LACP is not mandated along with ESI. A given ESI interface (PO) shares the same ESI ID across the VTEPs in the group.

The access switch receives the same configured MAC value from both switches (L1 and L2). Therefore, it puts the bundled link in the UP state. Since the ES MAC can be shared across all the Ethernet-segments on the switch, LACP PDUs use ES MAC as system MAC address and the admin\_key carries the ES ID.

Cisco recommends running LACP between the switches and the access devices since LACP PDUs have a mechanism to detect and act on the misconfigured ES IDs. In case there is mismatch on the configured ES ID under the same PO, LACP brings down one of the links (first link that comes online stays up). By default, on most Cisco Nexus platforms, LACP sets a port to the suspended state if it does not receive an LACP PDU from the peer. This is based on the **lACP suspend-individual** command that is enabled by default. This command helps in preventing loops that are created due to the ESI configuration mismatch. Therefore, it is recommended to enable this command on the port-channels on the access switches and the servers.

In some scenarios (for example, POAP or NetBoot), it can cause the servers to fail to boot up because they require LACP to logically bring up the port. In case you are using static port channel and you have mismatched ES IDs, the MAC address gets learned from both L1 and L2 switches. Therefore, both the switches advertise the same MAC address belonging to different ES IDs that triggers the MAC address move scenario. Eventually, no traffic is forwarded to that node for the MAC addresses that are learned on both L1 and L2 switches.

## Guidelines and Limitations for VXLAN EVPN Multihoming

See the following limitations for configuring VXLAN EVPN Multihoming:

- Beginning with Cisco NX-OS Release 9.2(3), a FEX member port on a VXLAN VLAN with peer-link less vPC/vPC<sup>2</sup> is not supported.
- VXLAN EVPN Multihoming works with the iBGP or eBGP control plane. iBGP is preferred.
- If iBGP is used with VXLAN EVPN Multihoming, the administrative distance for local learned endpoints value must be lower than the value of iBGP.

### Note

The default value for local learned endpoints is 190, the default value for eBGP is 20, and the default value for iBGP is 200.

- If eBGP is used with VXLAN EVPN Multihoming, the administrative distance for local learned endpoints must be lower than the value of eBGP. The administrative distance can be changed by entering the **fabric forwarding admin-distance distance** command.

### Note

The default value for local learned endpoints is 190, the default value for eBGP is 20, and the default value for iBGP is 200.

- EVPN Multihoming is supported on the Cisco Nexus 9300 platform switches only. It is not supported on the Cisco Nexus 9200, 9300-EX, FX/FXP/FX2, /FX3, 9300-GX, and 9500 platform switches. The Cisco Nexus 9500 platform switches can be used as spine switches, but they cannot be used as VTEPs.
- EVPN Multihoming requires that all switches in a given network must be EVPN Multihoming capable. Mixing platforms with and without EVPN Multihoming is not supported.
- EVPN multihoming is not supported on FEX.
- ARP suppression is supported with EVPN multihoming.
- EVPN Multihoming is supported with multihoming to two switches only.

- To enable EVPN Multihoming, the spine switches must be running the minimum software version as Cisco NX-OS Release 7.0(3)I5(2) or later.
- Switchport trunk native VLAN is not supported on the trunk interfaces.
- Cisco recommends enabling LACP on ES PO.
- IPv6 is not currently supported.
- ISSU is not supported if ESI is configured on the Cisco Nexus 9300 Series switches.

## Configuring VXLAN EVPN Multihoming

### Enabling EVPN Multihoming

Cisco NX-OS allows either vPC based EVPN multihoming or ESI based EVPN multihoming. Both features should not be enabled together. ESI based multihoming is enabled using **evpn esi multihoming** CLI command. It is important to note that the command for ESI multihoming enables the Ethernet-segment configurations and the generation of Ethernet-segment routes on the switches.

The receipt of type-1 and type-2 routes with valid ESI and the path-list resolution are not tied to the **evpn esi multihoming** command. If the switch receives MAC/MAC-IP routes with valid ESI and the command is not enabled, the ES based path resolution logic still applies to these remote routes. This is required for interoperability between the vPC enabled switches and the ESI enabled switches.

Complete the following steps to configure EVPN multihoming:

#### Before you begin

VXLAN should be configured with BGP-EVPN before enabling EVPN ESI multihoming.

#### SUMMARY STEPS

1. **evpn esi multihoming**
2. **address-family l2vpn evpn maximum-paths <>maximum-paths ibgp <>**
3. **evpn multihoming core-tracking**
4. **interface port-channel Ethernet-segment <>System-mac <>**
5. **hardware access-list tcam region vpc-convergence 256**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>evpn esi multihoming</b>	Enables EVPN multihoming globally.
Step 2	<b>address-family l2vpn evpn maximum-paths &lt;&gt;maximum-paths ibgp &lt;&gt;</b>  <b>Example:</b>  <pre>address-family l2vpn evpn</pre>	Enables BGP maximum-path to enable ECMP for the MAC routes. Otherwise, the MAC routes have only 1 VTEP as the next-hop. This configuration is needed under BGP in Global level.

	Command or Action	Purpose
	<pre>maximum-paths 64 maximum-paths ibgp 64</pre>	
<b>Step 3</b>	<b>evpn multihoming core-tracking</b>	Enables EVPN multihoming core-links. It tracks the uplink interfaces towards the core. If all uplinks are down, the local ES based the POs is shut down/suspended. This is mainly used to avoid black-holing South-to-North traffic when no uplinks are available.
<b>Step 4</b>	<b>interface port-channel Ethernet-segment &lt;&gt;System-mac &lt;&gt;</b>  <b>Example:</b> <pre>ethernet-segment 11 system-mac 0000.0000.0011</pre>	<p>Configures the local Ethernet Segment ID. The ES ID has to match on VTEPs where the PO is multihomed. The Ethernet Segment ID should be unique per PO.</p> <p>Configures the local system-mac ID that has to match on the VTEPs where the PO is multihomed. The system-mac address can be shared across multiple POs.</p>
<b>Step 5</b>	<b>hardware access-list tcam region vpc-convergence 256</b>  <b>Example:</b> <pre>hardware access-list tcam region vpc-convergence 256</pre>	Configures the TCAM. This command is used to configure the split horizon ACLs in the hardware. This command avoids BUM traffic duplication on the shared ES POs.

## VXLAN EVPN Multihoming Configuration Examples

See the sample VXLAN EVPN multihoming configuration on the switches:

```
Switch 1 (L1)

evpn esi multihoming

router bgp 1001

  evpn multihoming core-tracking
  mtu 9216
  ip address 10.1.1.2/30
  ip pim sparse-mode
  no shutdown

interface Ethernet2/2
  no switchport
  evpn multihoming core-tracking
  mtu 9216
  ip address 10.1.1.6/30
  ip pim sparse-mode
  no shutdown

interface port-channel11
  switchport mode trunk
  switchport access vlan 1001
  switchport trunk allowed vlan 901-902,1001-1050
  ethernet-segment 2011
    system-mac 0000.0000.2011
  mtu 9216

```

# Configuring Layer 2 Gateway STP

## Layer 2 Gateway STP Overview

EVPN multihoming is supported with the Layer 2 Gateway Spanning Tree Protocol (L2G-STP). The Layer 2 Gateway Spanning Tree Protocol (L2G-STP) builds a loop-free tree topology. However, the Spanning Tree Protocol root must always be in the VXLAN fabric. A bridge ID for the Spanning Tree Protocol consists of a MAC address and the bridge priority. When the system is running in the VXLAN fabric, the system automatically assigns the VTEPs with the MAC address c84c.75fa.6000 from a pool of reserved MAC addresses. As a result, each switch uses the same MAC address for the bridge ID emulating a single logical pseudo root.

The Layer 2 Gateway Spanning Tree Protocol (L2G-STP) is disabled by default on EVPN ESI multihoming VLANs. Use the **spanning-tree domain enable** CLI command to enable L2G-STP on all VTEPs. With L2G-STP enabled, the VXLAN fabric (all VTEPs) emulates a single pseudo root switch for the customer access switches. The L2G-STP is initiated to run on all VXLAN VLANs by default on boot up and the root is fixed on the overlay. With L2G-STP, the root-guard gets enabled by default on all the access ports. Use

**spanning-tree domain** *<id>* to additionally enable Spanning Tree Topology Change Notification(STP-TCN), to be tunneled across the fabric.

All the access ports from VTEPs connecting to the customer access switches are in a *desg* forwarding state by default. All ports on the customer access switches connecting to VTEPs are either in root-port forwarding or alt-port blocking state. The root-guard kicks in if better or superior STP information is received from the customer access switches and it puts the ports in the *blk l2g\_inc* state to secure the root on the overlay-fabric and to prevent a loop.

## Guidelines for Moving to Layer 2 Gateway STP

Complete the following steps to move to Layer 2 gateway STP:

- With Layer 2 Gateway STP, root guard is enabled by default on all the access ports.
- With Layer 2 Gateway STP enabled, the VXLAN fabric (all VTEPs) emulates a single pseudo-root switch for the customer access switches.
- All access ports from VTEPs connecting to the customer access switches are in the **Desg FWD** state by default.
- All ports on customer access switches connecting to VTEPs are either in the root-port FWD or Altn BLK state.
- Root guard is activated if superior spanning-tree information is received from the customer access switches. This process puts the ports in **BLK L2GW\_Inc** state to secure the root on the VXLAN fabric and prevent a loop.
- Explicit domain ID configuration is needed to enable spanning-tree BPDU tunneling across the fabric.
- As a best practice, you should configure all VTEPs with the lowest spanning-tree priority of all switches in the spanning-tree domain to which they are attached. By setting all the VTEPs as the root bridge, the entire VXLAN fabric appears to be one virtual bridge.
- ESI interfaces should not be enabled in spanning-tree edge mode to allow Layer 2 Gateway STP to run across the VTEP and access layer.
- You can continue to use ESIs or orphans (single-homed hosts) in spanning-tree edge mode if they directly connect to hosts or servers that do not run Spanning Tree Protocol and are end hosts.
- Configure all VTEPs that are connected by a common customer access layer in the same Layer 2 Gateway STP domain. Ideally, all VTEPs on the fabric on which the hosts reside and to which the hosts can move.
- The Layer 2 Gateway STP domain scope is global, and all ESIs on a given VTEP can participate in only one domain.
- Mappings between Multiple Spanning Tree (MST) instances and VLANs must be consistent across the VTEPs in a given Layer 2 Gateway STP domain.
- Non-Layer 2 Gateway STP enabled VTEPs cannot be directly connected to Layer 2 Gateway STP-enabled VTEPs. Performing this action results in conflicts and disputes because the non-Layer 2 Gateway STP VTEP keeps sending BPDUs and it can steer the root outside.
- Ensure that the root of an STP domain local to the VXLAN fabric is a VTEP or placed within the fabric.
- Keep the current edge and the BPDU filter configurations on both the Cisco Nexus switches and the access switches after upgrading to the latest build.

- Enable Layer 2 Gateway STP on all the switches with a recommended priority and the *mst* instance mapping as needed. Use the commands **spanning-tree domain enable** and **spanning-tree mst <instance-id's> priority 8192**.
  - Remove the BPDU filter configurations on the switch side first.
  - Remove the BPDU filter configurations and the edge on the customer access switch.
- Now the topology converges with Layer 2 Gateway STP and any blocking of the redundant connections is pushed to the access switch layer.

## Enabling Layer 2 Gateway STP on a Switch

Complete the following steps to enable Layer 2 Gateway STP on a switch.

### SUMMARY STEPS

1. **spanning-tree mode <rapid-pvst, mst>**
2. **spanning-tree domain enable**
3. **spanning-tree domain 1**
4. **spanning-tree mst <id> priority 8192**
5. **spanning-tree vlan <id> priority 8192**
6. **spanning-tree domain disable**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>spanning-tree mode &lt;rapid-pvst, mst&gt;</b>	Enables Spanning Tree Protocol mode.
<b>Step 2</b>	<b>spanning-tree domain enable</b>	Enables Layer 2 Gateway STP on a switch. It disables Layer 2 Gateway STP on all EVPN ESI multihoming VLANs.
<b>Step 3</b>	<b>spanning-tree domain 1</b>	Explicit domain ID is needed to tunnel encoded BPDUs to the core and processes received from the core.
<b>Step 4</b>	<b>spanning-tree mst &lt;id&gt; priority 8192</b>	Configures Spanning Tree Protocol priority.
<b>Step 5</b>	<b>spanning-tree vlan &lt;id&gt; priority 8192</b>	Configures Spanning Tree Protocol priority.
<b>Step 6</b>	<b>spanning-tree domain disable</b>	Disables Layer 2 Gateway STP on a VTEP.

### Example

All Layer 2 Gateway STP VLANs should be set to a lower spanning-tree priority than the customer-edge (CE) topology to help ensure that the VTEP is the spanning-tree root for this VLAN. If the access switches have a higher priority, you can set the Layer 2 Gateway STP priority to 0 to retain the Layer 2 Gateway STP root in the VXLAN fabric. See the following configuration example:

```
switch# show spanning-tree summary
```

```

Switch is in mst mode (IEEE Standard)
Root bridge for: MST0000
L2 Gateway STP bridge for: MST0000
L2 Gateway Domain ID: 1
Port Type Default          is disable
Edge Port [PortFast] BPDU Guard Default is disabled
Edge Port [PortFast] BPDU Filter Default is disabled
Bridge Assurance            is enabled
Loopguard Default          is disabled
Pathcost method used        is long
PVST Simulation             is enabled
STP-Lite                   is disabled

```

Name	Blocking	Listening	Learning	Forwarding	STP Active
MST0000	0	0	0	12	12
1 mst	0	0	0	12	12

```
switch# show spanning-tree vlan 1001
```

```

MST0000
  Spanning tree enabled protocol mstp

  Root ID    Priority    8192
             Address     c84c.75fa.6001   L2G-STP reserved mac+ domain id
             This bridge is the root
             Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec

  Bridge ID  Priority    8192 (priority 8192 sys-id-ext 0)
             Address     c84c.75fa.6001
             Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec

```

The output displays that the spanning-tree priority is set to 8192 (the default is 32768). Spanning-tree priority is set in multiples of 4096. The priority for individual instances is calculated as the priority and the Instance\_ID. In this case, the priority is calculated as  $8192 + 0 = 8192$ . With Layer 2 Gateway STP, access ports (VTEP ports connected to the access switches) have root guard enabled. If a superior BPDU is received on an edge port of a VTEP, the port is placed in the Layer 2 Gateway inconsistent state until the condition is cleared as displayed in the following example:

```

2016 Aug 29 19:14:19 TOR9-leaf4 %$ VDC-1 %$ %STP-2-L2GW_BACKBONE_BLOCK: L2 Gateway Backbone
port inconsistency blocking port Ethernet1/1 on MST0000.
2016 Aug 29 19:14:19 TOR9-leaf4 %$ VDC-1 %$ %STP-2-L2GW_BACKBONE_BLOCK: L2 Gateway Backbone
port inconsistency blocking port port-channel13 on MST0000.

```

```
switch# show spanning-tree
```

```

MST0000
  Spanning tree enabled protocol mstp
  Root ID    Priority    8192
             Address     c84c.75fa.6001
             This bridge is the root
             Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec

  Bridge ID  Priority    8192 (priority 8192 sys-id-ext 0)
             Address     c84c.75fa.6001
             Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec

```

Interface	Role	Sts	Cost	Prio.	Nbr	Type
Po1	Desg	FWD	20000	128.4096	Edge	P2p
Po2	Desg	FWD	20000	128.4097	Edge	P2p
Po3	Desg	FWD	20000	128.4098	Edge	P2p
Po12	Desg	BKN*2000		128.4107	P2p	*L2GW_Inc
Po13	Desg	BKN*1000		128.4108	P2p	*L2GW_Inc
Eth1/1	Desg	BKN*2000		128.1	P2p	*L2GW_Inc

To disable Layer 2 Gateway STP on a VTEP, enter the **spanning-tree domain disable** CLI command. This command disables Layer 2 Gateway STP on all EVPN ESI multihomed VLANs. The bridge MAC address is restored to the system MAC address, and the VTEP may not necessarily be the root. In the following case, the access switch has assumed the root role because Layer 2 Gateway STP is disabled:

```
switch(config)# spanning-tree domain disable
```

```
switch# show spanning-tree summary
Switch is in mst mode (IEEE Standard)
Root bridge for: none
L2 Gateway STP is disabled
Port Type Default is disable
Edge Port [PortFast] BPDU Guard Default is disabled
Edge Port [PortFast] BPDU Filter Default is disabled
Bridge Assurance is enabled
Loopguard Default is disabled
Pathcost method used is long
PVST Simulation is enabled
STP-Lite is disabled
```

Name	Blocking	Listening	Learning	Forwarding	STP Active
MST0000	4	0	0	8	12
1 mst	4	0	0	8	12

```
switch# show spanning-tree vlan 1001
```

```
MST0000
Spanning tree enabled protocol mstp
Root ID Priority 4096
Address 00c8.8ba6.5073
Cost 0
Port 4108 (port-channel13)
Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec

Bridge ID Priority 8192 (priority 8192 sys-id-ext 0)
Address 5897.bd1d.db95
Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
```

With Layer 2 Gateway STP, the access ports on VTEPs cannot be in an edge port, because they behave like normal spanning-tree ports, receiving BPDUs from the access switches. In that case, the access ports on VTEPs lose the advantage of rapid transmission, instead forwarding on Ethernet segment link flap. (They have to go through a proposal and agreement handshake before assuming the FWD-Desg role).

# Configuring VXLAN EVPN Multihoming Traffic Flows

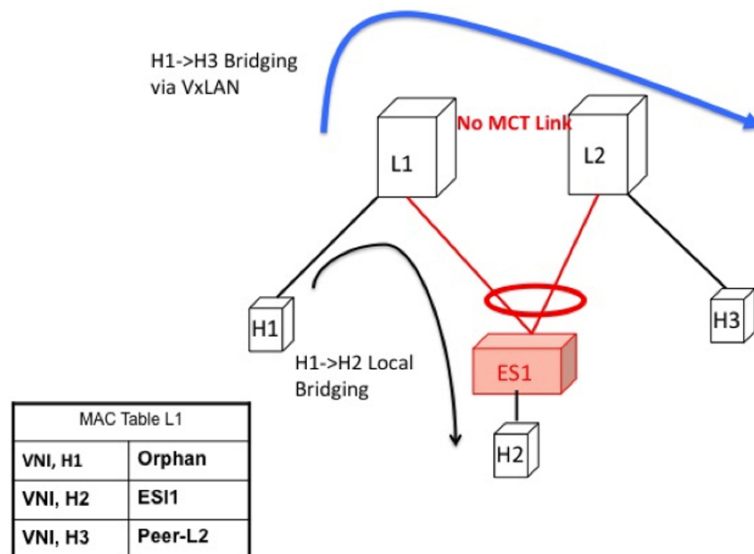

## EVPN Multihoming Local Traffic Flows

All switches that are a part of the same redundancy group (as defined by the ESI) act as a single virtual switch with respect to the access switch/host. However, there is no MCT link present to bridge and route the traffic for local access.

### Locally Bridged Traffic

Host H2 is dually homed whereas hosts H1 and H3 are single-homed (also known as orphans). The traffic is bridged locally from H1 to H2 via L1. However, if the packet needs to be bridged between the orphans H1 and H3, the packet must be bridged via the VXLAN overlay.

**Figure 55: Local Bridging at L1. H1->H3 bridging via VXLAN. In vPC, H1->H3 will be via MCT link.**

### Access Failure for Locally Bridged Traffic

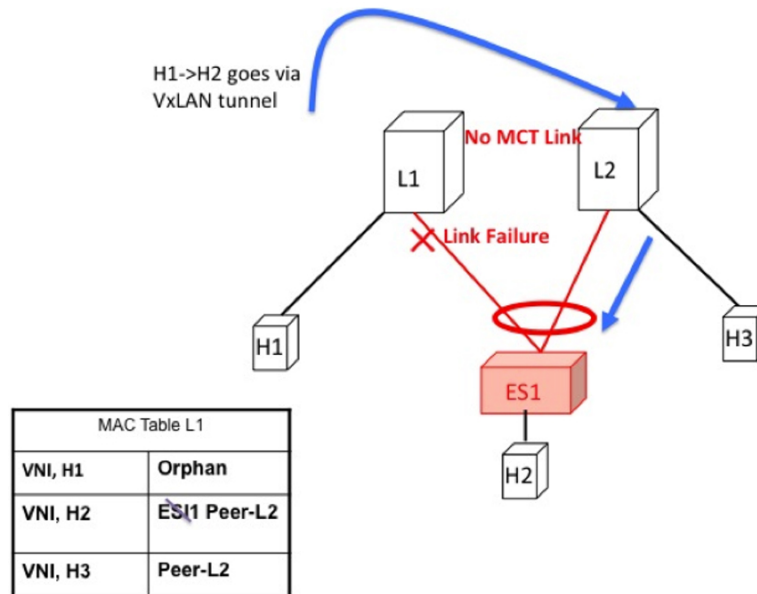

If the ESI link at L1 fails, there is no path for the bridged traffic to reach from H1 to H2 except via the overlay. Therefore, the local bridged traffic takes the sub-optimal path, similar to the H1 to H3 orphan flow.

#### Note

When such condition occurs, the MAC table entry for H2 changes from a local route pointing to a port channel interface to a remote overlay route pointing to peer-ID of L2. The change gets percolated in the system from BGP.

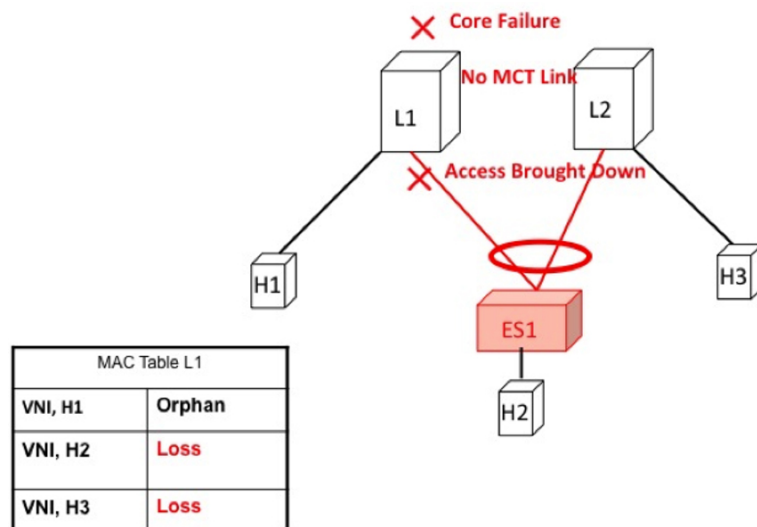

Figure 56: ES1 failure on L1. H1->H2 is now bridged over VXLAN tunnel.

### Core Failure for Locally Bridged Traffic

If switch L1 gets isolated from the core, it must not continue to attract access traffic, as it will not be able to encapsulate and send it on the overlay. This means that the access links must be brought down at L1 if L1 loses core reachability. In this scenario, orphan H1 loses all connectivity to both remote and locally attached hosts since there is no dedicated MCT link.

Figure 57: Core failure on L1. H1->H2 loses all connectivity as there is no MCT.

### Locally Routed Traffic

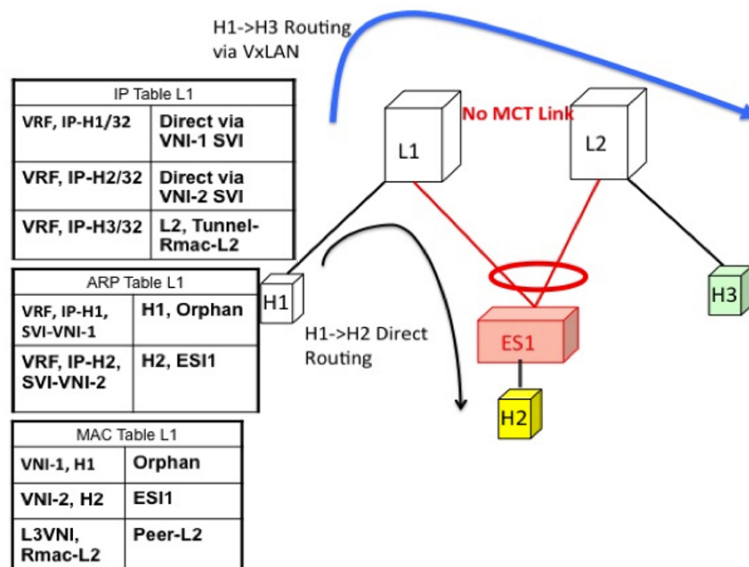

Consider H1, H2, and H3 being in different subnets and L1/L2 being distributed anycast gateways.

Any packet that is routed from H1 to H2 is directly sent from L1 via native routing.

However, host H3 is not a locally attached adjacency, unlike in vPC case where the ARP entry syncs to L1 as a locally attached adjacency. Instead, H3 shows up as a remote host in the IP table at L1, installed in the context of L3 VNI. This packet must be encapsulated in the router-MAC of L2 and routed to L2 via VXLAN overlay.

Therefore, routed traffic from H1 to H3 takes place exactly in the same fashion as routed traffic between truly remote hosts in different subnets.

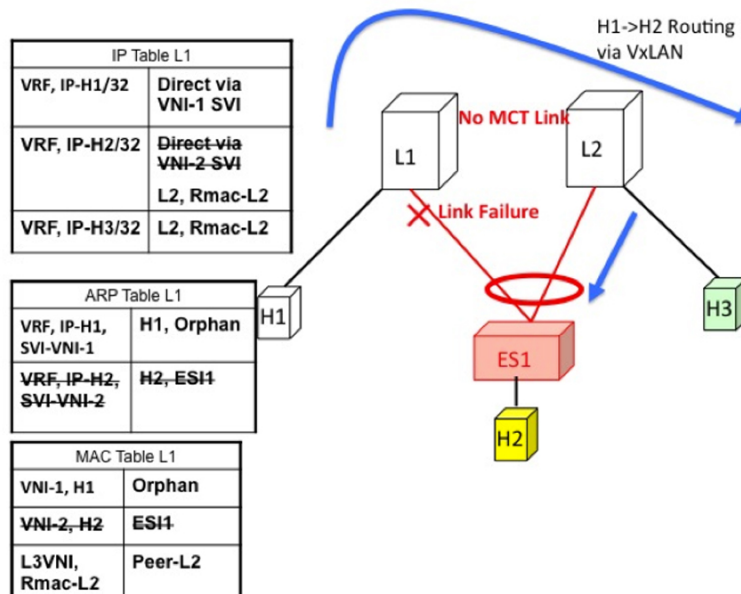

**Figure 58: L1 is Distributed Anycast Gateway. H1, H2, and H3 are in different VLANs. H1->H3 routing happens via VXLAN tunnel encapsulation. In vPC, H3 ARP would have been synced via MCT and direct routing.**

### Access Failure for Locally Routed Traffic

In case the ESI link at switch L1 fails, there is no path for the routed traffic to reach from H1 to H2 except via the overlay. Therefore, the local routed traffic takes the sub-optimal path, similar to the H1 to H3 orphan flow.

Figure 59: H1, H2, and H3 are in different VLANs. ES1 fails on L1. H1->H2 routing happens via VXLAN tunnel encapsulation.

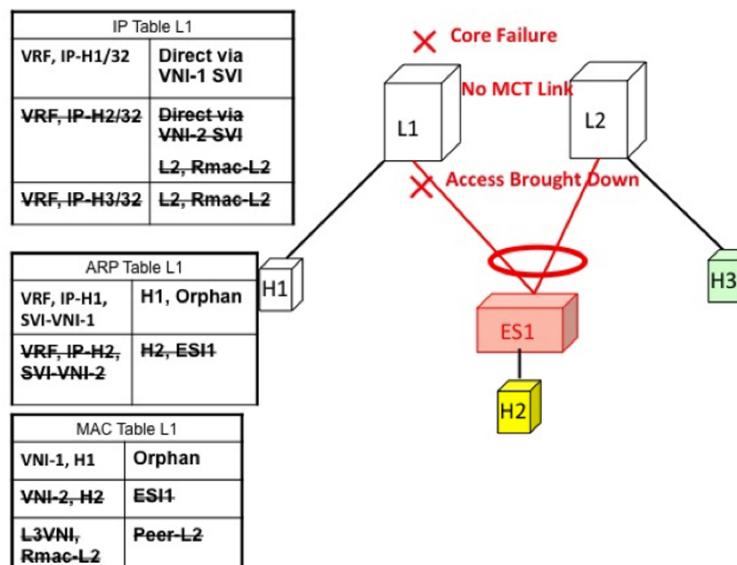

### Core Failure for Locally Routed Traffic

If switch L1 gets isolated from the core, it must not continue to attract access traffic, as it will not be able to encapsulate and send it on the overlay. It means that the access links must be brought down at L1 if L1 loses core reachability.

In this scenario, orphan H1 loses all connectivity to both remote and locally attached hosts as there is no dedicated MCT link.

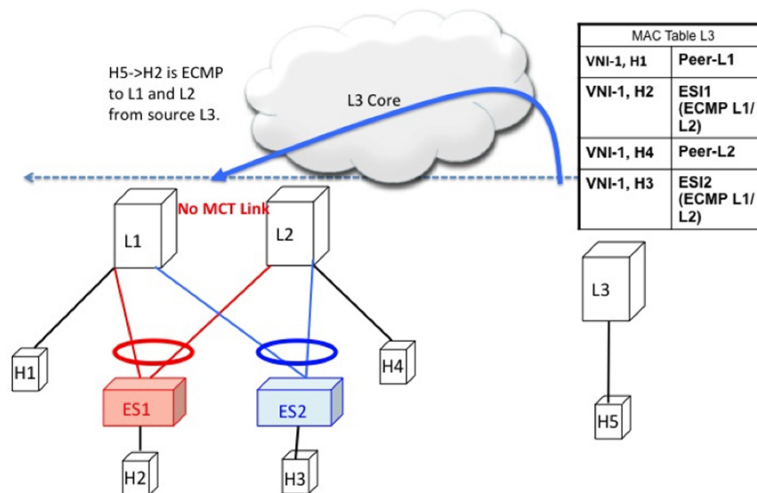

Figure 60: H1, H2, and H3 are in different VLANs. Core fails on L1. Access is brought down. H1 loses all connectivity.

## EVPN Multihoming Remote Traffic Flows

Consider a remote switch L3 that sends bridged and routed traffic to the multihomed complex comprising of switches L1 and L2. As there is no virtual or emulated IP representing this MH complex, L3 must do ECMP at the source for both bridged and routed traffic. This section describes how the ECMP is achieved at switch L3 for both bridged and routed cases and how the system interacts with core and access failures.

**Figure 61: Layer 2 VXLAN Gateway. L3 performs MAC ECMP to L1/L2.**

### Remote Bridged Traffic

Consider a remote host H5 that wants to bridge traffic to host H2 that is positioned behind the EVPN MH Complex (L1, L2). Host H2 builds an ECMP list in accordance to the rules defined in RFC 7432. The MAC table at switch L3 displays that the MAC entry for H2 points to an ECMP PathList comprising of IP-L1 and IP-L2. Any bridged traffic going from H5 to H2 is VXLAN encapsulated and load balanced to switches L1 and L2. When making the ECMP list, the following constructs need to be kept in mind:

- Mass Withdrawal: Failures causing PathList correction should be independent of the scale of MACs.
- Aliasing: PathList Insertions may be independent of the scale of MACs (based on support of optional routes).

Below are the main constructs needed to create this MAC ECMP PathList:

### Ethernet Auto Discovery Route (Type 1) per ES

EVPN defines a mechanism to efficiently and quickly signal the need to update their forwarding tables upon the occurrence of a failure in connectivity to an Ethernet Segment. Having each PE advertise a set of one or more Ethernet A-D per ES route for each locally attached Ethernet Segment does this.

Ethernet Auto Discovery Route (Route Type 1) per ES		
NLRI	Route Type	Ethernet Segment (Type 1)
	Route Distinguisher	Router-ID: Segment-ID (VNID << 8)
	ESI	<Type: 1B><MAC: 6B><LD: 3B>
	Ethernet Tag	MAX-ET
	MPLS Label	0
ATTRS	ESI Label Extended Community ESI Label = 0	Single Active = False
	Next-Hop	NVE Loopback IP
	Route Target	Subset of List of RTs of MAC-VRFs associated to all the EVIs active on the ES

#### MAC-IP Route (Type 2)

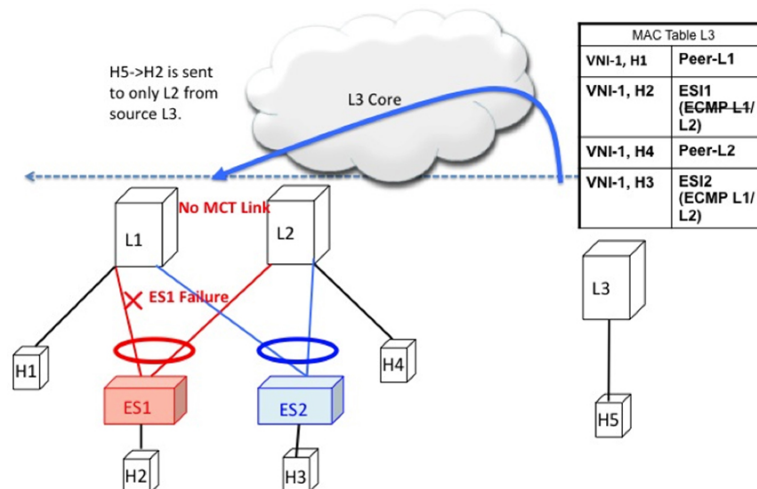

MAC-IP Route remains the same as used in the current vPC multihoming and standalone single-homing solutions. However, now it has a non-zero ESI field that indicates that this is a multihomed host and it is a candidate for ECMP Path Resolution.

MAC IP Route (Route Type 2)		
NLRI	Route Type	MAC IP Route (Type 2)
	Route Distinguisher	RD of MAC-VRF associated to the Host
	ESI	<Type : 1B><MAC : 6B><LD : 3B>
	Ethernet Tag	MAX-ET
	MAC Addr	MAC Address of the Host
	IP Addr	IP Address of the Host
	Labels	L2VNI associated to the MAC-VRF L3VNI associated to the L3-VRF
ATTRS	Next-Hop	Loopback of NVE
	RT Export	RT configured under MAC-VRF (AND/OR) L3-VRF associated to the host

### Access Failure for Remote Bridged Traffic

In the condition of a failure of ESI links, it results in mass withdrawal. The EAD/ES route is withdrawn leading the remote device to remove the switch from the ECMP list for the given ES.

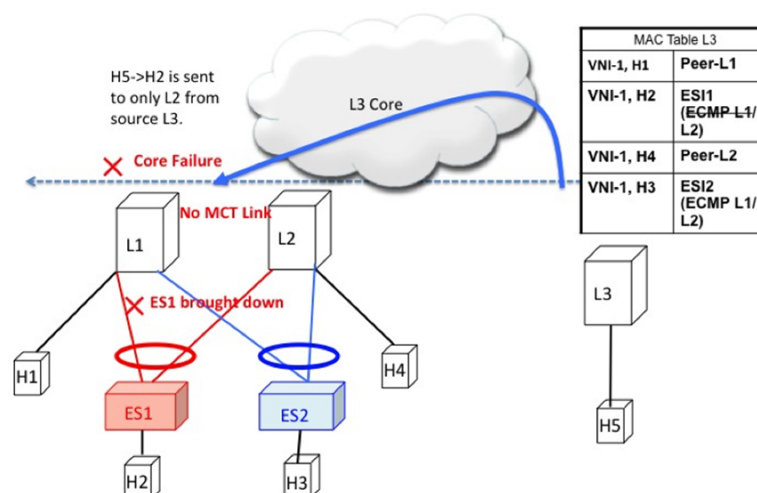

**Figure 62: Layer 2 VXLAN Gateway. ESI failure on L1. L3 withdraws L1 from MAC ECMP list. This will happen due to EAD/ES mass withdrawal from L1.**

### Core Failure for Remote Bridged Traffic

If switch L1 gets isolated from the core, it must not continue to attract access traffic, as it is not able to encapsulate and send it on the overlay. It means that the access links must be brought down at L1 if L1 loses core reachability.

**Figure 63: Layer 2 VXLAN Gateway. Core failure at L1. L3 withdraws L1 from MAC ECMP list. This will happen due to route reachability to L1 going away at L3.**

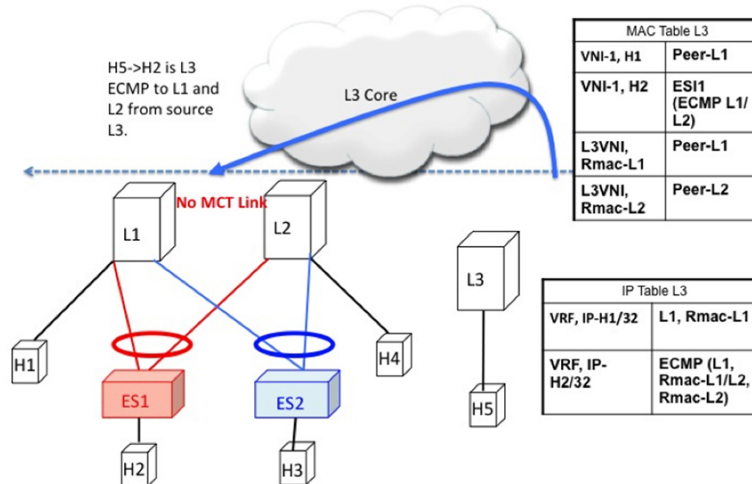

### Remote Routed Traffic

Consider L3 being a Layer 3 VXLAN Gateway and H5 and H2 belonging to different subnets. In that case, any inter-subnet traffic going from L3 to L1/L2 is routed at L3, that is a distributed anycast gateway. Both

L1 and L2 advertise the MAC-IP route for Host H2. Due to the receipt of these routes, L3 builds an L3 ECMP list comprising of L1 and L2.

**Figure 64: Layer 3 VXLAN Gateway. L3 does IP ECMP to L1/L2 for inter subnet traffic.**

### Access Failure for Remote Routed Traffic

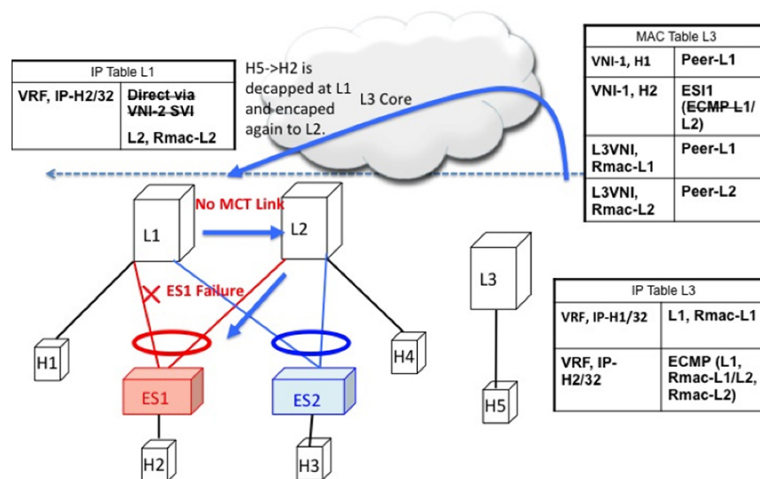

If the access link pointing to ES1 goes down on L1, the mass withdrawal route is sent in the form of EAD/ES and that causes L3 to remove L1 from the MAC ECMP PathList, leading the intra-subnet (L2) traffic to converge quickly. L1 now treats H2 as a remote route reachable via VXLAN Overlay as it is no longer directly connected through the ESI link. This causes the traffic destined to H2 to take the suboptimal path L3->L1->L2.

Inter-Subnet traffic H5->H2 will follow the following path:

- Packet are sent by H5 to gateway at L3.
- L3 performs symmetric IRB and routes the packet to L1 via VXLAN overlay.
- L1 decaps the packet and performs inner IP lookup for H2.
- H2 is a remote route. Therefore, L1 routes the packet to L2 via VXLAN overlay.
- L2 decaps the packet and performs an IP lookup and routes it to directly attached SVI.

Hence the routing happens 3 times, once each at L3, L1, and L2. This sub-optimal behavior continues until Type-2 route is withdrawn by L1 by BGP.

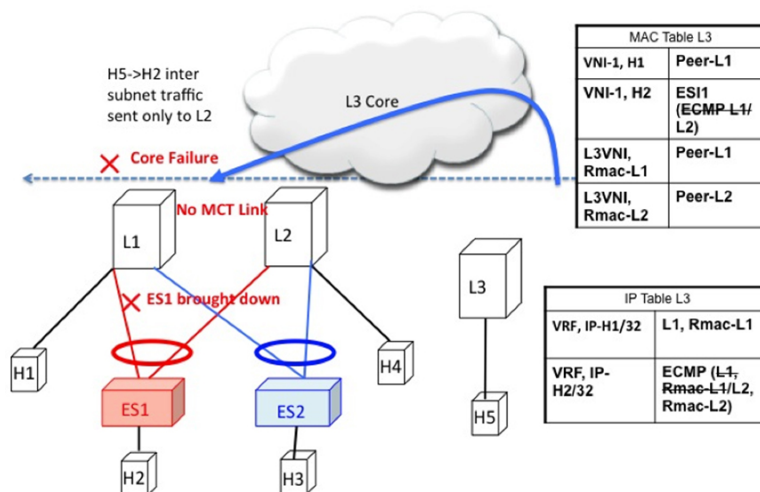

**Figure 65: Layer 3 VXLAN Gateway. ESI failure causes ES mass withdrawal that only impacts L2 ECMP. L3 ECMP continues until Type2 is withdrawn. L3 traffic reaches H2 via suboptimal path L3->L1->L2 until then.**

### Core Failure for Remote Routed Traffic

Core Failure for Remote Routed Traffic behaves the same as core failure for remote bridged traffic. As the underlay routing protocol withdraws L1's loopback reachability from all remote switches, L1 is removed from both MAC ECMP and IP ECMP lists everywhere.

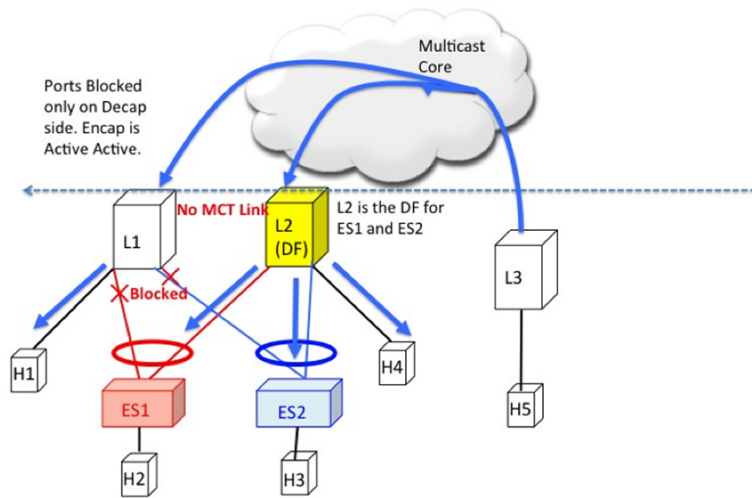

**Figure 66: Layer 3 VXLAN Gateway. Core failure. All L3 ECMP paths to L1 are withdrawn at L3 due to route reachability going away.**

## EVPN Multihoming BUM Flows

NX-OS supports multicast core in the underlay with ESI. Consider BUM traffic originating from H5. The BUM packets are encapsulated in the multicast group mapped to the VNI. Because both L1 and L2 have joined the shared tree (\*, G) for the underlay group based on the L2VNI mapping, both receive a copy of the BUM traffic.

**Figure 67: BUM traffic originating at L3. L2 is the DF for ES1 and ES2. L2 decapsulates and forwards to ES1, ES2 and orphan. L1 decapsulates and only forwards to orphan.**

### Designated Forwarder

It is important that only one of the switches in the redundancy group decaps and forwards BUM traffic over the ESI links. For this purpose, a unique Designated Forwarder (DF) is elected on a per Ethernet Segment basis. The role of the DF is to decap and forward BUM traffic originating from the remote segments to the destination local segment for which the device is the DF. The main aspects of DF election are:

- DF Election is per (ES, VLAN) basis. There can be a different DF for ES1 and ES2 for a given VLAN.
- DF election result only applies to BUM traffic on the RX side for decap.
- Every switch must decap BUM traffic to forward it to singly homed or orphan links.
- Duplication of DF role leads to duplicate packets or loops in a DHN. Therefore, there must be a unique DF on per (ES, VLAN) basis.

### Split Horizon and Local Bias

Consider BUM traffic originating from H2. Consider that this traffic is hashed at L1. L1 encapsulates this traffic in Overlay Multicast Group and sends the packet out to the core. All switches that have joined this multicast group with same L2VNI receive this packet. Additionally, L1 also locally replicates the BUM packet on all directly connected orphan and ESI ports. For example, if the BUM packet originated from ES1, L1 locally replicates it to ES2 and the orphan ports. This technique to replicate to all the locally attached links is termed as local-bias.

Remote switches decap and forward it to their ESI and orphan links based on the DF state. However, this packet is also received at L2 that belongs to the same redundancy group as the originating switch L1. L2 must decap the packet to send it to orphan ports. However, even though L2 is the DF for ES1, L2 must not forward this packet to ES1 link. This packet was received from a peer that shares ES1 with L1 as L1 would have done local-bias and duplicate copies should not be received on ES2. Therefore L2 (DF) applies a split-horizon filter for L1-IP on ES1 and ES2 that it shares with L1. This filter is applied in the context of a VLAN.

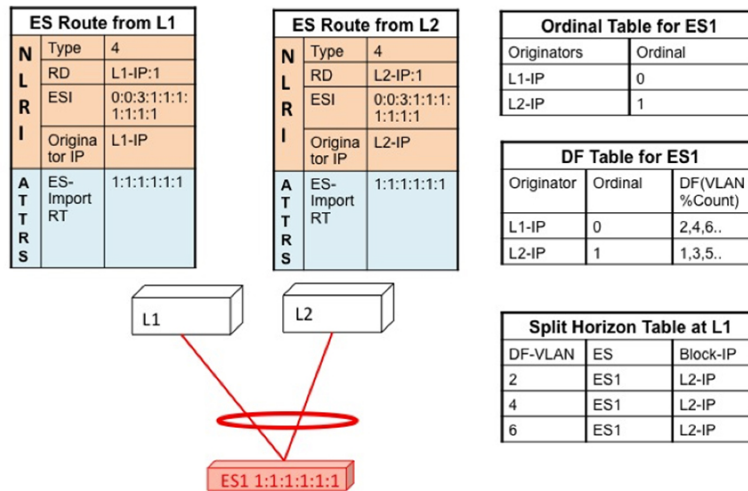

[illegible]

The Ethernet Segment Route is used to elect the Designated Forwarder and to apply Split Horizon Filtering. All the switches that are configured with an Ethernet Segment originate from this route. Ethernet Segment Route is exported and imported when ESI is locally configured under the PC.

## DF Election and VLAN Carving

494

Figure 69: If VLAN % count equals to ordinal, take up DF role.

### Core and Site Failures for BUM Traffic

If the access link pertaining to ES1 fails at L1, L1 withdraws the ES route for ES1. This leads to a change triggering re-compute the DF. Since L2 is the only TOR left in the Ordinal Table, it takes over DF role for all VLANs.

BGP EVPN multihoming on Cisco Nexus 9000 Series switches provides minimum operational and cabling expenditure, provisioning simplicity, flow based load balancing, multi pathing, and fail-safe redundancy.

## Configuring ESI ARP Suppression

### Overview of ESI ARP Suppression

Ethernet Segment Identifier (ESI) ARP suppression is an extension of the ARP suppression solution in VXLAN EVPN. It optimizes the ESI multihoming feature by significantly decreasing ARP broadcasts in the data center.

The host normally floods the VLAN with ARP requests. You can minimize this flooding by maintaining an ARP cache locally on the leaf switch. The ARP cache is built by:

- Snooping all ARP packets and populating the ARP cache with the source IP address and MAC bindings from the request
- Learning IP host or MAC address information through BGP EVPN IP or MAC route advertisements

With ESI ARP suppression, the initial ARP requests are broadcast to all sites. However, subsequent ARP requests are suppressed at the first-hop leaf switch and answered locally if possible. In this way, ESI ARP suppression significantly reduces ARP traffic across the overlay. If the cache lookup fails and the response cannot be generated locally, the ARP request can be flooded, which helps with the detection of silent hosts.

ESI ARP suppression is a per-VNI (L2 VNI) feature and is supported only with VXLAN EVPN (distributed gateway). This feature is supported only in L3 mode.

## Limitations for ESI ARP Suppression

See the following limitations for ESI ARP suppression:

- ESI multihoming solution is supported only on Cisco Nexus 9300 Series switches at the leafs.
- ESI ARP suppression is only supported in L3 [SVI] mode.
- ESI ARP suppression cache limit is 64K that includes both local and remote entries.

## Configuring ESI ARP Suppression

For ARP suppression VACLs to work, configure the TCAM carving using the **hardware access-list team region arp-ether 256** CLI command.

```
Interface nve1
  no shutdown
  source-interface loopback1
  host-reachability protocol bgp
  member vni 10000
  suppress-arp
  mcast-group 224.1.1.10
```

## Displaying Show Commands for ESI ARP Suppression

See the following Show commands output for ESI ARP suppression:

```
switch# show ip arp suppression-cache ?

# Configuring VLAN Consistency Checking

## Overview of VLAN Consistency Checking

In a typical multihoming deployment scenario, host 1 belonging to VLAN X sends traffic to the access switch and then the access switch sends the traffic to both the uplinks towards VTEP1 and VTEP2. The access switch does not have the information about VLAN X configuration on VTEP1 and VTEP2. VLAN X configuration mismatch on VTEP1 or VTEP2 results in a partial traffic loss for host 1. VLAN consistency checking helps to detect such configuration mismatch.

For VLAN consistency checking, CFSoIP is used. Cisco Fabric Services (CFS) provides a common infrastructure to exchange the data across the switches in the same network. CFS has the ability to discover CFS capable switches in the network and to discover the feature capabilities in all the CFS capable switches. You can use CFS over IP (CFSoIP) to distribute and synchronize a configuration on one Cisco device or with all other Cisco devices in your network.

CFSoIP uses multicast to discover all the peers in the management IP network. For EVPN multihoming VLAN consistency checking, it is recommended to override the default CFS multicast address with the **cfs ipv4 mcast-address** <mcast address> CLI command. To enable CFSoIP, the **cfs ipv4 distribute** CLI command should be used.

When a trigger (for example, device booting up, VLAN configuration change, VLANs administrative state change on the ethernet-segment port-channel) is issued on one of the multihoming peers, a broadcast request with a snapshot of configured and administratively up VLANs for the ethernet-segment (ES) is sent to all the CFS peers.

When a broadcast request is received, all CFS peers sharing the same ES as the requestor respond with their VLAN list (configured and administratively up VLAN list per ES). The VLAN consistency checking is run upon receiving a broadcast request or a response.

A 15 seconds timer is kicked off before sending a broadcast request. On receiving the broadcast request or response, the local VLAN list is compared with that of the ES peer. The VLANs that do not match are suspended. Newly matched VLANs are no longer suspended.

VLAN consistency checking runs for the following events:

- Global VLAN configuration: Add, delete, shut, or no shut events.
- Port channel VLAN configuration: Trunk allowed VLANs added or removed or access VLAN changed.
- CFS events: CFS peer added or deleted or CFSoIP configuration is removed.
- ES Peer Events: ES peer added or deleted.

The broadcast request is retransmitted if a response is not received. VLAN consistency checking fails to run if a response is not received after 3 retransmissions.

## VLAN Consistency Checking Guidelines and Limitations

See the following guidelines and limitations for VLAN consistency checking:

- The VLAN consistency checking uses CFSoIP. Out-of-band access through a management interface is mandatory on all multihoming switches in the network.
- It is recommended to override the default CFS multicast address with the CLI **cfs ipv4 mcast-address** *<mcast address>* command.
- The VLAN consistency check cannot detect a mismatch in **switchport trunk native vlan** configuration.
- CFSoIP and CFSoE should not be used in the same device.
- CFSoIP should not be used in devices that are not used for VLAN consistency checking.
- If CFSoIP is required in devices that do not participate in VLAN consistency checking, a different multicast group should be configured for devices that participate in VLAN consistency with the CLI **cfs ipv4 mcast-address** *<mcast address>* command.

## Configuring VLAN Consistency Checking

Use the **cfs ipv4 mcast-address** *<mcast address>* CLI command to override the default CFS multicast address. Use the **cfs ipv4 distribute** CLI command to enable CFSoIP.

To enable or disable the VLAN consistency checking, use the new **vlan-consistency-check** CLI command that has been added under the **evpn esi multihoming** mode.

```
switch (config)# sh running-config | in cfs
cfs ipv4 mcast-address 239.255.200.200
cfs ipv4 distribute

switch# sh run | i vlan-consistency
evpn esi multihoming
    vlan-consistency-check
```

## Displaying Show Command Output for VLAN Consistency Checking

See the following show commands output for VLAN consistency checking.

To list the CFS peers, use the **sh cfs peers name nve** CLI command.

```
switch# sh cfs peers name nve

Scope      : Physical-ip
-----
Switch WWN      IP Address
-----
20:00:f8:c2:88:23:19:47 172.31.202.228 [Local]
                        Switch
20:00:f8:c2:88:90:c6:21 172.31.201.172 [Not Merged]
20:00:f8:c2:88:23:22:8f 172.31.203.38  [Not Merged]
20:00:f8:c2:88:23:1d:e1 172.31.150.132 [Not Merged]
20:00:f8:c2:88:23:1b:37 172.31.202.233 [Not Merged]
20:00:f8:c2:88:23:05:1d 172.31.150.134 [Not Merged]
```

The **show nve ethernet-segment** command now displays the following details:

- The list of VLANs for which consistency check is failed.
- Remaining value (in seconds) of the global VLAN CC timer.

```
switch# sh nve ethernet-segment
ESI Database
-----
ESI: 03aa.aaaa.aaaa.aa00.0001,

## About Proportional Multipath for VNF

In Network Function Virtualization Infrastructures (NFVi), anycast services networks are advertised from multiple Virtual Network Functions (VNFs). The Proportional Multipath for VNF feature enables advertising of all the available next hops to a given destination network. This feature enables the switch to consider all paths to a given route as equal cost multipath (ECMP) allowing the traffic to be forwarded using all the available links stretched across multiple ToRs.

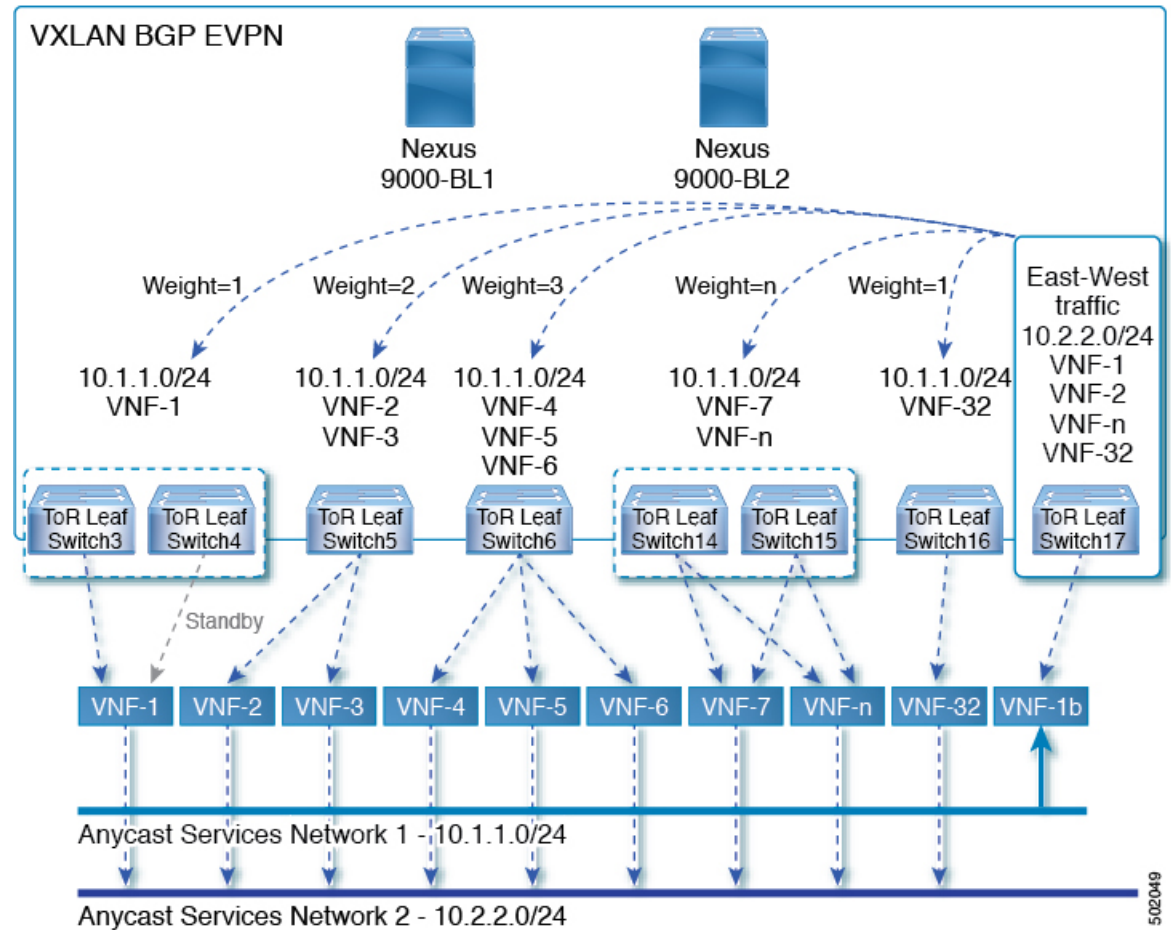

Figure 70: Sample Topology (North-South Traffic)

502048

In the preceding diagram, North-South traffic that enters the VXLAN fabric at a border leaf is sent across all egress endpoints with the traffic forwarded proportional to the number of links from the egress top of rack (ToR) to the destination network.

Figure 71: Sample Topology (East-West Traffic)

East-West traffic is forwarded between the VXLAN Tunnel Endpoints (VTEPs) proportional to the number of next hops advertised by each ToR switch to the destination network.

The switch uses BGP to advertise reachability within the fabric using the Layer 2 VPN (L2VPN)/Ethernet VPN (EVPN) address family. If all ToR switches and border leafs are within the same Autonomous System (AS), a full internal BGP (iBGP) mesh is configured by using route reflectors or by having each BGP router peer with every other router.

Each ToR and border leaf constitutes a VTEP in the VXLAN fabric. You can use a BGP route reflector to reduce the full mesh BGP sessions across the VTEPs to a single BGP session between a VTEP and the route reflector. Virtual Network Identifiers (VNIs) are globally unique within the overlay. Each Virtual Routing and Forwarding (VRF) instance is mapped to a unique VNI. The inner destination MAC address in the VXLAN header belongs to the receiving VTEP that does the routing of the VXLAN payload. This MAC address is distributed as a BGP attribute along with the EVPN routes.

### Advertisement of Customer Networks

Customer networks are configured statically or learned locally by using an interior gateway protocol, (IGP) or external BGP (eBGP), over a Provider Edge(PE)-Customer Edge(CE) link. These networks are redistributed into BGP and advertised to the VXLAN fabric.

The networks advertised to the ToRs by the virtual machines (VMs) attached to them are advertised to the VXLAN fabric as EVPN Type-5 routes with the following:

- The route distinguisher (RD) will be the Layer 3 VNI's configured RD.
- The gateway IP field will be populated with the next hop.
- The next hop of the EVPN route will continue to be the VTEP IP.
- The export route targets of the routes will be derived from the configured export route targets of the associated Layer 3 VNI.

Multiple VRF routes may generate the same Type-5 Network Layer Reachability Information (NLRI) differentiated only by the gateway IP field. The routes are advertised with the L3VNI's RD, and the gateway IP isn't part of the Type-5 NLRI's key. The NLRI is exchanged between BGP routers using update messages. These routes are advertised to the EVPN AF by extending the BGP export mechanism to include ECMPs and using the `addpath BGP` feature in the EVPN AF.

Each Type-5 route within the EVPN AF that is created by using the Proportional Multipath for VNF feature may have multiple paths that are imported into the corresponding VRF based on the matching of the received route targets and by having ECMP enabled within the VRF and in the EVPN AF. Within the VRF, the route is a single prefix with multiple paths. Each path represents a Type-5 EVPN path or those learned locally within the VRF. The EVPN Type-5 routes that are enabled for the Proportional Multipath for VNF feature will have their next hop in the VRF derived from their gateway IP field. Use the **`export-gateway-ip`** command to enable BGP to advertise the gateway IP in the EVPN Type-5 routes.

Use the **`maximum-paths mixed`** command to enable BGP and the Unicast Routing Information Base (URIB) to consider the following paths as ECMP:

- iBGP paths
- eBGP paths
- Paths from other protocols (such as static) that are redistributed or injected into BGP

The paths can be either local to the device (static, iBGP, or eBGP) or remote (eBGP or iBGP learned over BGP-EVPN). This overrides the default route selection behavior in which local routes are preferred over remote routes. URIB downloads all next hops of the route, including locally learned and user-configured routes, to the Unicast FIB Distribution Module (uFDM)/Forwarding Information Base (FIB).

Beginning with Cisco NX-OS Release 9.3(5), you don't need to use mixed paths. You can choose to have only eBGP or iBGP filter the ECMP paths.

When you enter the **`maximum-paths mixed`** command beginning with Cisco NX-OS Release 9.3(5), BGP checks for the AS-path length by default. If you want to ignore the AS-path length (for example, on nodes that participate in packet forwarding such as BGWs and VTEPs), you must enter the **`bestpath as-path ignore`** command. When the **`maximum-paths mixed`** command is enabled for earlier releases, BGP ignores the AS-path length, and URIB ignores the administrative distance when choosing ECMPs. To ensure that no impact is observed, we recommend upgrading to Cisco NX-OS Release 9.3(5) prior to entering this command.

### Legacy Peer Support

Use the **`advertise-gw-ip`** command to advertise EVPN Type-5 routes with the gateway IP set. ToRs then advertise the gateway IP in the Type-5 NLRI. However, legacy peers running on NX-OS version older than Cisco NX-OS Release 9.2(1) can't process the gateway IP which might lead to unexpected behavior. To prevent this scenario from occurring, use the **`no advertise-gw-ip`** command to disable the Proportional

Multipath for VNF feature for a legacy peer. BGP sets the gateway IP field of the Type-5 NLRI to zero even if the path being advertised has a valid gateway IP.

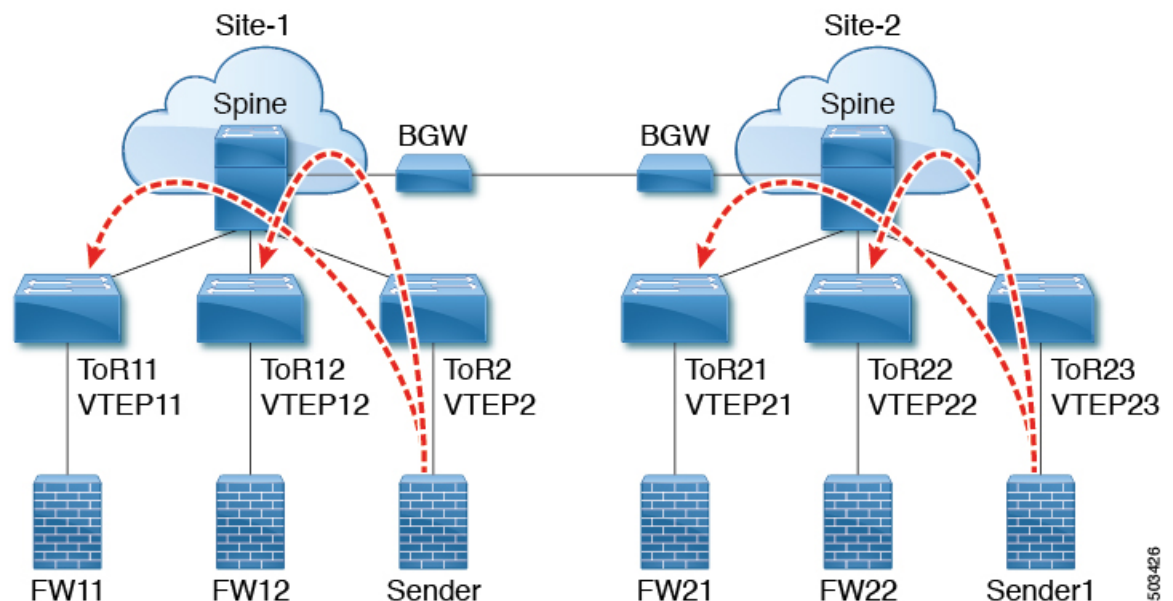

The **no advertise-gw-ip** command flaps the specified peer session as gracefully as possible. The remote peer triggers a graceful restart if the peer supports this capability. When the session is re-established, the local peer advertises EVPN Type-5 routes with the gateway IP set or with the gateway IP as zero depending on whether the **advertise-gw-ip** command has been used. By default, this knob is enabled and the gateway IP field is populated with the appropriate next hop value.

## Proportional Multipath for VNF with Multi-Site

Cisco NX-OS Release 9.3(6) and later releases support Proportional Multipath for VNF with Multi-Site. This feature allows traffic to be sent across sites if a local VNF isn't available.

ToRs prefer to use local VNFs. However, if local VNFs aren't available, they can use VNFs in a different site. In the following topology, the ToRs in site 2 would use VNFs 21 and 22. However, if these VNFs aren't available, sender 1 in site 2 could send traffic to VNFs 11 and 12 in site 1.

**Figure 72: VNFs in a Multi-Site Topology**

To use this feature, simply configure Proportional Multipath for VNF and enable Multi-Site. For a sample configuration, see [Configuration Example for Proportional Multipath for VNF with Multi-Site, on page 526](#).

## Prerequisites for Proportional Multipath for VNF

If desired, take the following actions before upgrading to Cisco NX-OS Release 9.3(5):

- Configure a route map for redistributed paths and use the **set ip next-hop redist-unchanged** command when using locally redistributed paths to export the gateway IP address. This command preserves the next hop for locally redistributed paths. For example:

```
route-map redist-rtmap permit 10
match ip prefix-list vm-pfx-list
set ip next-hop redist-unchanged
```

- Enter the **bestpath as-path ignore** command on nodes that participate in packet forwarding, such as BGWs and VTEPs. This command causes BGP to ignore the AS-path length.

## Guidelines and Limitations for Proportional Multipath for VNF

Proportional Multipath for VNF has the following guidelines and limitations:

- If the Proportional Multipath for VNF feature is enabled, maintenance mode isolation doesn't work because BGP installs all the paths in mixed multipath mode. Alternatively, a route-map is used to deny outbound BGP updates when a switch goes into maintenance mode by using user-defined profiles.
- This feature is supported for Cisco Nexus 9364C, 9300-EX, and 9300-FX/FX2/FX3 platform switches and Cisco Nexus 9500 platform switches with the N9K-C9508-FM-E2 fabric module and an -EX or -FX line card.
- This feature isn't supported on Cisco Nexus 9300-GX platform switches.
- Static and direct routes have to be redistributed into the BGP when the Proportional Multipath for VNF feature is enabled.
- If OSPF or EIGRP is being used as an IGP, routes can't be redistributed into BGP.
- If Proportional Multipath for VNF is enabled and routes aren't redistributed into BGP, asymmetric load balancing of traffic may occur as the local routes from URIB may not show up in BGP and on remote TORs as EVPN paths.
- Devices on which mixed-multipath is enabled must support the same load-balancing algorithm.
- If a VNF instance is multi-homed to multiple TORs, policies have to be configured or BGP routes have to be originated using a network command. As a result, each TOR connection to the VNF is displayed in the BGP routing table. Each TOR can now see the VNF's direct routes to the other TORs in which the VNF is multi-homed. Consequently, each TOR can advertise paths to the Gateway IPs through other TORs leading to a next hop resolution loop.

Consider a scenario in which a VNF is multi-homed to two TORs, TOR1 and TOR2. Individual links to the TORs are addressed as 1.1.1.1 and 2.2.2.2. If the VNF advertises a service 192.168.1.0/24 through the TORs, the TORs advertise EVPN routes to 192.168.1.0/24 with Gateway IPs of 1.1.1.1 and 2.2.2.2 respectively.

As a result, an issue occurs with the Recursive Next Hop (RNH) resolution on a remote TOR (for example, TOR3). The gateway IP is resolved to a /24 route pointing to another gateway IP. That second gateway IP is resolved by a route pointing to the first gateway IP. So, in our scenario, the gateway IP 1.1.1.1 is resolved by 1.1.1.0/24 which points to 2.2.2.2. And 2.2.2.2 is resolved by 2.2.2.0/24 which points to 1.1.1.1.

This condition occurs as both TORs connected to the VNF are advertising the VNF's connected routes. TOR1 is advertising 1.1.1.0/24 and 2.2.2.0/24. However, 1.1.1.0 is advertised without a gateway IP as it's a connected subnet on TOR1. Also, 2.2.2.0 is an OSPF route pointing to 1.1.1.1 which is the VNF's address connected to TOR1.

Similarly, TOR2 advertises both subnets and 2.2.2.0/24 is sent without a gateway IP as it is directly connected to TOR2. 1.1.1.0 is learned via OSPF and is sent with a gateway IP of 2.2.2.2 which is the VNF's address connected to TOR2. 1.1.1.1/32 and 2.2.2.2/32 won't be advertised as they are Adjacency Manager (AM) routes on each TOR.

This issue doesn't have a resolution when Type-5 routes are involved. However, this scenario can be avoided if the TORs advertise the gateway IP's /32 address using a network command. And if the gateway IPs are being resolved by Type-2 EVPN MAC/IP routes, this scenario can be avoided as the gateway IP will be resolved by the /32 IP route.

- The following guidelines and limitations apply to Proportional Multipath for VNF with Multi-Site:
  - This feature is supported for Cisco Nexus 9364C, 9300-EX, and 9300-FX/FX2/FX3 platform switches and Cisco Nexus 9500 platform switches with the N9K-C9508-FM-E2 fabric module and an -EX or -FX line card.
  - VNF moves across sites aren't supported.

## Configuring the Route Reflector

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp *number***
3. **address-family l2vpn evpn**
4. **additional-paths send**
5. **additional-paths receive**
6. **additional-paths selection route-map passall**
7. **route-map passall permit *seq-num***
8. **set path-selection all advertise**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> <code>switch# configure terminal</code>	Enter global configuration mode.
Step 2	<b>router bgp <i>number</i></b> <b>Example:</b> <code>switch(config)# router bgp 2</code>	Configure BGP.
Step 3	<b>address-family l2vpn evpn</b> <b>Example:</b> <code>switch(config-router)# address-family l2vpn evpn</code>	Configure address family Layer 2 VPN EVPN under <b>router bgp</b> context.

	Command or Action	Purpose
<b>Step 4</b>	<b>additional-paths send</b> <b>Example:</b> <code>switch(config-router-af) # additional-paths send</code>	The additional-paths configuration for sending..
<b>Step 5</b>	<b>additional-paths receive</b> <b>Example:</b> <code>switch(config-router-af) # additional-paths receive</code>	The additional-paths configuration for receiving.
<b>Step 6</b>	<b>additional-paths selection route-map passall</b> <b>Example:</b> <code>switch(config-router-af) # additional-paths selection route-map passall</code>	The additional-paths configuration applied the route map.
<b>Step 7</b>	<b>route-map passall permit <i>seq-num</i></b> <b>Example:</b> <code>switch(config) # route-map passall permit 10</code>	Configure the route map.
<b>Step 8</b>	<b>set path-selection all advertise</b> <b>Example:</b> <code>switch(config-route-map) # set path-selection all advertise</code>	Sets the route-map related to the additional-paths feature.

## Configuring the ToR

This procedure describes how to configure the ToR.

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp *number***
3. **address-family l2vpn evpn**
4. **[no] maximum-paths [*eBGP max-paths* |mixed | ibgp |local | eibgp ] *mpath-count***
5. **additional-paths send**
6. **additional-paths receive**
7. **additional-paths selection route-map passall**
8. **exit**
9. **vrf evpn-tenant-1001**
10. **address-family ipv4 unicast**
11. **export-gateway-ip**
12. **[no] maximum-paths [*eBGP max-paths* |mixed | ibgp |local | eibgp ] *mpath-count***
13. **redistribute static route-map redist-rtmap**
14. **maximum-paths local *number***
15. **exit**

16. **address-family ipv6 unicast**
17. **export-gateway-ip**
18. **[no] maximum-paths** [*eBGP max-paths* | **mixed** | **ibgp** | **local** | **eibgp** ] *mpath-count*
19. **redistribute static route-map redist-rtmap**
20. **maximum-paths local** *number*
21. **exit**
22. **route-map passall permit** *seq-num*
23. **set path-selection all advertise**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> <pre>switch# configure terminal</pre>	Enter global configuration mode.
Step 2	<b>router bgp</b> <i>number</i> <b>Example:</b> <pre>switch(config)# router bgp 2</pre>	Configure BGP.
Step 3	<b>address-family l2vpn evpn</b> <b>Example:</b> <pre>switch(config-router)# address-family l2vpn evpn</pre>	Configure address family Layer 2 VPN EVPN under <b>router bgp</b> context.
Step 4	<b>[no] maximum-paths</b> [ <i>eBGP max-paths</i>   <b>mixed</b>   <b>ibgp</b>   <b>local</b>   <b>eibgp</b> ] <i>mpath-count</i> <b>Example:</b> <pre>switch(config-router-af)# maximum-paths ? &lt;1-64&gt;  Number of parallel paths         *Default value is 1   eibgp  Configure multipath for both EBGP and   IBGP paths   ibgp   Configure multipath for IBGP paths   local  Configure multipath for local paths   mixed  Configure multipath for local and remote   paths switch(config-router-af)# maximum-paths mixed 32</pre> <b>Example:</b> <pre>switch(config-router-af)# maximum-paths ibgp 32</pre>	<p>The following options are available:</p> <ul style="list-style-type: none"> <li>• <b>eBGP max-path</b>—Enables the eBGP maximum paths. The range is from 1 to 64 parallel paths. The default value is 1.</li> <li>• <b>mixed</b>—Enables BGP and the Unicast Routing Information Base (URIB) to consider the following paths as Equal Cost Multi Path (ECMP): <ul style="list-style-type: none"> <li>• eBGP paths</li> <li>• eiBGP paths</li> <li>• iBGP paths</li> <li>• Paths from other protocols (such as static) that are redistributed or injected into BGP</li> </ul> </li> <li>• <b>ibgp</b>—Uses iBGP to filter the ECMP paths.</li> <li>• <b>local</b>—Enables the multipath for local paths.</li> <li>• If you enter the command without the <b>mixed</b> or <b>ibgp</b> option, eBGP is used to filter the ECMP paths.</li> </ul>

	Command or Action	Purpose
		<b>Note</b> Use the <b>no</b> form of this command if you want to use a single path instead of maximum paths.
<b>Step 5</b>	<b>additional-paths send</b> <b>Example:</b> <code>switch(config-router-af) # additional-paths send</code>	The additional-paths configuration for sending.
<b>Step 6</b>	<b>additional-paths receive</b> <b>Example:</b> <code>switch(config-router-af) # additional-paths receive</code>	The additional-paths configuration for receiving.
<b>Step 7</b>	<b>additional-paths selection route-map passall</b> <b>Example:</b> <code>switch(config-router-af) # additional-paths selection route-map passall</code>	The additional-paths configuration applied the route map.
<b>Step 8</b>	<b>exit</b> <b>Example:</b> <code>switch(config-router-af) # exit</code>	Exits command mode.
<b>Step 9</b>	<b>vrf evpn-tenant-1001</b> <b>Example:</b> <code>switch(config-router) # vrf evpn-tenant-1001</code>	Switch to the VRF configuration mode.
<b>Step 10</b>	<b>address-family ipv4 unicast</b> <b>Example:</b> <code>switch(config-router) # address-family ipv4 unicast</code>	Configure address family for IPv4.
<b>Step 11</b>	<b>export-gateway-ip</b> <b>Example:</b> <code>switch(config-router-vrf-af) # export-gateway-ip</code>	Enables BGP to advertise the gateway IP in the EVPN Type-5 routes. It exports the gateway IP for all prefixes in that VRF.  <b>Note</b> If you want choose specific prefixes for which to export the gateway IP, use the following configuration instead of the <b>export-gateway-ip</b> command:  <pre> route-map name permit sequence   match ip address prefix-list name   set evpn gateway-ip use-next-hop  vrf context vrf   address-family ipv4 unicast     export map name </pre>
<b>Step 12</b>	<b>[no] maximum-paths</b> [ <i>eBGP max-paths</i>   <b>mixed</b>   <b>ibgp</b>   <b>local</b>   <b>eibgp</b> ] <i>mpath-count</i>	The following options are available:

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>switch(config-router-vrf-af)# maximum-paths ? &lt;1-64&gt;  Number of parallel paths         *Default value is 1         eibgp  Configure multipath for both EBGp and IBGP paths         ibgp   Configure multipath for IBGP paths         local  Configure multipath for local paths         mixed  Configure multipath for local and remote paths  switch(config-router-vrf-af)# maximum-paths mixed 32</pre> <p><b>Example:</b></p> <pre>switch(config-router-vrf-af)# maximum-paths ibgp 32</pre>	<ul style="list-style-type: none"> <li>• <b>eBGP max-path</b>—Enables the eBGP maximum paths. The range is from 1 to 64 parallel paths. The default value is 1.</li> <li>• <b>mixed</b>—Enables BGP and the Unicast Routing Information Base (URIB) to consider the following paths as Equal Cost Multi Path (ECMP): <ul style="list-style-type: none"> <li>• eBGP paths</li> <li>• eiBGP paths</li> <li>• iBGP paths</li> <li>• Paths from other protocols (such as static) that are redistributed or injected into BGP</li> </ul> </li> <li>• <b>ibgp</b>—Uses iBGP to filter the ECMP paths.</li> <li>• <b>local</b>—Enables the multipath for local paths.</li> <li>• If you enter the command without the <b>mixed</b> or <b>ibgp</b> option, eBGP is used to filter the ECMP paths.</li> </ul> <p><b>Note</b> Use the <b>no</b> form of this command if you want to use a single path instead of maximum paths.</p>
<b>Step 13</b>	<p><b>redistribute static route-map redist-rtmap</b></p> <p><b>Example:</b></p> <pre>switch(config-router-vrf-af)# redistribute static route-map redist-rtmap</pre>	Preserves the next-hop of the redistributed paths.
<b>Step 14</b>	<p><b>maximum-paths local number</b></p> <p><b>Example:</b></p> <pre>switch(config-router-vrf-af)# maximum-paths local 32</pre>	<p>Specifies the number of local paths to be redistributed as the BGP best path for a route. The range is from 0 to 32. The default value is 1.</p> <p><b>Note</b> This command isn't supported with the <b>maximum-paths mixed mpath-count</b> command. An error message appears if you try to configure them together.</p> <p><b>Note</b> The <b>set ip next-hop redist-unchanged</b> command is required in order for the <b>maximum-paths local</b> command to work.</p>
<b>Step 15</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>switch(config-router-vrf-af)# exit</pre>	Exits command mode.
<b>Step 16</b>	<p><b>address-family ipv6 unicast</b></p> <p><b>Example:</b></p>	Configure address family for IPv6.

	Command or Action	Purpose
	<code>switch(config-router-vrf)# <b>address-family</b> ipv6 unicast</code>	
<b>Step 17</b>	<b>export-gateway-ip</b> <b>Example:</b> <code>switch(config-router-vrf-af)# <b>export-gateway-ip</b></code>	<p>Enables BGP to advertise the gateway IP in the EVPN Type-5 routes. It exports the gateway IP for all prefixes in that VRF.</p> <p><b>Note</b> If you want choose specific prefixes for which to export the gateway IP, use the following configuration instead of the <b>export-gateway-ip</b> command:</p> <pre>route-map name permit sequence   match ip address prefix-list name   set evpn gateway-ip use-next-hop  vrf context vrf   address-family ipv4 unicast   export map name</pre>
<b>Step 18</b>	<b>[no] maximum-paths [<i>eBGP max-paths</i>  mixed   ibgp  local   eibgp ] mpath-count</b> <b>Example:</b> <pre>switch(config-router-vrf-af)# maximum-paths ? &lt;1-64&gt;  Number of parallel paths         *Default value is 1   eibgp  Configure multipath for both EBGP and IBGP paths   ibgp   Configure multipath for IBGP paths   local  Configure multipath for local paths   mixed  Configure multipath for local and remote paths  switch(config-router-vrf-af)# <b>maximum-paths mixed 32</b></pre> <b>Example:</b> <pre>switch(config-router-vrf-af)# <b>maximum-paths ibgp 32</b></pre>	<p>The following options are available:</p> <ul style="list-style-type: none"> <li>• <b>eBGP max-path</b>—Enables the eBGP maximum paths. The range is from 1 to 64 parallel paths. The default value is 1.</li> <li>• <b>mixed</b>—Enables BGP and the Unicast Routing Information Base (URIB) to consider the following paths as Equal Cost Multi Path (ECMP): <ul style="list-style-type: none"> <li>• eBGP paths</li> <li>• eiBGP paths</li> <li>• iBGP paths</li> <li>• Paths from other protocols (such as static) that are redistributed or injected into BGP</li> </ul> </li> <li>• <b>ibgp</b>—Uses iBGP to filter the ECMP paths.</li> <li>• <b>local</b>—Enables the multipath for local paths.</li> <li>• If you enter the command without the <b>mixed</b> or <b>ibgp</b> option, eBGP is used to filter the ECMP paths.</li> </ul> <p><b>Note</b> Use the <b>no</b> form of this command if you want to use a single path instead of maximum paths.</p>
<b>Step 19</b>	<b>redistribute static route-map redist-rtmap</b> <b>Example:</b> <code>switch(config-router-vrf-af)# <b>redistribute static route-map redist-rtmap</b></code>	Preserves the next-hop of the redistributed paths.

	Command or Action	Purpose
<b>Step 20</b>	<b>maximum-paths local</b> <i>number</i> <b>Example:</b> <pre>switch(config-router-vrf-af)# maximum-paths local 32</pre>	<p>Specifies the number of local paths to be redistributed as the BGP best path for a route. The range is from 0 to 32. The default value is 1.</p> <p><b>Note</b> This command isn't supported with the <b>maximum-paths mixed</b> <i>mpath-count</i> command. An error message appears if you try to configure them together.</p>
<b>Step 21</b>	<b>exit</b> <b>Example:</b> <pre>switch(config-router-vrf-af)# exit</pre>	Exits command mode.
<b>Step 22</b>	<b>route-map passall permit</b> <i>seq-num</i> <b>Example:</b> <pre>switch(config)# route-map passall permit 10</pre>	Configure the route map.
<b>Step 23</b>	<b>set path-selection all advertise</b> <b>Example:</b> <pre>switch(config-route-map)# set path-selection all advertise</pre>	Sets the route-map related to the additional-paths feature.

## Configuring the Border Leaf

This procedure describes how to configure the border leaf.

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *number*
3. **address-family l2vpn evpn**
4. **[no] maximum-paths** [*eBGP max-paths* | **mixed** | **ibgp** | **local** | **eibgp** ] *mpath-count*
5. **additional-paths send**
6. **additional-paths receive**
7. **additional-paths selection route-map passall**
8. **exit**
9. **vrf evpn-tenant-1001**
10. **address-family ipv4 unicast**
11. **export-gateway-ip**
12. **[no] maximum-paths** [*eBGP max-paths* | **mixed** | **ibgp** | **local** | **eibgp** ] *mpath-count*
13. **redistribute static route-map redist-rtmap**
14. **maximum-paths local** *number*
15. **address-family ipv6 unicast**
16. **export-gateway-ip**

17. `[no] maximum-paths [eBGP max-paths |mixed | ibgp |local | eibgp ] mpath-count`
18. `redistribute static route-map redist-rtmap`
19. `maximum-paths local number`
20. `exit`
21. `route-map passall permit seq-num`
22. `set path-selection all advertise`
23. `ip load-sharing address source-destination rotate rotate universal-id seed`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>switch# configure terminal</pre>	Enter global configuration mode.
<b>Step 2</b>	<b>router bgp number</b> <b>Example:</b> <pre>switch(config)# router bgp 2</pre>	Configure BGP.
<b>Step 3</b>	<b>address-family l2vpn evpn</b> <b>Example:</b> <pre>switch(config-router)# address-family l2vpn evpn</pre>	Configure address family Layer 2 VPN EVPN under <b>router bgp</b> context.
<b>Step 4</b>	<b>[no] maximum-paths [eBGP max-paths  mixed   ibgp  local   eibgp ] mpath-count</b> <b>Example:</b> <pre>switch(config-router-af)# maximum-paths ? &lt;1-64&gt;  Number of parallel paths         *Default value is 1   eibgp  Configure multipath for both EBGP and   IBGP paths   ibgp   Configure multipath for IBGP paths   local  Configure multipath for local paths   mixed  Configure multipath for local and remote   paths  switch(config-router-af)# maximum-paths mixed 32</pre> <b>Example:</b> <pre>switch(config-router-af)# maximum-paths ibgp 32</pre>	<p>The following options are available:</p> <ul style="list-style-type: none"> <li>• <b>eBGP max-path</b>—Enables the eBGP maximum paths. The range is from 1 to 64 parallel paths. The default value is 1.</li> <li>• <b>mixed</b>—Enables BGP and the Unicast Routing Information Base (URIB) to consider the following paths as Equal Cost Multi Path (ECMP): <ul style="list-style-type: none"> <li>• eBGP paths</li> <li>• eiBGP paths</li> <li>• iBGP paths</li> <li>• Paths from other protocols (such as static) that are redistributed or injected into BGP</li> </ul> </li> <li>• <b>ibgp</b>—Uses iBGP to filter the ECMP paths.</li> <li>• <b>local</b>—Enables the multipath for local paths.</li> <li>• If you enter the command without the <b>mixed</b> or <b>ibgp</b> option, eBGP is used to filter the ECMP paths.</li> </ul> <p><b>Note</b> Use the <b>no</b> form of this command if you want to use a single path instead of maximum paths.</p>

	Command or Action	Purpose
<b>Step 5</b>	<b>additional-paths send</b> <b>Example:</b> <pre>switch(config-router-af) # additional-paths send</pre>	The additional-paths configuration for sending.
<b>Step 6</b>	<b>additional-paths receive</b> <b>Example:</b> <pre>switch(config-router-af) # additional-paths receive</pre>	The additional-paths configuration for receiving.
<b>Step 7</b>	<b>additional-paths selection route-map passall</b> <b>Example:</b> <pre>switch(config-router-af) # additional-paths selection route-map passall</pre>	The additional-paths configuration enables the additional-paths feature.
<b>Step 8</b>	<b>exit</b> <b>Example:</b> <pre>switch(config-router-af) # exit</pre>	Exits command mode.
<b>Step 9</b>	<b>vrf evpn-tenant-1001</b> <b>Example:</b> <pre>switch(config-router) # vrf evpn-tenant-1001</pre>	Switch to the VRF configuration mode.
<b>Step 10</b>	<b>address-family ipv4 unicast</b> <b>Example:</b> <pre>switch(config-router) # address-family ipv4 unicast</pre>	Configure address family for IPv4.
<b>Step 11</b>	<b>export-gateway-ip</b> <b>Example:</b> <pre>switch(config-router-vrf-af) # export-gateway-ip</pre>	<p>Enables BGP to advertise the gateway IP in the EVPN Type-5 routes. It exports the gateway IP for all prefixes in that VRF.</p> <p><b>Note</b> If you want choose specific prefixes for which to export the gateway IP, use the following configuration instead of the <b>export-gateway-ip</b> command:</p> <pre>route-map name permit sequence  match ip address prefix-list name  set evpn gateway-ip use-next-hop  vrf context vrf  address-family ipv4 unicast  export map name</pre>
<b>Step 12</b>	<b>[no] maximum-paths [eBGP max-paths  mixed   ibgp  local   eibgp ] mpath-count</b> <b>Example:</b> <pre>switch(config-router-af) # maximum-paths ? &lt;1-64&gt; Number of parallel paths</pre>	<p>The following options are available:</p> <ul style="list-style-type: none"> <li><i>eBGP max-path</i>—Enables the eBGP maximum paths. The range is from 1 to 64 parallel paths. The default value is 1.</li> </ul>

	Command or Action	Purpose
	<p>*Default value is 1</p> <p>eibgp      Configure multipath for both EBGp and IBGP paths</p> <p>ibgp        Configure multipath for IBGP paths</p> <p>local       Configure multipath for local paths</p> <p>mixed      Configure multipath for local and remote paths</p> <p>switch(config-router-vrf-af) # <b>maximum-paths mixed 32</b></p> <p><b>Example:</b></p> <p>switch(config-router-vrf-af) # <b>maximum-paths ibgp 32</b></p>	<ul style="list-style-type: none"> <li>• <b>mixed</b>—Enables BGP and the Unicast Routing Information Base (URIB) to consider the following paths as Equal Cost Multi Path (ECMP): <ul style="list-style-type: none"> <li>• eBGP paths</li> <li>• eiBGP paths</li> <li>• iBGP paths</li> <li>• Paths from other protocols (such as static) that are redistributed or injected into BGP</li> </ul> </li> <li>• <b>ibgp</b>—Uses iBGP to filter the ECMP paths.</li> <li>• <b>local</b>—Enables the multipath for local paths.</li> <li>• If you enter the command without the <b>mixed</b> or <b>ibgp</b> option, eBGP is used to filter the ECMP paths.</li> </ul> <p><b>Note</b>      Use the <b>no</b> form of this command if you want to use a single path instead of maximum paths.</p>
<b>Step 13</b>	<p><b>redistribute static route-map redist-rtmap</b></p> <p><b>Example:</b></p> <p>switch(config-router-vrf-af) # <b>redistribute static route-map redist-rtmap</b></p>	Preserves the next-hop of the redistributed paths.
<b>Step 14</b>	<p><b>maximum-paths local <i>number</i></b></p> <p><b>Example:</b></p> <p>switch(config-router-vrf-af) # <b>maximum-paths local 32</b></p>	<p>Specifies the number of local paths to be redistributed as the BGP best path for a route. The range is from 0 to 32. The default value is 1.</p> <p><b>Note</b>      This command isn't supported with the <b>maximum-paths mixed <i>mpath-count</i></b> command. An error message appears if you try to configure them together.</p>
<b>Step 15</b>	<p><b>address-family ipv6 unicast</b></p> <p><b>Example:</b></p> <p>switch(config-router-vrf) # <b>address-family ipv6 unicast</b></p>	Configure address family for IPv6.
<b>Step 16</b>	<p><b>export-gateway-ip</b></p> <p><b>Example:</b></p> <p>switch(config-router-vrf-af) # <b>export-gateway-ip</b></p>	Enables BGP to advertise the gateway IP in the EVPN Type-5 routes. It exports the gateway IP for all prefixes in that VRF.

	Command or Action	Purpose
		<p><b>Note</b> If you want choose specific prefixes for which to export the gateway IP, use the following configuration instead of the <b>export-gateway-ip</b> command:</p> <pre>route-map name permit sequence   match ip address prefix-list name   set evpn gateway-ip use-next-hop  vrf context vrf   address-family ipv4 unicast   export map name</pre>
<b>Step 17</b>	<p><b>[no] maximum-paths</b> [<i>eBGP max-paths</i>   <b>mixed</b>   <b>ibgp</b>   <b>local</b>   <b>eibgp</b> ] <i>mpath-count</i></p> <p><b>Example:</b></p> <pre>switch(config-router-vrf-af)# maximum-paths ? &lt;1-64&gt;  Number of parallel paths         *Default value is 1   eibgp  Configure multipath for both EBGP and   IBGP paths   ibgp   Configure multipath for IBGP paths   local  Configure multipath for local paths   mixed  Configure multipath for local and remote   paths  switch(config-router-vrf-af)# maximum-paths mixed 32</pre> <p><b>Example:</b></p> <pre>switch(config-router-vrf-af)# maximum-paths ibgp 32</pre>	<p>The following options are available:</p> <ul style="list-style-type: none"> <li>• <b>eBGP max-path</b>—Enables the eBGP maximum paths. The range is from 1 to 64 parallel paths. The default value is 1.</li> <li>• <b>mixed</b>—Enables BGP and the Unicast Routing Information Base (URIB) to consider the following paths as Equal Cost Multi Path (ECMP): <ul style="list-style-type: none"> <li>• eBGP paths</li> <li>• eiBGP paths</li> <li>• iBGP paths</li> <li>• Paths from other protocols (such as static) that are redistributed or injected into BGP</li> </ul> </li> <li>• <b>ibgp</b>—Uses iBGP to filter the ECMP paths.</li> <li>• <b>local</b>—Enables the multipath for local paths.</li> <li>• If you enter the command without the <b>mixed</b> or <b>ibgp</b> option, eBGP is used to filter the ECMP paths.</li> </ul> <p><b>Note</b> Use the <b>no</b> form of this command if you want to use a single path instead of maximum paths.</p>
<b>Step 18</b>	<p><b>redistribute static route-map redistribtmap</b></p> <p><b>Example:</b></p> <pre>switch(config-router-vrf-af)# redistribute static route-map redistribtmap</pre>	Preserves the next-hop of the redistributed paths.
<b>Step 19</b>	<p><b>maximum-paths local</b> <i>number</i></p> <p><b>Example:</b></p> <pre>switch(config-router-vrf-af)# maximum-paths local 32</pre>	Specifies the number of local paths to be redistributed as the BGP best path for a route. The range is from 0 to 32. The default value is 1.

	Command or Action	Purpose
		<b>Note</b> This command isn't supported with the <b>maximum-paths mixed</b> <i>mpath-count</i> command. An error message appears if you try to configure them together.
<b>Step 20</b>	<b>exit</b>  <b>Example:</b> <pre>switch(config-router-vrf-af) # exit</pre>	Exits command mode.
<b>Step 21</b>	<b>route-map passall permit seq-num</b>  <b>Example:</b> <pre>switch(config) # route-map passall permit 10</pre>	Configure the route map.
<b>Step 22</b>	<b>set path-selection all advertise</b>  <b>Example:</b> <pre>switch(config-route-map) # set path-selection all advertise</pre>	Sets the route-map related to the additional-paths feature.
<b>Step 23</b>	<b>ip load-sharing address source-destination rotate rotate universal-id seed</b>  <b>Example:</b> <pre>ip load-sharing address source-destination rotate 32 universal-id 1</pre>	<p>Configures the unicast FIB load-sharing algorithm for data traffic.</p> <ul style="list-style-type: none"> <li>The <b>universal-id</b> option sets the random seed for the hash algorithm and shifts the flow from one link to another.</li> </ul> <p>You do not need to configure the universal ID. Cisco NX-OS chooses the Universal ID if you do not configure it. The <i>seed</i> range is from 1 to 4294967295.</p> <ul style="list-style-type: none"> <li>The <b>rotate</b> option causes the hash algorithm to rotate the link picking selection so that it does not continually choose the same link across all nodes in the network. It does so by influencing the bit pattern for the hash algorithm. This option shifts the flow from one link to another and load balances the already load-balanced (polarized) traffic from the first ECMP level across multiple links.</li> </ul> <p>If you specify a <b>rotate</b> value, the 64-bit stream is interpreted starting from that bit position in a cyclic rotation. The <b>rotate</b> range is from 1 to 63, and the default is 32.</p> <p><b>Note</b> With multi-tier Layer 3 topology, polarization is possible. To avoid polarization, use a different rotate bit at each tier of the topology.</p>

	Command or Action	Purpose
		<b>Note</b> To configure a rotation value for port channels, use the <b>port-channel load-balance src-dst ip-l4port rotate</b> <i>rotate</i> command. For more information on this command, see the <a href="#">Cisco Nexus 9000 Series NX-OS Interfaces Configuration Guide, Release 9.x</a> .

## Configuring the BGP Legacy Peer

If you are running a Cisco Nexus Release prior to 9.2(1), follow this procedure to disable sending the gateway IP address to that peer.

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp** *number*
3. **neighbor** *address* **remote-as** *number*
4. **address-family l2vpn evpn**
5. **no advertise-gw-ip**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> switch# <b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>router bgp</b> <i>number</i> <b>Example:</b> switch(config)# <b>router bgp</b> 2000000	Configure BGP.
<b>Step 3</b>	<b>neighbor</b> <i>address</i> <b>remote-as</b> <i>number</i> <b>Example:</b> switch(config-router)# <b>neighbor</b> 8.8.8.8 <b>remote-as</b> 2000000	Define neighbor.
<b>Step 4</b>	<b>address-family l2vpn evpn</b> <b>Example:</b> switch(config-router-neighbor)# <b>address-family</b> l2vpn evpn	Configure address family Layer 2 VPN EVPN.
<b>Step 5</b>	<b>no advertise-gw-ip</b> <b>Example:</b>	Disables the BGP EVPN Mixed-path and Proportional Layer-3 Multipath feature for a legacy peer.

	Command or Action	Purpose
	<code>switch(config-router-neighbor-af) # no advertise-gw-ip</code>	

## Configuring a User-Defined Profile for Maintenance Mode

### SUMMARY STEPS

1. `configure terminal`
2. `configure maintenance profile maintenance-mode`
3. `route-map name deny sequence`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<code>configure terminal</code> <b>Example:</b> <code>switch# configure terminal</code>	Enter global configuration mode.
<b>Step 2</b>	<code>configure maintenance profile maintenance-mode</code> <b>Example:</b> <code>switch(config) # configure maintenance profile maintenance-mode</code>	Configure maintenance mode profile.
<b>Step 3</b>	<code>route-map name deny sequence</code> <b>Example:</b> <code>switch(config-mm-profile) # route-map GIR deny 5</code>	Configure route map. The value of <i>sequence</i> is from 0 to 65535. Default is 10.

## Configuring a User-Defined Profile for Normal Mode

### SUMMARY STEPS

1. `configure terminal`
2. `configure maintenance profile normal-mode`
3. `route-map name permit sequence`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<code>configure terminal</code> <b>Example:</b> <code>switch# configure terminal</code>	Enter global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure maintenance profile normal-mode</b>  <b>Example:</b> <pre>switch(config)# configure maintenance profile normal-mode</pre>	Configure maintenance mode.
<b>Step 3</b>	<b>route-map name permit sequence</b>  <b>Example:</b> <pre>switch(config-mm-profile)# route-map GIR permit 5</pre>	Configure route map. The value of <i>sequence</i> is from 0 to 65535. Default is 10.

## Configuring a Default Route Map

### SUMMARY STEPS

1. **configure terminal**
2. **route-map name permit sequence**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal</pre>	Enter global configuration mode.
<b>Step 2</b>	<b>route-map name permit sequence</b>  <b>Example:</b> <pre>switch(config-mm-profile)# route-map GIR permit 5</pre>	Configure route map. The value of <i>sequence</i> is from 0 to 65535. Default is 10.

## Applying a Route Map to a Route Reflector

### SUMMARY STEPS

1. **configure terminal**
2. **router bgp number**
3. **neighbor ip-address**
4. **address-family l2vpn evpn**
5. **route-map name out**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> switch# <b>configure terminal</b>	Enter global configuration mode.
<b>Step 2</b>	<b>router bgp number</b> <b>Example:</b> switch(config)# <b>router bgp 2</b>	Configure BGP.
<b>Step 3</b>	<b>neighbor ip-address</b> <b>Example:</b> switch(config-router)# <b>neighbor 10.1.1.1</b>	Configure the IP address of a BGP neighbor which is the route reflector. <i>ip-address</i> can be an IPv4 or IPv6 address or prefix.
<b>Step 4</b>	<b>address-family l2vpn evpn</b> <b>Example:</b> switch(config-router-neighbor)# <b>address-family l2vpn evpn</b>	Configure a Layer 2 VPN EVPN address family.
<b>Step 5</b>	<b>route-map name out</b> <b>Example:</b> switch(config-router-neighbor-af)# <b>route-map GIR out</b>	Apply the route map to the neighbor route reflector.

## Verifying Proportional Multipath for VNF

Command	Purpose
<b>show bgp ipv4 unicast</b>	Displays Border Gateway Protocol (BGP) information for the IPv4 unicast address family.
<b>show bgp l2vpn evpn</b>	Displays BGP information for the Layer-2 Virtual Private Network (L2VPN) Ethernet Virtual Private Network (EVPN) address family.
<b>show ip route</b>	Displays routes from the unicast RIB.
<b>show maintenance profile maintenance-mode</b>	Displays the GIR user-defined profile for the maintenance mode.
<b>show maintenance profile normal-mode</b>	Displays the GIR user-defined profile for the normal mode.

The following example shows how to display BGP information for the L2VPN EVPN address family:

```

switch# show bgp l2vpn evpn 11.1.1.0
BGP routing table information for VRF default, address family L2VPN EVPN
Route Distinguisher: 13.13.13.13:3 // Remote route
BGP routing table entry for [5]:[0]:[0]:[24]:[11.1.1.0]/224, version 1341
Paths: (3 available, best #1)
Flags: (0x000002) on xmit-list, is not in l2rib/evpn, is not in HW
Multipath: eBGP

  Advertised path-id 1
  Path type: external, path is valid, is best path
    Imported to 2 destination(s)
  Gateway IP: 11.1.1.133
  AS-Path: 2000000 100000 , path sourced external to AS
    11.11.11.11 (metric 5) from 102.102.102.102 (102.102.102.102)
      Origin incomplete, MED not set, localpref 100, weight 0
      Received label 22001

The following example shows how to display routes from the unicast RIB after the Proportional Multipath for VNF feature has been configured:

```
switch# show ip route 1.1.1.0 vrf cust_1
IP Route Table for VRF "cust_1"
...
1.1.1.0/24, ubest/mbest: 22/0, all-best (0x300003d)
  *via 3.0.0.1, [1/0], 08:13:17, static
    recursive next hop: 3.0.0.1/32
  *via 3.0.0.2, [1/0], 08:13:17, static
    recursive next hop: 3.0.0.2/32
  *via 3.0.0.3, [1/0], 08:13:16, static
    recursive next hop: 3.0.0.3/32
  *via 3.0.0.4, [1/0], 08:13:16, static
    recursive next hop: 3.0.0.4/32
  *via 2.0.0.1, [200/0], 06:09:19, bgp-2, internal, tag 2 (evpn) segid: 3003802 tunnelid:
0x300003e encap: VXLAN
    BGP-EVPN: VNI=3003802 (EVPN)
    client-specific data: 3b
    recursive next hop: 2.0.0.1/32
    extended route information: BGP origin AS 2 BGP peer AS 2
  *via 2.0.0.2, [200/0], 06:09:19, bgp-2, internal, tag 2 (evpn) segid: 3003802 tunnelid:
0x300003e encap: VXLAN
    BGP-EVPN: VNI=3003802 (EVPN)
    client-specific data: 3b
    recursive next hop: 2.0.0.2/32
    extended route information: BGP origin AS 2 BGP peer AS 2
```

The following example shows how to display the GIR user-defined profile for the maintenance mode:

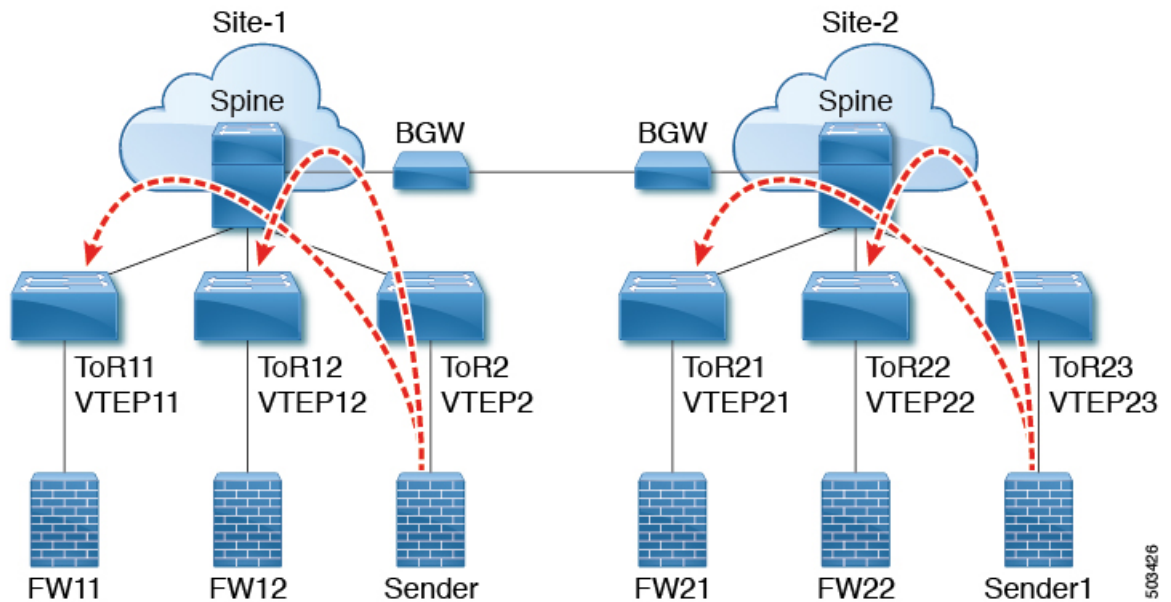

```
switch# show maintenance profile maintenance-mode
[Maintenance Mode]
ip pim isolate
router bgp 2
  isolate
router isis 1
  isolate
route-map GIR deny 5
```

The following example shows how to display the GIR user-defined profile for the normal mode:

```
switch# show maintenance profile normal-mode
[Normal Mode]
no ip pim isolate
router bgp 2
  no isolate
router isis 1
  no isolate
route-map GIR permit 5
```

# Configuration Example for Proportional Multipath for VNF with Multi-Site

Figure 73: VNFs in a Multi-Site Topology

The following configuration example allows traffic to be sent across sites if a local VNF isn't available.

```

The following example shows that the VTEP in site 1 prefers the local VNF (FW).

```

leaf1# show bgp l2vpn evpn 200.100.1.1
BGP routing table information for VRF default, address family L2VPN EVPN
Route Distinguisher: 1.3.12.0:3
BGP routing table entry for [5]:[0]:[0]:[32]:[200.100.1.1]/224, version 77902
Paths: (4 available, best #2)
Flags: (0x000002) (high32 00000000) on xmit-list, is not in l2rib/evpn, is not in HW
Multipath: eBGP iBGP Local

```

Path type: internal, path is valid, not best reason: Neighbor Address, no labeled nexthop

```

Gateway IP: 100.0.0.12
AS-Path: 99 100 , path sourced external to AS
1.3.12.1 (metric 81) from 1.2.12.1 (1.2.12.0)

```

```

Origin IGP, MED not set, localpref 100, weight 0
Received label 3000100
Received path-id 2
Extcommunity: RT:1:3000100 ENCAP:8 Router MAC:00be.7547.13bf
Originator: 1.3.12.0 Cluster list: 1.2.12.0

Advertised path-id 2
Path type: local, path is valid, not best reason: Locally originated, multipath, no labeled
nexthop
Gateway IP: 100.0.0.11
AS-Path: 99 100 , path sourced external to AS
  1.3.11.1 (metric 0) from 0.0.0.0 (1.3.11.0)
    Origin IGP, MED not set, localpref 100, weight 0
    Received label 3000100
    Received path-id 1
    Extcommunity: RT:1:3000100 ENCAP:8 Router MAC:d478.9bb3.c1a1

```

The following example shows how the local VNF is disabled so that the VNF from site 2 is used. The BGP adjacency is shut down between site 1's VTEP11 to FW11 and between VTEP12 to FW12.

```

leaf1(config-router)# vrf vrf100
leaf1(config-router-vrf)# neighbor 100::11
leaf1(config-router-vrf-neighbor)# shut
leaf1(config-router-vrf-neighbor)# neighbor 100::12
leaf1(config-router-vrf-neighbor)# shut
leaf1(config-router-vrf-neighbor)# neighbor 100:1::11
leaf1(config-router-vrf-neighbor)# shut
leaf1(config-router-vrf-neighbor)# neighbor 100:1::12
leaf1(config-router-vrf-neighbor)# shut
leaf1(config-router-vrf-neighbor)# neighbor 100.0.0.11
leaf1(config-router-vrf-neighbor)# shut
leaf1(config-router-vrf-neighbor)# neighbor 100.0.0.12
leaf1(config-router-vrf-neighbor)# shut
leaf1(config-router-vrf-neighbor)# neighbor 100.1.0.11
leaf1(config-router-vrf-neighbor)# shut
leaf1(config-router-vrf-neighbor)# neighbor 100.1.0.12
leaf1(config-router-vrf-neighbor)# shut
leaf1(config-router-vrf-neighbor)# end

```

The following example shows that the prefix now uses the VNF (FW) from site 2.

```

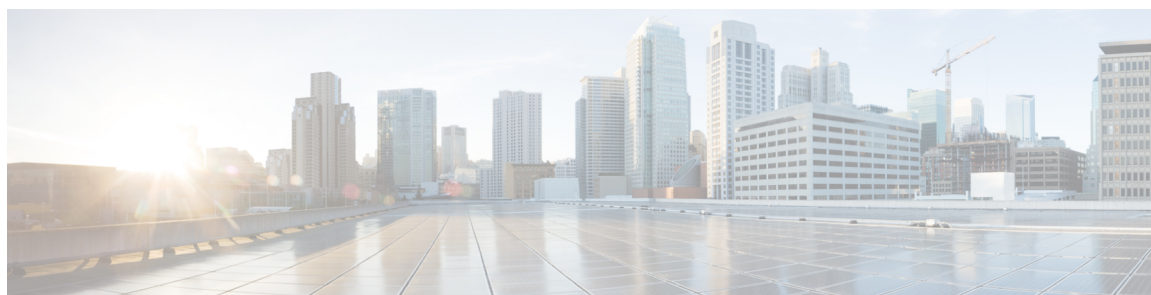

leaf1# show bgp 12vpn evpn 200.100.1.1
BGP routing table information for VRF default, address family L2VPN EVPN
