INFORMATION TO USERS IN EUROPE

NOTE

CISPR 22 CLASS A DIGITAL DEVICE OR PERIPHERAL

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to the European Union EMC directive. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

INFORMATION TO USERS IN THE U.S.A.

NOTE

FCC CLASS A DIGITAL DEVICE OR PERIPHERAL

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

WARNING

Changes or Modifications not expressly approved by Evertz Microsystems Ltd. could void the user's authority to operate the equipment.

Use of unshielded plugs or cables may cause radiation interference. Properly shielded interface cables with the shield connected to the chassis ground of the device must be used.

REVISION HISTORY

<u>REVISION</u>	<u>DESCRIPTION</u>	<u>DATE</u>
1.0	Preliminary Version – Installation section Only	Feb 00
1.1	Chapters 1, 3, 4, 5 and 6 added	Nov 00
1.2	Information about 2:3 Pulldown Referencing added	Aug 01
1.3	Added HD9150Q and HD9150QPS-AUD	Sep 02
1.4	Updated System Parameter table in Chapter 6	Mar 04

Information contained in this manual is believed to be accurate and reliable. However, Evertz assumes no responsibility for the use thereof nor for the rights of third parties, which may be effected in any way by the use thereof. Any representations in this document concerning performance of Evertz products are for informational use only and are not warranties of future performance, either express or implied. The only warranty offered by Evertz in relation to this product is the Evertz standard limited warranty, stated in the sales contract or order confirmation form.

Although every attempt has been made to accurately describe the features, installation and operation of this product in this manual, no warranty is granted nor liability assumed in relation to any errors or omissions unless specifically undertaken in the Evertz sales contract or order confirmation. Information contained in this manual is periodically updated and changes will be incorporated into subsequent editions. If you encounter an error, please notify Evertz Customer Service department. Evertz reserves the right, without notice or liability, to make changes in equipment design or specifications.

CHAPTER 1: OVERVIEW

TABLE OF CONTENTS

1. OVERVIEW..... 1-1

1.1. HOW TO USE THIS MANUAL 1-2

This page left intentionally blank

1. OVERVIEW

The HD9150 Afterburner is a powerful device designed to facilitate the creation of off-line video tapes from HDTV masters. The Afterburner downconverts the HDTV input video to SDI and analog standard definition video. When the input video is in the 1080p/24sF format the HD9150 also creates a 2:3 pulldown on the output video to create a 30 Fps output. The Afterburner can operate in a 'film mode' working with telecine masters or a 'video mode' working with field acquired HDTV.

In 'film mode' the Afterburner reads the film transfer data that was recorded in the VANC data area by the Evertz HD Film Footage Encoder (RP215 Film ANC) during the telecine transfer and makes burn-in windows. The essential timecode and KeyCode data are also converted into RP201 3-line VITC and output by the Afterburner. The 2:3 cadence can be controlled from the VANC data or from the LTC. The 2:3 cadence can also be locked to an external 6 Hz reference in telecine applications where the HD9150 is directly reading the HD9025TR output.

In 'video mode' the Afterburner reads the LTC or RP188 ancillary timecode and makes burn-in windows and new 30 Fps timecode that is in sync with the downconverted video. The original 24 Fps timecode numbers can be placed in the user bits of the VITC and displayed as a burned-in window. The 2:3 cadence can be controlled from the ancillary timecode or from the LTC.

The Afterburner automatically generates video timecode for the standard definition VTR that is converted from 24 to 30 Fps, and delayed to match the complete A frame cycle of delay through the Afterburner.

The HD9150 can be easily configured using the new multi-resolution version of Evertz popular KeyLog TRACKER™ software or from the 9150 ConfigWare™ software utility supplied with the unit. These graphical software interfaces allow the user to store multiple configurations for the HD9150.

The HD9150 Series Afterburners are available in two downconverter qualities. The original HD9150 versions have a monitoring downconverter and provide two SDI and two analog downconverted outputs with characters and VITC suitable for monitoring or compressed digitisation in a non-linear editing system. The HD9150Q versions have a high quality downconverter and provide two clean SDI downconverted outputs with VITC suitable for creation of high quality viewing copies. The HD9150Q versions also provide one SDI and one analog monitoring output with VITC and Characters suitable for monitoring or creation of tapes for non-linear editing systems.

The HD9150PS-AUD and HD9150QPS-AUD Post Slate Afterburners are special versions designed to facilitate the creation and logging of standard definition video tapes from field acquired HDTV masters. In addition to all the normal functions of the HD9150 series Afterburners, these units are used in conjunction with the KeyLog TRACKER™ software to log the video and audio time codes of each shot on the master. The KeyLog TRACKER™ software becomes the core of the Post Slate logging system. In the field, audio time code is recorded on one of the audio tracks of the HD VTR to facilitate syncing audio in post production. Scene and Take information can be stored in the user bits of the audio timecode that is also recorded on the ATR. During downconversion, the Post Slate Afterburner detects discontinuities of Audio timecode and logs each shot automatically. The unit can use the scene/take information from the audio userbits to display a virtual slate burn in at the beginning of each shot, eliminating the need for time code slates on the set. The Post Slate Afterburners also de-embed audio from the incoming HD bitstream, delay it so that it is in time with the output video from the downconverter and provide 2 AES outputs and 4 analog audio outputs for recording on the downconverted video tape.

The chart below summarises the features of each of the models.

Feature	HD9150	HD9150PS-AUD	HD9150Q	HD9150QPS-AUD
Downconverter	Monitoring	Monitoring	Presentation	Presentation
Clean outputs with VITC *	---	---	2 SDI	2 SDI
Monitor outputs with VITC and Characters	2 SDI 2 Analog	2 SDI 2 Analog	1 SDI 1 Analog	1 SDI 1 Analog
Delayed Audio Outputs	---	2 AES 4 Analog	---	2 AES 4 Analog
Data Logging	---	Yes	---	Yes

* Clean outputs can be programmed as additional monitor outputs with characters if required

Features:

- Accepts SMPTE 292M 1080i/59.94, 1080p/23.98sF and 1080i/50 serial digital video
- Downconverts HDTV inputs to SDTV and creates VITC and window burns on SDI and analog outputs
- Reads RP215 VANC film transfer information in 'Film mode'
- Reads RP188 ancillary timecode in 'Video mode'
- Creates 2:3 pulldown when downconverting 1080p/23.98sF video to NTSC.
- 2:3 cadence is determined from a 6Hz pulse input, RP215 Film ANC data (film mode), RP188 timecode (Video mode) or LTC
- Converts aspect ratio from 16:9 to 4:3 in anamorphic, letterbox or center crop mode
- LTC reader and generator for video timecode converts 24 Fps to 30 Fps and re-times the timecode to the output video
- Control from Evertz KeyLog TRACKER™ or 9150 ConfigWare™ software

1.1. HOW TO USE THIS MANUAL

Throughout this manual the term HD9150 will be used to refer to all members of the family of products. Where necessary specific model numbers will be used to distinguish features or specifications that do not apply to all models.

This manual is organized into 6 chapters: Overview, Installation, Film Mode, Video Mode, System Parameters, and Technical Description. The overview section contains a brief overview of the HD9150 operation and features and a glossary to define concepts and terms used throughout the remainder of the manual. We highly recommend taking the time to become familiar with the terms and concepts described here before proceeding into the rest of the manual.

Chapter 2 gives a detailed description of the rear panel connectors, and how the Afterburner should be connected into your system.

Chapter 3 gives a detailed description of the operation of the Afterburner in telecine applications where it is operated in 'film mode'. It includes details on installing and connecting the KeyLog TRACKER™ software and detailed discussion of how to operate the Afterburner as a downconversion device for telecine masters.

Chapter 4 gives a detailed description of the operation of the Afterburner in other applications where it is operated in 'video mode'. It includes details on installing and connecting the 9150 ConfigWare™ software

and detailed discussion of how to operate the Afterburner as a downconversion device for master tapes acquired directly in HDTV video.

Chapter 5 gives a detailed description of the operation of the Post Slate Afterburner for logging master tapes acquired directly in HDTV video in 'video mode'. It includes details on installing and connecting the KeyLog TRACKER™ software, setting up the software for logging, and detailed discussion of how to operate the Afterburner as a downconversion device.

Chapter 6 gives a discussion of how the default operation of the Afterburner can be changed using System Parameters. The system parameters can affect the system timing through the Afterburner, placement of characters on the raster, 2:3 cadence control, functions of parallel inputs and outputs to name a few.

Chapter 7 lists the technical specifications, provides a discussion of how to update the firmware in the Afterburner, and gives instructions on other technical details.

Items of special note are indicated with a double box like this.

2. INSTALLATION

There are currently four members of the HD9150 Series Afterburner family each one with a slightly different feature set. The four rear panels are shown below with a description of each of the input and output connectors.

2.1. REAR PANEL OVERVIEW

Figure 2-1: HD9150 Rear Panel

Figure 2-2: HD9150PS-AUD Rear Panel

Figure 2-3: HD9150Q Rear Panel

Figure 2-4: HD9150QPS-AUD Rear Panel

The following sections describe the purpose of the rear panel connectors of the HD9150 series units. Sections 2.1.1 to 2.1.7 describe the specific generator, reader, character inserter, and telecine signals that should be connected to the Afterburner. Some of the connectors are present only on certain models.

2.1.1. Downconverter Video Connections (models HD9150, HD9150PS-AUD)

HD PROG IN Input BNC connector for 10-bit serial digital video signals, compatible with the SMPTE 292M standard. The HD9150 is capable of working with video formats shown in Table 2-6. This input normally contains video with embedded RP 215 or RP 188 ancillary time code that is used to make character burns, VITC, and to control the 3:2 Pulldown of the output video. On the HD9150PS-AUD model this input will normally be connected to the **HD OUT** connector on the De-embedder section of the unit.

SDI OUT These 2 BNC connectors are used to output the downconverted input video as serial component video, compatible with the SMPTE 259M standard. When the input video format is 1080p/24sF, 3:2 pulldown will be inserted to generate the 29.97 Fps video output. These outputs may have VITC and character burn-ins inserted.

ANALOG OUT These 2 BNC connectors are a monitor grade composite analog output derived from the SDI output video and are normally connected to an analog monitor or video recorder.

2.1.2. Downconverter Video Connections (models HD9150Q, HD9150QPS-AUD)

HD PROG IN Input BNC connector for 10-bit serial digital video signals, compatible with the SMPTE 292M standard. The HD9150Q is capable of working with video formats shown in Table 2-6. This input normally contains video with embedded RP 215 or RP 188 ancillary time code that is used to make character burns, VITC, and to control the 3:2 Pulldown of the output video. On the HD9150QPS-AUD model this input will normally be connected to **HD OUT** connector on the De-embedder section of the unit.

PROGRAM SDI OUT These 2 BNC connectors are used to output the downconverted input video as serial component video, compatible with the SMPTE 259M standard. When the input video format is 1080p/24sF, 3:2 pulldown will be inserted to generate the 29.97 Fps video output. These “clean” outputs normally have VITC inserted but can be programmed to also have characters. (See chapter 6 for information about using the System Parameters) They are normally connected to a SDI video recorder for creation of presentation quality viewing copies.

MONITOR SDI OUT This BNC connector is used to output the downconverted input video as serial component video, compatible with the SMPTE 259M standard. When the input video format is 1080p/24sF, 3:2 pulldown will be inserted to generate the 29.97 Fps video output. These outputs normally have VITC and characters inserted and are normally connected to a SDI monitor or video recorder for creation of offline editing copies.

MONITOR ANALOG OUT This BNC connector is a monitor grade composite analog output derived from the monitor SDI output video and is normally connected to an analog monitor or video recorder for creation of offline editing copies.

2.1.3. Audio De-Embedder Video Connections (models HD9150PS-AUD and HD9150QPS-AUD Only)

HD IN Input BNC connector for 10-bit serial digital video signals, compatible with the SMPTE 292M standard. The HD9150PS Audio De-embedder is capable of working with video formats shown in Table 2-6. This input normally contains video with embedded audio and should be connected to the video from the camera or playback VTR.

HD OUT This BNC connector provides an equalized output from the **HD IN** video. This output will be connected to the **HD PROGRAM IN** connector of the Downconverter section of the unit.

AES OUT These 2 BNC connectors provide AES audio that has been de-embedded from group 1 of the **HD IN** video and delayed so that it is in time with the video output of the downconverter.

ANALOG AUDIO OUTPUT This 15 pin high density D connector provides 4 channels of analog audio that has been de-embedded from group 1 of the **HD IN** video and delayed so that it is in time with the video output of the downconverter. Connect the audio breakout cable (Part # WA-2EV) provided with the unit to the D connector. The other end of the breakout cable provides 4 Male XLR connectors, one for each of the audio channels.

HD9150PS-AUD End		XLR End

Table 2-1: WA-2EV Audio Breakout Cable

2.1.4. Linear Timecode Connectors

VIDEO LTC IN: (This connector is labelled *LTC In* on some models) A Female XLR connector for input of SMPTE/EBU linear time code from video recorder. The frame rate of this LTC input will correspond to the HD9150's input video frame rate. This input is used as a Jam sync source for the Video time code generator when the Input Time code source is set to LTC using the KeyLog TRACKER™ or 9150 ConfigWare™ software. The LTC input will also be used to control the 2:3 cadence of the downconverter output video when there is no 6 Hz pulse or RP188 timecode present.

This input is also used to connect the audio timecode to the Post Slate Afterburner

VIDEO LTC OUT: (This connector is labelled *LTC Out* on some models) A Male XLR connector for the output of SMPTE/EBU linear time code to the standard definition video recorder. This output will be jam synced to the RP188 ancillary timecode on the incoming HD video, adjusted for the video processing delay through the Afterburner. When the HD Video input is in the 1080p/24sF video format, the input timecode rate of 24 Fps will be converted to 30 Fps timecode such that the zero frame of the second is coincident. The LTC output can also be jam synced to incoming LTC by setting the Video TC source to *LTC* using the KeyLog TRACKER™ or 9150 ConfigWare™ software.

2.1.5. Parallel I/O Connections

PARALLEL I/O: A 9 pin female 'D' connector contains several general purpose parallel remote control inputs and outputs. Table 2-2 shows the default functions of the Parallel I/O connector pins. The functions of the pins shown are the power up defaults, however, the functions of pins 1, 4, 5, 8, and 9 may be altered by changing the default system parameter values using the KeyLog TRACKER™ or 9150 ConfigWare™ software. See chapter 6 for more information about system parameters

Pin #	Name	Description
1	6 Hz In	6 Hz Sequence Input
2	Reserved	
3	Reserved	
4	Vid Std	Video Standard Select
5	Vout SEQ	Output Video Sequence (3:2)
6	GND	Ground
7	Reserved	
8	VCGOnOFF	Characters On/Off
9	6 Hz	6 Hz Sequence Out

Table 2-2: Parallel I/O Connector Default Pin Definitions

2.1.6. Serial I/O Connections

SERIAL CONTROL: A 9 pin female 'D' connector for connection to a computer running the KeyLog TRACKER™ or 9150 ConfigWare™ software. This port is also used for firmware upgrades to the HD9150. The pinout of this connector is such that a 'straight-thru' cable can be used to connect to the computer COM port. See section 2.6 for a cable wiring diagram and more information on connecting the HD9150 to the computer. See section 7.2 for information about upgrading firmware.

Pin #	Name	Description

Table 2-4: Aux I/O Connector Pin Definitions

DE-EMBEDDER COM: (Models HD9150PS-AUD and HD9150QPS-AUD only) This 9-pin female 'D' connector is used for firmware upgrades to the Audio De-embedder module. The pinout of this connector is such that a 'straight-thru' cable can be used to connect to the computer COM port. See section 2.6 for a cable wiring diagram and more information on connecting the HD9150PS to the computer. See section 7.2 for information about upgrading firmware in the de-embedder module.

7	RTS	RS-232 RTS Input
8	CTS	RS-232 CTS Output
9		

Table 2-5: De-Embedder COM Connector Pin Definitions

2.1.7. Power Connections

LINE: The HD Afterburner has a universal power supply operating on either 115v/60 Hz or 230v/50 Hz AC operation.

2.2. MOUNTING

The HD Afterburner is equipped with rack mounting angles and fits into a standard 19 inches by 1.75 inches by 17.75 inches (483 mm x 45 mm x 451mm) rack space. The mounting angles may be removed if rack mounting is not desired.

2.3. POWER REQUIREMENTS

2.3.1. Selecting the Correct Mains Voltage

Power requirements are 115 or 230 volts AC at 50 or 60 Hz. The HD Afterburner has a universal power supply that automatically senses the input voltage. Power should be applied by connecting a 3-wire grounding type power supply cord to the power entry module on the rear panel. The power cord should be minimum 18 AWG wire size; type SVT marked VW-1, maximum 2.5 m in length.

The power entry module combines a standard power inlet connector, two 5 x 20 mm fuse holders and an EMI line filter.

2.3.2. Changing the Fuse

The fuse holder is located inside the power entry module. To change the fuses, disconnect the line cord from the power entry module and pull out the fuse holder from the power entry module using a small screwdriver. The fuse holder contains two fuses, one for the line and one for the neutral side of the mains connection. Pull out the blown fuse and place a fuse of the correct value in its place. Use slo blo (time delay) 5 x 20 mm fuses rated for 250 Volts with a current rating of 1 amp. Carefully reinsert the fuseholder into the power entry module.

Never replace with a fuse of greater value.

2.4. CONNECTING THE VIDEO

2.4.1. Video Input and output

The HD9150 requires that a serial digital HDTV video source be connected to the HD PROG IN BNC. The HD9150 may be configured to accept High definition digital video in the formats shown in Table 2-6. The HD9150 video standard will autodetect the input video type by default or may be set to specifically match the incoming video type using the KeyLog TRACKER™ or 9150 ConfigWare™ software.

The HD program video will normally be connected to the video output of a HD video playback device. In telecine applications where a standard definition video tape will be made concurrently with the high definition master, the input will be connected to the HD Program output of the HD9025TR Film Footage Encoder.

Common Name	Pixels / Active Lines	Frame Rate	Progressive /Interlace	SMPTE Standard
1080i/59.94	1920 x 1080	29.97 (30/1.001)	I	274M
1080i/50	1920 x 1080	25	I	274M
1080p/23.98sF	1920 x 1080	23.98 (24/1.001)	P (sF)	RP211

Table 2-6: Video Input Formats

On the Post Slate Afterburners (models HD9150PS-AUD or HD9150QPS-AUD) the HD program video should be connected to the HD INPUT BNC on the De-embedder section of the unit. The active loop through HD Output from the de-embedder should be connected to the HD PROGRAM IN BNC on the downconverter section.

On the HD9150 and HD9150PS-AUD models the SDI OUT outputs contain a monitoring quality downconverted copy of the input video with VITC and optional characters keyed in. The ANALOG OUT outputs are composite analog video outputs with the same information as the SDI OUT outputs. On the HD9150Q and HD9150QPS-AUD models the MONITOR SDI OUT output contains a high quality downconverted copy of the input video with VITC and optional characters keyed in. The ANALOG OUT output is a monitoring quality composite analog video output with the same information as the MONITOR SDI OUT output. In addition the HD9150Q and HD9150QPS-AUD models provide two PROGRAM SDI outputs with VITC only. (The PROGRAM SDI outputs can be programmed to behave like the MONITOR SDI outputs with VITC and characters – see chapter 6)

When the input video format is 1080p/24sF, 3:2 pulldown will be inserted to generate the 29.97 Fps video output. The cadence of the 3:2 is determined by the input video timecode contained on either the LTC or in the RP188 Ancillary time code packets. The 3:2 cadence can also be controlled by connecting an external 6 Hz reference pulse connected to the Parallel I/O connector. (See section 3.2 or 4.3 for information on controlling the 3:2 cadence)

2.5. CONNECTING THE VIDEO RECORDER TIME CODE

The Video timecode is normally extracted from RP215 (film mode) or RP188 (video mode) ancillary data packets on the incoming HD video and will be at the same rate as the input video frame rate. In Video mode, the video timecode can also be taken from LTC reader. The output VITC and LTC will be jam synced to this code and will be delayed by the downconverter delay. The Codes and Outputs tabs of the configuration screens in the KeyLog TRACKER™ or 9150 ConfigWare™ software control the use of the Video LTC reader and generator.

2.5.1. Connecting the LTC Reader

Connect the LTC output from your video recorder to the HD9150's LTC In XLR connector. When using an unbalanced input to the reader, the signal should be applied to pin 3 of the reader input connector. Normally, the unused input (pin 2) should be connected to ground (pin 1). This input may be used to jam sync the HD9150's Video LTC generator to the code previously recorded on tape.

On the Post Slate afterburners, the LTC input can also be used to connect audio timecode from the playback VTR. This timecode can be used to automatically trigger data log events at each time code break. In this case connect the timecode output from the Audio track on your VTR where production audio was recorded.

2.5.2. Connecting the Video LTC Generator

The generator Video LTC output is available on the Video Timecode Out XLR connector at the rear panel. The output level of the generator is factory set to 1 volt peak to peak, but may be adjusted using the level adjustment (labelled RTP1) located on the 9000TCIO circuit card.

The generator code output should be connected to the time code input of your standard definition video recorder. Pin 1 of the XLR is ground, and pins 2 and 3 provide a balanced output. When using a machine with an unbalanced input the signal should be connected to Pin 3 of the generator output XLR. Pin 2 should be left open.

The KeyLog TRACKER™ or 9150 ConfigWare™ utility software is used to configure whether the LTC Generator output will be jam synced to the incoming LTC, RP215 Film ANC video timecode data, or RP188 ANC timecode. The LTC output will normally be delayed from the incoming timecode by the same delay as the video, however this delay may be adjusted using system parameter xx. In addition, when the incoming timecode is counting 24 frames per second, the time code output will be converted to 30 frames per second and will be synchronous with the 2:3 cadence of the output video. The 00 frames of each second of the incoming timecode will be aligned to the 00 frames of the output timecode unless the 2:3 cadence is altered by system parameter 10. See Chapter 5 for more information about System parameters and how they affect the operation of the HD9150.

2.6. CONNECTING THE HD9150 TO A COMPUTER

The HD9150 can be controlled from the Evertz Film system's Graphical User interface (GUI) KEYLOG TRACKER™ or the 9150 ConfigWare™ configuration utility. The software is used to configure the HD9150's hardware for different applications. Configuration sets can be saved and recalled to speed setups of the hardware. Which software you use will depend on your application. The KeyLog Tracker software is used in telecine applications where the HD9150 is operated at the same time as the HD Film Footage Encoder, or in applications involving logging with a HD9150PS series PostSlate Afterburner. The 9150 ConfigWare™ software is designed to give a quick method of setting up the HD9150 for applications where there is no film data encoded onto the HD master tape.

2.6.1. Physical Connections

A nine pin sub-miniature 'D' connector **SERIAL CONTROL** is provided for connection to a computer running the software. This serial port provides a bi-directional RS-232-C data link at 57,600 baud. In order to connect your HD9150 to your computer make a cable as shown in Figure 2-5. Use this cable to connect the computer's COM port to the **SERIAL CONTROL** connector on the rear of the HD9150. The HD9150 serial port does not have connections for the DTR, DSR, DCD and RI handshake lines. A standard 9 pin 'straight through' cable may work with some computers if the handshake lines are internally pulled to the active state. See Chapter 3 for more information on installing the KeyLog TRACKER™ software and configuring the HD9150 for Telecine applications. See Chapter 4 for more information on installing the 9150 ConfigWare™ software and configuring the HD9150 for non-telecine applications.

Frame Gnd	Shield	----drain-----	Shield	Frame Gnd

Figure 2-5: Cable to Connect HD9150 to PC Communications Port

In telecine applications where you are making a standard definition work copy at the same time as the high definition master, you will also need to connect the HD Film Footage Encoder to the PC using a similar cable. The preferred method of doing this is to connect each hardware device to a different COM port on the PC as shown in Figure 2-6. Using this method, the KEYLOG TRACKER™ software can automatically switch the communications to the appropriate hardware device.

If your PC needs to have additional com ports added, make sure that they are configured so that each com port has its own interrupt.

Figure 2-6: Connecting KeyLog Tracker to Multiple Devices using 3 COM Ports

An alternate method of connecting the devices is to use a COM port switch as shown in Figure 2-7. Using this method you will have to physically change the switch device prior to selecting the controlled device within the KEYLOG TRACKER™ software.

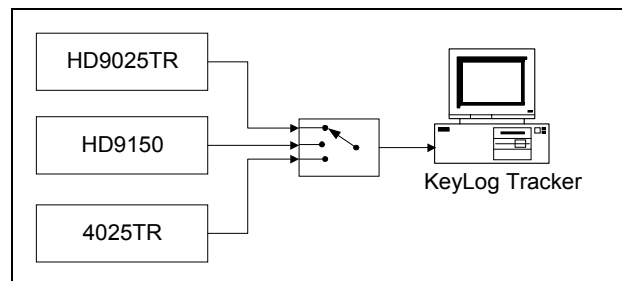

Figure 2-7: Connecting KeyLog TRACKER™ to Multiple Devices Using A Single COM Port

3. OPERATING THE HD9150 IN TELECINE APPLICATIONS

The HD9150 uses DIP switch #5 to determine if it will operate in the 'Film Mode' (Off) or 'Video Mode' (On). When it sees a change in this switch on boot-up it will force a factory reset to one of two conditions.

For Film Mode:

Source:

- VTR Time Code (Time and User Bits) will be taken from Film Ancillary Data.

Output:

- LTC Time will be the 30 Fps code jammed to the 24 Fps Film ANC VTR Timecode
- LTC User bits will be the same as the Film ANC VTR User Bits
- 3 line VITC
- VITC will be on lines 14, 15 and 16 with a second set on 18, 19, AND 20
- VITC1 Time will be the 30 Fps code jammed to the 24 Fps Film ANC VTR Timecode (same as LTC output)
- VITC1 User Bits will be the same as the Film ANC VTR User Bits
- VITC2 Time and User bits contain the KeyCode from the Film ANC
- VITC3 Time will be the Film ANC Audio Timecode
- VITC3 User Bits will be the Film ANC Audio User Bits
- White Flag is Off

Downconvert mode will be Letterbox

Characters will be in Tiny size with Video Time (30 Fps code), KeyCode, Audio Time, Ink Numbers and ABS Film Frames On

Pulldown cadence is set according to the following priority scheme:

6 Hz input - pin 1 of the Parallel I/O connector (Only recommended when HD9150 is in Film mode and reading the output of the HD9025TR in a telecine bay)

LTC input if present

Film ANC Data

For Video Mode:

Source:

- VTR Time and User Bits will be taken from RP188 LTC ANC Timecode. This is the 24 Fps code.

Output:

- LTC Time will be the 30 Fps code jammed to the 24 Fps input code
- LTC User bits will be the same as the RP188 LTC ANC User Bits
- VITC will be on lines 14 and 16
- VITC Time will be the 30 Fps code jammed to the 24 Fps input code (same as LTC output)
- VITC User Bits will be the original 24 Fps input code
- White Flag pulse in the first field of each new picture will be on line 11

Downconvert mode will be Letterbox

Characters will be in Tiny size with Video Time (30 Fps code), Video User Bits (24 Fps code) and pulldown windows On

Pulldown cadence is set according to the following priority scheme:

6 Hz input - pin 1 of the Parallel I/O connector (Normally not recommended/required in Video Mode)

LTC input if present

RP 188 ANC Data

These default settings may be overwritten from Tracker or the new 9150 Configuration utility (which is almost ready). All settings will be remembered after a power cycle UNLESS DIP switch #5 is changed, in which case the unit will revert to Factory Reset.

3.1. CONNECTING THE HD9150 TO KEYLOG TRACKER™

In telecine applications the HD9150 is be controlled from the Evertz Film system's Graphical User interface (GUI) KEYLOG TRACKER™. The software is used to configure the HD9150's hardware for different applications. Configuration sets can be saved and recalled to speed setups of the hardware. In order to control the HD9150 you must use version 1.4.60 or later of the KeyLog TRACKER™ software.

3.1.1. Physical Connections

A nine pin sub-miniature 'D' connector (**SERIAL CONTROL**) is provided for connection to a computer running the software. This serial port provides a bi-directional RS-232-C data link at 57,600 baud. In order to connect your HD9150 to your computer make a cable as shown in Figure 3-1. Use this cable to connect the computer's COM port to the **SERIAL CONTROL** connector on the rear of the HD9150.

HD9150 End		Belden 9501	Computer End	
9 pin D Male	Pin		Pin	9 pin D Female
TxD	2	-----	2	RxD
RxD	3	-----	3	TxD
Sig Gnd	5	----drain----	5	Sig Gnd
	7	[]	7	RTS
	8		8	CTS
	4	[]	4	DTR
			1	DCD
	6	[]	6	DSR
	9		9	RI
Frame Gnd	Shield	----drain----	Shield	Frame Gnd

Figure 3-1: Cable to Connect HD9150 to PC Communications Port

In telecine applications where you are making a standard definition work copy at the same time as the high definition master, you will also need to connect the HD9025TR HD Film Footage Encoder to the PC using a similar cable. The preferred method of doing this is to connect each hardware device to a different COM port on the PC as shown in Figure 2-6. You may also connect a 4025TR to a third COM port if the telecine suite will be used for standard definition transfers. Using this method, the KEYLOG TRACKER™ software can automatically switch the communications to the appropriate hardware device.

If your PC needs to have additional com ports added, make sure that they are configured so that each com port has its own interrupt.

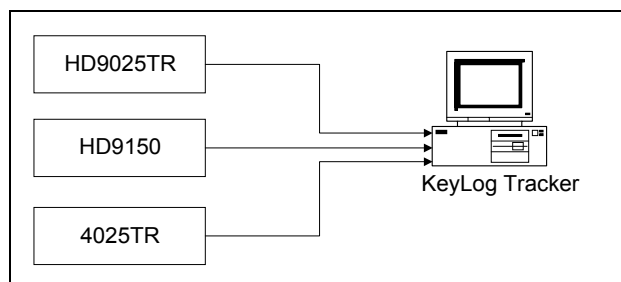

Figure 3-2: Connecting KeyLog Tracker to Multiple Devices using 3 COM Ports

An alternate method of connecting the devices is to use a COM port switch as shown in Figure 2-7. Using this method you will have to physically change the switch device prior to selecting the controlled device within the KEYLOG TRACKER™ software.

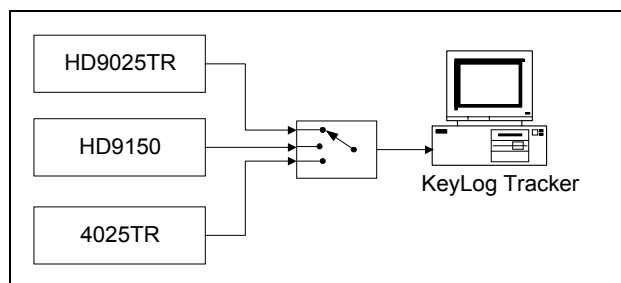

Figure 3-3: Connecting KeyLog TRACKER™ to Multiple Devices Using A Single COM Port

3.1.2. Installing KEYLOG TRACKER™

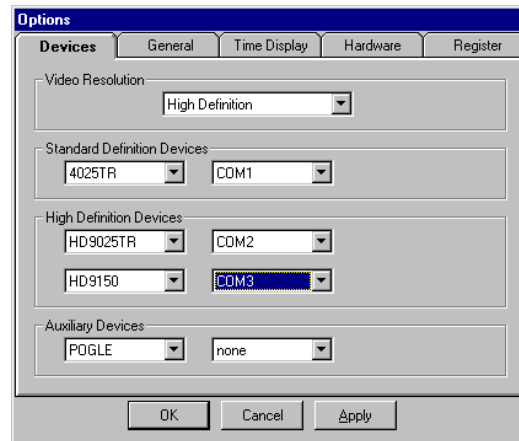

Insert the first KeyLog TRACKER™ CD-ROM into the PC's CD-ROM drive and click on the Start button and then click Settings. Click on the Control Panel, then ADD/Remove Programs. The KEYLOG TRACKER™ installation program will guide you through the installation procedure.

Once the installation is complete, click on the Start button and then click Programs. Select the "Evertz Products" program group and click on the KeyLog TRACKER™ icon.

You are presented with the KEYLOG TRACKER™ Splash screen and the "Login" dialog box. Enter "user" as a user name, leave the password area blank and click the "OK" button.

You are then presented with the "Devices" tab of the Options dialog box that prompts you to configure the Communications ports on the computer that you are using to control the hardware devices.

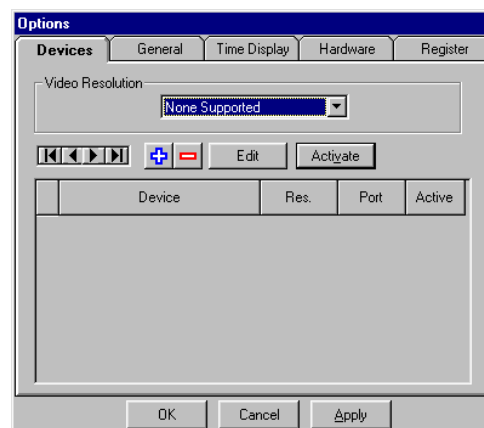

3.1.3. Configuring the PC Communications Ports - KeyLog TRACKER™ Version 1.4.xx

The “Resolution” control allows you to configure if the KEYLOG TRACKER™ will be operating in the Standard Definition or High Definition mode. Each of the devices has a Com port selector that shows what ports your computer has available for communications. Select the communications port used to connect each of the devices. Set the COM port selector to “none” for devices that are not present in the system. If you used the direct connection method shown in Figure 2-6, make sure each COM port selector is set to a different COM port. If you used the switch box connection method shown in Figure 2-7 then set all the COM port selectors to the same value.

To verify communications with the HD9150, set the resolution control to “High Definition”. Press Okay once you have verified the communications port settings. If the KEYLOG TRACKER™ is communicating with the HD9150, the COMM LED on the HD9150 front panel should be On and there should also be green indicators in the Status Bar at the bottom of the KEYLOG TRACKER™ screen. If the HD9150 COMM LED is off or the KEYLOG TRACKER™ COMM indicator is red, that shows that the hardware is not responding. If you receive a “Communications Error” message box, check your cable connection and verify that you have selected the correct communications port on your computer.

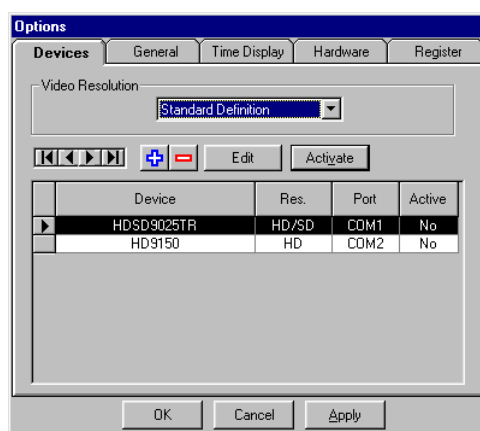

3.1.4. Configuring the PC Communications Ports - KeyLog TRACKER™ Version 1.5.xx

Press the button to add the HD9150 to the list of controlled devices. Click on the down arrow beside the *Device* dropdown and choose the HD9150 with the mouse.

Click on the down arrow beside the *Port* dropdown and choose the COM port that you connected to the HD9150. Press the Okay button to add the HD9150 to the list of controlled devices. If you need to add the HDSD9025 or HD9025 Film Footage Encoders to the controlled devices, repeat this procedure, selecting the correct device and COM port. If you used the direct connection method shown in Figure 2-6, make sure each COM port selector is set to a different COM port. If you used the switch box connection method shown in Figure 2-7 then set all the COM port selectors to the same value.

The “Resolution” control allows you to configure if the KEYLOG TRACKER™ will be operating in the Standard Definition or High Definition mode. When the resolution control is set to the high definition mode, KEYLOG TRACKER™ will *activate* the high definition capable devices. Only one encoder and one Afterburner device can be activated at any time. When you press the Okay button, KEYLOG TRACKER™ will attempt to communicate with the activated devices. If the HD9150 is not activated click on the HD9150 line then press the Activate button. To verify communications with the HD9150, press Okay once you have verified the communications port settings. Press the *Afterburner* button on the toolbar. If the KEYLOG TRACKER™ is communicating with the HD9150, the COMM LED on the HD9150 front panel should be On and there should also be a green indicator in the COMM Status Bar at the bottom of the KEYLOG TRACKER™ screen. If the HD9150 COMM LED is off or the KEYLOG TRACKER™ COMM indicator is red, that shows that the hardware is not responding. If you receive a “Communications Error” message box, check your cable connection and verify that you have selected the correct communications port on your computer.

3.1.5. KeyLog TRACKER™ First Time Setup

Once you have correctly established communications with the KeyLog TRACKER™ software, consult the **First Time Setup** section of the KeyLog TRACKER™ manual or on line help system for information on configuring the system. The first time you run the KeyLog TRACKER™ software you should see a dialog box asking if you want to see the First Time Setup section of the Tracker online Help.

Press the *Show Help* button to view the help file. Press the *Continue* button to proceed without opening the help file. Check the *Don't show this message again* check box before pressing the *Continue* button if you don't want to see this message each time you start the KeyLog TRACKER™ software. The first time setup section of the manual and online help file guides you through the steps required to configure the system. It also introduces you to some of the basic concepts of controlling the HD9150 from the KeyLog TRACKER™ software. We recommend that you read through this section before proceeding.

3.2. CONTROLLING THE 2:3 PULLDOWN IN FILM MODE

When the input video to the HD9150 is 1080p/23.98sF, the HD9150 will insert 1 extra field every 4 to create a 29.97 Fps output video. This process, known as 2:3 pulldown can be controlled by one of 3 sources when the HD9150 is operating in Film mode.

- External 6 Hz Reference pulse applied to the Parallel I/O connector
- LTC Timecode being read by the LTC reader
- Video Timecode values being read from the Film ANC data packet encoded in the vertical ancillary data space of the incoming video.

If more than one source is present then the HD9150 uses the 6Hz pulse as the highest priority and the ANC data as the lowest priority.

In the telecine bay, the 6Hz Pulse, being generated by the Evertz 7750SRG-HD Sync Generator card will be used by the Telecine Edit controller to make sure that the phase of all the sources is aligned. If the HD9150 is being used to provide the standard definition video for a slave recorder, then it is important that the HD9150's video output also be referenced to the 6 Hz. If you use either of the timecode methods of determining the 2:3 cadence, then the HD9150 video output cadence will change as the telecine edit controller synchronizes the sources, lengthening the preroll time required.

If you are using the HD9150 in a dubbing area where there is no defined relationship of the incoming 1080p/23.98sF video to the system 6 Hz pulse then you should **NOT** reference the HD9150 to the 6 Hz pulse, but use one of the timecode sources. Usually all you need is to use the Film ANC Video timecode that will be read directly from the incoming video. (See Figure 3-6)

If you use the HD9150 in both configurations (in the telecine bay and in the dubbing room) then you can either physically disconnect the 6 Hz pulse input when you are using it in the dubbing application, or you can use the HD9150 System Parameter 12 (Class 15) to disable referencing the HD9150 with the 6 Hz input. (See Chapter 5 for more information about using System Parameters)

The 6 Hz pulse output from the 7750SRG-HD can be connected directly to pin 1 of the Parallel I/O connector on the rear of the HD9150. (Pin 1 is the default input, other pins can be assigned to this function using System Parameters - see Chapter 5) If you are using another source for the 6 Hz pulse make sure that it is a TTL level signal that observes the timing shown in Figure 3-4.

Figure 3-4: 6 Hz Reference Pulse Timing

To confirm that the HD9150 is being properly referenced to one of the 6 Hz Sources, turn on the Debug character generator window (using the Configuration screen - Window tab in KeyLog Tracker. Set the horizontal position to 11. You will see a display on the HD9150 Character generator that looks something like the following:

```
REF: 6HZ 1 0 3
```

Consult section 5.2 for a more detailed description of how to use the debug character window and specific information on the Pulldown Reference Source Window.

Figure 3-5 shows the relationship between the incoming 1080p/24sF video and the outgoing 525i/59.94 video, with the A frames of the output video correctly aligned to the 6 Hz Pulse.

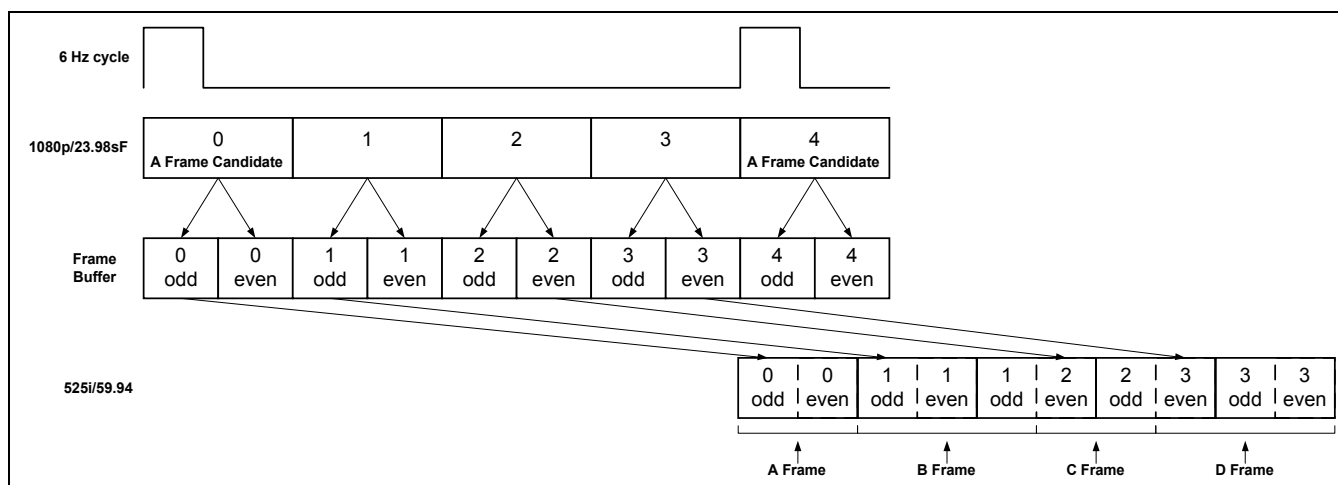

Figure 3-5: 6 Hz Referenced 2:3 Pulldown and Delay in HD9150

Note that there is a 5 video frame (1/6th of a second) delay inside the HD9150 to allow for the correct A frame alignment of the output video. You will have to apply an equivalent delay to the audio to keep it in time with the picture.

Figure 3-6 shows the relationship between the incoming 1080p/24sF video and the outgoing 525i/59.94 video, with the A frames of the output video correctly aligned to the incoming timecode. Then the A frames will be aligned with the 0 frames of either the input LTC or input Film ANC video timecode.

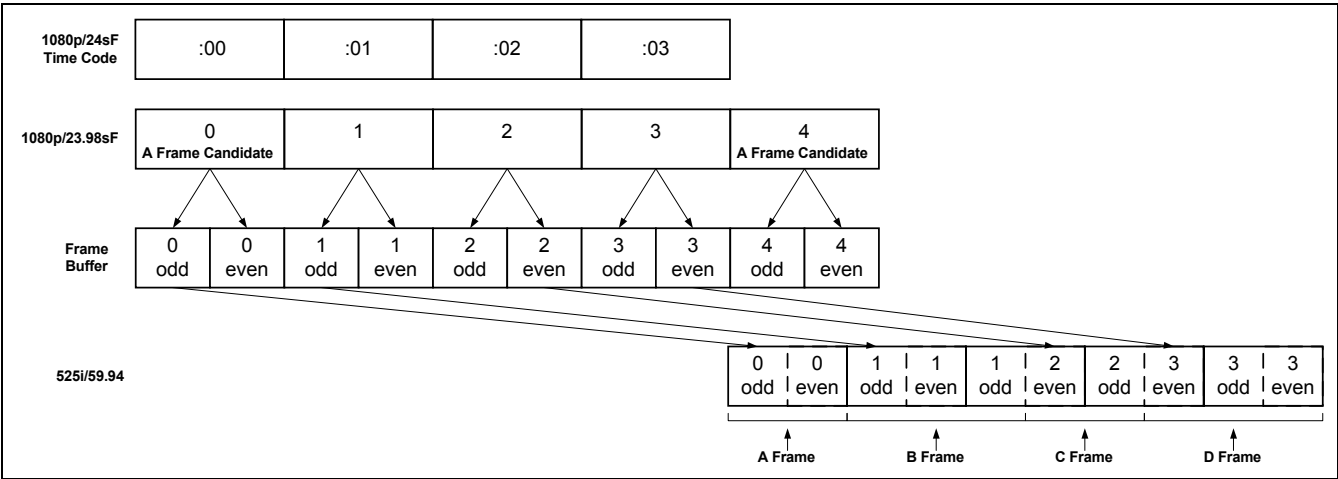

Figure 3-6: Timecode Referenced 2:3 Pulldown and Delay in HD9150

4. OPERATING THE HD9150 IN VIDEO MODE

Unlike master tapes made in the telecine suite, videotapes acquired directly in field video recorders do not have any of the film ancillary data. They only have the original field timecode recorded as linear time code (LTC) on an address track or as RP188 ancillary timecode recorded in the HANC area of the digital video bitstream. In *Video mode* the Afterburner downconverts video from material acquired by HDTV video cameras and makes burn-in windows and new 30 Fps timecode that is in sync with the downconverted video. The original 24 Fps timecode numbers can be placed in the user bits of the VITC and displayed as a burned-in window. The 2:3 cadence can be controlled from the ancillary timecode or from the LTC.

The HD9150 Afterburner uses DIP switch #5, located inside the unit to determine if it will default to 'Film Mode' (Off) or *Video mode* (On). When there is a change in this switch on boot-up it will force a factory reset to one of two conditions. Alternately the HD9150 can be put into *Video mode* using the 9150 ConfigWare™ or KeyLog TRACKER™ software. The default settings may also be overwritten from KeyLog TRACKER™ or the 9150 ConfigWare™ software. For most cases the 9150 ConfigWare™ software is the preferable way of controlling the HD9150 in Video mode if the user needs to change any of the default *Video mode* settings. All settings will be remembered after a power cycle UNLESS DIP switch #5 is changed, in which case the unit will revert to Factory Reset.

The *Video mode* defaults are:

- Auto Video Standard
- Incoming VTR Time Code (Time and User Bits) will be taken from RP188 LTC ANC Timecode. For 1080p/24sF input video this is the 24 Fps code.
- Output timecode is delayed to match the video delay through the HD9150 (5 frames at the output video frame rate). For 1080p/24sF input video the output timecode is 30 Fps code jammed to the 24 Fps input Timecode. For other input video formats the output code will be at the same frame rate as the input code.
- Output LTC Time will be the at the frame rate of the output video jammed to the input RP188 ANC Timecode. Output LTC User bits will be the same as the input RP188 ANC User Bits.
- Output VITC will be on lines 14 and 16. VITC Time will be the same as the LTC time. VITC User Bits will be the original RP188 input code
- A white Flag pulse in the first field of each new picture will be on line 11
- The downconverter will operate in the Letterbox mode
- The character generator will be in Tiny size with the Video Time (VITC time at output video frame rate), Video User Bits (VITC user bits at input video frame rate) and pulldown windows On
- When the input video is 1080p/24sF, the output video will have a 2:3 pulldown cadence set according to the following priority scheme:
 - 6 Hz input (normally on pin 1 of the Parallel I/O connector - not usually required in Video Mode)
 - LTC input if present
 - RP 188 ANC timecode if present

4.1. CONNECTING THE HD9150 IN VIDEO MODE

Figure 4-1 shows the typical connections when using the Afterburner to convert 1080p/24sF video to NTSC or 525 line digital video. The output video from the HD VTR is connected to the HD Video In connector on the Afterburner. The downconverted outputs of the Afterburner contain VITC and characters. These analog and SDI outputs contain the same video in NTSC and serial digital component video and are connected to video input of the standard definition VTR. If the HD video tape has RP188 ancillary timecode there is no need to connect the LTC from the HD VTR. The Afterburner's LTC output contains 30 Fps timecode that is in time with the downconverted video and should be connected to the LTC input of the record VTR.

Figure 4-1: Typical Connections for Converting 1080p/24sf Video To 525i/60

If you need to override the default *Video mode* settings you will need to connect a computer to run the 9150 ConfigWare™ software utility. (See section 4.2 for information about connecting the computer and installing the 9150 ConfigWare™ software) There is no need to run the software to operate the Afterburner on a day to day basis unless you need to change any of the configuration items.

The output video will contain a 2:3 cadence of pictures from the input 1080p/24sF video. The A frames that is determined from the timecode being read by the HD9150. By default, if there is LTC present then it will control the pulldown, otherwise the RP188 ancillary timecode will control the pulldown. The default pulldown cadence can be changed using the HD9150 system parameters, but should not be necessary under most circumstances. Figure 4-2 shows the default 2:3 relationship. Note that there is a 5 video frame (30 Fps) delay between the input video and the output video.

Figure 4-2: 2:3 Pulldown Cadence For Converting 1080p/24sf Video To 525i/60

4.2. CONNECTING THE HD9150 TO THE 9150 CONFIGWARE™ SOFTWARE

4.2.1. Physical Connections

A nine pin sub-miniature 'D' connector **SERIAL CONTROL** is provided for connection to a computer running the 9150 ConfigWare™ software utility. This serial port provides a bi-directional RS-232-C data link at 57,600 baud. The 9150 ConfigWare™ software is used to change the HD9150's default hardware setup for different applications. Configuration sets can be saved and recalled to speed setups of the hardware.

In order to connect your HD9150 to your computer make a cable as shown in Figure 4-3. Use this cable to connect the computer's COM port to the **SERIAL CONTROL** connector on the rear of the HD9150.

HD9150 End			Computer End	
9 pin D Male	Pin	Belden 9501	Pin	9 pin D Female
TxD	2	-----	2	RxD
RxD	3	-----	3	TxD

	9		9	RI
Frame Gnd	Shield	----drain----	Shield	Frame Gnd

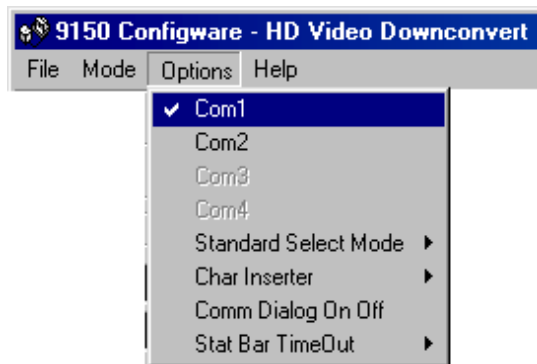

Figure 4-3: Cable to Connect HD9150 to PC Communications Port

4.2.2. Installing the 9150 ConfigWare™ Utility

Insert the first 9150 ConfigWare™ CD-ROM into the PC's CD-ROM drive and click on the Start button and then click Settings. Click on the Control Panel, then ADD/Remove Programs. The 9150 ConfigWare™ installation program will guide you through the installation procedure.

Once the installation is complete, click on the Start button and then click Programs. Select the *9150 Configware* program group and click on the *9150 Configware* icon.

The first time you run the software you will need to configure the Communications ports on the computer that you are using to control the hardware devices. This is done from the Options menu.

Select the communications port used to connect the HD9150.

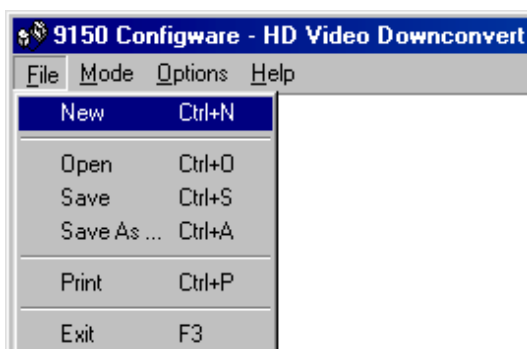

When with software is communicating with the HD9150, the COMM LED on the HD9150 front panel should be On and the COMM indicator in the Status Bar at the top of the 9150 ConfigWare™ screen should also be green. If the 9150 ConfigWare™ COMM indicator is red, that shows that the hardware is not responding. Check your cable connection and verify that you have selected the correct communications port on your computer.

4.2.3. 9150 ConfigWare™ Menus

The 9150 ConfigWare™ menu system is comprised of four drop down menus. Each menu is described in further detail in its own section.

4.2.3.1. File Menu

The *File* menu is used to load and save configurations to the hard disk, and to exit the program.

4.2.3.2. Mode Menu

The 9150 ConfigWare™ operates in one of two modes set on the *Mode* menu.

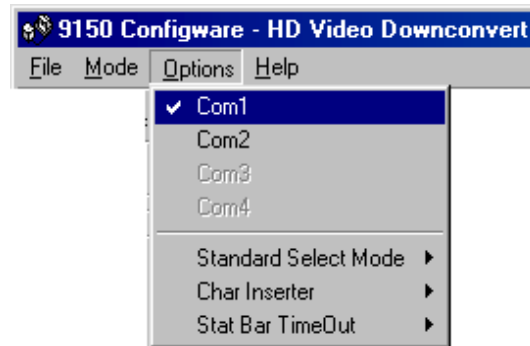

When the software is started up it is in *Offline* mode. This allows the user to make changes on the configuration screens of the computer without affecting the operation of the Afterburner. When you have the configuration items the way you want them, you can send them to the Afterburner using the *Send Config* button. In *Offline* mode, the COMM indicator on the screen will normally be yellow.

When the software is placed in the *Interactive* mode changes made on the configuration screens of the computer are immediately sent to the Afterburner so that you can see the effect of the changes. When you first enter *Interactive* mode the current configuration shown on the computer screen is immediately sent to the Afterburner. In *Interactive* mode, the COMM indicator on the screen will normally be green with an **e** and there will be some small dots changing in the indicator as the software dialogs with the hardware. You will also see various messages and their responses shown on the status bar at the bottom of the screen.

4.2.3.3. Options Menu

The *Options* menu is used to set the Communication port you are using to communicate with the Afterburner.

The *Standard Select* item is used to determine if you want to manually choose the input video standard of the Afterburner or have it automatically detect the incoming video standard.

The *Char Inserter* item is used to turn the Afterburner's character generator windows on or off. Individual windows can be turned on and off using the *Windows* screen.

The *Stat Bar Timeout* item is used to determine how often the status bar at the bottom of the screen will be refreshed. Status messages will be cleared out after the appropriate timeout selected by this item.

4.2.3.4. Help Menu

The *Help* menu is used to view the online help file and to see the version of the software.

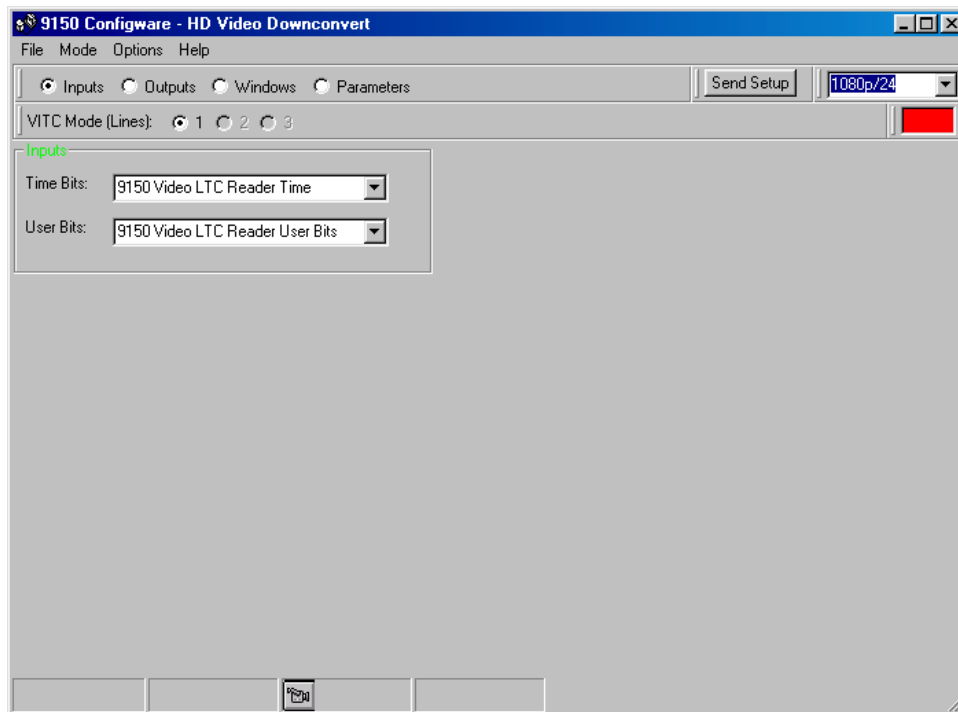

4.2.4. 9150 ConfigWare™ Screens

The 9150 ConfigWare™ has four main screens that hold the various configuration items for the Afterburner hardware. There are four radio buttons located under the menu bar that determine which screen you are working with. The values of all the configuration items can be saved to a configuration set and recalled at any time.

Many of the configuration items are display only items that do not allow any user choices. They are shown to give you a complete view of all the configuration items for the HD9150.

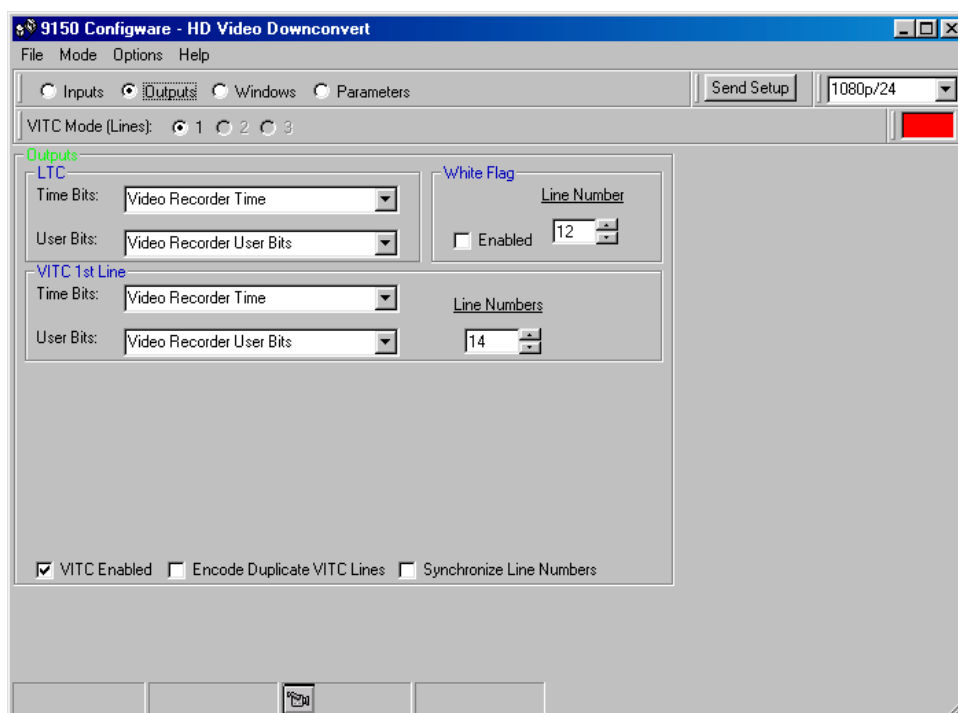

4.2.4.1. Inputs Screen

The *Inputs* screen is used to select what type of timecode input you want to read. Select the source for the Video Time code and user bits. Normally the time and user bits will come from the same source.

4.2.4.2. Outputs Screen

The *Outputs* screen is used to select what information will go into the LTC and VITC outputs,

LTC: Select the source for the LTC Time and user bits. Normally this will be the 'Video Recorder Time' and 'Video Recorder User Bits'.

White Flag: Click on the check box to enable the white flag output of the HD9150. When the White Flag output is enabled, a white level pulse is inserted in the first video field of each new picture. Enter the line number that you wish the while flag pulse to be on.

Normally in *Video mode* the Afterburner runs in '1 line' VITC mode. In this mode there is one set of VITC data on the specified line and an optional duplicate line on the output video.

VITC 1st line: The sources for the Time and user bits in the first line of VITC are set here. Normally the Time bits will be set to the 'Output Video Recorder time'. When the input video is 1080p/24sF the input video time with the frame rate converted to 30 Fps. The user bits can be set to either the input video recorder user bits or the input video recorder time (the original 24 Fps time code).

Enabling the VITC Generator Click on the "VITC Enabled" check box to turn on the VITC generator. When the VITC generator is disabled, the white flag output is also turned off.

Setting the VITC Lines Click on the Up and down arrows on the line number to change the line where the VITC will be recorded.

Click on the "Encode duplicate VITC lines" check box to record a redundant set of VITC Lines. Normally this is not required with modern video recorders.

Click on the "Synchronize lines" check box to move all the VITC lines together. In this mode you select the line number for the VITC 1st line and the line numbers for the remaining lines (and their duplicates) will stay the same distance away. When the Synchronize lines feature is off you can freely enter line numbers for each line.

4.2.4.3. Windows Screen

The *Windows* screen is used to control the Afterburner's character inserter. There is also a global Character generator on/off command available on the *Options* menu. It must be set to On in order to see any of the character generator windows.

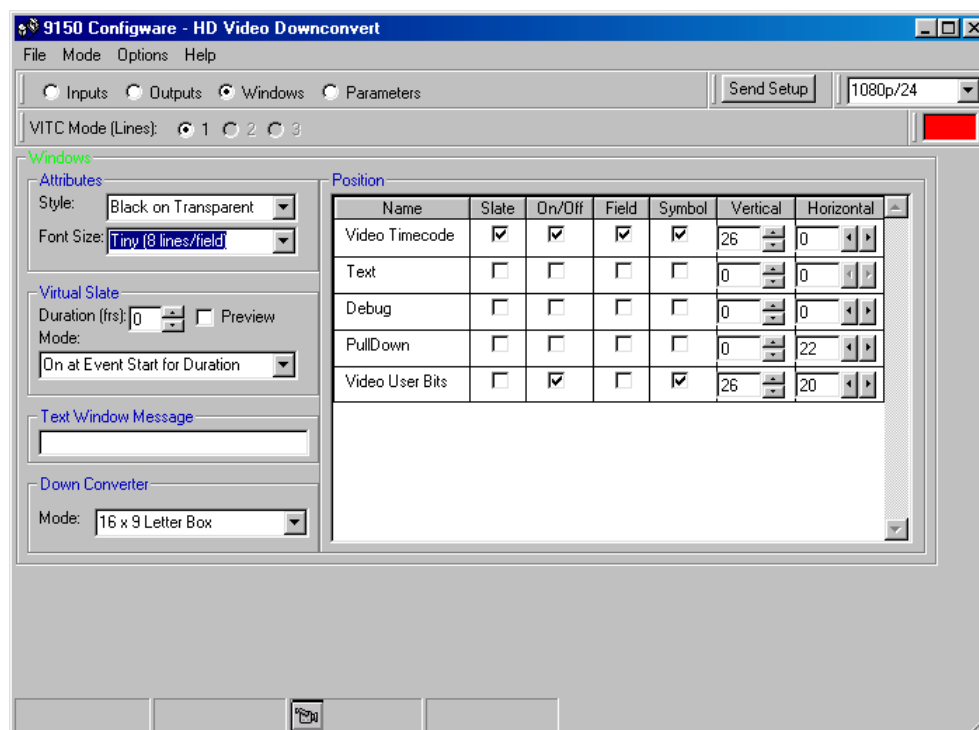

The *Video Timecode* window displays the VITC time information.

The *Video User Bits* window displays the VITC user bit information.

The *Text* window allows the user to enter up to 32 characters of text to be displayed.

The *Pulldown window* displays a letter showing the pulldown of the video picture when the input video is 1080p/24sF

The *Debug window* can display additional debugging information on the output video. Normally this window is turned off and should only be used under direction of an Evertz Factory technician. Changing the horizontal position value for the *Debug* window controls the information displayed. (The window can not be moved horizontally). See section **Error! Reference source not found.** for more information about the Debug Window displays.

Style: Choose the format for the Character Burn-in Windows displayed on the Video Monitor.

Font Size: Choose from one of 2 vertical character sizes for the character display windows.

Virtual Slate: The virtual slate allows you to configure various character display windows to be on for a specified length of time at the beginning of each shot.

Virtual Slate Length: Enter the length of time in video frames that the virtual slate is to be displayed.

Virtual Slate Preview: Check this box to turn on all the windows enabled for the virtual slate. This allows you to see the relative positions of the various windows when positioning other windows. Remember to turn off the Virtual slate preview when you are finished positioning the virtual slate windows.

Text Window Message: You can enter an alphanumeric text message up to 32 characters long to be displayed on the video monitor. The text window must be On and you must press be in *Interactive* mode or send the configuration to the Afterburner in order to view the Text window.

Position: This area shows a list of the available character windows with its attributes. The “Slate” column shows which windows are enabled for the virtual slate. The “On” column shows which windows are permanently On. The “Vertical” and “Horizontal” columns show the window’s relative position on the screen.

When the mouse is over the row for a specific window, that character window will be highlighted on the video monitor. You can turn the window on or off or change its attributes by clicking on the appropriate check box.

Click on the Window check box to permanently turn on the window.
Click on the Virtual Slate check box to turn on the window only when the virtual slate is on.
Click on the Display Fields check box to display the field information for Timecode values.
Click on the Display Symbols check box to turn on Display Symbols to the left of the character window.

If there is a check mark in the box then the option is already enabled. To disable the option click on the appropriate box.

To position the window click the position buttons beside the position indicators with the mouse.

Downconverter Mode:

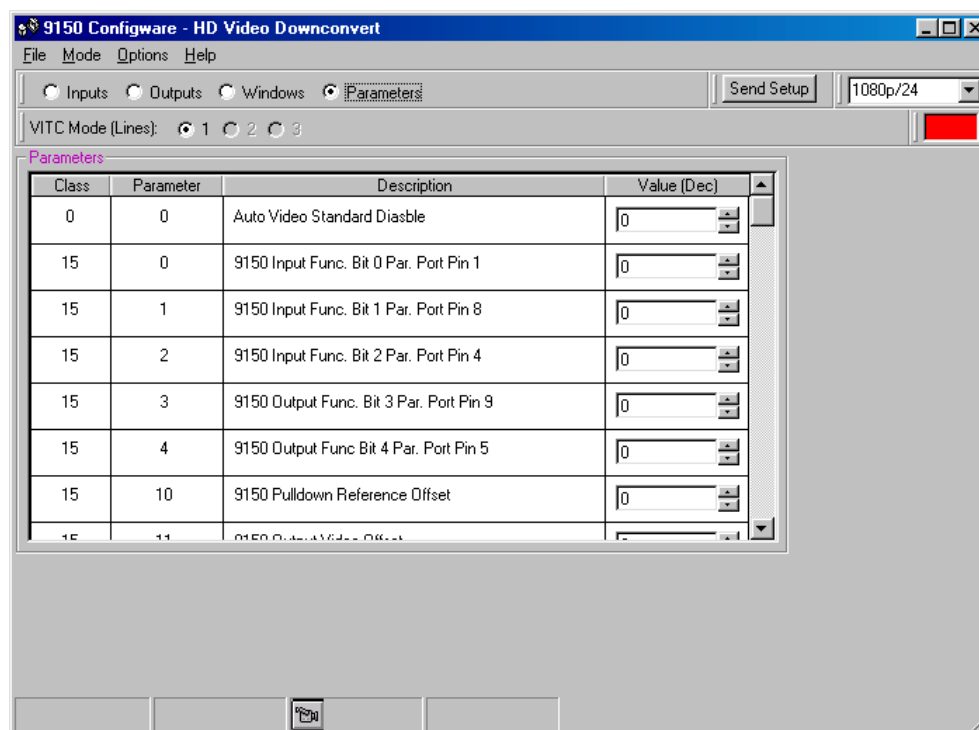

The downconverter in the Afterburner changes the 16:9 aspect ratio of the input HDTV signal to the 4:3 aspect ratio of the output SDTV in one of three ways. Letterbox mode reduces the overall picture proportionally so that the complete width fits in the width of the 4:3 raster. This produces a black 'letterbox' region above and below the active picture. Anamorphic mode squeezes the width of the picture to fit within the 4:3 raster while maintaining the height. Center Crop mode removes a 4:3 aspect ratio cut from the center of the picture while maintaining the full height of the picture. This loses picture information at the extreme left and right sides of the picture.

4.2.4.4. Parameters Screen

The *Parameters* screen is used to set various system parameters that control the Afterburner's behaviour. These parameters are grouped according to classes. Within each class a parameter number identifies individual parameters. Each parameter has a positive or negative value with the default value for each parameter being zero.

To change the value of a parameter press the up or down buttons beside the value indicators with the mouse. Clicking on the *Value* column heading will determine whether the parameters are displayed as decimal or hexadecimal values. Clicking on the Class column heading will sort the parameter display by Class/parameter number. Clicking on the Description column heading will sort the parameter display by its description.

For more information on the use of parameters see chapter 5

4.3. CONTROLLING THE 2:3 PULLDOWN IN VIDEO MODE

When the input video to the HD9150 is 1080p/23.98sF, the HD9150 will insert 1 extra field every 4 to create a 29.97 Fps output video. This process, known as 2:3 Pulldown can be controlled by one of 3 sources when the HD9150 is operating in Film mode.

- External 6 Hz Reference pulse applied to the Parallel I/O connector
- LTC Timecode being read by the LTC reader
- Video Timecode values being read from the RP188 ANC data packet encoded in the vertical ancillary data space of the incoming video.

If more than one source is present then the HD9150 uses the 6Hz pulse as the highest priority and the ANC data as the lowest priority.

In video mode the preferred method of controlling 2:3 cadence is to use the RP188 ANC timecode which will be read directly from the incoming video. (See Figure 3-6)

To confirm that the HD9150 is being properly referenced to one of the 6 Hz Sources, turn on the Debug character generator window (using the Window tab in the 9150 ConfigWare™ software. Set the horizontal position to 11. You will see a display on the HD9150 Character generator that looks something like the following:

REF: ANC 1 0 3

Consult section 5.2 for a more detailed description of how to use the debug character window and specific information on the Pulldown Reference Source Window.

Figure 3-6 shows the relationship between the incoming 1080p/24sF video and the outgoing 525i/59.94 video, with the A frames of the output video correctly aligned to the incoming timecode. Then the A frames will be aligned with the 0 frames of either the input LTC or input Film ANC video timecode.

Note that there is a 5 video frame (1/6th of a second) delay inside the HD9150 to allow for the correct A frame alignment of the output video. You will have to apply an equivalent delay to the audio to keep it in time with the picture.

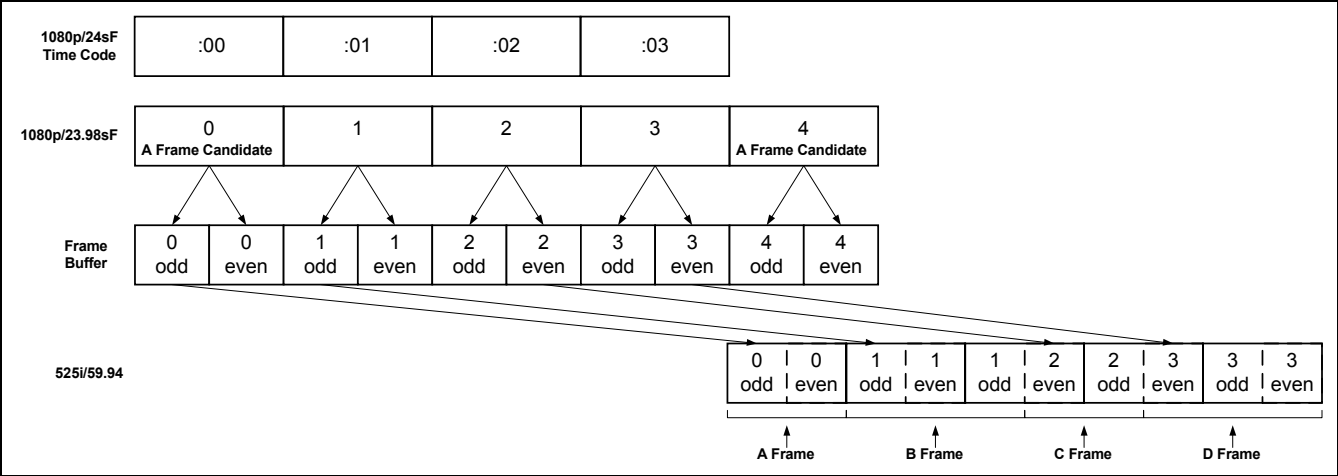

Figure 4-4: Timecode Referenced 2:3 Pulldown and Delay in HD9150

This page left intentionally blank

5. OPERATING THE POST SLATE AFTERBURNER

The HD9150PS-AUD and HD9150QPS-AUD Post Slate Afterburners are special versions designed to facilitate the creation and logging of standard definition video tapes from field acquired HDTV masters. In addition to all the normal functions of the HD9150 series Afterburners, these units are used in conjunction with the KeyLog TRACKER™ software to log the video and audio time codes of each shot on the master. The KeyLog TRACKER™ software becomes the core of the Post Slate logging system. In the field, audio time code is recorded on one of the audio tracks of the HD VTR to facilitate syncing audio in post production. Scene and Take information can be stored in the user bits of the audio timecode that is also recorded on the ATR. During downconversion, the Post Slate Afterburner detects discontinuities of Audio timecode and logs each shot automatically. The unit can use the scene/take information from the audio userbits to display a virtual slate burn in at the beginning of each shot, eliminating the need for time code slates on the set. The Post Slate Afterburners also de-embed audio from the incoming HD bitstream, delay it so that it is in time with the output video from the downconverter and provide 2 AES outputs and 4 analog audio outputs for recording on the downconverted video tape.

These two models operate in a very similar manner. The only difference between them is the quality of the downconverter hardware and the complement of video outputs available. For information on connecting these two different models see chapter 2. Throughout this chapter both of the Post Slate Afterburners will be referred to as HD9150PS. If there are specific differences that are important to the discussion, then the full model numbers (HD9150PS-AUD and HD9150QPS-AUD) will be used.

Field Acquired HDTV tapes contain the original field timecode recorded as linear time code (LTC) on an address track or as RP188 ancillary timecode recorded in the HANC area of the digital video bitstream. Often the production timecode is also recorded on one of the audio tracks of the VTR as an aid in syncing the audio. The Post Slate Afterburner operates in *Video mode*, downconverting video from material acquired by HDTV video cameras and makes burn-in windows and new 30 Fps timecode that is in sync with the downconverted video. The original 24 Fps timecode numbers can be placed in the user bits of the VITC and displayed as a burned-in window. The 2:3 cadence can be controlled from the ancillary timecode or from the LTC. See section 4.3 for more information.

The Post Slate Afterburner operates in the “video mode”

5.1. CONNECTING THE HD9150PS TO KEYLOG TRACKER™

For logging applications the HD9150PS is controlled from the Evertz Film system's Graphical User interface (GUI) KEYLOG TRACKER™. The software is used to configure the HD9150PS's hardware for different applications. Configuration sets can be saved and recalled to speed setups of the hardware. In order to control the HD9150PS you must use version 1.5.75 or later of the KeyLog TRACKER™ software.

5.1.1. Physical Connections

A nine pin sub-miniature 'D' connector **SERIAL CONTROL** is provided for connection to a computer running the software. This serial port provides a bi-directional RS-232-C data link at 57,600 baud. In order to connect your HD9150PS to your computer make a cable as shown in Figure 3-1. Use this cable to connect the computer's COM port to the **SERIAL CONTROL** connector on the rear of the HD9150PS.

Figure 5-1: Cable to Connect HD9150PS to PC Communications Port

5.1.2. Installing KEYLOG TRACKER™

Insert the first KeyLog TRACKER™ CD-ROM into the PC's CD-ROM drive and click on the Start button and then click Settings. Click on the Control Panel, then ADD/Remove Programs. The KEYLOG TRACKER™ installation program will guide you through the installation procedure.

Once the installation is complete, click on the Start button and then click Programs. Select the "Evertz Products" program group and click on the KeyLog TRACKER™ icon.

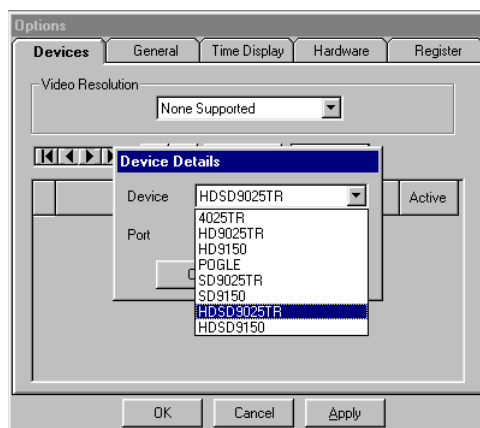

You are presented with the KEYLOG TRACKER™ Splash screen and the "Login" dialog box. Enter "user" as a user name, leave the password area blank and click the "OK" button.

You are then presented with the "Devices" tab of the Options dialog box that prompts you to configure the Communications ports on the computer that you are using to control the hardware devices.

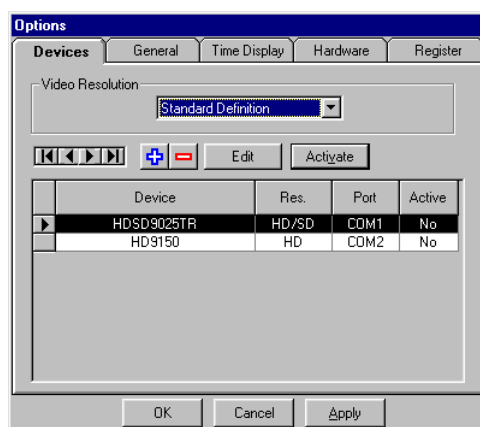

5.1.3. Configuring the PC Communications Ports

Press the  button to add the HD9150 to the list of controlled devices. Click on the down arrow beside the *Device* dropdown and choose the HD9150 with the mouse.

Click on the down arrow beside the *Port* dropdown and choose the COM port that you connected to the HD9150PS. Press the Okay button to add the HD9150 to the list of controlled devices.

The “Resolution” control allows you to configure if the KEYLOG TRACKER™ will be operating in the Standard Definition or High Definition mode. When the resolution control is set to the high definition mode, KEYLOG TRACKER™ will *activate* the high definition capable devices. Only one Afterburner device can be activated at any time. When you press the Okay button, KEYLOG TRACKER™ will attempt to communicate with the activated device. If the HD9150 is not activated click on the HD9150 line then press the Activate button. To verify communications with the HD9150PS, press Okay once you have verified the communications port settings. Normally the *Afterburner* button on the toolbar will be depressed. If the KEYLOG TRACKER™ is communicating with the HD9150PS, the COMM LED on the HD9150PS front panel should be On and there should also be a green indicator in the COMM Status Bar at the bottom of the KEYLOG TRACKER™ screen. If the HD9150PS COMM LED is off or the KEYLOG TRACKER™ COMM indicator is red, that shows that the hardware is not responding. If you receive a “Communications Error” message box, check your cable connection and verify that you have selected the correct communications port on your computer.

5.1.4. KeyLog TRACKER™ First Time Setup

Once you have correctly established communications with the KeyLog TRACKER™ software, consult the **First Time Setup** section of the KeyLog TRACKER™ manual or on line help system for information on configuring the system. The first time you run the KeyLog TRACKER™ software you should see a dialog box asking if you want to see the First Time Setup section of the Tracker online Help.

Press the *Show Help* button to view the help file. Press the *Continue* button to proceed without opening the help file. Check the *Don't show this message again* check box before pressing the *Continue* button if you don't want to see this message each time you start the KeyLog TRACKER™ software. The first time setup section of the manual and online help file guides you through the steps required to configure the system. Some of the concepts relate to the use of the software in Telecine applications so these can be ignored. The first time setup also introduces you to some of the basic concepts of controlling the HD9150PS from the KeyLog TRACKER™ software. We recommend that you read through these sections before proceeding.

CHAPTER 6: SYSTEM PARAMETERS

TABLE OF CONTENTS

6. SYSTEM PARAMETERS	6-1
6.1. GLOBAL PARAMETERS (CLASS 0)	6-1
6.1.1. Auto Video Standard Disable - Parameter [0][0]	6-1
6.1.2. HD9150Q Program Sdi Character Control - Parameter [0][3]	6-2
6.2. 9150 PARAMETERS (CLASS 15)	6-2
6.2.1. 9150 Parallel I/O Pin Functions	6-2
6.2.2. Pulldown Reference Offset - Parameter [15][10]	6-3
6.2.3. Output Video Phase Offset - Parameter [15][11]	6-3
6.2.4. 6 Hz Reference Control - Parameter [15][12]	6-3
6.2.5. LTC Reference Control - Parameter [15][13]	6-4
6.2.6. ANC TC Reference Control - Parameter [15][14]	6-4
6.2.7. Data Logging Enable - Parameter [15][32] (PS versions Only)	6-4
6.2.8. Dlo Delay/Advance ENABLE - Parameter [15][33] (PS versions Only)	6-4
6.2.9. 9150PS Special Function Control - Parameter [15][34] (PS versions Only)	6-4
6.2.10. Audio Delay - Parameter [15][36]	6-5
6.2.11. LTC Output Offset - Parameter [15][37]	6-5

Tables

Table 6-1: Class 0 - Global System Parameters	6-1
Table 6-2: Class 15 – 9150/9155 System Parameters	6-1
Table 6-3: Default 9150/9155 I/O Pin Functions	6-2

6. SYSTEM PARAMETERS

The HD9150 Afterburner hardware allows the user to change the default behaviour of various functions by the use of parameters. These parameters are grouped according to classes. Within each class parameters are identified by a parameter number. Each parameter has a value with the default value for each parameter being zero. Parameter class 0 and 15 apply to the HD9150 and will be described in this chapter. Table 6-1 and Table 6-2 show the currently defined parameters for each class with a brief description of what each parameter does. The parameter numbers shown in the tables below are decimal numbers. The following sections describe the operation of each parameter in detail.

Parameter	Name	Description
0	Auto Video Standard disable	Non-zero value disables auto video standard
2	Num-Print disable	Non-zero disables debug print of KK,TC numbers
3	Q Program SDI Char Control	>= 0 Off < -256 = slate, < 0 = Char on SD Prog video output

Table 6-1: Class 0 - Global System Parameters

Parameter	Name	Description
0	9150 Parallel I/O Port Pin 1 Input	Input function for this pin
1	9150 Parallel I/O Port Pin 8 Input	Input function for this pin
2	9150 Parallel I/O Port Pin 4 Input	Input function for this pin
3	9150 Parallel I/O Port Pin 9 Output	Output function for this pin
4	9150 Parallel I/O Port Pin 5 Output	Output function for this pin
10	9150 Pulldown Reference Offset	Output pulldown in relation to 6Hz cycle in 24P
11	9150 Output Video Offset	In/Out video offset (+50 lines)
12	9150 6Hz Ref Control	6Hz reference priority: neg = Ignore: pos 1-3 sets priority
13	9150 LTC Ref Control	LTC reference priority: neg = Ignore: pos 1-3 sets priority
14	9150 ANC Ref Control	ANC reference priority: neg = Ignore: pos 1-3 sets priority
32	9150PS Data Logging Enable	Non zero enables data logging and PS Functions
33	9150PS Delay and Advance Enable	Non zero enables Delay/Advance functions for DLO
34	9150PS Special functions	Bitmapped special function controls for 9150PS
36	9150 Audio Delay	+/- Num of samples of additional audio delay
37	9150 LTC Output Offset	+/- Num of frames of offset for LTC ooutput

Table 6-2: Class 15 – 9150/9155 System Parameters

6.1. GLOBAL PARAMETERS (CLASS 0)

6.1.1. Auto Video Standard Disable - Parameter [0][0]

zero Unit autodetects video standard
non-zero Video Standard must be set manually

6.1.2. HD9150Q Program Sdi Character Control - Parameter [0][3]

zero Character generator disabled on SD Prog video output
 < 0 All character windows available on SD Prog video output
 < -256 Virtual Slate character available on SD Prog video output

6.2. 9150 PARAMETERS (CLASS 15)

6.2.1. 9150 Parallel I/O Pin Functions

Parameters 0 to 2 of Class 15 control the functions of the three input pins on the Parallel I/O Connector. Parameters 3 and 4 of Class 15 control the functions of the two output pins on the Parallel I/O Connector. When the parameter value is set to zero (0) the default function of the I/O pin is selected as shown in Table 8.

The default pin functions are:

Pin	Signal Name	Description
1	INP_FUNC_6HZREF	Rising edge -> Start of 6Hz reference cycle
4	INP_FUNC_VSTD	Falling edge -> 1080i60, Rising edge -> 1080P24
5	DBUG_FRID	Output toggles with picture pulldown (FRID 3:2)
8	INP_FUNC_CHRONOFF	Falling edge -> Chars off, Rising edge -> Chars on
9	DBUG_SEQ_6HZ	Hi = start field of output video 6Hz cycle

Table 6-3: Default 9150/9155 I/O Pin Functions

To change the functions of the input pins change the respective parameter for the pin to the following values. (Negative values are input functions, and positive values are output functions).

Parameter Value	Signal Name	Description
0	INP_FUNC_DEFAULT	Functions as default input
-1	INP_FUNC_VSTD	Falling edge -> 1080i60, Rising edge -> 1080P24
-2	INP_FUNC_VSTD_INV	Falling edge -> 1080P24, Rising edge -> 1080i60
-11	INP_FUNC_CHRONOFF	Falling edge -> Chars off, Rising edge -> Chars on
-12	INP_FUNC_CHRONOFF_INV	Falling edge -> Chars on, Rising edge -> Chars off
-13	INP_FUNC_6HZREF	Rising edge -> Start of 6Hz reference cycle
-14	INP_FUNC_6HZREF_INV	Falling edge -> Start of 6Hz reference cycle
-15	INP_FUNC_CHRTOGL	pin toggles character on/off
-16	INP_FUNC_CHRTOGL_INV	Pin toggles character on/off inverted
-21	INP_FUNC_VDEF	Falling edge -> standard def, Rising edge -> Hi-def
-22	INP_FUNC_VDEF_INV	Falling edge -> Hi-def, Rising edge -> standard def

Table 6-4: Alternate 9150/9155 Input Pin Functions

Parameter Value	Signal Name	Description
0	DEBUG_MISC_NONE	Functions as default input
30	DEBUG_FRID	Output toggles with picture pulldown (FRID 3:2)
31	DEBUG_FRAME	1 field active low pulse on new picture (FRAME)
32	DEBUG_SEQ_6HZ	Hi = start field of output video 6Hz cycle
33	DEBUG_UPDVOFLDDB	Active low Blip at start of each field
34	DEBUG_ANCERR	Active low pulse on ANC errors
35	DEBUG_ANCF1DUPERR	Active low pulse on ANC VTR TC field 1 error
36	DEBUG_ANCF2DUPERR	Active low pulse on ANC VTR TC field 2 error
37	DEBUG_VTRSTARERR	Active low pulse on VTR TC displays stars (errors)
38	DEBUG_IO_SAMPLE	Toggles at each sampling of the inputs

Table 6-5: Alternate 9150/9155 Output Pin Functions

6.2.2. Pulldown Reference Offset - Parameter [15][10]

Output pulldown wrt 6Hz cycle in 24P

zero A frames are aligned to Pulldown reference

positive +1,+2 and +3 A Frames are aligned to input video frame corresponding to Pulldown reference +n frames.

6.2.3. Output Video Phase Offset - Parameter [15][11]

[01-10-12]

vertical phase offset from standard input video to output video, measured in output lines

prior to [01-10-12] the default offset this parameter value set to zero was 50 + 4 lines

and this parameter had a range of -50 to 0

this has been changed so the default offset is now 0 lines and so now the range is 0 to + 62 lines

for legacy reasons, if the parameter is set to a negative number then this results in the skew of 0 (which is fine for people who are still setting their video skew to -50)

6.2.4. 6 Hz Reference Control - Parameter [15][12]

priority of 6HZ ref input

negative disable 6 hz reference

zero default priority: for HD9155 is ANC,LTC,6HZ

 default priority: for HD9150 is 6HZ, LTC, ANC

positive +1,+2 and +3 now available to directly set the priority (3 is highest, 1 lowest, no duplicate values allowed in param 12, 13, 14)

6.2.5. LTC Reference Control - Parameter [15][13]

priority of LTC Time Code @ Frame Zero ref input

negative disable LTC reference

zero default priority: for HD9155 is ANC,LTC,6HZ

default priority: for HD9150 is 6HZ, LTC, ANC

positive +1,+2 and +3 now available to directly set the priority (3 is highest, 1 lowest, no duplicate values allowed in param 12, 13, 14)

6.2.6. ANC TC Reference Control - Parameter [15][14]

priority of ANC Time Code @ Frame Zero ref input

negative disable ANC reference

zero default priority: for HD9155 is ANC,LTC,6HZ

default priority: for HD9150 is 6HZ, LTC, ANC

positive +1,+2 and +3 now available to directly set the priority (3 is highest, 1 lowest, no duplicate values allowed in param 12, 13, 14)

6.2.7. Data Logging Enable - Parameter [15][32] (PS versions Only)

[01-10-02] non-zero = Enable data logging and complex slates in 9150PS

6.2.8. Dlo Delay/Advance ENABLE - Parameter [15][33] (PS versions Only)

[01-10-22] non-zero = use delay and advance for 9150PS Data logging

6.2.9. 9150PS Special Function Control - Parameter [15][34] (PS versions Only)

[01-11-06]

Byte 0 (LSB)\ bitmapped control register

Bit meaning

0 Lock condition: 0 = Lock from Video TC only, 1 = Lock from Video and Audio TC

1 Audio User bit parsing Enable

0 = Scene /Take comes from Tracker, 1 = Scene/Take Parsing from Audio UB (uses Scene/Take Map in byte 2

2 Video User bit parsing Enable

0 = Camera Roll comes from Tracker, 1 = Camera Roll Parsing from Video UB (uses Cam Roll Map in byte 3

3 0 = Process all Tag Changes, 1 = Ignore Tag changes to FFFFFFFF for starting new events. – indicates no matching audio

4 1 = replace Scene FFFFFFFF Take FF with "MOS" when Scene Take Parsing from Audio UB is enabled (bit 1)

5-7 not defined, set to 0

Byte 1 of parameter 15-34 is not defined and should be set to zero:

Byte 2 is the Audio User Bit Parsing Map:

This byte determines the parsing of Audio User bits when bit 1 of byte 0 is set to 1

The default parsing (When byte 2 is set to zero) is to take the left 6 digits for Scene and the right 2 for Take.

Bit	meaning
------------	----------------

0-3	BCD number of right justified digits for Take Number
-----	--

4-7	BCD number of left justified digits for Scene Number
-----	--

Byte 3 (MSB) is the Video User bit Parsing Map:

This byte determines the parsing of Video User bits when bit 2 of byte 0 is set to 1

The default parsing (When byte 3 is set to zero) is to take the left 4 digits for Camera Roll.

Bit	meaning
------------	----------------

0-3	not defined, set to 0
-----	-----------------------

4-7	BCD number of left justified digits for Camera Roll
-----	---

6.2.10. Audio Delay - Parameter [15][36]

[01-9-27] +/- additional audio delay for de-embedder in samples

6.2.11. LTC Output Offset - Parameter [15][37]

[02-2-07] +/- frames of offset for LTC output

This page left intentionally blank

CHAPTER 7: TECHNICAL DESCRIPTION

7. TECHNICAL DESCRIPTION

7.1. SPECIFICATIONS

7.1.1. HDTV Serial Digital Video Input

Standard: 1.485 Gb/sec HDTV Serial component digital SMPTE 292M standards supported shown in Table 2-6
software selectable or autodetect

Connector: BNC per IEC 169-8

Equalization: Automatic to 130m @ 1.5Gb/s with Belden 1694 or equivalent cable

7.1.2. SDTV Serial Digital Video Output

Standards: Serial component 270 Mb/s (SMPTE 259M-C)
525i/59.94 if input is 1080i/59.94 or 1080p/23.98sF video
625i/50 if input is 1080i/50

Connectors: BNC per IEC 169-8

Std versions: 2 monitor

Q versions: 2 program, 1 monitor

Signal Level: 800mV nominal

DC Offset: 0V \pm 0.5V

Rise and Fall Time: 470ps nominal

Overshoot: <10% of amplitude

Return Loss: > 15 dB

Wide Band Jitter: < 0.2 UI

7.1.3. Analog Monitor Video Output

Standards: Analog composite NTSC if input is 1080i/59.94 or 1080p/23.98sF video
Analog composite PAL if input is 1080i/50

Connectors: BNC per IEC 169-8

Std versions: 2

Q versions: 1

Signal Level: 1 V p-p nominal, internally adjustable

DC Offset: 0V \pm 0.1V

Return Loss: >35dB up to 5 MHz

Frequency Response: 0.8dB to 4 MHz

Differential Phase: <0.9°(<0.6° typical)

Differential Gain: <0.9% (<0.5 % typical)

SNR: >56dB to 5 MHz (shallow ramp)

Impedance: 75 ohm

7.1.4. LTC Generator

Standard: SMPTE 12M
Frame Rate: 25 and 30 Fps nominal
Connector: 3 pin male XLR type connector.
Level: Adjustable, 0.5V to 4.5V p-p

7.1.5. LTC Reader

Standard: SMPTE 12M
Frame Rate: 24, 25 and 30 Fps nominal
Connector: 3 pin female XLR type connector
Level: 0.2 to 4V p-p, balanced or unbalanced

7.1.6. Ancillary Timecode Reader

Standard: SMPTE RP188 or RP215
Line Select: Autodetect valid lines in vertical interval
Frame Rate: 24, 25 and 30 Fps nominal

7.1.7. Serial Communications

Standard: RS-232, 57600 baud, 8 bits, no parity
Connectors: 9 pin female "D"

7.1.8. Physical

Dimensions: 19" W x 1.75" H x 18.75" D.
(483mm W x 45mm H x 477mm D)
Weight: 8 lbs. (3.5Kg)

7.1.9. Electrical

Power: 115/230 V AC 50/60 Hz, 30 VA. ETL listed.
Complies with EU safety directive
EMI/RFI: Complies with FCC Part 15 Class A,
EU EMC Directive

7.2. DIP SWITCHES

The main circuit board contains an 8 position DIP switch (S1) that invokes setup and diagnostic functions. Most users will have no need to alter the factory switch settings. The functions of each switch are described below.

Switch	Name	Normal	Function when Open	Function when Closed
1	Aux Port Msg	Open	Normal	Enable Aux Port Messages
2	Not used	Open		
3	Not Used	Open		
4	Not used	Open		
5	9150 Mode	Open	Film Mode	Video Mode
6	Mode	Open	Must be open for 9150	
7	Tracker Msg	Open	Normal	Enable Tracker Messages
8	Debug Msg	Open	Normal	Enable Debug Messages

Table 7-1: DIP Switch Functions

7.3. UPGRADING FIRMWARE

The HD9150 series products contain firmware that is contained in a FLASH EPROM device. From time to time firmware updates will be provided to add additional features to the unit. If you have version 1.4.xx and later KeyLog Tracker software successfully interfaced to your unit, then it is very simple to upgrade your firmware from Tracker using the procedure outlined in section 7.3.1. Otherwise use the procedure outlined in section 7.3.2 to upload new firmware from your computer. If you have an HD9150 series product with an audio de-embedder card installed you will need to use the procedure in section 7.3.2 with the computer connected to the DE-EMBEDDER COM connector to update the de-embedder firmware.

7.3.1. Upgrading Firmware using KeyLog TRACKER™

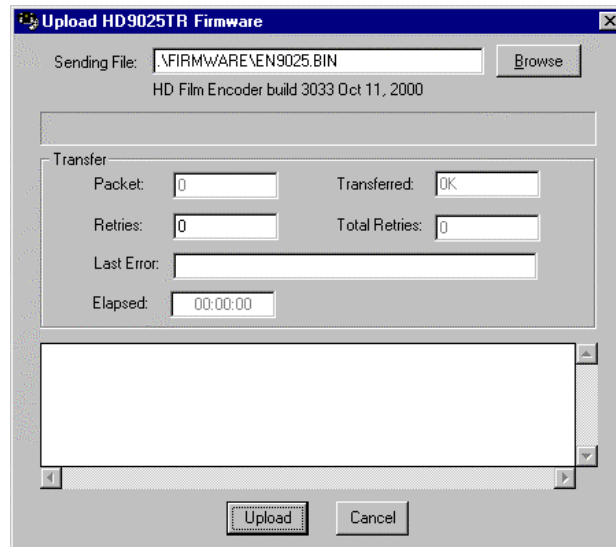

Versions 1.4.xx and later of KeyLog TRACKER™ allow firmware upgrades to the HD9150 downconverter hardware directly from within the Tracker software.

7.3.1.1. Step 1 – Configuring the unit for Firmware upgrades.

1. Power up the unit.

7.3.1.2. Step 2 – KeyLog TRACKER™ Setup

2. Start KeyLog TRACKER™
3. Confirm that you have established communications to the unit that you wish to upgrade. (a green COMM indicator will show at the bottom of the KeyLog TRACKER™ screen)
4. From the TOOLS menu of KeyLog TRACKER™ choose the UPGRADE FIRMWARE option. A dialog box titled UPGRADE FIRMWARE will appear.

5. Use the BROWSE button to open the file dialog and choose the new firmware file. Typical filenames are shown in Table 7-2. The build version of the firmware will be shown in the dialog box.
6. Click the UPLOAD button at the bottom of the upgrade dialog. Tracker will begin upgrading the firmware showing the communications and progress of the upgrade. On successful completion of the upload the unit should now reboot. After the unit reboots successfully with the new firmware the 'Upload Firmware' dialog will disappear. You can then resume normal operations with the KeyLog TRACKER™ software.
7. If the upgrade is interrupted or cancelled before completion, then KeyLog TRACKER™ will not be able to communicate to the unit. In that case you will have to manually upload the firmware using the procedure outlined in section 7.3.2.

7.3.2. Upgrading Firmware using a Terminal Program

You will need the following equipment in order to update the 9025/9150 Firmware

- PC with available communications port. The communication speed is 57600 baud, therefore a 486 PC or better with a 16550 UART based communications port is recommended.
- "Straight-thru" serial extension cable (DB9 female to DB9 male) or (DB25 female to DB9 male) This is the same cable you are using if you are running the KeyLog TRACKER™ or 9150 ConfigWare™ software.
- Terminal program that is capable of Xmodem file transfer protocol. (such as HyperTerminal)
- New firmware supplied by Evertz.

7.3.2.1. Step 1 – Configuring the unit for Firmware upgrades.

1. Connect the straight through Serial cable to the SERIAL REMOTE DB9 connector on the rear panel. If you are updating the Audio De-embedder firmware in units so equipped, connect the serial cable to the DE-EMBEDDER COM connector on the rear panel.
2. Connect the 9 pin connector on the end of the Serial Update cable to the PCs' RS-232 communications port

7.3.2.2. Step 2 – Terminal program Setup

3. Start the terminal program.
4. Configure the port settings of the terminal program as follows:

Baud	57600
Parity	No
Data bits	8
Stop bits	2
Flow Control	None

5. Power up the HD9150 unit. After the unit powers up, a banner with the boot code version information should appear in the terminal window. The cursor to the right of the word “BOOT>” should be spinning for about 5 seconds then the unit will continue to boot.

For example:

<pre>EVERTZ 7700PB MONITOR 1.2 COPYRIGHT 1997, 1998, 1999 EVERTZ MICROSYSTEMS LTD. COLD BOOT </pre>
--

6. The following is a list of possible reasons for failed communications:
 - Defective Serial Upgrade cable.
 - Wrong communications port selected in the terminal program.
 - Improper port settings in the terminal program. (Refer to step 4 for settings). Note that Hyperterminal will not change port settings while connected. Click on Hyperterminal's “Disconnect” Button then click the “Reconnect” button to activate changes to the port settings.
7. While the cursor is spinning press the <CTRL> and <X> keys on your computer keyboard at the same time, this should stop the cursor from spinning. The spinning prompt will only remain for about 5 seconds. You must press <CTRL-X> during this 5 second delay. If the unit continues to boot-up, simply cycle the power and repeat this step.
8. Hit the <ENTER> key on your computer once.
9. Type the word “upgrade”, without quotes, and hit the <ENTER> key once.
10. The boot code will ask for confirmation. Type “y”, without quotes.
11. You should now see a prompt asking you to upload the file.

7.3.2.3. Step 3 – Uploading the new firmware

7. Upload the “*.bin” file supplied using the X-Modem transfer protocol of your terminal program. If you do not start the upload within 10 minutes the unit’s Boot code will time out. You can restart the upgrade process by power cycling the unit. The following table indicates the file names of various firmware for these units.

Example of File name	Description
DE9150_XXXX.BIN	Binary File for downconverter module in HD9150, HD9150Q-AUD
HQ9150_XXXX.BIN	Binary File for downconverter module in HD9150Q, HD9150QPS-AUD
7720AD-A4-HD_XXXX.BIN	Binary File for Audio De-embedder module in HD9150PS-AUD, HD9150QPS-AUD

(XXXX will be the build number of the software).

Table 7-2: Typical File names

8. The boot code will indicate whether the operation was successful upon completion of the upload.

For Example:

```
UPLOAD OKAY
7700PB COLD BOOT> |
```

9. The following is a list of possible reasons for a failed upload:
 - If you get the message "transfer cancelled by remote" you must restart the terminal program and load the bin file, then remove and install the module again.
 - The supplied “*.bin” file is corrupt.
 - Wrong file specified to be uploaded.
 - Wrong file transfer protocol used – make sure you specify Xmodem, not Xmodem 1K.
 - The PCs’ RS-232 communications port can’t handle a port speed of 57600.
 - Noise induced into the Serial Upgrade cable.

7.3.2.4. Step 4 – Completing the Upgrade

10. Type the word “boot”, without quotes, and hit the <ENTER> key once or power cycle the unit. The unit should now reboot.
11. You can now close the terminal program and disconnect the RS-232 serial cable from the PC.

7.4. DEBUG WINDOW FUNCTIONS

The HD9150 units have three text windows called *DEBUG*, *DEBUG2* and *DEBUG3*. These windows can be controlled using the WINDOWS tab of the project or system configuration in the KeyLog TRACKER™ software or using the Windows radio button of the 9150 ConfigWare™ software and are used to display additional information on the output video. Changing the HORIZONTAL position value for the window controls what information is displayed. (The window can not be moved horizontally).

The format and content of the displays may change as the firmware evolves, but here are the current displays. Some content is intended for use only by the Evertz engineers, and is not documented.

Some displays show a line of @ characters under specific conditions. These displays are designed to be visible on an oscilloscope that is monitoring the output video (usually in some analog form).

Hor Pos Value	Debug Window Name	Description
0	WIN HW	IN: binary i/o pins DIP: binary dip switch input
1	WIN TFPHASE	VTF: video to film phase ATF: audio to film phase
2	WIN TFPHASERR	VTFX: error of video to film phase wrt target phase
3	WIN VFLD2	@@@@@ on field 2 characters
4	WIN VPULL	@@@@@ on new picture (pulldown)
5	WIN F0	@@@@@ on kk frames == 0
6	WIN V0	@@@@@ on VTR timecode frames == 0
7	WIN A0	@@@@@ on ATR timecode frames == 0
8	WIN VAPHASE	VPH: video phase APH: audio phase
9	WIN PULLT	PULL: pull type of kk
10	WIN ILTC	ILTC: LTC reader input
11	WIN REF	REF: ref src valid phase lock cnt
12	WIN VIDEO	VID: input video type -> output video type
13	WIN ANC VTR	ANC Video timecode
14	WIN ANC ATR	ANC Audio timecode
15	WIN MODES	RP215 Film ANC encoded information
16	WIN POP UP ERRORS	POP UP ERRORS
17	WIN IDLE	Processor Idle Measurement
18	WIN DLO	Data Logging Output
19	WIN GPI	GPI input frame number
20	WIN PRESET STS	STATUS: USER CONFIGURATION
21	WIN OP1 STS	Output 1 - Parallel connector Pin 9 status
22	WIN OP2 STS	Output 2 - Parallel connector Pin 5 status
23	WIN SLTC	Smoothed LTC stats
24	WIN REV	Firmware Revision
Last	WIN RAM	00000000: ram viewer values

Table 7-3: 9150 Debug Window Functions

7.4.0. WIN HW (0) Hardware Display

IN: 011 DIP:11111110 SW:001

IN: 011 real time display of parallel port inputs MSB (2) to LSB (0), including some internal inputs
 DIP:11111110 realtime display of DIP switch, MSB (8) to LSB (1), where 0 indicates switch is in the DOWN/ON position.

SW:001 realtime display of front panel switch inputs MSB () to LSB () - only displayed for HD9155 and HD9155AES

7.4.1. WIN TFPHASE (1) Timecode to film phase indicator

VTF:0000000.0 A:0000000.0

VTF:0000000.0 video timecode abs frames extrapolated back to film abs frames 0.

A:0000000.0 likewise for the audio timecode

7.4.2. WIN TFPHASERR (2) Timecode to film phase error indicator

VTFX:0000000.0 ATFX:0000000.0

VTFX:00000000 error between displayed video timecode absolute frames extrapolated back to film absolute frames 0 (video-tfphase) and expect video-tfphase computed from Film ANC data.

ATFX:00000000 likewise for the audio timecode

7.4.3. WIN VFLD2 (3) Video Field 2

@@@@ on video field 2 characters

7.4.4. WIN VPULL (4) Video Pulldown

@@@@ on new picture (pulldown)

7.4.5. WIN F0 (5) KeyKode Frames 0

@@@@ on KeyKode frames == 0

7.4.6. WIN V0 (6) Video Timecode Frames 0

@@@@ on VTR timecode frames == 0

7.4.7. WIN A0 (7) Audio Timecode Frames 0

@@@@ on ATR timecode frames == 0

7.4.8. WIN VAPHASE (8) Timebase Phase

VPH:0.000 APH:0.000 3

VPH:0.000 video timebase phase

APH:0.000 audio timebase phase

3 pulldown reference lock counter, 0=unlocked, 3=locked

7.4.9. WIN PULLT (9) Pulldown Type

PULL:K-A V-A B A(L):+0

K-A is the pulldown indicator (A,B,C,D) of KeyCode ffff+00 frames.
V-A is the pulldown indicator (A,B,C,D) of video timecode hh:mm:ss:00 frames.
B is the pulldown indicator (A,B,C,D) of the current picture field
A(L) (L) indicates audio timecode derived from LTC input, otherwise from ANC input
:+0 phase of audio timecode at video frame 0.

7.4.10. WIN ILTC (10) LTC Reader Input Data

LTC:%100T0+1L23:59:59:23@24

': ' LTC threshold set at 50% of frame. or '.' LTC threshold set at 70% of frame.
%100 valid read rate as a percentage of expected read rate
T0 phase of LTC input (0-9) w.r.t video/audio timebase. T1 indicates LTC was complete somewhere between 0% and 10% of the frame.
+1 numeric difference of timecode between successful reads
L dynamics flags L-locked, P-play, F-forward, S-stop, R-reverse
23:59:59:23 raw, uncompensated timecode read (NOT LIKELY TO EXACTLY MATCH picture content!)
'.' will be replaced by '*' when timecode not valid, or not readable or discontinuous
@24 timecode counting rate. or shown as @24/30 timecode counting rate / expected rate

7.4.11. WIN REF (11) Pulldown Reference Source Indicator

REF:ANC 1 0 3 @24

ANC Pulldown referenced to ANC/6HZ/LTC/NONE source
1 Valid indicator - 0 = not valid
0 Video Timecode frame number mod 4 wrt reference - 0,1,2,3
3 Pulldown reference Lock counter - 3 = locked, 0= unlocked
@24 timecode rate of reference timecode

7.4.12. WIN VIDEO (12) Video Mode Indicator

VID:1080P/23.98SF->525i/59.94 AV

1080P/23.98SF->525i/59.94 Displays the current input and output video standards,
AV indicates autovideo standard switching is enabled

7.4.13. WIN ANC VTR (13) ANC Video timecode

VAL:%100 F1 L23:59:59:23@24/24
 L source type L=RP188LTC, 1=RP188VITC1, 2=RP188VITC2, F=RP215
 %100 valid read rate as a percentage of expected read rate
 F1 Fields in which data is read - F12 indicates both field 1 and field 2
 L dynamics flags L-locked, P-play, F-forward, S-stop, R-reverse
 23:59:59:23 raw, uncompensated timecode read - NOT LIKELY TO EXACTLY MATCH picture content! ':' will be replaced by '*' when timecode not valid, or not readable or discontinuous
 @24/30 timecode counting rate / expected rate
 22 timecode dynamics flags

7.4.14. WIN ANC ATR (14) ANC Audio timecode

AAL:%100 F1 L23:59:59:23@24/24
 L source type L=RP188LTC, 1=RP188VITC1, 2=RP188VITC2, F=RP215
 %100 valid read rate as a percentage of expected read rate
 F1 Fields in which data is read - F12 indicates both field 1 and field 2
 L dynamics flags L-locked, P-play, F-forward, S-stop, R-reverse
 23:59:59:23 raw, uncompensated timecode read - NOT LIKELY TO EXACTLY MATCH picture content! ':' will be replaced by '*' when timecode not valid, or not readable or discontinuous
 @24/30 timecode counting rate / expected rate
 22 timecode dynamics flags

7.4.15. WIN MODES (15) RP215 Film ANC encoded information

ENC:35MM-4P@24 1080P23.98
 35MM-4P Film gauge of transfer encoded in film ANC
 @24 Film transfer rate encoded in film ANC
 1080P23.98 Video standard at which transfer was recorded, encoded in film ANC

7.4.16. WIN ERRS (16) Pop up errors

Various error and warning messages will display briefly as they occur

7.4.17. WIN IDLE (17) Processor Idle Measurement

IDL: 374 (73%) X:388 N:353 83
 2737 Average Number of times through the task list per frame
 (73%) average percentage of frame spent idling
 X:388 max idling
 N:353 min idling
 83 minimum microseconds to get through the task list

7.4.18. WIN DLO (18) Data Logging Output

DLO: NOT ENABLED
DLO:5 22:28:06:04@24 22:29:00:00
5 DLO Type Identifier
22:28:06:04 Video timecode value
@24 Video timecode counting rate
22:29:00:00 Audio timecode value

7.4.19. WIN GPI (19) GPI input frame number

GPI:12:59:59:23
Video timecode of frame number where GPI input is detected going from off to on

7.4.20. WIN PRESET STS (20) Preset status

USER CONFIG WRITE PENDING-20
Displays the above message and timer countdown until non-volatile settings are saved

7.4.21. WIN OP1 STS (21) Output 1 - Parallel Connector Pin 9 status

OP1H L22:00:00:22 H23:59:59:23
H current status of output pin H/L depends on function programmed for this output
L22:00:00:22 Output Video Timecode at which output pin last went low
H23:59:59:23 Output Video Timecode at which output pin last went high

7.4.22. WIN OP2 STS (22) Output 2 - Parallel Connector Pin 5 status

OP2H L22:00:00:22 H23:59:59:23
H current status of output pin H/L depends on function programmed for this output
L22:00:00:22 Output Video Timecode at which output pin last went low
H23:59:59:23 Output Video Timecode at which output pin last went high

7.4.23. WIN SLTC (23) Smoothed LTC Stats

STC:%100W1 N00E+1L23:59:59:23
STC:%100X12 N00E+1L23:59:59:23
' : ' LTC threshold set at 50% of frame. or '.' LTC threshold set at 70% of frame.
%100 valid read rate as a percentage of expected read rate
W1 tolerance: number of frames of difference allowable between input LTC and smoothed LTC
X12 tolerance delay count: counts down frames where tolerance must be 0. After delay count runs to zero, then non-zero tolerance (if any) is used.
N00 jam error counter - counts number of frames where difference exceeds tolerance until jam counter reaches limit and smoothed LTC is jammed to input LTC
E+1 difference between input LTC and smoothed LTC
L smoothed dynamics flags L-locked, P-play, F-forward, S-stop, R-reverse
23:59:59:23 smoothed LTC - NOT LIKELY TO EXACTLY MATCH picture content! ':' will be replaced by '*' when timecode not valid, or not readable, or discontinuous
@24 timecode counting rate. or shown as @24/30 - timecode counting rate / expected rate

7.4.24. WIN REV (24) Firmware Revision

REV DE9150B2 09 3157 U 020315
DE9150B2 Firmware name
09
3157 Firmware build number
U R = Released. U = unreleased
020315 Firmware build date

7.4.25. WIN RAM (always the last display) Ram Display

40000000:4f001000 08000402 4003a4b4
40000000: address, controlled by parameter 29-20, balance of line shows RAM contents for next 12 locations
