Introduction

This FortiOS™ Handbook v3 is the definitive guide to configuring and operating FortiOS 4.0 MR3. It contains concept and feature descriptions, as well as configuration examples worked out in detail for the web-based manager and the CLI. This document also contains operating and troubleshooting information.

This is the third version of the handbook. This version is still a work in progress but includes many improvements, corrections and additions. Among the additions are new chapters that describe troubleshooting and FortiGate hardware (including hardware installation, hardware acceleration, RAID, and FortiBridge). The new compliances and certifications chapter describes FortiOS PCI support and FIPS/CC support. New sections include more information about VRRP, SNMP, sFlow, advanced static routing, and more information about deploying wireless networks.

This introduction describes the following topics:

How this Handbook is organized

This handbook contains the following chapters:

- Chapter 1, What's New describes the new features in FortiOS 4.0 MR3 and includes some general upgrading information.
- Chapter 2, Firewall describes FortiOS firewall functionality on all FortiGate units. It includes the purpose of the firewall, how traffic moves through the FortiGate unit, the components involved in the firewall and its policies. This chapter also describes how to configure the basics and some more involved examples.
- Chapter 3, System Administration describes a number of administrative tasks to configure and setup the FortiGate unit for the first time. It also describes the best practices and sample configuration tips to secure your network and the FortiGate unit itself.
- Chapter 4, Logging and Reporting describes how to begin choosing a log device for your logging requirements, the types of log files, how to configure your chosen log device, including detailed explanations of each log type of log message.

- Chapter 5, Troubleshooting describes concepts of troubleshooting and solving issues that may occur with FortiGate units.
- Chapter 6, UTM Guide describes the Unified Threat Management (UTM) features available on your FortiGate unit, including antivirus, intrusion prevention system (IPS), anomaly protection (DoS), one-armed IPS (sniffer policies), web filtering, email filtering, data leak prevention (DLP), and application control. Also included is how to use the Endpoint features of FortiOS: endpoint Network Access Control (NAC), endpoint application detection, endpoint monitoring, and network vulnerability scanning. The chapter includes step-by-step instructions showing how to configure each feature. Example scenarios are included, with suggested configurations.
- Chapter 7, User Authentication defines authentication and describes the FortiOS options for configuring authentication for FortiOS.
- Chapter 8, IPsec VPNs provides a general introduction to IPsec VPN technology, explains the features available with IPsec VPN and gives guidelines to decide what features you need to use, and how the FortiGate unit is configured to implement the features.
- Chapter 9, SSL VPN provides a general introduction to SSL VPN technology, explains the features available with SSL VPN and gives guidelines to decide what features you need to use, and how the FortiGate unit is configured to implement the features.
- Chapter 10, Advanced Routing provides detailed information about FortiGate dynamic routing including common dynamic routing features, troubleshooting, and each of the protocols including RIP, BGP, and OSPF.
- Chapter 11, Virtual Domains describes FortiGate Virtual Domains (VDOMs) and is intended for administrators who need guidance on solutions to suit different network needs and information on basic and advanced configuration of VDOMs. Virtual Domains (VDOMs) multiply the capabilities of your FortiGate unit by using virtualization to partition your resources.
- Chapter 12, High Availability describes FortiGate HA, the FortiGate Clustering Protocol (FGCP), FortiGate support of VRRP, and FortiGate standalone TCP session synchronization.
- Chapter 13, Traffic Shaping describes how to configure FortiOS traffic shaping.
- Chapter 14, FortiOS Carrier describes FortiOS Carrier dynamic profiles and groups, Multimedia messaging service (MMS) protection, and GPRS Tunneling Protocol (GTP) protection.
- Chapter 15, Deploying Wireless Networks describes how to configure wireless networks with FortiWiFi, FortiGate, and FortiAP units.
- Chapter 16, VoIP Solutions: SIP & FortiGate Voice describes FortiOS SIP support.
- Chapter 17, WAN Optimization, Web Cache, Explicit Proxy, and WCCP describes how FortiGate WAN optimization, web caching, and web proxy work and also describes how to configure these features.
- Chapter 18, Load Balancing describes firewall HTTP, HTTPS, SSL or generic TCP/UDP or IP server load balancing.
- Chapter 19, Hardware describes how to mount, connect power, and turn on your FortiGate unit. Other topics include descriptions and configuration instructions for FortiGate accelerated hardware processing, RAID, and FortiBridge protection.
- Chapter 20, Certifications and Compliances explains how Fortinet products can help you comply with the Payment Card Industry Data Security standard and also describe FortiOS FIPS/CC support.

Chapter 1 What's New

This FortiOS Handbook chapter contains the following sections:

Upgrading to FortiOS 4.0 MR3 provides information about upgrading to the new release.

FortiOS 4.0 MR3 New Feature Highlights describes the key new features available in FortiOS 4.0 MR3.

Logging and reporting enhancements describes new logging and reporting features.

FortiOS 4.0 MR3 Usability improvements describes FortiOS 4.0 MR3 usability enhancements and changes.

More New Features describes other general new FortiOS 4.0 MR3 features and lists what's new in FortiOS 4.0 MR3 patches 1 to 5.

Upgrading to FortiOS 4.0 MR3

This section explains how to properly upgrade to FortiOS 4.0 MR3. The following topics are included in this section:

General firmware upgrade steps

Regardless of whether you are installing the 4.0 MR3, patch release or GA firmware, you should use the following general procedure as a guideline for installing the firmware image. Upgrade the firmware during a low-traffic time period to avoid disrupting your network.

For more information about upgrading to FortiOS 4.0 MR3 see the FortiOS 4.0 MR3 Release Notes.

General procedure for upgrading current firmware - web-based manager

1. Verify what firmware image you need to upgrade to from the current firmware image that is running on the unit.
2. Download the new firmware image.
3. Back up your current configuration file.
4. Log into the web-based manager and go to *System* > *Dashboard* > *Status* and in the System Information Widget select *Update* beside the *Firmware Version*.
5. Select the firmware image file to install.
6. Clear your browser's cache after the installation process is finished.

   After a few minutes you can log back into the web-based manager.
7. Manually update antivirus and intrusion protection definitions and engines to the current version.

   Go to *System* > *Config* > *FortiGuard* > *Antivirus and IPS Options* and select Update Now.

   The signatures included with a firmware image upgrade may be older than ones currently available from FortiGuard.

Backing up and restoring your FortiGate configuration file

Always back up your FortiGate configuration before upgrading or downgrading firmware, or resetting configuration to factory defaults. Then if required you can restore the configuration by uploading the backed up configuration file to your FortiGate unit.

Before installing any firmware image, you should back up the current FortiGate configuration file. This ensures that you have a current configuration file if the upgrade is not successful. You are also ensuring that all configuration settings are available if there are some that are not carried forward.

To back up your configuration file - web-based manager

1. Log into the web-based manager and go to *System* > *Dashboard* > *Status* and in the System Information Widget select *Backup* beside *System Configuration*.
2. Select where to save configuration file.
3. If you want to encrypt your configuration file to save VPN certificates, select *Encrypt configuration file* and enter and confirm a password. An encrypted configuration file can only be opened by uploading it to the same FortiGate unit and entering this password.
4. Select *Backup* and save the configuration file.

To restore your configuration file - web-based manager

You may need to restore your configuration file if you have experienced problems during a firmware upgrade.

1. Log into the web-based manager and go to *System* > *Dashboard* > *Status* and in the System Information Widget select *Restore* beside *System Configuration*.
2. Select to configuration file to restore.
3. If the configuration file is encrypted, enter the password.
4. Select *Restore* to restore the configuration to the one of the saved the configuration file.

   The FortiGate unit uploads and installs the configuration.
5. Clear your browser's cache after the installation process is finished.

   After a few minutes you can log back into the web-based manager.

Temporarily installing FortiOS 4.0 MR3

The following procedure describes how install temporarily install a firmware image to the system memory. When you reboot the FortiGate unit it will restart running the current firmware.

The procedure describes how to reboot the FortiGate unit and download firmware from a TFTP server and select the `Run image without saving` option to temporarily store the firmware image in memory without upgrading the firmware image stored on the FortiGate bootup device.

This procedure provides a way to become familiar with new FortiOS 4.0 MR3 new features and changes before committing to a full upgrade to the new version.

To temporarily install a new firmware image

1. Copy the new firmware image file to the root directory of a TFTP server.

2 Set up a console connection to the FortiGate unit CLI.

3 Make sure the FortiGate unit can connect to the TFTP server using the `execute ping command`.

4 Restart the FortiGate unit. For example, enter the following command:

```
execute reboot
```

5 As the FortiGate unit reboots, press any key to interrupt the system startup when the following message appears:

```
Press any key to display configuration menu …
```

You have only three seconds to press any key. If you do not press a key soon enough, the FortiGate unit reboots and you must log in and repeat the execute reboot command.

6 If you successfully interrupt the startup process, a message similar to the following appears:

```
[G]: Get firmware image from TFTP server
[F]: Format boot device
[B]: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default firmware
[H]: Display this list of options.

Enter G, F, Q, or H:
```

7 Type `G` to get the new firmware image from the TFTP server.

The following message appears:

```
Enter TFTP server address [192.168.1.168]:
```

8 Type the address of the TFTP server and press Enter.

The following message appears:

```
Enter Local Address [192.168.1.168]:
```

9 Type an IP address of the FortiGate unit to connect to the TFTP server.

The IP address must be on the same network as the TFTP server, but make sure you do not use the IP address of another device on the network.

The following message appears:

```
Enter File Name [image.out]:
```

10 Enter the firmware image file name and press Enter.

The TFTP server uploads the firmware image file to the FortiGate unit and the following appears:

```
Save as Default firmware/Backup firmware/Run image without
saving: [D/B/R]
```

11 Type `R`.

The firmware image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

12 When you are done, reboot the FortiGate unit and it will resume using the previous firmware image.

FortiOS 4.0 MR3 New Feature Highlights

This section describes the key new features available in FortiOS 4.0 MR3. In addition to the highlights described in this section see "Logging and reporting enhancements" on page 127 for information about the new logging features in FortiOS 4.0 MR3 and "FortiOS 4.0 MR3 Usability improvements" on page 139 for complete information about all of the usability improvements in FortiOS 4.0 MR3.

Flow-based UTM Extensions

Flow-based inspection can result in major performance improvements to UTM inspection. First introduced to improve antivirus performance in FortiOS 4.0 MR2, in MR3 flow-based inspection has been extended to web filtering and data leak prevention (DLP) and also includes the ability to virus scan compressed files.

This flow-based scanning performance improvements come from reduced memory requirements, high concurrent session count, high session start rates and low latency. In addition flow-based scanning is not affected by a maximum file size.

The trade-off for these advantages is that flow-based scanning may not be as accurate or comprehensive as proxy-based scanning although Fortinet is continuing to improve the accuracy and depth of coverage provided by flow-based UTM features.

Flow-based web filtering

Flow-based web filtering is a non-proxy solution which provides high concurrent session, high session rate, and low-latency web-filtering service. You can enable flow-based web filtering within a web filter profile.

You can enable flow-based web filtering in any Web Filter Profile by setting the *Inspection Mode* to *Flow-based*. Flow-based web filtering can be enabled in some web filtering profiles and not others, allowing you to apply flow-based web filtering to some traffic and proxy-based web filtering to other traffic.

Flow-based Data Leak Prevention (DLP)

Flow-based DLP is a non-proxy solution which provides high concurrent session, high session rate, and low-latency DLP services. You can enable flow-based DLP within a DLP sensor.

You can enable flow-based DLP in any DLP Sensor by setting the *Inspection Method* to *Flow-based Detection*. Flow-based DLP can be enabled in some DLP sensors and not others, allowing you to apply flow-based DLP to some traffic and proxy-based DLP to other traffic.

UTM Configuration and Inspection Enhancements

FortiOS 4.0 MR3 includes the following improvements to UTM functionality.

UTM profile and sensor configuration improvements

All UTM features including Antivirus, intrusion protection, web filtering, email filtering, data leak prevention, application control, VoIP and ICAP include one or more default profiles or sensors. In many cases you can add the default profile or sensor to a security policy to apply basic functionality for that UTM feature. You can also modify the default profiles and sensors to meet your requirements and create new profiles and sensors.

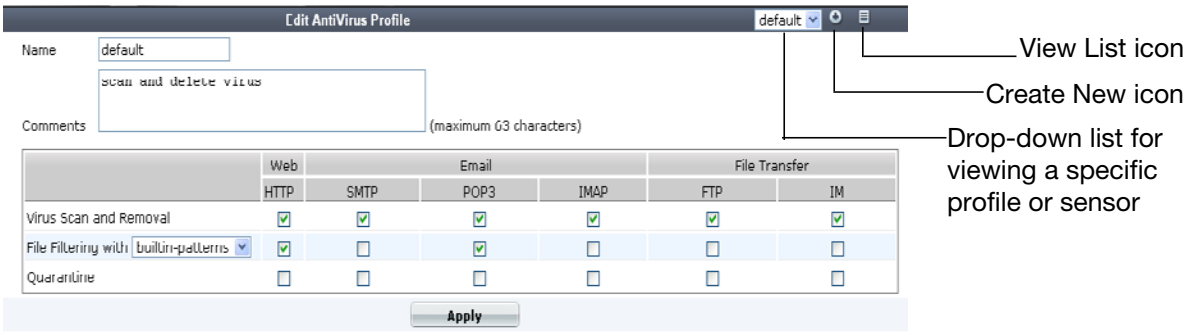
Within the Configuration Settings page for all UTM features you can to do the following:

- view and edit the default profile or sensor
- view the current settings of a profile or sensor
- create or remove a new profile or sensor
- view a list of profiles or sensors that you created

In the upper-right corner of the Configuration Settings page there is a drop-down list, *Create New* icon and *View List* icon. These are shown in Figure 1. You can use them in the following ways:

- Create a new profile or sensor by selecting *Create New*.
- View a specific profile or sensor by selecting it from the drop-down list.
- View the profiles or sensors that you have created by selecting *View List*.
- Remove the current profile or sensor that you are viewing by selecting *Delete*.

Figure 1: Example antivrus profile page



The actual configuration operations for all UTM profiles and sensors has also been modified to make configuration of sensors and profiles faster and more effective.

Archive inspection for antivirus profiles

Within antivirus profiles, you have more control about how the FortiGate unit handles file archives (for example .zip files). These options have been added because some archives cannot be virus scanned (for example, encrypted archives).

From the CLI you can select options to block all encrypted archives, block corrupted archives, block multipart archives, and write log messages whenever an archive file is received that cannot be virus scanned.

The following is an example.

```
config antivirus profile
  edit av_1
    config http
      set options block-encrypted-archive block-corrupted-
          archive block-multipart-archives log-unhandled-archive
    end
```

Improved IPS default block rate

The IPS default block rate was improved so that the critical level, high level and medium levels are now higher. The critical level now has an 80 percent default block rate or higher; high level has 70 percent or higher; and the medium level has 50 percent rate or higher.

IPS signature rate count threshold

The IPS signature threshold has been enhanced to allow you to configure a signature that will not be triggered until a rate count threshold is met. This provides a better, more controlled recording of attack activity. For example, multiple login-failed events are detected in a short period of time, and an alert is raised.

This enhancement is enabled from the CLI. Once you enter a value for the rate count you can configure the rate limit mode optionally the packet fields to track. The command syntax is:

```
config ips sensor
  edit <sensor_name>
    config override
      edit 0
        set rate-count <integer>
        set rate-duration <integer_seconds>
        set rate-mode {continous | periodical}
        set rate-track {dest-ip | dhcp-client-mac | dns-domain |
            none | src-ip}
    end
```

IPS Predefined signature viewer

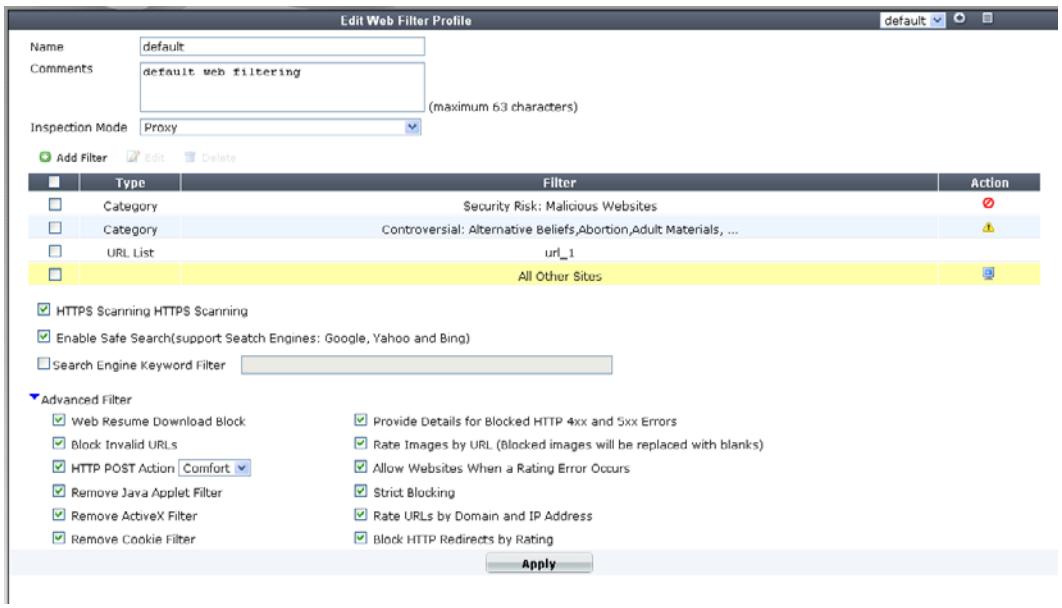
When you are viewing predefined signatures in *UTM Profiles* > *Intrusion Protection* > *Predefined*, you can more easily view information about each signature using the IPS Signatures Viewer.

Web Filter profiles

In *UTM Profiles* > *Web Filter* > *Profiles*, the Web Filter Profile Configuration Settings page contains a complete redesign of what was previously there. Previously, there was FortiGuard Web Filtering and FortiGuard Web Filtering Overrides; these are now in the CLI. Filters can be added to the profile. A filter is a category or banned word.

The Web Filtering feature contains the following new features and changes to existing features. The Web Filter menu no longer contains the submenu Web Content Filter; however, these settings are still available in the CLI.

Figure 2: The default configuration settings on the Edit Web Filter Profile page



Previous web filter profiles are carried forward and those settings are merged into the new redesign. If you want to view the previous settings in FortiOS 4.0 MR3, use the `show webfilter profile <name>` command to view the entire previous settings.

Depending on what settings you need to configure within the web filter profile, you may need to have access to both the CLI and web-based manager. The FortiGuard Web Filtering, FortiGuard Web Filtering Overrides and web content filtering are now configured in the CLI.

In a web filter profile, you can also include keywords that may appear in a search engine that a user enters in a search engine. These keywords are logged in the web filter log. The keywords are entered, separated with a comma, in the *Search Engine Keyword Filter* field.

Web Filtering Overrides

Web filtering overrides are now simplified and are profile-based. Profile-based overrides are web filter profiles that contain only overrides, and these overrides allow a rule to be created that changes the web-filter profile that applies to a user. The override feature is extended to apply to all features within the web-filter profile, and an override link appears in all related blocked pages where the user can override the block and continue on.

When you want to create a web filtering override, create a new web filter profile that is specifically for overrides. These configuration settings are available only in the CLI. These settings in the new override profile are configured by the administrator, and the administrator has complete control over the changes for the user.

The command syntax for configuring a new profile-based web filter override is as follows:

```
config webfilter {override | override-user}
  edit <id_number>
    set expires <yyyy/mm/dd hh:mm:ss>
    set initiator admin
```

```
    set status {enable | disable}
    set old-profile <old_profile_name>
    set new-profile <new_profile_name>
    set scope {ip | ip6 | user |user-group}
    set user <user_name>
    set user-group <user_group_name>
  end
```

For the option `initiator`, its value is always `admin`.

In the above command syntax, you see the commands `old-profile` and `new-profile` and its these commands that control how the override rule is applied. For example, if a user is browsing using a session that contains an old web filter profile applied, then the new-profile is used instead. If a user browses using a session that has a profile other an old profile, their profile will not be changed to a new profile. A user may be able to create a new override rule if the configuration permits it; however, only one override rule is allowed per user/profile pair.

With a web filter profile-based override, you can modify the URL filter list or add local ratings to deal with the extraction of offsite URLs. However, the function of this new override may change a user's FortiGuard categories, URL-filter list and so on.

When upgrading, existing web-filter profiles are carried forward but will not work until the administrator modifies them to the new settings. Any existing rules, both user and administrative, are not carried forward because there is no way to change the old override type to profiles for each rule without running out of profiles. This concerns only administrative overrides.

Application Control Sensors and filters

Application Sensors are similar to IPS or DoS sensors and replace the application control lists available in FortiOS 4.0 MR2.

An Application sensor contains application filters which you can configure to select individual applications to control or you can use categories, vendor names, behavior types, technology types, protocols, and tags to select groups of related applications. Application filters allow you to monitor, block, and reset sessions for single applications or groups of applications.

Application filters also allow you to apply shared traffic shaping to applications in the filter. You can apply forward and reverse traffic shaping and if the traffic shaper includes DSCP (or DiffServ) settings, these are also applied to applications specified in the filter. You can also set the session TTL for different applications and enable packet logging for applications.

Fortinet is constantly adding more applications to application control. Recent additions include the ability to individually monitor and block many Facebook applications.

Geography-based filtering for firewall addresses

Geography-based filtering for firewall addresses allows you to create a firewall address consisting of the name of a country. You can then add this address to a security policy to match traffic form any IP address assigned to that country. The list of countries and IP addresses that the FortiGate unit uses to identity the country of origin of an address is based on historical data compiled from the FortiGuard network.

For example, to configure a security policy to allow connections to multiple branch offices in Brazil (headquarters are in United States); the source address in this particular policy is *Any*, destination address is Brazil (geographic firewall address) and the *Action* is *Allow*.

To add a geography-based firewall address from the web-based manager, go to *Firewall Objects* > *Address*, select Create New, set Type to Geography and select a country name.

Use the following command to add a geography-based firewall address for Brazil:

```
config firewall address
  edit <addr_name>
    set type geography
    set country BR
end
```

In the command you set the `country` to the two-letter abbreviation for the country name. In the example, BR is the abbreviation for Brazil.

You can use the following command to view information about geography-based addressing. The command does not display information about the entire address database, but displays country and address information for the countries that have been added to firewall addresses.

```
diagnose firewall ipgeo {country-list | ip-list | ip2country}
```

Where:

`country-list` lists all of the countries that have been added to a firewall address.

`ip-list` lists the IP addresses of a specified country or all of the countries added to firewall addresses.

`ip2country` displays the country of origin for a specified IP address. The address must be assigned to one of the countries that has been added to a firewall address.

For example, use the following command to view the countries that have been added to a firewall address. The example command output shows that a firewall address has been added for Brazil.

```
diagnose firewall ipgeo country-list
  Total countries loaded:1

  BR
```

DLP document fingerprinting

DLP document fingerprinting is a new feature that allows you to better protect your network from the loss of specific documents. Document fingerprinting, in this sense, is a method of identifying a document. This method breaks up files into chunks, taking a checksum of those chunks and using that checksum as the fingerprint. The fingerprint is then applied to a DLP filter rule within a DLP sensor which is then used during the scanning process of DLP activity.

DLP document fingerprinting is configured in *UTM Profiles* > *Data Leak Prevention* > *Document Fingerprinting* and then a DLP filter rule is applied within a DLP Sensor in *UTM Profiles* > *Data Leak Prevention* > *Sensor* to instruct the FortiGate unit to look for document fingerprints when scanning DLP activity on a security policy. A percentage parameter set in the DLP sensor is used when the unit is trying to match the file chunks.

For example, you transfer a file that is on the server (or uploaded), it will match 100 percent; a truncated file on the server will be matched 100 percent except for possibly the first or last chunks that may have a different checksum because the boundaries are different. The same is true for a file that is partially copied into another file; if that part is large enough, it will match but at a low percentage.

All documents in the source, as well as the ones you uploaded individually, are pre-scanned. This means that the task of breaking the files into checksums occurs soon after creating them and are all put into the database on the FortiGate unit.

There is an option to upload archived files and have those archived files fingerprinted as well, however, this is for only individual files that are configured in *Manual Document Fingerprints* on the DLP Fingerprint page.

DLP document fingerprinting is available only on FortiGate models with internal hard drives or flash drive storage.

Internet Content Adaptation Protocol (ICAP)

The Internet Content Adaptation Protocol (ICAP) is supported in this release. ICAP is a light-weight response/request protocol that allows the FortiGate unit to offload HTTP traffic to external servers for different kinds of processing. ICAP is often used for offloading virus scanning and web filtering but has many other applications.

If you enable ICAP in a security policy, HTTP traffic intercepted by the policy is transferred to an ICAP server in the ICAP profile added to the policy. Responses from the ICAP server are returned to the FortiGate unit which forwards them to an HTTP client or server.

You can offload HTTP responses or HTTP requests (or both) to the same or different ICAP servers.

Example ICAP sequence for an ICAP server performing web URL filtering on HTTP requests

1. A user opens a web browser and sends an HTTP request to connect to a web server.
2. The FortiGate unit intercepts the HTTP request and forwards it to an ICAP server.
3. The ICAP server receives the request and determines if the request is for URL that should be blocked or allowed.
   - If the URL should be blocked the ICAP server sends a response to the FortiGate unit. The FortiGate unit returns this response to the user's web browser. This response could be a message informing the user that their request was blocked.
   - If the URL should be allowed the ICAP server sends a request to the FortiGate unit. The FortiGate unit forwards the request to the web server that the user originally attempted to connect to.

When configuring ICAP on the FortiGate unit, you must configure an ICAP profile that contains the ICAP server information; this profile is then applied to a security policy.

Example of adding ICAP to a security policy

The following is an example of configuring the ICAP feature on the FortiGate unit and applying an ICAP profile to an existing security policy.

1 Log in to the CLI.

2 Enter the following to configure the ICAP server:

```
config icap server
  edit icap_server
    set ip-address 172.16.122.151
    set ip-version 4
    set max-connections 25
    set port 453
  end
```

3 Enter the following to configure the ICAP profile to then apply to a security policy:

```
config icap profile
  edit icap_profile_1
    set request enable
    set request-failure error
    set request-path 1220
    set request-server icap_server
    set response enable
    set response-failure error
    set response-path 1225
    set response-server 172.16.122.151
    set streaming-content-bypass enable
  end
```

4 In the `config firewall policy` command, apply the ICAP profile to policy 1:

```
config firewall policy
  edit 1
    set icap-profile icap_profile_1
  end
```

Troubleshooting ICAP

You can use the following diagnose commands when troubleshooting ICAP.

`diag system icap server list <name>`

Displays a list of all servers or specified servers.

`diag system icap profile list <name>`

Displays information concerning total sent and responses, last connection attempts and host-bypass count.

Profile Group

The Profile Group feature is now included in the web-based manager of some models. This feature was previously only found in the CLI. Profile groups are groups of UTM profiles and sensors, which includes protocol options, and are often applied to security policies. By configuring a group of profiles and sensors, you can easily apply them to a security policy at once, instead of enabling them one at a time.

In *UTM Profiles* > *Profile Group* > *Profile Group*, you can create profile groups and view the selected profiles from within the group, either when creating a new group or editing an existing one. You can view the profile or sensor that you are including in the group by selecting the *View* icon. You can also create a new profile or sensor from within the page by selecting the *Create New* icon (the plus sign icon).

In this release, profile groups cannot be applied to security policies within the web-based manager, only in the CLI.

Modem interface Improvements

The Modem interface feature has been updated to include settings for configuring 3G or 4G wireless modems, as well as other modems. A list of supported modems is available from FortiGuard and can be updated to include recently supported modems.

When you first go to *System* > *Network* > *Modem*, the configuration settings within the page have changed, and now there is a *General Settings* section and *External Modem* section. The *General Settings* section is for configuring the primary modem, for example an external modem. You can still configure the modem to be *Standalone* or *Redundant* from this page, as well the type of *Dial Mode*.

The *External Modem* section of the page allows you to configure the external modem or USB modem. When you select *Configure Modem*, you are automatically redirected to the Modem Configuration Settings page. This page displays the supported modems under the *Supported* section, and the *Custom* section displays the external modems that you have configured. By selecting *Update Now*, you can easily update the list of supported modems from FortiGuard.

3G/4G modem list available from FortiGuard

You can now access a list from FortiGuard that contains all support 3G and 4G modems. The list is available without a subscription. By default, a list of supported modems is available on the FortiGate unit; however, you can update this list at any time from FortiGuard.

The list is available within the Modem page, on the Modem Selection page. This page appears when you select *Configure Custom Modem*. You can either update this page or choose a modem from the list.

WiFi Extensions

FortiOS 4.0 MR3 includes many improvements and changes to the WiFi controller feature (formerly the wireless controller feature). Among the highlights are automatic AP provisioning (channel, power, etc.) using distributed ARRP, Rogue AP “on wire” detection, Rogue AP Suppression, Unified FortiWifi and FortiAP management, support for new FortiAP models, and the addition of the WiFi controller feature to FortiWiFi units.

WiFi controller redesign

On the web-based manager the former wireless controller has been renamed *WiFi Controller* and menus and submenus have been redesigned as follows:

- WiFi Network
  - SSID
  - Rogue AP Settings
- Managed Access Points
  - Managed FortiAP
  - Custom AP Profile
- Monitor
  - Client Monitor
  - Rogue AP Monitor

Within the WiFi Network menu, instead of configuring a virtual access point, you configure an SSID. The SSID can easily be configured to be up or down, using the *Administrative Status* option within the SSID.

When configuring an SSID from the web-based manager you can choose from any of the following consolidated security options:

SSID security option	Descriptions
WPA/WPA2-Personal	Supports both WPA and WPA2 for personal use. Select this option and add a 8 to 63 character preshared key.
WPA/WPA2-Enterprise	Supports both WPA and WPA2 for enterprises. Select this option and select a RADIUS server or authentication group to use to authenticate connections to the SSID.
Captive Portal	Supports captive portal authentication. Select this option and select user groups that can authenticate with the captive portal. You can also configure the appearance of the captive portal page.

Configure an SSID from the CLI using the `config wireless-controller vap` command. From the CLI the following additional security options are available:

- open
- wep128
- wep64
- wpa-only-enterprise
- wpa-only-personal
- wpa2-only-enterprise
- wpa2-only-personal

Captive portal enhancements

The captive portal security option was previously available; however, in this release it has been enhanced and given additional replacement messages so that you can have specific pages for specific actions, such as when a failed login attempt or a declined disclaimer. The captive portal security is now more streamlined and is applied within an SSID, instead of previously being applied within a security policy.

Rogue AP detection and reporting

The PCI DSS regulatory compliance requires quarterly site surveys for unauthorized wireless access points on their networks to prevent data leakage, as well as assurance that trusted access points are running the latest WPA or WPA2 enterprise encryption. In this release, you can now easily gather this information and view it on the FortiGate unit.

From the WiFi Controller menu, you can configure the FortiGate unit to gather information on rogue APs, monitor them, and then take the information gathered from logs and generate a report.

The Rogue AP Settings submenu enables detecting rogue wireless access points. The option, *Enable On-Wire Rogue AP Detection Technique*, is a special detection technique that allows the FortiGate unit to help identify rogue APs that may be performing a bridging function, routing or NAT.

Rogue AP Suppression

Rogue AP suppression is now supported on the FortiWiFi and FortiAP units. This feature is available only when there is at least one radio signal dedicated to Rogue AP detection. On a FortiWiFi unit, this feature is available only when in dedicated detection mode. Rogue AP suppression is also not available for background Rogue AP scans.

On-wire Rogue AP detection

The on-wire scan feature allows you to detect if a rogue AP is connected to a wired network. A rogue AP poses a higher security risk if that rogue AP is an unmanaged AP and connected to an organization or company's wireless network. A rogue AP is an AP that is not managed by the controller.

To enable on-wire scan rogue AP detection go to *WiFi Controller* > *Wireless Network* > *Rogue AP Settings* and select *Enable On-Wire Rogue AP Detection Technique*.

Custom AP profiles

Previously, there were access point (AP) profiles that you could configure from within the WiFi Controller menu. These profiles are still available, however, to view them in the web-based manager you must enable the feature using the following command.

```
config system global
  set gui-ap-profile enable
end
```

Under Managed Access Points, the previous AP Profile menu has been replaced with the Custom AP Profile menu that contains a selection of default AP profiles. These default profiles have been designed to be a good starting point for many wireless network applications using FortiWiFi or FortiAP units. You can customize the default profiles for your needs and create new profiles.

Distributed ARRP (Automatic Radio Resource Provisioning)

For FortiAP units, each unit needs to autonomously and periodically determine the best channel that is best suited for communication. The distributed ARRP feature allows FortiAP units to select their channel so that they do not interfere with each other in a larger square footage network scenario.

The distributed ARRP behaves in the following way:

- Each FortiAP unit independently scans the available channels, measuring interface and channel utilization, and then selecting the channel with the least interface and then lowest utilization for communication.

- The FortiAP unit periodically performs this scan in the background to determine if any conditions have changed. This periodical scan is every ten minutes (by default).
- If any conditions have changed, the FortiAP unit signals all clients to move to a newly selected channel.

Log messages are recorded to reflect when the channel was changed by the FortiAP unit, and debug logs are also recorded to reflect the decision of the distributed ARRP algorithm for all runs. The ARRP algorithm is automatically on by default if multiple channels are selected in the web-based manager. If a single channel is selected, the ARRP algorithm becomes benign.

WiFi monitor

The WiFi Monitor menu is a new WiFi Controller feature in this release. It merges the previous monitoring menus into the new Monitor menu. There are two submenus, Client Monitor and Rogue AP Monitor.

The Client Monitor submenu allows you to view information about wireless clients of your managed access points. On the Client Monitor page, several columns have changed, as well as a new column added, called Auth. The following columns are no longer available on the page:

- Bandwidth Rx
- Bandwidth Tx
- Idle Time

Previously, the Client Monitor was available in *WiFi Controller* > *Wireless Client* > *Wireless Client*.

The Rogue AP Monitor allows you to view information about access points that may be rogue APs. Several columns have been removed. There are two new columns, Manufacturer and Security Mode. From the monitor you can also mark and suppress APs.

New WiFi commands

The following are new commands regarding WiFi server certificates and user group authentication for WiFi.

Certificate commands:

```
config system global
  set wifi-certificate <cert_name>
  set wifi-ca-certificate <ca_cert_name>
end
```

Authentication user group commands:

```
config system interface
  edit <wlan>
    set wifi-auth usergroup <user_name>
  end
```

The `wifi-auth usergroup` command is available only if WPA-Enterprise or WPA2-Enterprise option is selected as the security mode.

The authentication user group commands also apply to WiFi Controller.

Strong Authentication Enhancements

FortiOS 4.0 MR3 new strong authentication features include support for the FortiToken two-factor (2-factor) authentication solution as well as two-factor authentication using Email or SMS. Additional new strong authentication features include improved multiple user group support, dynamic profiles, and PKI authentication enhancements.

FortiToken support

The FortiToken-200 device provides time-based, one-time passwords (OTP) that are based on the Open Authentication (OATH) standard. Using FortiToken allows organizations to deploy a two-factor authentication solution that reduces the risk of compromise created by alternative single-factor authentication systems relying on, for example, static passwords. The FortiToken enables administrators with the need for two-factor authentication to offer enhanced security for both remote and on-premise users. The FortiToken-200 is a part of Fortinet's broad multi-factor authentication product strategy; it ensures that only authorized individuals access your organization's sensitive information; enabling business, protecting your data, lowering IT costs, and boosting user productivity.

The FortiToken-200 provides a secure one-time password (OTP) that is entered along with regular login credentials whenever authentication is required.

Each FortiToken device contains a serial number (located on the back of the device), a six-digit LCD display, and a small button. The serial number is used to activate the hardware token generator. When you press the small button, the LCD displays a six-digit token password code that is used in two-factor authentication. Two-factor authentication is authentication that requires an additional password or code that a user must enter to successfully authenticate in addition to their own user name and password.

The FortiToken device must be activated and synchronized with the FortiGate unit before it can be used for authentication purposes.

The FortiToken behaves as follows:

- FortiToken's serial number is added in the list in *User* > *FortiToken* > *FortiToken*. This serial number is a number containing 16 case-sensitive characters which is located on the back of the device. The serial number is used only in this way.
- The FortiToken is activated by selecting *Activate* on the FortiToken page. During the activation process the serial number is encrypted and sent to FortiGuard where it is verified as a valid FortiToken, and then activates the FortiToken on the FortiGate unit.

  If you have a file containing the seed used to generate a token password code, you can import that file to the FortiGate unit from *User* > *FortiToken* > *FortiToken*.
- Synchronize the FortiToken by selecting *Synchronize* on the FortiToken page. This synchronizes the FortiToken's system time with the unit's system time so that both contain the same time period. The correct time period is necessary to verify that the token password code that is being used by a user is valid.
- If you have more than one FortiToken device, you must enter each one in *User* > *FortiToken* > *FortiToken*; then select each one in the list and for each one activate and synchronize. FortiOS does not support the activation and synchronization of multiple FortiTokens at one time. For example, you cannot select four FortiTokens and then select *Activate* and immediately after select *Synchronization*.

The FortiToken works with two-factor authentication in the following way:

- FortiToken is assigned to a user (for example a local user in *User* > *User* > *User*)

- The user logs in with the token password code they received in an email or text message on their mobile phone

The token password code that is generated is from a seed that is unique within each FortiToken. When a user uses the correct token code for the current time period, that token code provides proof that the user is in possession of the physical FortiToken. The token code changes every 60 seconds on the FortiToken device, to prevent replay attacks. For example, a person steals some of a user's token code to reuse at a later time.

Two-factor authentication

Two-factor authentication provides a way to minimize security breaches due to stolen user credentials. Two-factor authentication requires the authenticating client to provide additional credentials beside a user name and password. You can add two-factor authentication to PKI users. SMS and Email token authentication is also supported. SSL VPN two-factor authentication supports FortiTokens.

Two-factor authentication is available for FortiGate administrators, local users and PKI users.

In *User* > *FortiToken* > *FortiToken*, the token password code from FortiToken is entered into the list by selecting *Create New*. You must activate and synchronize FortiToken so that you can use the generated token password code.

After synchronizing the token password code, you can then apply it where two-factor authentication is available within FortiOS. For example, FortiGate administrators can have the two-factor authentication enabled for their account in *System* > *Admin* > *Administrators*.

When FortiToken is used in a third-party IPsec client configuration, each user that has two-factor authentication enabled and configured must use the token password code when only a password is supported to gain access. This authentication using only a password is not supported when the password and token password code are sent in CHAP or MS-CHAP form, and the local user is authenticated using a remote server. This is because FortiOS is unable to extract back both the password and the token password code.

Example for configuring users with two-factor authentication

This example explains how to configure multiple users with the new feature two-factor authentication.

Your company requires remote access to the network for the following employees:

- two sales employees
- two employees that often work from home
- one remote FortiGate administrator for remote management

The company has purchased a FortiToken-200 for each employee that will be required to authenticate using two-factor authentication. The employees that will be logging in using two-factor authentication will be using SSL VPN. Each employee already has their own user account configured from a previous setup. You are only enabling two-factor authentication and notifying them of this new, additional log in credential.

To activate each FortiToken

1 Log in to the web-based manager of the FortiGate unit.

2 Go to *User* > *FortiToken* > *FortiToken*.

3 On the FortiToken page, enter the serial number of the first FortiToken, and repeat until all FortiTokens are entered.

4 Select *OK*.

5 For the first FortiToken in the list on the FortiToken page, select it and then select *Activate*.

6 After completing the activation, select the first FortiToken in the list and then select *Synchronization*.

7 Repeat steps 5 and 6 until all FortiTokens are synchronized.

The FortiTokens are now synchronized. Users can now be configured with the two-factor authentication. In the following procedure, the token password codes will be sent to users to their email accounts.

To configure employees with two-factor authentication

1 In the web-based manager, go to the location of the employee's account.

For example, *User* > *User* > *User*.

2 In the first employee's account, select *Enable Two-factor Authentication*.

3 Under *Deliver Token Code by*, select *FortiToken* and then select the FortiToken serial number of the FortiToken that the person will be using.

4 Select *Email to* and then enter the sales person's email address.

For example, sales_1@example.com

5 Select *OK*.

6 Repeat steps 3 and 4 to complete the rest of the employee's two-factor authentication settings.

The following procedure sends the token password code to the FortiGate administrator's mobile phone.

Enabling two-factor authentication for administrators

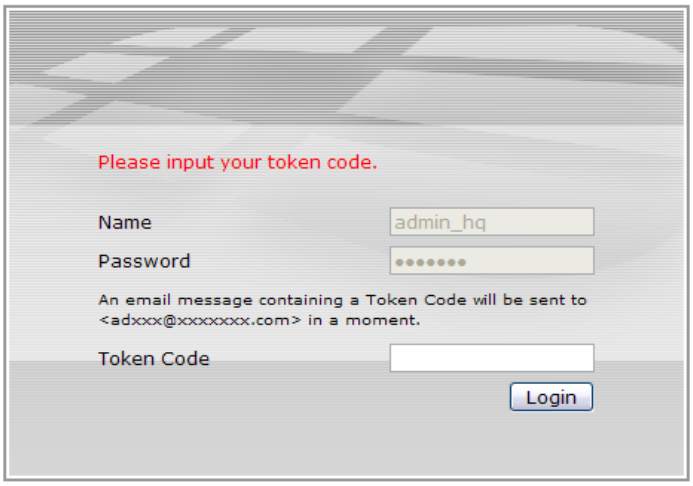
The new two-factor authentication is available for FortiGate administrator accounts in *System* > *Admin* > *Administrators*. Two-factor authentication is a way for you to add an additional log-in credential for users, which is a token password code. The token password code is provided by a device called the FortiToken.

FortiGate administrators with two-factor authentication must enter the token password code when logging in to the web-based manager. The token password code can be sent to the FortiGate administrator by either email or mobile phone in a text message. When an administrator with two-factor authentication first tries to log in to the web-based manager, a message similar to the following appears below *Password*.

```
An email message containing a Token Code will be sent to
<xxxxx@xxxxx.com> in a moment.
```

If *SMS* is enabled for sending the token password code to a mobile phone, the above message will reflect that. The administrator enters their token code in the *Token Code* field and then selects *Login*.

Figure 3: Example of an administrator who is logging in to the web-based manager for the first time who has two-factor authentication



To configure the FortiGate administrator with two-factor authentication

1. In the web-based manager, go to *System* > *Admin* > *Administrators*.
2. Edit a FortiGate administrator account.
3. In the Edit Administrator page, select *Enable Two-factor Authentication*.
4. Under *Deliver Token Code by*, select FortiToken and then select the FortiToken serial number that the administrator will be using.
5. Select *SMS*.
6. Select the mobile provider from the drop-down list beside *(Mobile Provider)*.
7. Enter the FortiGate administrator's phone number in the field beside *(Phone Number)*.
8. Select *OK*.

   A text message containing the token password code is sent to their phone.

Multiple authentication group enforcement

Previously, when a user belonged to multiple user groups, this user could only access the group services that were within one group. With the multiple group enforcement feature, a user can now access the services within the groups that the user is part of. For example, userA belongs to user_group1, user_group2, user_group3, and user_group4; userA can access services within user_group1, user_group2, user_group3, and user_group4.

This feature is available only in the CLI and is enabled by default. The new command for this feature is `auth-multi-group` and checks all groups a user belongs to for firewall authentication. This new command is found in `config user settings`.

Dynamic Profiles

The Dynamic Profile feature, previously only found in FortiOS Carrier, is now available for all FortiGate models. Using the dynamic profile feature a FortiGate unit can dynamically assign a UTM profile group to a user authenticated with a RADIUS server. Dynamically assigning a UTM profile group means you can dynamically assign different levels of UTM inspection, web access and other UTM features. For information about dynamic profiles, see the *Authentication* chapter of the *FortiOS Handbook*.

Hard-timeout enhancement

The new authentication hard-timeout feature ensures that users will always need to authenticate whenever their time expires. The timeout behavior is configure in the following ways:

- When the timeout behavior is set to be a hard timeout, this option forces all of the user's sessions to immediately end when the authentication timeout expires. This causes the user to re-authenticate.
- When the timeout behavior is set to be a hard timeout new sessions, this option keeps all existing sessions but forces new sessions on the same user, which that user then has to re-authenticate.

The following are the new commands you can use to configure authentication hard-timeout.

```
config user setting
  set auth-timeout <number_minutes>
  set auth-timeout-type {idle-timeout | hard-timeout | new-
     session}
end
```

PKI certificate authentication enhancement

PKI certificate authentication now supports the extraction of the user name from within the UPN field. This extraction allows users to log in without having to enter their user name.

This enhancement is available only in the CLI. The command syntax is as follows:

```
config user peer
  edit <peer_name>
    set ldap-mode {password | principal-name}
end
```

The `principal-name` value extracts the user name from within the UPN field.

An option for "user group matching" is available in the `config user group` command as well. This option allows you to configure authentication to match PKI user groups. The command syntax to configure this feature is as follows:

```
config user group
  edit <group_name>
    config match
      edit <group>
        set server-name <server_name>
        set group-name <group_name>
```

The following is an example of how to configure this user group matching feature.

```
config user group
  edit sslvpn
    set sslvpn-portal full-access
    set member vmlg test
      config match
        edit 1
          set server-name vmlg
          set group-name
              cn=Internet,ou=test,dc=ay,dc=fortinet,dc=com
        next
          edit 2
            set server-name test
```

```
            set group-name
                CN=qa,OU=T1359,DC=AY,DC=FORTINET,DC=COM
        end
    end
end
```

NTLM authentication enhancements

There are two enhancements for NTLM, one for guest profile access and one for inspection of initial HTTP-User-Agent values. These two enhancements are configured in the CLI. The new commands are `ntlm-guest {enable | disable}` and `ntlm-enabled-browsers <browser_name>`, which are available under the `config firewall policy` command.

The `ntlm-guest` command provides guest access to users who fail NTLM authentication. The `ntlm-enabled-browsers` command allows users to access non-supported browsers without a prompt beforehand.

NTLM authentication is essentially enabled when you configure FSSO and enabled NTLM in the identity-based security policy. Any users and user groups associated with the security policy will use NTLM to authenticate without further configuration.

New PCI Compliance Features

FortiOS 4.0 MR3 improves PCI compliance support by enhancing WiFi rogue AP detection, adding Rogue AP suppression and enhancing Endpoint security features. For information about Rogue AP features, see “Rogue AP detection and reporting” on page 113 and “Rogue AP Suppression” on page 113.

Endpoint Security enhancements

In FortiOS 4.0 MR3 Endpoint NAC has been renamed Endpoint Control and is available on the web-based manager from *UTM Profiles* > *Endpoint Control* you can configure endpoint security profiles, view the Endpoint Security application database, and work with FortiClient installers. From *UTM Profiles* > *Monitor* > *Endpoint Monitor* you can perform endpoint monitoring.

Endpoint profiles include the warn option, which displays a “block” page but allows a user to choose to continue or not, as well as sends the information back to the client. Previously, when the FortiGate unit blocks a client, the unit quarantines the user but no information was sent back to the client. With this new option, within FortiClient, you can view a list of applications that the FortiGate unit requested, any applications that caused the client to be blocked by the unit, and any applications that cause a user to continue on even though a “block” page was triggered.

The *Client Installers* submenu provides information regarding FortiClient installation, version enforcement, and FortiGuard availability for updating to a recent FortiClient Endpoint versions. The *Profile* submenu provides configuration settings for endpoint profiles which are then applied to firewall policies. The settings within application sensor were merged into the settings that are available in the Profile submenu.

Network Vulnerability Scan

The Network Vulnerability Scan feature provides more granularity and options for network scanning. Network vulnerability scanning now includes Asset Definition, Scan Schedule and Vulnerability Result. You can access the network vulnerability scanner from *UTM Profiles* > *Vulnerability Scan*.

Asset Definition

The Asset Definition menu allows adding ranges, discovering assets or start scans. Ranges can easily be added by selecting *Create New* on the Asset Definition page. Assets are still configured the same as they were previously, but you can now add an IP address range to be scanned.

When a scan is being performed, the activity icon in the Scan Activity column displays the progress. The scan's results appear in the Discovered Hosts for <network> window. You can scroll down the list to view all discovered assets.

Scan Schedule

The Scan Schedule menu allows you to see the status of a scan (or to start a scan), the schedule settings, the type of vulnerability scan mode, and advanced settings as well. The scheduled scan applies to all assets or asset groups that are currently enabled.

The types of scans that you can schedule are quick, standard and full. Quick scanning examines a set of the most commonly used ports for vulnerabilities. Standard scanning examines a larger number of application ports, covering many known applications. This scanning covers TCP, Service Discovery and OS Discovery but UDP is disabled.

The full scan scans the full port range 1-65535 and looks for applications running on non-standard ports, examining them for vulnerabilities.

The advanced options that are available are as follows:

- *Enable TCP Port Scan*
- *Enable Service Detection*
- *Enable OS Detection*
- *Enable UDP Port Scan*

When a scan is processing, the following occur:

- All Host assets are discovered as specified in the asset definition
  - All discovered hosts are scanned for the configured sensors, port scans and so on.
- all IP Range assets are discovered as specified in the asset definition
  - authentication is not available, reducing scan capabilities
  - these IP ranges should be converted to Host assets as needed to perform a full scan
- scanning will run for each unique IP in the list, and up to the maximum number of IP addresses supported, per-platform.
- logs are recorded about the scanning activity

Vulnerability Result

The Vulnerability Result menu allows you to view, in both graphical and tabular form, the results of the network scan. Platforms that do not have SQL logging enabled, or no SQL logging available, will only have the graphical representation.

When viewing the table containing vulnerabilities, a table similar to the log viewer table, appears at the left side of the page.

Netscan asset authentication options

In the `config netscan assets` command, the following values are hidden when the value `addr-type` is set to `range`:

- `auth-unix`

- auth-windows
- unix-username
- unix-password
- win-username
- win-password

Feature Improvements to extend IPv6 support

Each new release of FortiOS brings more IPv6 feature support. FortiOS 4.0 MR3 is no exception. This release adds IPv6 firewall acceleration using XG2, XE2, CE4, and FE8 security processors, IPv6 support for the SSL VPN web portal, IPv6 support for firewall authentication, IPv6 support for SNMP, IPv6 over DHCP, Addition IPv6 features for OSPF NSSA (not so stubby area), and more information is displayed about IPv6 sessions in the dashboard session widget.

In FortiOS 4.0 MR3, IPv6 traffic can now be redirected for user authentication using local database, RADIUS, TACACS+, or LDAP

In this release, the IPv6 Policy page contains the option of including a section title within the IPv6 security policy list. IPv6 security policies support antivirus, web filter, email filter, DLP sensor, VoIP and ICAP UTM features. Local in security policies also support IPv6.

Top Session dashboard widget IPv6 support

The Top Session dashboard widget can now display IPv4 and IPv6 addresses. IPv6 addresses are displayed only when the *IPv6 Support on GUI* is enabled in *System* > *Admin* > *Settings*.

OSPFv3 NSSA extension

OSPFv3 NSSA now includes the `default-information-originate` and `external route summary` commands for IPv6. This helps you to configure the originating default information and the external route information for IPv6 addresses.

A `get` command was also introduced to show the OSPFv3 NSSA external LSAs in the database.

The following commands have been added to `config router ospf6`, in config area:

```
set type {regular | stub | nssa}
set nssa-translator-role {candidate | never | always}
set nssa-default-information-originate {disable | enable}
set nssa-default-information-originate-metric <integer>
set nssa-default-information-originate-metric-type {2 | 1}
set nssa-redistribute {enable | disable}
```

The following were added to the config router ospf6 command:

```
set default-information-originate {disable | enable | always}
set default-information-metric <integer>
set default-information-metric-type {2 | 1}
set default-information-route-map {route-map-name}
```

The following were added to config summary-address:

```
set prefix6
set advertise {enable | disable}
set tag <tag_number>
```

The following `get` command was added: `get router info6 ospf database nssa-external`.

DHCP for IPv6

DHCP for IPv6 addresses is now supported in the CLI. DHCP IPv6 is similar to DHCP IPv4.

This release also introduces the rapid-commit option. Rapid-commit is the process whereby the DHCP client and the DHCP server use a rapid DHCP IPv6 two-message exchange. This provides a short cut and the messages that are exchanged are called the DHCP IPv6 “SOLICIT” and “REPLY” messages. The `rapid-commit` command is enabled or disabled in the CLI.

For more information about DHCP IPv6, see RFC 3315.

Explicit proxy and web caching improvements

The explicit proxy feature provides additional options in this release, as well as new features, such as forwarding servers and a completely new explicit FTP proxy.

The web proxy feature also now provides two `diagnose` commands to list and clear web proxy users. The `diag wad user list` command lists existing users and the `diag wad user clear` clears all users or a specific user.

Explicit FTP proxy

An explicit FTP proxy can be configured from the web-based manager and the CLI. The explicit FTP proxy is in *System* > *Network* > *Explicit Proxy* and in the CLI it is `config ftp-proxy explicit` command syntax.

FTP users connect to the explicit proxy and then connect through the proxy to remote FTP servers.

To enable the explicit FTP proxy go to *System* > *Network* > *Explicit Proxy* and select *Enable Explicit FTP Proxy* and select Apply. Then go to *System* > *Network* > *Interface*, select the Interface on which to enable the explicit FTP proxy and select *Enable Explicit FTP Proxy*.

Enter the following command to enable the explicit FTP proxy from the CLI:

```
config ftp-proxy explicit
  set status enable
end
```

Enter the following command to enable the explicit FTP proxy on the internal interface:

```
config system interface
  edit internal
    set explicit-ftp-proxy enable
end
```

Once the explicit FTP proxy is enabled on an interface you must create security policies with the *ftp-proxy* as the source interface to allow explicit FTP proxy traffic. For example, to allow FTP connections from the internal network to an FTP server on the Internet, enable the explicit FTP proxy on the FortiGate internal interface and add ftp-proxy to wan1 security policies.

To connect to an FTP server through the explicit FTP proxy

The following steps are required when a user starts an FTP client to connect to an FTP server through the explicit FTP proxy. Any RFC-compliant FTP client can be used.

1 The user connects to the explicit FTP proxy by starting an FTP session with the explicit proxy. In this example, the IP address of the FortiGate interface on which the explicit FTP proxy is enabled is 10.31.101.100.

For example:

```
ftp 10.31.101.100
```

2 The explicit FTP proxy responds with a welcome message and requests the user's FTP proxy user name and password and a username and address of the FTP server to connect to:

```
Connected to 10.31.101.100.
220 Welcome to Fortigate FTP proxy
Name (10.31.101.100:user):
```

You can change the message by editing the FTP Proxy replacement message.

3 At the prompt the user enters their FTP proxy username and password and a username and address for the FTP server. The FTP server address can be a domain name or numeric IP address. This information is entered using the following syntax:

```
<proxy-user>:<proxy-password>:<server-user>@<server-address>
```

For example, if the proxy username and password are `p-name` and `p-pass` and a valid username for the FTP server is `s-name` and the server's IP address is `ftp.example.com` the syntax would be:

```
p-name:p-pass:s-name@ftp.example.com
```

If the FTP proxy accepts anonymous logins `p-name` and `p-pass` can be any characters.

4 The FTP proxy forwards the connection request, including the user name, to the FTP server.

5 If the user name is valid for the FTP server it responds with a password request prompt.

6 The FTP proxy relays the password request to the FTP client.

7 The user enters the FTP server password and the client sends the password to the FTP proxy.

8 The FTP proxy relays the password to the FTP server.

9 The FTP server sends a login successful message to the FTP proxy.

10 The FTP proxy relays the login successful message to the FTP client.

11 The FTP client starts the FTP session.

All commands entered by the client are relayed by the proxy to the server. Replies from the server are relayed back to the FTP client.

Explicit Web Proxy Forwarding Servers (proxy chaining)

For the explicit web proxy you can configure web proxy forwarding servers to use proxy chaining to redirect web proxy sessions to other proxy servers. Proxy chaining can be used to forward web proxy sessions from the FortiGate unit to one or more other proxy servers on your network or on a remote network. You can use proxy chaining to integrate the FortiGate explicit web proxy with an already existing web proxy solution.

A FortiGate unit can forward sessions to most web proxy servers including a remote FortiGate unit with the explicit web proxy enabled. No special configuration of the explicit web proxy on the remote FortiGate unit is required.

You can deploy the explicit web proxy with proxy chaining in an enterprise environment consisting of small satellite offices and a main office. If each office has a FortiGate unit, users at each of the satellite offices can use their local FortiGate unit as an explicit web proxy server. The satellite office FortiGate units can forward explicit web proxy sessions to an explicit web proxy server at the central office. From here the sessions can connect to web servers on the Internet.

If the explicit proxy feature is enabled and configured, you can apply a web proxy forwarding server to a web proxy security policy. Applying a forwarding server to the policy is the same as applying a UTM profile or sensor; select the *Web Proxy Forwarding Server* check box and then select a forwarding server from the drop-down list.

Authentication cookie for session-based authentication of explicit web proxy sessions

When configuring a web proxy security policy, you can now include a web-proxy cookie option which reduces the amount of authentication requests to authentication servers when session-based authentication is applied using explicit web proxy. The cookie will remember the user's session, which will then be used to map to an existing user, reducing the chance to require an authentication. This feature provides better load balancing, as well as latency.

The web authentication cookie is available only in the CLI. The `web-auth-cookie` command is used to configure this feature and is within the `config firewall policy` command.

The `web-auth-cookie` command is available only when session-based authentication is enabled.

Form-based user authentication for explicit web proxy

Previously, the explicit web proxy supported authentication only through the HTTP protocol using HTTP headers. A form-based user authentication for explicit web proxy is now available, which is similar to form-based authentication for regular security policies. A form-based authentication is used when a web page is returned to a web client which the user then authenticates with his or her user name and password. These credentials are then sent through HTTP Post request.

The form-based authentication for explicit web proxy authenticates the user and then redirects the user back to their own original URL, if the user authorizes access to the URL. This authentication is available only for IP-based authentication.

Web caching in security policies

Web caching can now be enabled in a security policy. When enabled, the FortiGate unit will apply web caching to HTTP traffic accepted by the security policy. This option is available only on FortiGate units that support WAN Optimization and web caching. Enabling web caching in a security policy is similar to enabling web caching in a WAN Optimization rule. However, enabling web caching in a security policy means you can also apply UTM options to web cached traffic in a single VDOM.

You can use this option to apply web caching for explicit web proxy traffic if the Source Interface/Zone is set to the web-proxy interface. Previously, web caching was enabled as part of the explicit proxy configuration. In this release, web caching does not need to be applied to all explicit proxy traffic.

Enabling web caching in a security policy can not apply web caching to HTTPS traffic. To apply web caching to HTTPS traffic you need to create a WAN optimization rule.

Web Caching in a security policy takes place before web caching in a WAN Optimization rule. So traffic accepted by a security policy that includes web caching will not be cached by the WAN optimization rule.

Web caching supports caching of HTTP 1.0 and HTTP 1.1 web sites on the FortiGate unit hard disk. Some HTTP content accepted by the security policy may not be cached. See RFC 2616 for information about web caching for HTTP 1.1.

Logging and reporting enhancements

This section describes new FortiOS 4.0 MR3 Log and Reporting features including:

The FortiGate UTM Weekly Activity Report

The FortiGate UTM Weekly Activity Report is available on FortiGate units with hard disks if logging to disk is enabled by going to *Log&Report* > *Log Config* > *Log Setting* and selecting Disk Logging and Archiving. When you enable Disk logging you can go to *Log&Report* > *Report Access* to view the FortiGate UTM Weekly Activity Report. You can browse through the sections of this report to view current bandwidth and application usage, web usage, email usage, threats, and VPN usage.

The data for the report is generated by saved SQL logging messages. By default logging to disk and SQL logging are enabled and the report is produced. If logging to disk is disabled the report does not appear. If logging to disk is enabled and SQL logging is not enabled the report appears but will not contain any data. If some report data appears and some does not the cause could be that only some types of SQL logging are enabled.

SQL logging is only enabled and configured from the CLI. Use the following command to enable SQL logging:

```
config log disk setting
  set status enable
  config sql-logging
    set app-ctrl enable
    set attack enable
    set dlp enable
    set event enable
    set netscan enable
    set spam enable
    set traffic enable
    set virus enable
```

```
      set webfilter enable
    end
  end
```

By default the UTM Weekly Activity Report is generated and saved weekly and from any report access page you can select Historical Reports to view previously generated reports. From the Historical reports list you can also download the reports in PDF format and delete them.

You can modify the default FortiGate UTM Weekly Activity Report to meet your requirements from any report page by selecting *Edit*. When you select *Edit*, the page refreshes in Editing mode. In editing mode can change the content and the appearance of the report pages, change the data displayed on individual report pages and add or delete report pages.

A modified report must be saved using the Save icon. Any modifications that are not saved, are lost.

A report consists of text, charts and images. Text elements are used to add titles and descriptive text to the report. Images are used to add graphics to the report. Charts and used to add text and graphical data to the report. You can add a bar chart, line chart, pie chart and table chart. When you add a chart you can customize its appearance as well as the data that the chart displays. To customize the data displayed you can choose for hundreds of predefined reports. Each report includes formatting settings and settings to extract data from the FortiGate log database.

FortiOS 4.0 MR3 includes the following new reports:

- traffic.bandwidth.apps.app_cat
- traffic.bandwidth.app_cats.user
- traffic.bandwidth.users
- traffic.sessions.apps.app_cat
- traffic.sessions.app_cats.user
- traffic.sessions.users
- traffic.bandwidth.apps.user
- traffic.bandwidth.users.app
- traffic.bandwidth.app_cats
- traffic.sessions.apps.user
- traffic.sessions.users.app
- traffic.sessions.app_cats
- traffic.bandwidth.wanopt
- web.allowed-request.sites.user
- web.allowed-request.users.web_cat
- web.allowed-request.web_cats
- web.blocked-request.sites.user
- web.blocked-request.users.web_cat
- web.blocked-request.web_cats
- web.requests.phrases.user
- web.requests.users.phrase
- web.requests.phrases

- web.allowed-request.users.site
- web.allowed-request.sites
- web.blocked-request.users.site
- web.blocked-request.sites
- web.bandwidth.sites.user
- web.bandwidth.users.site
- web.bandwidth.sites
- web.bandwidth.stream-sites.user
- web.bandwidth.users.stream-site
- web.bandwidth.stream-sites
- email.request.timeperiods.sender
- email.request.senders
- email.bandwidth.timeperiods.sender
- email.bandwidth.senders
- email.request.timeperiods.receiver
- email.request.receivers
- virus.count.viruses.user
- virus.count.users.virus
- virus.count.viruses
- virus.count.users
- virus.count.viruses.protocol
- virus.count.protocols
- attack.count.critical-attacks.user
- attack.count.users.critical-attack
- attack.count.critical-attacks
- attack.count.attacks.user
- attack.count.users.attack
- attack.count.attacks
- vpn.bandwidth.static-tunnels.user
- vpn.bandwidth.users.static-tunnel
- vpn.bandwidth.static-tunnels
- vpn.bandwidth.ssl-sources.user
- vpn.bandwidth.users.ssl-source
- vpn.bandwidth.ssl-sources
- vpn.bandwidth.dynamic-tunnels.user
- vpn.bandwidth.users.dynamic-tunnel
- vpn.bandwidth.dynamic-tunnels

Viewing the current and historical reports

Going to *Log&Report* > *Report Access* you can view current data in the FortiGate UTM Weekly Activity Report.

You can also select *Historical Reports* to view previously generated FortiGate UTM Weekly Activity Reports. When you select *Historical Reports* on the Viewing default layout page, you are automatically redirected to the Historical Reports page where you can view, download, and delete generated reports.

Historical Reports page	
Lists all generated reports. You can remove generated reports from this page or return to the previous page, the Viewing default layout page.	
Return to Layout	When selected, you are automatically redirected to the Viewing default layout page.
Delete	Removes a report from within the list. To remove multiple reports from within the list, on the page, in each of the rows of the reports you want removed, select the check box and then select *Delete*. To remove all reports from the list, on the page, select the check box in the check box column, and then select *Delete*.
Report File	The report name that the FortiGate unit gave the report. This name is in the format <scheduletype>-<report_title>-<yyyy-mm-dd>-<start_time>. For example, Once-examplereport_1-2010-09-12-103044, which indicates that the report titled examplereport_1 was scheduled to generate only once and did on September 12 at 10:30 am. The hour format is hh:mm:ss.
Started	The time when the report began generating. The format is yyyy-mm-dd hh:mm:ss.
Finished	The time when the report finished generating. The format is yyyy-mm-dd hh:mm:ss.
Size (bytes)	The size of the report after it was generated. The size is in bytes.
Other Formats	The other type of format you chose the report to be in, for example PDF. When you select PDF in this column, the PDF opens up within the page. You can download the PDF to your local PC from this page as well.

Creating custom reports from the CLI

You can add additional reports from the CLI by adding datasets, charts, layout, style, summary, and themes for reports; however, these options are available only from the CLI. When you add a report from the CLI the report layout does not appear on web-based manager. You can review historical reports for CLI-configured reports in the same way as FortiGate UTM Weekly Activity Reports.

Log Access Improvements

The Log & Archive Access menu contains the following changes to existing features, as well as support for downloading log messages directly from the FortiGate unit to your PC.

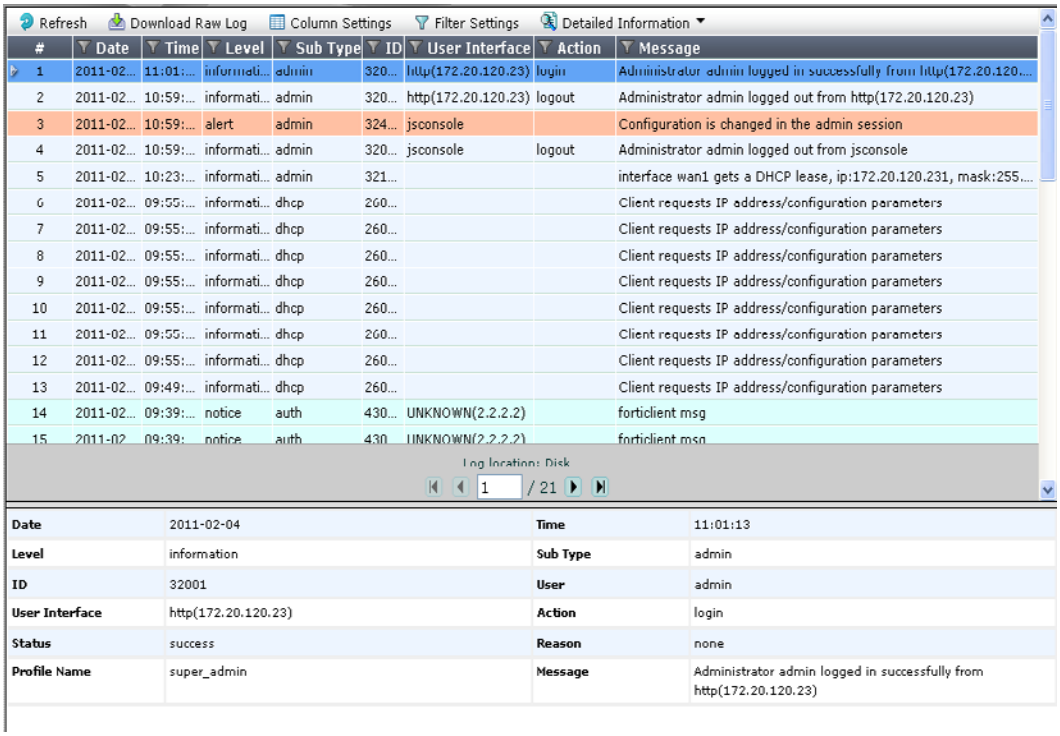
- Viewing log messages
- Filtering log messages
- Downloading log messages

Viewing log messages

When you are viewing log messages within the Log & Archive Access menu, you will find detailed information about the log messages at the bottom of the page. For example, you are viewing event log messages in *Log&Report* > *Log & Archive Access* > *Event*, and you see the first log message, in detail, in a table below the *Log location: <log_storage_device>* and page controls.

By selecting the down arrow beside *Detailed Information*, you can view this detailed information about log messages either at the bottom of the page, or on the right side of the page. You can also select *Hidden*, which hides the table.

Figure 4: Viewing event log messages with the default Bottom viewing option selected



At the bottom of the list of logs on the page, before page controls, the *Log location: <log_storage_device>* indicates where the logs are being stored, such as the local hard disk or memory.

Filtering log messages

Previously, when filtering log messages, you had to select the Filter icon within each column and then indicate the information that you wanted filtered. You can now use *Filter Settings*, providing an easier way to filter the information on the page without using the Filter icons. The Filter icons still indicate if filtering is enabled for that column.

Downloading log messages

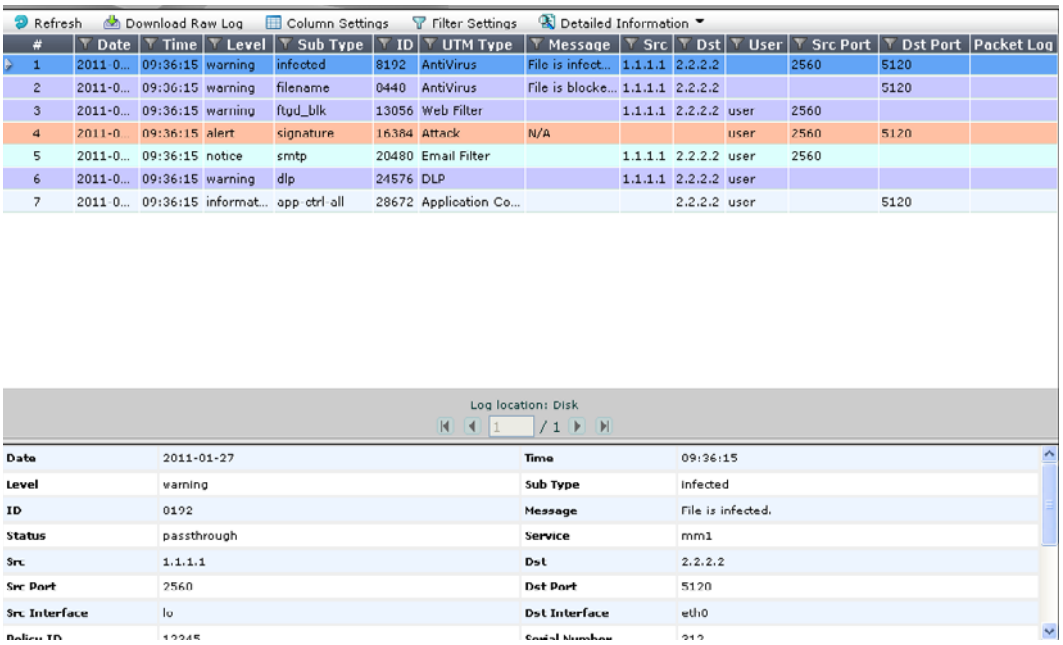
Log messages can now be downloaded in Raw format directly from within the Log Access menu. For example, in *Log&Report* > *Log & Archive Access* > *Event*; within the Event page, select *Download Raw Log*.

All log messages, including archived log messages, can be downloaded from the FortiGate unit to the management computer at any time. The downloaded file is a text file, which can be viewed on a text editor, such as Notepad. The log file name is in the format <log name><number>.log. For example, elog0101.log. The last number changes to reflect the log type number, such as DLP, which is nine (for example, dlog0109.log).

New Unified UTM Log Access

The new UTM Log submenu in *Log&Report* > *Log & Archive Access* > *UTM Log* provides a central location for all UTM-related log messages. These include virus, attack, DLP, application control, email filter, and web filter log messages. On the UTM Log access page includes a new column called *UTM Type* which indicates if the UTM feature that generated the log message.

Figure 5: The UTM page in *Log&Report > Log Access > UTM*



When viewing logs in Raw format, the downloaded UTM log file is called ulog and contains all the UTM-related log types, such as virus and attack. There is no log field called UTM Type in the log message when viewing them in the Raw format. The type and subtype fields indicate which log file the log message is associated with. For example, type=virus and subtype=filename.

SQL logging enabled by default

SQL is not enabled by default on models with an internal hard disk, such as a FortiGate-60C, as well as models with a removable hard drive when the disk is inserted into the FortiGate unit.

After upgrading to this release, a window appears when logging into the web-based manager. In the window, you can enable SQL logging when you select *Go*. This option does not immediately send logs to the FortiGate unit's local hard disk or removable hard disk; traffic must be flowing through the unit as well as UTM profiles and/or sensors applied to security policies.

The window appears when both the following are present:

- the model contains an internal or removable hard disk
- no SQL logging options are enabled

If you decide you would rather enable SQL logging later, select Remind me Later, which will prompt you when you log into the web-based manager again.

When SQL is enabled from the window, the FortiGate unit converts an previous logs to SQL format, and all log categories are that were previously enabled for disk logging are written in SQL format.

Sending DLP archives to multiple FortiAnalyzer units

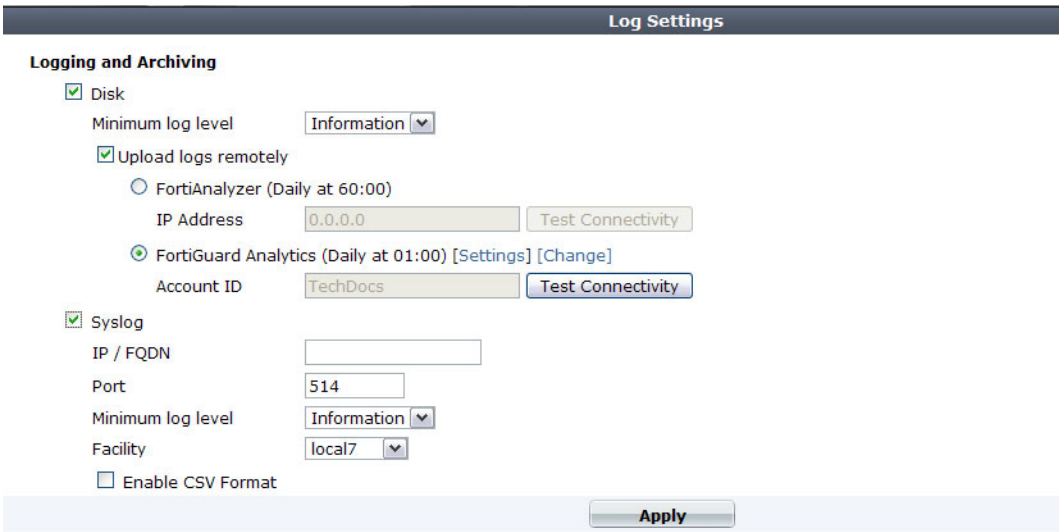
When configuring multiple FortiAnalyzer units, you can now include sending DLP archives to both the second and third FortiAnalyzer units. This enhancement allows you to ensure DLP archives are not lost when logging to multiple FortiAnalyzer units.

Remote logging configuration enhancements

Remote logging to a log device is now configured mostly in the CLI, except you can configure uploading logs to a FortiAnalyzer unit or FAMS in either the CLI or web-based manager. However, you must configure when to upload the logs from the CLI, since the time period is not supported in the web-based manager until after the time period is configured in the CLI.

SQL logging is enabled by default for those models that have SQL databases. If you want to disable or enable certain SQL logs, including archiving, you must use the CLI.

Figure 6: Log settings in FortiOS 4.0 MR3



When configuring logging to a FortiAnalyzer unit, you can control the buffer rate to the FortiAnalyzer unit. This is available only in the CLI. The buffer size is between 20 to 20 000.

Previously, you could upload logs to an AMC disk; however, this feature has been removed because of the new feature of remotely storing and uploading logs to a FortiAnalyzer unit and FAMS server.

Log and Report Monitoring

The new Monitor submenus allow you to view monitored network activity on the FortiGate unit. In *Log&Report* > *Monitor* > *Logging Monitor*, you can view the log activity being recorded by the FortiGate unit on a weekly basis.

Logging Monitor

The Logging Monitor allows you to view the log activity that is being recorded by the FortiGate unit. The information displays as a bar chart and contains information regarding the total number of logs recorded by the unit on each day of the week. For example, on Wednesday of this week there were a total of 30 log entries recorded by the event log.

When you select a bar in the bar chart, you are automatically redirected to the Log Activity for <day of week> page. On this page you can view the logs for that day and the number of entries for that log file that occurred. For example, you select Wednesday's bar on the Logging Monitor page; you are redirected to the Log Activity for Wednesday page, where the logs for that day display. When you want to return to the Logging Monitor page, select *Return*.

Log Message Enhancements

There are several enhancements, as well as changes, that occurred for logs in this release. For example, event logs contain a new subtype called DNS.

This topic includes the following:

- Event logs
- Other-traffic logs
- Chat message log support for MSNP21

In antivirus logs, the URL address now states the type of protocol used instead of always using "http://". For example, in an ftp-over-http traffic log, the URL starts with ftp://.

Event logs

There are two new subtypes that have been added to the event log file, config and dns. The following explains each one.

A new subtype was added to event logs, called DNS. This new log message provides information about any DNS look-up that occurred. The option is enabled within the Event Log page (*DNS lookup event)*, or within the CLI.

There is only one log message that occurs within the event log.

The following is an example of an event-dns log message.

```
2010-08-13 20:05:43 log_id=0108050000 type=event subtype=dns
vd=root pri=information policyid=1 src=172.16.120.166
dst=10.10.1.10 src-intf="internal" dst_intf="wan1" user="user1"
group="group123" dns_name="xx.example.com" dns_ip="172.55.154.199"
```

The event-config log messages provides detailed information about what setting was changed by a user. For example, a user disabled the explicit web proxy event on the Event Log page.

You can enable this subtype within the Event Log page, by selecting *Configuration change event*, or in the CLI. By default, this option is disabled.

The following is an example of an event-config log message:

```
2010-09-15 10:15:55 log_id=010 type=event subtype=config vd=root
pri=information vd=root user="admin" ui="GUI(10.10.10.1)"
action="edit" cfg_tid=1179790 cfg_path="log.eventfilter"
cfg_attr="wan-opt[enable->disable]" msg="Edit log.eventfilter"
```

Within the event log file, a log message containing information about an explicit web proxy event is recorded when enabled in *Log&Report* > *Log Config* > *Event Log*. The check box beside *Explicit web proxy event* must be selected so that this log can be recorded by the unit. This option is also available in the CLI.

Event-system

There are now two specific log messages that indicate when the system starts up and when it shuts down. These log messages are included in the event-system logs, and log message 20202 indicates when the system started up, and log message 20203 indicates when the system shut down.

The following are examples of these two event-system log messages:

```
2010-09-12 10:24:02 log_id=0100020203 type=event subtype=system
vd=root pri=information action=daemon-shutdown daemon=getty pid=68
msg= "Daemon getty shut down"
```

```
2010-09-12 10:24:02 log_id=0100020203 type=event subtype=system
vd=root pri=information action=daemon-startup daemon=cauploadd
pid=94 msg "Daemon cauploadd started."
```

Traffic logs

There are two new enhancements for traffic logs. Additional information has been added to other-traffic logs and a new subtype introduced. The new webproxy-traffic subtype for traffic logs indicates activity regarding web proxy traffic that was detected using a web-proxy security policy.

Other-traffic logs

When viewing other-traffic logs in the web-based manager, you will see additional information such as IM and P2P application information, as well as two icons in the status field that indicate the status of the traffic logs of 6 and 5. The status icons that appear in the web-based manager are a green check mark or a circle with a line through it. When you move your mouse over the icon, it indicates what the icon is, either *accept* (which is the green check mark), or *deny* (the circle with a line through it).

Chat message log support for MSNP21

In Windows Live Messenger 2011, a new protocol was introduced called Microsoft Notification Protocol 21 (MSNP21) which handles chat messages. The FortiGate unit now supports logging of chat messages that use this new protocol.

The FortiGate unit detects the protocol by following the same path as previously for IM logging. These logs are found in the DLP archive logs.

SSL connection encryption level option over OFTP

The SSL connection encryption level option for SSL connections that occur over OFTP, such as FortiGate to FortiAnalyzer, is now available. This type of connection provides a way to customize the level of SSL encryption over OFTP for these connections.

The commands are as follows:

```
config log fortianalyzer setting
  set enc-algorithm {default | high | low | disable}
end
config log fortianalyzer2 setting
  set enc-algorithm {default | high | low | disable}
end
config log fortianalyzer3 setting
  set enc-algorithm {default | high | low | disable}
end
config log fortianalyzer override-setting
  set enc-algorithm {default | high | low | disable}
end
config log fortiguard setting
  set enc-algorithm {default | high | low | disable}
end
config system central-management
  set enc-algorithm {default | high | low | disable}
end
config log disk setting
  set upload-ssl-conn {default | high | low | disable}
end
```

When you select the `default` option, you are choosing to have the SSL communication encryption with high and medium encryption algorithms.

Uploading logs to a FTP server in text format

Logs can now be uploaded in text format to a FTP server. This provides more flexibility for saving logs in a specific format for viewing later on. This is available only for FortiGate units with hard disks and only for uploading to a FTP server.

Logs that are saved in text format can be viewed in a text editor, and these logs are in Raw format. Raw format is a type of format that displays log messages as they would appear in the log file.

Example for uploading logs to a FTP server in text format

In this example, an administrator is configuring logging to the FortiGate unit's disk, as well as specifying uploading logs to an FTP server in text format.

```
config log disk setting
  set status enable
    config sql-logging
      set app-crtl enable
      set attack enable
      set dlp enable
      set event enabel
      set netscan enable
      set traffic enable
      set spam enable
      set traffic enable
      set virus enable
      set webfilter enable
    end
  set ips-archive enable
```

```
    set storage Internal
    set diskfull overwrite
    set log-quota 50
    set report-quota 50
    set upload enable
    set upload-destination ftp-sesrver
    set uploadip 172.16.120.154
    set uploadport 443
    set uploaduser user_1
    set uploadpass 123456789
    set uploaddir c:\logs_fgt50B
    set uploadtype appctrl attack dlp event spamfilter traffic
       virus webfilter
    set uploadzip enable
    set upload-format text
    set uploadsched enable
    set uploadtime 7
    set drive-standby-time 19800
    set upload-delete-files disable
    set sql-max-size 65536
    set sql-max-size-action overwrite
    set sql-oldest-entry 1024
end
```

Deleting all local logs, archives and user-configured report templates

The new `execute` command, `execute log-report reset`, deletes all local logs, log archives and user-configured report templates on the FortiGate unit. However, this command also restores the default FortiOS UTM Activity report to its original default settings, if the default report has been modified. The user-configured templates are the themes that you have configured from scratch for reports.

FortiGuard Analysis and Management Service (FAMS)

Enhancements, such as support for FortiAnalyzer units, was introduced. The following explains this support and additional enhancements:

FortiAnalyzer with FAMS support

The FortiAnalyzer unit now provides support for FAMS. The FAMS subscription service allows you to backup and store logs on a FortiAnalyzer unit. This provides additional archival storage as well as a back up solution in the event the FortiAnalyzer unit becomes unavailable.

Logs on the FortiAnalyzer unit are sent on a regular basis, based on a scheduled time period, to the FAMS server.

FAMS enhancements

The FortiGate unit can now be configured to upload recently recorded logs to the FAMS servers on a regular basis, similar to how the unit uploads logs to the FortiAnalyzer unit on a regular basis.

When you are configuring to upload logs to FAMS, you can also test the connection between FAMS and the FortiGate unit by selecting *Test Connectivity*, in *Log&Report* > *Log Config* > *Log Settings*.

The FAMS server stores the logs for archival usage. The FortiGate unit stores the logs locally either in system memory or disk, and then uploads the logs to the FAMS server.

FortiOS 4.0 MR3 Usability improvements

A major effort has been made to improve the usability of the FortiOS 4.0 MR3 web-based manager experience. Changes have been made throughout to improve the visibility of information and make it easier and more efficient to view and change configurations and monitor network activity and FortiGate activities and processes.

This section contains the following topics:

High-level web-based manager menu changes

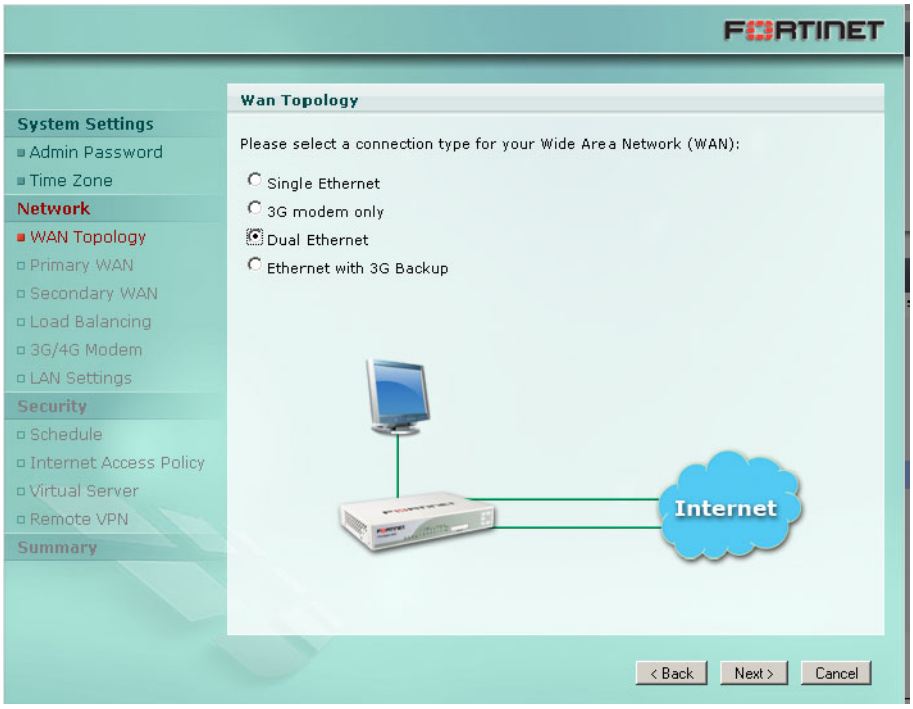
FortiOS 4.0 MR3 patch 1 introduces the following menu changes to the web-based manager. The CLI commands for these configuration items have not changed.

- The new *Policy* menu is used to configure IPv4 and IPv6 security policies, view the central NAT table, configure DoS policies, Sniffer policies, and protocol options. You can also monitor sessions and policy usage. Security policies are also called firewall policies. These options were available from *Firewall* > *Policy*.
- The *Firewall* menu has been renamed *Firewall Objects* and contains menus for configuring firewall addresses, services, schedules, traffic shapers, virtual IPs, firewall load balancing and monitoring load balancing and traffic shaping.
- The *UTM* menu has been renamed *UTM Profiles*.
- *Endpoint Control* and *Vulnerability Scan* have been moved under *UTM Profiles*. This functionality is now documented in the UTM Guide chapter of the FortiOS Handbook.
- The *System* > *Network* > *DNS* contains DNS fields formerly present in the *System* > *Network* > *Options* page. This page also includes DDNS settings.

New FortiGate Setup Wizard

Available on selected models, the new FortiGate setup wizard allows for quick and easy set-up of your FortiGate configuration. Within the wizard, you can configure the administrator password, FortiGate unit time zone, network settings (single or dual WAN interfaces, modem settings, DHCP and LAN settings), apply security features such as access schedules, UTM features, NAT, virtual servers, and remote SSL or IPsec VPN access.

Figure 7: Configuration wizard WAN topology setting



FortiExplorer enhancements

The most recent versionof FortiExplorer is compatible with recent FortiGate models running FortiOS 4.0 MR3. You can use FortiExplorer to easily and quickly configure your FortiGate unit with basic settings. FortiExplorer also allows access to the web-based manager and CLI through a USB connection. FortiExplorer runs on all Windows platforms and on Mac OS X.

FortiExplorer contains improved setup wizard support, FortiGuard support, additional system improvements and a new security policy wizard which is similar to the FortiGate setup wizard but for security policies. FortiExplorer also contains a 3G/4G modem configuration page, for those units that have 3G/4G modem capabilities.

Dashboard Widgets

There are several enhancements to dashboard widgets in this release, as well as a new widget called Network Protocol Usage. You can view dashboard widgets from *System* > *Dashboard* > *Status*.

Traffic History

The Traffic History widget has been enhanced, allowing you to customize which line charts contain a specified time period range. For example, the second line chart displays the last seven days of traffic information.

You can choose to have the time period display in days, minutes or hours. You must enter a time period that is either in minutes or days, such as 10 minutes or 30 days. If you choose to enter zero, that specific time period is disabled.

Dashboard - Traffic History Settings	
Provides settings for modifying the default settings of the Traffic History widget.	
Custom Widget Name	Enter a new name for the widget. This is optional.
Select Network Interface	Select an interface (FortiGate unit's interfaces) from the drop-down list. The interface you choose displays the traffic occurring on it.
Enable Refresh	Select to enable the information to refresh.
Time Period 1	The time period for the first line chart. Enter a number in the first field, then select *Hour(s)*, *Minute(s)* or *Day(s)* from the drop-down list beside the field.
Time Period 2	The time period for the second line chart. Enter a number in the first field, then select *Hour(s)*, *Minute(s)* or *Day(s)* from the drop-down list beside the field.
Time Period 3	The time period for the third line chart. Enter a number in the first field, then select *Hour(s)*, *Minute(s)* or *Day(s)* from the drop-down list beside the field.

System Resources

The System Resource widget now only displays information concerning the CPU and memory usage amounts. You can view this information either in real-time or current information, or historical. If you want to view the information in historical view, you can also change the type of fill-line color.

Dashboard - Custom System Resource Display	
Provides settings to modify the default or current configuration of the System Resource widget.	
Custom Widget Name	Enter a new name for the widget. This is optional.

View Type	Select which type you want to view the system resource information in. • Real-time – displays the current information as a dial gauge, along with a percent, located at the bottom. For example, Memory Usage 58%. • Historical – displays the information in a fill-line chart for each CPU and memory. When you select *Historical*, the *Chart Color* option appears. • When viewing CPU and memory usage in the web-based manager, only the information for core processes displays. CPU for management processes, is excluded. For example, HTTPS connections to the web-based manager.
Chart Color	Select *Change* to change add a new fill color to the chart. Select *Reset* to reset the color back to its default color.
Time Period	Select from the drop-down list, the period of time that the information will be displayed.

Network Protocol Usage

The Network Protocol widget allows you to view many different protocols over a period of time. This widget reflects what was previously found in the basic traffic report, located in *Log&Report* > *Report Access* > *Memory* in FortiOS 4.0 MR1 and lower.

The Network Protocol Usage widget allows you to view many different protocols over a period of time. You can view this information with either a line chart or bar chart style. Network protocol usage information can be viewed for up to the last 30 days, or as recent as the last 24 hours.

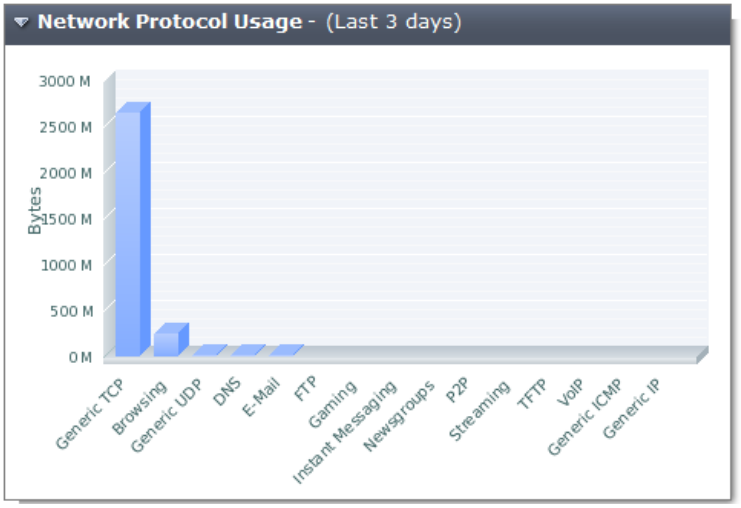
Custom Network Protocol Usage Display Provides settings for modifying the default settings of the Network Protocol Usage widget.		
Custom Widget Name	Enter a new name for the widget. This is optional.	
Chart Style	Select either *Line* or *Bar* style for the chart. The line chart is a fill-line chart style type.	
Time Period	Select a time period from the drop-down list. For example, if you choose *Last 24 hours*, only the information gathered in the last 24 hours displays.	
Protocols	You can choose from any of the following protocols:	
	• Browsing	• DNS
	• FTP	• Gaming
	• Newsgroups	• P2P
	• TFTP	• VoIP
	• Generic UDP	• Generic ICMP
	• E-mail	• Instant Messaging
	• Streaming	• Generic TCP

	• Generic IP	
	All protocols are enabled by default. If you do not want to include certain protocols, select the check box beside each protocol that should not be included.	

Chart display improvements

Charts within the web-based manager have a larger font size and chart style applied to them. These changes make it easier to read the information that displays. These chart improvements include the charts within widgets as well as within FortiOS reports.

Figure 8: Example of the display improvements to a chart



Monitoring Improvements

In each menu in the web-based manager, there is now a Monitor submenu containing one or multiple submenus that allow you to view the activity of a specific feature that is currently being monitored by the FortiGate unit. The information displayed is usually in a table or graphical format, providing a more user-friendly display of the monitored information.

The information is displayed in a similar manner as to how widgets display their information in charts or lists on a dashboard in *System* > *Dashboard*.

You must enable logging for certain features since the information that is compiled for certain Monitor submenus only comes from logs. These features are the UTM Monitor submenus, security policy (Policy Monitor), and the Logging Monitor submenu.

DHCP Monitor

The DHCP Monitor is available from *System* > *Monitor* > *DHCP Monitor*. Using this monitor you can view the DHCP servers and relays that are being monitored by the FortiGate unit.

On the DHCP Monitor page, you can also add IP addresses from the page to the IP reservation list. The IP reservation list is a list of reserved IP addresses on a DHCP network for a user who wants to always assign that same IP address to one of the DHCP network's hosts.

On the DHCP Monitor page, you can also refresh the information to ensure current information displays on the page.

Modem Monitor

The Modem monitor is available from *System* > *Monitor* > *Modem Monitor*. Using this monitor, you can view the unit's modem status and activity. The information on the page is displayed in a bar chart as well as in a table, located below the bar chart.

On the Modem Monitor page, you can refresh the information to ensure current information displays on the page. You can also reset the information, which removes the information from the page and starts the monitoring process again.

Session Monitor

The Session Monitor is available from *Policy* > *Monitor* > *Session Monitor*. Using this monitor you can view all of the sessions that are currently being monitored by the FortiGate unit. On the Session Monitor page, you can filter the information, delete a session, or refresh the list.

This monitoring submenu is similar to the widget, Top Sessions, which is still available in *System* > *Dashboard*. The session information that displays in the widget can also be seen within the Session Monitor submenu.

On the Session Monitor page, you can refresh the information to ensure current information displays on the page. You can also filter the information using Filter Settings. If you want to delete a session, select the Delete icon in the row of the session you want removed.

Policy Monitor

The Policy Monitor submenu is available from *Policy* > *Monitor* > *Policy Monitor*. Using this monitor you to view the top security policy usage by the FortiGate unit. The information displays in a bar chart and details such as action and packets, are displayed in a table below the bar chart.

On the Policy Monitor page, you can refresh the information to ensure current information displays on the page. You can also reset the information, which removes the information from the page and starts the monitoring process again.

Load Balance Monitor

The Load Balance Monitor is available from *Firewall Objects* > *Monitor* > *Load Balance Monitor*. this monitor display the status of each virtual server and real server, as well as the start or stop status of the real servers, is displayed on the Load Balance Monitor page.

Traffic Shaper Monitor

The Traffic Shaper Monitor is available from *Firewall Objects* > *Monitor* > *Traffic Shaper Monitor*. Using this monitor you can view traffic shaping activity that is being monitored by the FortiGate unit. This information displays in a bar chart. You can view the traffic shaper usage information by current bandwidth or by dropped packets. Use the *Report By* drop-down list on the page to view traffic shaper usage by selecting either *Current Bandwidth* or *Dropped packets*.

On the Traffic Shaper Monitor page, you can refresh the information to ensure current information displays on the page. You can also reset the information, which removes the information from the page and starts the monitoring process again.

AV Monitor

The AV Monitor is available from *UTM Profiles* > *Monitor* > *AV Monitor*. Using this monitor you can view activity concerning viruses detected by the FortiGate unit. This information displays on the AV Monitor page in a bar chart as well as in a table located below the bar chart.

On the AV Monitor page, you can refresh the information to ensure current information displays on the page. You can also reset the information, which removes the information from the page and starts the monitoring process again.

Intrusion Monitor

The Intrusion Monitor is available from *UTM Profiles* > *Monitor* > *Intrusion Monitor*. Using this monitor you can view the attack activity detected by the FortiGate unit. This information displays on the Intrusion Monitor page, in a bar chart as well as in a table located below the bar chart.

On the Intrusion Monitor page, you can refresh the information to ensure current information displays on the page. You can also reset the information, which removes the information from the page and starts the monitoring process again.

Web Monitor

The Web Monitor is available from *UTM Profiles* > *Monitor* > *Web Monitor*. Using this monitor you can view the web activity detected by the FortiGate unit. This information displays on the Web Monitor page, in a pie chart and bar chart. The total HTTP requests information displays in the pie chart and the blocked HTTP requests display in a bar chart. The total number of web requests display at the bottom of the charts, in *Total Web Requests (HTTP): <number>*.

On the Web Monitor page, you can refresh the information to ensure current information displays on the page. You can also reset the information, which removes the information from the page and starts the monitoring process again.

Email Monitor

The Email Monitor is available from *UTM Profiles* > *Monitor* > *Email Monitor*. Using this monitor you can view the email activity detected by the FortiGate unit. This information displays on the Email Monitor page, similar to how the Web Monitor page displays its monitoring information, the total number of emails in a pie chart and the blocked emails in a bar chart. The total number of emails is located at the bottom of the charts, in *Total Emails: <number>*.

On the Email Monitor page, you can refresh the information to ensure current information displays on the page. You can also reset the information, which removes the information from the page and starts the monitoring process again.

Archive & Data Leak Monitor

The Archive & Data Leak Monitor is available from *UTM Profiles* > *Monitor* > *Archive & Data Leak Monitor*. Using this monitor you can view the DLP usage performed that is being detected by the FortiGate unit. This information displays in a bar chart. You can view this information by security policy, DLP sensor, or by protocol using the *Report By* drop-down list. The total number of dropped DLP archives is located at the bottom of the chart, in *Total Dropped Archives: <number>*.

On the Archive & Data Leak Monitor page, you can refresh the information to ensure current information displays on the page. You can also reset the information, which removes the information from the page and starts the monitoring process again.

Application Monitor

The Application Monitor is available from *UTM Profiles* > *Monitor* > *Application Monitor*. Using this monitor you can view the application usage detected by the FortiGate unit. This information displays in a bar chart.

On the Application Monitor page, you can refresh the information to ensure current information displays on the page. You can also reset the information, which removes the information from the page and starts the monitoring process again.

IPsec Monitor

The IPsec Monitor is available from *VPN* > *Monitor* > *IPsec Monitor*. Using this monitor you can view the activity on IPsec VPN tunnels. The page also shows the start and stop of tunnel activity.

The list includes both dial-up IPsec users as well as static IP or Dynamic DNS VPNs. The list provides status and IP addressing information about VPN tunnels, which VPN tunnels are active or non-active, connecting to remote peers that have static IP addresses or domain names. If you want, you can also start and stop individual tunnels from the list as well.

SSL-VPN Monitor

The SSL Monitor is available from *VPN* > *Monitor* > *SSL-VPN Monitor*. Using this monitor you can view the activity of SSL VPN sessions. The list displays the user name of the remote user, the IP address of the remote client, and the time the connection was made. You can also see which services are being provided, and delete an active web or tunnel session from the unit.

Web Cache Monitor

The Web Cache Monitor is available from *WAN Opt. & Cache* > *Monitor* > *Cache Monitor*. Using this monitor you can view the activity of SSL VPN sessions. The web cache monitor includes two widgets that display information about web cache requests and web cache traffic. The Web Cache Requests widget displays the number of session that were cached and the number that were not in a pie chart. The Web Cache Traffic widget consists of a line graph that compares the amount of HTTP traffic in kbytes on the WAN with the amount of HTTP traffic in kbytes on the LAN. The difference between the LAN and WAN traffic shows how much traffic was cached.

WAN optimization Peer Monitor

The WAN optimization Peer Monitor is available from *WAN Opt. & Cache* > *Monitor* > *Peer Monitor*. Using this monitor you can view a list of WAN optimization peers that the FortiGate unit can communicate with. For each peer you can view the peer's name and IP address, the type of peer, and the amount of traffic reduction as a result of WAN optimization or web caching with that peer.

WAN optimization web cache monitor

To view the web cache monitor, go to WAN Opt. & Cache > Monitor > Cache Monitor.

The web cache monitor shows the percentage of web cache requests that retrieved content from the cache (hits) and the percentage that did not receive content from the cache (misses). A higher the number of hits usually indicates that the web cache is being more effective at reducing WAN traffic.To improve cache performance you can

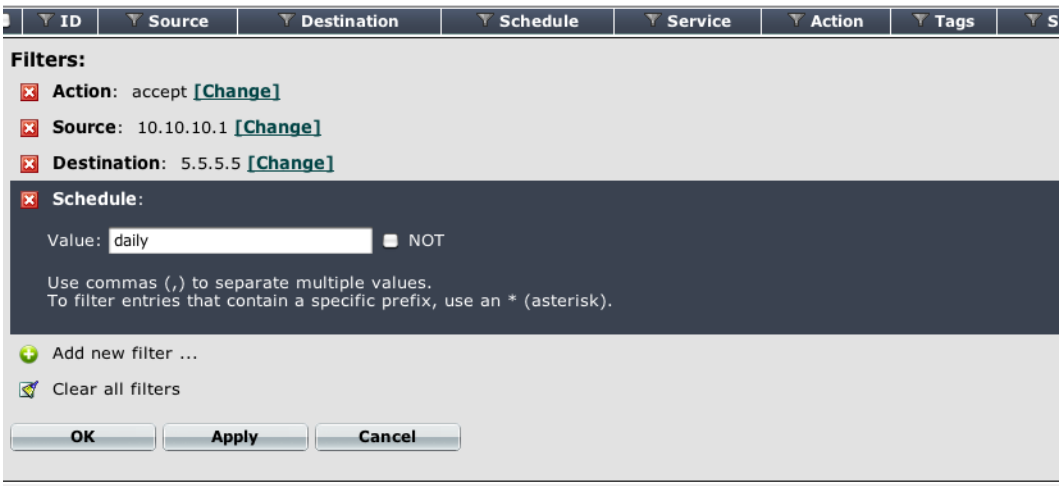
The web cache monitor also shows a graph of web traffic on the WAN and LAN. A lower WAN line on the graph indicates the web cache is reducing traffic on the WAN. The web cache monitor also displays the total number of web requests processed by the web cache.

Filtering web-based manager lists

In previous releases, when you wanted to filter information within a web-based manager list you used the filter icons. Filter icons are still available for filtering, however, *Filter Settings* have been introduced, providing a central location to configure multiple filters at once. Previously, you had to configure filters one at a time.

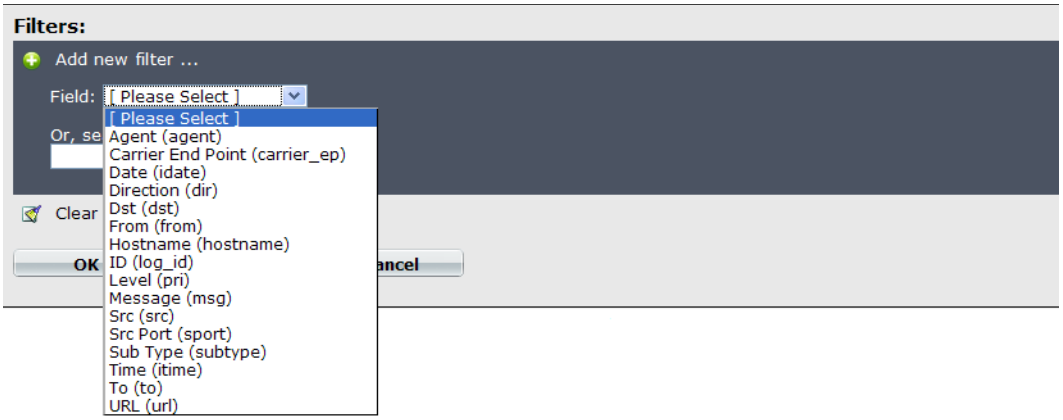
When you select *Filter Settings*, a new *Filters:* pane appears at the top of the list. You can use this pane to add and remove multiple filters and configure settings for each one. Add a filter by selecting Add new filter or by selecting the filter icon for a column in the list. When you select a filter icon in a list column the Filters pane opens with that column added to it.

Figure 9: Filter Settings



You must select *OK* when you are ready to apply the filters, otherwise the filter settings will not be applied to the information on the page. You can modify or remove a filter at any time.

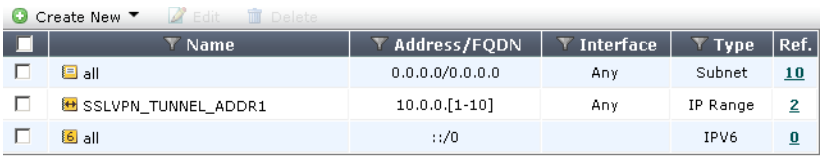
Figure 10: Example of adding a log field from the Field drop-down list when filtering log messages



Reference count column (object usage visibility)

Within most web-based manager lists, a new column displays called the Reference count column, or *Ref.* This new column shows that a configuration object (for example an interface) is referenced to another object (for example a security policy) and how many times that object is referenced within FortiOS. For example, in Figure 11 the default antivirus profile is referenced once. Finding a referenced object in previous releases was available only in the CLI.

Figure 11: The Ref. count column in the firewall address list

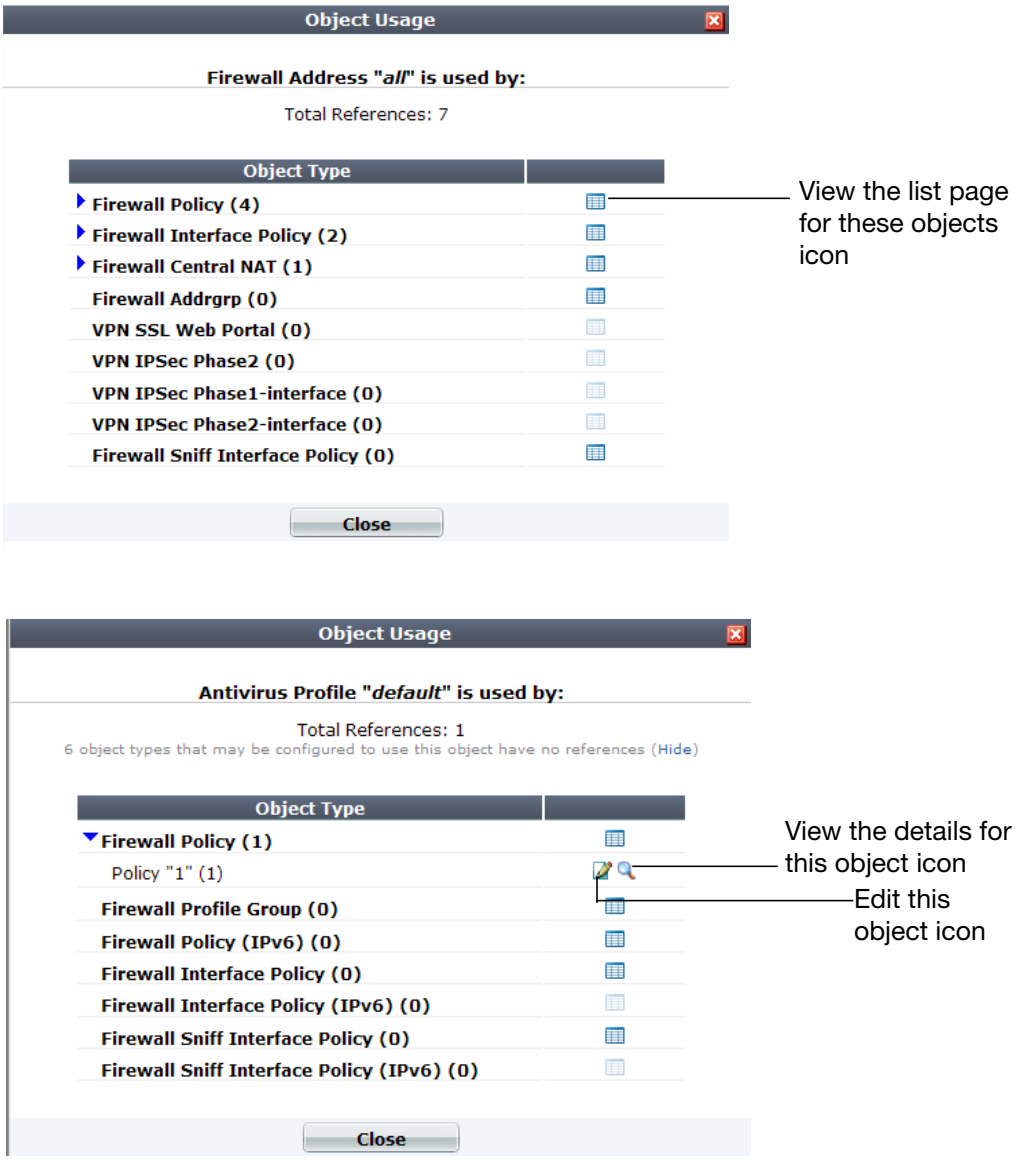


The *Ref.* column helps you to determine the object that is being referenced, and where it is referenced in. The Ref. column also helps you when you need to remove an object but are unable to because it is being referenced.

When you select the number within the reference count column, the Object Usage window appears, showing you exactly where the object is referenced within an object type. An object type in this usage is the location of where an object is referenced in. For example, in Figure 12 the Object Usage window shows that the firewall address “all” is referenced within seven object types; in the default antivirus profile, it referenced once in a security policy.

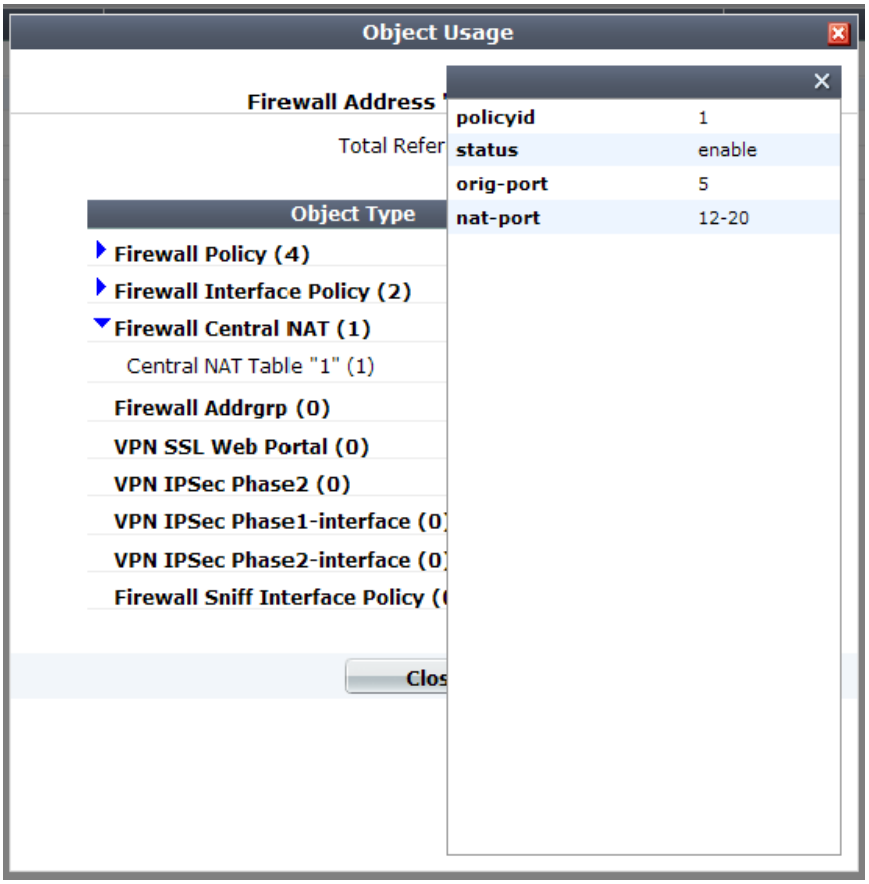
By selecting on the *View the list page for these objects* icon, you are automatically redirected to the page where the entry is referenced in. When you see the Expand Arrow beside some of the object types, it means that you can either view the location of the object in that particular object type, or modify the object type.

Figure 12: Two views of the Object Usage window, one without any expanded object types, and one with an object type expanded showing the available icons



The Object Usage window also provides a way to view the settings for an object, as seen in Figure 1.

Table 1: The Object Usage window displaying the object type table



If you have selected *View the list page for these objects*, and are on the page where the entry is referenced, you can go back to the previous location by selecting the back option on your browser.

Configuration object tagging and coloring

The Tag Management menu provides a central location to view, search and manage tags that you created. Tags are keywords or a term that is assigned to a specific configuration that can be used for searching or filtering purposes.

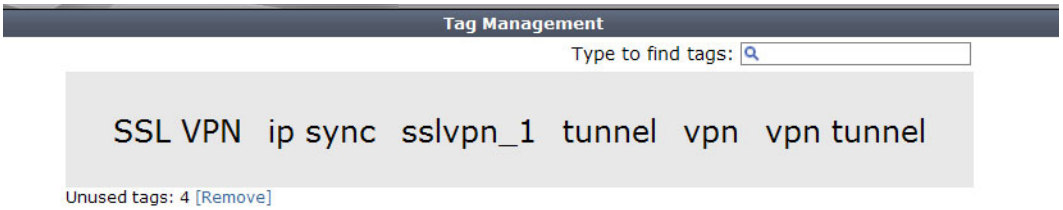
From this central location in *System* > *Config* > *Tag Management*, you can do any of the following:

- a search to find a specific tag
- view where a tag is referenced, for example, a single tag could be referenced in a security policy, predefined signature and application
- go to where the tag is located, for example, a security policy
- view how many tags are currently unused
- remove tags.

The Tag Management page also provides a way to easily locate a specific object, such as a security policy, because of how tags work. For example, an SSL VPN security policy is tagged with the keywords `ssl vpn`, `SSL VPN`, `remote`, and `ssl branch office`; from the Tag Management page, enter `ssl` and the tags for that security policy appear; select one of the tags and within the Object Usage window, select to go to the SSL VPN security policy.

You can view detailed information about what object is using a tag by selecting one of the tags in the rectangular area that contains a gray background. The Object Usage window appears, which displays similar information as when you select a number in the *Ref.* column.

Figure 13: Tag Management page with the option to remove four unused tags



Adding tags to configuration objects

Tags can be created for security policies and firewall addresses. Tags are keywords or a term that is assigned to a specific piece of information, for example a firewall address, which can then be used for filtering or searching purposes.

Tags created within security policies and firewall addresses are used only for filtering and searching purposes. This provides a more concise output. For example, you have multiple VDOMs that contain multiple security policies; tags applied to these security policies allow you to find specific security policies within specific VDOMs.

Tags can also be added to predefined signatures and applications and are used within IPS and application sensors so that only those signatures are used.

The following example explains how to add tags to multiple security policies and then use Tag Management to find a security policy using the tags that were applied to the security policy. Tags are used in the same way for firewall addresses so the example can also be used as basis when configuring and applying tags for firewall addresses.

In the Add Tags window, you can select to add existing tags to the security policy or address list; however, these tags belong to predefined signatures and applications as well as to other security policies and address lists so the tags may not be applicable. You should make sure that the tag is valid for its use when applied to a security policy or other object otherwise it becomes redundant.

Example of how to find a security policy using Tag Management

Your FortiGate unit contains many security policies and the unit is currently in VDOM mode. You want to apply tags to only the SSL VPN security policies so that you can easily get to those policies. There are two SSL VPN security policies.

To add tags to multiple security policies

1 In vdom_1, go to *Policy* > *Policy* > *Policy*.
2 For the first security policy, select it in the row to highlight it.
3 Select the down arrow beside *Edit*, and then select *Add Tags*.
4 In the Add Tags window, enter `remote ssl, ssl vpn, remote, intranet, non-public, internal` and then select the plus sign.

  By selecting the plus sign, the tag is automatically added. If you do not select the plus sign, the tag is not added and you have to enter the tag again.
5 Select *OK*.
6 In the second security policy, select it in the row to highlight it.
7 Select the down arrow beside *Edit*, and then select *Add Tags*.
8 In the Add Tags window, enter `internet, ssl vpn, remote, public, external` and then select the plus sign.
9 Select *OK*.

To search for a security policy from Tag Management

1 Go to *System* > *Config* > *Tag Management*.
2 On the Tag Management page, enter `remote` in the *Type to find tags:* search field.

  The tag appears in the rectangular box with the gray background.
3 Select `remote` to view where the tag is currently being used.
4 In the Object Usage window, select the *View the list page for these objects* icon in the row of the *Object Type*.

  You are redirected to the *Policy* > *Policy* > *Policy*, where you can select the security policy and then make changes to that policy.

Adding tags to predefined signatures and applications

Tags can be created for predefined signatures and applications which are then used in a sensor to provide a means to specify the use of only those tagged objects. Tags are keywords or a term that describes a piece of information and are assigned to that specific piece of information.

Tags that are created within a signature in *UTM Profiles* > *Intrusion Protection* > *Predefined* can be used within an IPS sensor by applying that same tag in an IPS filter entry. Tags that are created are not displayed within the IPS filter list; you must view them from within the IPS filter itself.

Tags that are created within an application in *UTM Profiles* > *Application Control* > *Application List are applied to an application entry within an application sensor. Tags are used in the exact same as they are for IPS sensors. Tags* that are used for predefined signatures cannot be used for applications within the application control list and vice versa.

Tags can also be added to security policies and address lists. When you want to view all tags that are configured for predefined signatures, application control list, security policies and addresses, go to *System* > *Config* > *Tag Management*.

Security configuration object icons

Within the Firewall Objects menu, there are now firewall configuration object icons that you can change the color for. For example, within *Firewall Objects* > *Address* > *Address*, the configuration object icon for IP/Netmask was changed to pink.

These icons also include representing an action within the Action column in security policies. For example, for a deny security policy the Action column on the IPv6 Policy page shows a red circle with a line through it.

The following table explains the security policy configuration object icons that you can customize the color for.

Table 2: Security policy configuration object icons

Icon	Definition	Icon	Definition
	**Allow**		**Recurring schedule**
	**Deny**		**One-time schedule**
	**IPsec**		**Schedule group**
	**SSL VPN**		**Pre-defined service**
	**IP/Netmask**		**Custom Service**
	**IP Range**		**Service Group**
	**IPv6 Address**		**Virtual IP**
	**FQDN Address**		**Virtual Server**
	**Address group**		**Virtual IP Group**

Access to online help

Online help is stored and accessed from our Tech Docs web site; previously it was within the firmware image itself. Online help works in the exact same way as before, providing the same search capabilities as well.

Backing up and restoring configuration files per-VDOM

From the Global VDOM, you can now back up or restore a configuration file for a specific VDOM within the web-based manager. This provides a quick and easy way to back up or restore your configuration file within a specific VDOM. There is an option to back up or restore the full configuration, if needed.

You can back up or restore a specific VDOM configuration file from the System Information widget. When you are on the Backup or Restore page, the *VDOM Config* option is available and you can then choose the specific VDOM you want to back up or restore the configuration from by selecting a VDOM from the drop-down list. These options are only available when you are in the Global VDOM.

This feature is available only when VDOMs are enabled on the FortiGate unit.

More New Features

This section describes additional new features available in FortiOS 4.0 MR3 and contains the following sections:

- SSL renegotiation for SSL offloading provides allow/deny client renegotiation
- SSL VPN Port forwarding support
- IKE negotiation
- SHA-384 and SHA-512 support for IKE
- FortiOS Carrier URL extraction feature

New features for FortiOS 4.0 MR3 Patch 5

- Intrusion Protection (IPS) is now supported for load balancing virtual servers (load balancing virtual IPs (VIPs)). You can now enable UTM and select an IPS sensor in a firewall policy that contains a load balancing virtual server. This includes the case where the load balancing virtual server supports persistence. However, IPS does not work with virtual server load balancing of SSL sessions.

New features for FortiOS 4.0 MR3 Patch 4

- Combine IPS and vulnerability management service into one section
- Move disk management to *System* > *Config* > *Advanced* > *Disk Management*
- Disable memory logging for low-end models with large flash drives
- Enhance memory logging for low-end models with no log disk
- WAN Opt & Cache no longer available on the web-based manager for low-end FortiGate/FortiWiFi models since these features can affect performance of the low-end models. The features are still available from the CLI.

New features for FortiOS 4.0 MR3 Patch 3

- FortiGuard Web Filter category update
- Multiple email fields in log messages
- Weekly Report in PDF and Web Format
- Up to 100 VDOMs supported for the FortiGate-1240B
- "WAN optimization web cache monitor" on page 146.

New features for FortiOS 4.0 MR3 Patch 2

The following is a list of changes made to FortiOS 4.0 MR3 Patch 2:

- Central Management has been moved from *System* > *Admin* > *Central Management* to *System* > *Admin* > *Settings*.
- The web-based manager page for adding and editing security policies has been enhanced to make policies easier to configure and understand.
- "WAN optimization Peer Monitor" on page 146.
- FortiClient Connect is now called FortiClient.
- From *System* > *Certificates* > *CA Certificates*, the Fortinet_Wifi_CA certificate is now called PositiveSSL_CA.
- FortiGate-VM now has a 15-day trial evaluation license and upgrade available.

- Firewall address table size has been increased to 2000 on FortiGate-110C, 200A, 200B, and 80C series models.
- Static route entries table size has been increased to 5000 for the FortiGate-310B and 300C models.
- Support for load balancing on the FMG-XG2 card is now available.
- The Session widget now contains offload information in the Offload information column.
- In *Firewall Objects* > *Service* > *Service Groups*, the following are default service groups you can use:
  - *Exchange Server*
  - *Exchange Service OWA*
  - *Outlook*
  - *Windows AD*
- In *Firewall Objects* > *Service* > *Web Proxy Service*, there is one default web proxy service available for you to use.
- You can now capture packets within the web-based manager by going to *System* > *Config* > *Advanced* and creating a packet capture filter. You can start and stop a filter at any time.
- Support is now available for 64bit FortiOS on the FortiGate-1240B.
- When configuring wireless settings in an SSID for wireless networking, you can now choose to have both TKIP and AES.
- On the Application Control Monitor page, it has changed to look similar to a Dashboard page. There are three widgets and each display data using specific commands in the CLI. The three widgets are:
  - Top Applications by Bandwidth (use diag stats app-bandwidth)
  - Top Applications by Session Count
  - Top IP/User for <ip address_application> (use diag stats app-usage-ip <address/application>)
- SQL logging may or may not be, by default, enabled on certain models. You should verify that SQL logging is enabled after upgrading to FortiOS 4.0 MR3 Patch-2.
- Report function may be affected by the change of logging back to text-based logs.
- For FortiGate models that support SSD, the default database size is 10GB in a single VDOM environment. FortiGate models that support a flash drive, their default database size is 1.5GB. You can change this default size to meet your own network logging requirements.
- When searching for information in logs in the web-based manager, you may not be able to continue searching if your search resulted in less than 50 records. Use the CLI instead if you want to continue your search.
- When configuring RADIUS servers for dynamic profile configurations, you can now choose to close all sessions associated with an IP address when a RADIUS STOP message is received. You can also enable logging of these RADIUS message events.

  A dynamic profile group must be configured first, before these RADIUS configuration settings become available within the New RADIUS Server page.

- Load balance mode allows you increased flexibility in how you use the interfaces on the FortiGate unit. When enabled on a FortiGate-3140B or a FortiGate-3950B/3951B with an installed FMC-XG2, traffic between any two interfaces (excluding management and console) is accelerated. Traffic is not limited to entering and leaving the FortiGate unit in specific interface groupings to benefit from NP4 and SP2 acceleration. You can use any pair of interfaces.

  Security acceleration in this mode is limited, however. Only IPS scanning is accelerated in load balance mode.

New features for FortiOS 4.0 MR3 Patch 1

The following is a list of changes made to FortiOS 4.0 MR3 Patch 1.

- The configuration of Web Filtering local ratings and local categories has been simplified.
- Support FSSO and sniffer policies: Log messages recording information gathered by a sniffer policy include a user name if the IP address in the log message corresponds to the IP address if a user who has been authenticated with FSSO.
- Web Filter Profile, IPS and application control pages of the web-based manager have been changed to enhance usability.
- "High-level web-based manager menu changes" on page 139.
- FortiGate unit Central Management Locking: FortiGate configuration changes cannot be made of the CLI or web-based manager if the unit is being remotely managed from FortiManager.
- FortiOS 4.0 MR3 patch 1 is compatible with FortiClient. FortiGate units support up to 10 FortiClient Connect connections.
- The new FortiGate UTM Weekly Activity Report now includes support for data based on geographic locations. For example, the default report includes a graph of Top Destination Countries by session
- BGP dynamic routing now supports AS override. With `as-override` enabled, while advertising an AS path to a peer, all leading occurrences of the peer's AS number are replaced with the AS number of the advertising router.

```
config router bgp
  config neighbor
    edit 192.168.1.112
      ...
      set as-override disable|enable
      set as-override6 disable|enable
      ...
```

- Forward and reverse traffic shaping can now be set independently in security policies and in application control sensors
- The WiFi controller feature in a FortiWiFi unit can manage local WiFi functions in the same manner as a remote FortiAP or FortiWiFi unit.
- SMTP virus scanning now supports scanning of STARTTLS messages.
- "Web Cache Monitor" on page 146.
- Control whether to bypass or block SSL sessions that cannot be decrypted by SSL content scanning and inspection. This behavior is controlled from the CLI in a protocol options profile. For example, for POP3S:

```
config firewall profile-protocol-options
```

```
edit new_profile
  config pop3s
    set unsupported-ssl {bypass | block}
    ...
```

- When adding LDAP, RADIUS or TACAS+ authentication servers you can select Test to verify that the configuration is correct. You can also use `diagnose test authserver` commands to test a number of aspects of authentication server configuration.
- LDAP group checking is now supported using the following command. You can set LDAP group checking to perform group object checking or user attribute checking.

```
config user ldap
  edit new_ldap
    set group-member-check {group-object | user-attr}
      set unsupported-ssl {bypass | block}
```

- FortiOS Carrier supports GTPv1 release 7.15.0 and GTPv1 release 8.12.0

Login grace timer for SSH connections

A grace timer has been introduced which allows control over the login time limits of SSH connections to the FortiGate unit. The grace timer can close open but unauthenticated SSH connections to the FortiGate unit. For example, if the timer is set to 60 seconds, any open, unauthenticated SSH session is closed after 60 seconds.

The default value of the allowed time is 120 seconds but can be configured for 10 to 3600 seconds.

This feature is available only in the CLI. The CLI command syntax used is:

```
config system global
  set admin-ssh-grace-time <seconds>
end
```

FortiManager automatic authorization

In previous releases, the `authorize-manager-only` command restricted access to authorized FortiManager units. This authorization is now automatically found during the communication exchanges between the FortiGate and FortiManager units.

This automatic authorization behaves as follows:

- On the FortiManager unit, an administrator enters the management IP or FQDN of the FortiManager unit.
- During the protocol exchange between the two units, on the FortiManager unit's side that management IP or FQDN is sent to the FortiGate unit.
- The FortiGate unit, after receiving the management IP or FQDN, determines that is valid, saves that management IP or FQDN as the FortiManager unit's

Dynamic DNS commands

The following DDNS commands were removed from the `config system interface` command. The DDNS commands are now found under the new `config system ddns` command.

```
set ddns {enable | disable}
```

```
set ddns-server <server>
set ddns-domain <server>
set ddns-username <username>
set ddns-password <password>
```

The DDNS commands above now in the `config system ddns` command:

```
set monitor-interface <interface_name>
set ddns-server <server>
set ddns-domain <domain_name>
set ddns-username <username>
set ddns-password <password>
```

New diagnose commands

Real-time session, traffic shaper bandwidth and CP6 statistics

The following CLI commands display real-time session set up rate statistics, accurate current traffic shaper bandwidth, and CP6 statistics information.

```
diag hardware ipsec
diag hardware deviceinfo cp6 {brief | cmdq | cmdqdis | rng |
    task}
```

The CLI command `diag firewall shaper traffic-shaper list` now displays the accurate current traffic shaper bandwidth.

diag sys session filter proto-state

A new `diag` command has been introduced, which is an enhancement to the `get sys session-info {stat|full-stat}` command. The new command includes counts of the various TCP states, which the `get sys session-info stat|full-stat` command previously did not have.

The `diag sys session filter proto-state` command allows you to view the counts of various TCP states. This command can help in enterprise-type environments when tuning various protocol timers, for example, there are 60 percent of sessions in syn-sent state in comparison to the established sessions.

diag log-stats show

The new `diag log-stats show` command displays the number log messages that were discarded by the unit.

New get commands

IPsec get commands

There are several new `get` commands that help you to view IPSec VPN tunnel information as well as IKE gateway information and IPSec tunnel statistics.

The following `get` commands for IPSec VPN are as follows:

```
get vpn ike gateway
get vpn ipsec stats crypto
get vpn ipsec stats tunnel
get vpn ipsec tunnel summary
get vpn ipsec tunnel details
get vpn ipsec tunnel name
```

An example of the output of the `get vpn ipsec tunnel summary` is:

```
gateway
    name: 'phase1'
    type: policy-based
    local-gateway: 0.0.0.0:0 (dynamic)
    remote-gateway: 10.10.5.24:0 (static)
    mode: ike-v1
    interface: 'wan2' (4)
    rx  packets: 0  bytes: 0  errors: 0
    tx  packets: 0  bytes: 0  errors: 0
    dpd: enabled/unnegotiated
    selectors
        name: 'phase2'
        auto-negotiate: disable
        mode: tunnel
        src: 0:0.0.0.0/0.0.0.0:0
        dst: 0:0.0.0.0/0.0.0.0:0
```

The `get vpn ipsec stats tunnel` command gives statistics about the total number of IPSec tunnels and their types, including the number of selectors, how many are up, and any errors.

The following `get` commands for IPsec are now removed:

```
get vpn status concentrators
get vpn status ike config
get vpn status ike errors
get vpn status ike routers
get vpn status ike status detailed
get vpn status ike status summary
get vpn status ipsec
get vpn status tunnel stat
get vpn status tunnel dialup-list
get vpn status tunnel number
```

The following commands were changed:

- `get vpn status ike gateway` is replaced by `get vpn ike gateway`
- `get vpn status tunnel list` is replaced by `get vpn ipsec tunnel summary` and `get vpn ipsec tunnel details`
- `get vpn status tunnel name` is replaced by `get vpn ipsec tunnel name`
- `get vpn status ike crypto` is replaced by `get vpn ipsec stats crypto`

Traffic shaper and per-IP shaper

You can now view traffic shaper and per-IP shaper information from within the CLI. The commands display general information about shapers which includes their current bandwidth.

These commands are within the `get` command branch:

```
get firewall shaper traffic
get firewall shaper per-ip-shaper
```

Management checksum configuration information for FortiManager

There are now three new `get` commands that allow you to view the configuration checksum information to the FortiManager unit.

The management checksum commands are:

```
get system mgmt-csum global
get system mgmt-csum vdom <vdom_name>
get system mgmt-csum all
```

If you have no VDOMs enabled, entering `get system mgmt-csum` allows you to view the overall checksum information. The following is an example:

```
get system mgmt-csum
debugzone
global: 5c d6 08 fd e5 52 b3 18 e3 4d be 7f dc 40 86 66
root: 04 02 f0 e5 f2 21 36 63 72 05 f5 dc 31 94 c5 63
all: 24 90 19 d0 e4 67 7a c1 81 99 67 ae 77 fa bb 01

checksum
global:5c d6 08 fd e5 52 b3 18 e3 4d be 7f dc 40 86 66
root: 04 02 f0 e5 f2 21 36 63 72 05 f5 dc 31 94 c5 63
all: 24 90 19 d0 e4 67 7a c1 81 99 67 ae 77 fa bb 01
```

MTU configuration support on non-IPsec tunnel interfaces

MTU configuration for non-IPsec tunnel interfaces is now supported. This allows you to customize the transmission amount for each interface on the FortiGate unit.

MTU is configured only in the CLI. The MTU setting is hidden until you enable the `mtu-override` setting.

Customizing maximum number of invalid firewall authentication attempts

A new option in the `config user setting` command allows you to customize the maximum number of invalid firewall authentication attempts before the FortiGate unit blocks them. This provides a way to tune CPU usage against invalid authentication connections.

The new option in the `config user setting` command is `auth-invalid-max`, and you can set the value between 1 and 100. For example, entering five allows five invalid authentication attempts before the unit blocks the user.

The following is an example of using this feature.

```
config user setting
  set auth-invalid-max 3
end
```

Controlling the connection between a FortiManager unit and a FortiGate unit

In the `config system interface` command, you can now configure whether an interface lets a FortiManager unit connect with a FortiGate on that unit's interface. For example, port 2 on the FortiGate unit does not allow the FortiManager unit to connect to it. When the FortiManager unit tries to connect to the FortiGate unit, the FortiGate unit refuses the connection.

If this feature is configured to not allow the FortiGate unit to connect to a FortiManager unit, the FortiGate unit will not allow an administrator to input the FortiManager unit's serial number into the central management configuration.

The command syntax for configuring this feature is as follows:

```
config system interface
  edit <interface>
    set allowaccess {ping | http | https | ssh | telnet | snmp |
       fgfm}
end
```

Bringing up or down IPsec tunnels

Previously, you could activate or shut down IPsec tunnels using the `diag vpn tunnel {up | down}` commands. You can now use the following `execute` commands to help you bring up or down, and IPsec tunnel.

```
execute vpn ipsec tunnel down <phase2> <phase1> <serial>
execute vpn ipsec tunnel up <phase2> <phase1> <serial>
```

When using these `execute` commands, you can optionally use the phase 1 name, phase 2 or serial number to shut down or bring up the tunnel. However, if you are bringing down a tunnel, and that is a dial-up tunnel, phase 1 name is required. Bringing up a tunnel using the `execute vpn ipsec tunnel up` command cannot be used to activate a dial-up tunnel.

Configuring active CPUs

The new global command, num-cpus, allows you to configure a set number of active CPUs. This new feature is available only on platforms with eight or more CPUs.

The following is an example of how to configure five active CPUs.

```
config system global
  set num-cpus 10
end
```

Formatting multiple disk partitions

On a FortiGate unit with multiple disk partitions, you can now format multiple partitions at one time. This provides a quick and easy way to format multiple disk partitions.

Formatting multiple disk partitions uses the `execute disk format` command. The formatting process behaves in the following ways:

- If the formatting requires a reboot because one of the partitions is currently in use, all partitions are formatted before the reboot.
- If no reboot is required and an error occurs in the formatting process, the error is written to the event log.
- If an error occurs in formatting and a reboot is required, the error is logged to the event log.
- RAID (enable or disable) and RAID rebuilds take place before the reboot

- The `execute disk format` command requires that you enter each of the reference numbers of the partitions you want formatted. The reference numbers are found using the `execute disk list` command.

Table 3: Explanation of the encryption levels available

Encryption level	Explanation of encryption level	Algorithm associated with encryption level
High	Encryptions with key lengths larger than 128 bits, and some Cipher suites with 128-bit keys.	DHE-RSA-AES256-SHA AES256-SHA EDH-RSA-DES-CBC3-SHA DES-CBC3-SHA DES-CBC3-MD5 DHE-RSA-AES128-SHA AES128-SHA
Medium	Encryptions that are using 128 bit encryption	RC4-SHA RC4-MD5 RC4-MD
Low	Encryptions using 64 or 56 bit encryption but excluding export Cipher suites.	EDH-RSA-DES-CDBC-SHA DES-CBC-SHA DES-CBC-MD5

Transparent mode port pairs

Port pairing is an option in transparent mode to bind two ports together. In doing this, you can create security policies that regulate traffic only between two specific ports, VLANs or VDOMs. In its simplest form, this enables an administrator to create security policies that are only between these two ports. Traffic is captured between these ports. No other traffic can enter or leave a port pairing.

For example, a FortiGate unit has three ports, where port 1 and port 2 are paired together, because the two networks only need to communicate with each other. If packet arrives on port 1, the FortiGate unit needs to figure out whether the packet goes to port 2 or port 3. With port pairing configured, it is more simple. If packet arrives on port 1, then the FortiGate automatically directs the packet to port 2. The opposite is also true in the other direction. This can be ideal when to groups only need to transfer data between each other.

To configure port pairing - web-based manager

1. Go to System > Network > Interface.
2. Select the arrow next to the Create New button and select Port Pair.
3. Enter a Name for the port pair.
4. Select the physical or virtual ports from the Available Members list and select the right-facing arrow to add the ports to the Selected Members.

   There can be only two ports added.
5. Select OK.

To configure port pairing - CLI

```
config system port-pair
  edit <pair_name>
    set member <port_names>
end
```

When configuring security policies with the port pairs, selecting the Source Interface automatically populates the Destination Interface, and vice versa. All other aspects of the security policy configuration remain the same.

DNS server changes

Previously, when a DNS request was locally matched to a defined zone with no answer defined, it was not recursively forwarded. In this release, the DNS request is now forwarded when it cannot find a local answer in a non-authoritative zone, provided that the ingress interface has recursive DNS query enabled, using the authoritative option. This option is available within a DNS zone, in *System* > *Network* > *DNS Server*.

This new option, *Authoritative*, controls the DNS server's behavior so that it is more flexible. You can enable or disable this option in the web-based manager or CLI.

Fortinet recommends not using a FortiGate unit as an authoritative domain server.

DHCP Server changes

The DHCP Server information in the web-based manager is now located within the Network menu, *System* > *Network* > *DHCP Server*. The Network menu also contains the DHCP feature IP Reservation which is located in *System* > *Network* > *IP Reservation*. IP Reservation allows you to reserve an IP address that is on a DHCP network for a user who wants to always assign that same IP address to one of the DHCP network's hosts. The DHCP feature also includes support for IPv6.

When you create a new DHCP server, you can configure additional options under the Advanced section of the service page. There can be up to three options configured for a service. You can also add excluded ranges when configuring a DHCP server.

DHCP IP Reservation

Within the DHCP pool of addresses, you can ensure certain computers will always have the same address. This can be to ensure certain users always have an IP address when connecting to the network, or if you want a device that connects occasionally to have the same address for monitoring its activity or use.

In the example below, the IP address 172.20.19.69 will be matched to MAC address 00:1f:5c:b8:03:57.

1. Go to *System* > *Network* > *DHCP Server*.
2. Select the DHCP server from the list or add a new DHCP server.
3. Select IP Reservation and select Create New.
4. Enter an IP address of 172.20.19.69
5. Enter the MAC address of 00:1f:5c:b8:03:57.
6. Select OK.

You can also select *Add from DHCP Client List* and select the MAC and IP address pairs to add.

Installing firmware on a partition without a reboot

When you are upgrading the firmware on your FortiGate unit, you now have the option of installing the firmware on a partition without having to reboot the unit and run the image as the active firmware that is running on the unit. You can easily upgrade or downgrade to the firmware of your choice by using this new feature.

The following is an example of how to install the firmware image on a partition and not have the firmware running as the active firmware on the unit. The following also explains how to install the new firmware from the non-active partition and then make it the current active firmware running on the unit.

Example of installing a firmware on a partition without rebooting

You have decided to install FortiOS 4.0 MR3 release on the unit but still want to be able to easily switch back to a FortiOS 4.0 MR2 Patch release afterwards. You currently have two partitions on the unit's local hard disk and would like to be able to switch between the two firmware images at any given time.

The following procedures do not include backing up the configuration file since it is assumed that the back up has already been done.

To install a firmware image on a partition without a reboot

1. Go to *System* > *Dashboard* > *Status* and locate the System Information widget.
2. In the System Information widget, select *Update* in the *Firmware Version* row.
3. On the Firmware Upgrade/Downgrade page, select *Local Hard Disk* from the drop-down list beside *Upgrade From*.
4. Select *Browse* beside the *Upgrade File* field to locate the firmware image.
5. Clear the check box beside *Boot the New Firmware*.

   This disables the reboot process that occurs when a firmware is being installed on the FortiGate unit.
6. Select *OK*.

   A message similar to the following appears:

   ```
   Software upload has completed. To use the new firmware, please
   select it under System > Maintenance > Firmware, and use the
   'Upgrade' option.
   ```
7. Go to *System* > *Maintenance* > *Firmware*.

   In the table on the Firmware page, you can see that Partition 1 has the firmware image FortiOS 4.0 MR3 release.

The following procedure assumes that you are already in *System* > *Maintenance* > *Firmware*.

To install the new firmware from the partition

1. On the Firmware page, select the check box in the row of the firmware image FortiOS 4.0 MR3.

2 Select the Upgrade icon, located above the table.

The following message appears:

```
The page at http://172.16.177.153 says:

System will reboot immediately and the current non-active
partition will be set as the default boot partition. Continue?
```

3 Select OK.

The Boot alternate firmware page appears with the following message:

```
Please wait for system reboot to the new partition. Refresh your
browser after a few minutes.
```

The unit reboots with the FortiOS 4.0 MR3 as the firmware image actively running on the unit.

SNMP enhancements

The SNMP feature contains several enhancements, as well as changes to the SNMP menu in the web-based manager.

Previously, for SNMP OIDs in FortiOS 4.0, the FortiOS OIDs were re-numbered so that each separate Fortinet product has its own root in the FortiOS OID space. SNMP 3.0 OIDs were still supported in FortiOS 4.0; however, both types of OIDs appear during an SNMP walk. In FortiOS 4.0 MR3 release, they are no longer supported so that only 4.0 SNMP OIDs appear.

IPv6 is now supported for SNMP.

WAN optimization, Web Cache and Explicit proxy MIBs

There are new MIBs for the new web proxy and caching features as well as explicit proxy. Some MIBs are supported by transparent proxy and these can be ported to the explicit proxy. There are also special OIDs for specific models.

SNMPv3

SNMPv3 is now supported. Within the SNMP configuration settings, you can configure SNMPv3 users, and include the events as well. The SNMP menu (*System* > *Config* > *SNMP*) provides all the configuration settings to create multiple SNMPv3 users. Each user can have multiple events enabled for them, as well as their specific security level. Multiple notification hosts can also be configured for each user.

SNMPv3 is usually included for additional security and remote configuration enhancements to SNMP. SNMPv3 provides confidentiality, integrity and authentication. For additional information about SNMPv3, see RFC 3411-3418.

Replacement message changes

There are several changes to replacement messages, as well as a new feature that allows you to upload images and use them in certain replacement messages. In this document, uploading images and using them in replacement messages is referred to as image embedding.

Replacement messages that contain authentication pages are now updated using the color scheme and image embedding feature. The types of replacement messages that are updated to the new color scheme and image embedding are:

- disclaimer pages
- login pages
- declined disclaimer pages
- login failed page
- login challenge page
- keepalive page

Endpoint NAC download portal and recommendation portal replacement messages are also updated to the new color scheme and image embedding feature. HTTP replacement messages are also updated.

Archive replacement messages and FTP proxy replacement message

The archive replacement messages and the FTP proxy replacement message are introduced because of the changes that occurred to the antivirus profile with regards to log archival options, and the new FTP proxy.

The following are the archive replacement messages and the FTP proxy replacement message.

- FTP Explicit-banner (under FTP Proxy)
- Archive block message (under HTTP)

Successful firewall authentication replacement message

The new Success message within the Authentication replacement messages provides a message indicating to the authenticating user that they have successfully authenticated their Telnet session. This replacement message is a text-only message.

Web filtering disclaimer replacement message

The web filtering disclaimer page allows users to bypass an override whenever they try to access a blocked page. The FortiGuard Web Filtering override form replacement message contains information so that the user can override the blocked page by authenticating with their user name and password. This replacement message is available in *System* > *Config* > *Replacement Message*, under FortiGuard Web Filtering.

Video chat block replacement message

The video chat block replacement message displays when a video chat has been blocked by the FortiGate unit. This message is available in *System* > *Config* > *Replacement Message*, under IM and P2P.

Replacement message images

The Replacement Message Image menu allows you to upload your organization or company's image to include in a replacement message. You can upload GIF, JPEG, TIFF, or PNG files, and give the file a unique name as well. The maximum image size that can be uploaded is 6000 bytes.

There are three default Fortinet images that you can choose from: the logo_fguard_wf, logo_fnet and logo_fw_auth. The following is a special tag to indicate that an image from the replacement message image list should be used in the replacement message.

```
<img src=%%IMAGE: <config_image_name>%% size=<btyes> >
```

When you include an image in a replacement message, it is referenced by the FortiGate unit. This reference number is displayed in the reference column of the Replacement Message Image page.

VDOM and global privileges for access profiles

Access profiles can now be configured with a VDOM or global privilege. These two privileges allow the FortiGate administrator access to either a specific VDOM or global access. Global access allows access to all VDOMs and global settings. When an administrator's account contains an access profile with a VDOM privilege, that administrator can access only the VDOM that is specified in their account. For example, admin_1 has the access profile admin_vdom; admin_vdom contains read and write privileges for logging and VDOM access; admin_1's account is associated with vdom_1. The admin_1 accessibility is limited to vdom_1 and the ability to configure only log settings.

Previously, when administrator accounts were configured, the VDOM was specified in the administrator account and access permissions were specified in an admin profile. By using this new access profile privilege, you can apply an access profile to an administrator that is specific for VDOM configuration.

These new access profile privileges are available only in the CLI. A new command, `scope`, provides the ability to have an access profile contain VDOM privileges or global privileges.

Example of incorporating the new access profile to existing administrator accounts

Company_A's branch office requires two administrators to access their FortiGate unit and they currently have VDOMs configured. An administrator with global access must be configured and an administrator with VDOM access that can configure reports are required.

There are currently two administrator accounts that contain global access and VDOM access to the FortiGate unit. However, management wants to apply the new privileges to the existing accounts.

This example explains how to incorporate the new privileges into two existing administrator accounts. The existing administrator accounts are admin_vdom and admin_global. You need to configure a global access profile because you cannot modify the super_admin access profile.

To modify the existing access profiles

1 Log in to the CLI and then in to the global level.

```
config global
```

2 Enter the following command within the global VDOM:

```
config system accprofile
```

3 Modify the vdom access profile first:

```
edit vdom
  set scope vdom
next
```

The admin_vdom account will now be only able to access VDOMs within the configuration.

4 Enter the following commands to modify the global access profile:

```
  edit global
    set scope global
    set admingrp read-write
    set authgrp read-write
    set endpoint-control-grp read-write
    set fwgrp read-write
    set loggrp read
    set mntgrp read-write
    set netgrp read-write
    set routegrp read-write
    set sysgrp read-write
    set updategrp read-write
    set utmgrp read-write
    set vpngrp read-write
    set wanoptgrp read-write
end
```

5 Enter the following command to apply the new global access profile to the existing admin_global administrator account:

```
config system admin
  edit admin_global
    set accprofile global
end
```

You can verify that the access profiles have their global and VDOM privileges by going to *System* > *Admin* > *Administrators* and viewing the *Scope* column. In the *Scope* column, admin_vdom contains VDOM: vdom_1, and in the admin_global.

HA dynamic weighted load balancing

The following explains the weighted failover feature that is supported in this release. It is explained in two parts; the configuration of weighted-round-robin weights and weighted load balancing.

Configuring weighted-round-robin weights

You can configure weighted round-robin load balancing for a cluster and configure the static weights for each of the cluster units according to their priority in the cluster. When you set `schedule` to `weight-round-robin` you can use the `weight` option to set the static weight of each cluster unit. The static weight is set according to the priority of each unit in the cluster. A FortiGate HA cluster can contain up to 16 FortiGate units so you can set up to 16 static weights.

The priority of a cluster unit is determined by its device priority, the number of monitored interfaces that are functioning, its age in the cluster and its serial number. Priorities are used to select a primary unit and to set an order of all of the subordinate units. Thus the priority order of a cluster unit can change depending on configuration settings, link failures and so on. Since weights are also set using this priority order the weights are independent of specific cluster units but do depend on the role of the each unit in the cluster.

You can use the following command to display the priority order of units in a cluster. The following example displays the priority order for a cluster of 5 FortiGate-620B units:

```
get system ha status
  Model: 620
  Mode: a-p
```

```
Group: 0
Debug: 0
ses_pickup: disable
Master:150 head_office_cla FG600B3908600825 0
Slave :150 head_office_clb FG600B3908600705 1
Slave :150 head_office_clc FG600B3908600702 2
Slave :150 head_office_cld FG600B3908600605 3
Slave :150 head_office_cle FG600B3908600309 4
number of vcluster: 1
vcluster 1: work 169.254.0.1
Master:0 FG600B3908600825
Slave :1 FG600B3908600705
Slave :2 FG600B3908600702
Slave :3 FG600B3908600605
Slave :4 FG600B3908600309
```

The cluster units are listed in priority order starting at the 6th output line. The primary unit always has the highest priority and is listed first followed by the subordinate units in priority order. The last 5 output lines list the cluster units in vcluster 1 and are not always in priority order.

The default static weight for each cluster unit is 40. This means that sessions are distributed evenly among all cluster units. You can use the `set weight` command to change the static weights of cluster units to distribute sessions to cluster units depending on their priority in the cluster. The weight can be between 0 and 255. Increase the weight to increase the number of connections processed by the cluster unit with that priority.

You set the weight for each unit separately. For the example cluster of 5 FortiGate-620B units you can set the weight for each unit as follows:

```
config system ha
  set mode a-a
  set schedule weight-roud-robin
  set weight 0 5
  set weight 1 10
  set weight 2 15
  set weight 3 20
  set weight 4 30
end
```

If you enter the `get` command to view the HA configuration the output for `weight` would be:

```
weight 5 10 15 20 30 40 40 40 40 40 40 40 40 40 40 40
```

This configuration has the following results if the output of the `get system ha status` command is that shown above:

- The first five connections are processed by the primary unit (host name head_office_cla, priority 0, weight 5). From the output of the
- The next 10 connections are processed by the first subordinate unit (host name head_office_clb, priority 1, weight 10)
- The next 15 connections are processed by the second subordinate unit (host name head_office_clc, priority 2, weight 15)
- The next 20 connections are processed by the third subordinate unit (host name head_office_cld, priority 3, weight 20)

- The next 30 connections are processed by the fourth subordinate unit (host name head_office_cle, priority 4, weight 30)

Dynamic weighted load balancing

You can configure active-active HA weighted round robin load balancing to load balance sessions according to individual cluster unit CPU usage, memory usage, and number of UTM proxy sessions. If any of these system loading indicators increases above configured high watermark thresholds, weighted load balancing sends fewer new sessions to the busy unit until it recovers.

For example, if you set a CPU usage high watermark, when a cluster unit's CPU usage reaches the high watermark threshold fewer sessions are sent to it. With fewer sessions to process the cluster unit's CPU usage should fall back to a low watermark threshold. When this happens the cluster resumes load balancing sessions to the cluster unit as normal.

You can set different high and low watermark thresholds for CPU usage and memory usage, and for the number of HTTP, FTP, IMAP, POP3, SMTP, or NNTP UTM proxy sessions. For each loading indicator you set a high watermark threshold a low watermark threshold and a weight. When you first enable this feature the weighted load balancing configuration is synchronized to all cluster units. Subsequent changes to the weighted load balancing configuration are not synchronized so you can configure different weights on each cluster unit.

The CPU usage, memory usage, and UTM proxy weights determine how the cluster load balances sessions when a high watermark threshold is reached and also affect how the cluster load balances sessions when multiple cluster units reach different high watermark thresholds at the same time. For example, you might be less concerned about a cluster unit reaching the memory usage high watermark threshold than reaching the CPU usage high watermark threshold. If this is the case you can set the weight lower for memory usage. Then, if one cluster unit reaches the CPU usage high watermark threshold and a second cluster unit reaches the memory usage high watermark threshold the cluster will load balance more sessions to the unit with high memory usage and fewer sessions to the cluster unit with high CPU usage.

Use the following command to set thresholds and weights for CPU and memory usage and UTM proxy sessions:

```
config system ha
  set mode a-a
  set schedule weight-round-robin
  set cpu-threshold <weight> <low> <high>
  set memory-threshold <weight> <low> <high>
  set http-proxy-threshold <weight> <low> <high>
  set ftp-proxy-threshold <weight> <low> <high>
  set imap-proxy-threshold <weight> <low> <high>
  set nntp-proxy-threshold <weight> <low> <high>
  set pop3-proxy-threshold <weight> <low> <high>
  set smtp-proxy-threshold <weight> <low> <high>
end
```

For each option, the weight range is 0 to 255 and the default weight is 5. The low and high watermarks are a percent (0 to 100). The default low and high watermarks are 0 which means they are disabled. The high watermark must be greater than the low watermark.

For CPU and memory usage the low and high watermarks are compared with the percentage CPU and memory use of the cluster unit. For each of the UTM proxies the high and low watermarks are compared to a number that represents percent of the max number of proxy sessions being used by a proxy. This number is calculated using the formula:

```
proxy usage = (current sessions * 100) / max sessions
```

where:

`current sessions` is the number of active sessions for the proxy type.

`max sessions` is the session limit for the proxy type. The session limit depends on the FortiGate unit and its configuration.

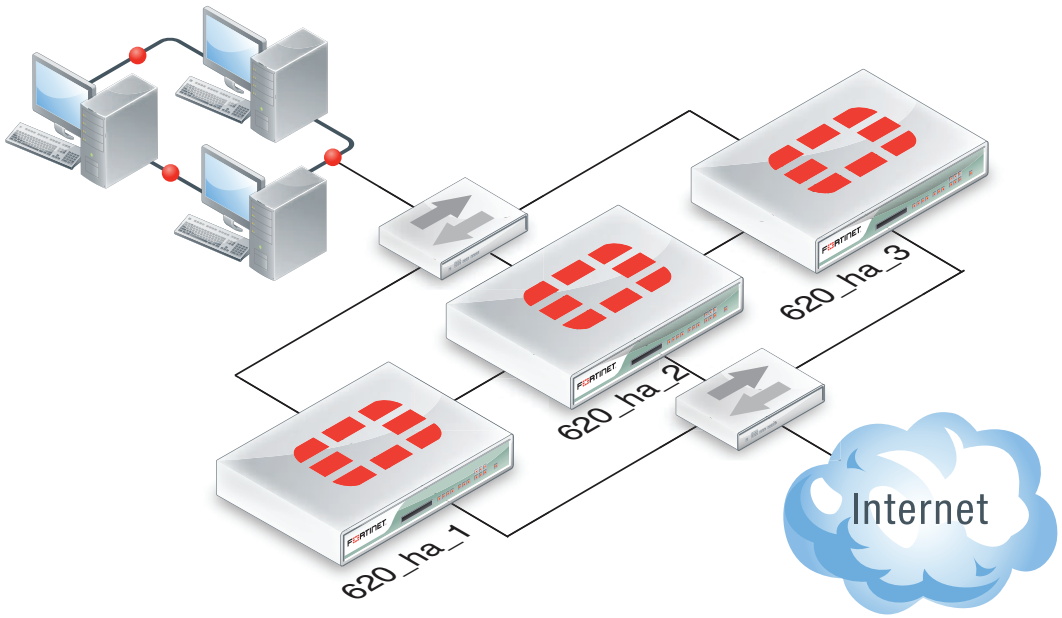
You can use the following command to display the maximum and current number of sessions for a UTM proxy:

```
get test {ftpd | http | imap | nntp | pop3 | smtp} 4
```

Example weighted load balancing configuration

Consider a cluster to three FortiGate-620B units with host names 620_ha_1, 620_ha_2, and 620_ha_3 as shown in Figure 14. This example describes how to configure weighted load balancing settings for CPU and memory usage for the cluster and then to configure UTM proxy weights for each cluster unit.

Figure 14: Example HA weighted load balancing configuration



Use the following command to set the CPU usage threshold weight to 30, low watermark to 60, and high watermark to 80. This command also sets the memory usage threshold weight to 10, low watermark to 60, and high watermark to 90.

```
config system ha
  set mode a-a
  set schedule weight-round-robin
  set cpu-threshold 30 60 80
  set memory-threshold 10 60 90
end
```

The static weights for the cluster units remain at the default values of 40. Since this command changes the mode to `a-a` and the schedule to `weight-round-robin` the weight settings a synchronized to all cluster units.

For FortiOS 4.0 MR3, the static weights assigned to cluster units using the `set weight` have changed. The default value is 40 and the range is now 0 to 255.

As a result of this configuration, if the CPU usage of 620_ha_1 reaches 80% the static weight for 620_ha_1 is reduced from 40 to 10 and correspondingly fewer sessions are load balanced to it. If the memory usage of this same cluster unit also reaches 90% the static weight further reduces to 0 and no new sessions are load balanced to it. If the memory usage of a 620_ha_2 reaches 90% the static weight of 620_ha_2 reduces to 30 and 30 and fewer new sessions are load balanced to it.

Now that you have set the basic weighted load balancing configuration for the cluster you can configure different settings on each cluster unit. For example, to set the HTTP usage threshold weight to 20, low watermark to 60, and high watermark to 90 for 620_ha_2 use the `execute ha manage` command to log into the 620_ha_2 CLI. Then enter the following command:

```
config system ha
  set http-proxy-threshold 20 60 90
end
```

To set the pop3 usage threshold weight to 20, low watermark to 60, and high watermark to 90 for 620_ha_3 use the `execute ha manage` command to log into the 620_ha_3 CLI. Then enter the following command:

```
config system ha
  set pop3-proxy-threshold <weight> <low> <high>
end
```

VRRP virtual MAC address support

Previously in FortiOS 4.0 MR2, the VRRP virtual MAC address (also know as the virtual router MAC address) feature, as described in RFC 3768, **was supported.** The VRRP virtual MAC address is a shared MAC address adopted by the VRRP master. If the VRRP router group master fails the same virtual MAC master fails over to the new master of the group. As a result, all packets for VRRP routers can continue to use the same virtual MAC address. You must enable the VRRP virtual MAC address feature on all members of a VRRP group.

Each VRRP router is associated with its own virtual MAC address. The last part of the virtual MAC depends on the VRRP virtual router ID using the following format:

```
00-00-5E-00-01-<VRID_hex>
```

Where `<VRID_hex>` is the VRRP virtual router ID in hexadecimal format in internet standard bit-order. For more information about the format of the virtual MAC see RFC 3768.

Some examples:

- If the VRRP virtual router ID is 10 the virtual MAC would be 00-00-5E-00-01-05.
- If the VRRP virtual router ID is 200 the virtual MAC would be 00-00-5E-00-01-c8.

The VRRP virtual MAC address feature is disabled by default. Wen you enable the feature on a FortiGate interface, all of the VRRP routers added to that interface use their own VRRP virtual MAC address. Each virtual MAC address will be different because each virtual router has its own ID.

Use the following command to enable the VRRP virtual MAC address on the port2 interface and add a VRRP virtual router with ID 5, IP address 10.31.101.120 and priority 255.

```
config system interface
  edit port2
  set vrrp-virtual-mac enable
    config vrrp
      edit 5
        set vrip 10.31.101.120
        set priority 255
      end
  end
```

The port2 interface will now accept packets sent to the MAC address 00-00-5E-00-01-05.

FGCP HA subsecond failover

FGCP HA subsecond failover (that is a failover time of less than one second) can reduce the failover time after a device or link failover. In FortiOS 4.0 MR3 the CLI option for configuring subsecond failover has been removed and the feature is available for interfaces that include:

- Network processors: NP2, NP4
- Content processors: CP4, CP5, CP6
- Accelerated interfaces, for example the ASM-FB4, ADM-FB8, ADM-XB2, ADM-XD4, RTM-XD2
- Security processor modules: ASM-CE4, ASM-XE2

Subsecond failover can accelerate HA failover depending on the FortiGate unit HA and hardware configuration and the network configuration. Network devices that respond slowly to an HA failover can prevent this feature from reducing failover times to less than a second. Also, subsecond failover can normally only be achieved for a cluster of two units operating in Transparent mode with only two interfaces connected to the network.

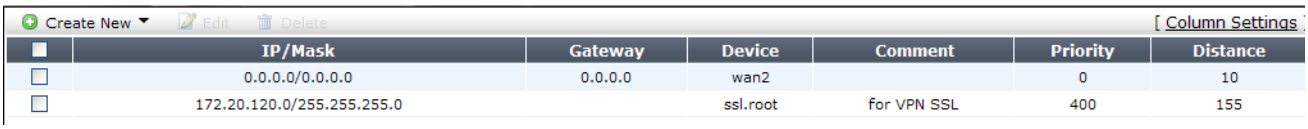
For best subsecond failover results, the recommended heartbeat interval is 100ms and the recommended lost heartbeat threshold is 5.

```
config system ha
  set hb-lost-threshold 5
  set hb-interval 1
end
```

Static Route enhancements

Static routes now provides *Priority* and *Distance* settings in the Advanced section on the New Static Route page. The priority and distance settings can be displayed on the Static Route page using *Column Settings*. The priority and distance columns do not appear by default.

Figure 15: The Static Route page with the priority and distance columns displayed



When configuring a static route (or when modifying its settings), you can now include a comment within the static route. If you want to configure the priority and/or distance within a static route, you must select *Advanced...* to display priority and distance options.

Monitoring ISIS from the Routing Monitor page

You can now view ISIS routes from the Routing Monitor page. ISIS, introduced in FortiOS 4.0 MR2, is a routing protocol described in RFC 1142. ISIS is configured within the CLI.

Security Policy and Firewall Object Enhancements

There are several enhancements to firewall policies, including the Policy page (in *Policy* > *Policy* > *Policy*), which provides more flexibility and granularity. These enhancements also include page controls on the Address page in *Firewall Objects* > *Address* > *Address* to easily navigate through the list of addresses on the page.

The Firewall menu also provides more granularity when configuring a schedule. When configuring a schedule, you can now specify minutes in five minute intervals, for example, 5, 10, 15, 20, and all the way up to 55.

In FTP proxy security policies, FSSO guest user groups are now supported. FSSO authentication is IP-based authentication.

Traffic shaping bandwidth is now in kbits.

Source IP addresses for FortiGate-originating traffic

Previously, the source IP address feature was introduced in FortiOS 4. 0MR2. In this release the source-ip address is extended, adding more options for configuring a source IP address to self-originating traffic. For example, NTP.

The source-ip address feature allows you to specify the source IP address of self-originating traffic.

This feature is configured only in the CLI. A source IP address can be configured for NTP FortiGuard, DNS, RADIUS, TACACS+, and FSSO.

You can use the `get system source-ip status` command to view the services that force their communication to use a specific source IP address.

Example of using the source IP address feature to track logs at a syslog server

Management wants to be able to track logs at a syslog server. There are five log devices; two FortiAnalyzer units that are being used for archival purposes, and three Syslog servers that store all other log files. All log devices have been configured and you must edit the existing Syslog server configuration for the Syslog server that management wants tracked, syslog_2. The source IP address is 172.20.120.155.

To include the source IP address to track logs in the existing configuration

1 Log in to the CLI.

2 Enter the following command:

```
config log syslog2 setting
```

3 In the syslog_2 configuration, enter the following commands:

```
  set source-ip 172.20.120.155
end
```

4 View the services for syslog_2 using the following command:

```
get system source-ip status
```

Local-in security policies

Local-in security policies are policies that are designed for traffic that is FortiGate-oriented. For example, central management. There are already local-in policies, which are automatically set up by the FortiGate unit. These policies include central-management, update announcement, and Netbios forward.

When configuring security policies for local-in traffic, the destination address is limited to the FortiGate interface IP and secondary IP addresses. Local-in policies are used in a backward compatible way with allow-access. These security policies are configured only in the CLI. You can configure local-in security policies for both IPv4 and IPv6.

The following are the commands used to configure a local-in security policy:

```
config firewall policy
  edit <integer>
    set intf <source_inteface_name>
    set srcaddr <source_address_name>
    set dstaddr <destination_address_name>
    set action {accept | deny}
    set service <service_name>
    set schedule <schedule_type>
    set auto-asic-offload {enable |disable}
    set status {enable | disable}
  end
```

Protocol Options

When accessing *Policy* > *Policy* > *Protocol Options*, you will notice that you are directed to the Edit Protocol Options page. This page is referred to as the Configuration Settings page, similar to how the UTM profiles and sensors are accessed. A default protocol options list is available as well as your configured protocol options lists.

You can create a new protocol option list from the Configuration Settings page by selecting the *Create New* icon. If you want to view a list of all protocol option lists, select the *View List* icon. You can access a protocol option list at any time on the Settings page by selecting one from the drop-down list beside the *Create New* icon.

FTPS support

FTPS is now supported within the Protocol Options page as well as within the UTM features. This support extends the SSL proxy so that decrypted FTPS data can be examined by the proxies.

Virtual IP source address filter support

In *Firewall Objects* > *Virtual IP* > *Virtual IP*, you can now add multiple source IP addresses for filtering purposes. This feature allows packets from different sources to be translated to different VIPs. By default, the filter is set to 0.0.0.0, which means that all source IP addresses provide a backward compatibility. The mapped IP address range is also set to 0.0.0.0 by default.

When you enter the mapped IP address for the mapped range for source address filter, the FortiGate unit automatically calculates the range.

Virtual IP port forwarding enhancements

The VIP port forwarding feature (*Firewall Objects* > *Virtual IP* > *Virtual IP*) has been enhanced so that you can easily enter the external service port range first. The FortiGate unit calculates the mapped port range after you enter the start of the port range.

You must select *Port Forwarding* to reveal the configuration settings for port forwarding as well as enable it.

Load balancing HTTP host connections

Load balancing for HTTP host connections can be used for load balancing across multiple realservers using the host's HTTP header to guide the connection to the correct real server, providing better load balancing for those connections. The HTTP host can be configured either in the CLI or web-based manager, in *Firewall Objects* > *Load Balance* > *Virtual Server*.

The load balancing method used is called http-host. When selected in the CLI, this allows a real server to specify a http-host attribute which is the domain name of the traffic for that real server. For example, a FortiGate unit is load balancing traffic to three realservers; traffic for www.example.com should go to 10.10.10.1, traffic for www.example.org should go to 10.10.10.5, and traffic for any other domain should go to 10.10.10.100.

Web Proxy Service and Web Proxy Service Group

There are two new menus in *Firewall Objects* > *Service*: Web Proxy Service and Web Proxy Group.

The Web Proxy Service menu provides configuration settings for web proxy services that can then be applied to a security policy. Web proxy services are similar to custom services, where you can configure the services to define one or more protocols and port numbers that are associated with each web proxy service. Web proxy services can also be grouped, in *Firewall Objects* > *Service* > *Web Proxy Service Group*.

The Web Proxy Service Group menu, similar to the Group menu, provides configuration settings for grouping the configured web proxy services. By grouping web proxy services, you can apply multiple services to a security policy.

SSL renegotiation for SSL offloading provides allow/deny client renegotiation

FortiOS now supports SSL offloading that either allows or denies client renegotiation. This feature helps to resolve the issue that affects all SSL and TLS servers that support renegotiation, which was identified by the Common Vulnerabilities and Exposures system, in CVE-2009-3555. The IETF is working on a TLS protocol change that will permanently fix the issue and until they implement the change, the allow and deny client renegotiation feature in FortiOS provides a workaround. This workaround allows you to disable support for SSL/TLS renegotiation in a server, for the SSL offloading feature.

The configuration is in the CLI:

```
config firewall vip
  set ssl-client-renegotiation {allow | deny}
end
```

The allow option is enabled by default for backwards capability. If you choose deny, as soon as a “ClientHello” message (indicating a renegotiation) is received from the client, the server terminates the TCP connection.

You can test the renegotiation behavior using OpenSSL. The OpenSSL client application has a request feature that it can do renegotiation, by typing “R”. When you use this feature, the `diag debug appl vs -1` can be used to view the renegotiation where deny is used.

SSL VPN Port forwarding support

You can now configure port forwarding for Citrix, native RDP and general port forwarding for portals for web mode. The configuration settings are found in the Portal Settings page, in the Settings Window. These port forwarding settings are also available in the CLI.

IKE negotiation

The IKE negotiation process now provides options for how the negotiation is controlled when there is no traffic, as well as how long the FortiGate unit waits for the negotiation to occur. Within the CLI, two new commands help you to configure the `negotiation-timeout` (which is new) and `auto-negotiation` which now replaces `auto-keepalive` or `set keepalive {enable | disable}`.

The `auto-negotiation` command controls whether IKE is negotiation even when there is no traffic. This command would usually be used where there is multiple redundant or overlapping tunnels and there is a need to have the primary connection established. When enabled, the FortiGate unit keeps trying to negotiation IKE event if the link is down and traffic is flowing over a secondary tunnel.

For `auto-negotiation`, if the previous configuration has DPD enabled, the upgrade process automatically enables auto-negotiation so that the behavior is the same as previously configuration.

The `negotiation-timeout` command controls how long the FortiGate unit waits for IKE to negotiate, similar to the web-based manager’s timeout settings. The default time is 30 seconds. If DPD was enabled in a previous configuration, the `negotiate-timeout` settings will be that of the dpd-retrycount and dpd-retryinterval so that the FortiGate unit will time out connections at the same rate as they would have in the previous build.

SHA-384 and SHA-512 support for IKE

For IPsec, you can now choose either SHA-384 or SHA-512 when configuring IPsec. These authentication algorithms are available for IKE (including phase 1 and phase 2), and manual key configurations.

In the web-based manager, both *Authentication Algorithm* and *Encryption Algorithm* drop-down lists provide the SHA-384 and SHA-512 options for IPsec.

FortiOS Carrier URL extraction feature

The URL extraction feature extracts the embedded Uniform Resource Identifier (URI) within the path for only the host that is specified. The feature applies to HTTP requests for URIs. For example, the URI “http://example.proxy.com/http://www.example.com”; when the URI is broken down, you find the FQDN (example.proxy.com) and the path (http://www.example.com).

The URL extraction feature, however, does not extract the URL if its a regular HTTP request, such as http://example.proxy.com/examples/example.html. The feature also does not extract a URL if the request does not match the FQDN of the proxy server.

This feature is available within a web filter profile, under *URL Extraction*. You must select the *Enable URL Extraction* check box to enable it and access the other settings. The settings that you can choose from are:

- *URL Extraction proxy server FQDN* – the proxy server hostname, such as FQDN, for which the URL extraction will apply. The proxy server hostname must be entered in the field.
- *Blocked page redirect header name* – HTTP header name that is used for client redirect on blocked requests.
- *Blocked page redirect header value (URL)* – HTTP header value that is used for client redirect on blocked requests.

You can also use the CLI command `redirect-no-content` which behaves in the following way:

- `enabled` – if extracted URL is blocked by this feature, the HTTP response contains no content, for example message body is no present.
- `disabled` – the value from Blocked Page redirect header name configuration includes both the redirect header and the message body.

Chapter 2 Firewall

This FortiOS Handbook chapter contains the following sections:

Understanding the FortiGate firewall provides general information about what the FortiGate firewall does, what it is comprised of, and explains how a packet travels through the FortiGate unit.

Working with NAT in FortiOS provides information about how NAT works in FortiOS and the combinations of NAT that you can use in your configuration. This section explains how the different modes, such as Transparent mode, work and how the FortiGate unit behaves when in each of these modes.

Firewall components provides in-depth information about the firewall components that help in creating a FortiGate firewall configuration.

Security policies explains what security policies are, as well as how these rules work to help protect your network. This section also explains the importance of how security policies are ordered within the security policy list, and describes the different policies that can be created for different firewall configurations.

Monitoring firewall traffic explains how you can monitor traffic within the web-based manager using the Session and Policy Monitoring pages.

Internet Protocol version 6 (IPv6) explains how IPv6 can be implemented in FortiOS, as well as what features support IPv6, such as IPsec VPN and dynamic routing. This section also explains a high-level summary of IPv6.

Advanced FortiGate firewall concepts explains the advanced firewall features that you may want to configure for your network, as it expands. This section explains advanced firewall features that include stateful inspection of SCTP traffic, port pairing (Transparent mode only), and adding NAT security policies in Transparent mode.

Understanding the FortiGate firewall

The FortiGate firewall is one of the most important features on the FortiGate unit, allowing not only traffic to flow through, but also, with the help of security policies, scan the traffic for vulnerabilities and misuse and abuse. This type of firewall provides flexibility for expansion in a growing network environment.

This section helps to explain the FortiGate firewall and its role in protecting your network. This section also explains the life of a packet, which helps you to understand how the traffic flows through the FortiGate unit and the role the FortiGate firewall plays in the life of a packet.

The following topics are included in this section:

What is the FortiGate firewall?

A firewall is, in the simplest of terms, a device that permits or denies network traffic based on a set of rules. For the FortiGate firewall, it can do this and much more. The FortiGate firewall scans the network traffic, and based on the set of rules (in Fortinet, however, these rules are called security policies), determines what action needs to be taken. The action may be to quarantine a virus that the FortiGate unit finds, or to record the activity, or both. These security policies provide the information the FortiGate unit needs to determine what to do with the incoming and outgoing traffic.

At the heart of these networking security functions, is the security policies. Security policies control all traffic attempting to pass through the FortiGate unit, and between FortiGate interfaces, zones, and VLAN subinterfaces. They are instructions the FortiGate unit uses to decide connection acceptance and packet processing for traffic attempting to pass through. When the firewall receives a connection packet, it analyzes the packet's source address, destination address, and service (by port number), and attempts to locate a security policy matching the packet.

Security policies can contain many instructions for the FortiGate unit to follow when it receives matching packets. Some instructions are required, such as whether to drop or accept and process the packets, while other instructions, such as logging and authentication, are optional. It is through these policies that the FortiGate unit permits or denies the packets to pass through to the network, who gets priority (bandwidth) over other users, and when the packets can come through.

FortiGate firewall components

The FortiGate firewall is comprised of many different features that provides flexibility for the specific needs of your network, both now and as it grows. These features are:

- interfaces (including VLANs)
- zones
- unified threat management (UTM)
- firewall addresses (this includes IPv4 and IPv6, IP pools,. wildcard addresses and netmasks, and geography-based addresses)
- monitoring traffic
- traffic shaping and per-ip traffic shaping (advanced)
- firewall schedules
- services (such as AOL, DHCP and FTP)
- logging traffic (advanced)
- QoS (advanced)
- identity-based policies (advanced)
- endpoint security (advanced)

All of these components each provide an important role in configuring your FortiGate firewall. For example, the administrator applies the PING admin access to the wan1 interface so that he or she can ping this external interface and verify that Internet traffic is hitting the internal to wan1 security policy. If there was no PING admin access applied to the external interface, the administrator could not properly verify if traffic is hitting the policy.

For more in-depth explanations of these components, see the "Firewall components" on page 195.

How the firewall components create a FortiGate firewall and help in protecting your network

The firewall components each help in protecting your network, as well as helping traffic to flow better through the network, for example traffic shaping helps to load balance traffic on your network.

The following explains how all of the firewall components get combined to create the FortiGate firewall.

1. **In *System* > *Network* > *Interface*, create VLAN subinterfaces for each department: sales, marketing and engineering.**

   These VLAN subinterfaces will be grouped into a zone and the zone will then be applied to a security policy.

2. **Create a zone for the VLAN subinterfaces.**
3. **In *Firewall Objects* > *Address* > *Address*, create the IP address ranges that are required: one for sales, one for marketing, and one for engineering.**

   Each of these ranges corresponds to the departments that have these IP address ranges. For example, sales has 172.16.120.100 - 172.16.120.200.

4. **Create a firewall schedule that allows sales and marketing Internet access all day; create another firewall schedule that allows engineering access to the Internet only during their lunch break.**

   By creating two different firewall schedules, you can block access for one group for a specified time period, and allow another group all day access.

5. **Group the firewall schedules together so that you can apply them both to a security policy.**

6 **Create a virtual IP address that will be used to allow Internet users access to a web server on your DMZ network.**

7 **In *Policy* > *Policy* > *Policy*, create the following:**

- a security policy that allows Internet users access to the web server
- a security policy that applies the firewall schedule group for Internet access for the sales, marketing and engineering departments (this applies the zone)
- a deny policy that blocks FTP downloads

8 **With all the policies now in the list, arrange them so that the most important policies are first, and least important are last. The list order is:**

- deny policy
- security policy that allows Internet users access to the web server
- security policy for sales, engineering and marketing that allows Internet access

Now that all the policies are in the correct order, you need to test that all are working properly.

9 **To verify that traffic is hitting the policies, verify that there is a packet count increase occurring in the Count column of each of the policies in the policy list. Troubleshoot any issues using the diagnose sniffer and diagnose debug flow commands in the CLI.**

By testing that traffic is hitting the policies that you just created, you can see whether you need to solve any issues or not. When you use the `diagnose` commands, you can see detailed information about the traffic hitting the policy.

10 **Back up the configuration after testing and troubleshooting.**

By backing up the changes your made to the configuration, you ensure that a current configuration of this FortiGate firewall configuration is available at any time.

Understanding how a packet travels through the FortiGate unit

Directed by security policies, a FortiGate unit screens network traffic from the IP layer up through the application layer of the TCP/IP stack. The FortiGate firewall plays an important role in how the packet travels through the FortiGate unit out to its destination. The following explains how the packet travels through the FortiGate unit and how the FortiGate firewall plays a role in the life of a packet.

The FortiGate unit performs three types of security inspection:

- stateful inspection, that provides individual packet-based security within a basic session state
- flow-based inspection, that buffers packets and uses pattern matching to identify security threats
- proxy-based inspection, that reconstructs content passing through the FortiGate unit and inspects the content for security threats.

Each inspection component plays a role in the processing of a packet as it traverses the FortiGate unit en route to its destination. When you understand these inspections, you will understand the packet's journey through the FortiGate unit and how the FortiGate firewall helps the packet along to its destination.

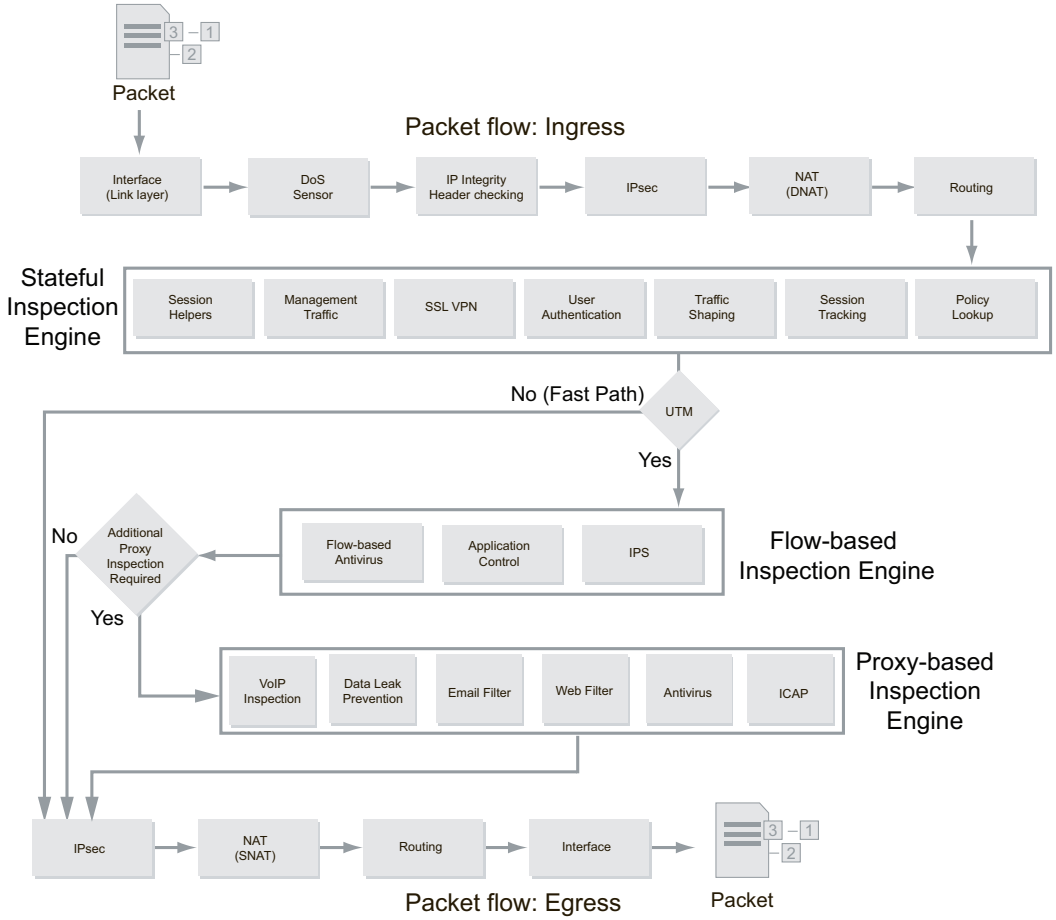
For more information about how packets travel through the FortiGate unit, see the Troubleshooting chapter in the *FortiOS Handbook*. The following explains, in a high-level description, of how a packet travels through the FortiGate unit.

How packets flow in and out of the FortiGate unit

The following provides a high-level description of the steps a packet takes when it enters the FortiGate unit, travelling to its destination, the internal network. Similar steps occur for outbound traffic; they are just in reverse.

1. **An incoming packet enters the external interface of the FortiGate unit to start its journey through to the internal network. This is called ingress. During ingress, the following processes occur:**
   - DoS Sensor
   - IP integrity header checking
   - IPsec
   - Destination NAT (DNAT)
   - Routing
2. **After the Routing process finishes, the stateful inspection engine processes the packet, and does the following:**
   - Session Helpers
   - Management Traffic
   - SSL VPN
   - User Authentication
   - Traffic Shaping
   - Session Tracking
   - Policy lookup
3. **If nothing comes from the stateful inspection engine, then the packet travels to the UTM scanning process. This process may have either a flow-based or proxy-based inspection engine that also processes the packet.**
4. **If nothing matches the UTM rules, the packet then travels to other processing steps, which include:**
   - IPsec
   - NAT (Source NAT)
   - Routing
   - Internal Interface
5. **After step 4 is finished, the packet travels out of the internal interface of the FortiGate unit, heading towards its final destination, the internal network. This is referred to as Egress.**

Figure 16: Packet flow



Working with NAT in FortiOS

This section explains NAT and the NAT/Route mode of the FortiGate unit, as well as Transparent mode and its role with NAT. This section also explains the types of NAT that FortiOS supports, including combinations of NAT that you can configure in FortiOS.

This section also includes information about Route mode and how it behaves in FortiOS.

The following topics are included in this section:

NAT in FortiOS

Network address translation (NAT) translates one IP address (either a source IP address or destination IP address) for another IP address. NAT in FortiOS, however, can translate IP addresses in many different ways, providing the flexibility you need for your specific network requirements. For example, you can use the Central NAT table to help in translating multiple IP addresses.

When configuring NAT in FortiOS, you should also know how it works within the different modes that the FortiGate unit can be configured in.

This topic contains the following:

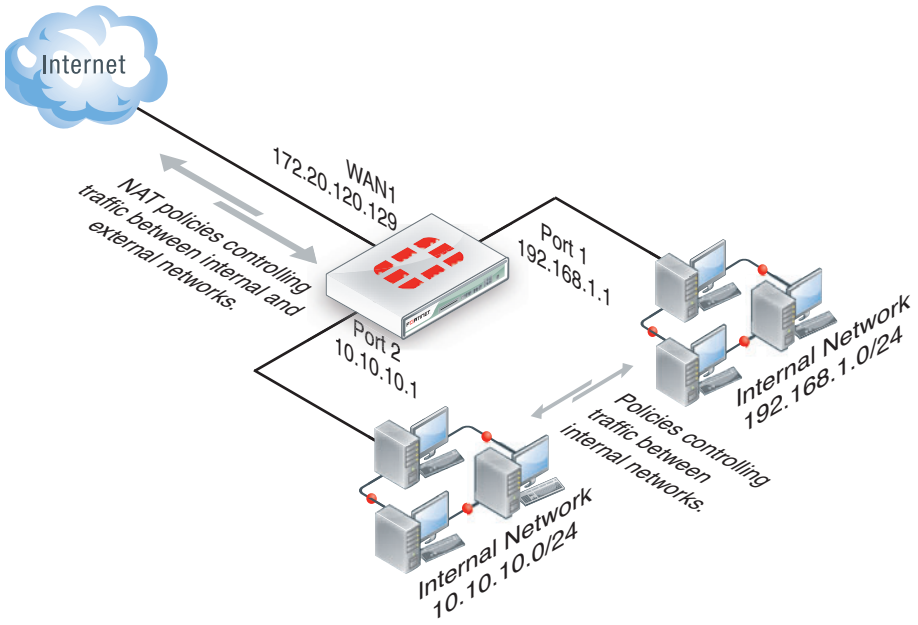
NAT/Route mode

In NAT/Route mode, the FortiGate unit is visible to the network that is connected to. All of its interfaces are on different subnets. Each interface it is connected to a network that must be configured with an IP address that is valid for that subnetwork.

NAT/Route mode is typically used when the FortiGate unit is deployed as a gateway between private and public networks. In its default NAT mode configuration, the FortiGate unit functions as a firewall. Security policies control communications through the FortiGate unit to both the Internet and between internal networks. In NAT/Route mode, the FortiGate unit performs network address translation before IP packets are sent to the destination network. For example, a company has a FortiGate unit as their interface to the Internet. The FortiGate unit also acts as a router to multiple sub-networks within the company.

In Figure 17, the FortiGate unit is set to NAT/Route mode and is connected to a network. By using this mode, the FortiGate unit can have a designated port for the Internet, and the internal segments are behind the FortiGte unit, which are invisible to the public access. The FortiGate unit translates IP addresses passing through it to route the traffic to the correct subnet on the Internet.

Figure 17: An example of a FortiGate unit in NAT/Route mode on a network



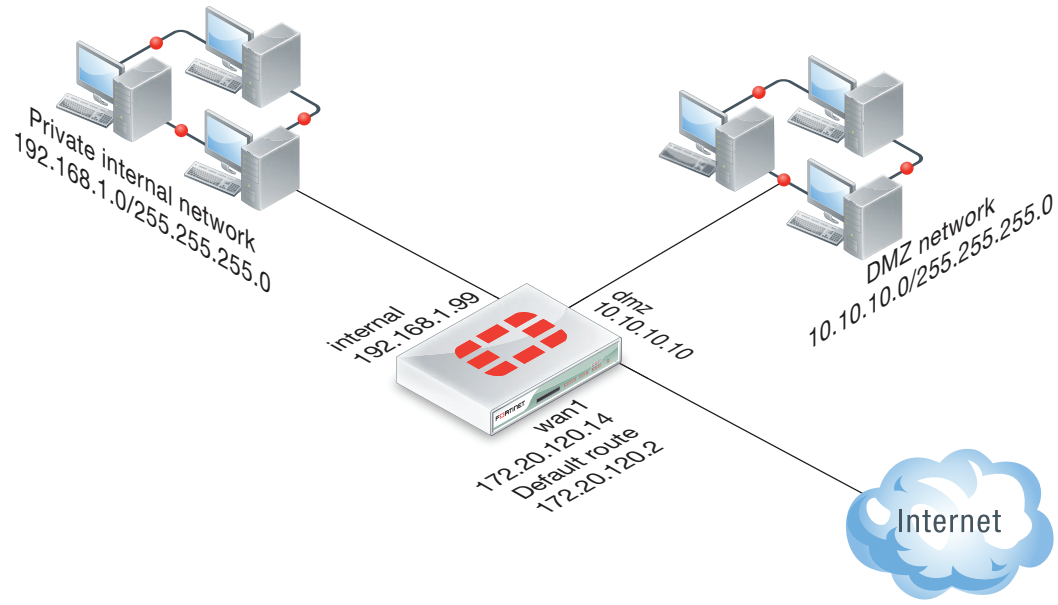
Route mode

In Route mode, the FortiGate unit is only routing traffic, not translating the IP addresses. In this mode, the FortiGate unit acts similar to a switch, passing the packet along to the destination network. This mode is not to be confused with Transparent mode, which is invisible on the network; rather, in Route mode, the FortiGate unit is visible to the network, but does only routing.

The FortiGate unit is used in Route mode whenever no NAT translation needs to be done. For example, you want to connect two separate subnets without using NAT.

You must select NAT/Route mode when configuring the FortiGate unit for Route mode.

Figure 18: An example of a FortiGate unit in Route mode on a network



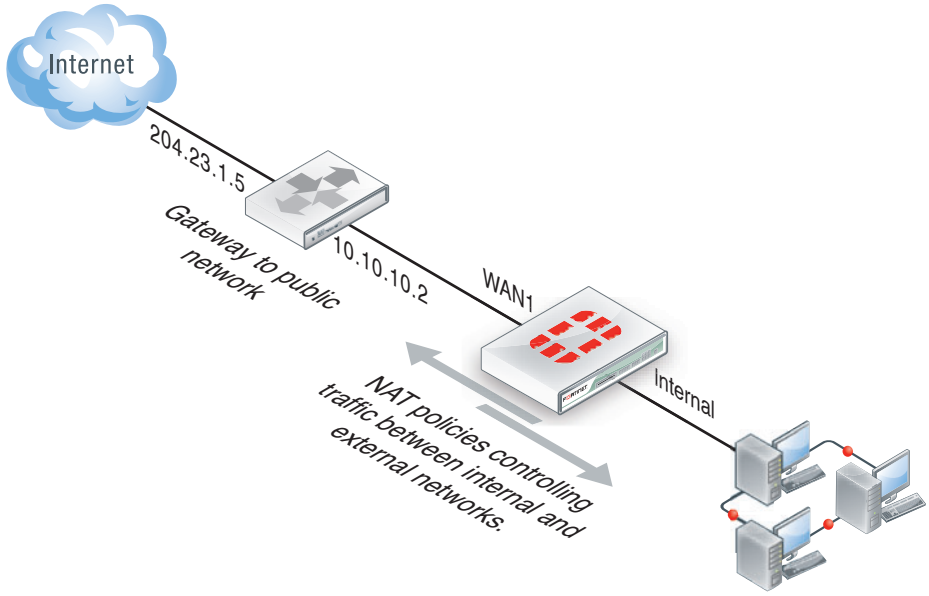
Transparent mode

In Transparent mode, the FortiGate unit is invisible to the network. All of its interfaces are on the same subnet and share the same IP address. If you want to configure the FortiGate unit in Transparent mode, all you need to do is to configure a management IP address and a default route.

You would typically use Transparent mode on a private network behind an existing firewall or behind a router. In Transparent mode, the FortiGate unit functions as a firewall and can even perform NAT. Security policies control communications through the FortiGate unit to the Internet and internal network. Traffic cannot pass through until you add security policies when the FortiGate unit is in Transparent mode.

In Transparent mode, you can also perform NAT by creating a security policy or policies that translates the source addresses of packets passing through the FortiGate unit as well as virtual IP addresses and/or IP pools. If you want NAT to be performed in Transparent mode, you must configure two management IP addresses that are on different subnets.

Figure 19: A FortiGate unit in Transparent mode



Types of NAT in FortiOS

There are many types of NAT that are available, some you may already know such as port address translation (PAT). The following explains these types of NAT that are available in FortiOS.

This topic contains the following:

Static NAT (SNAT)

Static NAT, or source address translation (SNAT), is when a static source IP address is translated by NAT to another source IP address. In FortiOS, when a packet with a specific source address is accepted by a security policy with NAT enabled, the source address is swapped with another IP address. For example, you want to allow a web server on a private network that is protected by a FortiGate unit to connect to the Internet; the web server has a static IP address of 10.10.30.10 and the external interface of the unit is 172.20.120.233; when the packet is received at the FortiGate's internal interface, it is translated from 10.10.30.10 to 172.20.120.133, and forwards the packet out to the Internet.

Static NAT is used when configuring basic security policies. For example, you want users on a private network to connect to the Internet.

When configuring static NAT security policies, there are several steps that must be configured prior to configuring the actual security policy. For example, for static DNAT, you must configure a virtual IP address that maps to a specific destination address.

Static Destination NAT (SDNAT)

As stated for static NAT, the same is true for static destination address translation, or SDNAT, whereby a packet with a specific destination address is accepted by a security policy with NAT enabled, the destination address is swapped with another destination address.

Static NAT port forwarding

There is also static port forwarding, which acts similarly to static DNAT, translating a destination address and port number to another destination address and port number. The difference is that port forwarding requires a virtual IP address so that the FortiGate unit can properly translate the port number.

When a packet with a destination address to be translated is accepted by a security policy (with DNAT enabled), and a virtual IP with an external port mapped to that address's port, then the FortiGate unit swaps the packet's destination address with the other IP address, and its port number with the external port.

Dynamic NAT (DNAT)

As subnets grow larger, more work is required to set network address translation with each additional client. Rather than assigning static addresses, an administrator may want to set up IP pools. IP pools are ranges of addresses that clients on a subnet can use to send and receive packets, as well as which FortiGate units can use to translate the addresses of packets going through them. This type of translation is known as dynamic NAT, when address translation is done on a flexible or "many-to-one" basis using IP pools.

IP pools do not randomly assign addresses, rather, each IP pool is a prioritized list of IP addresses. When a client is assigned an IP address from the IP pool, it retains that address. Another client that requires an address is then assigned the next IP address from that IP pool list. When the range of virtual IPs are used instead of IP pools, these virtual IPs are prioritized in the same type of list.

Dynamic source address translation

Dynamic source address translation has economies of scale for larger subnets and more flexible subnets, enabling network infrastructure to change without the hassle of reconfiguring addresses after every change. Dynamic source address NAT or DNAT translates many source addresses as defined by an IP pool. Whenever a packet with the specific source address to be translated is accepted by a security policy with source NAT enabled, the FortiGate unit swaps the packet's source address with the other IP address selected from the IP pool.

For example, an organization may want packets leaving the FortiGate unit for the Internet to have source Ips in the range of 172.16.0.1-10. This means that packets accepted by a firewall policy must have their source addresses translated to an address in this range before being forwarded to the Internet. So if the server on the private network with the address 10.0.0.1 has its source IP translated to 172.16.0.1, then the next available source IP in the IP pool will be 172.16.0.2, which a server with address 10.0.0.2 can use.

Dynamic destination address

Dynamic destination address NAT (or DDNAT) translates one range of destination addresses to another range of destination addresses. Whenever a packet within the specified range of destination addresses to be translated is accepted by a security policy with DNAT is enabled, the FortiGate unit swaps the packet's destination address with one of the addresses from the other specified range.

For example, to allow customers from the Internet to connect to several web servers protected by a FortiGate unit, you require a range of Internet addresses (for example, 172.16.0.1-10), enough for each protected web server, and a range of real addresses (for example, 10.0.0.1-10) for each web server. When a packet is received at the external interface of the FortiGate unit with a destination IP address within the Internet range of addresses, the FortiGate unit translates the destination address of the packet to the real address and forwards the packet to the web server on the network protected by the FortiGate unit.

Dynamic port forwarding

Dynamic port forwarding translates one range of destination addresses and ports to another range of destination addresses and ports. Whenever a packet with a specified destination address to be translated is accepted by a security policy with destination NAT enabled, and a virtual IP with an external port mapped to that address's port, then the FortiGate unit swaps the packet's destination address with the other IP address, and its port number with the external port.

For example, to allow customers from the Internet to connect to web servers protected by a FortiGate unit, you require a range of Internet addresses (for example, 172.16.0.1-10) and a range of port numbers (for example, 80-89), and a range of ports numbers to be mapped to (for example, 8080-8089). When a packet is received at the external interface of the FortiGate unit with the 172.16.0.3 destination IP address and port number 8082, the FortiGate unit translates that address to 10.0.0.3 and port number to 82, and then forwards the packet to the web server.

Combining types of NAT

In FortiOS, you can combine a number of NAT features to get the best firewall configuration possible for your network requirements. NAT combinations include Double NAT, which is combining IP pool with virtual IP, and using VIP range for SNAT and static one-to-one mapping.

These combinations can help you when creating your FortiGate firewall configuration. The combinations help when you have multiple addresses (IP pools) and when you need to use a virtual IP address with the IP pool. An example of this combination is called Double NAT.

You can also combine dynamic NAT types, such as dynamic source address translation, to help you with creating the FortiGate firewall using dynamic NAT. An example of this combination is using the Central NAT table.

When considering your FortiGate firewall configuration, you should also consider how to combine NAT types. By combining NAT types, you can easily use multiple addresses when configuring security policies, as well as when you want to provide specific NAT translations, such as using dynamic source NAT that will not change the source port; this combination allows for the handling of specific protocols or services that function only if they use a specific port and that port does not change.

The following are some combinations of NAT that you can use in your FortiGate firewall configuration:

- Double NAT
- Central NAT table (similar to IP pools)
- virtual IP range for SNAT
- static one-to-one mapping
- dynamic source NAT (also known as one-to-one source NAT)
- dynamic source NAT (this uses Dynamic IP pool and a virtual IP)

Firewall components

The FortiGate unit's primary purpose is to act as a firewall to protect your networks from unwanted attacks and to control the flow of network traffic. The firewall consists of many different and important components so that you can better protect your network as your network requirements grow. This section explains these components.

The following topics are included in this section:

Using Interfaces and zones in the FortiGate firewall

Interfaces and zones are used when configuring security policies to define incoming and outgoing traffic. For example, in an internal to wan 1 security policy, the internal interface is where traffic is coming in, and the wan 1 interface is where the traffic is going out to. When the FortiGate unit sees that traffic came in using the internal interface, and needs to leave using the wan 1 (or external interface), the security policy internal to wan1 is matched to the traffic and additional rules are applied to the traffic as well.

Interfaces, either virtual or physical, can be applied to security policies. VLAN subinterfaces are virtual interfaces that can be applied to security policies to control and direct traffic on those subinterfaces. VLAN subinterfaces are interfaces that are part of one of the main interfaces, for example, wan1. For more information about VLAN subinterfaces and how to configure them, see the System Admin chapter of the *FortiOS Handbook*.

Zones provide the option of grouping multiple FortiGate interfaces, both virtual and physical, that you can then apply to security policies to control the incoming and outgoing traffic on those interfaces. By using zones, you can easily group multiple interfaces and VLAN subinterfaces together to help simplify creating security policies where a number of network segments can use the same policy and UTM settings.

How to apply VLANs and zones and to a security policy

The following explains how to create three VLAN subinterfaces, grouping these subinterfaces into a zone, and then applying the zone to a security policy. The security policy will control the traffic for these VLAN subinterfaces.

1. **Create three VLANs in *System* > *Network* > *Interface* for engineering, sales and marketing on the internal interface.**

   These three VLANs will be grouped together to create a zone which will then be applied to the security policy. The zone will be applied to the policy instead of the individual VLANs.

2. **Group the VLANs into a zone.**
3. **Create DHCP servers for each of the VLAN subinterfaces in *System* > *Network* > *DHCP*.**

4 **Create the security policy for the zone to control traffic in *Policy* > *Policy* > *Policy*.**

In the *Source Interface/Zone* list, you would instead choose the zone. The *Destination Interface/Zone* is the external interface, wan1. By choosing the zone, you apply all the subinterfaces at once.

5 **Select *Enable NAT* and *Use Destination Interface Address*; ensure that *Log Allowed Traffic* is also enabled so that you can use the logs to help determine if traffic is hitting the security policy.**

Understanding the firewall address component

Firewall addresses in FortiOS provide flexibility when configuring access control over the network traffic. When this document talks about firewall addresses, this encompasses:

- IP addresses and netmasks
- IP pools (this can include the Central NAT table)
- virtual IP addresses
- geography-based addresses
- IPv4 addresses
- wildcard addresses and netmasks
- Fully Qualified Domain Name addresses (FQDN)
- IP address groups

Firewall addresses help define the network addresses that you use when configuring a security policy's source and destination address. The FortiGate unit compares the IP addresses contained in packet headers with a security policy's source and destination addresses to determine if the security policy matches the traffic.

A firewall address can contain one or more network addresses. Network addresses can be represented by an IP address with a netmask, an IP address range, or a fully qualified domain name (FQDN).

When representing hosts by an IP address with a netmask, the IP address can represent one or more hosts. For example, a firewall address can be:

- a single computer, such as `192.45.46.45`
- a subnetwork, such as `192.168.1.0` for a class C subnet
- `0.0.0.0`, which matches any IP address

The netmask corresponds to the subnet class of the address being added, and can be represented in either dotted decimal or CIDR format. The FortiGate unit automatically converts CIDR formatted netmasks to dotted decimal format. Example formats:

- netmask for a single computer: `255.255.255.255`, or `/32`
- netmask for a class A subnet: `255.0.0.0`, or `/8`
- netmask for a class B subnet: `255.255.0.0`, or `/16`
- netmask for a class C subnet: `255.255.255.0`, or `/24`
- netmask including all IP addresses: `0.0.0.0`

Valid IP address and netmask formats include:

- x.x.x.x/x.x.x.x, such as `192.168.1.0/255.255.255.0`

- x.x.x.x/x, such as `192.168.1.0/24`

An IP address of 0.0.0.0 with a netmask 255.255.255.255 is not a valid firewall address.

When representing hosts by an IP address range, the range indicates hosts with continuous IP addresses in a subnet, such as `192.168.1.[2-10]`, or `192.168.1.*` to indicate the complete range of hosts on that subnet. Valid IP Range formats include:

- x.x.x.x-x.x.x.x, such as `192.168.110.100-192.168.110.120`
- x.x.x.[x-x], such as `192.168.110.[100-120]`
- x.x.x.*, such as `192.168.110.*`

When representing hosts by an FQDN, the domain name can be a subdomain, such as mail.example.com. A single FQDN firewall address may be used to apply a security policy to multiple hosts, as in load balancing and high availability (HA) configurations. FortiGate units automatically resolve and maintain a record of all addresses to which the FQDN resolves. Valid FQDN formats include:

- <host_name>.<second_level_domain_name>.<top_level_domain_name>, such as `mail.example.com`
- <host_name>.<top_level_domain_name>

Be cautious when employing FQDN firewall addresses. By using a fully qualified domain name in a security policy, while convenient, does present some security risks, because policy matching then relies on a trusted DNS server. If the DNS server should ever be compromised, security policies requiring domain name resolution may no longer function properly.

This topic contains the following:

IP addresses for self-originated traffic

On the FortiGate unit, there are a number of protocols and traffic that is specific to the internal workings of FortiOS. For many of these traffic sources, you can identify a specific port/IP address for this self-originating traffic. The following traffic can be configured to a specific port/IP address:

- SNMP
- Syslog

- alert email
- FortiManager connection IP
- FortiGuard services
- FortiAnalyzer logging
- NTP
- DNS
- Authorization requests such as RADIUS
- FSSO

Configuration of these services is performed in the CLI. In each instance, there is a command set `source-ip`. For example, to set the source IP of NTP to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config system ntp
  set ntpsyn enable
  set syncinterval 5
  set source-ip 192.168.4.5
end
```

To see which services are configured with source-ip settings, use the `get` command:

```
get system source-ip status
```

The output will appear similar to the sample below:

```
NTP: x.x.x.x
DNS: x.x.x.x
SNMP: x.x.x.x
Central Management: x.x.x.x
FortiGuard Updates (AV/IPS): x.x.x.x
FortiGuard Queries (WebFilter/SpamFilter): x.x.x.x
```

IP pools

An IP pool defines a single IP address or a range of IP addresses. A single IP address in an IP pool becomes a range of one IP address. For example, if you enter an IP pool as 1.1.1.1, the IP pool is actually the address range, 1.1.1.1 to 1.1.1.1. Use IP pools to add NAT policies that translate source addresses to addresses randomly selected from the IP pool, rather than the IP address assigned to that FortiGate interface. You can use the Central NAT table as a way to configure IP pools. For more information, see “Central NAT table” on page 265.

If a FortiGate interface IP address overlaps with one or more IP pool address ranges, the interface responds to ARP requests for all of the IP addresses in the overlapping IP pools.

For example, consider a FortiGate unit with the following IP addresses for the port1 and port2 interfaces:

- port1 IP address: 1.1.1.1/255.255.255.0 (range is 1.1.1.0-1.1.1.255)
- port2 IP address: 2.2.2.2/255.255.255.0 (range is 2.2.2.0-2.2.2.255)

And the following IP pools:

- IP_pool_1: 1.1.1.10-1.1.1.20
- IP_pool_2: 2.2.2.10-2.2.2.20
- IP_pool_3: 2.2.2.30-2.2.2.40

The port1 interface overlap IP range with IP_pool_1 is:

- (1.1.1.0-1.1.1.255) and (1.1.1.10-1.1.1.20) = 1.1.1.10-1.1.1.20

The port2 interface overlap IP range with IP_pool_2 is:

- (2.2.2.0-2.2.2.255) & (2.2.2.10-2.2.2.20) = 2.2.2.10-2.2.2.20

The port2 interface overlap IP range with IP_pool_3 is:

- (2.2.2.0-2.2.2.255) & (2.2.2.30-2.2.2.40) = 2.2.2.30-2.2.2.40

And the result is:

- The port1 interface answers ARP requests for 1.1.1.10-1.1.1.20
- The port2 interface answers ARP requests for 2.2.2.10-2.2.2.20 and for 2.2.2.30-2.2.2.40

Select *Enable NAT* in a security policy and then select *Dynamic IP Pool.* Select an IP pool to translate the source address of packets leaving the FortiGate unit to an address randomly selected from the IP pool.

IP pools cannot be set up for a zone. IP pools are connected to individual interfaces.

IP Pools for security policies that use fixed ports

Some network configurations do not operate correctly if a NAT policy translates the source port of packets used by the connection. NAT translates source ports to keep track of connections for a particular service.

From the CLI you can enable `fixedport` when configuring a security policy for NAT policies to prevent source port translation.

```
config firewall policy
  edit policy_name
    ...
    set fixedport enable
    ...
end
```

However, enabling `fixedport` means that only one connection can be supported through the firewall for this service. To be able to support multiple connections, add an IP pool, and then select *Dynamic IP pool* in the policy. The firewall randomly selects an IP address from the IP pool and assigns it to each connection. In this case, the number of connections that the firewall can support is limited by the number of IP addresses in the IP pool.

Source IP address and IP pool address matching

When the source addresses are translated to the IP pool addresses, one of the following three cases may occur:

Scenario 1: The number of source addresses equals that of IP pool addresses

In this case, the FortiGate unit always matches the IP addressed one to one.

If you enable `fixedport` in such a case, the FortiGate unit preserves the original source port. This may cause conflicts if more than one security policy uses the same IP pool, or the same IP addresses are used in more than one IP pool.

Original address	Change to
192.168.1.1	172.16.30.1
192.168.1.2	172.16.30.2
.....	.....
192.168.1.254	172.16.30.254

Scenario 2: The number of source addresses is more than that of IP pool addresses

In this case, the FortiGate unit translates IP addresses using a wrap-around mechanism.

If you enable `fixedport` in such a case, the FortiGate unit preserves the original source port. But conflicts may occur since users may have different sessions using the same TCP 5 tuples.

Original address	Change to
192.168.1.1	172.16.30.10
192.168.1.2	172.16.30.11
.....	.....
192.168.1.10	172.16.30.19
192.168.1.11	172.16.30.10
192.168.1.12	172.16.30.11
192.168.1.13	172.16.30.12
.....	.....

Scenario 3: The number of source addresses is fewer than that of IP pool addresses

In this case, some of the IP pool addresses are used and the rest of them are not be used.

Original address	Change to
192.168.1.1	172.16.30.10
192.168.1.2	172.16.30.11
192.168.1.3	172.16.30.12
No more source addresses	172.16.30.13 and other addresses are not used

Geography-based addressing

An option is available to add a geography-based address scheme. With this type of addressing, you indicate the geographic region, or country. The FortiGate unit includes an internal list of countries and IP addresses based on historical data from the FortiGuard network.

IPv6 does not support geography-based addressing. This feature is for IPv4 addresses only.

When used in security policies, traffic originating or going to a particular country can be logged, blocked or specific filtering applied.

In the following examples, an geographic-based address for China is added for the WAN1 port.

To add a geography-based address - web-based manager

1. Go to *Firewall Objects* > *Address* > *Address* and select *Create New*.
2. Enter the *Name* of `China`
3. For the *Type*, select *Geography*.
4. From the *Country* list, select *China*.
5. Select the *Interface* of *WAN1*.
6. Select *OK*.

To add a geography-based address - CLI

```
config firewall address
  edit China
    set type geography
    set country CN
    set interface wan1
end
```

You can use a `diagnose` command to view more information about geography-based addressing. The command displays country and address information for the countries that have been added to firewall addresses.

```
diagnose firewall ipgeo {country-list | ip-list | ip2country}
```

Where:

- `country-list` shows all of the countries that have been added to a firewall address.
- `ip-list` shows the IP addresses of a specified country or all of the countries added to firewall addresses.
- `ip2country` shows the country of origin for a specified IP address. The address must be assigned to one of the countries that has been added to a firewall address.

Wildcard addresses

Wildcard addresses are addresses that identify ranges of IP addresses, reducing the amount of firewall addresses and security policies required to match some of the traffic on your network. Wildcard addresses are an advanced feature, usually required only for complex networks with complex firewall filtering requirements. By using these wildcard addresses in the firewall configuration, administrators can eliminate creating multiple, separate IP addresses and then grouping them to then apply to multiple security policies.

A wildcard address consists of an IP address and a wildcard netmask, for example, 192.168.0.56 255.255.0.255. In this example, the IP address is 192.168.0.56 and the wildcard netmask is 255.255.0.255. The IP address defines the networks to match and the wildcard netmask defines the specific addresses to match on these networks.

In a wildcard netmask, zero means ignore the value of the octet in the IP address, which means the wildcard firewall address matches any number in this address octet. This also means that the number included in this octet of IP address is ignored and can be any number. Usually, if the octet in the wildcard netmask is zero, the corresponding octet in the IP address is also zero.

In a wildcard netmask, a number means match addresses according to how the numbers translate into binary addresses. For example, the wildcard netmask is 255; the wildcard address will only match addresses with the value for this octet that is in the IP address part of the wildcard address. So, if the first octet of the IP address is 192 and the first octet of the wildcard netmask is 255, the wildcard address will only match addresses with 192 in the first octet.

In the above example, the wildcard address 192.168.0.56 255.255.0.255 would match the following IP addresses:

192.168.0.56, 192.168.1.56, 192.168.2.56, ..., 192.168.255.56

The wildcard addresses 192.168.0.56 255.255.0.255 and 192.168.1.56 255.255.0.255 define the same thing since the 0 in the wildcard mask means to match any address in the third octet.

If we use the wildcard address 172.0.20.10 255.0.255.255, it would match the following IP addresses:

172.1.20.10, 172.2.20.10, 172.3.20.10, ..., 172.255.20.10

In a wildcard netmask, a number other than 255 matches multiple addresses for this octet. You can perform a binary conversion to calculate the addresses that would be matched by a given value. For example, to create the IP address and wildcard netmask to match the following network addresses:

```
192.168.32.0/24
192.168.33.0/24
192.168.34.0/24
192.168.35.0/24
192.168.36.0/24
192.168.37.0/24
192.168.38.0/24
192.168.39.0/24
```

Table 4 shows how to write the third octet for these networks according to the octet bit position and address value for each bit.

Table 4: Octet bit position and address value for each bit

Decimal	128	64	32	16	8	4	2	1
32	0	0	1	0	0	0	0	0

Table 4: Octet bit position and address value for each bit

33	0	0	1	0	0	0	0	1
34	0	0	1	0	0	0	1	0
35	0	0	1	0	0	0	1	1
36	0	0	1	0	0	1	0	0
37	0	0	1	0	0	1	0	1
38	0	0	1	0	0	1	1	0
39	0	0	1	0	0	1	1	1
	M	M	M	M	M	D	D	D

Since the first five bits match, the networks can be summarized into one network (192.168.32.0/21 or 192.168.32.0 255.255.248.0). All eight possible combinations of the three low-order bits are relevant for the network ranges. The wildcard address that would match all of these subnet addresses can be written as 192.168.32.0 255.255.248.0.

Wildcard addresses are similar to routing access list wildcard masks. You add routing access lists containing wildcard masks using the `config router access-list` command. However, router access list wildcard masks use the inverse of the masking system used for firewall wildcard addresses. For the router access list wildcard masks, zero (0)means match all IP addresses and one (1)means ignore all IP addresses. So to match IP addresses 192.168.0.56, 192.268.1.56, 192.168.2.56, ... 192.168.255.56 you would use the following router access IP address prefix and wildcard mask: 192.168.0.56 0.0.255.0.

Wildcard firewall addresses are configured only in the CLI. The following is an example of how to configure a wildcard firewall address.

```
config firewall address
  edit example_wildcard_address
    set type wildcard
    set wildcard 192.168.0.56 255.255.0.255
  end
```

Using wildcard addresses in the firewall configuration

The following example shows how wildcard addresses can be applied to network traffic. This example consists of a security policy where both the source and destination addresses are firewall wildcard addresses.

Source Address: 10.129.5.0 255.127.7.0

Destination Address: 10.129.0.10 255.127.7.255

A security policy with these source and destination addresses would permit:

- A device with IP address 10.129.5.100 to connect through the FortiGate unit to IP address 10.129.0.10
- A device with IP address 10.129.13.100 to connect through the FortiGate unit to IP address 10.129.8.10
- A device with IP address 10.129.21.100 to connect through the FortiGate unit to IP address 10.129.0.10

In another example of wildcard addresses, the following shows how only odd numbered addresses get allowed through:

1 Create wildcard address 4.2.2.0/255.255.255.1.

This is configured in the CLI.

2 Create a deny security policy that uses the wildcard address, 4.2.2.0.

The results are that only the odd-numbered 4.2.2.0 addresses are allowed in; all other addresses are blocked.

Fully Qualified Domain Name addresses

Be cautious when employing FQDN firewall addresses. Using a fully qualified domain name in a security policy, while convenient, does present some security risks, because policy matching then relies on a trusted DNS server. Should the DNS server be compromised, security policies requiring domain name resolution may no longer function properly.

Using Fully Qualified Domain Name (FQDN) addresses in security policies has the advantage of causing the FortiGate unit to keep track of DNS TTLs and adapt as records change. As long as the FQDN address is used in a security policy, it stores the address in the DNS cache. The FortiGate unit will query the DNS for an amount of time specified, in seconds, and update the cache as required. This feature can reduce maintenance requirements for changing firewall addresses for dynamic IP addresses. This also means that you can create security policies for networks configured with dynamic addresses using DHCP.

You specify the TTL time in the CLI only. For example, to set the TTL for 30 minutes on an FQDN of www.example.com on port 1, enter the following commands:

```
config firewall address
  edit FQDN_example
    set type fdqn
    set associated-interface port 1
    set fqdn www.example.com
    set cache-ttl 1800
end
```

Address groups

Similar to zones, if you have a number of addresses or address ranges that require the same security policies, you can put them into address groups, rather than creating multiple similar policies. Because security policies require addresses with homogenous network interfaces, address groups should contain only addresses bound to the same network interface, or to *Any* — addresses whose selected interface is *Any* are bound to a network interface during creation of a security policy, rather than during creation of the firewall address.

For example, if address 1.1.1.1 is associated with port1, and address 2.2.2.2 is associated with port2, they cannot be in the same group. However, if 1.1.1.1 and 2.2.2.2 are configured with an interface of *Any*, they can be grouped, even if the addresses involve different networks.

You cannot mix IPv4 firewall addresses and IPv6 firewall addresses in the same address group.

Virtual IP addresses

In FortiOS, virtual IP addresses (VIPs) can be used when configuring security policies to translate IP addresses and ports of packets received by a network interface. When the FortiGate unit receives inbound packets matching a security policy whose *Destination Address* field is a virtual IP, the FortiGate unit applies NAT, replacing packets's IP addresses with the virtual IP's mapped IP address.

VIPs can specify translation of packets' port numbers and/or IP addresses for both inbound and outbound connections. In Transparent mode, virtual IPs are available only in the CLI.

VIP addresses are typically used to map external (public) to internal (private) IP addresses for Destination NAT (DNAT).

Grouping virtual IPs

You can organize multiple virtual IPs into a virtual IP group to simplify your security policy list. For example, instead of having five identical policies for five different but related virtual IPs located on the same network interface, you might combine the five virtual IPs into a single virtual IP group, which is used by a single security policy.

Security policies using VIP Groups are matched by comparing both the member VIP IP addresses) and port numbers).

Match-vip

The match-vip feature allows the FortiGate unit to log virtual IP traffic that gets implicitly dropped. This feature eliminates the need to create two policies for virtual IPs; one that allows the virtual IP, and the other to get proper log entry for DROP rules.

For example, you have a virtual IP security policy and enabled the match-vip feature; the virtual IP traffic that is not matched by the policy is now caught.

The match-vip feature is available only in the CLI. Use the following command syntax to enable this feature. By default, it is disabled.

```
config firewall policy
  edit <vip_policy_name>
    set match-vip {disable | enable}
  end
```

How to use match-vip

In this example, a deny security policy has already been configured that blocks FTP sessions. A virtual IP address will be configured in this example and then applied to a security policy that allows Internet users access to a web server on the company's DMZ network.

1 **Create the virtual IP address in *Firewall Objects > Virtual IP > Virtual IP*.**

  This address is called vip-dmz. You can configure the virtual IP address solely in the CLI. This would eliminate having to go back and forth.

2 **Log in to the CLI and enter the following commands:**

```
config firewall policy
  edit vip-dmz
    set match-vip enable
  end
```

3 **Create the virtual IP security policy.**

For this security policy, you need to turn on logging within the security policy.

4 **Test the policy to view the activity that is occurring with the `match-vip` command enabled.**

Services

Services represent typical traffic types and application packets that pass through the FortiGate unit. Firewall services define one or more protocols and port numbers associated with each service. Security policies use service definitions to match session types. You can organize related services into service groups to simplify your security policy list.

Many well-known traffic types have been predefined in firewall services and protocols on the FortiGate unit. These predefined services and protocols are defaults, and cannot be edited or removed. However, if you require different services, you can create custom services.

To view the predefined servers, go to *Firewall Objects* > *Service* > *Predefined*.

If there is a service that does not appear on the list, or you have a unique service or situation, you can create your own custom service. You need to know the ports, IP addresses or protocols of that particular service or application uses, to create the custom service.

Predefined service list

Many well-known traffic types have been predefined in firewall services. These predefined services are defaults, and cannot be edited or removed. However, if you require different services, you can create custom services.

Predefined services are located in *Firewall Objects* > *Service* > *Predefined*. Table 5 lists the FortiGate firewall predefined services.

Table 5: Predefined services

Service name	Description	Protocol	Port
AFS3	Advanced File Security Encrypted File, version 3, of the AFS distributed file system protocol.	TCP	7000-7009
		UDP	7000-7009
AH	Authentication Header. AH provides source host authentication and data integrity, but not secrecy. This protocol is used for authentication by IPSec remote gateways set to aggressive mode.	IP	51
ANY	Matches connections using any protocol over IP.	all	all
AOL	America Online Instant Message protocol.	TCP	5190-5194
BGP	Border Gateway Protocol. BGP is an interior/exterior routing protocol.	TCP	179

Table 5: Predefined services (Continued)

Service name	Description	Protocol	Port
CVSPSERVER	Concurrent Versions System Proxy Server.CSSPServer is very good for providing anonymous CVS access to a repository.	TCP	2401
		UDP	2401
DCE-RPC	Distributed Computing Environment / Remote Procedure Calls. Applications using DCE-RPC can call procedures from another application without having to know on which host the other application is running.	TCP	135
		UDP	135
DHCP	Dynamic Host Configuration Protocol. DHCP allocates network addresses and delivers configuration parameters from DHCP servers to hosts.	UDP	67 68
DHCP6	Dynamic Host Configuration Protocol for IPv6.	UDP	546, 547
DNS	Domain Name Service. DNS resolves domain names into IP addresses.	TCP	53
		UDP	53
ESP	Encapsulating Security Payload. ESP is used by manual key and AutoIKE IPSec VPN tunnels for communicating encrypted data. AutoIKE VPN tunnels use ESP after establishing the tunnel by IKE.	IP	50
FINGER	A network service providing information about users.	TCP	79
FTP	File Transfer Protocol.	TCP	21
FTP_GET	File Transfer Protocol. FTP GET sessions transfer remote files from an FTP server to an FTP client computer.	TCP	21
FTP_PUT	File Transfer Protocol. FTP PUT sessions transfer local files from an FTP client to an FTP server.	TCP	21
GOPHER	Gopher organizes and displays Internet server contents as a hierarchically structured list of files.	TCP	70
GRE	Generic Routing Encapsulation. GRE allows an arbitrary network protocol to be transmitted over any other arbitrary network protocol, by encapsulating the packets of the protocol within GRE packets.	IP	47
GTP (FortiOS Carrier only)	GPRS Tunneling protocol (GTP). GTP is used with GSM and UMTS networks to carry user data within GPRS core networks. FortiOS Carrier can accept and process IPv4 GTP packet.	UDP	2123,2152,3386

Table 5: Predefined services (Continued)

Service name	Description	Protocol	Port
H323	H.323 multimedia protocol. H.323 is a standard approved by the International Telecommunication Union (ITU) defining how audiovisual conferencing data can be transmitted across networks. For more information, see the *FortiGate Support for H.323 Technical Note*.	TCP	1720, 1503
		UDP	1719
HTTP	Hypertext Transfer Protocol. HTTP is used to browse web pages on the World Wide Web.	TCP	80
HTTPS	HTTP with secure socket layer (SSL). HTTPS is used for secure communication with web servers.	TCP	443
ICMP_ANY	Internet Control Message Protocol. ICMP allows control messages and error reporting between a host and gateway (Internet).	ICMP	Any
IKE	Internet Key Exchange. IKE obtains authenticated keying material for use with the Internet Security Association and Key Management Protocol (ISAKMP) for IPSEC.	UDP	500, 4500
IMAP	Internet Message Access Protocol. IMAP is used by email clients to retrieves email messages from email servers.	TCP	143
IMAPS	IMAP with SSL. IMAPS is used for secure IMAP communication between email clients and servers. IMAPS is only available on FortiGate units that support SSL content scanning and inspection. For more information, see the UTM chapter of the FortiOS Handbook.	TCP	993
INFO_ADDRESS	ICMP information request messages.	ICMP	17
INFO_REQUEST	ICMP address mask request messages.	ICMP	15
IRC	Internet Relay Chat. IRC allows users to join chat channels.	TCP	6660-6669
Internet-Locator-Service	Internet Locator Service. ILS includes LDAP, User Locator Service, and LDAP over TLS/SSL.	TCP	389
L2TP	Layer 2 Tunneling Protocol. L2TP is a PPP-based tunnel protocol for remote access.	TCP	1701
		UDP	1701
LDAP	Lightweight Directory Access Protocol. LDAP is used to access information directories.	TCP	389
MGCP	Media Gateway Control Protocol. MGCP is used by call agents and media gateways in distributed Voice over IP (VoIP) systems.	UDP	2427, 2727

Table 5: Predefined services (Continued)

Service name	Description	Protocol	Port
MMS (FortiOS Carrier only)	MMS tunneling protocol. MMS is used when sending and receiving multimedia content to a mobile phone.	TCP UDP	1755 1024-5000
MS-SQL	Microsoft SQL Server is a relational database management system (RDBMS) produced by Microsoft. Its primary query languages are MS-SQL and T-SQL.	TCP	1433, 1434
MYSQL	MySQL is a relational database management system (RDBMS) which runs as a server providing multi-user access to a number of databases.	TCP	3306
NFS	Network File System. NFS allows network users to mount shared files.	TCP	111, 2049
		UDP	111, 2049
NNTP	Network News Transport Protocol. NNTP is used to post, distribute, and retrieve Usenet messages.	TCP	119
NTP	Network Time Protocol. NTP synchronizes a host's time with a time server.	TCP	123
		UDP	123
NetMeeting	NetMeeting allows users to teleconference using the Internet as the transmission medium.	TCP	1720
ONC-RPC	Open Network Computing Remote Procedure Call. ONC-RPC is a widely deployed remote procedure call system.	TCP	111
		UDP	111
OSPF	Open Shortest Path First. OSPF is a common link state routing protocol.	IP	89
PC-Anywhere	PC-Anywhere is a remote control and file transfer protocol.	TCP	5631
		UDP	5632
PING	Ping sends ICMP echo request/replies to test connectivity to other hosts.	ICMP	8
PING6	Ping6 sends ICMPv6 echo request/replies to network hosts to test IPv6 connectivity to other hosts.	ICMP6	58
POP3	Post Office Protocol v3. POP retrieves email messages.	TCP	110
POP3S	Post Office Protocol v3 with secure socket layer (SSL). POP3S is used for secure retrieval of email messages. POP3S is only available on FortiGate units that support SSL content scanning and inspection. For more information, see the UTM chapter of the FortiOS Handbook.	TCP	995

Table 5: Predefined services (Continued)

Service name	Description	Protocol	Port
PPTP	Point-to-Point Tunneling Protocol. PPTP is used to tunnel connections between private network hosts over the Internet. **Note:** Also requires IP protocol 47.		47
		TCP	1723
QUAKE	Quake multi-player computer game traffic.	UDP	26000, 27000, 27910, 27960
RADIUS	Remote Authentication Dial In User Service. RADIUS is a networking protocol that provides centralized access, authorization and accounting management for people or computers to connect and use a network service.	TCP	1812, 1813
RAUDIO	RealAudio multimedia traffic.	UDP	7070
RDP	Remote Desktop Protocol is a multi-channel protocol that allows a user to connect to a networked computer.	TCP	3389
REXEC	Rexec traffic allows specified commands to be executed on a remote host running the rexecd service (daemon).	TCP	512
RIP	Routing Information Protocol. RIP is a common distance vector routing protocol. This service matches RIP v1.	UDP	520
RLOGIN	Remote login traffic.	TCP	513
RSH	Remote Shell traffic allows specified commands to be executed on a remote host running the rshd service (daemon).	TCP	514
RTSP	Real Time Streaming Protocol is a protocol for use in streaming media systems which allows a client to remotely control a streaming media server, issuing VCR-like commands such as play and pause, and allowing time-based access to files on a server.	TCP	554, 7070, 8554
		UDP	554
SAMBA	Server Message Block. SMB allows clients to use file and print shares from enabled hosts. This is primarily used for Microsoft Windows hosts, but may be used with operating systems running the Samba daemon.	TCP	139
SCCP	Skinny Client Control Protocol. SCCP is a Cisco proprietary standard for terminal control for use with voice over IP (VoIP).	TCP	2000

Table 5: Predefined services (Continued)

Service name	Description	Protocol	Port
SIP	Session Initiation Protocol. SIP allows audiovisual conferencing data to be transmitted across networks. For more information, see the Voice Solutions: SIP chapter of the FortiOS Handbook.	UDP	5060
SIP-MSNmessenger	Session Initiation Protocol used by Microsoft Messenger to initiate an interactive, possibly multimedia session.	TCP	1863
SMTP	Simple Mail Transfer Protocol. SMTP is used for sending email messages between email clients and email servers, and between email servers.	TCP	25
SMTPS	SMTP with SSL. Used for sending email messages between email clients and email servers, and between email servers securely. SMTPS is only available on FortiGate units that support SSL content scanning and inspection. For more information, see the UTM chapter of the *FortiOS Handbook*.	TCP	465
SNMP	Simple Network Management Protocol. SNMP can be used to monitor and manage complex networks.	TCP	161-162
		UDP	161-162
SOCKS	SOCKetS. SOCKS is an Internet protocol that allows client-server applications to transparently use the services of a network firewall.	TCP	1080
		UDP	1080
SQUID	A proxy server and web cache daemon that has a wide variety of uses that includes speeding up a web server by caching repeated requests; caching web, DNS and other computer network lookups for a group of people sharing network resources; aiding security by filtering traffic.	TCP	3128
SSH	Secure Shell. SSH allows secure remote management and tunneling.	TCP	22
		UDP	22
SYSLOG	Syslog service for remote logging.	UDP	514
TALK	Talk allows conversations between two or more users.	UDP	517-518
TCP	Matches connections using any TCP port.	TCP	0-65535
TELNET	Allows plain text remote management.	TCP	23

Table 5: Predefined services (Continued)

Service name	Description	Protocol	Port
TFTP	Trivial File Transfer Protocol. TFTP is similar to FTP, but without security features such as authentication.	UDP	69
TIMESTAMP	ICMP timestamp request messages.	ICMP	13
TRACEROUTE	A computer network tool used to determine the route taken by packets across an IP network.	TCP	33434
		UDP	33434
UDP	Matches connections using any UDP port.	UDP	0-65535
UUCP	Unix to Unix Copy Protocol. UUCP provides simple file copying.	UDP	540
VDOLIVE	VDO Live streaming multimedia traffic.	TCP	7000-7010
VNC	Virtual Network Computing.VNC is a graphical desktop sharing system which uses the RFB protocol to remotely control another computer.	TCP	5900
WAIS	Wide Area Information Server. WAIS is an Internet search protocol which may be used in conjunction with Gopher.	TCP	210
WINFRAME	WinFrame provides communications between computers running Windows NT, or Citrix WinFrame/MetaFrame.	TCP	1494
WINS	Windows Internet Name Service is Microsoft's implementation of NetBIOS Name Service (NBNS), a name server and service for NetBIOS computer names.	TCP	1512
		UDP	1512
X-WINDOWS	X Window System (also known as X11) can forward the graphical shell from an X Window server to X Window client.	TCP	6000-6063

Service groups

You can organize multiple firewall services into a service group to simplify your security policy list. For example, instead of having five identical policies for five different but related firewall services, you might combine the five services into a single address group that is used by a single security policy.

Service groups can contain both predefined and custom services. Service groups cannot contain other service groups.

You can organize multiple firewall services into a service group to simplify your security policy list. For example, instead of having five identical policies for five different but related firewall services, you might combine the five services into a single service group that is used by a single security policy.

Service groups can contain both predefined and custom services. Service groups cannot contain other service groups.

Firewall schedules

When you add security policies on a FortiGate unit, those policies are always on, policing the traffic through the device. Firewall schedules control when policies are in effect, that is, when they are on. You can create one-time schedules which are schedules that are in effect only once for the period of time specified in the schedule. You can also create recurring schedules that are in effect repeatedly at specified times of specified days of the week.

You can create a recurring schedule that activates a policy during a specified period of time. For example, you might prevent game playing during office hours by creating a recurring schedule that covers office hours.

If a recurring schedule has a stop time that is earlier than the start time, the schedule will take effect at the start time but end at the stop time on the next day. You can use this technique to create recurring schedules that run from one day to the next. For example, to prevent game playing except at lunchtime, you might set the start time for a recurring schedule at 1:00 p.m. and the stop time at 12:00 noon. To create a recurring schedule that runs for 24 hours, set the start and stop times to 00.

You can organize multiple firewall schedules into a schedule group to simplify your security policy list. For example, instead of having five identical policies for five different but related firewall schedules, you might combine the five schedules into a single schedule group that is used by a single security policy.

Schedule groups can contain both recurring and one-time schedules. Schedule groups cannot contain other schedule groups.

Schedule groups

You can organize multiple firewall schedules into a schedule group to simplify your security policy list. For example, instead of having five identical policies for five different but related firewall schedules, you might combine the five schedules into a single schedule group that is used by a single security policy.

Schedule groups can contain both recurring and on-time schedules. Schedule groups cannot contain other schedule groups.

Schedule expiry

The schedule in a security policy enables certain aspects of network traffic to occur for a specific length of time. What it does not do however, is police that time. That is, the policy is active for a given time frame, and as long as the session is open, traffic can continue to flow.

For example, in an office environment, Skype use is allowed between noon and 1pm. During that hour, any Skype traffic continues. As long as that session is open, after the 1pm end time, the Skype conversations can continue, yet new sessions will be blocked. Ideally, the Skype session should close at 1pm.

Using a CLI command you can set the schedule to terminate all sessions when the end time of the schedule is reached. Within the `config firewall command` enter the command:

```
set schedule-timeout enable
```

By default, this is set to disable.

UTM profiles

Where security policies provide the instructions to the FortiGate unit as to what traffic is allowed through the device, the Unified Threat Management (UTM) profiles provide the screening that filters the content coming and going on the network. The UTM profiles enable you to instruct the FortiGate unit what to look for in the traffic that you don't want, or want to monitor, as it passes through the device.

A UTM profile is a group of options and filters that you can apply to one or more firewall policies. UTM profiles can be used by more than one security policy. You can configure sets of UTM profiles for the traffic types handled by a set of security policies that require identical protection levels and types, rather than repeatedly configuring those same UTM profile settings for each individual security policy.

For example, while traffic between trusted and untrusted networks might need strict antivirus protection, traffic between trusted internal addresses might need moderate antivirus protection. To provide the different levels of protection, you might configure two separate protection profiles: one for traffic between trusted networks, and one for traffic between trusted and untrusted networks.

UTM profiles are available for various unwanted traffic and network threats. Each are configured separately and can be used in different groupings as needed. You configure UTM profiles in the *UTM* menu and applied when creating a security policy by selecting the UTM profile type.

For more information about configuring profiles that will be used in a security policy, see the UTM chapter of the *FortiOS Handbook*.

How to use UTM profiles to monitor and protect your network

In this example, UTM profiles help you in monitoring and protecting your network from viruses, email filtering and web filtering. This example uses the default UTM profiles.

1. **Locate the security policy that allows access to the Internet (internal -> wan 1) in *Policy* > *Policy* > *Policy*.**
2. **On the Edit Policy page, select UTM and then select these options: *Enable Antivirus*, *Enable Web Filter* and *Enable Email Filter*.**

   The FortiGate unit will apply the antivirus, web filter, and email filter settings to the packet if a match is found.
3. **Select *OK*.**

   When packets enter the FortiGate unit's internal interface, if a packet matches the internal -> wan 1 policy, the FortiGate unit now scans for viruses and applies any web filtering and email filtering rules if there are matches as well.
4. **Go to the eicar.org web site and download the eicar test file.**

   By downloading the eicar test file, you can determine that the antivirus profile is working properly, as well as to see this activity on the AV Monitor page. When attempting to download the file, a web page appears, stating that you are not permitted to download the file. This indicates that the antivirus profile is working properly.

5 **Go to *UTM Profiles > Monitor > AV Monitor* to view the virus activity that just occurred.**

On the page, you should see that the eicar test file was detected by the FortiGate unit; you can select the bar in the chart to see more details. This takes you directly to the FortiGuard Virus Encyclopedia.

6 **Go to *UTM Profiles > Monitor > Web Monitor* to view the Internet activity that is occurring on your network.**

On the page, you will see a pie chart that displays all HTTP requests and a bar chart that displays all blocked HTTP requests. If you want to view more detailed information about the blocked requests, hover your mouse over a bar; a tool-tip appears stating how many blocked requests occurred for that item. For example, for Virus, it is one blocked request because you tried to download the eicar test file.

7 **Go to *UTM Profiles > Monitor > Email Monitor* to view the email activity that is occurring on your network.**

On the page, you will see both a pie chart and a bar chart, similar to the Web Monitor page. The pie chart displays all the email activity and the bar chart displays all the blocked emails for SMTP, POP3, IMAP, and NNTP.

Security policies

Security policies control all traffic attempting to pass through the FortiGate unit, between FortiGate interfaces, zones, and VLAN subinterfaces.

This section explains what security policies are and how they affect all traffic to and from your network. This section also describes how to configure basic policies which are used as a building block to more complex policies, but they enable you to get the FortiGate unit running on the network quickly.

The following topics are included in this section:

Security policy overview

Security policies are instructions the FortiGate unit uses to decide connection acceptance and packet processing for traffic attempting to pass through. When the firewall receives a connection packet, it analyzes the packet's source address, destination address, and service (by port number), and attempts to locate a security policy matching the packet.

Security policies can contain many instructions for the FortiGate unit to follow when it receives matching packets. Some instructions are required, such as whether to drop or accept and process the packets, while other instructions, such as logging and authentication, are optional. The FortiGate unit requires one security policy per traffic flow. For example, network traffic must flow from the internal network to the Internet; a security policy is created (internal interface -> external interface) that allows packets to flow freely from the Internet to the internal network, and from the internal network to the Internet.

Policy instructions may include network address translation (NAT), or port address translation (PAT), or by using virtual IPs or IP pools to translate source and destination IP addresses and port numbers.

Policy instructions may also include UTM profiles, which can specify application-layer inspection and other protocol-specific protection and logging, as well as IPS inspection at the transport layer.

You configure security policies to define which sessions will match the policy and what actions the FortiGate unit will perform with packets from matching sessions.

Sessions are matched to a security policy by considering these features of both the packet and policy:

- Source Interface/Zone
- Source Address
- Destination Interface/Zone
- Destination Address

- Schedule and time of the session's initiation
- Service and the packet's port numbers.

If the initial packet matches the security policy, the FortiGate unit performs the configured Action and any other configured options on all packets in the session.

Packet handling actions can be *ACCEPT*, *DENY*, *IPSEC* or *SSL-VPN*.

- ACCEPT policy actions permit communication sessions, and may optionally include other packet processing instructions, such as requiring authentication to use the policy, or specifying one or more UTM profiles to apply features such as virus scanning to packets in the session. An ACCEPT policy can also apply interface-mode IPsec VPN traffic if either the selected source or destination interface is an IPsec virtual interface.
- DENY policy actions block communication sessions, and you can optionally log the denied traffic. If no security policy matches the traffic, the packets are dropped, therefore it is not required to configure a DENY security policy in the last position to block the unauthorized traffic. A DENY security policy is needed when it is required to log the denied traffic, also called "violation traffic".
- IPSEC and SSL-VPN policy actions apply a tunnel mode IPsec VPN or SSL VPN tunnel, respectively, and may optionally apply NAT and allow traffic for one or both directions. If permitted by the firewall encryption policy, a tunnel may be initiated automatically whenever a packet matching the policy arrives on the specified network interface, destined for the local private network.

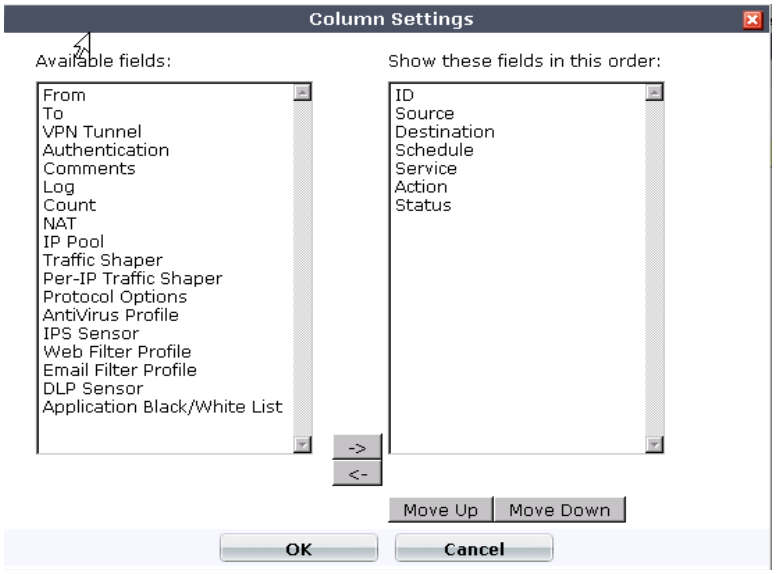
You need to create security policies based on how the network traffic is going to be flowing through the FortiGate unit. For example, a policy for POP3, where the email server is outside of the internal network, traffic should be from an internal interface to an external interface rather than the other way around. It is typically the user on the network requesting email content from the email server and thus the originator of the open connection is on the internal port, not the external one of the email server. This is also important to remember when view log messages as to where the source and destination of the packets can seem backwards.

If you make any changes to existing policies, those changes take effect immediately.

Security policy list details

The security policy table includes, by default, a number of columns to display information about the policy, for example, source, destination, service, and so on. You can add a number of additional columns to the table to view more information about the policies and what is in their configuration. By going to *Policy* > *Policy* > *Policy* and selecting the *Column Settings* link, you can add or remove a number of different columns of information to the policy list, and arrange their placement within the table.

Figure 20: Security policy column selection



Viewing security policies

When viewing security policies in the security policy list, you can view them in either *Section View* or *Global View*. In *Section View*, policies are grouped by how the traffic is directed by interface, for example, internal -> wan1. In *Global View*, policies are listed in one large list with no groupings, referred to as interface pairings.

The FortiGate unit will automatically change the view on the policy list page to *Global View* whenever a policy containing *any* in the *Source interface/zone* or *Destination interface/zone* is created. This occurs because the FortiGate unit understands that this particular policy allows or denies traffic on any FortiGate interface, which breaks the original policy sequence order.

Policies are ordered by fixed policies (ones that contain static interfaces) with each interface pairing (for example, port1 -> port2) and each pairing has their own specific policy order, which does not cause any conflict. However, this interface pairing creates a conflict when a policy containing an ANY interface is created, because the FortiGate unit is now unable to determine which policy set to use and which, in the pair's ordering, should traffic be blocked. The FortiGate unit uses Global View to represent its own understanding of the global policy that was created, using this to help determine the action to take.

Policy order

Each time a FortiGate unit receives a connection attempting to pass through one of its interfaces, the unit searches its security policy list for a matching security policy.

The search begins at the top of the policy list and progresses in order towards the bottom. The FortiGate unit evaluates each policy in the security policy list for a match until a match is found. When the FortiGate unit finds the first matching policy, it applies the matching policy's specified actions to the packet, and disregards subsequent security policies. Matching security policies are determined by comparing the security policy and the packet's:

- source and destination interfaces
- source and destination firewall addresses

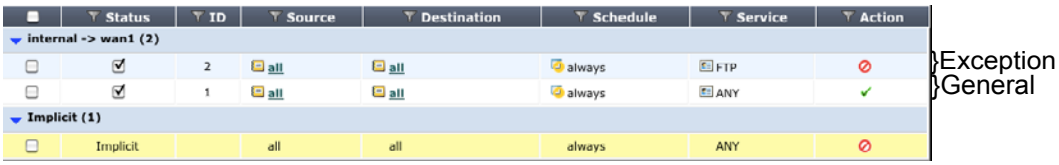
- services
- time/schedule.

If no policy matches, the connection is dropped.

As a general rule, you should order the security policy list from most specific to most general because of the order in which policies are evaluated for a match, and because only the ***first*** matching security policy is applied to a connection. Subsequent possible matches are not considered or applied. Ordering policies from most specific to most general prevents policies that match a wide range of traffic from superseding and effectively masking policies that match exceptions.

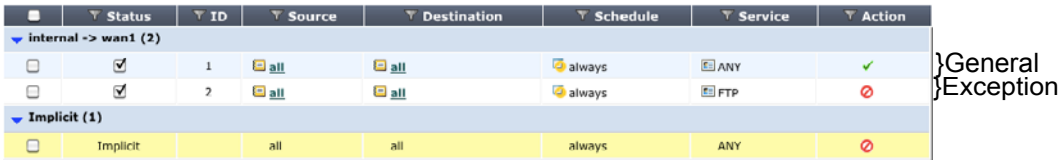
For example, you might have a general policy that allows all connections from the internal network to the Internet, but want to make an exception that blocks FTP. In this case, you would add a policy that denies FTP connections above the general policy.

Figure 21: Example: Blocking FTP — Correct policy order



FTP connections would immediately match the deny policy, blocking the connection. Other kinds of services do not match the FTP policy, and so policy evaluation would continue until reaching the matching general policy. This policy order has the intended effect. But if you reversed the order of the two policies, positioning the general policy before the policy to block FTP, all connections, including FTP, would immediately match the general policy, and the policy to block FTP would never be applied. This policy order would not have the intended effect.

Figure 22: Example: Blocking FTP — Incorrect policy order



Similarly, if specific traffic requires authentication, IPsec VPN, or SSL VPN, you would position those policies above other potential matches in the policy list. Otherwise, the other matching policies would always take precedence, and the required authentication, IPsec VPN, or SSL VPN might never occur.

A default security policy may exist, which accepts all connections. You can move, disable or delete it. If you move the default policy to the bottom of the security policy list and no other policy matches the packet, the connection will be accepted. If you disable or delete the default policy and no other policy matches the packet, the connection will be dropped.

You can arrange the security policy list to influence the order in which policies are evaluated for matches with incoming traffic. When more than one policy has been defined for the same interface pair, the first matching security policy will be applied to the traffic session.

How to arrange policies

In this example, there are four policies that the FortiGate unit must use when packets enter the FortiGate unit's interface. These policies are IPsec VPN, DENY, Internet access, and an identity-based policy. You need to make sure that the policies are arranged so that the policies that are important do not get left out.

1 **On the policy list, select *Global* view to view all policies in the list.**

   By viewing the list using Global view, you can easily see all policies in the list regardless of the sections that they are in. This helps you to see where in the list you need to move the policies, without having to expand each section to view the policies.

2 **Move the IPsec VPN policy to the first line in the table.**

   You want the IPsec VPN policy to come first so that the process matches this policy first. If the IPsec VPN policy is not first, other policies would always take precedence and the authentication required for IPsec may never occur.

3 **Move the DENY policy to the third line of the table.**

   This DENY policy contains information that denies all FTP traffic.

4 **Move the identity-based policy to the fourth line in the table.**

5 **Move the Internet access policy after the identity-based policy.**

Security policies

There are many different security policies that you can configure for the FortiGate firewall. These policies include SSL VPN, wireless, and identity-based policies. With different configurations come different security policies, and each contain different information for processing the packets coming into the FortiGate unit.

The following explain each type of security policy that can be configured and the reason for configuring such a security policy.

This topic contains the following:

- Identity-based policies
- SSL VPN policies
- IPsec policies
- Accept policies
- Deny policies
- IPv6 policies
- Security policy 0
- Local-in policies

If you make any changes to existing policies, those changes take effect immediately.

Identity-based policies

If you enable *Enable Identity Based Policy* in a security policy, network users must send traffic involving a supported firewall authentication protocol to trigger the firewall authentication challenge, and successfully authenticate, before the FortiGate unit will allow any other traffic matching the security policy.

User authentication can occur through any of the following supported protocols:

- HTTP
- HTTPS
- FTP
- Telnet

Authentication can also occur through automatic login using NTLM and FSSO receiverships, to bypass user intervention.

The authentication style depends on which of these supported protocols you have included in the selected firewall services group and which of those enabled protocols the network user applies to trigger the authentication challenge. The authentication style will be one of two types. For certificate-based (HTTPS or HTTP redirected to HTTPS only) authentication, you must install customized certificates on the FortiGate unit and on the browsers of network users, which the FortiGate unit matches. For user name and password-based (HTTP, FTP, and Telnet) authentication, the FortiGate unit prompts network users to input their firewall user name and password.

For example, if you want to require HTTPS certificate-based authentication before allowing SMTP and POP3 traffic, you must select a firewall service (in the security policy) that includes SMTP, POP3 and HTTPS services. Prior to using either POP3 or SMTP, the network user would send traffic using the HTTPS service, which the FortiGate unit would use to verify the network user's certificate; upon successful certificate-based authentication, the network user would then be able to access his or her email.

In most cases, you should ensure that users can use DNS through the FortiGate unit without authentication. If DNS is not available, users will not be able to use a domain name when using a supported authentication protocol to trigger the FortiGate unit's authentication challenge.

If you do not install certificates on the network user's web browser, then network users may see an SSL certificate warning message and have to manually accept the default FortiGate certificate, which the network user's web browser may then deem as invalid.

When you use certificate authentication, if you do not specify any certificate when you create a security policy, the FortiGate unit will use the default certificate from the global settings. If you specify a certificate, the per-policy setting will override the global setting.

Authentication requires that *Action* is ACCEPT or SSL-VPN, and that you first create users, assign them to a firewall user group, and assign UTM profiles to that user group.

For additional information about identity-based-policy positioning and identity-based sub-policies, see "Identity-based security policies" on page 285.

Identity-based policy example

With this basic identity-based policy example, the security policy will allow HTTPS traffic passing from the external interface (WAN1) to the internal interface (Internal) at all times, as soon as the network user enters their user name and password. For simplicity, the policy will request the firewall authentication. This authentication can be set up for users by going to *User* > *User* > *User* and their groupings by going to *User* > *User Group* > *User Group*. For this example, the group “accounting” is used. When a user attempts to browse to a secure site, they will be prompted for their log in credentials.

To create a identity-based policy - web-based manager

1. Go to *Policy* > *Policy* > *Policy* and select *Create New*.
2. Enter the following:
3. Select *Enable Identity Based Policy*.
4. *Firewall* authentication is enabled by default.
5. Select *Add*.
6. From the *Available User Groups* list, select the *Accounting* user group and select the right arrow to move it to the *Selected User Groups* area.
7. From the *Available Services* list, select the *HTTPS* and select the right arrow to move it to the *Selected Services* area.
8. For the *Schedule*, select *Always*.
9. Select *OK*.

To create a identity-based policy - CLI

```
config firewall policy
  edit 1
    set srcintf internal
    set srcaddr 10.13.20.22
    set dstintf wan1
    set dstaddr 172.20.120.141
    set action accept
    set schedule always
    set identity-based enable
      config identity-based-policy
        edit 1
          set group accounting
          set service HTTPS
          set schedule always
        end
  end
```

SSL VPN policies

SSL VPN security policies are created for permitting SSL VPN clients, web-mode or tunnel-mode, access to the protected network behind the FortiGate unit. These security policies also contain authentication information that will authenticate the users and user group or groups.

IPsec policies

IPsec policies allow IPsec VPN traffic access to the internal network from a remote location. These policies include authentication information that authenticates users and user group or groups. These policies specify the following:

- the FortiGate interface that provides the physical connection to the remote VPN gateway, usually an interface connected to the Internet
- the FortiGate interface that connects to the private network
- IP addresses associated with data that has to be encrypted and decrypted
- optional: a schedule that restricts when the VPN can operate, and services (or types of data) that can be sent.

For a route-based (interface mode) VPN, you do not configure an IPsec security policy. Instead, you configure two regular ACCEPT security policies, one for each direction of communication, with the IPsec virtual interface as the source or destination interface, as appropriate.

Accept policies

Accept security policies accept traffic that is coming into the network. These policies allow traffic through the FortiGate unit, where the packets are scanned, translated if NAT is enabled, and then sent out to its destination.

Accept security policies are the most common security policies that are created in FortiOS. These security policies are basic policies, such as allowing Internet access, as well as complex policies, such as IPsec VPN.

For information about how to configure accept policies, see “Security policy list details” on page 218.

Deny policies

Deny security policies deny traffic that is coming into the network. The FortiGate unit automatically blocks traffic that is associated with a deny security policy.

Deny security policies are usually configured when you need to restrict specific traffic, for example, SSH traffic. Deny security policies can also help when you want to block a service, such as DNS, but allow a specific DNS server.

For information about how to configure DENY policies, see “Security policy list details” on page 218.

How to allow DNS queries to only one DNS server

In this example, a specific DNS server is used for all DNS queries. All other requests for DNS is not allowed. A deny security policy is used to restrict this access.

1 **In *Firewall Objects* > *Address* > *Address*, create an IP address for the DNS server.**

This address will be used for the policy that allows DNS requests from this DNS server.

2 **Create a new security policy that blocks all DNS sessions to the Internet.**

This policy would have the Action set to DENY and the Service set to DNS. In this policy, the FortiGate unit restricts all requests for any DNS queries.

3 **Create a new policy that allows access to only the DNS server.**

This policy is used by the FortiGate unit to allow DNS requests to the DNS server that is specified.

4 **Move the policies so that they are in the correct order.**

If the policies are not in the correct order, the FortiGate unit will not process the instructions properly and the policies will not work properly. The allowed policy needs to be first and the deny policy needs to come right after.

5 **Test the policies.**

You can test the policies by using diagnose debug command in the CLI or view the packet count in the Count columns of the policies. For more information about how to test and/or verify if traffic is hitting a policy, see "How to create a basic security policy for Internet access" on page 227.

IPv6 policies

IPv6 security policies are created both for an IPv6 network, and a transitional network. A transitional network is a network that is transitioning over to IPv6, but must still have access to the Internet or must connect over an IPv4 network.

These policies allow for this specific type of traffic to travel between the IPv6 and IPv4 networks. The IPv6 options for creating these policies is hidden by default. You must enable this feature in *System* > *Admin* > *Settings*.

For more information about IPv6 in FortiOS, see "Internet Protocol version 6 (IPv6)" on page 235.

Security policy 0

Any security policy that is automatically added by the FortiGate unit has a policy ID number of zero (0). The most common reasons the FortiGate unit creates this policy is:

- The IPsec policy for FortiAnalyzer (and FortiManager version 3.0) is automatically added when an IPsec connection to the FortiAnalyzer unit or FortiManager is enabled.
- The policy to allow FortiGuard servers to be automatically added has a policy ID number of zero.
- The (default) drop rule that is the last rule in the policy and that is automatically added has a policy ID number of zero.
- When a network zone is defined within a VDOM, the intra-zone traffic set to allow or block is managed by policy 0 if it is not processed by a configured security policy.

This policy can appear in logs but will never appear in the security policy list, and therefore, can never be repositioned in the list.

When viewing the FortiGate logs, you may find a log field entry indicating policyid=0. The following log message example indicates the log field policyid=0 in bold.

```
2008-10-06 00:13:49 log_id=0022013001 type=traffic
subtype=violation pri=warning vd=root SN=179089 duration=0
user=N/A group=N/A rule=0 policyid=0 proto=17 service=137/udp
app_type=N/A status=deny src=10.181.77.73 srcname=10.181.77.73
dst=10.128.1.161 dstname=10.128.1.161 src_int=N/A
dst_int="Internal" sent=0 rcvd=0 src_port=137 dst_port=137 vpn=N/A
tran_ip=0.0.0.0 tran_port=0
```

Local-in policies

Security policies control the flow of traffic through the FortiGate unit. The FortiGate unit also includes the option of controlling internal traffic, that is, management traffic.

Each interface includes an allow access configuration to allow management access for specific protocols. Local policies are set up automatically to allow all users all access. Local-in policies takes this a step further, to enable or restrict the user with that access. This also extends beyond the allow access selection.

Local-in policies are configured in the CLI with the commands:

```
config firewall local-in-policy
  edit <policy_number>
    set intf <source_interface>
    set srcaddr <source_address>
    set dstaddr <destination_address>
    set action {accept | deny}
    set service <service name>
    set schedule <schedule_name>
end
```

For example, you can configure a local-in policy so that only administrators can access the FortiGate unit on weekends from a specific management computer at 192.168.21.12 using SSH on port 3 (192.168.21.77) using the Weekend schedule which defines the time the of access.

```
config firewall local-in-policy
  edit <1>
    set intf port3
    set srcaddr 192.168.21.12
    set dstaddr 192.168.21.77
    set action accept
    set service SSH
    set schedule Weekend
end
```

You can also disable a policy should there be a requirement to turn off a policy for troubleshooting or other purpose. To disable a policy enter the commands:

```
config firewall local-in-policy
  edit <policy_number>
    set status disable
end
```

Use the same commands with a `status` of `enable` to use the policy again.

Local-in policies are also supported for IPv6 by entering the command `config firewall local-in-policy6`.

Creating a basic security policy

The following describes how to configure a basic security policy as well as how to test and verify that traffic hitting the policy.

This topic includes the following:

- How to create a basic security policy for Internet access
- How to verify if traffic is hitting the basic security policy
- How to test the basic security policy

How to create a basic security policy for Internet access

The following explains how a basic security policy is created, as well as how to test and verify that the policy is working properly. Testing a policy and verifying if traffic is hitting a policy are two ways to ensure that the policy that you created is working properly.

1 **In the web-based manager, go to *Policy* > *Policy* > *Policy* and select *Create New*.**

2 **The source interface should be *internal* and the destination interface should *wan1*.**

This indicates to the FortiGate unit that the incoming packets will be coming from the internal network and proceeding to the publica network or Internet. The interfaces are also understood in reverse: packets that are coming from the outside or Internet and are destined for the internal network.

3 **The source and destination addresses should *all*.**

This is the default IP address range in *Firewall Objects* > *Addresses* > *Address*. This default IP address range indicates that any IP address is accepted within the range. This is written as 0.0.0.0/0.0.0.0.

4 **For this policy, you must choose the default *always* schedule for *Schedule*, the *ANY* service for *Service*, and the *Action* to *ACCEPT*.**

The default schedule always provides the time limitation, which is none, for the policy. A time limitation can limit the access users have to the Internet or can allow users to access resources at any time of the day or night.

5 **Select *Log Allowed Traffic* to view the traffic activity using either *Policy* > *Monitor* > *Policy Monitor*, or traffic logs. Select *OK* to save the security policy.**

You should test the policy after it has been created. To test a security policy, go to a web site; if you are able to get to the web site, the policy is working properly. You can also view the Count column on the Policy page. The Count column displays the number of packets that have recently passed through, which increases as the packets pass through the FortiGate unit.

How to test the basic security policy

After a security policy has been configured, you can test to see if the policy is working. This should be done after you create a security policy so that you can modify the policy's settings, if required, before backing up the configuration. You should always back up the configuration after making modifications to the FortiGate configuration; by doing so, you will have a current configuration whenever you need it.

1 **On a computer that is on the internal network, open a web browser and access any web site.**

You should be able to get to that web site.

2 **If you are unable to get to a web site, use the following to help troubleshoot the problem:**

- Is the policy order correct?
- Using the diag debug flow command, see if traffic is hitting the policy. If not, use the diag sniffer command to determine what is going on
- View the Count column; if no number appears, traffic is not hitting the policy.

3 **After troubleshooting the problem, browse to a web site and if you can access it, and then save the current configuration.**

How to verify if traffic is hitting the basic security policy

After configuring a security policy, you will want to verify that it is working properly. The following explains how to verify that traffic is hitting the basic security policy that you configured in "How to verify if traffic is hitting the basic security policy" on page 228.

1. **In the web-based manager, go to *Policy* > *Policy* > *Policy* and locate the internal to wan1 policy.**
2. **In the Count column, verify that there is packets hitting the security policy.**

   The Count column displays the amount of packets that are hitting the security policy. In the beginning this count will be low, be increase as the packets come through the FortiGate unit.
3. **Go to *Policy* > *Monitor* > *Policy Monitor* to view the security policy.**

   On the Policy Monitor page, you can see the active sessions, bytes or packets that are occurring from the bar chart and table. By selecting the bar within the chart, you can view more detailed information.
4. **Go to the CLI, log in, and use `diag debug flow` commands to show traffic is hitting the security policy.**

   The `diag debug flow` commands show packet flow through the FortiGate unit. The following is an example of what the information gives when you use the `diag debug flow` commands to see if traffic is hitting a policy.

```
diagnose debug enable
diagnose debug flow show console enable
diagnose debug flow filter add 192.168.1.110
diagnose debug flow trace start 50

id=36871 trace_id=1 msg="vd-root received a packet(proto=6,
   192.168.1.110:3152->172.16.100.148:80) from internal."
id=36871 trace_id=1 msg="allocate a new session-0000724b"
id=36871 trace_id=1 msg="find a route: gw-172.20.120.2 via wan1"
id=36871 trace_id=1 msg="find SNAT: IP-172.20.120.11, port-
   40156"
id=36871 trace_id=1 msg="Allowed by Policy-3: SNAT"
id=36871 trace_id=1 msg="SNAT 192.168.1.110-
   >172.20.120.11:40156"
```

Monitoring firewall traffic

You can easily monitor the network traffic on the FortiGate firewall from either the Dashboard or the Monitor menus in the Policy and Firewall Objects menus. By using these monitors, you can understand how to improve your firewall, or resolve issues.

The following explains the various features that you can use to monitor firewall traffic.

The following topics are included in this section:

Session tables

Firewall session tables include entries to record source and destination IP addresses and port numbers. For each packet received by a FortiGate unit, it references the session table for a match. Packets of an established session are checked against the session table continually throughout the communication. The performance of depends on the performance of processing session table.

Firewall sessions clear from the table based on the timeout, that is, Time-to-live (TTL) setting. Equally, a completely inactive session with no FIN or RESET will be flushed by the by the session TTL timer. Sessions are not closed based on FIN or a RESET. A FIN that is acknowledged with a FIN ACK would slush the session.

Viewing session tables in the web-based manager

Firewall sessions are viewable in the web-based manager using the *Top Sessions* widget. If this widget is not on the Dashboard, select the *Widget* link at the top of the web-based manager and select it from the pop-up dialog box.

While this view shows a graph of the connecting users and IP addresses, double-clicking on a bar in the graph will display the complete session information for that user.

You can clear a session from the table by scrolling to the right and selecting the delete icon for a given session.

Sessions Monitor

Session information display in *Policy* > *Monitor* > *Session Monitor*. You can delete sessions, refresh so that you are viewing current sessions, and you can also filter the session information on the page as well. Filtering allows you to view specific information. For example, you want to view only TCP sessions.

Session Monitor page

Displays the sessions that are currently being monitored by the unit.

Refresh	Select to refresh the information in the list.

Filter Settings	Select to filter the information on the page. *Filters* appears automatically after selecting *Filter Settings*, below the column headings. Use to configure filter settings. **Note:** *Filter Settings* configures all filter settings. Filter icons are used to configure filter settings within that column. To apply a filter setting, select the plus sign beside *Add new filter* and then select and enter the information required. Repeat to add other filter settings. To modify the settings, select *Change* beside the setting and edit the settings. To clear all filters settings. Select the icon beside *Clear all filters*. To use a filter icon to filter settings within a column, select the filter icon in the column. *Filters* appears. Within *Filters*, configure the settings for that column.
IPv4	Select to display only IPv4 addresses.
IPv6	Select to display only IPv6 addresses.
Both	Select to display both IPv4 and IPv6 addresses.
Total Concurrent Sessions: <number>/ New Sessions per Second: <number>	Indicates the total number of concurrent sessions, as well as new sessions that are occurring each second.
Page Controls	Use to navigate through the list.
Total: <number>	The total number of current sessions.
#	The number of the session within the list.
Protocol	The service protocol of the connection, for example, UDP.
Src Address	The source IP address of the connection.
Src Port	The source port of the connection.
Src NAT IP	The source NAT IP address.
Src NAT Port	The source NAT IP port.
Dst Address	The destination address of the connection.
Dst Port	The destination port of the connection.
Policy ID	The security policy identification number.
Expiry (sec)	The time, in seconds, before the connection expires.
Duration (sec)	The duration, in seconds, of the session.
Delete	Select to remove a session from within the list.

Viewing session tables in the CLI

Session tables and information is also viewable from the CLI. More information on sessions are available from the CLI where various diagnose commands reveal more granular data. To view the session information enter the following CLI command:

```
diagnose sys session list
```

Output will look something similar to:

```
session info: proto=17 proto_state=01 duration=121 expire=58
   timeout=0 flags=00000000 sockflag=00000000 sockport=0
   av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
ha_id=0 hakey=0
policy_dir=0 tunnel=/
state=may_dirty br
statistic(bytes/packets/allow_err): org=63/1/1 reply=133/1/1
   tuples=2
orgin->sink: org pre->post, reply pre->post dev=6->2/2->6
   gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 172.20.120.85:51167-
   >8.8.8.8:53(0.0.0.0:0)
hook=post dir=reply act=noop 8.8.8.8:53-
   >172.20.120.85:51167(0.0.0.0:0)
misc=0 policy_id=3 id_policy_id=0 auth_info=0 chk_client_info=0
   vd=0
serial=000171db tos=ff/ff app_list=0 app=0
dd_type=0 dd_rule_id=0
per_ip_bandwidth meter: addr=172.20.120.85, bps=1984
total session 189
```

To clear a session enter the following command:

```
diagnose sys session clear
```

State	Meaning
log	Session is being logged
local	Session is originating from, or destined for, a local stack.
ext	Session is created by a firewall session helper.
may_dirty	Session is created by a policy. For example, the session for FTP channel control will have this state but the FTP data channel will not.
ndr	Session will be checked by an IPS signature.
nds	Session will be checked by an IPS anomaly.
br	Session is being bridged, that is, in transparent mode.
npu	Session will possibly be offloaded to NPU.
wccp	Session is handled by WCCP.

Proto_state fields: TCP

The proto_state field value has two digits. This is because the FortiGate unit keeps track of the original direction and the reply direction.

State	Value	Expire Timer Default (seconds)
NONE	0	10
ESTABLISHED	1	3600
SYN_SENT	2	120

SYN & SYN/ACK	3	60
FIN_WAIT	4	120
TIME_WAIT	5	120
CLOSE	6	10
CLOSE_WAIT	7	120
LAST_ACK	8	30
LISTEN	9	120

Proto_state fields: SCTP

State	Value	Expire Timer Default (seconds)
SCTP_S_NONE	0	60
SCTP_S_ESTABLISHED	1	3600
SCTP_S_CLOSED	2	10
SCTP_S_COOKIE_WAIT	3	5
SCTP_S_COOKIE_ECHOED	4	10
SCTP_S_SHUTDOWN_SENT	5	30
SCTP_S_SHUTDOWN_RECD	6	30
SCTP_S_ACK_SENT	7	3
SCTP_S_MAX	8	120

Proto_state fields: UDP

UDP is a sessionless protocol, however the FortiGate unit still monitors two different states:

- Reply Not Seen - 0
- Reply Seen - 1

In the example output below, a state of 00, the UDP packet has been seen and a session will be created, but no reply packet has been seen:

```
session info: proto=17 proto_state=00 expire=179 timeout=3600
   use=3
```

In this example, the UDP packet has been seen and a session created. Reply packets have also been seen:

```
session info: proto=17 proto_state=01 expire=22 timeout=3600
   use=3
```

Proto_state field for ICMP

There are no states for ICMP traffic; it will always appear as `proto_state=00`.

Monitoring security policy traffic activity

The Policy Monitor page provides information about the activity of security policies. This activity can be viewed at a high level, or in much more detail, by drilling down to get more specific information.

The Policy Monitor page allows you to view the information in either a graphical format, or in a table. The graphical format, or chart, provides an easy and user-friendly view of the traffic activity that is occurring. The chart also provides a way to drill-down to more information; you can view this information by selecting on a bar within the chart. The drill-down information can be displayed by source address or destination address or by destination port.

Below the chart, a table provides information as well about each policy include the type of action the policy

Policy Monitor page

Displays information about the security policy traffic occurring on the unit.

Tip: View additional and more detailed information by selecting a bar within the chart.

Refresh	Select to refresh the information on the page.
Reset	Select to reset the information to clear the current information from the page. New information is included on the page.
Top Policy Usage	Displays the top security policy usage in a bar chart.
Report By	Select to view information by the current active sessions, bytes or packets.

(Table explaining detailed information about the top policy usage)

Policy ID	The security policy identification number.
Source Interface/Zone	The source address or zone used within that security policy.
Destination Interface/Zone	The destination address of zone used within that security policy.
Action	The type of action that is specified in the security policy. For example *Action* is set to *DENY*. The action displays as an icon; for example, a green check mark is *ALLOW*.
Bytes	The number of bytes used by the security policy. This is reflected in the bar chart.
Packets	The number of packets.

Internet Protocol version 6 (IPv6)

This section explains IPv6 in FortiOS. This section does not explain IPv6 in its entirety, only a high-level summary of IPv6 and how IPv6 is supported in FortiOS. For any additional information about IPv6, see the ipv6.com web site.

The following topics are included in this section:

What is IPv6?

Internet Protocol version 6 (IPv6) is the next-generation version of IP addressing. This updated version of IP addressing provides many advances, such as more routing efficiency and reducing the need for NAT. IPv6 also provides better security and mobility support, as well as stateless auto-reconfiguration of hosts which allows IPv6 hosts to automatically configure when connected to a routed IPv6 network.

IPv6 uses 128-bit addressing, which is written in hexadecimal digits separated by a colon. For example, 2001:DB8::6334. This revised version of IP addressing has the potential to provide trillions and trillions of addresses, or an address for each device on the Internet.

For IPv6 address examples, documents use the IPv6 special address 2001:DB8::/32 to indicate that the address is an example. This is stated in RFC 3849. For more information about the specific addresses that are used in IPv6, see ipv6.com.

IPv6 in FortiOS

By default, the FortiGate unit is not enabled to use IPv6 options and settings; however, they are there. To enable IPv6, go to *System* > *Admin* > *Settings* and select *IPv6 Support on GUI*. When enabled, you can use IPv6 addressing on any of the address-dependant components of the FortiGate unit, including security policies, interface addressing and DNS servers. IPv6 addressing can be configured on the web-based manager and in the CLI.

There are many different features that FortiOS supports in IPv6. The following is what FortiOS supports in IPv6:

- Static routing
- Dynamic routing (RIPv6, BGP4+, and OSPFv3)
- DNS
- Network interface addressing
- Routing access lists and prefix lists
- IPv6 tunnel over IPv4 and IPv4 tunnel over IPv6
- Security policies
- Authentication
- IPv6 over SCTP
- UTM protection
- Packet and network sniffing
- IPsec VPN
- SSL VPN
- UTM protection
- NAT/Route and Transparent mode
- Logging and reporting
- SNMP
- Virtual IPs and groups
- IPv6-specific troubleshooting, such as ping6

When configuring IPv6 in FortiOS, you can create a dual stack route or IPv4-IPv6 tunnel. A dual stack routing configuration implements dual IP layers, supporting both IPv4 and IPv6, in both hosts and routers. An IPv4-IPv6 tunnel is essentially similar, creating a tunnel that encapsulates IPv6 packets within IPv4 headers that carry these IPv6 packets over IPv4 tunnels. The FortiGate unit can also be easily integrated into an IPv6 network.

IPv6 works almost the same as IPv4 in FortiOS. The only main difference is the IP addresses, since you are using IPv6 addressing instead of IPv4. There is also no NAT, unless you are configuring a dual stack routing or IPv4 tunnelling configuration.

Connecting the FortiGate unit to an IPv6 network is exactly the same as connecting it to an IPv4 network, the only difference is that you are using IPv6 addresses.

Dual stack routing configuration

A dual stack routing configuration implements dual IP layers in hosts and routers, supporting both IPv6 and IPv4. The FortiOS dual stack architecture supports both IPv4 and IPv6 traffic and routes the appropriate traffic as required to any device on the network. Administrators can update network components and applications to IPv6 on their own schedule, and even maintain some IPv4 support indefinitely if that is necessary.

Devices that are on this type of configured network, and connect to the Internet, can query Internet DNS servers for both IPv4 and IPv6 addresses. If the Internet site supports IPv6, the device can easily connect using the IPv6 address. If the Internet site does not support IPv6, then the device can connect using the IPv4 addresses. The dual stack architecture of FortiOS provides all the features that you need for protecting your network, such as UTM security for the traffic, and routing.

If an organization with a mixed network uses an Internet service provider that does not support IPv6, they can use an IPv6 tunnel broker to connect to IPv6 addresses that are on the Internet. FortiOS supports IPv6 tunneling over IPv4 networks to tunnel brokers. The tunnel broker extracts the IPv6 packets from the tunnel and routes them to their destinations.

IPv4 tunneling configuration

In an IPv4 tunneling configuration, IPv6 packets are encapsulated within IPv4 headers, which carry these IPv6 packets over IPv4 tunnels. This type of configuration is more appropriate for those who have completely transitional over to IPv6, but need an Internet connection, which is still mostly IPv4 addresses.

Remotely connecting to an IPv6 network over the Internet

Similar to the IPv4 tunneling configuration, FortiOS supports IPv6 tunneling over IPv4 across the Internet between two IPv6 networks that are protected by FortiGate units.

All traffic between the IPv6 networks are tunnelled over IPv4, which in this case is the Internet. Each FortiGate unit extracts the IPv6 traffic from the IPv4 tunnel and traffic on the internal networks uses IPv6.

In FortiOS, you configure this type of network configuration using IPsec VPN because IPv6 is supported for IPsec VPNs. The VPN provides higher security for the data transmitted between the IPv6 networks. This configuration includes an interface-based IPsec VPN between IPv6 interfaces on each FortiGate unit.

IPv6 overview

IP version 6 handles issues that weren't around decades ago when IPv4 was created such as running out of IP addresses, fair distributing of IP addresses, built-in quality of service (QoS) features, better multimedia support, and improved handling of fragmentation. A bigger address space, bigger default packet size, and more optional header extensions provide these features with flexibility to customize them to any needs.

IPv6 has 128-bit addresses compared to IPv4's 32-bit addresses, effectively eliminating address exhaustion. This new very large address space will likely reduce the need for network address translation (NAT) since IPv6 provides more than a billion IP addresses for each person on Earth. All hardware and software network components must support this new address size, an upgrade that may take a while to complete and will force IPv6 and IPv4 to work side-by-side during the transition period. During that time FortiOS supports IPv4 and IPv6 will ensure a smooth transition for networks.

Differences between IPv4 and IPv6

Table 6: IPv4 and IPv6 differences

Property	IPv4	IPv6
Address size	32 bits	128 bits
Network size	8 - 30 bits	64 bits
Packet header size	20 - 60 bytes	40 bytes
Header-level extension	Limited number of small IP options.	Unlimited number of IPv6 extension headers.

Table 6: IPv4 and IPv6 differences

Property	IPv4	IPv6
Fragmentation	Sender or any intermediate router allowed to fragment.	Only sender may fragment.
Control Protocols	Mixture of non-IP (ARP), ICMP and other protocols.	All control protocols based on ICMPv6.
Minimum MTU	567 bytes	1280 bytes
Address assignment	one address per host	multiple addresses per interface.
Address types	Use of unicast, multicast and broadcast address types.	Broadcast addressing no longer used, use of unicast, multicast and anycast address types
Address configuration	Devices configured manually or with host configuration protocols such as DHCP.	Devices configure themselves independently using stateless auto configuration or use DHCP.

IPv6 addresses are assigned to interfaces rather than nodes, thereby recognizing that a node can have more than one interface, and you can assign more than one IPv6 address to an interface. In addition, the larger address space in IPv6 addresses allows flexibility in allocating addresses and routing traffic, and simplifies some aspects of address assignment and renumbering when changing Internet Service Providers.

With IPv4, complex Classless Inter-Domain Routing (CIDR) techniques were developed to make the best use of the small address space. CIDR facilitates routing by allowing blocks of addresses to be grouped together into a single routing table entry. With IPv4, renumbering an existing network for a new connectivity provider with different routing prefixes is a major effort (see RFC 2071, Network Renumbering Overview: Why would I want it and what is it anyway? and RFC 2072, Router Renumbering Guide). With IPv6, however, it is possible to renumber an entire network ad hoc by changing the prefix in a few routers, as the host identifiers are decoupled from the subnet identifiers and the network provider's routing prefix.

The size of each subnet in IPv6 is 2^{64} addresses (64 bits), which is the square of the size of the entire IPv4 Internet. The actual address space utilized by IPv6 applications will most likely be small in IPv6, but both network management and routing will be more efficient.

IPv6 MTU

Maximum Transmission Unit (MTU) refers to the size (in bytes) of the largest packet or frame that a given layer of a communications protocol can pass onwards. A higher MTU brings higher bandwidth efficiency. IPv6 requires an MTU of at least 1280 bytes. With encapsulations (for example, tunneling), an MTU of 1500 or more is recommended.

IPv6 address format

The IPv6 address is 128 bits long and consists of eight, 16-bit fields. Each field is separated by a colon and must contain a hexadecimal number. In Figure 23, an X represents each field.

The IPv6 address is made up of two logical parts:

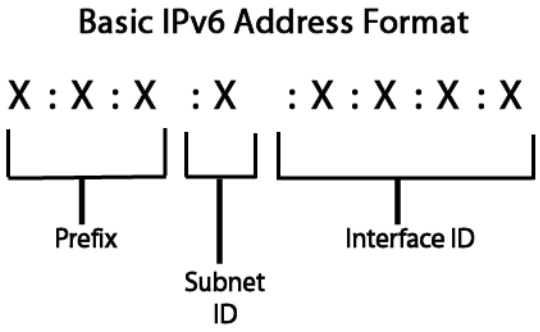
- 64-bit (sub)network prefix

- 64-bit host

The (sub)network prefix part contains the site prefix (first three fields, 48 bits) and the subnet ID (next two fields, 16-bits), for a total of 64-bits. The information contained in these fields is used for routing IPv6 packets. The (sub)network prefix defines the site topology to a router by specifying the specific link to which the subnet has been assigned. The site prefix details the public topology allocated (usually by an Internet Service Provider, ISP) to your site. The subnet ID details the private topology (or site topology) to a router that you assign to your site when you configure your IPv6 network.

The host part consists of the interface ID (or token) which is 64-bits in length and must be unique within the subnet. The length of the interface ID allows for the mapping of existing 48-bit MAC addresses currently used by many local area network (LAN) technologies such as Ethernet, and the mapping of 64-bit MAC addresses of IEEE 1394 (FireWire) and other future LAN technologies. The host is either configured automatically from the MAC address of the interface, or is manually configured.

Figure 23: IPv6 Address Format



IP address notation

IPv6 addresses are normally written as eight groups of four hexadecimal digits each, separated by a colon, for example:

```
2001:db8:3c4d:0d82:1725:6a2f:0370:6234
```

is a valid IPv6 address.

There are several ways to shorten the presentation of an IPv6 address. Most IPv6 addresses do not occupy all of the possible 128 bits. This results in fields that are “padded” with zeros or contain only zeros. If a 4-digit group is 0000, it may be replaced with two colons (::), for example:

```
2001:db8:3c4d:0000:1725:6a2f:0370:6234
```

is the same IPv6 address as:

```
2001:db8:3c4d::1725:6a2f:0370:6234
```

Leading zeroes in a group may be omitted, for example (in the address above):

```
2001:db8:3c4d::1725:6a2f:370:6234
```

The double colon (::) must only be used once in an IP address, as multiple occurrences lead to ambiguity in the address translation.

The following examples of shortened IP address presentations all resolve to the same address.

```
19a4:0478:0000:0000:0000:0000:1a57:ac9e
19a4:0478:0000:0000:0000::1a57:ac9e
19a4:478:0:0:0:0:1a57:ac9e
```

```
19a4:478:0:0::1a57:ac9e
19a4:478::0:0:1a57:ac9e
19a4:478::1a57:ac9e
```

All of these address presentations are valid and represent the same address.

For IPv4-compatible or IPv4-mapped IPv6 addresses (see "Address types" on page 240), you can enter the IPv4 portion using either hexadecimal or dotted decimal, but the FortiGate CLI always shows the IPv4 portion in dotted decimal format. For all other IPv6 addresses, the CLI accepts and displays only hexadecimal.

Netmasks

As with IP addresses, hexadecimal notation replaces the dotted decimal notation of IPv4. IPv4 Classless Inter-Domain Routing (CIDR) notation can also be used. This notation appends a slash ("/") to the IP address, followed by the number of bits in the network portion of the address.

Table 7: IPv6 address notation

IP Address	`3ffe:ffff:1011:f101:0210:a4ff:fee3:9566`
Netmask	`ffff:ffff:ffff:ffff:0000:0000:0000:0000`
Network	`3ffe:ffff:1011:f101:0000:0000:0000:0000`
CIDR IP/Netmask	`3ffe:ffff:1011:f101:0210:a4ff:fee3:9566/64`

Address scopes

Address scopes define the region where an address may be defined as a unique identifier of an interface. The regions are: local link (link-local), site network (site-local), and global network. Each IPv6 address can only belong to one zone that corresponds to its scope.

Address types

IPv6 addresses are classified into three groups - Unicast, Multicast, and Anycast.

Unicast

Identifies an interface of an individual node. Packets sent to a unicast address are sent to that specific interface. Unicast IPv6 addresses can have a scope reflected in more specific address names - global unicast address, link-local address, and unique local unicast address.

Multicast

Multicast addresses are assigned to a group of interfaces that typically belong to different nodes. A packet that is sent to a multicast address is delivered to all interfaces identified by the address.

IPv6 multicast addresses are distinguished from unicast addresses by the value of the high-order octet of the addresses. A value of 0xFF (binary 11111111) identifies an address as a multicast address. Any other value identifies an address as a unicast address.

The four least significant bits of the second address octet identify the address scope or the span over which the multicast address is propagated.

Anycast

Anycast addresses are assigned to a group of interfaces usually belonging to different nodes. A packet sent to an anycast address is delivered to just one of the member interfaces, typically the 'nearest' according to the router protocols' choice of distance. They cannot be identified easily as their structure is the same as a normal unicast address, differ only by being injected into the routing protocol at multiple points in the network. When a unicast address is assigned to more than one interface (making it an anycast address), the address assigned to the nodes must be configured in such as way as to indicate that it is an anycast address.

Interfaces configured for IPv6 must have at least one link-local unicast address and additional ones for site-local or global addressing. Link-local addresses are often used in network address autoconfiguration where no external source of network addressing information is available.

Special addresses

Special IPv6 addresses include unspecified and loopback addresses. For more information about IPv6 addresses, see RFC 4921, IP Version 6 Addressing Architecture

The IPv6 address space is split into scopes, or address scopes. The table below indicates which IPv6 address is used.

Table 8: IPv6 addresses with prefix information

Address Type	Binary Prefix	IPv6 Notation	Uses
Embedded IPv4 address	00...1111 1111 1111 1111 (96 bits)	::FFF/96	Prefix for embedding IPv4 address in an IPv6 address.
Loopback	00...1 (128 bits)	::1/128	Used as a node to send an IPv6 packet to itself. Seen as link-local unicast address of a virtual interface (loopback interface) to an imaginary link that goes nowhere. Must never be assigned to a physical interface, or as the source address of IPv6 packets that are sent outside of the single node. IPv6 destination address of loopback should not be sent outside a single node, and never forwarded by an IPv6 router. Equivalent to 127.0.0.1 in IPv4. RFC 246022
Global unicast	001	2000::3	Global unicast and anycast. RFC 429120
Global unicast	01 - 1111 1000 0	4000::/2 - FC00::/9	Global unicast and anycast (unallocated)

Table 8: IPv6 addresses with prefix information

Address Type	Binary Prefix	IPv6 Notation	Uses
Teredo	0010 0000 000 0001 0000 0000 000 0000	2001:0000::/32	Teredo - RFC 438023
Nonroutable	0010 0000 0000 0001 1101 1000 1000 0000	2001:D88::/32	Nonroutable. Documentation purposes only - RFC 384924
6to4	0010 0000 0000 0010	2002::/16	Used for communication between two nodes running both IPv4 and IPv6 over the Internet. Formed by combining the IPv6 prefix with the 32-bits of the public IPv4 address of the node, creating a 48-bit address prefix. - RFC 3056
6Bone	0011 1111 1111 1110	3FFE::/16	Deprecated. 6Bone testing assignment 1996 to mid-2006 RFC 370125
Local-link unicast	1111 1110 10	FE80::/10	Used for addressing on a single link for automatic address configuration, neighbor discovery, or when no routers are present. Routers must not forward packets with link-local source or destination addresses.
Reserved	1111 1110 11	FEC0::/10	Used for addressing inside of a site without needing a global prefix. Routers must not forward packets with site-local source or destination addresses outside of the site. RFC 387926
Local IPv6 address	1111 110	FC00::/7	Unicast unique local address space, unicast and anycast - RFC 419327
Multicast	1111 1111	FF00::/8	Multicast address space - RFC 4291 For more information, see “Multicast” on page 240.

Header Extension

The base header of an IPv6 address is fixed for efficient processing. Header extensions are indicated by the next header value in the next header field. Header extensions are optional and do not need to be present in all IPv6 packets. The sequence for the next header in order is represented by the diagram below.

IPv6 Header	Hop-by-Hop Options Header	Destinations OPtions Header Router	Routing Header	Fragment Header	Authentication on Header	Encapsulation Security Payload	Destination Options Header Destination	Mobility Header (MIPv6)	TCP/UDP/ SCTP	Payload

The last header extension is the value of either 6 for TCP, 17 for UDP, 132 for SCTP or any other transport protocol defined by the IETF.

Header extensions appear in the following sequence:

- Hop-by-Hop Options Header
  - First Extension Header
  - Next Header value of 0 indicates the Hop-by-Hop Options Extension Header
  - All nodes along the route or path must process this extension header
- Routing Header
  - Second Extension Header
  - Next Header value of 43 indicates the Routing Extension Header
  - All nodes along the route or path must process this extension header
  - Note that the Routing Header Type 0 is due to security reason depreciated
- Fragmentation Header
  - Third Extension Header
  - Next Header value of 44 indicates the Fragmentation Extension Header
  - Used in case of transmitting payload longer than a IPv6 packet can carry
- • Authentication Header (AH)
  - Fourth Extension Header
  - Next Header value of 50 indicates the Authentication Extension Header
  - Used to provide protection against replay, origin authentication and connectionless integrity
- Encapsulating Security Payload (ESP) Header
  - Fifth Extension Header
  - Next Header value of 51 indicates the ESP Extension Header
  - Used to provide protection against replay, origin authentication and connectionless integrity
- Destination Options Header
  - Sixth Extension Header
  - Next Header value of 60 indicates the Destination Options Header
  - Used to provide additional information for the end systems node
- Mobility Header
  - Seventh Extension Header
  - Next Header value of 135 indicates the Mobility Header
  - Used by mobile nodes to exchange information for Mobile IP nodes (MIPv6)

Table 9: Header and Protocol Types

Extension Header	Type

Table 9: Header and Protocol Types

Hop-by hop Options	0
Routing	43
Fragment	44
Destination Options	60
Authentication Header (AH)	50
Encapsulating Security Payload	51
Mobility	135
Protocol	**Type**
TCP	6
UDP	17
IPv6-in-IPv6	41
GRE	47
ICMPv6	58
No next header	59
OSPF	89
PIM	103
SCTP	132

IPv6 neighbor discovery

IPv6 Neighbor Discovery (ND) is a set of messages and processes that determine relationships between neighboring nodes. Neighboring nodes are on the same link. The IPv6 ND protocol replaces the IPv4 protocols Address Resolution Protocol (ARP), Internet Control Message Protocol (ICMPv4), Router Discovery (RDISC), and ICMP Redirect, and provides additional functionality. The IPv6 ND protocol facilitates the autoconfiguration of IPv6 addresses. Autoconfiguration is the ability of an IPv6 host to automatically generate its own IPv6 address, making address administration easier and less time-consuming.

Hosts use ND to:

- discover addresses, address prefixes, and other configuration parameters
- discover neighboring routers.

Routers use ND to:

- advertise their presence, host configuration parameters, and on-link prefixes
- inform hosts of ‘better’ next-hop address to forward packets for a specified destination.

Nodes use ND to:

- resolve link-layer address of a neighboring node to which an IPv6 packet is being forwarded and determine whether the link-layer address of a neighboring node has altered
- determine whether IPv6 packets can be sent to and received from a neighbor
- automatically configure IPv6 addresses for its interfaces.

To facilitate neighbor discovery, routers periodically send messages advertising their availability. This communication includes lists of the address prefixes for destinations available on each router's interfaces.

ND defines five different Internet Control Message Protocol (ICMP) packet types: a pair of Neighbor Solicitation and Neighbor Advertisement messages, a pair of Router Solicitation and Router Advertisement messages, and a Redirect message.

A Neighbor Solicitation is sent by a node to determine the link-layer address of a neighbor, or to verify that a neighbor is still reachable via a cached link-layer address. Also used for Duplicate Address Detection (how a node determines that an address it wants to use is not already in use by another node). The Neighbor Advertisement message is a response to a Neighbor Solicitation message. A node may also announce a link-layer address change by sending unsolicited Neighbor Advertisements.

A host may send a Router Solicitation when an interface becomes enabled, requesting routers to generate a Router Advertisement immediately rather than at their next scheduled time.

Routers advertise their presence together with various link and Internet parameters according to a specific schedule or in response to a Router Solicitation message. A Router Advertisement contains prefixes used for on-link determination and/or address configuration, a suggested hop limit value, etc.

The Redirect message is used by routers to inform hosts of a better first-hop for a destination.

For more information, see RFC 2461, *Neighbor Discovery for IP Version 6 (IPv6)*.

Transition from IPv4 to IPv6

If the Internet is to take full advantage of the benefits of IPv6, there must be a period of transition to enable IPv6-only hosts to reach IPv4 services and to allow isolated IPv6 hosts and networks to reach the IPv6 Internet over the IPv4 infrastructure.

RFC 2893, *Transition Mechanisms for IPv6 Hosts and Routers* and RFC 2185, *Routing Aspects of IPv6 Transition* define several mechanisms to ensure that IPv6 hosts and routers maintain interoperability with the existing IPv4 infrastructure, and facilitate a gradual transition that does not impact the functionality of the Internet. The mechanisms, known collectively as Simple Internet Transition (SIT), include:

- dual-stack IP implementations for hosts and routers that must interoperate between IPv4 and IPv6
- embedding of IPv4 addresses in IPv6 addresses. IPv6 hosts are assigned addresses that are interoperable with IPv4, and IPv4 host addresses are mapped to IPv6
- IPv6-over-IPv4 tunneling mechanisms to encapsulate IPv6 packets within IPv4 headers to carry them over IPv4 infrastructure
- IPv4/IPv6 header translation, used when implementation of IPv6 is well-advanced and few IPv4 systems remain.

FortiGate units are dual IP layer IPv6/IPv4 nodes and they support IPv6 over IPv4 tunneling. For more information, see RFC 2893, Transition Mechanisms for IPv6 Hosts and Routers and RFC 2185, Routing Aspects of IPv6 Transition.

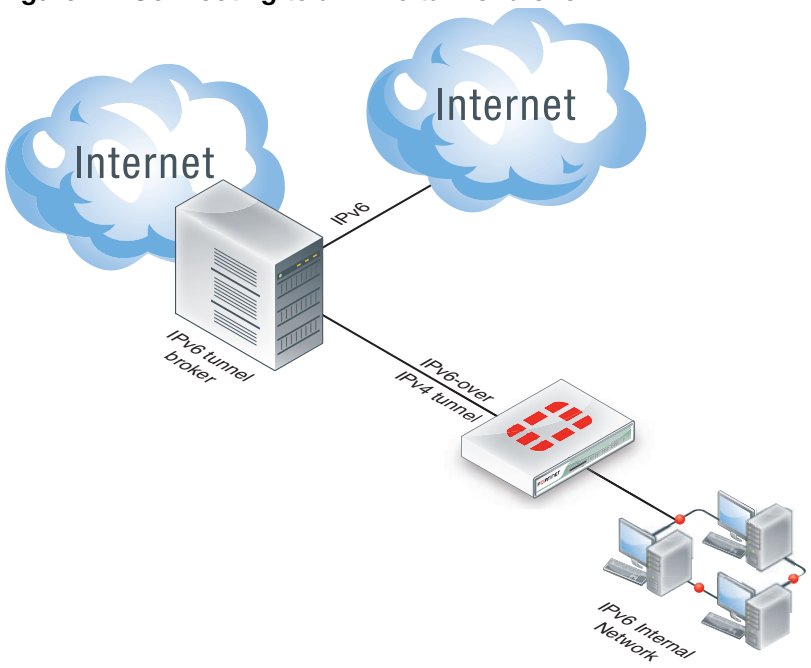
Configuring FortiOS to connect to an IPv6 tunnel provider

If an organization with a mixed network uses an Internet service provider that does not support IPv6, they can use an IPv6 tunnel broker to connect to IPv6 addresses on the Internet. FortiOS supports IPv6 tunnelling over service provider IPv4 networks to tunnel brokers. The tunnel broker extracts the IPv6 packets from the tunnel and routes them to their IPv6 destination. The internal network is running IPv6. The FortiGate unit creates an IPv6-over-IPv4 tunnel to the IPv6 tunnel broker. From the tunnel broker, your network can access IPv6 addresses on the Internet.

In this example the internal network is small and directly connected to the FortiGate unit. There is no need for routing on the internal network since everything is connected and on the same subnet. For this example, consider the following:

- Before configuring your FortiGate unit for IPv6-over-IPv4 tunneling, you need to choose an IPv6 tunnel broker and get their information.
- The addresses used in this example are for example use only.
- VDOMs are not enabled.
- The tunnel broker IPv4 address is 78.35.24.124.
- The tunnel broker IPv6 end of the tunnel is 2001:4dd0:ff00:15e::1/64.
- The FortiGate unit external IPv4 address is 172.20.120.17.
- The FortiGate unit IPv6 address of the tunnel is 2001:4dd0:ff00:15e::2/64.
- port1 of the FortiGate unit is connected to the internal network.
- port2 of the FortiGate unit is connected to the external network (Internet).

Figure 24: Connecting to an IPv6 tunnel broker



Steps to connect to an IPv6 tunnel broker

1. Create a SIT-Tunnel Interface.
2. Create a static IPv6 Route into the Tunnel-Interface.

3 Assign your IPv6 Network to your FortiGate.

4 Create a Firewall-Policy to allow Traffic from LAN to the Tunnel-Interface.

Create a SIT-tunnel interface

Creating the SIT-tunnel creates a virtual interface in the form of a tunnel, much like a VPN interface. The end points of the tunnel are the FortiGate unit and the tunnel broker's server addresses.

In the example, the external address of the FortiGate unit is DHCP-based and may change to any value on that subnet, so the source address allows for that.

```
config system sit-tunnel
  edit HE_ip6_broker
    set destination 78.35.24.124
    set interface port2
    set ip6 2001:4dd0:ff00:15e::2/64
    set source 172.20.120.0
  next
end
```

Now that the tunnel exists, some additional interface commands are required. Such as enabling ping6 for troubleshooting and allow HTTPS and SSH administration connections to the interface.

```
config system interface
  edit HE_ip6_broker
    config ipv6
      set ip6-allowaccess ping https ssh
    end
  next
end
```

Create a static IPv6 route into the tunnel-Interface

With the tunnel up and the security policies in place, all that remains is to add a default route for IPv6 traffic to go over the tunnel. As there will only be one static routing entry, there is no need for a priority. This may change in the future if other routes are added.

```
config router static6
  edit 1
    set device HE_ip6_broker
  next
end
```

Assign your IPv6 network to your FortiGate

This step assigns an IPv6 address to the internal interface on the FortiGate unit. That way all IPv6 traffic entering on this interface will be routed to the tunnel. Systems with addresses within this prefix are reachable on the subnet in question without help from a router, so the `onlink-flag` is enabled. Hosts can create an address for themselves by combining this prefix with an interface identifier, so the `autonomous-flag` is enabled.

```
config system interface
  edit port1
    config ipv6
      set ip6-address 2001:4dd0:ff42:72::1/64
      set ip6-allowaccess ping https ssh
      config ip6-prefix-list
      edit 2001:4dd0:ff42:72::/64
```

```
        set autonomous-flag enable
        set onlink-flag enable
        set preferred-life-time 3600
        set ip6-send-adv enable
      next
    end
  next
end
```

At this point any PCs on your internal network that are set to auto-configure, should have their addresses. To test this you can ping6 from the PC to the FortiGate unit. See "IPv6 ping description" on page 260.

Create a security policy to allow traffic from port1 to the tunnel interface

With the tunnel configured, it will appear as an interface in the Network interface list. That means the next step is to add a security policies to allow traffic to and from the tunnel.

```
config firewall policy6
  edit 2
    set srcintf port1
    set dstintf HE_ip6_broker
    set srcaddr "::/0"
    set dstaddr "::/0"
    set action accept
    set schedule "always"
    set service "ANY"
    set logtraffic enable
  next
end
```

Test the connection

To test the tunnel, try to connect to an external IPv6 address such as `http://ipv6.google.com`.

If you want to see the path the IPv6 traffic takes, do a traceroute from a PC on the internal network to an external address. You will see the traffic enter the FortiGate unit, enter the tunnel, pass through the tunnel broker server, and on out over the Internet.

If you are entering an IPv6 address into your web browser, you have to type: `https://[2001:4dd0:ff42:72::1]`. The square brackets are to discriminate between the address part and a port, like in `https://[2001:4dd0:ff42:72::1]:8080`

FortiGate IPv6 configuration

FortiOS (4.0 MR2) supports the following FortiOS IPv6 features (all configurable from the web-based manager or CLI):

- Static routing and dynamic routing
- Network interface addressing
- DHCP Server (CLI only)
- Routing access lists and prefix lists
- IPv6 tunnel over IPv4, IPv4 tunnel over IPv6
- Security policies and identity-based security policies

- Local-in security policies
- IPv6 over SCTP
- Packet and network sniffing
- IPsec VPNs
- UTM protection including
- NAT/Route and Transparent mode
- Logging and reporting
- IPv6 specific troubleshooting such as ping6

Displaying IPv6 options on the web-based manager

Before configuring IPv6 using the web-based manager, you must first turn on IPv6 display by going to *System* > *Admin* > *Settings* and selecting the IPv6 support option.Once turned on, IPv6-related options and pages appear throughout the web-based manager. For example, you can add IPv6 addresses to any FortiGate interface, you can add IPv6 DNS server IP addresses, IPv6 security policies, IPv6 firewall addresses and so on.

UTM protection for IPv6 networks

FortiOS uses IPv6 security policies to provide UTM protection for IPv6 traffic. Antivirus, web filtering, FortiGuard Web Filtering, email filtering, FortiGuard Email Filtering, data leak prevention (DLP), and VoIP protection features can be enabled in IPv6 security policies using normal FortiOS UTM profiles for each UTM feature.

Configuring IPv6 interfaces

The dual stack architecture is most obvious when configuring IPv6 on interfaces on your FortiGate unit.

IPv6 interfaces - web-based manager

In the *Addressing mode* section of the *Create New* or *Edit* screen, there are two fields instead of one. Without IPv6 enabled, there is only the *IP/Netmask* field for IPv4 addresses. With IPv6 enabled, there is an additional field called *IPv6 Address*.

With both addresses configured for an interface, that interface will accept both IPv4 and IPv6 traffic. Each protocol will be handled differently, depending on the security policies and routing in place for it. This allows traffic from IPv6 to be sent to other IPv6 devices, and IPv4 traffic to be sent only to other IPv4 devices. This separation of the traffic is required because if IPv6 traffic is sent to devices that don't support it, that traffic will not reach its destination.

You should enable IPv6 Administrative Access to connect to the IPv6 address of an interface for administration.

IPv6 interfaces - CLI

In the CLI, there are a number of IPv6 specific interface settings. These are found as part of the `config system interface` command under `config ipv6`. In the CLI there are many more settings available, although many are optional. The settings that are required or recommended are highlighted.

```
config system interface
  edit <interface_string>
    config ipv6
```

```
        set ip6-address <ipv6_addr>
        set ip6-allowaccess <http https ping ssh telnet>
        set ip6-link-mtu <bytes_int>
        set ip6-send-adv <enable | disable>
        set autoconf <enable | disable>
        set ip6-default-life <seconds_int>
        set ip6-hop-limit <count_int>
        set ip6-manage-flag <enable | disable>
        set ip6-max-interval <integer>
        set ip6-min-interval <integer>
        set ip6-other-flag <enable | disable>
        set ip6-reachable-time <integer>
        set ip6-retrans-time <integer>
          config ip6-extra-addr
            edit <ipv6_addr>
          end
          config ip6-prefix-list
            set autonomous-flag <enable | disable>
            set onlink-flag <enable | disable>
            set preferred-life-time <integer>
            set valid-life-time <integer>
        end
      end
end
```

Configuring IPv6 routing

IPv6 routing is supported in both static and dynamic routing. The main difference from a configuration point of view is in the addresses.

Static routing

Static routing for IPv6 is essentially the same as with IPv4. From a configuration point of view, the only difference is the type of addresses used. When both IPv4 and IPv6 static routes are configured, they are displayed under two separate headings on the static routing page - *Route* and *IPv6 Route*. Use the arrows next to each heading to expand or minimize that list of routes.

To configure IPv6 static routes - web-based manager

1. Go to *Router* > *Static* > *Static Route*.
2. Select arrow to expand the *Create New* menu.
3. Select *IPv6 Route*.
4. Enter *Destination IP/Mask, Device, Gateway, Distance,* and *Priority* as with normal static routing using IPv6 addresses.
5. Select *OK*.

To configure IPv6 static routes - CLI

Use the following command to add an IPv6 static route:

```
config router static6
  edit 1
    set dst <ipv6_addr>
    set gateway <ipv6_addr>
    set device <interface>
```

```
        set priority <integer>
    end
```

Dynamic routing

As with static routing, the dynamic routing protocols all have IPv6 versions. Both IPv4 and IPv6 dynamic routing can be running at the same time due to the dual stack architecture of the FortiGate unit. IPv6 dynamic routing must be configured using CLI commands.

Table 10: Dynamic routing protocols, IPv6 versions, CLI command, and RFCs

Dynamic Routing	IPv6	CLI command	IPv6 RFC
RIP	RIP next generation (RIPng)	`config router ripng`	RFC 2080
BGP	BGP4+	`config router bgp` All parts of bgp that include IP addresses have IPv4 and IPv6 versions.	RFC 2545 and RFC 2858
OSPF	OSPFv3	`config rotuer ospf6`	RFC 2740

Configuring IPv6 security policies

Configuring IPv6 security policies is similar to configuring IPv4 security policies. On the web-based manager go to *Policy* > *IPv6 Policy*. From the CLI use the command `config firewall policy6`. You must also add IPv6 firewall addresses (*Firewall Objects* > *Address* or `config firewall address6`) and address groups (*Firewall Objects* > *Address* > Group or `config firewall addgrp6`).

Under the security policies for IPv6, you can also define SSL-VPN actions and authentication policies.

IPv6 Policy configuration settings

The following are IPv6 security policy configuration settings in *Policy* > *Policy* > *IPv6 Policy*.

New Policy page	
Source Interface/Zone	Select the name of the FortiGate network interface, virtual domain (VDOM) link, or zone on which IP packets are received. Interfaces and zones are configured on the System Network page. You can also create a web proxy firewall proxy by selecting *web-proxy* in Source Interface/Zone.
	If you select *any* as the source interface, the security policy matches all interfaces as source. When you select *any* as the source interface, that security policy list is displayed only in global view.
	If *Action* is set to *IPSEC*, the interface is associated with the local private network.
	If *Action* is set to *SSL-VPN*, the interface is associated with connections from remote SSL VPN clients.
Source Address	Select the name of a firewall address to associate with the *Source Interface/Zone*.

	You can also create firewall addresses by selecting *Create New* from this list. If you want to associate multiple firewall addresses or address groups with *Source Interface/Zone*, from *Source Address*, select *Multiple*. In the dialog box, move the firewall addresses or address groups from the *Available Addresses* section to the *Members* section, then select *OK*.
Destination Interface/Zone	Select the name of the FortiGate network interface, virtual domain (VDOM) link, or zone to which IP packets are forwarded. Interfaces and zones are configured on the System Network page.
	If you select *any* as the source interface, the security policy matches all interfaces as source. When you select *any* as the source interface, that security policy list is displayed only in *Global View*.
Destination Address	Select the name of a firewall address to associate with *Destination Interface/Zone*. Only packets whose header contains an IP address matching the selected firewall address will be subject to this security policy.
	You can also create firewall addresses by selecting *Create New* from this list.
	If you want to associate multiple firewall addresses or address groups with the *Destination Interface/Zone*, from *Destination Address*, select *Multiple*. In the dialog box, move the firewall addresses or address groups from the *Available Addresses* section to the *Members* section, then select *OK*.
	If you select a virtual IP, the unit applies NAT or PAT. The applied translation varies by the settings specified in the virtual IP, and whether you select NAT (below).
Schedule	Select a one-time or recurring schedule or a schedule group that controls when the security policy is in effect. You can also create schedules by selecting *Create New* from this list.
Service	Select a firewall service or create a new custom service. If you are creating a web proxy security policy, *Web Proxy Service* appears and you can choose either a web proxy service or web proxy group.
Action	Select how you want the firewall to respond when a packet matches the conditions of the security policy.
Log Allowed Traffic	Select to record security policy traffic activity whenever the security policy processes a connection. These log messages are located in the traffic log. You must also enable traffic log for a logging location and set the logging severity level to *Notification* or lower using the Log&Report menu. This option is not available for web-proxy security policies.
Log Violation traffic	Select to record security policy traffic activity whenever the security policy processes a violation. These log messages are located in the traffic log. Appears only when *Action* is *DENY*.

Enable web cache	Select to enable web caching for HTTP traffic accepted by the security policy. This option is available only on FortiGate units that support WAN Optimization and web caching. Enabling web caching in a security policy is similar to enabling web caching in a WAN Optimization rule. However, enabling web caching in a security policy means you can also apply UTM options to web cached traffic in a single VDOM. You can use this option to apply web caching for explicit web proxy traffic if the Source Interface/Zone is set to the web-proxy interface. Web caching supports caching of HTTP 1.0 and HTTP 1.1 web sites on the FortiGate unit hard disk. Some HTTP content accepted by the security policy may not be cached. See **RFC 2616** for information about web caching for HTTP 1.1.
Enable NAT	Available only if *Action* is set to *ACCEPT* or *SSL-VPN*. Enable or disable Network Address Translation (NAT) of the source address and port of packets accepted by the security policy. When *NAT* is enabled, you can also configure *Dynamic IP Pool* and *Fixed Port*. If you select a virtual IP as the *Destination Address*, but do not select the *NAT* option, the unit performs destination NAT (DNAT) rather than full NAT. Source NAT (SNAT) is not performed.
Use Destination Interface Address	Select to use the destination interface address. If *Central NAT Table* is enabled, you can choose between this option and using the central NAT table.
Use Central NAT Table	Select to enabling logging using the Central NAT table that you configured in the Central NAT Table menu.
Use Dynamic IP Pool	Available only when *Enable NAT* is selected. Select the check box, then select an IP pool to translate the source address to an IP address randomly selected from addresses in the IP Pool. *IP Pool* cannot be selected if the destination interface, VLAN subinterface, or one of the interfaces or VLAN subinterfaces in the destination zone is configured using DHCP or PPPoE.
Enable Identity Based Policy	Select to configure security policies that require authentication.
Resolve User Names Using FSSO Agent	Select to resolve user names when using the Fortinet Single Sign-On Agent feature.

Enable Dynamic Profile	Select to configure a dynamic profile security policy. Dynamic profile is a method for users to use a RADIUS server for a single sign-on access to network resources. The *Enable Dynamic Profile* option does not display by default on the web-based manager; you must first enable it in *System* > *Admin* > *Settings*. If you have VDOMs enabled, you can configure one RADIUS server and security policy for dynamic profile per VDOM. With multiple VDOMs, you can have each one with their own profile group on their own RADIUS server with their own custom level of access. After selecting the check box beside *Enable Dynamic Profile*, the following options appear below: • *Profile Group* – select a dynamic profile group from the drop-down list • *Dynamic Profile Users Only* – select to only accept sessions with source addresses that are in the user context list
UTM	Select an UTM option to apply to the security policy. You must enable UTM before you can select the available UTM options. When selecting an option, select a profile from the list, or select *Create New* from the list to build a profile.
Web Proxy Forwarding Server	Select a web proxy forwarding server from the drop-down list. This appears only when configuring a web proxy security policy.
GTP Profile (FortiOS Carrier only)	Select a GTP profile from the drop-down list. Select *Create New* to create a new GTP profile. Select *View* to view the GTP profile.
Traffic Shaping	Select a traffic shaper for the security policy. You can also create a new shared traffic shaper. Shared traffic shapers control the bandwidth available to and set the priority of the traffic as its processed by, the security policy.
Reverse Direction Traffic Shaping	Select to enable reverse traffic shaping and select a shared traffic shaper. For example, if the traffic direction that a security policy controls is from port1 to port2, select this option will also apply the security policy shaping configuration to traffic from port2 to port1.
Dynamic Profile Users Only	Select to configure the security policy to only accept sessions with source addresses that are in the dynamic profile user context list. Sessions with source addresses that are not in the user context list do not match the security policy. For sessions that do not match the security policy, the unit continues searching down the security policy list for a match.
Enable Endpoint Security	Select to enable the Endpoint NAC feature and select the Endpoint NAC profile to apply. • You cannot enable Endpoint in security policies if *Redirect HTTP Challenge to a Secure Channel (HTTPS)* is enabled in *User* > *Options* > *Authentication*. • If the security policy involves a load balancing virtual IP, the Endpoint check is not performed.
Enable Disclaimer	Select to include a disclaimer page. Select *Edit* to modify the disclaimer replacement message.

Tags	Applies tags to the security policy. Tags can be viewed on the Policy page in the *Tags* column.
Applied Tags	Displays the tags that you have added to the security policy.
Add Tags	Enter the tag in the field and select the plus (+) sign to add the tag to the security policy. This also adds the tag to the *Applied Tags* list.
Comments	Add information about the security policy. The maximum length is 63 characters.

Configuring IPv6 DNS

Configuring DNS servers with IPv6 addresses is located in the same location as IPv4, by going to *System* > *Network* > *DNS*. There is a separate area for adding IPv6 addresses for DNS. From the CLI, use the command `config system dns`, where additional commands `ip6-primary` and `ip6-secondary` are available.

Configuring IPv6 DHCP

Configuring DHCP servers with IPv6 is performed using the CLI only. While similar to IPv4, there are a few exceptions:

- There is no gateway to define. A host is learns the gateway using router advertisement messages
- There is no WINS servers defined for dhcpv6, as it is obsolete.

To configure DHCP use the following command set:

```
config system dhcp6 server
  edit 1
    set domain example.com
    set interface port3
      config ip-range
        edit 1
          set end-ip 2800:68:15:3::10
          set start-ip 2800:68:15:3::1
        end
          set option1 50 'AABB'
          set subnet 2800:68:15:3::/64
          set dns-server1 2800:68:15:3::2
          set dns-server2 2800:68:15:3::29
          set dns-server3 2800:68:15:3::28
          set enable enable
    end
end
```

For more information on the commands, see the *CLI Reference*.

Configuring IPv6 over IPv4 tunneling

IPv6 over IPv4 tunneling can only be configured in the CLI using the `config system sit-tunnel` command. When you configure an IPv6 over IPv4 tunnel, you are creating a virtual interface that can be used in configurations just like any other virtual interface such as VLANs.

The name of the command `sit-tunnel` comes from Simple Internet Transition (SIT) tunneling. For the period while IPv6 hosts and routers co-exist with IPv4, a number of transition mechanisms are needed to enable IPv6-only hosts to reach IPv4 services and to allow isolated IPv6 hosts and networks to reach the IPv6 Internet over the IPv4 infrastructure.

These techniques, collectively called Simple Internet Transition, include:

- dual-stack IP implementations for interoperating hosts and routers
- embedding IPv4 addresses in IPv6 addresses
- IPv6-over-IPv4 tunneling mechanisms
- IPv4/IPv6 header translation

The syntax for the IPv6 over IPv4 tunneling CLI command is:

```
config system sit-tunnel
  edit <name_string>
    set destination <ipv4_addr>
    set interface <interface_string>
    set ip6 <ipv6_addr>
    set source <ipv4_addr>
  next
end
```

<name_string>	This will be the name of the tunnel, and appear in the network interface list. It should be descriptive such as `my_ip6_tunnel`. The maximum length allowed is 15 characters.
destination <ipv4_addr>	This is the tunnel broker's IPv4 server address. It is one of the two ends of the tunnel.
interface <interface_string>	This interface is the interface the tunnel piggy backs on. Generally this should be the external interface of the FortiGate unit. This setting is optional if you don't have a fixed IP address from your ISP.
ip6 <ipv6_addr>	The IPv6 address of the tunnel.
source <ipv4_addr>	This is the FortiGate unit end of the tunnel. It is just like any other FortiGate unit interface address. If this address is DHCP-based, it will change. In that case you should ensure the netmask covers the possible range of addresses. It is possible to use 0.0.0.0 to cover all possible addresses if you have a DDNS or PPPoE connection where the address changes.

For more configuration of tunnels see "Configuring FortiOS to connect to an IPv6 tunnel provider" on page 246.

Configuring IPv6 IPsec VPNs

The FortiGate unit supports route-based IPv6 IPsec, but not policy-based.

Where both the gateways and the protected networks use IPv6 addresses, sometimes called IPv6 over IPv6, you can create either an auto-keyed or manually-keyed VPN. You can combine IPv6 and IPv4 addressing in an auto-keyed VPN in the following ways:

IPv4 over IPv6	The VPN gateways have IPv6 addresses. The protected networks have IPv4 addresses. The phase 2 configurations at either end use IPv4 selectors.
IPv6 over IPv4	The VPN gateways have IPv4 addresses. The protected networks use IPv6 addresses. The phase 2 configurations at either end use IPv6 selectors.

Compared with IPv4 IPsec VPN functionality, there are some limitations:

- Except for IPv6 over IPv4, remote gateways with Dynamic DNS are not supported. This is because FortiOS 3.0 does not support IPv6 DNS.
- You cannot use RSA certificates in which the common name (cn) is a domain name that resolves to an IPv6 address. This is because FortiOS 3.0 does not support IPv6 DNS.
- DHCP over IPsec is not supported, because FortiOS 3.0 does not support IPv6 DHCP.
- Selectors cannot be firewall address names. Only IP address, address range and subnet are supported.
- Redundant IPv6 tunnels are not supported.

Certificates

On a VPN with IPv6 phase 1 configuration, you can authenticate using VPN certificates in which the common name (cn) is an IPv6 address. The `cn-type` keyword of the `user peer` command has an option, `ipv6`, to support this.

Configuring IPv6 IPsec VPNs

Configuration of an IPv6 IPsec VPN follows the same sequence as for an IPv4 route-based VPN: phase 1 settings, phase 2 settings, security policies and routing.

To access IPv6 functionality through the web-based manager, go to *System Admin* > *Settings* and enable *IPv6 Support on GUI*.

Phase 1 configuration

In the web-based manager, you define the Phase 1 as IPv6 in the *Advanced* settings. Enable the *IPv6 Version* check box. You can then enter an IPv6 address for the remote gateway.

In the CLI, you define an IPsec phase 1 configuration as IPv6 by setting `ip-version` to `6`. Its default value is `4`. Then, the `local-gw` and `remote-gw` keywords are hidden and the corresponding `local-gw6` and `remote-gw6` keywords are available. The values for `local-gw6` and `remote-gw6` must be IPv6 addresses.

For example:

```
config vpn ipsec phase1-interface
  edit tunnel6
    set ip-version 6
    set remote-gw6 0:123:4567::1234
    set interface port3
    set proposal 3des-md5
  end
```

Phase 2 configuration

To create an IPv6 IPsec phase 2 configuration in the web-based manager, you need to define IPv6 selectors in the Advanced settings. Change the default `0.0.0.0/0` address for Source address and Destination address to the IPv6 value `::/0`. If needed, enter specific IPv6 addresses, address ranges or subnet addresses in these fields.

In the CLI, set `src-addr-type` and `dst-addr-type` to `ip6`, `range6` or `subnet6` to specify IPv6 selectors. By default, zero selectors are entered, `::/0` for the `subnet6` address type, for example. The simplest IPv6 phase 2 configuration looks like the following:

```
config vpn ipsec phase2-interface
  edit tunnel6_p2
    set phase1name tunnel6
    set proposal 3des-md5
    set src-addr-type subnet6
    set dst-addr-type subnet6
  end
```

Security policies

To complete the VPN configuration, you need a security policy in each direction to permit traffic between the protected network's port and the IPsec interface. You need IPv6 policies unless the VPN is IPv4 over IPv6.

Routing

Appropriate routing is needed for both the IPsec packets and the encapsulated traffic within them. You need a route, which could be the default route, to the remote VPN gateway via the appropriate interface. You also need a route to the remote protected network via the IPsec interface.

To create a static route in the web-based manager, go to *Router* > *Static* > *Static Route*. Select the drop-down arrow for *Create New* and select *IPv6 Route*. Enter the information and select *OK*. In the CLI, use the `router static6` command. For example, where the remote network is fec0:0000:0000:0004::/64 and the IPsec interface is `toB`:

```
config router static6
  edit 1
    set device port2
    set dst 0::/0
  next
  edit 2
    set device toB
    set dst fec0:0000:0000:0004::/64
  next
end
```

If the VPN is IPV4 over IPv6, the route to the remote protected network is an IPv4 route. If the VPN is IPv6 over IPv4, the route to the remote VPN gateway is an IPv4 route.

IPv6 troubleshooting

There are a number of troubleshooting methods that can be used with IPv6 issues.

ping6

The main method of troubleshooting IPv6 traffic is using the IPv6 version of ping.

You can use the IPv6 ping command to:

- send an ICMP echo request packet to the IPv6 address that you specify.
- specify a source interface other than the one from which the probe originates by using the source interface keywords.
- specify a source IP address other than the one from which the probe originates by using the source address keywords

You can specify the following options:

packetCount	Number of packets to send to the destination IPv6 address. If you specify a zero, echo requests packets are sent indefinitely.
data-pattern	Sets the type of bits contained in the packet to all ones, all zeros, a random mixture of ones and zeros, or a specific hexadecimal data pattern that can range from 0x0 to 0xFFFFFFFF. The default is all zeros.
extended header attributes	Set the interface type and specifier of a destination address on the system that is configured for external loopback; the command succeeds only if the specified interface is configured for external loopback.
sweep interval	Specifies the change in the size of subsequent ping packets while sweeping across a range of sizes. For example, you can configure the sweep interval to sweep across the range of packets from 100 bytes to 1000 bytes in increments specified by the sweep interval. By default, the system increments packets by one byte; for example, it sends 100, 101, 102, 103, ... 1000. If the sweep interval is 5, the system sends 100, 105, 110, 115, ... 1000.
sweep sizes	Enables you to vary the sizes of the echo packets being sent. Used to determine the minimum sizes of the MTUs configured on the nodes along the path to the destination address. This reduces packet fragmentation, which contributes to performance problems. The default is to not sweep (all packets are the same size).
timeout	Sets the number of seconds to wait for an ICMP echo reply packet before the connection attempt times out.
hop limit	Sets the time-to-live hop count in the range 1-255; the default is 255.

The following characters may appear in the display after the ping command is issued:

! - reply received

. - timed out while waiting for a reply

? - unknown packet type

A - admin unreachable

b - packet too big

H - host unreachable

N - network unreachable

P - port unreachable

p - parameter problem

S - source beyond scope

t - hop limit expired (TTL expired)

IPv6 ping description

Ping uses the ICMP protocol's mandatory ECHO_REQUEST datagram to elicit an ICMP ECHO_RESPONSE from a host or gateway. ECHO_REQUEST datagrams (''pings'') have an IP and ICMP header, followed by a strict timeval and then an arbitrary number of ''pad'' bytes used to fill out the packet.

See also

IPv6 ping options

-a	Audible ping.
-A	Adaptive ping. Interpacket interval adapts to round-trip time, so effectively no more than one (or more, if preload is set) unanswered probe is present in the network. Minimal interval is 200msec for any user other than administrator. On networks with low rtt this mode is essentially equivalent to flood mode.
-b	Allow pinging of a broadcast address.
-B	Do not allow ping to change source address of probes. The address is bound to one selected when the ping starts.
-c *count*	Stop after sending count ECHO_REQUEST packets. With deadline option, ping waits for count ECHO_REPLY packets, until the timeout expires.
-d	Set the SO_DEBUG option on the socket being used. This socket option is not used by a Linux kernel.
-F *flow label*	Allocate and set 20 bit flow label on echo request packets (only ping6). If value is zero, kernel allocates random flow label.
-f	Flood ping. For every ECHO_REQUEST sent a period ''.'' is displayed, while for ever ECHO_REPLY received a backspace is displayed. This provides a rapid display of how many packets are being dropped. If interval is not specified, it is set to zero and packets are output as fast as they come back or one hundred times per second, whichever is faster. Only the administrator may use this option with zero interval.
-i *interval*	Wait a specified interval of seconds between sending each packet. The default is 1 second between each packet, or no wait in flood mode. Only an administrator can set the interval to a value of less than 0.2 seconds.
-I *interface address*	Set source address to specified interface address. Argument may be numeric IP address or name of device. This option is required when you ping an IPv6 link-local address.
-l *preload*	If preload is specified, ping sends this number of packets that are not waiting for a reply. Only the administrator may select a preload of more than 3.
-L	Suppress loopback of multicast packets. This flag only applies if the ping destination is a multicast address.
-n	Numeric output only. No attempt will be made to look up symbolic names for host addresses.

-p *pattern*	You may specify up to 16 ''pad'' bytes to fill out the packet you send. This is useful for diagnosing data-dependent problems in a network. For example, -p ff will cause the sent packet to be filled with all ones.
-Q *tos*	Set Quality of Service -related bits in ICMP datagrams. tos can be either decimal or hex number. Traditionally (RFC1349), these have been interpreted as: 0 for reserved (currently being redefined as congestion control), 1-4 for Type of Service and 5-7 for Precedence. Possible settings for Type of Service are: minimal cost: 0x02, reliability: 0x04, throughput: 0x08, low delay: 0x10. Multiple TOS bits should not be set simultaneously. Possible settings for special Precedence range from priority (0x20) to net control (0xe0). You must be root (CAP_NET_ADMIN capability) to use Critical or higher precedence value. You cannot set bit 0x01 (reserved) unless ECN has been enabled in the kernel. In RFC 2474, these fields has been redefined as 8-bit Differentiated Services (DS), consisting of: bits 0-1 of separate data (ECN will be used, here), and bits 2-7 of Differentiated Services Codepoint (DSCP).
-q	Quiet output. Nothing is displayed except the summary lines at startup time and when finished
-R	Record route. (IPv4 only) Includes the RECORD_ROUTE option in the ECHO_REQUEST packet and displays the route buffer on returned packets. Note that the IP header is only large enough for nine such routes. Many hosts ignore or discard this option.
-r	Bypass the normal routing tables and send directly to a host on an attached interface. If the host is not on a directly-attached network, an error is returned. This option can be used to ping a local host through an interface that has no route through it provided the option -I is also used.
-s *packetsize*	Specifies the number of data bytes to be sent. The default is 56, which translates into 64 ICMP data bytes when combined with the 8 bytes of ICMP header data.
-S *sndbuf*	Set socket sndbuf (send buffer). If not specified, it is selected to buffer not more than one packet.
-t *ttl*	Set the IP Time to Live.
-T *timestamp option*	Set special IP timestamp options. May be either tsonly (only timestamps), tsandaddr (timestamps and addresses) or tsprespec host1 [host2 [host3 [host4]]] (timestamp prespecified hops).
-M *hint*	Select Path MTU Discovery strategy. hint may be either do (prohibit fragmentation, even local one), want (do PMTU discovery, fragment locally when packet size is large), or don’t (do not set DF flag).
-U	Print full user-to-user latency (the old behavior). Normally ping prints network round trip time, which can be different f.e. due to DNS failures.
-v	Verbose output.
-V	Show version and exit.

-w *deadline*	Specify a timeout, in seconds, before ping exits regardless of how many packets have been sent or received. In this case ping does not stop after count packet are sent, it waits either for deadline expire or until count probes are answered or for some error notification from network.
-W *timeout*	Time to wait for a response, in seconds. The option affects only timeout in absence of any responses, otherwise ping waits for two RTTs.

Examples

Ping a global V6 address with a 1400 byte packet from FortiGate CLI:

```
execute ping6 –s 1400 2001:480:332::10
```

Ping a multicast group using a ping6 command on FortiGate CLI (-I and port name must be specified for CLI ping6 command to ping v6 multicast group):

```
execute ping6 –I port1 ff02::1
```

Ping a localnet v6 address from FortiGate CLI:

```
execute ping6 FE80:0:0:0:213:e8ff:fe9e:ccf7
```

This address would normally be written as `FE80::213:e8ff:fe9e:ccf7`.

diagnose sniffer packet

The FortiOS built in packet sniffer also works with IPv6. The following are some examples using an IPv6-over-IPv4 tunnel called `test6`.

```
diagnose sniffer packet test6 'none' 4
interfaces=[test6]
filters=[]
pcap_lookupnet: test6: no IPv4 address assigned
34.258651 test6 -- 2001:4dd0:ff00:15d::2 -> 2001:4dd0:ff00:15d::1:
    icmp6: echo request seq 1
34.324658 test6 -- 2001:4dd0:ff00:15d::1 -> 2001:4dd0:ff00:15d::2:
    icmp6: echo reply seq 1
35.268581 test6 -- 2001:4dd0:ff00:15d::2 -> 2001:4dd0:ff00:15d::1:
    icmp6: echo request seq 2
35.334230 test6 -- 2001:4dd0:ff00:15d::1 -> 2001:4dd0:ff00:15d::2:
    icmp6: echo reply seq

diagnose sniffer packet any 'ip6 and tcp port 80' 4 10
interfaces=[any]
filters=[ip6 and tcp port 80]
1 LAN in 2001:4dd0:ff42:72:21b:63ff:fe08:e071.53037 ->
    2a00:1450:8007::63.80: syn 2298823882
2 test6 out 2001:4dd0:ff42:72:21b:63ff:fe08:e071.53037 ->

```

```
6 test6 out 2001:4dd0:ff42:72:21b:63ff:fe08:e071.53037 ->
   2a00:1450:8007::63.80: ack 4218782320
```

diagnose debug flow

The `diagnose debug flow` CLI command is the same for IPv6 or IPv4. The output format is the same, however the command is only slightly different in that it uses `filter6` and an IPv6 address.

To enable diag debug flow for IPv6 - CLI

```
# diagnose debug enable
# diagnose debug flow show console enable
# diagnose debug flow show func enable
# diagnose debug flow filter6 addr 2001:4dd0:ff42:12::24
# diagnose debug flow trace start6
```

IPv6 specific diag commands

To list all the sit-tunnels that are configured:

```
diagnose ipv6 sit-tunnel list
total tunnel = 1:
devname=test6 devindex=4 ifindex=22 saddr=0.0.0.0
   daddr=88.25.29.134 proto=41 vfid=0000 ref=2
```

To list all the IPv6 routes:

```
diagnose ipv6 route list
vf=0 type=02 protocol=unspec flag=00200001 oif=8(root)
   dst:::1/128 gwy::: prio=0
vf=0 type=02 protocol=unspec flag=00200001 oif=8(root)
   dst:2001:4dd0:ff00:75d::2/128 gwy::: prio=0
vf=0 type=01 protocol=kernel flag=00240021 oif=22(sixxs)
   dst:2001:4dd0:ff00:75d::/64 gwy::: prio=100
vf=0 type=02 protocol=unspec flag=00200001 oif=8(root)
   dst:2001:4dd0:ff42:68::1/128 gwy::: prio=0
vf=0 type=01 protocol=kernel flag=01040001 oif=19(LAN)
   dst:2001:4dd0:ff42:68:225:ff:feee:5314/128
gwy:2001:4dd0:ff42:68:225:ff:feee:5314 prio=0
.....
```

Some other IPv6 diagnose commands include:

`diagnose ipv6 neighbor-cache`	Add, delete, flush, or list the IPv6 ARP table or table entry.
`diagnose sys session6`	Clear, filter, full-stat, list, stat IPv6 sessions.
`tree diagnose ipv6`	View all the diagnose IPv6 commands.

Additional IPv6 resources

There are many RFCs available regarding IPv6. The following table lists the major IPv6 articles and their Internet Engineering Task Force (IETF) web locations.

RFC	Subject	Location
RFC 1933, *Transition Mechanisms for IPv6 Hosts and Routers*	Describes IPv4 compatibility mechanisms that can be implemented by IPv6 hosts and routers	http://www.ietf.org/rfc/rfc1933
RFC 2185, *Routing Aspects of IPv6 Transition*	Provides an overview of the routing aspects of the IPv6 transition	http://www.ietf.org/rfc/rfc2185
RFC 2373, IP Version 6 Addressing Architecture	Defines the addressing architecture of the IP Version 6 protocol [IPV6]	http://www.ietf.org/rfc/rfc2373
RFC 2402, *IP Authentication Header*	Describes functionality and implementation of IP Authentication Headers (AH)	http://www.ietf.org/rfc/rfc2402
RFC 2460, *Internet Protocol, Version 6 (IPv6) Specification*	Describes functionality, configuration of IP version 6 (IPv6) and differences from IPv4.	http://www.ietf.org/rfc/rfc2460
RFC 2461, *Neighbor Discovery for IP Version 6 (IPv6*)	Describes the features and functions of IPv6 Neighbor Discovery protocol	http://www.ietf.org/rfc/rfc2461
RFC 2462, *IPv6 Stateless Address Autoconfiguration*	Specifies the steps a host takes in deciding how to autoconfigure its interfaces in IPv6	http://www.ietf.org/rfc/rfc2462
RFC 2893, *Transition Mechanisms for IPv6 Hosts and Routers*	Specifies IPv4 compatibility mechanisms that can be implemented by IPv6 hosts and routers	http://www.ietf.org/rfc/rfc2893
RFC 3306, *Unicast-Prefix-Based IPv6 Multicast Addresses*	Describes the format and types of Ipv6 multicast addresses	http://www.ietf.org/rfc/rfc3306
RFC 3484, *Default Address Selection for Internet protocol version 6 (IPv6)*	Describes the algorithms used in IPv6 default address selection	http://www.ietf.org/rfc/rfc3484
RFC 3513, *Internet Protocol version 6 (IPv6) Addressing Architecture*	Contains details about the types of IPv6 addresses and includes examples	http://www.ietf.org/rfc/rfc3513
RFC 3587, *IPv6 Global Unicast Address Format*	Defines the standard format for IPv6 unicast addresses	http://www.ietf.org/rfc/rfc3587

Advanced FortiGate firewall concepts

The FortiGate firewall has advanced firewall component options, which allows for greater flexibility when these advanced options are needed to help with your growing network. These advanced firewall components include traffic shaping, QoS and identity-based policies.

The following topics are included in this section:

Central NAT table

The central NAT table enables you to define, and control with more granularity, the address translation performed by the FortiGate unit. With the NAT table, you can define the rules which dictate the source address or address group and which IP pool the destination address uses.

While similar in functionality to IP pools, where a single address is translated to an alternate address from a range of IP addresses, with IP pools there is no control over the translated port. When using the IP pool for source NAT, you can define a fixed port to guarantee the source port number is unchanged. If no fix port is defined, the port translation is randomly chosen by the FortiGate unit. With the central NAT table, you have full control over both the IP address and port translation.

The NAT table also functions in the same way as the security policy table. That is, the FortiGate unit reads the NAT rules in a top-down methodology, until it hits a matching rule for the incoming address. This enables you to create multiple NAT policies that dictate which IP pool is used based on the source address. The NAT policies can be rearranged within the policy list as well, the same way as security policies. NAT policies are applied to network traffic after a security policy.

To view the Central NAT configuration page, and use them in a security policy, you need to first enable it.

To enable Central NAT - web-based manager

1 Go to *System* > *Admin* > *Settings*.

2 In the Display Options on GUI section, select the check box beside *Central NAT table*.

3 Select *Apply*.

To enable Central NAT - CLI

```
config system global
  set gui-central-nat-table
end
```

NAT policies are created in the web-based manager by going to *Policy* > *Policy* > *Central NAT Table*. The NAT policies are enabled when you configure the security policy by selecting the *Use Central NAT Table* option.

NAT policies are created in the CLI by using the commands under `config firewall central-nat`. To enable the policies use the commands

```
config security policy
  edit <policy_number>
    set central-nat enable
end
```

Central NAT Table configuration settings

To configure the Central NAT table, go to *Policy* > *Policy* > *Central NAT Table* and select *Create New*.

New NAT page	
Source Address	Select the source IP address from the drop-down list. You can optionally create a group of source IP addresses when you select *Multiple* in the drop-down list. You can also create a new source IP address when you select *Create New* in the drop-down list.
Translated Address	Select the dynamic IP pool from the drop-down list.
Original Source Port	Enter the source port that the address is originating from.
Translated Port	Enter the translated port number. The number in the *From* field must be greater than the lower port number that is entered in the *To* field.

Stateful inspection of SCTP traffic

The Stream Control Transmission Protocol (SCTP) is a transport layer protocol similar to TCP and UDP. SCTP is designed to provide reliable, in-sequence transport of messages with congestion control. SCTP is defined in RFC 4960.

Some common applications of SCTP include supporting transmission of the following protocols over IP networks:

- SCTP is important in 3G and 4G/LTE networks (for example, HomeNodeB = FemtoCells)
- SS7 over IP (for example, for 3G mobile networks)
- SCTP is also defined and used for SIP over SCTP and H.248 over SCTP
- Transport of Public Switched Telephone Network (PSTN) signaling messages over IP networks.

SCTP is a reliable transport protocol that runs on top of a connectionless packet network (IP). SCTP provides the following services:

- Acknowledged error-free non-duplicated transfer of user data
- Data fragmentation to conform to discovered path MTU size
- Sequenced delivery of user messages within multiple streams, with an option for order-of-arrival delivery of individual user messages
- Optional bundling of multiple user messages into a single SCTP packet
- network-level fault tolerance through supporting of multi-homing at either or both ends of an association
- Congestion avoidance behavior and resistance to flooding and masquerade attacks

SCTP is effective as the transport protocol for applications that require monitoring and session-loss detection. For such applications, the SCTP path and session failure-detection mechanisms actively monitor the connectivity of the session. SCTP differs from TCP in having multi-homing capabilities at either or both ends and several streams within a connection, typically referred to as an association. A TCP stream represents a sequence of bytes; an SCTP stream represents a sequence of messages.

Configuring FortiGate SCTP filtering

The FortiGate firewall can apply security policies to SCTP sessions in the same way as TCP and UDP sessions. You can create security policies that accept or deny SCTP traffic by setting the service to ANY. FortiOS does not include pre-defined SCTP services. To configure security policies for traffic with specific SCTP source or destination ports you must create custom firewall services for SCTP.

FortiGate units route SCTP traffic in the same way as TCP and UDP traffic. You can configure policy routes specifically for routing SCTP traffic by setting the protocol number to 132. SCTP policy routes can route SCTP traffic according to the destination port of the traffic if you add a port range to the policy route.

You can configure a FortiGate unit to perform stateful inspection of different types of SCTP traffic by creating custom SCTP services and defining the port numbers or port ranges used by those services. FortiGate units support SCTP over IPv4. The FortiGate unit performs the following checks on SCTP packets:

- Source and Destination Port and Verification Tag.
- Chunk Type, Chunk Flags and Chunk Length
- Verify that association exists
- Sequence of Chunk Types (INIT, INIT ACK, etc)
- Timer checking
- Four way handshake checking
- Heartbeat mechanism

- Protection against INIT/ACK flood DoS attacks, and long-INIT flooding
- Protection against association hijacking

FortiOS also supports SCTP sessions over IPsec VPN tunnels, as well as full traffic and event logging for SCTP sessions.

Adding an SCTP custom service

This example creates a custom SCTP service that accepts SCTP traffic using destination port 2905. SCTP port number 2905 is used for SS7 Message Transfer Part 3 (MTP3) User Adaptation Layer (M3UA) over IP.

To add the SCTP custom service - web-based manager

1 Go to *Firewall Objects* > *Service* > *Custom* and select *Create New*.

2 Enter the following and select *OK*.

Name	M3UA_service
Protocol Type	TCP/UDP/SCTP
Protocol	SCTP
Source Port (Low)	1
Source Port (High)	65535
Destination Port (Low)	2905
Destination Port (High)	2905

To add the SCTP custom service - CLI

```
config firewall service custom
  edit M3UA_service
    set protocol TCP/UDP/SCTP
    set sctp-portrange 2905
  end
```

Adding an SCTP policy route

You can add policy routes that route SCTP traffic based on the SCTP source and destination port as well as other policy route criteria. The SCTP protocol number is 132.

The following example directs all SCTP traffic with SCTP destination port number 2905 to the next hop gateway at IP address 1.1.1.1.

To add the policy route - web-based manager

1 Go to *Router* > *Static* > *Policy Route*.

2 Select *Create New*.

3 Enter the following information and select *OK*.

Protocol	132
Incoming interface	internal
Source address / mask	0.0.0.0 0.0.0.0
Destination address / mask	0.0.0.0 0.0.0.0
Destination Ports	From 2905 to 2905

Force traffic to:

Outgoing interface	external
Gateway Address	1.1.1.1

To add the policy route - CLI

```
config router policy
  edit 1
    set input-device internal
    set src 0.0.0.0 0.0.0.0
    set dst 0.0.0.0 0.0.0.0
    set output-device external
    set gateway 1.1.1.1
    set protocol 132
    set start-port 2905
    set end-port 2905
  end
```

Changing the session time to live for SCTP traffic

Use the following command to change the session timeout for SCTP protocol M3UA on port 2905 to 3600 seconds.

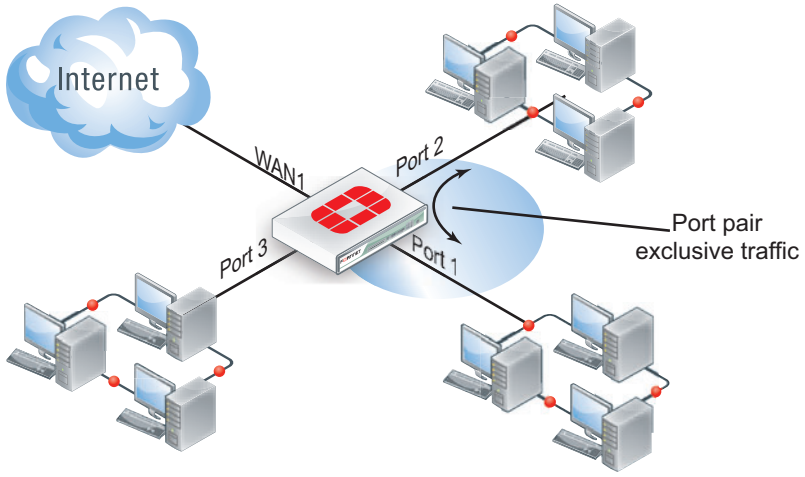
```
config system session-ttl
  config port
  edit 1
    set protocol 132
    set start-port 2905
    set end-port 2905
    set timeout 3600
  end
end
```

Port pairing

Port pairing is an option in Transparent mode to bind two ports together. In doing this, you can create security policies that regulate traffic only between two specific ports, VLANs or VDOMs. In its simplest form, this enables an administrator to create security policies that are only between these two ports. Traffic is captured between these ports. No other traffic can enter DNS services or leave a port pairing.

For example, a FortiGate unit has three ports, where port 1 and port 2 are paired together, because the two networks only need to communicate with each other. If packet arrives on port 1, the FortiGate unit needs to figure out whether the packet goes to port 2 or port 3. With port pairing configured, it is more simple. If packet arrives on port 1, then the FortiGate automatically directs the packet to port 2. The opposite is also true in the other direction. This can be ideal when to groups only need to transfer data between each other.

Figure 25: Port pairing



To configure port pairing - web-based manager

1 Go to *System* > *Network* > *Interface*.

2 Select the arrow beside *Create New*, and select *Port Pair*.

3 Enter a *Name* for the port pair.

4 Select the physical or virtual ports from the *Available Members* list and select the right-facing arrow to add the ports to the *Selected Members* list.

There can be only two ports added.

5 Select *OK*.

To configure port pairing - CLI

```
config system port-pair
  edit <pair_name>
    set member <port_names>
end
```

When configuring security policies with the port pairs, selecting the *Source Interface* automatically populates the *Destination Interface*, and vice versa. All other aspects of the security policy configuration remains the same.

Blocking port 25 to email server traffic

Port 25 is the default port for SMTP traffic. Certain types of malware can install themselves on an unsuspecting user's computer and send spam using its own email server. By blocking port 25, this prevents a host system, and potentially your network or company, from being deemed a spam source.

This does, however limit your corporation from using a web server. You have a few options for this:

- if the email server is on a dedicated port, such as a DMZ port, security policies can ensure no traffic goes out from this port except the email server.
- Block all traffic on port 25 except the specific address of the email server.

Dedicated traffic

This example show the steps to ensure only traffic exits from the DMZ where the email server is connected. The internal port is connected to the internal network and the WAN1 port connects to the Internet.

First, create a security policy that will not allow any traffic through port 25 from the internal interface, which connects to the internal network. Place this policy at the top of the security policy list.

To block traffic on port 25 - web-based manager

1 Go to *Policy* > *Policy* > *Policy* and select *Create New*.

2 Set the following options and select *OK*.

Source Interface	Internal
Source Address	ALL
Destination Interface	WAN1
Destination Address	ALL
Schedule	ALWAYS
Service	SMTP
Action	DENY
Comments	Prevent Malware spam.

You may also want to enable *Log Violation Traffic* to see if there is any potential malware or other user sending email using the non-corporate email server.

To block traffic on port 25 - CLI

```
config security policy
  edit <policy_number>
    set srcintf Internal
    set srcaddr all
    set dstintf wan1
    set dstaddr all
    set schedule always
    set service smtp
    set action deny
    set comment "Prevent Malware spam."
end
```

Next, create a security policy for the email server, IP address 10.10.11.29 that only allows SMTP traffic from the email server on port 25.

To allow traffic on port 25 for the email server - web-based manager

3 Go to *Policy* > *Policy* > *Policy* and select *Create New*.

4 Set the following options and select *OK*.

Source Interface	DMZ
Source Address	10.10.11.29
Destination Interface	WAN1
Destination Address	ALL

Schedule	ALWAYS
Service	SMTP
Action	ACCEPT

To allow traffic on port 25 for the email server- CLI

```
config security policy
  edit <policy_number>
    set srcintf dmz
    set srcaddr 10.10.11.29
    set dstintf wan1
    set dstaddr all
    set schedule always
    set service smtp
    set action allow
  end
```

Restricting traffic on port 25

This example shows how to limit traffic on port 25 on the wan port to only traffic from the email server. The web server's address is 10.10.10.29.

To allow traffic on port 25 for the email server - web-based manager

1 Go to *Policy* > *Policy* > *Policy* and select *Create New*.

2 Set the following options and select *OK*.

Source Interface	INTERNAL
Source Address	10.10.10.29
Destination Interface	WAN1
Destination Address	ALL
Schedule	ALWAYS
Service	SMTP
Action	ACCEPT

To allow traffic on port 25 for the email server- CLI

```
config security policy
  edit <policy_number>
    set srcintf internal
    set srcaddr 10.10.10.29
    set dstintf wan1
    set dstaddr all
    set schedule always
    set service smtp
    set action allow
  end
```

Next, add a deny security policy that blocks all SMTP traffic from the Internal port to the WAN1 port. Ensure this policy is directly after the policy created above.

To block SMTP traffic on port 25 for the rest of the company - web-based manager

3 Go to *Policy* > *Policy* > *Policy* and select *Create New*.

4 Set the following options and select *OK*.

Source Interface	INTERNAL
Source Address	ALL
Destination Interface	WAN1
Destination Address	ALL
Schedule	ALWAYS
Service	SMTP
Action	DENY

To block SMTP traffic on port 25 for the rest of the company - CLI

```
config security policy
  edit <policy_number>
    set srcintf internal
    set srcaddr all
    set dstintf wan1
    set dstaddr all
    set schedule always
    set service smtp
    set action deny
  end
```

Blocking HTTP access by IP

To block a web site using the IP, create a URL filter entry, using the additional information below. Note that this is only effective with HTTP or FortiGate units running Deep Inspection.

You need to create two URL filter entries. The first filter only allowing a text string containing two or more sets of text separated by a period. This is to match the various domain possibilities for web sites, for example:

- example.org
- www.example.com
- www.example.co.jp

The second filter blocks any IP address lookup.

To add the URL filter entries

1 Go to *UTM Profiles* > *Web Filter* > *URL Filter*.
2 Select *Create New* to add a filter group, give it a name and select *OK*.
3 Select *Create New* for a new filter.
4 Enter the *URL* of `^([a-z0-9-]+\.){1,}[a-z]+`
5 Set the *Type* to *Regex*.
6 Set the *Action* to *Allow*.
7 Select *OK*.
8 Select *Create New*.
9 Enter the *URL* of `[0-9]{1,3}\.[0-9]{1,3}\.[0-9]{1,3}\.[0-9]{1,3}`

10 Set the *Type* to *Regex*.

11 Set the *Action* to *Block*.

12 Select *OK*.

Position these at the end of the URL filter list so that any exemptions or blocks before that are still effective.

Both of these filter entries are required. If you only enter the second one, the FortiGate unit will also catch a URL lookup as they both behave in a similar fashion after the URL is resolved to an IP. The first entry is needed to break out of the URL filter and allow the web site before it does the second check if they entered text.

ICMP packet processing

ICMP messages are used to relay feedback to the traffic source that the destination IP is not reachable. ICMP message types are:

- ICMP_ECHO
- ICMP_TIMESTAMP
- ICMP_INFO_REQUEST
- ICMP_ADDRESS

For ICMP error messages, only those reporting an error for an existing session can pass through the firewall. The security policy will allow traffic to be routed, forwarded or denied. If allowed, the ICMP packets will start a new session. Only ICMP error messages of a corresponding security policy is available will be sent back to the source. Otherwise, the packet is dropped. That is, only ICMP packets for a corresponding security policy can traverse the FortiGate unit.

Common error messages include:

- destination unreachable messages
- time exceeded messages
- redirect messages

For example, a security policy that allows TFTP traffic through the FortiGate unit. User1 (192.168.21.12) attempts to connect to the TFTP server (10.11.100.1), however, the UDP port 69 has not been opened on the server. The corresponding sniffer trace occurs:

```
diagnose sniffer packet any "host 10.11.100.1 or icmp 4"
 3.677808 internal in 192.168.21.12.1262 -> 10.11.100.1.69: udp 20
 3.677960 wan1 out 192.168.21.12.1262 -> 10.11.100.1.69: udp 20
 3.678465 wan1 in 10.11.100.1.132 -> 192.168.21.12: icmp:
 10.11.100.1 udp port 69 unreachable
 3.678519 internal out 10.11.100.1 -> 192.168.21.12: icmp:
 192.168.182.132 udp port 69 unreachable
```

Adding NAT security policies in Transparent mode

Similar to operating in NAT mode, when operating a FortiGate unit in Transparent mode you can add security policies and:

- Enable NAT to translate the source addresses of packets as they pass through the FortiGate unit.
- Add virtual IPs to translate destination addresses of packets as they pass through the FortiGate unit.

- Add IP pools as required for source address translation

For NAT firewall policies to work in NAT mode you must have two interfaces on two different networks with two different subnet addresses. Then you can create firewall policies to translate source or destination addresses for packets as they are relayed by the FortiGate unit from one interface to the other.

A FortiGate unit operating in Transparent mode normally has only one IP address, the management IP. To support NAT in Transparent mode, you can add a second management IP. These two management IPs must be on different subnets. When you add two management IP addresses, all FortiGate unit network interfaces will respond to connections to both of these IP addresses.

In the example shown in Figure 26, all of the PCs on the internal network (subnet address 192.168.1.0/24) are configured with 192.168.1.99 as their default route. One of the management IPs of the FortiGate unit is set to 192.168.1.99. This configuration results in a typical NAT mode firewall. When a PC on the internal network attempts to connect to the Internet, the PC's default route sends packets destined for the Internet to the FortiGate unit internal interface. Similarly on the DMZ network (subnet address 10.1.1.0/24) all of the PCs have a default route of 10.1.1.99.

This example describes adding an internal to WAN1 security policy to relay these packets from the internal interface out the WAN1 interface to the Internet. Because the WAN1 interface does not have an IP address of its own, you must add an IP pool to the WAN1 interface that translates the source addresses of the outgoing packets to an IP address on the network connected to the wan1 interface.

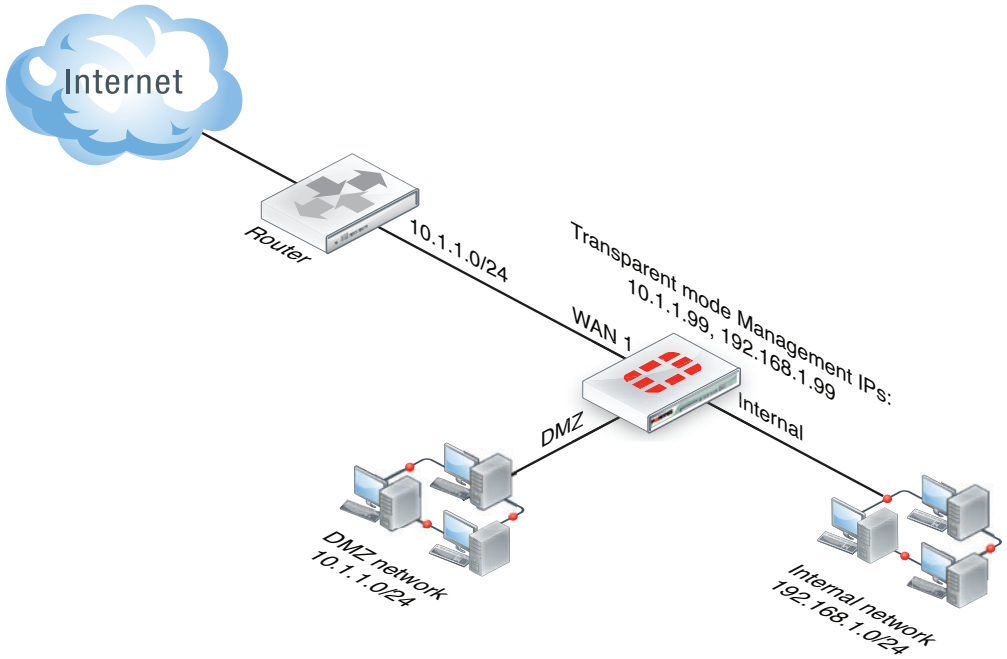
The example describes adding an IP pool with a single IP address of 10.1.1.201. So all packets sent by a PC on the internal network that are accepted by the Internal to WAN1 policy leave the WAN1 interface with their source address translated to 10.1.1.201. These packets can now travel across the Internet to their destination. Reply packets return to the WAN1 interface because they have a destination address of 10.1.1.201. The Internal to WAN1 NAT policy translates the destination address of these return packets to the IP address of the originating PC and sends them out the internal interface to the originating PC.

Use the following steps to configure NAT in Transparent mode

- Add two management IPs
- Add an IP pool to the WAN1 interface
- Add an Internal to WAN1 security policy

You can add the security policy from the web-based manager and then use the CLI to enable NAT and add the IP pool.

Figure 26: Example NAT in Transparent mode configuration



To add a source address translation NAT policy in Transparent mode

1 Enter the following command to add two management IPs.

The second management IP is the default gateway for the internal network.

```
config system settings
  set manageip 10.1.1.99/24 192.168.1.99/24
end
```

2 Enter the following command to add an IP pool to the WAN1 interface:

```
config firewall ippool
  edit nat-out
    set interface "wan1"
    set startip 10.1.1.201
    set endip 10.1.1.201
  end
```

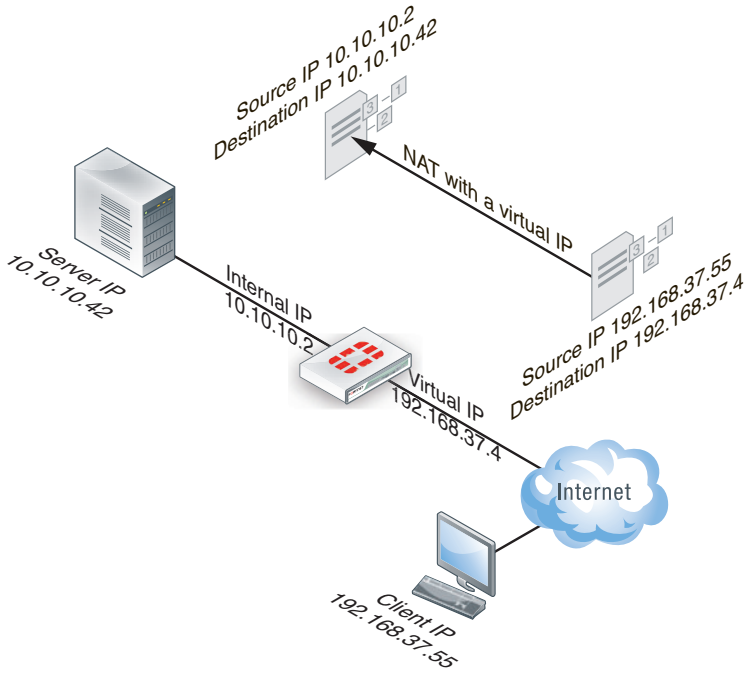
3 Enter the following command to add an Internal to WAN1 security policy with NAT enabled that also includes an IP pool:

```
config security policy
  edit 1
    set srcintf "internal"
    set dstintf "wan1"
    set scraddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ANY"
    set nat enable
    set ippool enable
    set poolname nat-out
  end
```

Adding a static NAT virtual IP for a single IP address and port

In this example, the wan1 interface of the FortiGate unit is connected to the Internet and the Internal interface is connected to the DMZ network. The IP address 192.168.37.4 on port 80 on the Internet is mapped to 10.10.10.42 on port 8000 on the private network. Attempts to communicate with 192.168.37.4 from the Internet are translated and sent to 10.10.10.42 by the FortiGate unit. The computers on the Internet are unaware of this translation and see a single computer at 192.168.37.4 rather than a FortiGate unit with a private network behind it.

Figure 27: Static NAT virtual IP for a single IP address example



To add a static NAT virtual IP for a single IP address and port - web-based manager

1 Go to *Firewall Objects* > *Virtual IP* > *Virtual IP*.

2 Select *Create New*.

3 Complete the following and select *OK*.

Name	static_NAT
External Interface	wan1
Type	Static NAT
External IP Address/Range	192.168.37.4.
Mapped IP Address/Range	10.10.10.42
Port Forwarding	Selected
Protocol	TCP
External Service Port	80
Map to Port	8000

To add a static NAT virtual IP for a single IP address and port - CLI

```
config firewall vip
  edit static_NAT
    set extintf wan1
    set type static-nat
    set extip 192.168.37.4
    set mappedip 10.10.10.42
    set portforward enable
    set extport 80
    set mappedport 8000
  end
```

Add a external to dmz1 security policy that uses the virtual IP so that when users on the Internet attempt to connect to the web server IP address packets pass through the FortiGate unit from the external interface to the dmz1 interface. The virtual IP translates the destination address of these packets from the external IP to the DMZ network IP address of the web server.

To add a static NAT virtual IP for a single IP address to a security policy - web-based manager

1 Go to *Policy* > *Policy* > *Policy* and select *Create New*.

2 Complete the following:

Source Interface/Zone	wan1
Source Address	All
Destination Interface/Zone	Internal
Destination Address	static_nat
Schedule	always
Service	HTTP
Action	ACCEPT

3 Select *NAT*.

4 Select *OK*.

To add a static NAT virtual IP for a single IP address to a security policy - CLI

```
config security policy
  edit 1
    set srcintf wan1
    set dstintf internal
    set srcaddr all
    set dstaddr static_nat
    set action accept
    set schedule always
    set service ANY
    set nat enable
end
```

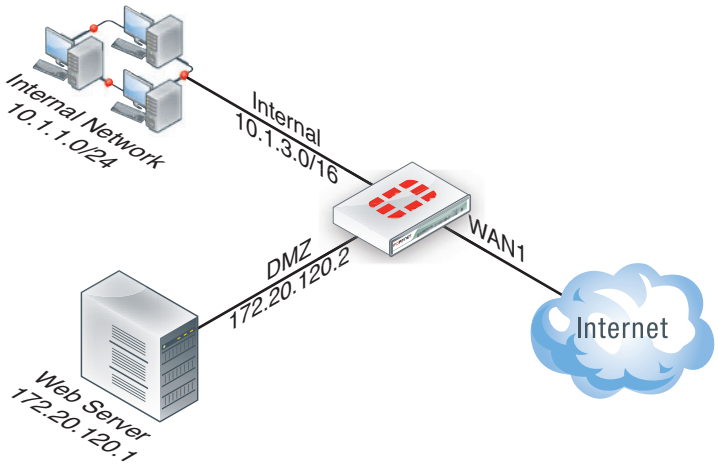
Double NAT: combining IP pool with virtual IP

In this example, a combination of virtual IPs, IP pools and security policies will allow the local users to access the servers on the DMZ. The example uses a fixed port and IP pool to allow more than one user connection while using virtual IP to translate the destination port from 8080 to 80. The security policy uses both the IP pool and the virtual IP for double IP and/or port translation.

For this example:

- Users in the 10.1.1.0/24 subnet use port 8080 to access server 172.20.120.1.
- The server's listening port is 80.
- Fixed ports must be used.

Figure 28: Double NAT



To create an IP pool - web-based manager

1 Go to *Firewall Objects* > *Virtual IP* > *IP Pool*.
2 Select *Create New*.
3 Enter the *Name* `pool-1`.
4 Enter the *IP Range/Subnet* `10.1.3.1-10.1.3.254`.
5 Select *OK*.

To create an IP pool - CLI

```
config firewall ippool
  edit pool-1
    set startip 10.1.3.1
    set endip 10.1.3.254
  end
```

Next, create the virtual IP with port translation to translate the user internal IP used by the network users to the DMZ port and IP address of the server.

To create a Virtual IP with port translation - web-based manager

1 Go to *Firewall Objects* > *Virtual IP* > *Virtual IP*.
2 Select *Create New*.

3 Enter the following information and select *OK*.

Name	server-1
External Interface	Internal
Type	Static NAT
External IP Address/Range	172.20.120.1 **Note:** This address is the same as the server address.
Mapped IP Address/Range	172.20.120.1
Port Forwarding	Enable
Protocol	TCP
External Service Port	8080
Map to Port	80

To create a Virtual IP with port translation - CLI

```
config firewall vip
  edit server-1
    set extintf internal
    set type static-nat
    set extip 172.20.120.1
    set mappedip 172.20.120.1
    set portforward enable
    set extport 80
    set mappedport 8080
end
```

Add an internal to DMZ security policy that uses the virtual IP to translate the destination port number and the IP pool to translate the source addresses.

To create the security policy - web-based manager

1 Go to *Policy* > *Policy* > *Policy* and select *Create New*.

2 Complete the following and select *OK*:

Source Interface/Zone	internal
Source Address	all
Destination Interface/Zone	dmz
Destination Address	server-1
Schedule	always
Service	HTTP
Action	ACCEPT
NAT	Select
Dynamic IP Pool	Select, and select the *pool-1* IP pool.

To create the security policy - CLI

```
config security policy
```

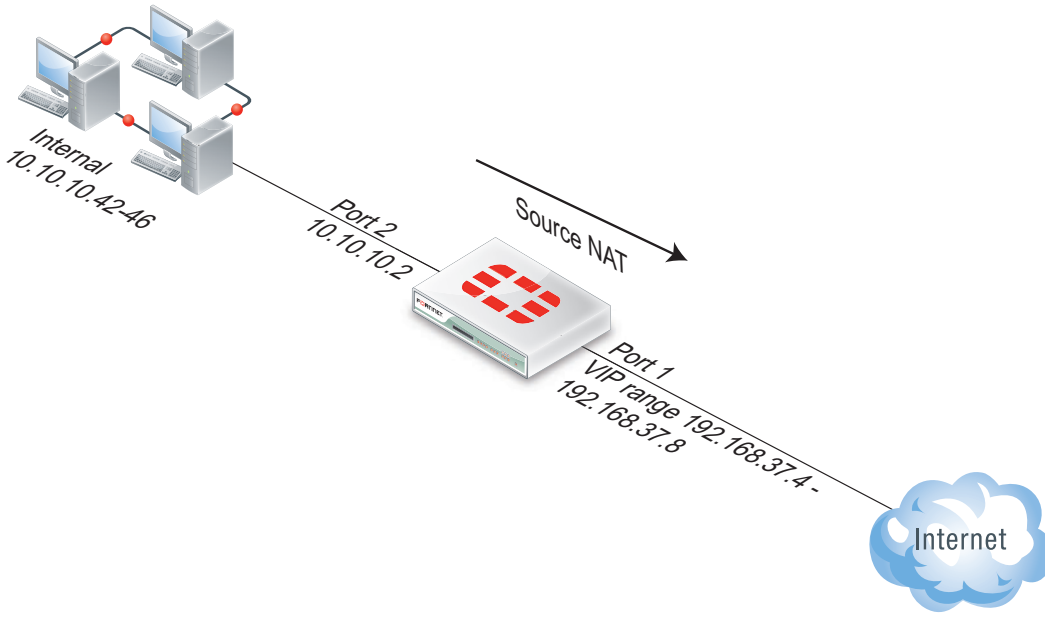
```
    edit 1
      set srcintf internal
      set dstintf dmz1
      set srcaddr all
      set dstaddr server-1
      set action accept
      set schedule always
      set service HTTP
      set nat enable
      set ippool enable
      set poolname pool-1
end
```

Using VIP range for Source NAT (SNAT) and static 1-to-1 mapping

VIP addresses are typically used to map external (public) to internal (private) IP addresses for Destination NAT (DNAT).

This example shows how to use VIP ranges to perform source NAT (SNAT) with a static 1-to-1 mapping from internal to external IP addresses. This is similar to using an IP pool with the advantage of having predictable and static 1-to-1 address mapping.

Figure 29: Network diagram



This example will associate each internal IP address to one external IP address for the Source NAT (SNAT) translation.

Using the diagram above, the translations will look like the following:

Traffic from Source IP	Translated to Source IP (SNAT)
10.10.10.42	192.168.37.4
10.10.10.43	192.168.37.5

...	...
10.10.10.46	192.168.37.8

First, configure the virtual IP.

To configure the virtual IP - web-based manager

1 Go to *Firewall Objects* > *Virtual IP* > *Virtual IP* and select *Create New*.
2 Enter the *Name* of `Static_NAT_1to1`.
3 Select the *External Interface* of *port 1* from the drop-down list.
4 Enter the *External IP Address* of `192.168.37.4`.
5 Enter the *Mapped IP Address* range of `10.10.10.42` to `10.10.10.46`.
6 Select OK.

To configure the virtual IP - CLI

```
config firewall vip
  edit "Static_NAT_1to1"
    set extip 192.168.37.4
    set extintf "port1"
    set mappedip 10.10.10.42-10.10.10.46
  next
end
```

Next, configure the firewall policies. Even if no connection needs to be initiated from external to internal, a second security policy number is required to activate the VIP range. Otherwise the IP address of the physical interface is used for NAT. In this example it is set as a “DENY” security policy for security purpose.

To configure the firewall policies - web-based manager

1 Go to *Policy* > *Policy* > *Policy* and select *Create New*.
2 Complete the following and select *OK*:

Source Interface/Zone	port2
Source Address	all
Destination Interface/Zone	port1
Destination Address	all
Schedule	always
Service	ANY
Action	ACCEPT
NAT	Select

3 Complete the following and select *OK*:

Source Interface/Zone	port 1
Source Address	all
Destination Interface/Zone	port 2
Destination Address	Static_NAT_1to1

Schedule	always
Service	ALL
Action	deny
Comments	Used to activate static Source NAT 1-to-1

To configure the firewall policies - CLI

```
config firewall policy
  edit 1
    set srcintf port2
    set dstintf port1
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
    set nat enable
  next
  edit 2
    set srcintf port1
    set dstintf port2
    set srcaddr all"
    set dstaddr Static_NAT_1to1
    set schedule always
    set service ANY
    set action deny
    set comments (Used to activate static Source NAT 1-to-1)
    next
  end
end
```

Traffic shaping and per-IP traffic shaping

Traffic shaping helps to optimize traffic flow through the FortiGate unit, and per-IP traffic shaping does much the same, however, it is applies traffic shaping per IP address instead of per policy or per shaper. Traffic shaping, when included in a security policy, controls the bandwidth available to the policy, and sets the priority of the traffic processed by the policy. Traffic shaping makes it possible to control which policies have the highest priority when large amounts of data are moving through the FortiGate unit. For example, the policy for the corporate web server might be given higher priority than the policies for most employee's computers. An employee who needs extra high speed Internet access could have a special outgoing policy set up with higher bandwidth.

Traffic shaping is available for security policies whose Action is ACCEPT, IPSEC, or SSL VPN. It is also available for all supported services, including H.323, TCP, UDP, ICMP, and ESP.

Traffic shaping is used to improve the quality of bandwidth-intensive and sensitive traffic; it also cannot increase the total amount of bandwidth available. The bandwidth available for traffic set in a traffic shaper is used to control data sessions for traffic in both directions.

For more information about traffic shaping, see the Traffic Shaping chapter in the *FortiOS Handbook*.

Endpoint Security

Endpoint security enforces the use of the FortiClient End Point Security (FortiClient and FortiClient Lite) application on your network. It can also allow or deny endpoints access to the network based on the application installed on them.

By applying endpoint security to a security policy, you can enforce this type of security on your network. FortiClient enforcement can check that the endpoint is running the most recent version of the FortiClient application, that the antivirus signatures are up-to-date, and that the firewall is enabled. An endpoint is usually often a single PC with a single IP address being used to access network services through a FortiGate unit.

With endpoint security enabled on a policy, traffic that attempts to pass through, the FortiGate unit runs compliance checks on the originating host on the source interface. Non-compliant endpoints are blocked. If someone is browsing the web, the endpoints are redirected to a web portal which explains the non-compliance and provides a link to download the FortiClient application installer. The web portal is already installed on the FortiGate unit, as a replacement message, which you can modify if required.

Endpoint Security requires that all hosts using the security policy have the FortiClient Endpoint Security agent installed. Currently, FortiClient Endpoint Security is available for Microsoft Windows 2000 and later only.

For more information about endpoint security, see the UTM chapter in the *FortiOS Handbook*.

Logging traffic

When you enable logging on a security policy, the FortiGate unit records the scanning process activity that occurs, as well as whether the FortiGate unit allowed or denied the traffic according to the rules stated in the security policy. This information can provide insight into whether a security policy is working properly, as well as if there needs to be any modifications to the security policy, such as adding traffic shaping for better traffic performance.

Traffic is logged in the traffic log file and provides detailed information that you may not think you need, but do. For example, the traffic log can have information about an application used (web: HTTP.Image), and whether or not the packet was SNAT or DNAT translated. The following is an example of a traffic log message.

```
2011-04-13 05:23:47 log_id=4 type=traffic subtype=other pri=notice
vd=root status="start" src="10.41.101.20" srcname="10.41.101.20"
src_port=58115 dst="172.20.120.100" dstname="172.20.120.100"
dst_country="N/A" dst_port=137 tran_ip="N/A" tran_port=0
tran_sip="10.31.101.41" tran_sport=58115 service="137/udp"
proto=17 app_type="N/A" duration=0 rule=1 policyid=1 sent=0 rcvd=0
shaper_drop_sent=0 shaper_drop_rcvd=0 perip_drop=0
src_int="internal" dst_int="wan1" SN=97404 app="N/A" app_cat="N/A"
carrier_ep="N/A"
```

If you want to know more about logging, see the Logging and Reporting chapter in the *FortiOS Handbook*. If you want to know more about traffic log messages, see the *FortiGate Log Message Reference*.

Quality of Service (QoS)

The Quality of Service (QoS) feature is an advanced firewall component that applies bandwidth limits and prioritization to traffic. QoS is the capability of the network to adjust some quality aspects for selected flows within your overall network traffic, and may include such techniques as priority-based queuing and traffic policing.

QoS can be implemented for services that include H.323, TCP, UDP, ICMP, and ESP. QoS uses the following techniques:

Traffic policing	Drops packets that do not conform to bandwidth limitations
Traffic shaping	This helps to ensure that the traffic may consume bandwidth at least at the guaranteed rate by assigning a greater priority queue if the guarantee is not being met. Traffic shaping also ensures that the traffic cannot consume bandwidth greater than the maximum at any given instant in time. Flows that are greater than the maximum rate are subject to traffic policing.
Queuing	This transmits packets in order of their assigned priority queue for that physical interface. All traffic in a higher priority traffic queue must be completely transmitted before traffic in lower priority queues will be transmitted.

QoS can be helpful for organizations that are trying to manage their voice and streaming multi-media traffic, which can rapidly consume bandwidth. Both voice and streaming multi-media are sensitive to latency.

For additional information about QoS, see the Traffic Shaping chapter in the *FortiOS Handbook*.

Identity-based security policies

Identity-based security policies, also known as authentication policies, match traffic that requires a supported authentication protocol to trigger the firewall authentication challenge and successfully authenticate network users. Network users authentication can occur using HTTP, HTTPS, FTP, and Telnet protocols as well as through automatic login using NTLM and FSSO, to bypass user intervention.

Identity-based security policies are usually configured for IPsec or SSL VPN traffic since this type of traffic usually requires authentication from network users.

When configuring identity-based policies, you can use schedules to limit network users authentication sessions. For example, example.com has a schedule policy to use P2P applications between noon and 1:00 pm, and a user authentication timeout of 30 minutes. When a user logs in at 12:15 pm, their authentication time logs them off at 12:45 (30 minutes later). You can configure this type of authentication by using the `schedule-timeout` field in the `config firewall policy` command in the CLI.

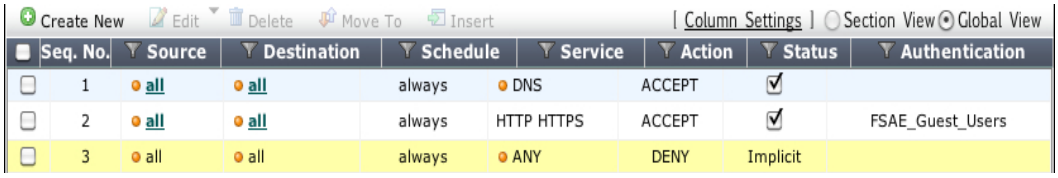
Identity-based policy positioning

With identity-based security policies, positioning is extremely important. For a typical security policy, the FortiGate unit matches the source, destination and service of the policy. If matched, it acts on that policy. If not, the FortiGate unit moves to the next policy.

With identity-based policies, once the FortiGate unit matches the source and destination addresses, it processes the identity sub-rules for the user groups and services. That is, it acts on the authentication and completes the remainder of that policy and goes no further in the policy list.

The way identity based policies work is that once src/dest are matched, it will process the identity based sub-rules (for lack of a better term) around the user groups and services. It will never process the rest of your rulebase. For this reason, unique security policies should be placed ***before*** an identity-based policy.

For example, consider the following policies:



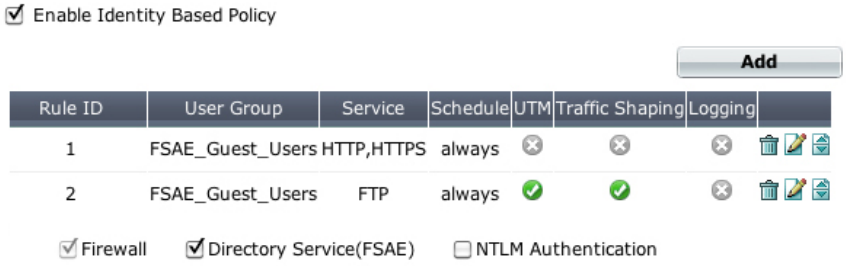
DNS traffic goes through successfully as does any HTTP traffic after being authenticated. However, if there was FTP traffic, it would not get through. As the FortiGate unit processes FTP traffic, it skips rule one since it's matching the source, destination and service. When it moves to rule two it matches the source and destination, it determines there is a match and, sees there are also processes the group/service rules, which requires authentication and acts on those rules. Once satisfied, the FortiGate unit will never go to rule three.

In this situation, where you would want FTP traffic to traverse the FortiGate unit, create a security policy specific to the services you require and place it above the authentication policy.

Identity-based sub-policies

When adding authentication to a security policy, you can add multiple authentication rules, or sub-policies. Within these policies you can include additional UTM profiles, traffic shaping and so on, to take affect on the selected services.

Figure 30: Authentication sub-policies



These sub-policies work on the same principle as normal security policies, that is, top down until the criteria has been met. As such, if there is no matching policy within the list, the packet can still be dropped even after authentication is successful.

Chapter 3 System Administration

This guide contains the following sections:

Using the web-based manager provides an overview of the web-based manager interface for FortiOS. If you are new to the FortiOS web-based manager, this chapter provides a high level overview of how to use this method of administration.

Using the CLI provides an overview of the command line interface (CLI) for FortiOS. If you are new to the FortiOS CLI, this chapter provides a high level overview of how to use this method of administration.

Basic setup describes the simple setup requirements an Administrator should do to get the FortiGate unit on the network and enabling the flow of traffic.

Interfaces describes FortiGate interface settings.

Central management describes how to configure the FortiGate unit to use FortiManager as a method of maintaining the device and other features that FortiManager has to facilitate the administration of multiple devices.

Best practices discusses methods to make the various components of FortiOS more efficient, and offer suggestions on ways to configure the FortiGate unit.

FortiGuard discusses the FortiGuard network services and configuration examples.

Monitoring describes various methods of collecting log data and tracking traffic flows and tends.

Multicast forwarding describes multicasting (also called IP multicasting) and how to configure it on the FortiGate unit.

Virtual LANs discusses their implementation in FortiOS and how to configure and use them.

PPTP and L2TP describes these VPN types and how to configure them.

Session helpers describes what they are and now to view and configure various session helpers.

Advanced concepts describes more involved administrative topics to enhance network security and traffic efficiency.

Using the web-based manager

This section describes the features of the web-based manager administrative interface (sometimes referred to as a graphical user interface, or GUI) of your unit. This section also explains common web-based manager tasks that an administrator does on a regular basis, as well as online help.

The following topics are included in this section:

Web-based manager overview

The web-based manager is a user-friendly interface for configuring settings and managing the unit. Accessing the web-based manager is easy; by using HTTP or a secure HTTPS connection from any management computer using a web browser. The recommended minimum screen resolution for properly displaying the web-based manager is 1280 by 1024. Some web browsers do not correctly display the windows within the web-based manager interface. Verify that you have a supported web browser by reviewing the Knowledge Base articles, Microsoft Windows web browsers supported by Fortinet products web-based manager (GUI) web browsers, and Mac OS browsers for use with Fortinet hardware web-based manager (GUI).

The web-based manager also provides the CLI Console widget, which enables you to connect to the command line interface (CLI) without exiting out of the web-based manager.

Web-based manager menus and pages

The web-based manager provides access to configuration options for most of the FortiOS features from the main menus. The web-based manager contains the following main menus:

System	Configure system settings, such as network interfaces, virtual domains, DHCP services, administrators, certificates, High Availability (HA), system time and set system options.
Router	Configure static, dynamic and multicast routing and view the router monitor.
Policy	Configure firewall policies, protocol options and Central NAT Table.
Firewall Objects	Configure supporting content for firewall policies including scheduling, services, traffic shapers, addresses, virtual IP and load balancing.

UTM Profiles	Configure antivirus and email filtering, web filtering, intrusion protection, data leak prevention, and application control. This menu also includes endpoint security features, such as FortiClient configuration and application detection patterns.
VPN	Configure IPsec and SSL virtual private networking.
User	Configure user accounts and user authentication including external authentication servers.
WAN Opt. & Cache	Configure WAN optimization and web caching to improve performance and security of traffic passing between locations on your wide area network (WAN) or from the Internet to your web servers.
WiFi Controller	Configure the unit to act as a wireless network controller, managing the wireless Access Point (AP) functionality of FortiWiFi and FortiAP units.
Log&Report	Configure logging and alert email as well as reports. View log messages and reports.
Current VDOM	Appears only when VDOMs are enabled on the unit to switch between VDOMs.

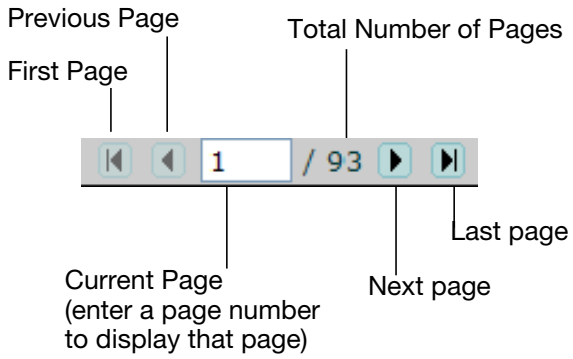
Using information tables

Many of the web-based manager pages contain tables of information which you can filter to display specific information. Administrators with read and write access can define the filters.

Using page navigation

The web-based manager pages that contain information and lists that span multiple pages. At the bottom of the page is the page navigation controls that enable you to move between pages.

Figure 31: Page controls



Adding filters to web-based manager lists

To locate a specific set of information or content within multiple pages, you use filters. These are especially useful in locating specific log entries. Depending on the type of information, the filtering options vary.

To create a filter, select *Filter Settings*, or a filter icon in a column heading. When a filter is applied to a column, the filter icon becomes green.Filter settings are stored in the unit's configuration and will be maintained the next time that you access any list for which you have added filters.

Filtering variable can include a numeric range such as 25-50 or an IP address or part of an address, or any text string combination, including special characters.

Note that the filtering ignores characters following a "<" unless the followed by a space. For example, the filtering ignores `<string` but not `< string`. Filtering also ignores matched opening and closing (< and >) characters and any characters between them. For example, filtering will ignore `<string>`.

For columns that can contain only specific content, such as log message severity, you can only select a single item from a list.

Using column settings

On pages where large amounts of information is available, not all content can be displayed, or some content may not be of use to you. Using column settings, you can display only that content which is important to your requirements.

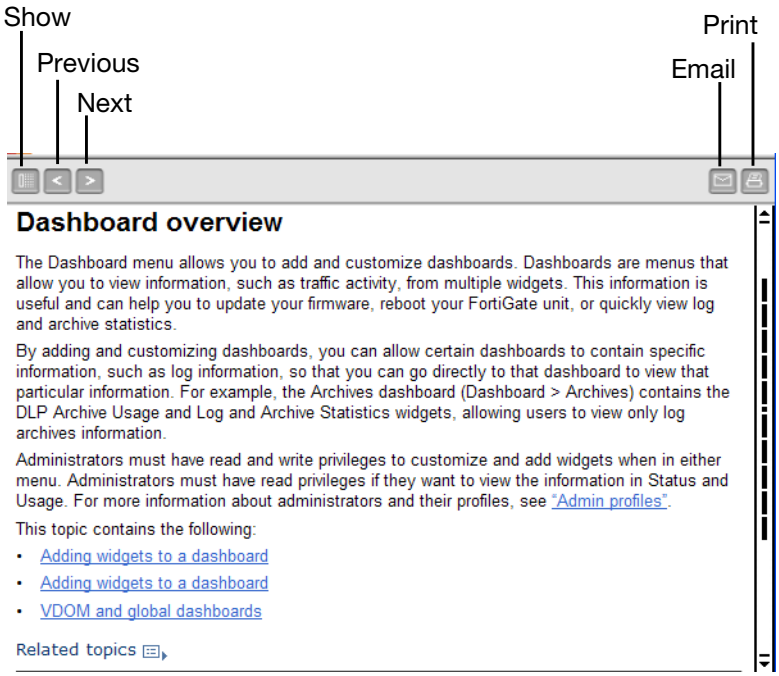
To configure column settings, select the *Column Settings* link at the top right of the page.

Any changes that you make to the column settings of a list are stored in the unit's configuration and will display the next time that you access the list.

Using online help

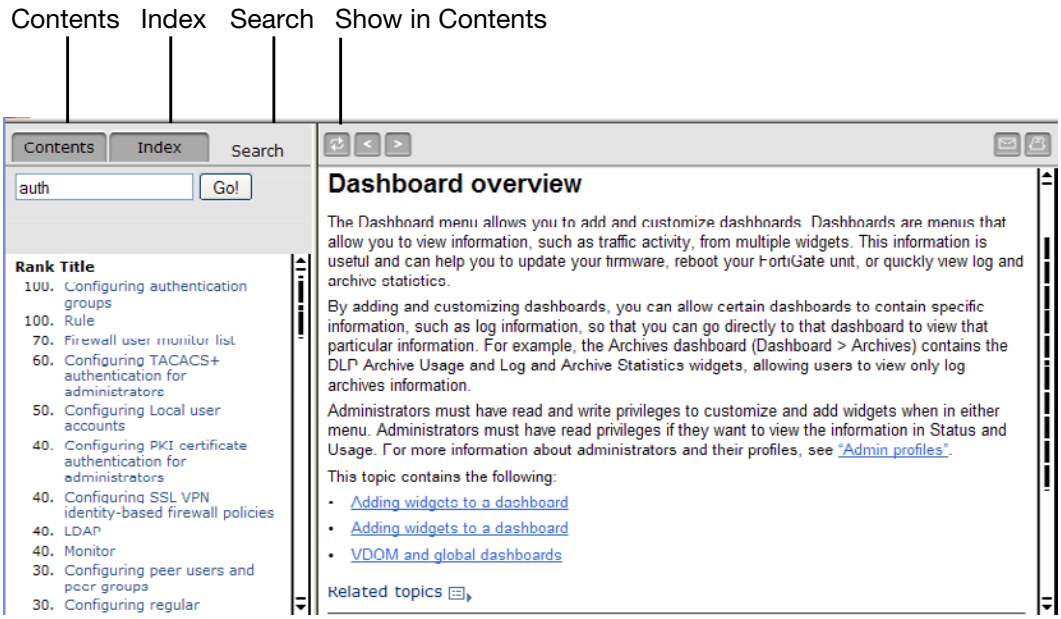
This Online Help button system provides context-sensitive help for the current web-based manager page, as well as access to the online version of the FortiGate Handbook.

Figure 32: A context-sensitive online help page (content pane only)



To view the online help table of contents or index, and to use the search, select *Show Navigation*.

Figure 33: Online help page with navigation pane and content pane



Contents	Display the online help table of contents. The online help is organized in the same way as the web-based manager.
Index	Display the online help index.
Search	Display the online help search.
Show in Contents	Select *Show in Contents* to display the location of the current help page within the table of contents. If you have used the index, search, or hyperlinks to find information in the online help, the table of contents may not be visible or the table of contents may display where you are within the table of contents.

Online help search tips

- If you search for multiple words, the search finds only those results that contain all of the words that you entered. The search does not find pages that only contain one of the words that you entered.
- The pages found by the search are ranked in order of relevance. The higher the ranking, the more likely the page includes the information a you are searching for. Help pages with the search words in the help page title are ranked highest.
- You can use the asterisk (*) as a wildcard. For example, if you search for **auth*** the search finds help pages containing **auth**, **authenticate**, **authentication**, **authenticates**.

Using the keyboard to navigate in the online help

You can use the keyboard shortcuts listed below to display and find information in the online help.

Key	Function
Alt+1	Display the table of contents.
Alt+2	Display the index.
Alt+3	Display the Search tab.
Alt+4	Go to the previous page.
Alt+5	Go to the next page.
Alt+7	Send an email to Fortinet Technical Documentation at techdoc@fortinet.com if you have comments on or corrections for the online help or any other Fortinet technical documentation product.
Alt+8	Print the current online help page.
Alt+9	Add an entry for this online help page to your browser bookmarks or favorites list, to make it easier to find useful online help pages.

Entering text strings

The configuration of a FortiGate unit is stored as configuration settings in the FortiOS configuration database. To change the configuration you can use the web-based manager or CLI to add, delete or change configuration settings. These configuration changes are stored in the configuration database as you make them.

Individual settings in the configuration database can be text strings, numeric values, selections from a list of allowed options, or on/off (enable/disable) settings.

Entering text strings (names)

Text strings are used to name entities in the configuration. For example, the name of a firewall address, administrative user, and so on. You can enter any character in a FortiGate configuration text string except, to prevent Cross-Site Scripting (XSS) vulnerabilities, text strings in FortiGate configuration names cannot include the following characters:

" (double quote), & (ampersand), ' (single quote), < (less than) and > (greater than)

Most web-based manager text string fields make it easy to add an acceptable number of characters and prevent you from adding the XSS vulnerability characters.

From the CLI, you can also use the `tree` command to view the number of characters that are allowed in a name field. For example, firewall address names can contain up to 64 characters. When you add a firewall address to the web-based manager you are limited to entering 64 characters in the firewall address name field. From the CLI you can enter the following `tree` command to confirm that the firewall address `name` field allows 64 characters.

```
config firewall address
  tree
  -- [address] --*name (64)
               |- subnet
               |- type
               |- start-ip
```

```
|- end-ip
|- fqdn (256)
|- cache-ttl (0,86400)
|- wildcard
|- comment (64 xss)
|- associated-interface (16)
+- color (0,32)
```

The `tree` command output also shows the number of characters allowed for other firewall address name settings. For example, the fully-qualified domain name (`fqdn`) field can contain up to 256 characters.

Entering numeric values

Numeric values set various sizes, rates, numeric addresses, and other numeric values. For example, a static routing priority of 10, a port number of 8080, or an IP address of 10.10.10.1. Numeric values can be entered as a series of digits without spaces or commas (for example, 10 or 64400), in dotted decimal format (for example the IP address 10.10.10.1) or as in the case of MAC or IPv6 addresses separated by colons (for example, the MAC address 00:09:0F:B7:37:00). Most numeric values are standard base-10 numbers, but some fields (again such as MAC addresses) require hexadecimal numbers.

Most web-based manager numeric value fields make it easy to add the acceptable number of digits within the allowed range. CLI help includes information about allowed numeric value ranges. Both the web-based manager and the CLI prevent you from entering invalid numbers.

Selecting options from a list

If a configuration field can only contain one of a number of selected options, the web-based manager and CLI present you a list of acceptable options and you can select one from the list. No other input is allowed. From the CLI you must spell the selection name correctly.

Enabling or disabling options

If a configuration option can only be on or off (enabled or disabled) the web-based manager presents a check box or other control that can only be enabled or disabled. From the CLI you can set the option to `enable` or `disable`.

Dashboard

The Dashboard menu provides a way to access information about network activity and events, as well as configure basic system settings. FortiOS includes a default dashboard, called Status. You can add more dashboards to contain the content you need at your fingertips.

Each information “chunk” is within a widget. Widgets provide an easy and quick way to view a variety of information, such as statistical information or network activity. There are a selection of widgets to choose from by selecting the *Widgets* option.

Administrators must have read and write privileges for adding and configuring dashboards and widgets.

Your browser must have Java script enabled to view the Dashboard page.

Adding dashboards

Dashboards that you create are automatically added under the default status and usage dashboards. You can add, remove or rename a dashboard, regardless of whether it is default. You can also reset the Dashboard menu to its default settings by selecting *Reset Dashboards*.

If VDOMs are enabled, only the dashboards within Global are available for configuration.

To add a dashboard

1. Go to *System* > *Dashboard* > *Status*.
2. Select *Dashboard*, located at the top left of the page.
3. Select *Add Dashboard*.
4. Enter a name for the dashboard.
5. Select *OK*.

Adding widgets to a dashboard

To add a widget to a dashboard, select *Widget* located at the top left of the dashboard page. Select a widget add it to the dashboard. Select the red X-box to close the window.

Figure 34: A minimized display

In an HA cluster, the information that appears applies to the whole HA cluster, not just the primary FortiGate unit.

System Information widget

The System Information widget status information on the FortiGate unit and provides the access point to update the firmware and backup the configurations.

System Information widget	
Host Name	The name of the FortiGate unit. For details on changing the name, see Changing the FortiGate unit's host name. If the FortiGate unit is in HA mode, this information is not displayed.
Serial Number	The serial number of the FortiGate unit. The serial number is specific to that FortiGate unit and does not change with firmware upgrades.
Operation Mode	The current operating mode of the FortiGate unit. A FortiGate unit can operate in NAT mode or transparent mode. Select *Change* to switch between NAT and transparent mode. For more information, see Changing the operation mode. If virtual domains are enabled, this field shows the operating mode of the current virtual domain. The Global System Status dashboard does not include this information.
HA Status	The status of high availability within the cluster. Standalone indicates the FortiGate unit is not operating in HA mode. Active-Passive or Active-Active indicate the FortiGate unit is operating in HA mode. Select *Configure*, to change the HA configuration.
Cluster Name	The name of the HA cluster for this FortiGate unit. The FortiGate unit must be operating in HA mode to display this field.
Cluster Members	The FortiGate units in the HA cluster. Information displayed about each member includes host name, serial number, and whether the FortiGate unit is a primary (master) or subordinate (slave) FortiGate unit in the cluster. The FortiGate unit must be operating in HA mode with virtual domains disabled to display this information.
Virtual Cluster 1 **Virtual Cluster 2**	The role of each FortiGate unit in virtual cluster 1 and virtual cluster 2. The FortiGate unit must be operating in HA mode with virtual domains enabled to display this information.
System Time	The current date and time. Select *Change*, to configure the system time. For more information, see Configuring system time.
Firmware Version	The version of the current firmware installed on the FortiGate unit. Select *Update* to upload a newer or older firmware version. For more information, see Changing the firmware.
System Configuration	The time period of when the configuration file was backed up. Select *Backup* to back up the current configuration. For more information, see Backing up the configuration. To restore a configuration file, select *Restore*. For more information, see Restoring your firmware configuration.

Current Administrator	The number of administrators currently logged into the FortiGate unit. Select *Details* to view more information about each administrator that is currently logged in If you want to changed the current administrator's password, see Changing the currently logged in administrator's password.
Uptime	The time in days, hours, and minutes since the FortiGate unit was started or rebooted.
Virtual Domain	Status of virtual domains on your FortiGate unit. Select *Enable* or *Disable* to change the status of virtual domains feature. If you enable or disable virtual domains, your session will be terminated and you will need to log in again.

Changing the FortiGate unit's host name

The host name appears in the *Host Name* row, in the *System Information* widget. The host name also appears at the CLI prompt when you are logged in to the CLI and as the SNMP system name.

The only administrators that can change a FortiGate unit's host name are administrators whose admin profiles permit system configuration write access. If the FortiGate unit is part of an HA cluster, you should use a unique host name to distinguish the FortiGate unit from others in the cluster.

To change the host name on the FortiGate unit, in the *System Information* widget, select *Change* in the *Host Name* row.

Changing the operation mode

FortiGate units and individual VDOMs can operate in NAT or transparent mode. From the *System Information* dashboard widget you can change the operating mode for your FortiGate unit or for a VDOM and perform sufficient network configuration to ensure that you can connect to the web-based manager in the new mode.

NAT mode

In NAT mode (also called NAT mode), the FortiGate unit is visible to the network that it is connected to. All of its interfaces are on different subnets. Each interface that is connected to a network must be configured with an IP address that is valid for that subnetwork. The FortiGate unit functions as a

You would typically use NAT mode when the FortiGate unit is deployed as a gateway between private and public networks (or between any networks). In its default NAT mode configuration, the FortiGate unit functions as a router, routing traffic between its interfaces. Security policies control communications through the FortiGate unit to both the Internet and between internal networks. In NAT mode, the FortiGate unit performs network address translation before IP packets are sent to the destination network.

For example, a company has a FortiGate unit as their interface to the Internet. The FortiGate unit also acts as a router to multiple sub-networks within the company. In this situation the FortiGate unit is set to NAT mode. Using this mode, the FortiGate unit can have a designated port for the Internet, in this example, wan1 with an address of 172.20.120.129, which is the public IP address. The internal network segments are behind the FortiGate unit and invisible to the public access, for example port 2 with an address of 10.10.10.1. The FortiGate unit translates IP addresses passing through it to route the traffic to the correct subnet or the Internet.

Transparent Mode

In transparent mode, the FortiGate unit is invisible to the network. All of its interfaces are on the same subnet and share the same IP address. To connect the FortiGate unit to your network, all you have to do is configure a management IP address and a default route.

You would typically use the FortiGate unit in transparent mode on a private network behind an existing firewall or behind a router. In transparent mode, the FortiGate unit also functions as a firewall. Security policies control communications through the FortiGate unit to the Internet and internal network. No traffic can pass through the FortiGate unit until you add security policies.

For example, the company has a router or other firewall in place. The network is simple enough that all users are on the same internal network. They need the FortiGate unit to perform application control, antivirus and intrusion protection and similar traffic scanning. In this situation the FortiGate unit is set to transparent mode. The traffic passing through the FortiGate unit does not change the addressing from the router to the internal network. Security policies and UTM profiles define the type of scanning the FortiGate unit performs on traffic entering the network.

To switch from NAT to transparent mode

1 From the *System Information* dashboard widget select *Change* beside *Operation Mode*.

2 From the *Operation Mode* list, select *Transparent*.

3 Enter the *Management IP* address and Netmask. This is the IP address to connect to when configuring and maintaining the device.

4 Enter the *Default Gateway*.

5 Select *OK*.

To change the transparent mode management IP address

1 From the *System Information* dashboard widget select *Change* beside *Operation Mode*.

2 Enter a new IP address and netmask in the *Management IP/Network* field as required and select *OK*.

Your web browser is disconnected from the web-based manager. To reconnect to the web-based manager browse to the new management IP address.

To switch from transparent to NAT mode

1 From the *System Information* dashboard widget select *Change* beside *Operation Mode*.

2 From the *Operation Mode* list, select *NAT*.

3 Enter a valid IP address and netmask for the network from which you want to manage the FortiGate unit.

4 Select the interface to which the Interface IP/Netmask settings apply

5 Enter the IP address default gateway required to reach other networks from the FortiGate unit. This option address a default route to the static routing table. The gateway setting of this default route is set to the IP address that you enter and the device setting of this default route is set to the interface selected in the Device field.

6 After the FortiGate unit switches to NAT mode you may need to go to *Router* > *Static Route* and edit this default route.

7 Select *OK*.

Configuring system time

The FortiGate unit's system time can be changed using the *System Information* widget by selecting *Change* in the *System Time* row.

Time Settings page	
System Time	The current system date and time on the FortiGate unit.
Refresh	Update the display of the FortiGate unit's current system date and time.
Time Zone	Select the current system time zone for the FortiGate unit.
Set Time	Select to set the system date and time to the values.
Synchronize with NTP Server	Select to use a Network Time Protocol (NTP) server to automatically set the system date and time. You must specify the server and synchronization interval. FortiGate units use NTP Version 4. For more information about NTP see http://www.ntp.org.
Server	Enter the IP address or domain name of an NTP server. To find an NTP server that you can use, see http://www.ntp.org.
Sync Interval	Specify how often the FortiGate unit should synchronize its time with the NTP server.

Daylight savings time is enabled by default. You can disable daylight savings time using the CLI commands:

```
config system global
  set dst disable
end
```

Changing the firmware

To avoid loosing configuration settings you should always back up your configuration before changing the firmware image.

Administrators whose admin profiles permit maintenance read and write access can change the FortiGate unit's firmware. Firmware images can be installed from a number of sources including a local hard disk, a local USB disk, or the FortiGuard Network.

To change the firmware, go to *System* > *Dashboard* > *Status* > *System Information* widget and select the *Update* link on the *Firmware Version* row.

Firmware Upgrade/Downgrade page	
Upgrade From	Select the firmware source from the drop down list of available sources.
Firmware Version	This appears only when selecting *FortiGuard Network* is selected from the *Upgrade From* drop-down list. Select a firmware version from the drop-down list. If downgrading the firmware on the FortiGate unit, select the check box beside Allow Firmware Downgrade.
Upgrade File	Browse to the location of the firmware image on your local hard disk. This field is available for local hard disk and USB only.
Allow Firmware Downgrade	Select to confirm the installation of an older firmware image (downgrade). This appears only when selecting *FortiGuard Network* is selected from the *Upgrade From* drop-down list.
Upgrade Partition	The number of the partition being updated. This field is available only if your FortiGate unit has more than one firmware partition.
Boot the New Firmware	By default, this is enabled. Select to disable the FortiGate unit's reboot process when installing a firmware image to a partition. This option enables you to install a firmware image to a partition without the FortiGate unit rebooting itself and making the firmware image the default firmware that is currently running.

You need to register your FortiGate unit with Customer Support to access firmware updates for your model. For more information, go to http://support.fortinet.com or contact Customer Support.

Backing up the configuration

Administrators can back up the FortiGate unit's configuration file from the *System Information* widget. Select *Backup* in the *System Configuration* row, to back up the firmware configuration file to a local computer, USB disk or to a FortiManager unit.

You should always back up your configuration whenever you make any modifications to the device configuration or performing any firmware updates or changes.

Backup page	
Local PC	Select to back up the configuration file to a local management computer.
FortiManager	Select to back up the configuration file to a FortiManager unit. The Central Management settings must be enabled and a FortiManager unit connected with the FortiGate unit so that the FortiGate unit can send the configuration file to the FortiManager unit. To enable central management, go to *System* > *Admin* > *Central Management*.

USB Disk	Select to back up the configuration file to a USB key that is connected to the FortiGate unit.
Full Config	Select to backup the full VDOM configuration. This appears only when the FortiGate unit has VDOM configuration enabled.
VDOM Config	Select to backup the only the VDOM configuration file. This option backs up only the configuration file within that VDOM. Select the VDOM from the drop-down list, and select *Backup*.
Encrypt configuration file	Select to enable a password to the configuration file for added security.
Password	Enter the password that will be used to restore the configuration file.
Confirm	Re-enter the password.

Formatting USB

The FortiGate unit enables you to back up the configuration of the device to a USB flash drive. The USB flash drive must be formatted as a FAT16 disk.

To formate the USB flash drive, either use the CLI command `exe usb-disk format`. or within Windows at a command prompt, enter the command...

“`format <drive_letter>: /FS:FAT /V:<drive_label>`

... where `<drive_letter>` is the letter of the connected USB flash drive and `<drive_label>` is the name to give the USB drive.

Remote FortiManager backup and restore options

After successfully connecting to the FortiManager unit from your FortiGate unit, you can back up and restore your configuration to and from the FortiManager unit.

A list of revisions is displayed when restoring the configuration from a remote location. The list allows you to choose the configuration to restore. To use the FortiManager unit as a method of backup and restore of configuration files, you must first configure a connection between the two devices. For more information, see Central management.

Remote FortiGuard backup and restore options

Your FortiGate unit can be remotely managed by a central management server, which is available when you register for the FortiGuard Analysis and Management Service. FortiGuard Analysis and Management Service is a subscription-based service and is purchased by contacting support.

After registering, you can back up or restore your configuration. FortiGuard Analysis and Management Service is useful when administering multiple FortiGate units without having a FortiManager unit. Using this service you can also upgrade the firmware. Upgrading the firmware is available in the *Firmware Upgrade* section of the backup and restore menu.

When restoring the configuration from a remote location, a list of revisions is displayed so that you can choose the configuration file to restore.

The FortiGuard-FortiManager protocol is used when connecting to the FortiGuard Analysis and Management Service. This protocol runs over SSL using IPv4/TCP port 541 and includes the following functions:

- detects FortiGate unit dead or alive status
- detects management service dead or alive status
- notifies the FortiGate units about configuration changes, AV/IPS database update and firewall changes.

Restoring your firmware configuration

Administrators can restore a configuration file that was backed up using the *System Information* widget. If the configuration file was encrypted, you will need the password to restore the configuration file.

Restore	
Local PC	Select to back up the configuration file to a local management computer.
FortiManager	Select to back up the configuration file to a FortiManager unit. The Central Management settings must be enabled and a FortiManager unit connected with the FortiGate unit so that the FortiGate unit can send the configuration file to the FortiManager unit. To enable central management, go to *System* > *Admin* > *Central Management*.
USB Disk	Select to back up the configuration file to a USB key that is connected to the FortiGate unit.
Filename	Select Browse to locate the configuration file
Password	If a password was set when saving the configuration file, enter the password.

Viewing online administrators

The *System Information* widget enables you to view information about the administrators logged into the FortiGate unit. To view logged in administrators, in the *System Information* widget, select *Details*. in the *Current Administrator* row.

Administrators logged in window (System Information widget) Lists the administrators that are currently logged into the FortiGate unit.	
Disconnect	To disconnect an administrator, select the check box next to the administrator's name and select *Disconnect*. This is available only if your admin profile gives you *System Configuration* write permission. You cannot log off the default "admin" user.
Refresh	Select to update the list.
User Name	The administrator account name.
Type	The type of access: http, https, jsconsole, sshv2.

From	The administrator's IP address. If *Type* is *jsconsole*, the value in *From* is *N/A*.
Time	The date and time the administrator logged on.

Changing the currently logged in administrator's password

Use the *System Information* widget, to change your password. To do this, select the *Change Password* option in the *Current Administrator* row.

Edit Password	
Administrator	The name of the administrator who is changing their password.
Old Password	Enter your current password.
New Password	Enter the new password.
Confirm Password	Enter the new password again to confirm.

License Information widget

License Information displays the status of your technical support contract and FortiGuard subscriptions. The FortiGate unit updates the license information status indicators automatically when attempting to connect to the FortiGuard Distribution Network (FDN). FortiGuard Subscriptions status indicators are green if the FDN was reachable and the license was valid during the last connection attempt, grey if the FortiGate unit cannot connect to the FDN, and orange if the FDN is reachable but the license has expired.

When a new FortiGate unit is powered on, it automatically searches for FortiGuard services. If the FortiGate unit is configured for central management, it will look for FortiGuard services on the configured FortiManager system. The FortiGate unit sends its serial number to the FortiGuard service provider, which then determines whether the FortiGate unit is registered and has valid contracts for FortiGuard subscriptions and FortiCare support services. If the FortiGate unit is registered and has a valid contract, the License Information is updated.

If the FortiGate unit is not registered, any administrator with the super_admin profile sees a reminder message that provides access to a registration form.

When a contract is due to expire within 30 days, any administrator with the super_admin profile sees a notification message that provides access to an Add Contract form. Simply enter the new contract number and select *Add*. Fortinet Support also sends contract expiry reminders.

You can optionally disable notification for registration or contract inquiry using the `config system global` command in the CLI. Selecting any of the *Configure* options will take you to the Maintenance page.

License Information widget	
Support Contract	Displays details about your current Fortinet Support contract. • If *Not Registered* appears, select *Register* to register the FortiGate unit. • If *Expired* appears, select *Renew* for information on renewing your technical support contract. Contact your local reseller. • If *Registered* appears the name of the support that registered this FortiGate unit is also displayed. • You can select *Login Now* to log into the Fortinet Support account that registered this FortiGate unit. The support contract section also includes information on the number of FortiClient users connecting to the FortiGate unit. It displays the number of FortiClient connections allowed, and the number of users connecting. By selecting the Details link for the number of connections, you can view more information about the connecting user, including IP address, user name and type of operating system the user is connecting with.
FortiGuard Services	Displays the currently installed version of the attack and virus definitions for the various UTM services from FortiGuard. Select *Renew* to update any of the licenses.
Virtual Domain	Displays the maximum number of virtual domains the FortiGate unit supports with the current license. For high-end models, you can select the *Purchase More* link to purchase a license key through Fortinet technical support to increase the maximum number of VDOMs.
FortiClient Software	View information about the latest version of FortiClient licenses and users connecting using the software.

Manually updating FortiGuard definitions

You can update the definition files for a number of FortiGuard services from the *License Information* widget.

To update FortiGuard definitions manually

1. Download the latest update files from Fortinet support site and copy it to the computer that you use to connect to the web-based manager.
2. Log in to the web-based manager and locate the *License Information* widget.
3. In the License Information widget, in the *AV Definitions* row, select *Update*.
4. Select *Browse* and locate the update file, or type the path and filename.
5. Select *OK*.
6. Verify the update was successful by locating the License Information widget and viewing the date given in the row.

FortiGate unit Operation widget

The *Unit Operation* widget is an illustrated version of the FortiGate unit's front panel that shows the status of the FortiGate unit's network interfaces. The interface appears green, when the interface is connected. Hover the mouse pointer over the interface to view details about the interface.

The *Unit Operation* widget also is where you reboot or shutdown the FortiGate unit.

Icons around the front panel indicate when the FortiGate unit is connected to a FortiAnalyzer or FortiManager device, or FortiClient installations. Select the icon in the widget to jump to the configuration page for each device. When connected to one of these devices, a green check mark icon appears next to the icon. If the device communication is configured, but the device is unreachable, a red X appears.

System Resources widget

The *System Resources* widget displays basic FortiGate unit resource usage. This widget displays the information for CPU and memory in either real-time or historical data. For FortiGate units with multiple CPUs, you can view the CPU usage as an average of all CPUs or each one individually.

Use the *Refresh* icon when you want to view current system resource information, regardless of whether you are viewing real-time or historical type format.

To change the resource view from real-time to historical, or change the CPU view (for multiple CPU FortiGate units), select the *Edit* icon (visible when you hover the mouse over the widget).

When viewing CPU and memory usage in the web-based manager, only the information for core processes displays. CPU for management processes, is excluded. For example, HTTPS connections to the web-based manager.

Alert Message Console widget

Alert messages help you monitor system events on your FortiGate unit such as firmware changes, network security events, or virus detection events. Each message shows the date and time that the event occurred.

The types of messages can appear in the Alert Message Console include:

System restart	The system restarted. The restart could be due to operator action or power off/on cycling.
System shutdown	An administrator shut down the FortiGate unit from the web-based manager or CLI.
Firmware upgraded by <admin_name>	The named administrator upgraded the firmware to a more recent version on either the active or non-active partition.
Firmware downgraded by <admin_name>	The named administrator downgraded the firmware to an older version on either the active or non-active partition.
FortiGate has reached connection limit for <n> seconds	The antivirus engine was low on memory for the duration of time shown and entered conserve mode. Depending on model and configuration, content can be blocked or can pass unscanned under these conditions.

Found a new FortiAnalyzer **Lost the connection to FortiAnalyzer**	Shows that the FortiGate unit has either found or lost the connection to a FortiAnalyzer unit.
New firmware is available from FortiGuard	An updated firmware image is available to be downloaded to this FortiGate unit.

You can configure the alert message console settings to control what types of messages are displayed on the console.

To configure the Alert Message Console

1 Locate the Alert Message Console widget within the Dashboard menu.

2 Select the *Edit* icon in the *Alert Message Console* title bar.

3 Select the types of alerts that you do not want to be displayed in the widget.

4 Select *OK*.

Log and Archive Statistics widget

The *Log and Archive Statistics* widget displays the activity of what is DLP archiving, network traffic, and security problems including attack attempts, viruses caught, and spam email caught.

The information displayed in the *Log and Archive Statistics* widget is derived from log messages. Various configuration settings are required to collect data, as described below.

Log and Archive Statistics widget	
Since	The date and time when the counts were last reset. Counts are reset when the FortiGate unit reboots, or when you select *Reset* in the title bar area.

DLP Archive	A summary of the HTTP, HTTPS, MM1, MM3, MM4, MM7, email, FTP IM, and VoIP (also called session control) traffic that has passed through the FortiGate unit, and has been archived by DLP. MM1, MM3, MM4, and MM7 are only available in FortiOS Carrier. This widget also Indicates the average DLP archive bytes per day since the last time it was reset. The *Details* pages list the last items of the selected type—up to 64 items—and provides links to the FortiAnalyzer unit where the archived traffic is stored. If logging to a FortiAnalyzer unit is not configured, the *Details* pages provide a link to *Log & Report* > *Log Config* > *Log Settings*. You configure the FortiGate unit to collect DLP archive data for the widget by configuring a DLP sensor to archive its log data. You must also add the profile to a security policy. When the security policy receives sessions for the selected protocols, meta-data is added to the statistics widget. In FortiOS Carrier, you can configure an MMS profile to collect statistics for MM1, MM3, MM4 and MM7 traffic. The Email statistics are based on email POP3, IMAP and SMTP protocols. If your FortiGate unit supports SSL content scanning and inspection, POP3S, IMAPS and SMTPS are also included. The IM statistics are based on the AIM, ICQ, MSN, and Yahoo! protocols and configured by selecting *Archive* in DLP Sensors for IM DLP rules. The VoIP statistics are based on the SIP, SIMPLE and SCCP session control protocols and configured by selecting *Archive* in DLP Sensors for Session Control DLP rules.
Log	A summary of traffic, viruses, attacks, spam email messages, and blocked URLs that the FortiGate unit has logged. *DLP data loss detected* displays the number of sessions that have matched DLP sensor profiles. DLP collects meta data about all sessions matched by DLP sensors and records this meta-data in the DLP log. Every time a DLP log message is recorded, the DLP data loss detected number increases. If you are using DLP for summary or full archiving the DLP data loss detected number can get very large. This number may not indicate that data has been lost or leaked.

Viewing DLP archive section of the Log and Archive Statistics widget

From the *Log and Archive Statistics* widget, you can view statistics about HTTP, HTTPS, FTP and IM traffic coming through the FortiGate unit. In FortiOS Carrier, you can view the MM1, MM3, MM4, MM7 email statistics. Select the *Details* link beside each traffic type to view more information.

DLP archive information is viewed from the DLP Archive section of the Log and Archive Statistics widget. You must select *Details* to view the available archive information.

Viewing the Log section of the Log and Archive Statistics widget

From the *Log and Archive Statistics* widget, you can view statistics about the network attacks that the FortiGate unit has stopped, statistics on viruses caught, attacks detected, spam email detected, and URLs blocked. Select the *Details* link beside each attack type to view more information.

CLI Console widget

The *CLI Console* widget enables you to access the CLI without exiting from the web-based manager.

The two controls located on the CLI Console widget title bar are *Customize*, and *Detach*.

- *Detach* moves the CLI Console widget into a pop-up window that you can resize and reposition. Select *Attach*. to move the widget back to the dashboard's page.
- *Customize* enables you to change the appearance of the console by selecting fonts and colors for the text and background.

Session History widget

The *Session History* widget displays the total session activity on the device. Activity displays on a per second basis. Select the *Edit* icon in the title bar (which appears when you hover the mouse over the widget) to change the time period for the widget.

Top Sessions widget

The *Top Sessions* widget polls the FortiGate unit for session information for IPv4 or IPv6 addresses, or both. Rebooting the FortiGate unit will reset the Top Session statistics to zero.

When you select *Details* to view the current sessions list, a list of all sessions currently processed by the FortiGate unit.

Detailed information is available in *System* > *Monitor* > *Sessions*. Use the following table to modify the default settings of the Top Sessions widget.

Traffic History widget

The *Traffic History* widget displays the traffic on one selected interface over a specified time period.

Only one interface can be monitored at a time. By default, no interface is monitored. Configure an interface to monitor by selecting the *Edit* icon in the title bar (which appears when you hover the mouse over the widget) and choosing the interface from the drop down menu. All traffic history data is cleared when you select *Apply*.

To expand the information for the widget, select *Enlarge* in the title bar area. The data will appear in a larger, pop up window.

You can modify several default settings for this widget when you select the *Edit* icon in the title bar (which appears when you hover the mouse over the widget).

RAID monitor widget

The *RAID Monito*r widget displays the current state of the RAID array and each RAID disk. This widget does not display unless the FortiGate unit has more than one disk installed, and is not available for FortiOS Carrier.

RAID monitor widget	
Configure	Select to configure the RAID array, or rebuild a degraded array.

Array Status	
Array status icon	Displays the status of the RAID array. • Green with a check mark shows a healthy RAID array. • Yellow triangle shows the array is in a degraded state but it is still functioning. A degraded array is slower than a healthy array. Rebuild the array to fix the degraded state. • A wrench shows the array is being rebuilt. Positioning the mouse over the array status icon displays a text message of the status of the array.
Disk status icon	There is one icon for each disk in the array. • Green with a check mark shows a healthy disk. • Red with an X shows the disk has failed and needs attention. Positioning the mouse over the disk status icon displays the status of the disk, and the storage capacity of the disk.
RAID Level	The RAID level of this RAID array. The RAID level is set as part of configuring the RAID array.
Disk Space Usage	
Status bar	The bar shows the percentage of the RAID array that is currently in use.
Used/Free/Total	Displays the amount of RAID array storage that is being used, the amount of storage that is free, and the total storage in the RAID array. The values are in GB. *Used* added to *Free* should equal *Total*.
Synchronizing status	Display the percent complete of the RAID array synchronization. Synchronizing may take several hours. When synchronizing the status of the RAID array will indicate synchronizing is happening in the background. Synchronizing progress bar is visible only when the RAID array is synchronizing. You may need to select the refresh icon in the widget title bar to update this progress bar.
Rebuild status	Display the percent complete of the RAID array rebuild. Rebuilding the array may take several hours. While rebuilding the array, it is in a degraded and vulnerable state — any disk failure during a rebuild will result in data loss. A warning is displayed indicating the RAID array is running in reduced reliability mode until the rebuild is completed. You may need to select the refresh icon in the widget title bar to update this progress bar.

RAID disk configuration

The RAID disk is configured from the Disk Configuration page.

Disk Configuration page	
RAID level	Select the level of RAID. Options include: • **RAID-0** — (striping) better performance, no redundancy • **RAID-1** — (mirroring) half the storage capacity, with redundancy • **RAID-5** — striping with parity checking, and redundancy Available RAID level options depend on the available number of hard disks. Two or more disks are required for RAID 0 or RAID 1. Three or more disks are required for RAID 5. Changing the RAID level will erase any stored log information on the array, and reboot the FortiGate unit. The FortiGate unit will remain offline while it reconfigures the RAID array. When it reboots, the array will need to synchronize before being fully operational.
Status	The status, or health, of RAID array. This status can be one of: • **OK** — standard status, everything is normal • **OK (Background-Synchronizing) (%)** — synchronizing the disks after changing RAID level, Synchronizing progress bar shows percent complete • **Degraded** — One or more of the disks in the array has failed, been removed, or is not working properly. A warning is displayed about the lack of redundancy in this state. Also, a degraded array is slower than a healthy array. Select *Rebuild RAID* to fix the array. • **Degraded (Background-Rebuilding) (%)** — The same as degraded, but the RAID array is being rebuilt in the background. The array continues to be in a fragile state until the rebuilding is completed.
Size	The size of the RAID array in gigabytes (GB). The size of the array depends on the RAID level selected, and the number of disks in the array.
Rebuild RAID	Select to rebuild the array after a new disk has been added to the array, or after a disk has been swapped in for a failed disk. If you try to rebuild a RAID array with too few disks you will get a rebuild error. After inserting a functioning disk, the rebuild will start. This button is only available when the RAID array is in a degraded state and has enough disks to be rebuilt. You cannot restart a rebuild once a rebuild is already in progress. **Note:** If a disk has failed, the number of working disks may not be enough for the RAID level to function. In this case, replace the failed disk with a working disk to rebuild the RAID array.
Disk#	The disk's position in the array. This corresponds to the physical slot of the disk. If a disk is removed from the FortiGate unit, the disk is marked as not a member of the array and its position is retained until a new disk is inserted in that drive bay.

Status	The status of this disk. Options include OK, and unavailable. A disk is unavailable if it is removed or has failed.
Member	Display if the selected disk is part of the RAID array. • A green icon with a check mark indicates the disk is part of the array. • A grey icon with an X indicates the disk is not part of the RAID array. A disk may be displayed as healthy on the dashboard display even when it is not a member in the RAID array. A disk may be available but not used in the RAID array. For example three disks in a RAID 1 array, only two are used.
Capacity	The storage capacity that this drive contributes to the RAID array. The full storage capacity of the disk is used for the RAID array automatically. The total storage capacity of the RAID array depends on the capacity and numbers of the disks, and the RAID level of the array.

Top Application Usage widget

The *Top Application Usage* widget shows the volume of traffic passing through the FortiGate unit classified by application type as either a chart or a table. The chart displays applications in order of use.

From the chart or table display you can:

- View traffic volumes by pausing the mouse pointer over each bar.
- Select an application type on the graph to view information about the source addresses that used the application and the amount of data transferred by sessions from each source address.

Top application usage data collection is started by adding application control lists to security policies. Sessions accepted by security policies (with no application control list applied to that security policy) do not contribute to the data displayed.

Use the following table to modify the default settings for the Top Application Usage widget.

Storage widget

The *Storage* widget displays the status of disks currently installed on your FortiGate unit. The status includes how much space is used and how much free space is available. You can find out more detailed information about a disk's status by going to *System* > *Config* > *Disk*. The Storage page displays information regarding the disk's health, RAID events, visual representation of the disk, and configuration of the management of the disk.

P2P Usage widget

The *P2P Usage* widget displays the total bytes and total bandwidth for each supported instant messaging client. These clients are WinNY, BitTorrent, eDonkey, Guntella, and KaZaa. With P2P Usage, you can only modify the default name of the widget.

Per-IP Bandwidth Usage widget

The *Per-IP Bandwidth Usage* widget displays the per-IP address session data. The data, displays each IP address that initiated the traffic (and its current bandwidth consumption), and is similar to the top session widget. Instead of viewing the IP address of the person who initiated the traffic, you can choose to view their name by selecting *Resolve Host Name* in the editing window.

VoIP Usage widget

The *VoIP Usage* widget displays current active VoIP call information (using over SIP and SCCP protocols), which include complete calls, calls that have been dropped, failed or went unanswered.

IM Usage widget

The *IM Usage* widget displays instant messaging clients and their activity that is occurring on your network, including chats, messages, file transfer between clients, and any voice chats. IM Usage provides this information for IM, Yahoo!, AIM, and ICQ.

Network Protocol Usage

The *Network Protocol Usage* widget displays protocol activity over a defined time period and the amount of bandwidth used during the activity.

Basic configurations

Before going ahead and configuring security policies, users, and UTM profiles, you should perform some basic configurations to set up your FortiGate unit.

Changing your administrator password (best practices)

By default, you can log in to the web-based manager by using the admin administrator account and no password. It is highly recommended that you add a password to the admin administrator account. For improved security, you should regularly change the admin administrator account password and the passwords for any other administrator accounts that you add.

To change an administrator's password, go to *System* > *Admin* > *Administrators*, edit the administrator account, and then change the password.

For details on selecting a password, and password best practices, see "Passwords" on page 348.

If you forget or lose an administrator account password and cannot log in to the unit, see the Fortinet Knowledge Base article Recovering a lost FortiGate administrator account password.

Changing the web-based manager language

The default language of the web-based manager is English. A selection of localized iterations are available to selected from. For best results, you should select the language that the management computer operating system uses.

To change the language, go to *System* > *Admin* > *Settings*. In the *Display Settings section*, select the language you want from the *Language* drop-down list.

Changing administrative access

Through administrative access, an administrator can connect to the FortiGate unit. Access is available through a number of services including HTTPS and SSH.The default configuration allows administrative access to one or more of the unit's interfaces as described in the *QuickStart Guide*.

To change administrative access

1. Go to *System* > *Network* > *Interface*.
2. Select the interface.
3. Select the administrative access type or types for that interface.
4. Select *OK*.

Changing the web-based manager idle timeout

By default, the web-based manager disconnects administrative sessions if no activity occurs for five minutes. This prevents someone from using the web-based manager if the management PC is left unattended.

To change the idle timeout

1. Go to *System* > *Admin* > *Settings*.
2. In the *Administration Settings* section, enter the time in minutes in the *Idle Timeout* field
3. Select *Apply*.

Switching VDOMs

When VDOMs are enabled, a menu appears in the left column called *Current VDOM*. This menu displays a drop-down list that lists the configured VDOMs.

To switch to a VDOM using the *Current VDOM* menu, select the VDOM that you want to switch to from the drop-down list. You are automatically redirected to that VDOM.

VDOMs are enabled on the *System Information* Dashboard Widget.

Connecting to the CLI from the web-based manager

You can use the CLI to configure all configuration options available from the web-based manager. Some configuration options are available only from the CLI.

To connect to the CLI console, go to *System* > *Dashboard* > *Status,* and in the CLI Console widget select inside the window, and are automatically logged in to the CLI. For more information on using the CLI, see "Using the CLI" on page 315.

Logging out

Select the Logout icon to quit your administrative session. If you only close the browser or leave the web-based manager to surf to another web site, you remain logged in until the idle timeout (default 5 minutes) expires. To change the timeout, see "Changing the web-based manager idle timeout" on page 313.

Using the CLI

The command line interface (CLI) is an alternative configuration tool to the web-based manager.

Both can be used to configure the FortiGate unit. While the configuration, in the web-based manager, a point-and-click method, the CLI, would require typing commands, or upload batches of commands from a text file, like a configuration script.

If you are new to Fortinet products, or if you are new to the CLI, this section can help you to become familiar.

This section includes the topics:

Connecting to the CLI

You can access the CLI in two ways:

- Locally — Connect your computer directly to the FortiGate unit's console port.
- Through the network — Connect your computer through any network attached to one of the FortiGate unit's network ports. The network interface must have enabled Telnet or SSH administrative access if you will connect using an SSH/Telnet client, or HTTP/HTTPS administrative access if you will connect using the *CLI Console* widget in the web-based manager.

Local access is required in some cases.

- If you are installing your FortiGate unit for the first time and it is not yet configured to connect to your network, unless you reconfigure your computer's network settings for a peer connection, you may only be able to connect to the CLI using a local serial console connection. For more information, see "Connecting to the CLI" on page 336.
- Restoring the firmware utilizes a boot interrupt. Network access to the CLI is not available until after the boot process has completed, and therefore local CLI access is the only viable option.

Before you can access the CLI through the network, you usually must enable SSH and/or Telnet on the network interface through which you will access the CLI.

Connecting to the CLI using a local console

Local console connections to the CLI are formed by directly connecting your management computer or console to the FortiGate unit, using its DB-9 or RJ-45 console port. To connect to the local console you need:

- a computer with an available serial communications (COM) port
- the RJ-45-to-DB-9 or null modem cable included in your FortiGate package
- terminal emulation software such as HyperTerminal for Microsoft Windows

The following procedure describes connection using Microsoft HyperTerminal software; steps may vary with other terminal emulators.

To connect to the CLI using a local serial console connection

1. Using the null modem or RJ-45-to-DB-9 cable, connect the FortiGate unit's console port to the serial communications (COM) port on your management computer.
2. On your management computer, start HyperTerminal.
3. For the *Connection Description*, enter a *Name* for the connection, and select *OK*.
4. On the *Connect using* drop-down list box, select the communications (COM) port on your management computer you are using to connect to the FortiGate unit.
5. Select *OK*.
6. Select the following *Port* settings and select *OK*.

Bits per second	9600
Data bits	8
Parity	None
Stop bits	1
Flow control	None

7. Press Enter or Return on your keyboard to connect to the CLI.
8. Type a valid administrator account name (such as `admin`) and press Enter.
9. Type the password for that administrator account and press Enter. (In its default state, there is no password for the `admin` account.)

   The CLI displays the following text:

   ```
   Welcome!

   Type ? to list available commands.
   ```

   You can now enter CLI commands, including configuring access to the CLI through SSH or Telnet. For details, see "Enabling access to the CLI through the network (SSH or Telnet)" on page 317.

Enabling access to the CLI through the network (SSH or Telnet)

SSH or Telnet access to the CLI is accomplished by connecting your computer to the FortiGate unit using one of its RJ-45 network ports. You can either connect directly, using a peer connection between the two, or through any intermediary network.

If you do not want to use an SSH/Telnet client and you have access to the web-based manager, you can alternatively access the CLI through the network using the *CLI Console* widget in the web-based manager.

You must enable SSH and/or Telnet on the network interface associated with that physical network port. If your computer is not connected directly or through a switch, you must also configure the FortiGate unit with a static route to a router that can forward packets from the FortiGate unit to your computer. You can do this using either a local console connection or the web-based manager.

Requirements

- a computer with an available serial communications (COM) port and RJ-45 port
- terminal emulation software such as HyperTerminal for Microsoft Windows
- the RJ-45-to-DB-9 or null modem cable included in your FortiGate package
- a network cable
- prior configuration of the operating mode, network interface, and static route (for details, see)

To enable SSH or Telnet access to the CLI using a local console connection

1 Using the network cable, connect the FortiGate unit's network port either directly to your computer's network port, or to a network through which your computer can reach the FortiGate unit.

2 Note the number of the physical network port.

3 Using a local console connection, connect and log into the CLI. For details, see "Connecting to the CLI using a local console" on page 316.

4 Enter the following command:

```
config system interface
  edit <interface_str>
    set allowaccess <protocols_list>
    next
```

```
end
```

where:

- `<interface_str>` is the name of the network interface associated with the physical network port and containing its number, such as `port1`
- `<protocols_list>` is the complete, space-delimited list of permitted administrative access protocols, such as `https ssh telnet`

For example, to exclude HTTP, HTTPS, SNMP, and PING, and allow only SSH and Telnet administrative access on `port1`:

```
set system interface port1 config allowaccess ssh telnet
```

Telnet is not a secure access method. SSH should be used to access the CLI from the Internet or any other untrusted network.

5 To confirm the configuration, enter the command to display the network interface's settings.

```
get system interface <interface_str>
```

The CLI displays the settings, including the allowed administrative access protocols, for the network interfaces.

To connect to the CLI through the network interface, see "Connecting to the CLI using SSH" on page 318 or "Connecting to the CLI using Telnet" on page 319.

Connecting to the CLI using SSH

Once the FortiGate unit is configured to accept SSH connections, you can use an SSH client on your management computer to connect to the CLI.

Secure Shell (SSH) provides both secure authentication and secure communications to the CLI. FortiGate units support 3DES and Blowfish encryption algorithms for SSH.

Before you can connect to the CLI using SSH, you must first configure a network interface to accept SSH connections. For details, see "Enabling access to the CLI through the network (SSH or Telnet)" on page 317. The following procedure uses PuTTY. Steps may vary with other SSH clients.

To connect to the CLI using SSH

1 On your management computer, start an SSH client.

2 In *Host Name (or IP Address)*, enter the IP address of a network interface on which you have enabled SSH administrative access.

3 In *Port*, enter `22`.

4 For the *Connection type*, select *SSH*.

5 Select *Open*.

The SSH client connects to the FortiGate unit.

The SSH client may display a warning if this is the first time you are connecting to the FortiGate unit and its SSH key is not yet recognized by your SSH client, or if you have previously connected to the FortiGate unit but it used a different IP address or SSH key. If your management computer is directly connected to the FortiGate unit with no network hosts between them, this is normal.

6 Click *Yes* to verify the fingerprint and accept the FortiGate unit's SSH key. You will not be able to log in until you have accepted the key.

The CLI displays a login prompt.

7 Type a valid administrator account name (such as `admin`) and press Enter.

8 Type the password for this administrator account and press Enter.

If three incorrect login or password attempts occur in a row, you will be disconnected. Wait one minute, then reconnect to attempt the login again.

The FortiGate unit displays a command prompt (its host name followed by a `#`).

You can now enter CLI commands.

Connecting to the CLI using Telnet

Once the FortiGate unit is configured to accept Telnet connections, you can use a Telnet client on your management computer to connect to the CLI.

Telnet is not a secure access method. SSH should be used to access the CLI from the Internet or any other untrusted network.

Before you can connect to the CLI using Telnet, you must first configure a network interface to accept SSH connections. For details, see "Enabling access to the CLI through the network (SSH or Telnet)" on page 317.

To connect to the CLI using Telnet

1 On your management computer, start a Telnet client.

2 Connect to a FortiGate network interface on which you have enabled Telnet.

3 Type a valid administrator account name (such as `admin`) and press Enter.

4 Type the password for this administrator account and press Enter.

If three incorrect login or password attempts occur in a row, you will be disconnected. Wait one minute, then reconnect to attempt the login again.

The FortiGate unit displays a command prompt (its host name followed by a `#`).

You can now enter CLI commands.

Command syntax

When entering a command, the command line interface (CLI) requires that you use valid syntax, and conform to expected input constraints. It will reject invalid commands.

Fortinet documentation uses the following conventions to describe valid command syntax

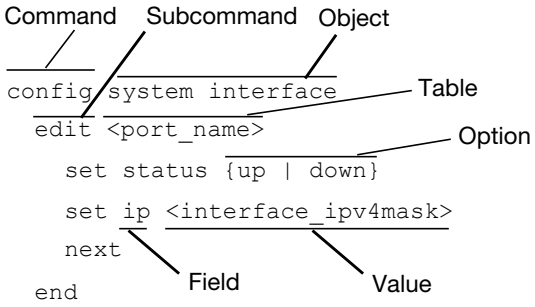
Terminology

Each command line consists of a command word that is usually followed by words for the configuration data or other specific item that the command uses or affects:

```
get system admin
```

To describe the function of each word in the command line, especially if that nature has changed between firmware versions, Fortinet uses terms with the following definitions.

Figure 35: Command syntax terminology



- **command** — A word that begins the command line and indicates an action that the FortiGate unit should perform on a part of the configuration or host on the network, such as `config` or `execute`. Together with other words, such as fields or values, that end when you press the Enter key, it forms a command line. Exceptions include multiline command lines, which can be entered using an escape sequence. (See "Shortcuts and key commands" on page 327.)

  Valid command lines must be unambiguous if abbreviated. (See "Command abbreviation" on page 328.) Optional words or other command line permutations are indicated by syntax notation. (See "Notation" on page 321.)
- **sub-command** — A kind of command that is available only when nested within the scope of another command. After entering a command, its applicable sub-commands are available to you until you exit the scope of the command, or until you descend an additional level into another sub-command. Indentation is used to indicate levels of nested commands. (See "Indentation" on page 321.)

  Not all top-level commands have sub-commands. Available sub-commands vary by their containing scope. (See "Sub-commands" on page 323.)
- **object** — A part of the configuration that contains tables and/or fields. Valid command lines must be specific enough to indicate an individual object.
- **table** — A set of fields that is one of possibly multiple similar sets which each have a name or number, such as an administrator account, policy, or network interface. These named or numbered sets are sometimes referenced by other parts of the configuration that use them. (See "Notation" on page 321.)
- **field** — The name of a setting, such as `ip` or `hostname`. Fields in some tables must be configured with values. Failure to configure a required field will result in an invalid object configuration error message, and the FortiGate unit will discard the invalid table.
- **value** — A number, letter, IP address, or other type of input that is usually your configuration setting held by a field. Some commands, however, require multiple input values which may not be named but are simply entered in sequential order in the same command line. Valid input types are indicated by constraint notation. (See "Notation" on page 321.)
- **option** — A kind of value that must be one or more words from of a fixed set of options. (See "Notation" on page 321.)

Indentation

Indentation indicates levels of nested commands, which indicate what other subcommittees are available from within the scope. For example, the `edit` sub-command is available only within a command that affects tables, and the `next` sub-command is available only from within the `edit` sub-command:

```
config system interface
  edit port1
    set status up
    next
  end
```

For information about available sub-commands, see "Sub-commands" on page 323.

Notation

Brackets, braces, and pipes are used to denote valid permutations of the syntax. Constraint notations, such as `<address_ipv4>`, indicate which data types or string patterns are acceptable value input.

Table 11: Command syntax notation

Convention	Description
Square brackets `[ ]`	A non-required word or series of words. For example: `[verbose {1 | 2 | 3}]` indicates that you may either omit or type both the `verbose` word and its accompanying option, such as `verbose 3`.

Table 11: Command syntax notation

Angle brackets < >	A word constrained by data type. The angled brackets contain a descriptive name followed by an underscore (_) and suffix that indicates the valid data type. For example, <retries_int>, indicates that you should enter a number of retries, such as 5. Data types include: • <xxx_name>: A name referring to another part of the configuration, such as policy_A. • <xxx_index>: An index number referring to another part of the configuration, such as 0 for the first static route. • <xxx_pattern>: A regular expression or word with wild cards that matches possible variations, such as *@example.com to match all email addresses ending in @example.com. • <xxx_fqdn>: A fully qualified domain name (FQDN), such as mail.example.com. • <xxx_email>: An email address, such as admin@example.com. • <xxx_ipv4>: An IPv4 address, such as 192.168.1.99. • <xxx_v4mask>: A dotted decimal IPv4 netmask, such as 255.255.255.0. • <xxx_ipv4mask>: A dotted decimal IPv4 address and netmask separated by a space, such as 192.168.1.99 255.255.255.0. • <xxx_ipv4/mask>: A dotted decimal IPv4 address and CIDR-notation netmask separated by a slash, such as 192.168.1.1/24. • <xxx_ipv4range>: A hyphen (-)-delimited inclusive range of IPv4 addresses, such as 192.168.1.1-192.168.1.255. • <xxx_ipv6>: A colon(:)-delimited hexadecimal IPv6 address, such as 3f2e:6a8b:78a3:0d82:1725:6a2f:0370:6234. • <xxx_v6mask>: An IPv6 netmask, such as /96. • <xxx_ipv6mask>: A dotted decimal IPv6 address and netmask separated by a space. • <xxx_str>: A string of characters that is not another data type, such as P@ssw0rd. Strings containing spaces or special characters must be surrounded in quotes or use escape sequences. See "Special characters" on page 328. • <xxx_int>: An integer number that is ***not*** another data type, such as 15 for the number of minutes.
Curly braces { }	A word or series of words that is constrained to a set of options delimited by either vertical bars or spaces. You must enter at least one of the options, unless the set of options is surrounded by square brackets [ ].
Options delimited by vertical bars |	Mutually exclusive options. For example: {enable | disable} indicates that you must enter either enable or disable, but must not enter both.

Table 11: Command syntax notation

Options delimited by spaces	Non-mutually exclusive options. For example:
	`{http https ping snmp ssh telnet}`
	indicates that you may enter all or a subset of those options, in any order, in a space-delimited list, such as:
	`ping https ssh`
	Note: To change the options, you must re-type the entire list. For example, to add `snmp` to the previous example, you would type:
	`ping https snmp ssh`
	If the option adds to or subtracts from the existing list of options, instead of replacing it, or if the list is comma-delimited, the exception will be noted.

Sub-commands

Each command line consists of a command word that is usually followed by words for the configuration data or other specific item that the command uses or affects:

```
get system admin
```

Sub-commands are available from within the scope of some commands.When you enter a sub-command level, the command prompt changes to indicate the name of the current command scope. For example, after entering:

```
config system admin
```

the command prompt becomes:

```
(admin)#
```

Applicable sub-commands are available to you until you exit the scope of the command, or until you descend an additional level into another sub-command.

For example, the `edit` sub-command is available only within a command that affects tables; the `next` sub-command is available only from within the `edit` sub-command:

```
config system interface
  edit port1
    set status up
    next
  end
```

Sub-command scope is indicated by indentation. See “Indentation” on page 321.

Available sub-commands vary by command.From a command prompt within `config`, two types of sub-commands might become available:

- commands affecting fields

- commands affecting tables

Table 12: Commands for tables

clone <table>	Clone (or make a copy of) a table from the current object.
	For example, in `config firewall policy`, you could enter the following command to clone security policy 27 to create security policy 30:
	`clone 27 to 39`
	In `config antivirus profile`, you could enter the following command to clone an antivirus profile named `av_pro_1` to create a new antivirus profile named `av_pro_2`:
	`clone av_pro_1 to av_pro_2`
	`clone` may not be available for all tables.

delete <table>	Remove a table from the current object. For example, in `config system admin`, you could delete an administrator account named `newadmin` by typing `delete newadmin` and pressing Enter. This deletes `newadmin` and all its fields, such as `newadmin`'s `first-name` and `email-address`. `delete` is only available within objects containing tables.
edit <table>	Create or edit a table in the current object. For example, in `config system admin`: • edit the settings for the default `admin` administrator account by typing `edit admin`. • add a new administrator account with the name `newadmin` and edit `newadmin`'s settings by typing `edit newadmin`. `edit` is an interactive sub-command: further sub-commands are available from within `edit`. `edit` changes the prompt to reflect the table you are currently editing. `edit` is only available within objects containing tables. In objects such as security policies, `<table>` is a sequence number. To create a new entry without the risk of overwriting an existing one, enter `edit 0`. The CLI initially confirms the creation of entry 0, but assigns the next unused number after you finish editing and enter `end`.
end	Save the changes to the current object and exit the `config` command. This returns you to the top-level command prompt.
get	List the configuration of the current object or table. • In objects, `get` lists the table names (if present), or fields and their values. • In a table, `get` lists the fields and their values. For more information on `get` commands, see the *CLI Reference*.

Table 12: Commands for tables

purge	Remove all tables in the current object. For example, in `config forensic user`, you could type `get` to see the list of user names, then type `purge` and then `y` to confirm that you want to delete all users. `purge` is only available for objects containing tables. **Caution:** Back up the FortiGate unit before performing a `purge`. `purge` cannot be undone. To restore purged tables, the configuration must be restored from a backup. **Caution:** Do not purge `system interface` or `system admin` tables. `purge` does not provide default tables. This can result in being unable to connect or log in, requiring the FortiGate unit to be formatted and restored.
rename <table> to <table>	Rename a table. For example, in `config system admin`, you could rename `admin3` to `fwadmin` by typing `rename admin3 to fwadmin`. `rename` is only available within objects containing tables.
show	Display changes to the default configuration. Changes are listed in the form of configuration commands.

Example of table commands

From within the `system admin` object, you might enter:

```
edit admin_1
```

The CLI acknowledges the new table, and changes the command prompt to show that you are now within the `admin_1` table:

```
new entry 'admin_1' added
(admin_1)#
```

Table 13: Commands for fields

abort	Exit both the `edit` and/or `config` commands without saving the fields.
end	Save the changes made to the current table or object fields, and exit the `config` command. (To exit without saving, use `abort` instead.)
get	List the configuration of the current object or table. • In objects, `get` lists the table names (if present), or fields and their values. • In a table, `get` lists the fields and their values.
next	Save the changes you have made in the current table's fields, and exit the `edit` command to the object prompt. (To save and exit completely to the root prompt, use `end` instead.) `next` is useful when you want to create or edit several tables in the same object, without leaving and re-entering the `config` command each time. `next` is only available from a table prompt; it is not available from an object prompt.

Table 13: Commands for fields

set <field> <value>	Set a field's value. For example, in `config system admin`, after typing `edit admin`, you could type `set password newpass` to change the password of the `admin` administrator to `newpass`. **Note:** When using `set` to change a field containing a space-delimited list, type the whole new list. For example, `set <field> <new-value>` will replace the list with the `<new-value>` rather than appending `<new-value>` to the list.
show	Display changes to the default configuration. Changes are listed in the form of configuration commands.
unset <field>	Reset the table or object's fields to default values. For example, in `config system admin`, after typing `edit admin`, typing `unset password` resets the password of the `admin` administrator account to the default (in this case, no password).

Example of field commands

From within the `admin_1` table, you might enter:

```
set password my1stExamplePassword
```

to assign the value `my1stExamplePassword` to the `password` field. You might then enter the `next` command to save the changes and edit the next administrator's table.

Permissions

Depending on the account that you use to log in to the FortiGate unit, you may not have complete access to all CLI commands.

Access profiles control which CLI commands an administrator account can access.

Access profiles assign either read, write, or no access to each area of the FortiGate software. To view configurations, you must have read access. To make changes, you must have write access.

Unlike other administrator accounts, the administrator account named `admin` exists by default and cannot be deleted. The `admin` administrator account is similar to a root administrator account. This administrator account always has full permission to view and change all FortiGate configuration options, including viewing and changing ***all*** other administrator accounts. Its name and permissions cannot be changed. It is the only administrator account that can reset another administrator's password without being required to enter that administrator's existing password.

Set a strong password for the `admin` administrator account, and change the password regularly. By default, this administrator account has no password. Failure to maintain the password of the `admin` administrator account could compromise the security of your FortiGate unit.

For complete access to all commands, you must log in with the administrator account named `admin`.

Tips

Basic features and characteristics of the CLI environment provide support and ease of use for many CLI tasks.

Help

To display brief help during command entry, press the question mark (?) key.

- Press the question mark (?) key at the command prompt to display a list of the commands available and a description of each command.
- Type a word or part of a word, then press the question mark (?) key to display a list of valid word completions or subsequent words, and to display a description of each.

Shortcuts and key commands

Table 14: Shortcuts and key commands

Action	Keys
List valid word completions or subsequent words. If multiple words could complete your entry, display all possible completions with helpful descriptions of each.	?
Complete the word with the next available match. Press the key multiple times to cycle through available matches.	Tab
Recall the previous command. Command memory is limited to the current session.	Up arrow, or Ctrl + P
Recall the next command.	Down arrow, or Ctrl + N
Move the cursor left or right within the command line.	Left or Right arrow
Move the cursor to the beginning of the command line.	Ctrl + A
Move the cursor to the end of the command line.	Ctrl + E
Move the cursor backwards one word.	Ctrl + B
Move the cursor forwards one word.	Ctrl + F
Delete the current character.	Ctrl + D
Abort current interactive commands, such as when entering multiple lines. If you are not currently within an interactive command such as `config` or `edit`, this closes the CLI connection.	Ctrl + C
Continue typing a command on the next line for a multi-line command. For each line that you want to continue, terminate it with a backslash (\ ). To complete the command line, terminate it by pressing the spacebar and then the Enter key, without an immediately preceding backslash.	\ then Enter

Command abbreviation

You can abbreviate words in the command line to their smallest number of non-ambiguous characters.

For example, the command `get system status` could be abbreviated to `g sy st`.

Environment variables

The CLI supports the following environment variables. Variable names are case-sensitive.

$USERFROM	The management access type (`ssh`, `telnet`, `jsconsole` for the *CLI Console* widget in the web-based manager, and so on) and the IP address of the administrator that configured the item.
$USERNAME	The account name of the administrator that configured the item.
$SerialNum	The serial number of the FortiGate unit.

For example, the FortiGate unit's host name can be set to its serial number.

```
config system global
  set hostname $SerialNum
end
```

As another example, you could log in as `admin1`, then configure a restricted secondary administrator account for yourself named `admin2`, whose `first-name` is `admin1` to indicate that it is another of your accounts:

```
config system admin
  edit admin2
    set first-name $USERNAME
```

Special characters

The characters <, >, (,), #, ', and " are not permitted in most CLI fields. These characters are special characters, sometimes also called reserved characters.

You may be able to enter special character as part of a string's value by using a special command, enclosing it in quotes, or preceding it with an escape sequence — in this case, a backslash (\ ) character.

Table 15: Entering special characters

Character	Keys
?	Ctrl + V then ?
Tab	Ctrl + V then Tab
Space (to be interpreted as part of a string value, not to end the string)	Enclose the string in quotation marks: `"Security Administrator"`. Enclose the string in single quotes: `'Security Administrator'`. Precede the space with a backslash: `Security\ Administrator`.
' (to be interpreted as part of a string value, not to end the string)	\'

Table 15: Entering special characters

" (to be interpreted as part of a string value, not to end the string)	\"
\	\\

If you need to add configuration via CLI that requires ? as part of config, you need to input CTRL-V first. If you enter the question mark (?) without first using CTRL-V, the question mark has a different meaning in CLI: it will show available command options in that section.

For example, if you enter ? without CTRL-V:

```
edit "*.xe
token line: Unmatched double quote.
```

If you enter ? with CTRL-V:

```
edit "*.xe?"
new entry '*.xe?' added
```

Using grep to filter get and show command output

In many cases the `get` and `show` (and `diagnose`) commands may produce a large amount of output. If you are looking for specific information in a large get or show command output you can use the grep command to filter the output to only display what you are looking for. The `grep` command is based on the standard UNIX grep, used for searching text output based on regular expressions.

Information about how to use grep and regular expressions is available on the Internet, just to a search for grep. For example, see http://www.opengroup.org/onlinepubs/009695399/utilities/grep.html.

Use the following command to display the MAC address of the FortiGate unit internal interface:

```
get hardware nic internal | grep Current_HWaddr
Current_HWaddr                  00:09:0f:cb:c2:75
```

Use the following command to display all TCP sessions in the session list and include the session list line number in the output

```
get system session list | grep -n tcp
```

Use the following command to display all lines in HTTP replacement message commands that contain `URL` (upper or lower case):

```
show system replacemsg http | grep -i url
```

Language support and regular expressions

Characters such as ñ, é, symbols, and ideographs are sometimes acceptable input. Support varies by the nature of the item being configured. CLI commands, objects, field names, and options must use their exact ASCII characters, but some items with arbitrary names or values may be input using your language of choice.

For example, the host name must not contain special characters, and so the web-based manager and CLI will not accept most symbols and other non-ASCII encoded characters as input when configuring the host name. This means that languages other than English often are not supported. However, some configuration items, such as names and comments, may be able to use the language of your choice.

To use other languages in those cases, you must use the correct encoding.

Input is stored using Unicode UTF-8 encoding, but is not normalized from other encodings into UTF-8 before it is stored. If your input method encodes some characters differently than in UTF-8, your configured items may not display or operate as expected.

Regular expressions are especially impacted. Matching uses the UTF-8 character values. If you enter a regular expression using another encoding, or if an HTTP client sends a request in an encoding other than UTF-8, matches may not be what you expect.

For example, with Shift-JIS, backslashes (\ ) could be inadvertently interpreted as yen symbols (¥) and vice versa. A regular expression intended to match HTTP requests containing money values with a yen symbol therefore may not work it if the symbol is entered using the wrong encoding.

For best results, you should:

- use UTF-8 encoding, or
- use only the characters whose numerically encoded values are the same in UTF-8, such as the US-ASCII characters that are also encoded using the same values in ISO 8859-1, Windows code page 1252, Shift-JIS and other encodings, or
- for regular expressions that must match HTTP requests, use the same encoding as your HTTP clients

HTTP clients may send requests in encodings other than UTF-8. Encodings usually vary by the client's operating system or input language. If you cannot predict the client's encoding, you may only be able to match any parts of the request that are in English, because regardless of the encoding, the values for English characters tend to be encoded identically. For example, English words may be legible regardless of interpreting a web page as either ISO 8859-1 or as GB2312, whereas simplified Chinese characters might only be legible if the page is interpreted as GB2312.

It configure your FortiGate unit using other encodings, you may need to switch language settings on your management computer, including for your web browser or Telnet/SSH client. For instructions on how to configure your management computer's operating system language, locale, or input method, see its documentation.

If you choose to configure parts of the FortiGate unit using non-ASCII characters, verify that all systems interacting with the FortiGate unit also support the same encodings. You should also use the same encoding throughout the configuration if possible in order to avoid needing to switch the language settings of the web-based manager and your web browser or Telnet/SSH client while you work.

Similarly to input, your web browser or CLI client should usually interpret display output as encoded using UTF-8. If it does not, your configured items may not display correctly in the web-based manager or CLI. Exceptions include items such as regular expressions that you may have configured using other encodings in order to match the encoding of HTTP requests that the FortiGate unit receives.

To enter non-ASCII characters in the CLI Console widget

1. On your management computer, start your web browser and go to the URL for the FortiGate unit's web-based manager.
2. Configure your web browser to interpret the page as UTF-8 encoded.
3. Log in to the FortiGate unit.
4. Go to *System* > *Dashboard* > *Status*.

5 In title bar of the *CLI Console* widget, click *Edit* (the pencil icon).

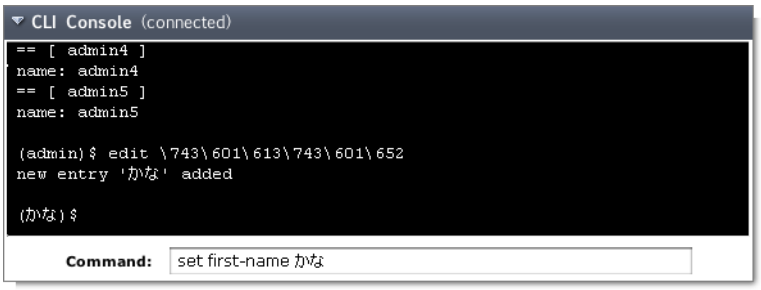
6 Enable *Use external command input box*.

7 Select *OK*.

The *Command* field appears below the usual input and display area of the *CLI Console* widget.

8 In *Command*, type a command.

Figure 36: Entering encoded characters *(CLI Console* widget)



9 Press Enter.

In the display area, the *CLI Console* widget displays your previous command interpreted into its character code equivalent, such as:

```
edit \743\601\613\743\601\652
```

and the command's output.

To enter non-ASCII characters in a Telnet/SSH client

1 On your management computer, start your Telnet or SSH client.

2 Configure your Telnet or SSH client to send and receive characters using UTF-8 encoding.

Support for sending and receiving international characters varies by each Telnet/SSH client. Consult the documentation for your Telnet/SSH client.

3 Log in to the FortiGate unit.

4 At the command prompt, type your command and press Enter.

Figure 37: Entering encoded characters (PuTTY)

You may need to surround words that use encoded characters with single quotes (').

Depending on your Telnet/SSH client's support for your language's input methods and for sending international characters, you may need to interpret them into character codes before pressing Enter.

For example, you might need to enter:

```
edit '\743\601\613\743\601\652'
```

5 The CLI displays your previous command and its output.

Screen paging

You can configure the CLI to, when displaying multiple pages' worth of output, pause after displaying each page's worth of text. When the display pauses, the last line displays `--More--`. You can then either:

- press the spacebar to display the next page.
- type `Q` to truncate the output and return to the command prompt.

This may be useful when displaying lengthy output, such as the list of possible matching commands for command completion, or a long list of settings. Rather than scrolling through or possibly exceeding the buffer of your terminal emulator, you can simply display one page at a time.

To configure the CLI display to pause when the screen is full:

```
config system console
  set output more
end
```

Baud rate

You can change the default baud rate of the local console connection.

To change the baud rate enter the following commands:

```
config system console
  set baudrate {115200 | 19200 | 38400 | 57600 | 9600}
end
```

Editing the configuration file on an external host

You can edit the FortiGate configuration on an external host by first backing up the configuration file to a TFTP server. Then edit the configuration file and restore it to the FortiGate unit.

Editing the configuration on an external host can be time-saving if you have many changes to make, especially if your plain text editor provides advanced features such as batch changes.

To edit the configuration on your computer

1 Use `execute backup` to download the configuration file to a TFTP server, such as your management computer.

2 Edit the configuration file using a plain text editor that supports Unix-style line endings.

Do not edit the first line. The first line(s) of the configuration file (preceded by a `#` character) contains information about the firmware version and FortiGate model. If you change the model number, the FortiGate unit will reject the configuration file when you attempt to restore it.

3 Use `execute restore` to upload the modified configuration file back to the FortiGate unit.

The FortiGate unit downloads the configuration file and checks that the model information is correct. If it is, the FortiGate unit loads the configuration file and checks each command for errors.If a command is invalid, the FortiGate unit ignores the command. If the configuration file is valid, the FortiGate unit restarts and loads the new configuration.

Using Perl regular expressions

Some FortiGate features, such as spam filtering and web content filtering can use either wildcards or Perl regular expressions.

See http://perldoc.perl.org/perlretut.html for detailed information about using Perl regular expressions.

For more information on using Perl expressions see the *UTM* chapter of *The Handbook*.

Differences between regular expression and wildcard pattern matching

In Perl regular expressions, the period ('.') character refers to any single character. It is similar to the question mark ('?') character in wildcard pattern matching. As a result:

- `fortinet.com` not only matches `example.com` but also matches `exampleacom`, `examplebcom`, `exampleccom` and so on.

To match a special character such as the period ('.') and the asterisk ('*'), regular expressions use the slash ('\') escape character. For example:

- To match `example.com`, the regular expression should be `example\.com`.

In Perl regular expressions, the asterisk ('*') means match 0 or more times of the character before it, not 0 or more times of any character. For example:

- `exam*\.com` matches `examiiii.com` but does not match `eample.com`.

To match any character 0 or more times, use '.*' where '.' means any character and the '*' means 0 or more times. For example:

- the wildcard match pattern `exam*.com` is equivalent to the regular expression `exam.*\.com`.

Word boundary

In Perl regular expressions, the pattern does not have an implicit word boundary. For example, the regular expression "test" not only matches the word "test" but also matches any word that contains the word "test" such as "atest", "mytest", "testimony", "atestb". The notation "\b" specifies the word boundary. To match exactly the word "test", the expression should be `\btest\b`.

Case sensitivity

Regular expression pattern matching is case sensitive in the Web and Spam filters. To make a word or phrase case insensitive, use the regular expression `/i`. For example, `/bad language/i` will block all instances of "bad language" regardless of case.

Table 16: Perl regular expression examples

Expression	Matches
abc	abc (that exact character sequence, but anywhere in the string)
^abc	abc at the beginning of the string

Table 16: Perl regular expression examples

abc$	abc at the end of the string
a|b	either of a and b
^abc|abc$	the string abc at the beginning or at the end of the string
ab{2,4}c	an a followed by two, three or four b's followed by a c
ab{2,}c	an a followed by at least two b's followed by a c
ab*c	an a followed by any number (zero or more) of b's followed by a c
ab+c	an a followed by one or more b's followed by a c
ab?c	an a followed by an optional b followed by a c; that is, either abc or ac
a.c	an a followed by any single character (not newline) followed by a c
a\.c	a.c exactly
[abc]	any one of a, b and c
[Aa]bc	either of Abc and abc
[abc]+	any (nonempty) string of a's, b's and c's (such as a, abba, acbabcacaa)
[^abc]+	any (nonempty) string which does not contain any of a, b and c (such as defg)
\d\d	any two decimal digits, such as 42; same as \d{2}
/i	makes the pattern case insensitive. For example, `/bad language/i` blocks any instance of “bad language” regardless of case.
\w+	a "word": a nonempty sequence of alphanumeric characters and low lines (underscores), such as foo and 12bar8 and foo_1
100\s*mk	the strings 100 and mk optionally separated by any amount of white space (spaces, tabs, newlines)
abc\b	abc when followed by a word boundary (e.g. in abc! but not in abcd)
perl\B	perl when not followed by a word boundary (e.g. in perlert but not in perl stuff)
\x	tells the regular expression parser to ignore white space that is neither backslashed nor within a character class. You can use this to break up your regular expression into (slightly) more readable parts.

Basic setup

The FortiGate unit requires some basic configuration to add it to your network. These basic steps include assigning IP addresses, adding routing and security policies. Until the administrator completes these steps inter-network and internet traffic will not flow through the device.

There are two methods of configuring the FortiGate unit: either the web-based manager or the command line interface (CLI). This chapter will step through both methods to complete the basic configurations to put the device on your network. Use whichever you are most comfortable with.

This chapter also provides guidelines for password and administrator best practices as well as how to upgrade the firmware.

This section includes the topics:

Connecting to the FortiGate unit

To configure, maintain and administer the FortiGate unit, you need to connect to it from a management computer. There are two ways to do this:

- using the web-based manager: a GUI interface that you connect to using a current web browser such as Firefox or Internet Explorer.
- using the command line interface (CLI): a command line interface similar to DOS or UNIX commands that you connect to using SSH or a Telnet terminal.

Connecting to the web-based manager

To connect to the web-based manager, you require:

- a computer with an Ethernet connection
- Microsoft Internet Explorer version 6.0 or higher or any recent version of a common web browser
- an Ethernet cable.

To connect to the web-based manager

1 Set the IP address of the management computer to the static IP address `192.168.1.2` with a netmask of `255.255.255.0`.

2 Using the Ethernet cable, connect the internal or port 1 interface of the FortiGate unit to the computer Ethernet connection.

3 Start your browser and enter the address `https://192.168.1.99`. (remember to include the “s” in `https://`).

To support a secure HTTPS authentication method, the FortiGate unit ships with a self-signed security certificate, which is offered to remote clients whenever they initiate a HTTPS connection to the FortiGate unit. When you connect, the FortiGate unit displays two security warnings in a browser.

The first warning prompts you to accept and optionally install the FortiGate unit’s self-signed security certificate. If you do not accept the certificate, the FortiGate unit refuses the connection. If you accept the certificate, the FortiGate login page appears. The credentials entered are encrypted before they are sent to the FortiGate unit. If you choose to accept the certificate permanently, the warning is not displayed again.

Just before the FortiGate login page is displayed, a second warning informs you that the FortiGate certificate distinguished name differs from the original request. This warning occurs because the FortiGate unit redirects the connection. This is an informational message. Select OK to continue logging in.

4 Type `admin` in the Name field and select Login.

Connecting to the CLI

The command line interface (CLI) is an alternative method of configuring the FortiGate unit. The CLI compliments the web-based manager in that it not only has the same configuration options, but additional settings not available through the web-based manager.

If you are new to FortiOS or a command line interface configuration tool, see “Using the CLI” on page 315 for an overview of the CLI, how to connect to it, and how to use it.

Setup Wizard

For the FortiGate-50B, 60C and 80C series, FortiOS includes a wizard to step you through the basic configuration of the FortiGate unit. The Setup Wizard will configure your FortiGate unit from factory default settings. If you set your management computer to the default IP address of the FortiGate unit, 192.168.1.99, and connect it to the FortiGate unit, when the device starts it will automatically launch the wizard.

A Wizard button also appears in the web-based manager. Use this button to update the configuration if required. Because the wizard configures from a default setting, it will reset the FortiGate unit to its factory defaults before beginning. The wizard will prompt you to save the existing configuration before proceeding.

FortiExplorer

FortiExplorer is a software tool for easy configuration of a new FortiGate unit, or simple updates to existing FortiGate units on a Microsoft Windows or Mac OS computer. FortiExplorer is included with the FortiGate-60C series of devices, as well as is available from the Fortinet web site.

FortiExplorer uses a USB connection to the FortiGate unit, rather than using a console cable or Ethernet connection. The USB connection does not replace the other options, but adds another option when configuring the FortiGate unit.

Installation

FortiExplorer is available for Microsoft Windows XP, Windows 7, and Mac OS X. The software is available on the Tools and Documentation CD included with your FortiGate unit, or is available for download from the Fortinet web site at http://www.fortinet.com/resource_center/product_demos.html.

Microsoft Windows install

To install FortiClient on Windows

1. Extract the ZIP (if downloaded) and double-click the .MSI or .EXE file and follow the instructions on screen. If loading from the CD, select the icon for your version of Windows.
2. Connect the USB cable to the FortiGate unit and the management computer.
3. For Windows XP, the New Hardware Wizard opens when the cables are connected. Select the option No, not at this time and select Next.
4. Select Install the hardware automatically and select Next.
5. After a few moments, FortiExplorer will launch.

Apple Macintosh OS X

To install FortiClient on Mac OS X

1. Double-click the .dmg file and drag the FortiExplorer program file into the Applications folder.
2. Connect the USB cable to the FortiGate unit and the management computer.
3. Double-click the FortiExplorer icon to launch the application.

Configuration options

With FortiExplorer, you are provided a number of options on how to configure the FortiGate unit, depending on your level of comfort with various interfaces. The options available are:

- the configuration wizard, which guides you through the basic configuration of IP addresses, passwords and security policies
- the web-based manager, which when chosen, appears within the FortiExplorer window.
- the command line interface (CLI), which when chosen, appears within the FortiExplorer window.

Updating FortiExplorer and firmware

FortiExplorer may be updated from time to time to update and add features, or correct other issues. To ensure you have the most recent FortiExplorer, use the Check for Updates option in FortiExplorer.

To check for updates on Microsoft Windows XP or Windows 7, go to *Help* > *Check for Updates*.

To check for updates on Apple Macintosh OS X, go to *FortiExplorer* > *Check for Updates*.

You can also use FortiExplorer to check for new firmware for a FortiGate unit. To check for new firmware, select the FortiGate unit from the *Device* list and select *Check for Update*.

Configuring NAT mode

When configuring NAT mode, you need to define interface addresses and default routes, and simple security policies. You can use the web-based manager or the CLI to configure the FortiGate unit in NAT mode.

Configure the interfaces

When shipped, the FortiGate unit has a default address of 192.168.1.99 and a netmask of 255.255.255.0. for either the Port 1 or Internal interface. You need to configure this and other ports for use on your network.

If you change the IP address of the interface you are connecting to, you must connect through a web browser again using the new address. Browse to https:// followed by the new IP address of the interface. If the new IP address of the interface is on a different subnet, you may have to change the IP address of your computer to the same subnet.

To configure interface for manual addressing - web-based manager

1. Go to *System* > *Network* > *Interface*.
2. Select an interface and select *Edit*.
3. Enter the *IP address* and *netmask* for the interface.
4. Select *OK*.

To configure an interface for manual addressing - CLI

```
config system interface
  edit <interface_name>
    set mode static
    set ip <interface_ipv4mask>
end
```

To configure DHCP addressing - web-based manager

1. Go to *System* > *Network* > *Interface*.
2. Select the *Edit* icon for an interface.
3. Select *DHCP* and complete the following:

Distance	Enter the administrative distance, between 1 and 255 for the default gateway retrieved from the DHCP server. The administrative distance specifies the relative priority of a route when there are multiple routes to the same destination. A lower administrative distance indicates a more preferred route.

Retrieve default gateway from server	Enable to retrieve a default gateway IP address from the DHCP server.
Override internal DNS	Enable to use the DNS addresses retrieved from the DHCP server instead of the DNS server IP addresses on the DNS page on *System* > *Network* > *Options*. You should also enable Obtain DNS server address automatically in *System* > *Network* > *Options*.

4 Select *OK*.

For more information on DHCP, see "DHCP servers and relays" on page 570.

To configure DHCP addressing - CLI

```
config system interface
  edit <interface_name>
    set mode dhcp
    set distance <integer>
    set defaultgw enable
end
```

To configure PPPoE addressing - web-based manager

1 Go to *System* > *Network* > *Interface*.

2 Select an interface and select *Edit*.

3 Select *PPPoE*, and complete the following:

Username	Enter the username for the PPPoE server. This may have been provided by your Internet Service Provider.
Password	Enter the password for the PPPoE server for the above user name.
Unnumbered IP	Specify the IP address for the interface. If your Internet Service Provider has assigned you a block of IP addresses, use one of these IP addresses. Alternatively, you can use, or borrow, the IP address of a configured interface on the router. You may need to do this to minimize the number of unique IP addresses within your network. If you are borrowing an IP address, remember the interface must be enabled, and the Ethernet cable connected to the FortiGate unit.
Initial Disc Timeout	Initial discovery timeout in seconds. The amount of time to wait before starting to retry a PPPoE discovery. To disable the discovery timeout, set the value to 0.
Initial PADT Timeout	Initial PPPoE Active Discovery Terminate (PADT) timeout in seconds. Use this timeout to shut down the PPPoE session if it is idle for this number of seconds. Your Internet Service Provider must support PADT. To disable the PADT timeout, set the value to 0.

Distance	Enter the administrative distance, between 1 and 255, for the default gateway retrieved from the DHCP server. The distance specifies the relative priority of a route when there are multiple routes to the same destination. A lower distance indicates a more preferred route.
Retrieve default gateway from server	Enable to retrieve a default gateway IP address from the DHCP server. The default gateway is added to the static routing table.
Override internal DNS	Enable to use the DNS addresses retrieved from the DHCP server instead of the DNS server IP addresses on the DNS page on *System* > *Network* > *Options*. On FortiGate-100A units and lower, you should also enable Obtain DNS server address automatically in *System* > *Network* > *Options*.

4 Select *OK*.

To configure PPPoE addressing - CLI

```
config system interface
  edit <interface_name>
    set mode pppoe
    set username <pppoe_username>
    set password <pppoe_password>
    set ipunnumbered <unnumbered_ipv4>
    set disc-retry-timeout <pppoe_retry>
    set padt-retry-timeout <pppoe_retry>
    set distance <integer>
    set defaultgw enable
end
```

Configure a DNS

A DNS server is a public service that converts symbolic node names to IP addresses. A domain name server (DNS) implements the protocol. In simple terms, it acts as a phone book for the Internet. A DNS server matches domain names with the computer IP address. This enables you to use readable locations, such as fortinet.com when browsing the Internet.

The FortiGate unit includes default DNS server addresses. However, these should be changed to those provided by your Internet Service Provider. The defaults are DNS proxies and are not as reliable as those from your ISP.

To configure DNS settings - web-based manager

1 Go to *System* > *Network* > *DNS*.

2 Enter the IP address of the primary DNS server.

3 Enter the IP address of the secondary DNS server.

4 Select *Apply*.

For more information on DNS servers see “DNS services” on page 574.

To configure DNS server settings - CLI

```
config system dns
  set primary <dns_ipv4>
  set secondary <dns_ipv4>
end
```

Add a default route and gateway

A route provides the FortiGate unit with the information it needs to forward a packet to a particular destination. A static route causes packets to be forwarded to a destination other than the default gateway. You define static routes manually. Static routes control traffic exiting the FortiGate unit. You can specify through which interface the packet will leave and to which device the packet should be routed.

In the factory default configuration, entry number 1 in the Static Route list is associated with a destination address of 0.0.0.0/0.0.0.0, which means any/all destinations. This route is called the “static default route”. If no other routes are present in the routing table and a packet needs to be forwarded beyond the FortiGate unit, the factory configured static default route causes the FortiGate unit to forward the packet to the default gateway.

For an initial configuration, you must edit the static default route to specify a different default gateway for the FortiGate unit. This will enable the flow of data through the unit.

To modify the default gateway - web-based manager

1. Go to *Router* > *Static* > *Static Route*.
2. Select the default route and select *Edit*.
3. In the *Gateway* field, type the IP address of the next-hop router where outbound traffic is directed.
4. If the FortiGate unit reaches the next-hop router through a different interface (compared to the interface that is currently selected in *Device*, select the name of the interface from the *Device* drop-down list.
5. Select *OK*.

To modify the default gateway - CLI

```
config router static
  edit <sequence_num>
    set gateway <gateway_address_ipv4>
    set device <interface_name>
end
```

Add security policies

Security policies enable traffic to flow through the FortiGate interfaces. Security policies define how the FortiGate unit processes the packets in a communication session. For the initial installation, a single security policy that enables all traffic to flow through will enable you to verify your configuration is working. On lower-end units such a default security policy is already in place. For the high-end FortiGate units, you need to add a security policy.

The following steps add two policies that allows all traffic through the FortiGate unit, to enable you to continue testing the configuration on the network. These steps provide a quick way to get traffic flowing through the FortiGate unit. It is a very broad policy and not recommended to keep on the system once initial setup and testing are complete. You will want to add more restrictive security policies to provide better network protection. For more information on security policies, see the *FortiGate Fundamentals*.

To add an outgoing traffic security policy - web-based manager

1 Go to *Policy* > *Policy* > *Policy*.

2 Select *Create New*.

3 Set the following and select *OK*.

Source Interface/Zone	Select the port connected to the network.
Source Address	All
Destination Interface/Zone	Select the port connected to the Internet.
Destination Address	All
Schedule	always
Service	Any
Action	Accept

To add an outgoing traffic security policy - CLI

```
config firewall policy
  edit <interface_name>
    set srcintf <name_str>
    set srcaddr <name_str>
    set dstintf <name_str>
    set dstaddr <name_str>
    set schedule always
    set service ANY
    set action accept
end
```

To add an incoming traffic security policy - web-based manager

1 Go to *Policy* > *Policy* > *Policy*.

2 Select *Create New*.

3 Set the following and select *OK*.

Source Interface	Select the port connected to the Internet.
Source Address	All
Destination Interface	Select the port connected to the network.
Destination Address	All
Schedule	always
Service	Any
Action	Accept

To add an incoming traffic security policy - CLI

```
config firewall policy
  edit <interface_name>
    set srcintf <name_str>
    set srcaddr <name_str>
```

```
    set dstintf <name_str>
    set dstaddr <name_str>
    set schedule always
    set service ANY
    set action accept
end
```

To create an incoming traffic security policy, you use the same commands with the addresses reversed. security policy configuration is the same in NAT and transparent mode.

These policies allow all traffic through. No UTM profiles have been configured or applied. Ensure you create additional security policies to accommodate your network requirements.

Configuring transparent mode

You can then configure the management IP address, default routes, and security policies. You can use the web-based manager or the CLI to configure the FortiGate unit in transparent mode.

Switching to transparent mode

First need to switch to transparent mode.

To switch to transparent mode - web-based manager

1. Go to *System* > *Status*.
2. Under *System Information*, select *Change* beside the *Operation Mode*.
3. Select *Transparent*.
4. Enter the *Management IP/Netmask* address and the *Default Gateway* address.

   The default gateway IP address is required to tell the FortiGate unit where to send network traffic to other networks.
5. Select *Apply*.

To switch to transparent mode

```
config system settings
  set opmode transparent
  set manageip <manage_ipv4>
  set gateway <gw_ipv4>
end
```

Configure a DNS

A DNS server is a service that converts symbolic node names to IP addresses. A domain name server (DNS) implements the protocol. In simple terms, it acts as a phone book for the Internet. A DNS server matches domain names with the computer IP address. This enables you to use readable locations, such as fortinet.com when browsing the Internet.

DNS server IP addresses are typically provided by your Internet Service Provider. For further DNS configuration and concepts, see “DNS services” on page 574.

To configure DNS server settings - web-based manager

1 Go to *System* > *Network* > *DNS*.
2 Enter the IP address of the primary DNS server.
3 Enter the IP address of the secondary DNS server.
4 Select *Apply*.

To configure DNS server settings - CLI

```
config system dns
  set primary <dns_ipv4>
  set secondary <dns_ipv4>
end
```

Add security policies

Security policies enable traffic to flow through the FortiGate interfaces. Security policies define the FortiGate unit process the packets in a communication session. You can configure the security policies to allow only specific traffic, users and specific times when traffic is allowed.

For the initial installation, a single security policy that enables all traffic through will enable you to verify your configuration is working. On lower-end units such a default security policy is already in place. For the higher end FortiGate units, you will need to add a security policy.

The following steps add two policies that allows all traffic through the FortiGate unit, to enable you to continue testing the configuration on the network.

These steps provide a quick way to get traffic flowing through the FortiGate unit. It is a very broad policy and not recommended to keep on the system once initial setup and testing are complete. You will want to add more restrictive security policies to provide better network protection. For more information on security policies, see the *FortiGate Fundamentals*.

To add an outgoing traffic security policy - web-based manager

1 Go to *Policy* > *Policy* > *Policy*.
2 Select *Create New*.
3 Set the following and select *OK*.

Source Interface/Zone	Select the port connected to the network.
Source Address	All
Destination Interface/Zone	Select the port connected to the Internet.
Destination Address	All
Schedule	always
Service	Any
Action	Accept

To add an outgoing traffic security policy - CLI

```
config firewall policy
  edit <policy_number>
    set srcintf <name_str>
```

```
    set srcaddr <name_str>
    set dstintf <name_str>
    set dstaddr <name_str>
    set schedule always
    set service ANY
    set action accept
end
```

To add an incoming traffic security policy - web-based manager

1 Go to *Policy* > *Policy* > *Policy*.

2 Select *Create New*.

3 Set the following and select *OK*.

Source Interface	Select the port connected to the Internet.
Source Address	All
Destination Interface	Select the port connected to the network.
Destination Address	All
Schedule	always
Service	Any
Action	Accept

To add an incoming traffic security policy - CLI

```
config firewall policy
  edit <policy_number>
    set srcintf <name_str>
    set srcaddr <name_str>
    set dstintf <name_str>
    set dstaddr <name_str>
    set schedule always
    set service ANY
    set action accept
end
```

To create an incoming traffic security policy, you use the same commands with the addresses reversed.

Security policy configuration is the same in NAT mode and transparent mode.

These policies allow all traffic through. No UTM profiles have been configured or applied. Ensure you create additional security policies to accommodate your network requirements.

Verifying the configuration

Your FortiGate unit is now configured and connected to the network. To verify that the FortiGate unit is connected and configured correctly, use your web browser to browse a web site, or use your email client to send and receive email.

If you cannot browse to the web site or retrieve/send email from your account, review the previous steps to ensure all information was entered correctly and try again.

Remember to verify the security policies. The security policies control the flow of information through the FortiGate unit. If the policies are not set up correctly, or are too restrictive, they can prohibit network traffic flow.

Additional configuration

Once the FortiGate unit is connected and traffic can pass through, several more configuration options are available. While not mandatory, they will help to ensure better control with the firewall.

Setting the time and date

For effective scheduling and logging, the FortiGate system date and time should be accurate. You can either manually set the system date and time or configure the FortiGate unit to automatically keep its time correct by synchronizing with a Network Time Protocol (NTP) server.

To set the date and time - web-based manager

1. Go to *System* > *Dashboard* > *Status*.
2. Under *System Information* > *System Time*, select *Change*.
3. Select your *Time Zone*.
4. Select *Set Time* and set the FortiGate system date and time.
5. Select *OK*.

Set the time and date - CLI

```
config system global
  set timezone <zone_value>
end
execute date [<date_str>]
execute time [<time_str>]
```

By default, FortiOS has the daylight savings time configuration enabled. The system time must be manually adjusted after daylight saving time ends. To disable DST, in the CLI enter the commands:

```
config system global
  set dst disable
end
```

Using the NTP Server

The Network Time Protocol enables you to keep the FortiGate time in sync with other network systems. By enabling NTP on the FortiGate unit, FortiOS will check with the NTP server you select at the configured intervals. This will also ensure that logs and other time-sensitive settings on the FortiGate unit are correct.

The FortiGate unit maintains its internal clock using the built-in battery. At startup, the time reported by the FortiGate unit will indicate the hardware clock time, which may not be accurate. When using NTP, the system time might change after the FortiGate has successfully obtained the time from a configured NTP server.

For the NTP server, you can identify a specific port/IP address for this self-originating traffic. The configuration is performed in the CLI with the command set `source-ip`. For example, to set the source IP of NTP to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config system ntp
  set ntpsyn enable
  set syncinterval 5
  set source-ip 192.168.4.5
end
```

Configuring FortiGuard

The FDN is a world-wide network of FortiGuard Distribution Servers (FDS). When the FortiGate unit connects to the FDN, it connects to the nearest FDS. To do this, all FortiGate units are programmed with a list of FDS addresses sorted by nearest time zone according to the time zone configured for the FortiGate unit.

Before you can begin receiving updates, you must register your FortiGate unit from the Fortinet web page. After which, you need to configure the FortiGate unit to connect to the FortiGuard Distribution Network (FDN) to update the antivirus, antispam and IPS attack definitions.

Updating antivirus and IPS signatures

After you have registered your FortiGate unit, you can update antivirus and IPS signatures. The FortiGuard Center enables you to receive push updates, allow push update to a specific IP address, and schedule updates for daily, weekly, or hourly intervals.

To update antivirus definitions and IPS signatures

1. Go to *System* > *Config* > *FortiGuard*.
2. Select the expand arrow for *AntiVirus and IPS Options* to expand the options.
3. Select *Update Now* to update the antivirus definitions.

   If the connection to the FDN is successful, the web-based manager displays a message similar to the following:

```
Your update request has been sent. Your database will be updated in a few minutes. Please check your update page for the status of the update.
```

After a few minutes, if an update is available, the FortiGuard Center Services information on the Dashboard lists new version information for antivirus definitions. The System Status page also displays new dates and version numbers for the antivirus definitions. Messages are recorded to the event log indicating whether or not the update was successful or not.

Updating antivirus definitions can cause a very short disruption in traffic currently being scanned while the FortiGate unit applies the new signature database. Schedule updates when traffic is light, for example overnight, to minimize any disruption.

Passwords

The FortiGate unit ships with a default empty password, that is, there is no password. You will want to apply a password to prevent anyone from logging into the FortiGate unit and changing configuration options.

To change the administrator password - web-based manager

1 Go to *System* > *Admin* > *Administrators*.

2 Select the admin account and select *Change Password*.

3 Enter a new password and select *OK*.

Set the admin password - CLI

```
config system admin
  edit admin
    set password <admin_password>
end
```

Password considerations

When changing the password, consider the following to ensure better security.

- Do not make passwords that are obvious, such as the company name, administrator names or other obvious word or phrase.
- Use numbers in place of letters, for example, `passw0rd`. Alternatively, spell words with extra letters, for example, *password*.
- Administrative passwords can be up to 256 characters.
- Include a mixture of letters, numbers, and upper and lower case.
- Use multiple words together, or possibly even a sentence, for example keytothehighway, or with a combination of the above suggestions.
- Use a password generator.
- Change the password regularly and always use a code unique (not a variation of the existing password by adding a “1” to it, for example `password`, `password1`).
- Write the password down and store it in a safe place away from the management computer, in case you forget it.
- Alternatively, ensure at least two people know the password in the event that one person becomes ill, is away on vacation or leaves the company. Alternatively have two different admin logins.

Password policy

The FortiGate unit includes the ability to enforce a password policy for administrator login. with the policy, you can enforce regular changes and specific criteria for a password including:

- minimum length between 8 and 32 characters.
- if the password must contain uppercase (A, B, C) and/or lowercase (a, b, c) characters.
- if the password must contain numbers (1, 2, 3).
- if the password must contain non-alphanumeric characters (!, @, #, $, %, ^, &, *, ().
- where the password applies (admin or IPsec or both).

- the duration of the password before a new one must be specified.

To apply a password policy - web-based manager

1 Go to *System* > *Admin* > *Settings*.

2 Select *Enable* and configure the settings as required.

To apply a password policy - CLI

```
config system password-policy
  set status enable
```

Configure the other settings as required.

Forgotten password?

It happens that the administrator of the FortiGate unit leaves the company and does not have the opportunity to provide the administrative password or forgets. Or you simply forgot the password.

In the event you lose or forget the password, you need to contact Customer Support for the steps required to reset the password. For information on contacting Customer Support, see the Support web site at web site at https://support.fortinet.com.

Administrators

By default, the FortiGate unit has a super administrator called “admin”. This user login cannot be deleted and always has ultimate access over the FortiGate unit. As well you can add administrators for various functions and VDOMs. Each one can have their own username and password and set of access privileges.There are two levels of administrator accounts; regular administrators and system administrators. Regular administrators are administrators with any admin profile other than the default super_admin. System administrators are administrators that are assigned the super_admin profile.

Administrator configuration

To create a new administrator account, go to *System Admin* > *Administrators* and select *Create New*.

You need to use the default ”admin” account, an account with the super_admin admin profile, or an administrator with read-write access control to add new administrator accounts and control their permission levels. If you log in with an administrator account that does not have the super_admin admin profile, the administrators list will show only the administrators for the current virtual domain.

The name of the administrator should not contain the characters `<>()#"'`. Using these characters in the administrator account name can result in a cross site scripting (XSS) vulnerability.

Regular (password) authentication for administrators

You can use a password stored on the local FortiGate unit to authenticate an administrator. When you select *Regular* for *Type*, you will see *Local* as the entry in the *Type* column when you view the list of administrators.

If you forget or lose an administrator account password and cannot log in to your FortiGate unit, see the Fortinet Knowledge Base article Recovering a lost FortiGate administrator account passwords.

Management access

Management access defines how administrators are able to log on to the FortiGate unit to perform management tasks such as configuration and maintenance. Methods of access can include local access through the console connection, or remote access over a network or modem interface using various protocols including Telnet and HTTPS.

You can configure management access on any interface in your VDOM. In NAT mode, the interface IP address is used for management access. In transparent mode, you configure a single management IP address that applies to all interfaces in your VDOM that permit management access. The FortiGate unit also uses this IP address to connect to the FDN for virus and attack updates.

The system administrator (admin) can access all VDOMs, and create regular administrator accounts. A regular administrator account can access only the VDOM to which it belongs. The management computer must connect to an interface in that VDOM. It does not matter to which VDOM the interface belongs. In both cases, the management computer must connect to an interface that permits management access and its IP address must be on the same network. Management access can be via HTTP, HTTPS, telnet, or SSH sessions if those services are enabled on the interface. HTTPS and SSH are preferred as they are more secure.

You can allow remote administration of the FortiGate unit. However, allowing remote administration from the Internet could compromise the security of the FortiGate unit. You should avoid this unless it is required for your configuration. To improve the security of a FortiGate unit that allows remote administration from the Internet:

- Use secure administrative user passwords.
- Change these passwords regularly.
- Enable two-factor authentication for administrators.
- Enable secure administrative access to this interface using only HTTPS or SSH.
- Use Trusted Hosts to limit where the remote access can originate from.
- Do not change the system idle timeout from the default value of 5 minutes.

Tightening Security

One point of security breach is at the management computer. Administrators who leave their workstations for a prolonged amount of time while staying logged into the web-based manager or CLI (whether on purpose or not), leave the firewall open to malicious intent.

Passwords

Do not make passwords that are obvious, such as the company name, administrator names or other obvious word or phrase. Administrative passwords can be up to 256 characters. For more information on passwords, see “Passwords” on page 348.

Preventing unwanted login attempts

Setting trusted hosts for an administrators increases limiting what computers an administrator can log in from. When you identify a trusted host, the FortiGate unit will only accept the administrator's login from the configured IP address. Any attempt to log in with the same credentials from any other IP address will be dropped. To ensure the administrator has access from different locations, you can enter up to ten IP addresses. Ideally, this should be kept to a minimum. For higher security, use an IP address with a net mask of 255.255.255.255, and enter an IP address (non-zero) in each of the three default trusted host fields.

Trusted hosts are configured when adding a new administrator by going to *System* > *Admin* > *Administrators* in the web-based manager or `config system admin` in the CLI.

The trusted hosts apply to the web-based manager, ping, snmp and the CLI when accessed through Telnet or SSH. CLI access through the console port is not affected.

Also ensure all entries contain actual IP addresses, not the default 0.0.0.0.

Disable admin services

On untrusted networks, turn off the weak administrative services such as TLENET and HTTP. With these services, passwords are passed in the clear, not encrypted.

These services can be disabled by going to *System* > *Network* > *Interface* and deselecting the required check boxes.

SSH login time out

When logging into the console using SSH, the default time of inactivity is 120 seconds (2 minutes) to successfully log into the FortiGate unit. To enhance security, you can configure the time to be shorter. Using the CLI, you can change the length of time the command prompt remains idle before the FortiGate unit will log the administrator out. The range can be between 10 and 3600 seconds. To set the logout time enter the following commands:

```
config system global
  set admin-ssh-grace-time <number_of_seconds>
end
```

Administrator lockout

By default, the FortiGate unit includes set number of password retries. That is, the administrator has a maximum of three attempts to log into their account before they are locked out for a set amount of time. The number of attempts can be set to an alternate value.

As well, the default wait time before the administrator can try to enter a password again is 60 seconds. You can also change this to further sway would-be hackers. Both settings are configured only in the CLI

To configure the lockout options use the following commands:

```
config system global
  set admin-lockout-threshold <failed_attempts>
  set admin-lockout-duration <seconds>
end
```

For example, to set the lockout threshold to one attempt and a five minute duration before the administrator can try again to log in enter the commands"

```
config system global
  set admin-lockout-threshold 1
  set admin-lockout-duration 300
end
```

Idle time-out

To avoid the possibility of an administrator walking away from the management computer and leaving it exposed to unauthorized personnel, you can add an idle time-out. That is, if the web-based manager is not used for a specified amount of time, the FortiGate unit will automatically log the user out. To continue their work, they must log in to the device again.

The time-out can be set as high as 480 minutes, or eight hours, although this is not recommend.

To set the idle time out - web-based manager

1 Go to *System* > *Admin* > *Settings*.

2 In the *Administration Settings*, enter the amount of time the Administrator login can remain idol in the *Idle Timeout* field.

3 Select *Apply*.

To set the idle time out - CLI

```
config system global
  set admintimeout <minutes>
end
```

Administrative ports

You can set the web-based manager access as through HTTP, HTTPS, SSH and Telnet. In these cases, the default ports for these protocols are 80, 443, 22 and 23 respectively. You can change the ports used for network administration to a different, unused port to further limit potential hackers.

Ensure the port you select is not a port you will be using for other applications. For a list of assigned port numbers see http://www.iana.org/assignments/port-numbers.

To change the administrative ports - web-based manager

1 Go to *System* > *Admin* > *Settings*.

2 In the *Web Administration Ports* section, change the port numbers.

3 Select *Apply*

To change the administrative ports - CLI

```
config system global
  set admin-port <http_port_number>
  set admin-sport <https_port_number>
  set admin-ssh-port <ssh_port_number>
  set admin-telnet-port <telnet_port_number>
end
```

When logging into the FortiGate unit, by default FortiOS will automatically use the default ports. That is, when logging into the FortiGate IP address, you only need to enter the address, for example:

```
https://192.168.1.1
```

When you change the administrative port number, the port number must be added to the url. For example, if the port number for HTTPS access is 2112, the administrator must enter the following address:

```
https://192.168.1.1:2112
```

Disable interfaces

If any of the interfaces on the FortiGate unit are not being used, disable traffic on that interface. This avoids someone plugging in network cables and potentially causing network bypass or loop issues.

To disable an interface - web-based manager

1 Go to *System* > *Network* > *Interface*.

2 Select the interface from the list and select *Edit*.

3 For *Administrative Access*, select *Down*.

4 Select *OK*.

To disable an interface - CLI

```
config system interface
  edit <inerface_name>
    set status down
end
```

Change the admin username

The default super administrator user name, admin, is a very standard default administrator name. Leaving this as is, is one half of the key to the FortiGate unit being compromised. The name can be changed.

To do this, you need to create another super user with full access and log in as that user. Then go to *System* > *Admin* > *Administrator*, select the *admin* account and select *Edit* to change the user name.

Segregated administrative roles

To minimize the affect of an administrator doing complete harm to the FortiGate configuration and possibly jeopardize the network, create individual administrative roles where none of the administrators have super-admin permissions. For example, and admin solely to create security policies, another for users and groups, another for VPN and so on.

RADIUS authentication for administrators

Remote Authentication and Dial-in User Service (RADIUS) servers provide authentication, authorization, and accounting functions. FortiGate units use the authentication and authorization functions of the RADIUS server. To use the RADIUS server for authentication, you must configure the server before you configure the FortiGate users or user groups that will need it.

If you have configured RADIUS support and a user is required to authenticate using a RADIUS server, the FortiGate unit sends the user's credentials to the RADIUS server for authentication. If the RADIUS server can authenticate the user, the user is successfully authenticated with the FortiGate unit. If the RADIUS server cannot authenticate the user, the FortiGate unit refuses the connection.

If you want to use a RADIUS server to authenticate administrators in your VDOM, you must configure the authentication before you create the administrator accounts. To do this you need to:

- configure the FortiGate unit to access the RADIUS server
- create the RADIUS user group
- configure an administrator to authenticate with a RADIUS server.

Configuring LDAP authentication for administrators

Lightweight Directory Access Protocol (LDAP) is an Internet protocol used to maintain authentication data that may include departments, people, groups of people, passwords, email addresses, printers, etc.

If you have configured LDAP support and an administrator is required to authenticate using an LDAP server, the FortiGate unit contacts the LDAP server for authentication. If the LDAP server cannot authenticate the administrator, the FortiGate unit refuses the connection.

If you want to use an LDAP server to authenticate administrators in your VDOM, you must configure the authentication before you create the administrator accounts. To do this you need to:

- configure an LDAP server
- create an LDAP user group
- configure an administrator to authenticate with an LDAP server.

To view the LDAP server list, go to *User* > *Remote* > *LDAP*.

TACACS+ authentication for administrators

Terminal Access Controller Access-Control System (TACACS+) is a remote authentication protocol that provides access control for routers, network access servers, and other network computing devices via one or more centralized servers.

If you have configured TACACS+ support and an administrator is required to authenticate using a TACACS+ server, the FortiGate unit contacts the TACACS+ server for authentication. If the TACACS+ server cannot authenticate the administrator, the connection is refused by the FortiGate unit.

If you want to use an TACACS+ server to authenticate administrators in your VDOM, you must configure the authentication before you create the administrator accounts. To do this you need to:

- configure the FortiGate unit to access the TACACS+ server
- create a TACACS+ user group
- configure an administrator to authenticate with a TACACS+ server.

PKI certificate authentication for administrators

Public Key Infrastructure (PKI) authentication uses a certificate authentication library that takes a list of peers, peer groups, and user groups and returns authentication successful or denied notifications. Users only need a valid certificate for successful authentication; no username or password is necessary.

To use PKI authentication for an administrator, you must configure the authentication before you create the administrator accounts. To do this you need to:

- configure a PKI user
- create a PKI user group
- configure an administrator to authenticate with a PKI certificate.

Administrator profiles

Administer profiles define what the administrator user can do when logged into the FortiGate unit. When you set up an administrator user account, you also assign an administrator profile, which dictates what the administrator user will see. Depending on the nature of the administrator's work, access level or seniority, you can allow them to view and configure as much, or as little, as required.

super_admin profile

The super_admin administrator is the administrative account that the primary administrator should have to log into the FortiGate unit. The profile can not be deleted or modified to ensure there is always a method to administer the FortiGate unit.This user profile has access to all components of FortiOS, including the ability to add and remove other system administrators. For some administrative functions, such as backing up and restoring the configuration using SCP, super_admin access is required.

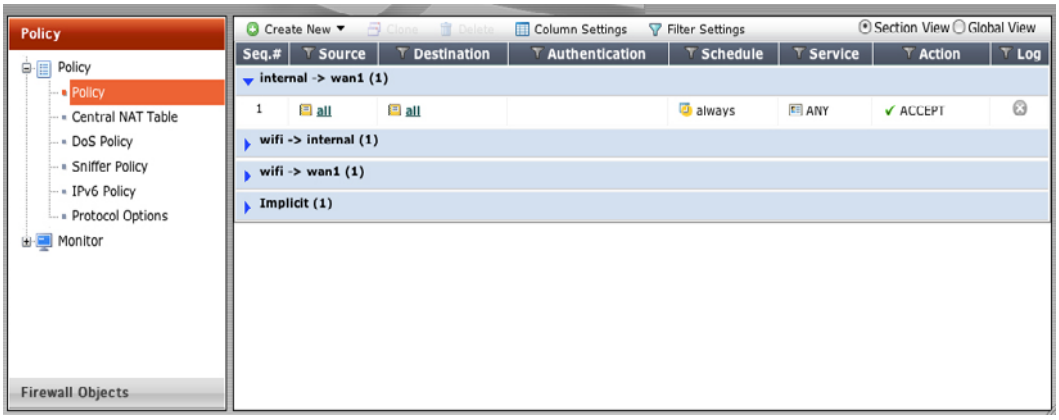
By default, the super_admin user (username is "admin"), does not have a password. Ensure you assign a password. You can also change the name of the account from "admin" to another name for better security.

Creating profiles

To configure administrator profiles go to *System* > *Admin* > *Admin Profile*. You can only assign one profile to an administrator user.

On the *New Admin Profile* page, you define the components of FortiOS that will be available to view and/or edit. For example, if you configure a profile so that the administrator can only access the firewall components, when an administrator with that profile logs into the FortiGate unit, they will only be able to view and edit any firewall components including policies, addresses, schedules and any other settings that directly affect security policies.

Figure 38: The view of an administrator with firewall-only access



Global and vdom profiles

By default, when you add a new administrative profile, it is set to have a vdom scope. That is, only the super_admin has a global profile that enables configuration of the entire FortiGate unit.

There may be instances where additional global administrative profiles may be required. To add more global profiles, use the following CLI command to set or change an administrative profile to be global.

```
config system accprofile
  set scope global
    ...
end
```

Once the scope is set, you can enable the read and read/write settings.

Adding administrators

When adding administrators, you are setting up the administrator's user account. An administrator account comprises of an administrator's basic settings as well as their access profile. The access profile is a definition of what the administrator is capable of viewing and editing. For information on administrator profiles, see "Administrator profiles" on page 355.

To add an administrator - web-based manager

1. Go to *System* > *Admin* > *Administrators*.
2. Select *Create New*.
3. Enter the administrator name.
4. Select the type of account it will be. If you select *Remote*, the FortiGate unit can reference a RADIUS, LDAP or TACAS+ server.
5. When selecting *Remote* or *PKI* accounts, select the User Group the account will access.

   For information on logging in using remote authentication servers, see the *User Authentication Guide*. For an example of setting up a user with LDAP, see "LDAP Admin Access and Authorization" on page 357

6 Enter the password for the user.

This may be a temporary password that the administrator can change later. Passwords can be up to 256 characters in length. For more information on passwords, see “Passwords” on page 348.

7 Select *OK*.

To add an administrator - CLI

```
config system admin
  edit <admin_name>
    set password <password>
    set accprofile <profile_name>
end
```

LDAP Admin Access and Authorization

You can use the LDAP server as a means to add administrative users, saving the time to add users to the FortiGate unit administrator list. After configuring, any user within the selected LDAP group server can automatically log into the FortiGate unit as an adm i st rat or. Ensure that the admin profile is the correct level of access, or the users within the LDAP group are the only ones authorized to configure or modify the configuration of the FortiGate unit.

To do this, requires three steps:

- configure the LDAP server
- add the LDAP server to a user group
- configure the administrator account

Configure the LDAP server

First set up the LDAP server as you normally would, and include a group to bind to.

To configure the LDAP server - web-based manager

1 Go to *User* > *Remote* > *LDAP* and select *Create New*.

2 Enter a *Name* for the server.

3 Enter the *Server IP* address or name.

4 Enter the *Common Name Identifier* and *Distinguished Name*.

5 Set the *Bind Type* to *Regular* and enter the *User DN* and *Password*.

6 Select *OK*.

To configure the LDAP server - CLI

```
config user ldap
      edit <ldap_server_name>
        set server <server_ip>
        set cnid cn
        set dn DC=XYZ,DC=COM
        set type regular
    set username CN=Administrator,CN=Users,DC=XYZ,DC=COM
    set password <password>
        set member-attr <group_binding>
end
```

Add the LDAP server to a user group

Next, create a user group that will include the LDAP server that was created above.

To create a user group - web-based manager

1. Go to *User* > *User Group* > *User Group* and select *Create New*.
2. Enter a *Name* for the group.
3. In the section labelled *Remote authentication servers*, select *Add*.
4. Select the *Remote Server* from the drop-down list.
5. Select *OK*.

To create a user group - CLI

```
config user group
  edit <group_name>
    config match
      edit 1
        set server-name <LDAP_server>
        set group-name <group_name>
    end
end
```

Configure the administrator account

Now you can create a new administrator, where rather than entering a password, you will use the new user group and the wildcard option for authentication.

To create an administrator - web-based manager

1. Go to *System* > *Admin* > *Administrators* and select *Create New*.
2. In the *Administrator* field, enter the name for the administrator.
3. For *Type*, select *Remote*.
4. Select the *User Group* created above from the drop-down list.
5. Select *Wildcard*.

   The Wildcard option allows for LDAP users to connect as this administrator.
6. Select an *Admin Profile*.
7. Select *OK*.

To create an administrator - CLI

```
config system admin
  edit <admin_name>
    set remote-auth enable
    set accprofile super_admin
    set wildcard enable
    set remote-group ldap
end
```

Monitoring administrators

You can view the administrators logged in using the *System Information* widget on the Dashboard. On the widget is the *Current Administrator* row that shows the administrator logged in and the total logged in. Selecting *Details* displays the administrators), where they are logging in from and how (CLI, web-based manager) and when they logged in.

You are also able to monitor the activities the administrators perform on the FortiGate unit using the logging of events. Event logs include a number of options to track configuration changes.

To set logging - web-based manager

1 Go to *Log&Report* > *Log Config* > *Log Setting*.
2 Select a location to store logs and set the *Minimum log level* to *Information*.
3 Select *Apply*.
4 Go to *Log&Report* > *Event Log*.
5 Select the following event logs:
   - System activity event
   - Admin event
   - Configuration change event
6 Select *Apply*.

To set logging - CLI

```
config log <log_location> (log configuration will vary depending
    on location)
end
config log eventfilter
  set admin enable
  set system enable
  set config enable
end
```

To view the logs go to *Log&Report* > *Log Access* > *Event*.

Trusted hosts

Setting trusted hosts for administrators limits what computers an administrator can log in from. When you identify a trusted host, the FortiGate unit will only accept the administrator's login from the configured IP address. Any attempt to log in with the same credentials from any other IP address will be dropped. To ensure the administrator has access from different locations, you can enter up to ten IP addresses. Ideally, this should be kept to a minimum. For higher security, use an IP address with a net mask of 255.255.255.255, and enter an IP address (non-zero) in each of the three default trusted host fields.

Trusted hosts are configured when adding a new administrator by going to *System* > *Admin* > *Administrators* in the web-based manager or `config system admin` in the CLI.

The trusted hosts apply to the web-based manager, ping, snmp and the CLI when accessed through Telnet or SSH. CLI access through the console port is not affected.

Also ensure all entries contain actual IP addresses, not the default 0.0.0.0.

General Settings

Go to *System* > *Admin* > *Settings* to configure basic settings for administrative access, password policies and displaying additional options in the web-based manager.

Administrative port settings

The Administrative Settings enable you to change the default port configurations for administrative connections to the FortiGate unit for added security. When connecting to the FortiGate unit when the port has changed, the port must be included, such as `https://<ip_address>:<port>`. For example, if you are connecting to the FortiGate unit using port 99, the url would be `https://192.168.1.99:99`.

If you make a change to the default port number for HTTP, HTTPS, Telnet, or SSH, ensure that the port number is unique.

Password policies

Password policies, available by going to *System* > *Admin* > *Settings*, enable you to create a password policy that any administrator or user who updates their password, must follow. Using the available options you can define the required length of the password, what it must contain (numbers, upper and lower case, and so on) and an expiry time frame.

The FortiGate unit will warn of any password that is added and does not meet the criteria.

Display options

To minimize clutter on the web-based manager interface, a number of FortiOS features to not appear on the web-based manager. By going to *System* > *Admin Settings*, you can enable, or if not needed, disable various features. The change takes effect immediately without having to log out or reboot the device.

Backing up the configuration

Once you configure the FortiGate unit and it is working correctly, it is extremely important that you back up the configuration. In some cases, you may need to reset the FortiGate unit to factory defaults, or perform a TFTP upload of the firmware. In these instances, the configuration on the device will be lost.

Always back up the configuration and store it on the management computer or off site. It is also recommended that once the FortiGate is configured, and *any* further changes are made, that you back up the configuration immediately, to ensure you have the most current configuration available.

You have the option to save the configuration file to various locations including the local PC, USB key, FTP and TFTP site.The latter two are configurable through the CLI only.

If you have VDOMs, you can back up the configuration of the entire FortiGate unit, or only a specific VDOM. Note that if you are using FortiManager or the Fortinet Management Services (FAMS), full backups are performed, and the option to backup individual VDOMs will not appear.

To back up the FortiGate configuration - web-based manager

1 Go to *System* > *Dashboard* > *Status*.

2 On the *System Information* widget, select *Backup* for the *System Configuration*.

3 Select to back up to your *Local PC, FortiManager* or to a *USB key*.

The *USB Disk* option will be grayed out if no USB drive is inserted in the USB port. The FortiManager option will not be available if the FortiGate unit is not being managed by a FortiManager system.

4 If VDOMs are enabled, select to backup the entire FortiGate configuration (*Full Config*) or only a specific VDOM configuration (*VDOM Config*).
5 If backing up a VDOM configuration, select the VDOM name from the list.
6 Select *Encrypt configuration file*.

Encryption must be enabled on the backup file to back up VPN certificates.

7 Enter a password and enter it again to confirm it. You will need this password to restore the file.
8 Select *Backup*.
9 The web browser will prompt you for a location to save the configuration file. The configuration file will have a .conf extension.

To back up the FortiGate configuration - CLI

```
execute backup config management-station <comment>
```

… or …

```
execute backup config usb <backup_filename> [<backup_password>]
```

… or for FTP, note that port number, username are optional depending on the FTP site…

```
execute backup config ftp <backup_filename> <ftp_server>
   [<port>] [<user_name>] [<password>]
```

… or for TFTP …

```
execute backup config tftp <backup_filename> <tftp_servers>
   <password>
```

Use the same commands to backup a VDOM configuration by first entering the commands:

```
config vdom
  edit <vdom_name>
```

It is a good practice to backup the FortiGate configuration after any modification to any of the FortiGate settings. Alternatively, before performing an upgrade to the firmware, ensure you back up the configuration before upgrading. Should anything happen during the upgrade that changes the configuration, you can easily restore the saved configuration.

Backup and restore a configuration file using SCP

You can use secure copy protocol (SCP) to download the configuration file from the FortiGate unit as an alternative method of backing up the configuration file or an individual VDOM configuration file. This is done by enabling SCP for and administrator account and enabling SSH on a port used by the SCP client application to connect to the FortiGate unit. SCP is enabled using the CLI commands:

```
config system global
    set admin-scp enable
end
```

Use the same commands to backup a VDOM configuration by first entering the commands:

```
config global
  set admin-scp enable
end
config vdom
  edit <vdom_name>
```

Enable SSH access on the interface

SCP uses the SSH protocol to provide secure file transfer. The interface you use for administration must allow SSH access.

To enable SSH - web-based manager:

1 Go to *System* > *Network* > *Interface*.
2 Select the interface you use for administrative access and select *Edit*.
3 In the *Administrative Access* section, select *SSH*.
4 Select *OK*.

To enable SSH - CLI:

```
config system interface
    edit <interface_name>
        set allowaccess ping https ssh
  end
```

When adding to, or removing a protocol, you must type the entire list again. For example, if you have an access list of HTTPS and SSH, and you want to add PING, typing:

```
set allowaccess ping
```

...only PING will be set. In this case, you must type...

```
set allowaccess https ssh ping
```

Using the SCP client

The FortiGate unit downloads the configuration file as `sys_conf`. Use the following syntax to download the file:

Linux

```
scp admin@<FortiGate_IP>:sys_config <location>
```

Windows

```
pscp admin@<FortiGate_IP>:sys_config <location>
```

These examples show how to download the configuration file from a FortiGate-100A, at IP address 172.20.120.171, using Linux and Windows SCP clients.

Linux client example

To download the configuration file to a local directory called `~/config`, enter the following command:

```
scp admin@172.20.120.171:sys_config ~/config
```

Enter the admin password when prompted.

Windows client example

To download the configuration file to a local directory called c:\config, enter the following command in a Command Prompt window:

```
pscp admin@172.20.120.171:sys_config c:\config
```

Enter the admin password when prompted.

SCP public-private key authentication

SCP authenticates itself to the FortiGate unit in the same way as an administrator using SSH accesses the CLI. Instead of using a password, you can configure the SCP client and the FortiGate unit with a public-private key pair.

To configure public-private key authentication

1 Create a public-private key pair using a key generator compatible with your SCP client.

2 Save the private key to the location on your computer where your SSH keys are stored.

This step depends on your SCP client. The Secure Shell key generator automatically stores the private key.

3 Copy the public key to the FortiGate unit using the CLI commands:

```
config system admin
    edit admin
        set ssh-public-key1 "<key-type> <key-value>"
    end
```

`<key-type>` must be the ssh-dss for a DSA key or ssh-rsa for an RSA key. For the `<key-value>`, copy the public key data and paste it into the CLI command.

If you are copying the key data from Windows Notepad, copy one line at a time and ensure that you paste each line of key data at the end of the previously pasted data. As well:

- Do not copy the end-of-line characters that appear as small rectangles in Notepad.
- Do not copy the `---- BEGIN SSH2 PUBLIC KEY ----` or `Comment: "[2048-bit dsa,...]"` lines.
- Do not copy the `---- END SSH2 PUBLIC KEY ----` line.

4 Type the closing quotation mark and press Enter.

Your SCP client can now authenticate to the FortiGate unit based on SSH keys rather than the administrator password.

Restoring a configuration using SCP

To restore the configuration using SCP, use the commands:

```
scp <local_file> <admin_user>@<FGT_IP>:fgt_restore_config
```

To use this command/method of restoring the FortiGate configuration, you need to log in as the “admin” administrator.

Restoring a configuration

Should you need to restore a configuration file, use the following steps.

To restore the FortiGate configuration - web-based manager

1 Go to *System* > *Dashboard* > *Status*.

2 On the *System Information* widget, select *Restore* for the *System Configuration*.

3 Select to upload the configuration file to be restored from your *Local PC* or a *USB key*.

The *USB Disk* option will be grayed out if no USB drive is inserted in the USB port. The FortiManager option will not be available if the FortiGate unit is not being managed by a FortiManager system.

4 Enter the path and file name of the configuration file, or select *Browse* to locate the file.

5 Enter a password if required.

6 Select *Restore*.

To back up the FortiGate configuration - CLI

```
execute restore config management-station normal 0
```

… or …

```
execute restore config usb <filename> [<password>]
```

… or for FTP, note that port number, username are optional depending on the FTP site…

```
execute backup config ftp <backup_filename> <ftp_server> [<port>]
[<user_name>] [<password>]
```

… or for TFTP …

```
execute backup config tftp <backup_filename> <tftp_server>
<password>
```

The FortiGate unit will load the configuration file and restart. Once the restart has completed, verify that the configuration has been restored.

Configuration revisions

The *Configuration Revisions* menu enables you to manage multiple versions of configuration files. Revision control requires either a configured central management server, or FortiGate units with 512 MB or more of memory. The central management server can either be a FortiManager unit or the FortiGuard Analysis & Management Service.

When revision control is enabled on your unit, and configurations have been backed up, a list of saved revisions of those backed-up configurations appears.

Configuration revisions are viewed in *System* > *Maintenance* > *Configuration Revision*.

Firmware

Fortinet periodically updates the FortiGate firmware to include new features and address issues. After you have registered your FortiGate unit, you can download firmware updates from the support web site, http://support.fortinet.com.

You can also use the instructions in this chapter to revert, to a previous version. The FortiGate unit includes a number of firmware installation options that enables you to test new firmware without disrupting the existing installation, and load it from different locations as required.

Fortinet issues patch releases--maintenance release builds that resolve important issues. Fortinet strongly recommends reviewing the release notes for the patch release, as well as testing and reviewing the patch release before upgrading the firmware. Follow the steps below:

- download and review the release notes for the patch release
- download the patch release
- back up the current configuration
- test the patch release until you are satisfied that it applies to your configuration.

Installing a patch release without reviewing release notes or testing the firmware may result in changes to settings or unexpected issues.

Only FortiGate admin user and administrators whose access profiles contain system read and write privileges can change the FortiGate firmware.

Downloading firmware

Firmware images for all FortiGate units is available on the Fortinet Customer Support web site. You must register your FortiGate unit to access firmware images. Register the FortiGate unit by visiting http://support.fortinet.com and select Product Registration.

To download firmware

1 Log into the site using your user name and password.
2 Go to *Firmware Images* > *FortiGate*.
3 Select the most recent FortiOS version.
4 Locate the firmware for your FortiGate unit, right-click the link and select the Download option for your browser.

Always review the *Release Notes* for a new firmware release before installing. The *Release Notes* can include information that is not available in the regular documentation.

Upgrading the firmware - web-based manager

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

Always remember to back up your configuration before doing any firmware upgrade or downgrade.

To upgrade the firmware

1 Download the firmware image file to your management computer.
2 Log into the web-based manager as the admin administrative user.
3 Go to *System* > *Dashboard* > *Status*.
4 Under *System Information* > *Firmware Version*, select *Update*.
5 Type the path and filename of the firmware image file, or select *Browse* and locate the file.
6 Select *OK*.

The FortiGate unit uploads the firmware image file, upgrades to the new firmware version, restarts, and displays the FortiGate login. This process takes a few minutes.

Reverting to a previous firmware version

The following procedures revert the FortiGate unit to its factory default configuration and deletes any configuration settings.

Before beginning this procedures, ensure you back up the FortiGate unit configuration.

If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Installing firmware replaces the current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To use this procedure, you must log in using the admin administrator account, or an administrator account that has system configuration read and write privileges.

To revert to a previous firmware version

1. Copy the firmware image file to the management computer.
2. Log into the FortiGate web-based manager.
3. Go to *System* > *Dashboard* > *Status*.
4. Under *System Information* > *Firmware Version*, select *Update*.
5. Type the path and filename of the firmware image file, or select Browse and locate the file.
6. Select *OK*.

   The FortiGate unit uploads the firmware image file, reverts to the old firmware version, resets the configuration, restarts, and displays the FortiGate login. This process takes a few minutes.
7. Log into the web-based manager.
8. Restore your configuration.

   For information about restoring your configuration see “Restoring a configuration” on page 363.

Configuration Revision

The *Configuration Revisions* menu enables you to manage multiple versions of configuration files on models that have a 512 flash memory and higher. Revision control requires either a configured central management server, or the local hard drive. The central management server can either be a FortiManager unit or the FortiGuard Analysis and Management Service.

If central management is not configured on your FortiGate unit, a message appears to tell you to do one of the following:

- enable central management (see Central management)
- obtain a valid license.

When revision control is enabled on your FortiGate unit, and configurations have been backed up, a list of saved revisions of those backed-up configurations appears.

Configuration revisions are viewed in *System* > *Maintenance* > *Configuration Revision*.

Configuration Revision page.	
Delete	Removes a configuration revision from the list. To remove multiple configurations from within the list, on the Configuration Revision page, in each of the rows of revisions you want removed, select the check box and then select *Delete*. To remove all configuration revisions from within the list, on the Configuration Revision page, select the check box in the check box column and then select *Delete*.
Details	View the CLI settings of a configuration revision.
Change Comments	Modifies the description for the configuration revision.
Diff	Select when you want to compare two revisions. You must select two revisions. From the Diff Display window you can view and compare the selected revision to one of: • the current configuration • a selected revision from the displayed list including revision history and templates • a specified revision number.
Revert	Restores the previous selected revision.
Upload	Uploads a configuration file to the FortiGate unit, which is then added to the list.
OS Version <firmware_version_build> (appears as sections on the page)	The section of the page that contains the configuration files that belong to the specified FortiOS firmware version and build number. For example, if you have four configuration revisions for 4.0 MR1 (build-178) they appear in the section OS Version 4.00 build178 on the Configuration Revision page.
Revision	An incremental number indicating the order in which the configurations were saved. These may not be consecutive numbers if configurations are deleted.
Date/Time	The date and time this configuration was saved on the FortiGate unit.
Administrator	The administrator account that was used to back up this revision.
Comments	Any relevant information saved with the revision.
Ref.	Displays the number of times the object is referenced to other objects.

Upgrading the firmware - CLI

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date. You can also use the CLI command `execute update-now` to update the antivirus and attack definitions. For more information, see the *FortiGate Administration Guide*.

Before you begin, ensure you have a TFTP server running and accessible to the FortiGate unit.

To upgrade the firmware using the CLI

1. Make sure the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log into the CLI.
4. Make sure the FortiGate unit can connect to the TFTP server.

   You can use the following command to ping the computer running the TFTP server. For example, if the IP address of the TFTP server is 192.168.1.168:

   ```
   execute ping 192.168.1.168
   ```

5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

   ```
   execute restore image tftp <filename> <tftp_ipv4>
   ```

   Where `<name_str>` is the name of the firmware image file and `<tftp_ip4>` is the IP address of the TFTP server. For example, if the firmware image file name is `image.out` and the IP address of the TFTP server is 192.168.1.168, enter:

   ```
   execute restore image tftp image.out 192.168.1.168
   ```

   The FortiGate unit responds with the message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```

6. Type `y`.

   The FortiGate unit uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.
7. Reconnect to the CLI.
8. Update antivirus and attack definitions, by entering:

   ```
   execute update-now
   ```

USB Auto-Install

The USB Auto-Install feature automatically updates the FortiGate configuration file and firmware image file on a system reboot. Also, this feature provides you with an additional backup if you are unable to save your system settings before shutting down or rebooting your FortiGate unit.

You need an unencrypted configuration file for this feature. Also the required files, must be in the root directory of the USB key.

The FortiGate unit will only load a configuration file from a USB key when the FortiGate unit is restarted from a factory reset. This means that with any normal reboot commands, the FortiGate unit will not reload the configuration file.

This was done to ensure that if the USB key was left in the USB port, an older configuration would not be loaded by accident, losing any configuration settings changed after the initial save.

To configure the USB Auto-Install - web-based manager

1 Go to *System* > *Config* > *Advanced*.

2 Select the following:

- On system restart, automatically update FortiGate configuration file if default file name is available on the USB disk.
- On system restart, automatically update FortiGate firmware image if default image is available on the USB disk.

3 Enter the configuration and image file names or use the default configuration filename (system.conf) and default image name (image.out).

4 The default configuration filename should show in the *Default configuration file name* field.

5 Select *Apply*.

To configure the USB Auto-Install using the CLI

1 Log into the CLI.

2 Enter the following command:

```
config system auto-install
   set default-config-file <filename>
   set auto-install-config {enable | disable}
   set default-image-file <filename>
   set auto-install-image {enable | disable}
end
```

Reverting to a previous firmware version

This procedure reverts the FortiGate unit to its factory default configuration and deletes IPS custom signatures, web content lists, email filtering lists, and changes to replacement messages.

Before beginning this procedure, it is recommended that you:

- back up the FortiGate unit system configuration using the command `execute backup config`
- back up the IPS custom signatures using the command `execute backup ipsuserdefsig`
- back up web content and email filtering lists

To use the following procedure, you must have a TFTP server the FortiGate unit can connect to.

To revert to a previous firmware version using the CLI

1 Make sure the TFTP server is running

2 Copy the firmware image file to the root directory of the TFTP server.

3 Log into the FortiGate CLI.

4 Make sure the FortiGate unit can connect to the TFTP server execute by using the `execute ping` command.

5 Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

```
execute restore image tftp <name_str> <tftp_ipv4>
```

Where `<name_str>` is the name of the firmware image file and `<tftp_ip4>` is the IP address of the TFTP server. For example, if the firmware image file name is `imagev28.out` and the IP address of the TFTP server is 192.168.1.168, enter:

```
execute restore image tftp image28.out 192.168.1.168
```

The FortiGate unit responds with this message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```

6 Type `y`.

The FortiGate unit uploads the firmware image file. After the file uploads, a message similar to the following appears:

```
Get image from tftp server OK.
Check image OK.
This operation will downgrade the current firmware version!
Do you want to continue? (y/n)
```

7 Type `y`.

The FortiGate unit reverts to the old firmware version, resets the configuration to factory defaults, and restarts. This process takes a few minutes.

8 Reconnect to the CLI.

9 To restore your previous configuration, if needed, use the command:

```
execute restore config <name_str> <tftp_ip4>
```

10 Update antivirus and attack definitions using the command:

```
execute update-now.
```

Installing firmware from a system reboot using the CLI

This procedure installs a firmware image and resets the FortiGate unit to default settings. You can use this procedure to upgrade to a new firmware version, revert to an older firmware version, or re-install the current firmware.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to DB-9, or null modem cable.

This procedure reverts the FortiGate unit to its factory default configuration.

For this procedure you install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

Before beginning this procedure, ensure you back up the FortiGate unit configuration.

If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To install firmware from a system reboot

1 Connect to the CLI using the RJ-45 to DB-9 or null modem cable.

2 Make sure the TFTP server is running.

3 Copy the new firmware image file to the root directory of the TFTP server.

4 Make sure the internal interface is connected to the same network as the TFTP server.

5 To confirm the FortiGate unit can connect to the TFTP server, use the following command to ping the computer running the TFTP server. For example, if the IP address of the TFTP server is 192.168.1.168:

```
execute ping 192.168.1.168
```

6 Enter the following command to restart the FortiGate unit.

```
execute reboot
```

The FortiGate unit responds with the following message:

```
This operation will reboot the system!
Do you want to continue? (y/n)
```

7 Type `y`.

As the FortiGate unit starts, a series of system startup messages appears. When the following messages appears:

```
Press any key to display configuration menu.........
```

Immediately press any key to interrupt the system startup.

You have only 3 seconds to press any key. If you do not press a key soon enough, the FortiGate unit reboots and you must log in and repeat the execute reboot command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.
[F]: Format boot device.
[B[: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default
firmware.
[H]: Display this list of options.

Enter G, F, Q, or H:
```

8 Type G to get to the new firmware image form the TFTP server.

The following message appears:

```
Enter TFTP server address [192.168.1.168]:
```

9 Type the address of the TFTP server and press Enter:

The following message appears:

```
Enter Local Address [192.168.1.188]:
```

10 Type an IP address the FortiGate unit can use to connect to the TFTP server. The IP address can be any IP address that is valid for the network the interface is connected to. Make sure you do not enter the IP address of another device on this network.

The following message appears:

```
Enter File Name [image.out]:
```

11 Enter the firmware image filename and press Enter.

The TFTP server uploads the firmware image file to the FortiGate unit and a message similar to the following appears:

```
Save as Default firmware/Backup firmware/Run image without
saving: [D/B/R]
```

12 Type `D`.

The FortiGate unit installs the new firmware image and restarts. The installation might take a few minutes to complete.

Backup and Restore from a USB key

Use a USB key to either backup a configuration file or restore a configuration file. You should always make sure a USB key is properly install before proceeding since the FortiGate unit must recognize that the key is installed in its USB port.

You can only save VPN certificates if you encrypt the file. Make sure the configuration encryption is enabled so you can save the VPN certificates with the configuration file. An encrypted file is ineffective if selected for the USB Auto-Install feature.

To backup configuration using the CLI

1 Log into the CLI.

2 Enter the following command to backup the configuration files:

```
exec backup config usb <filename>
```

3 Enter the following command to check the configuration files are on the key:

```
exec usb-disk list
```

To restore configuration using the CLI

1 Log into the CLI.

2 Enter the following command to restore the configuration files:

```
exec restore image usb <filename>
```

The FortiGate unit responds with the following message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```

3 Type `y`.

Testing new firmware before installing

FortiOS enables you to test a new firmware image by installing the firmware image from a system reboot and saving it to system memory. After completing this procedure, the FortiGate unit operates using the new firmware image with the current configuration. This new firmware image is not permanently installed. The next time the FortiGate unit restarts, it operates with the originally installed firmware image using the current configuration. If the new firmware image operates successfully, you can install it permanently using the procedure “Upgrading the firmware - web-based manager” on page 365.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to DB-9 or null modem cable. This procedure temporarily installs a new firmware image using your current configuration.

For this procedure you install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

To test the new firmware image

1 Connect to the CLI using a RJ-45 to DB-9 or null modem cable.

2 Make sure the TFTP server is running.

3 Copy the new firmware image file to the root directory of the TFTP server.

4 Make sure the FortiGate unit can connect to the TFTP server using the `execute ping` command.

5 Enter the following command to restart the FortiGate unit:

```
execute reboot
```

6 As the FortiGate unit reboots, press any key to interrupt the system startup. As the FortiGate unit starts, a series of system startup messages appears.
When the following messages appears:

```
Press any key to display configuration menu....
```

7 Immediately press any key to interrupt the system startup.

You have only 3 seconds to press any key. If you do not press a key soon enough, the FortiGate unit reboots and you must login and repeat the execute reboot command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.
[F]: Format boot device.
[B[: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default
firmware.
[H]: Display this list of options.

Enter G, F, Q, or H:
```

8 Type G to get the new firmware image from the TFTP server.

The following message appears:

```
Enter TFTP server address [192.168.1.168]:
```

9 Type the address of the TFTP server and press Enter:

The following message appears:

```
Enter Local Address [192.168.1.188]:
```

10 Type an IP address of the FortiGate unit to connect to the TFTP server.

The IP address must be on the same network as the TFTP server, but make sure you do not use the IP address of another device on the network.

The following message appears:

```
Enter File Name [image.out]:
```

11 Enter the firmware image file name and press Enter.

The TFTP server uploads the firmware image file to the FortiGate unit and the following appears.

```
Save as Default firmware/Backup firmware/Run image without
saving: [D/B/R]
```

12 Type `R`.

The FortiGate image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

You can test the new firmware image as required. When done testing, you can reboot the FortiGate unit, and the FortiGate unit will resume using the firmware that was running before you installed the test firmware.

Controlled upgrade

Using a controlled upgrade, you can upload a new version of the FortiOS firmware to a separate partition in the FortiGate memory for later upgrade. The FortiGate unit can also be configured so that when it is rebooted, it will automatically load the new firmware (CLI only). Using this option, you can stage a number of FortiGate units to do an upgrade simultaneously to all devices using FortiManager or script.

To load the firmware for later installation - web-based manager

1 Go to *System* > *Dashboard* > *Status*.

2 Under *System Information* > *Firmware Version*, select *Update*.

3 Type the path and filename of the firmware image file, or select *Browse* and locate the file.

4 Deselect the *Boot the New Firmware* option

5 Select *OK*.

To load the firmware for later installation - CLI

```
execute restore secondary-image {ftp | tftp | usb}
```

To set the FortiGate unit so that when it reboots, the new firmware is loaded, use the CLI command...

```
execute set-next-reboot {primary | secondary}
```

... where `{primary | secondary}` is the partition with the preloaded firmware.

To trigger the upgrade using the web-based manager

1 Go to *System* > *Dashboard* > *Status*.

2 Under *System Information* > *Firmware Version*, select *Details.*

3 Select the check box for the new firmware version.

The *Comments* column indicates which firmware version is the current active version.

4 Select *Upgrade* icon.

Interfaces

Interfaces, both physical and virtual, enable traffic to flow to and from the internal network, and the Internet and between internal networks. The FortiGate unit has a number of options for setting up interfaces and groupings of subnetworks that can scale to a company's growing requirements.

Physical

FortiGate units have a number of physical ports where you connect Ethernet or optical cables. Depending on the model, they can have anywhere from four to 40 physical ports. Some units have a grouping of ports labelled as internal, providing a built-in switch functionality.

In FortiOS, the port names, as labeled on the FortiGate unit, appear in the web-based manager in the *Unit* Operation the Dashboard. They also appear when you are configuring the interfaces, by going to *System* > *Network* > *Interface*. As shown below, the FortiGate-60C has eight interfaces

Figure 39: FortiGate-60C physical interfaces

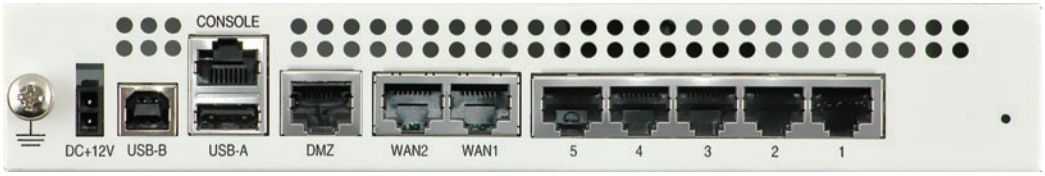


Figure 40: FortiGate-60C interfaces on the Dashboard

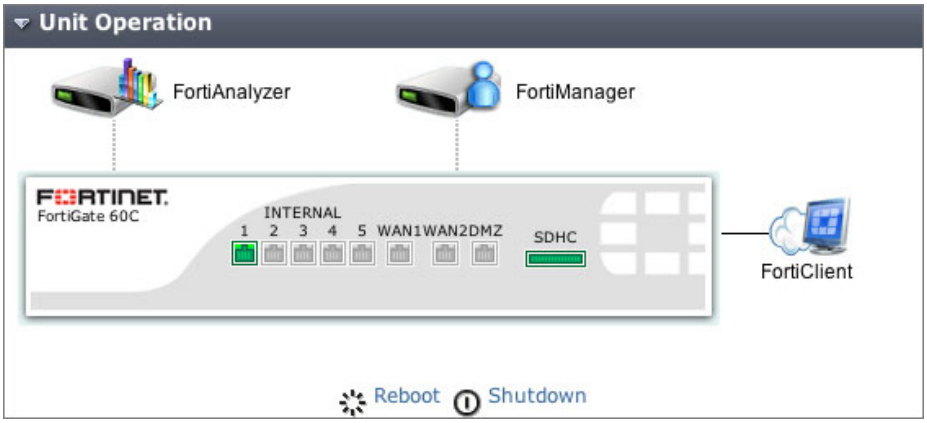

Figure 41: Configuring the FortiGate-60C ports

	Name	IP/Netmask	Access	Administrative Status	Link Status	Ref.
☐	dmz	10.10.10.1 / 255.255.255.0	HTTPS,PING	↑	↓	0
☐	internal	172.20.120.129 / 255.255.255.0	HTTP,SSH	↑	↑	2
☐	wan1	192.168.100.99 / 255.255.255.0	PING	↑	↓	2
☐	wan2	192.168.101.99 / 255.255.255.0	PING	↑	↓	0

Normally the internal interface is configured as a single interface shared by all physical interface connections - a switch. The switch mode feature has two states - switch mode and interface mode. Switch mode is the default mode with only one interface and one address for the entire internal switch. Interface mode allows you to configure each of the internal switch physical interface connections separately. This enables you to assign different subnets and netmasks to each of the internal physical interface connections.

The larger FortiGate units can also include Advanced Mezzanine Cards (AMC), which can provide additional interfaces (ethernet or optical), with throughput enhancements for more efficient handling of specialized traffic. These interfaces appear in FortiOS as port amc/sw1, amc/sw2 and so on. In the following illustration, the FortiGate-3810A has three AMC cards installed: two single-width (amc/sw1, amc/sw2) and one double-width (amc/dw).

Figure 42: FortiGate-3810A AMC card port naming

	Name	IP/Netmask	Access	Administrative Status	Link Status
☐	amc-dw2/1	0.0.0.0 / 0.0.0.0		↑	↓
☐	amc-dw2/2	0.0.0.0 / 0.0.0.0		↑	↓

Interface settings

In *System* > *Network* > *Interface*, you configure the interfaces, physical and virtual, for the FortiGate unit. There are different options for configuring interfaces when the FortiGate unit is in NAT mode or transparent mode. On FortiOS Carrier, you can also enable the Gi gatekeeper on each interface for anti-overbilling.

Interface page	
Lists all the interfaces that are default and those that you have created. On this page you can view the status of each interface, create a new interface, edit an existing interface, or remove an interface.	
Create New	Select to add a new interface, zone or, in transparent mode, port pair. For more information on configuring zones, see "Zones" on page 392. For more information on port pairing in transparent mode, see "Port pairing" on page 269. Depending on the model you can add a VLAN interface, a loopback interface, a IEEE 802.3ad aggregated interface, or a redundant interface. When VDOMs are enabled, you can also add Inter-VDOM links.
Switch Mode	On supported models, select *Switch Mode* to change between switch mode and interface mode. Interface mode enables you to configure a switch interface to be separate configurable interfaces. On some FortiGate models you can also select *Hub Mode*. Hub mode is similar to switch mode except that in hub mode the interfaces do not learn the MAC addresses of the devices on the network they are connected to and may also respond quicker to network changes. Normally, you would only select *Hub Mode* if you are having network performance issues when operating with switch mode. Before switching modes, all configuration settings for the interfaces affected by the change must be set to defaults, that is, no assigned IP addresses or used in any other part of the device. When you select *Switch Mode* the web-based manager displays the list of affected interfaces.
Show backplane interfaces	Select to make FortiGate-5000 series backplane interfaces visible. Once visible, these interfaces can be configured as regular physical interfaces.
Column Settings	Select to change the columns of information that are displayed on the interface list.
Description (appears as a note icon)	Displays a description for the interface when one has been added. Move your mouse over the icon to view the description.

Name	The names of the physical interfaces on your FortiGate unit. This includes any alias names that have been configured.
	When you combine several interfaces into an aggregate or redundant interface, only the aggregate or redundant interface is listed, not the component interfaces.
	On FortiGate models that support switch mode, the individual interfaces in the switch are not displayed when in switch mode. For more information, see “Switch Mode” on page 382. If you have added VLAN interfaces, they also appear in the name list, below the physical or aggregated interface to which they have been added.
	If you have added loopback interfaces, they also appear in the interface list, below the physical interface to which they have been added. If you have software switch interfaces configured, you will be able to view them. For more information, see “Software switch interfaces” on page 388.
	If your FortiGate unit supports AMC modules, the interfaces are named amc-sw1/1, amc-dw1/2, and so on.
IP/Netmask	The current IP address/netmask of the interface. In VDOM mode, when VDOMs are not all in NAT or Transparent mode some values may not be available for display and will be displayed as “-”.
Access	The administrative access configuration for the interface.
Administrative Status	Indicates if the interface can be accessed for administrative purposes. If the administrative status is a green arrow, and administrator could connect to the interface using the configured access. If the administrative status is a red arrow, the interface is administratively down and cannot be accessed for administrative purposes.
Link Status	The status of the interface physical connection. Link status can be either up or down. If link status is up (green arrow) the interface is connected to the network and accepting traffic. If link status is down (red arrow) the interface is not connected to the network or there is a problem with the connection. You cannot change link status from the web-based manager. Link status is only displayed for physical interfaces.
MAC	The MAC address of the interface.
Mode	Shows the addressing mode of the interface. The addressing mode can be manual, DHCP, or PPPoE.
MTU	The maximum number of bytes per transmission unit (MTU) for the interface.
Secondary IP	Displays the secondary IP addresses added to the interface.

Type	The type of the interface. Valid types include: • Physical • VLAN • Aggregate • Redundant • VDOM Link • Pair • Switch • Tunnel • VAP - a wireless virtual access point (VAP or virtual AP) interface
Virtual Domain	The virtual domain to which the interface belongs. This column is visible when VDOM configuration is enabled.
VLAN ID	The configured VLAN ID for VLAN subinterfaces.
Delete	Removes an interface from the list on the Interface page. Available for interfaces added by selecting *Create New*. For example, you can remove VLAN, loopback, aggregate, and redundant interfaces. You can only remove an interface if it is not used in another configuration.
Edit	Modifies settings within the configuration of an interface.
View	View the interface's configuration.
Ref.	Displays the number of times the object is referenced to other objects. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object.

•

Interface configuration and settings

To configure an interface, go to *System* > *Network* > *Interface*.

New Interface page	
Provides settings for configuring a new interface.	
Name	Enter a name of the interface. Physical interface names cannot be changed.
Alias	Enter an alternate name for a physical interface on the FortiGate unit. The alias can be a maximum of 25 characters. The alias name will not appears in logs. This field appears when editing an existing physical interface.
Link Status	Indicates whether the interface is connected to a network (link status is *Up*) or not (link status is *Down*). This field appears when editing an existing physical interface.
Type	Select the type of interface that you want to add. On some models you can set *Type* to *802.3ad Aggregate* or *Redundant Interface*.

Interface	Select the name of the physical interface to which to add a VLAN interface. Once created, the VLAN interface is listed below its physical interface in the Interface list. You cannot change the physical interface of a VLAN interface except when adding a new VLAN interface. Displayed when *Type* is set to *VLAN*.
VLAN ID	Enter the VLAN ID. You cannot change the *VLAN ID* except when add a new VLAN interface. The VLAN ID can be any number between 1 and 4094 and must match the VLAN ID added by the IEEE 802.1Q-compliant router or switch connected to the VLAN subinterface. Displayed when *Type* is set to *VLAN*.
Virtual Domain	Select the virtual domain to add the interface to. Admin accounts with super_admin profile can change the *Virtual Domain*.
Physical Interface Members	This section has two different forms depending on the interface type: • **Software switch interface** - this section is a display-only field showing the interfaces that belong to the software switch virtual interface. • **802.3ad aggregate or Redundant interface** - this section includes available interface and selected interface lists to enable adding or removing interfaces from the interface. For more information, see Redundant interfaces. Select interfaces from this *Available Interfaces* list and select the right arrow to add an interface to the *Selected Interface* list.
Addressing mode	Select the addressing mode for the interface. • Select *Manual* and add an *IP/Netmask* for the interface. If IPv6 configuration is enabled you can add both a IPv4 and an IPv6 IP address. • Select *DHCP* to get the interface IP address and other network settings from a DHCP server. See DHCP on an interface • Select *PPPoE* to get the interface IP address and other network settings from a PPPoE server. See PPPoE on an interface.
IP/Netmask	If *Addressing Mode* is set to *Manual*, enter an IPv4 address/subnet mask for the interface. FortiGate interfaces cannot have IP addresses on the same subnet.
IPv6 Address	If *Addressing Mode* is set to *Manual* and IPv6 support is enabled, enter an IPv6 address/subnet mask for the interface. A single interface can have both an IPv4 and IPv6 address or just one or the other.

Enable one-arm sniffer	Available when editing a physical interface. Select to configure this interface to operate as a one-armed sniffer as part of configuring a FortiGate unit to operate as an IDS appliance by sniffing packets for attacks without actually receiving and otherwise processing the packets. Once the interface is enabled for sniffing you cannot use the interface for other traffic. You must add sniffer policies for the interface to actually sniff packets.
Dedicate this interface to FortiAP connection	Select have the FortiAP connect exclusively to the interface. This option is only available when editing a physical interface, and it has a static IP address.
Reserve IP addresses for FortiAP	Enter the IP address range that will be used for the FortiAP units. When you enter the reserved IP address range, the FortiGate unit automatically creates a DHCP server.
Enable explicit Web Proxy	This option is not available for a VLAN interface selection. Select to enable explicit web proxying on this interface. When enabled, this interface will be displayed on *System* > *Network* > *Web Proxy* under *Listen on Interfaces* and web traffic on this interface will be proxied according to the Web Proxy settings.
Override Default MTU Value	To change the MTU, select Override default MTU value (1 500) and enter the MTU size based on the addressing mode of the interface • 68 to 1 500 bytes for static mode • 576 to 1 500 bytes for DHCP mode • 576 to 1 492 bytes for PPPoE mode • larger frame sizes if supported by the FortiGate model Only available on physical interfaces. Virtual interfaces associated with a physical interface inherit the physical interface MTU size. In transparent mode, if you change the MTU of an interface, you must change the MTU of all interfaces to match the new MTU.
Administrative Access	Select the types of administrative access permitted for IPv4 connections to this interface.
HTTPS	Allow secure HTTPS connections to the web-based manager through this interface.
PING	Interface responds to pings. Use this setting to verify your installation and for testing.
HTTP	Allow HTTP connections to the web-based manager through this interface. HTTP connections are not secure and can be intercepted by a third party.
SSH	Allow SSH connections to the CLI through this interface.
SNMP	Allow a remote SNMP manager to request SNMP information by connecting to this interface.
TELNET	Allow Telnet connections to the CLI through this interface. Telnet connections are not secure and can be intercepted by a third party.
FMG-Access	Allow FortiManager authorization automatically during the communication exchange between the FortiManager and FortiGate units. For example, port1 on the FortiGate unit allows the FortiManager unit to connect to it.

IPv6 Administrative Access	Select the types of administrative access permitted for IPv6 connections to this interface. These types are the same as for Administrative Access.
Detect Interface Status for Gateway Load Balancing	Configure interface status detection for the main interface IP address.
Detect Server	Enter the server's IP address.
Detect Protocol	Select the check box beside the protocol that will be detected. for gateway load balancing.
Weight	Enter the load balancing weight.
Spillover Threshold	Enter the spillover threshold number in KBps.
Secondary IP Address	Add additional IPv4 addresses to this interface. Select the Expand Arrow to expand or hide the section.
Comments	Enter a description up to 63 characters to describe the interface.
Administrative Status	Select either *Up* (green arrow) or *Down* (red arrow) as the status of this interface. • *Up* indicates the interface is active and can accept network traffic. • *Down* indicates the interface is not active and cannot accept traffic.
Gi Gatekeeper (FortiOS Carrier only)	For FortiOS Carrier, enable Gi Gatekeeper to enable the Gi firewall as part of the anti-overbilling configuration. You must also configure *Gi Gatekeeper Settings* by going to *System* > *Admin* > *Settings*.

Switch Mode

Switch mode enables you to switch a group of related FortiGate interfaces to operate as a multi-port switch with one IP address. Switch mode is available on models with switch hardware; however, it is not available on models running FortiOS Carrier.

Switch mode has two states - switch mode and interface mode. Switch mode enables you to combine multiple interfaces into a single switch with one interface and one address. Interface mode enables you to configure each of the internal switch physical interface connections separately.

Before you are able to change between switch mode and interface mode, all configuration settings for the affected interfaces must be set to defaults. This includes security policies, routing, DNS forwarding, DHCP services, VDOM interface assignments, and routing. If they are not removed, you will not be able to switch modes, and you will see an error message. The web-based manager displays the list of affected interfaces.

To configure a mode, go to *System* > *Network* > *Interface*, and select *Switch Mode* at the top of the interface table.

Interface page containing switch mode settings	
Provides settings for switching a group of related FortiGate interfaces to operate as a multi-port switch with one IP address.	
Switch Mode	Only one internal interface is displayed. This is the default mode.

Interface Mode	All internal interfaces on the switch are displayed as individually configurable interfaces.
Hub Mode	On some models you can select *Hub Mode*. Hub mode is similar to switch mode except that in hub mode the interfaces do not learn the MAC addresses of the devices on the network they are connected to and may also respond quicker to network changes in some circumstances. You should only select *Hub Mode* if you are having network performance issues when operating with switch mode. The configuration of the FortiGate unit is the same whether in switch mode or hub mode.

Loopback interfaces

A loopback interface is a logical interface that is always up (no physical link dependency) and the attached subnet is always present in the routing table.

The FortiGate's loopback IP address does not depend on one specific external port, and is therefore possible to access it through several physical or VLAN interfaces. Multiple loopback interfaces can be configured in either non-VDOM mode or in each VDOM.

Loopback interfaces still require appropriate firewall policies to allow traffic to and from this type of interface.

A loopback interface can be used with:

- Management access
- BGP (TCP) peering
- PIM RP

Loopback interfaces are a good practice for OSPF. Setting the OSPF router ID the same as loopback IP address troubleshooting OSPF easier, and remembering the management IP addresses (telnet to “router ID”).

Dynamic routing protocols can be enabled on loopback interfaces

For blackhole static route, use the blackhole route type instead of the loopback interface.

Redundant interfaces

On some models you can combine two or more physical interfaces to provide link redundancy. This feature enables you to connect to two or more switches to ensure connectivity in the event one physical interface or the equipment on that interface fails.

In a redundant interface, traffic is only going over one interface at any time. This differs from an aggregated interface where traffic is going over all interfaces for distribution of increased bandwidth. This difference means redundant interfaces can have more robust configurations with fewer possible points of failure. This is important in a fully-meshed HA configuration.

An interface is available to be in a redundant interface if:

- it is a physical interface, not a VLAN interface
- it is not already part of an aggregated or redundant interface
- it is in the same VDOM as the redundant interface
- it has no defined IP address
- is not configured for DHCP or PPPoE
- it has no DHCP server or relay configured on it
- it does not have any VLAN subinterfaces

- it is not referenced in any security policy, VIP, or multicast policy
- it is not monitored by HA
- it is not one of the FortiGate-5000 series backplane interfaces

When an interface is included in a redundant interface, it is not listed on the *System* > *Network* > *Interface* page. You cannot configure the interface individually and it is not available for inclusion in security policies, VIPs, or routing.

DHCP on an interface

If you configure an interface to use DHCP, the FortiGate unit automatically broadcasts a DHCP request from the interface. The interface is configured with the IP address and any DNS server addresses and default gateway address that the DHCP server provides.

DHCP IPv6 is similar to DHCP IPv4, however there is:

- no default gateway option defined because a host learns the gateway using router advertisement messages
- there is no WINS servers because it is obsolete.

For more information about DHCP IPv6, see RFC 3315.

Configure DHCP for an interface in *System* > *Network* > *Interface* and selecting the interface from the list, and selecting *DHCP* in the *Address Mode*. The table describes the DHCP status information when DHCP is configured for an interface.

Addressing mode section of New Interface page for DHCP information	
Status	Displays DHCP status messages as the interface connects to the DHCP server and gets addressing information. Select *Status* to refresh the addressing mode status message. Status can be one of: • **initializing -** No activity. • **connecting -** interface attempts to connect to the DHCP server. • **connected -** interface retrieves an IP address, netmask, and other settings from the DHCP server. • **failed -** interface was unable to retrieve an IP address and other settings from the DHCP server.
Obtained IP/Netmask	The IP address and netmask leased from the DHCP server. Only displayed if *Status* is *connected*.
Renew	Select to renew the DHCP license for this interface. Only displayed if *Status* is *connected*.
Expiry Date	The time and date when the leased IP address and netmask is no longer valid for the interface. The IP address is returned to the pool to be allocated to the next user request for an IP address. Only displayed if *Status* is *connected*.
Default Gateway	The IP address of the gateway defined by the DHCP server. Only displayed if *Status* is *connected*, and if *Receive default gateway* from server is selected.

Distance	Enter the administrative distance for the default gateway retrieved from the DHCP server. The administrative distance, an integer from 1-255, specifies the relative priority of a route when there are multiple routes to the same destination. A lower administrative distance indicates a more preferred route.
Retrieve default gateway from server	Enable to retrieve a default gateway IP address from the DHCP server. The default gateway is added to the static routing table.
Override internal DNS	Enable to use the DNS addresses retrieved from the DHCP server instead of the DNS server IP addresses on the DNS page. When VDOMs are enabled, you can override the internal DNS only on the management VDOM.

PPPoE on an interface

If you configure the interface to use PPPoE, the FortiGate unit automatically broadcasts a PPPoE request from the interface.

The FortiGate units support many PPPoE RFC features (RFC 2516) including unnumbered IPs, initial discovery timeout and PPPoE Active Discovery Terminate (PADT).

Configure PPPoE on an interface in *System* > *Network* > *Interface.* The table describes the PPPoE status information when PPPoE is configured for an interface.

Addressing mode section of New Interface page	
Status	Displays PPPoE status messages as the FortiGate unit connects to the PPPoE server and gets addressing information. Select Status to refresh the addressing mode status message. The status is only displayed if you selected *Edit*. Status can be any one of the following 4 messages.
initializing	No activity.
connecting	The interface is attempting to connect to the PPPoE server.
connected	The interface retrieves an IP address, netmask, and other settings from the PPPoE server. When the status is connected, PPPoE connection information is displayed.
failed	The interface was unable to retrieve an IP address and other information from the PPPoE server.
Reconnect	Select to reconnect to the PPPoE server. Only displayed if Status is connected.
User Name	The PPPoE account user name.
Password	The PPPoE account password.
Unnumbered IP	Specify the IP address for the interface. If your ISP has assigned you a block of IP addresses, use one of them. Otherwise, this IP address can be the same as the IP address of another interface or can be any IP address.
Initial Disc Timeout	Enter Initial discovery timeout. Enter the time to wait before starting to retry a PPPoE discovery.

Initial PADT timeout	Enter Initial PPPoE Active Discovery Terminate (PADT) timeout in seconds. Use this timeout to shut down the PPPoE session if it is idle for this number of seconds. PADT must be supported by your ISP. Set initial PADT timeout to 0 to disable.
Distance	Enter the administrative distance for the default gateway retrieved from the PPPoE server. The administrative distance, an integer from 1-255, specifies the relative priority of a route when there are multiple routes to the same destination. A lower administrative distance indicates a more preferred route. The default distance for the default gateway is 1.
Retrieve default gateway from server	Enable to retrieve a default gateway IP address from a PPPoE server. The default gateway is added to the static routing table.
Override internal DNS	Enable to replace the DNS server IP addresses on the System DNS page with the DNS addresses retrieved from the PPPoE server. When VDOMs are enabled, you can override the internal DNS only on the management VDOM.

Administrative access

Interfaces, especially the public-facing ports can be potentially accessed by those who you may not want access to the FortiGate unit. When setting up the FortiGate unit, you can set the type of protocol an administrator must use to access the FortiGate unit. The options include:

- HTTPS
- HTTP
- SSH
- TELNET
- PING
- SNMP

You can select as many, or as few, even none, that are accessible by an administrator.

Example

This example adds an IPv4 address 172.20.120.100 to the WAN1 interface as well as the administrative access to HTTPS and SSH. As a good practice, set the administrative access when you are setting the IP address for the port.

To add an IP address on the WAN1 interface - web-based manager

1 Go to *System* > *Network* > *Interface*.
2 Select the WAN1 interface row and select *Edit*.
3 Select the *Addressing Mode* of *Manual*.
4 Enter the IP address for the port of 172.20.120.100/24.
5 For *Administrative Access,* select HTTPS and SSH.
6 Select *OK*.

To create IP address on the WAN1 interface - CLI

```
config system interface
```

```
  edit wan1
    set ip 172.20.120.100/24
    set allowaccess https ssh
end
```

When adding to, or removing a protocol, you must type the entire list again. For example, if you have an access list of HTTPS and SSH, and you want to add PING, typing:

```
set allowaccess ping
```

...only PING will be set. In this case, you must type...

```
set allowaccess https ssh ping
```

Wireless

A wireless interface is similar to a physical interface only it does not include a physical connection. The FortiWiFi units enables you to add multiple wireless interfaces that can be available at the same time (the FortiWiFi-30B can only have one wireless interface). On FortiWiFi units, you can configure the device to be either an access point, or a wireless client. As an access point, the FortiWiFi unit can have up to four separate SSIDs, each on their own subnet for wireless access. In client mode, the FortiWiFi only has one SSID, and is used as a receiver, to enable remote users to connect to the existing network using wireless protocols.

Wireless interfaces also require additional security measures to ensure the signal does not get hijacked and data tampered or stolen.

Interface MTU packet size

You can change the maximum transmission unit (MTU) of the packets that the FortiGate unit transmits to improve network performance. Ideally, the MTU should be the same as the smallest MTU of all the networks between the FortiGate unit and the destination of the packets. If the packets that the FortiGate unit sends are larger than the smallest MTU, they are broken up or fragmented, which slows down transmission. You can easily experiment by lowering the MTU to find an MTU size for optimum network performance.

Interfaces on some models support frames larger than the traditional 1 500 bytes. Contact Fortinet Customer Support for the maximum frame sizes that your FortiGate unit supports.

If you need to enable sending larger frames over a route, you need all Ethernet devices on that route to support that larger frame size, otherwise your larger frames will not be recognized and are dropped.

If you have standard size and larger size frame traffic on the same interface, routing alone cannot route them to different routes based only on frame size. However, you can use VLANs to make sure the larger frame traffic is routed over network devices that support that larger size. VLANs will inherit the MTU size from the parent interface. You will need to configure the VLAN to include both ends of the route as well as all switches and routers along the route.

MTU packet size is changed in the CLI. If you select an MTU size larger than your FortiGate unit supports, an error message will indicate this. In this situation, try a smaller MTU size until the value is supported.

If you change the MTU, you need to reboot the FortiGate unit to update the MTU value of VLAN subinterfaces on the modified interface.

In Transparent mode, if you change the MTU of an interface, you must change the MTU of all interfaces on the FortiGate unit to match the new MTU.

Secondary IP addresses to an interface

If an interface is configured with a manual or static IP address, you can also add secondary static IP addresses to the interface. Adding secondary IP addresses effectively adds multiple IP addresses to the interface. Secondary IP addresses cannot be assigned using DCHP or PPPoE.

All of the IP addresses added to an interface are associated with the single MAC address of the physical interface and all secondary IP addresses are in the same VDOM as the interface that are added to. You configure interface status detection for gateway load balancing separately for each secondary IP addresses. As with all other interface IP addresses, secondary IP addresses cannot be on the same subnet as any other primary or secondary IP address assigned to a FortiGate interface unless they are in separate VDOMs.

To configure a secondary IP, go to *System* > *Network* > *Interface*, select *Edit* or *Create New* and select the *Secondary IP Address* check box.

- Interface configuration and settings

Software switch interfaces

A software switch, or soft switch, is a virtual switch that is implemented at the software, or firmware level, rather than the hardware level. Adding a software switch can be used to simplify communication between devices connected to different FortiGate interfaces. For example, using a software switch you can place the FortiGate interface connected to an internal network on the same subnet as your wireless interfaces. Then devices on the internal network can communicate with devices on the wireless network without any additional configuration such as additional security policies, on the FortiGate unit.

It can also be useful if you require more hardware ports on for the switch on a FortiGate unit. For example, if your FortiGate unit has a 4-port switch, WAN1, WAN2 and DMZ interfaces, and you need one more port, you can create a soft switch that can include the 4-port switch and the DMZ interface all on the same subnet. These types of applications also apply to wireless interfaces and virtual wireless interfaces and physical interfaces such as those with FortiWiFi and FortiAP unit.

Similar to a hardware switch, a software switch functions like a single interface. A software switch has one IP address; all of the interfaces in the software switch are on the same subnet. Traffic between devices connected to each interface are not regulated by security policies, and traffic passing in and out of the switch are affected by the same policy.

There are a few things to consider when setting up a software switch:

- Ensure you create a back up of the configuration.

- Ensure you have at least one port or connection such as the console port to connect to the FortiGate unit. If you accidentally combine too many ports, you will need a way to undo any errors.

The ports that you include must not have any link or relation to any other aspect of the FortiGate unit. For example, DHCP servers, security policies, and so on.

To add a software switch interface

1 Go to *System* > *Network* > *Interface* and select *Create New*.

2 Set *Type* to *Software Switch*.

3 Enter a name, select the interfaces to be in the software switch, and configure other standard interface options as required.

Virtual domains

Virtual domains (VDOMs) are a method of dividing a FortiGate unit into two or more virtual units that function as multiple independent units. A single FortiGate unit is then flexible enough to serve multiple departments of an organization, separate organizations, or to act as the basis for a service provider's managed security service.

Some smaller FortiGate units do not support virtual domains.

VDOMs provide separate security domains that allow separate zones, user authentication, security policies, routing, and VPN configurations. By default, each FortiGate unit has a VDOM named root. This VDOM includes all of the FortiGate physical interfaces, modem, VLAN subinterfaces, zones, security policies, routing settings, and VPN settings.

When a packet enters a VDOM, it is confined to that VDOM. In a VDOM, you can create security policies for connections between Virtual LAN (VLAN) subinterfaces or zones in the VDOM. Packets do not cross the virtual domain border internally. To travel between VDOMs, a packet must pass through a firewall on a physical interface. The packet then arrives at another VDOM on a different interface, but it must pass through another firewall before entering the VDOM. Both VDOMs are on the same FortiGate unit. Inter-VDOMs change this behavior in that they are internal interfaces; however their packets go through all the same security measures as on physical interfaces.

-

Example

This example shows how to enable VDOMs on the FortiGate unit and the basic and create a VDOM accounting on the DMZ2 port and assign an administrator to maintain the VDOM. First enable Virtual Domains on the FortiGate unit. When you enable VDOMs, the FortiGate unit will log you out.

To enable VDOMs - web-based manager

1 Go to *System* > *Dashboard* > *Status*.

2 In the *System Information* widget, select *Enable* for *Virtual Domain.*

The FortiGate unit logs you out. Once you log back in, you will notice that the menu structure has changed. This reflects the global settings for all Virtual Domains.

To enable VDOMs - CLI

```
config system global
  set vdom-admin enable
end
```

Next, add the VDOM called accounting.

To add a VDOM - web-based manager

1 Go to *System* > *VDOM* > *VDOM*, and select *Create New*.

2 Enter the VDOM name `accounting`.

3 Select *OK*.

To add a VDOM - CLI

```
config vdom
  edit <new_vdom_name>
end
```

With the Virtual Domain created, you can assign a physical interface to it, and assign it an IP address.

To assign physical interface to the accounting Virtual Domain - web-based manager

1 Go to *System* > *Network* > *Interface*.

2 Select the DMZ2 port row and select *Edit*.

3 For the *Virtual Domain* drop-down list, select *accounting*.

4 Select the *Addressing Mode* of *Manual*.

5 Enter the IP address for the port of 10.13.101.100/24.

6 Set the *Administrative Access* to *HTTPS* and *SSH*.

7 Select *OK*.

To assign physical interface to the accounting Virtual Domain - CLI

```
config global
  config system interface
    edit dmz2
      set vdom accounting
      set ip 10.13.101.100/24
      set allowaccess https ssh
    next
  end
```

Virtual LANs

The term VLAN subinterface correctly implies the VLAN interface is not a complete interface by itself. You add a VLAN subinterface to the physical interface that receives VLAN-tagged packets. The physical interface can belong to a different VDOM than the VLAN, but it must be connected to a network route that is configured for this VLAN. Without that route, the VLAN will not be connected to the network, and VLAN traffic will not be able to access this interface.The traffic on the VLAN is separate from any other traffic on the physical interface.

FortiGate unit interfaces cannot have overlapping IP addresses—the IP addresses of all interfaces must be on different subnets. This rule applies to both physical interfaces and to virtual interfaces such as VLAN subinterfaces. Each VLAN subinterface must be configured with its own IP address and netmask. This rule helps prevent a broadcast storm or other similar network problems.

Any FortiGate unit, with or without VDOMs enabled, can have a maximum of 255 interfaces in Transparent operating mode. In NAT/Route operating mode, the number can range from 255 to 8192 interfaces per VDOM, depending on the FortiGate model. These numbers include VLANs, other virtual interfaces, and physical interfaces. To have more than 255 interfaces configured in Transparent operating mode, you need to configure multiple VDOMs with many interfaces on each VDOM.

Example

This example shows how to add a VLAN, vlan_accounting on the FortiGate unit internal interface with an IP address of 10.13.101.101.

To add a VLAN - web-based manager

1 Go to *System* > *Network* > *Interface* and select *Create New*.

The *Type* is by default set to VLAN.

2 Enter a name for the VLAN to `vlan_accounting`.

3 Select the *Internal* interface.

4 Enter the *VLAN ID*.

The VLAN ID is a number between 1 and 4094 that allow groups of IP addresses with the same VLAN ID to be associated together.

5 Select the *Addressing Mode* of *Manual*.

6 Enter the IP address for the port of 10.13.101.101/24.

7 Set the *Administrative Access* to *HTTPS* and *SSH*.

8 Select *OK*.

To add a VLAN - CLI

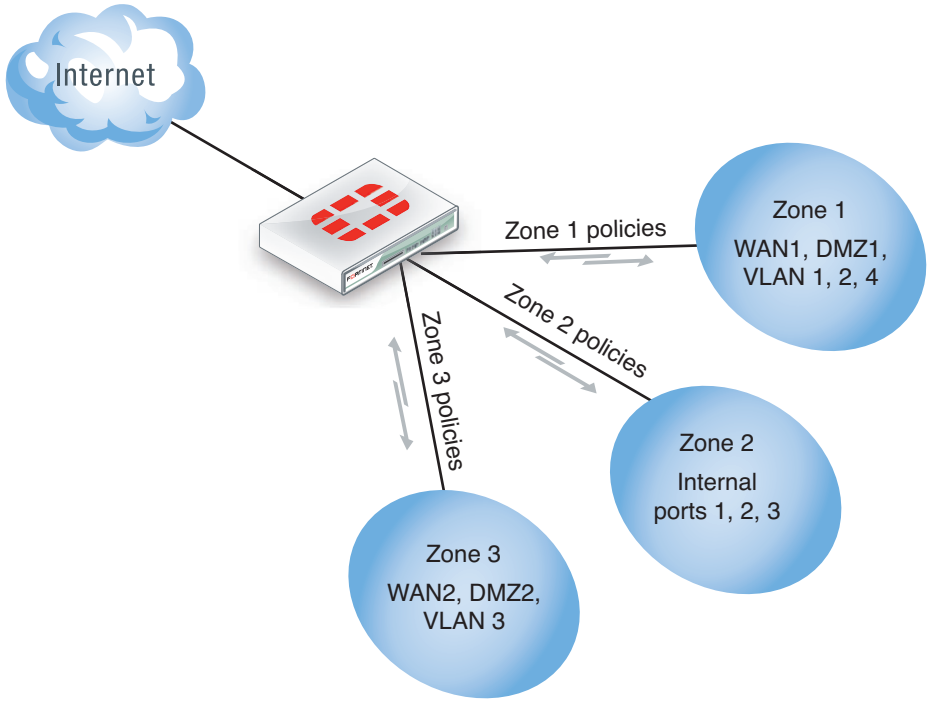
```
config system interface
  edit VLAN_1
    set interface internal
    set type vlan
    set vlanid 100
    set ip 10.13.101.101/24
    set allowaccess https ssh
  next
end
```

Zones

Zones are a group of one or more FortiGate interfaces, both physical and virtual, that you can apply security policies to control inbound and outbound traffic. Grouping interfaces and VLAN subinterfaces into zones simplifies the creation of security policies where a number of network segments can use the same policy settings and protection profiles. When you add a zone, you select the names of the interfaces and VLAN subinterfaces to add to the zone. Each interface still has its own address and routing is still done between interfaces, that is, routing is not affected by zones. Security policies can also be created to control the flow of intra-zone traffic.

For example, in the illustration below, the network includes three separate groups of users representing different entities on the company network. While each group has its own set of port and VLANs, in each area, they can all use the same security policy and protection profiles to access the Internet. Rather than the administrator making nine separate security policies, he can add the required interfaces to a zone, and create three policies, making administration simpler.

Figure 43: Network zones



You can configure policies for connections to and from a zone, but not between interfaces in a zone. Using the above example, you can create a security policy to go between zone 1 and zone 3, but not between WAN2 and WAN1, or WAN1 and DMZ1.

Example

This example explains how to set up a zone on the FortiGate unit to include the Internal interface and a VLAN.

To create a zone - web-based manager

1 Go to *System* > *Network* > *Interface.*

2 Select the arrow on the *Create New* button and select *Zone*.

3 Enter a zone name of Zone_1.

4 Select the Internal interface and the virtual LAN interface vlan_accounting from the previous section.

5 Select *OK*.

To create a zone - CLI

```
config system zone
  edit Zone_1
    set interface internal VLAN_1
end
```

IPv6

Internet Protocol version 6 (IPv6) is the next-generation version of IP addressing, to eventually replace IPv4. IPv6 was developed because there is a concern that in the near future, the available addresses for the IPv4 infrastructure will be exhausted. The IPv6 infrastructure will supplement, and eventually, replace the IPv4 standard.

Where IPv4 uses 32 bit addressing, IPv6 uses 128 bit addressing, effectively providing trillions upon trillions of unique addresses, whereas IPv4 can have a a little over 4 billion. With this larger address space, allocating addresses and routing traffic becomes easier, and network address translation (NAT) becomes virtually unnecessary.

Where IPv4 addresses are written numerals separated by a decimal, the IPv6 address is written with hexadecimal digits separated by a colon. For example, fe80:218:8bff:fe84:4223.

By default, the FortiGate unit is not enabled to use IPv6 addressing. To enable this feature, go to *System* > *Admin* > *Settings* and select *IPv6 Support on GUI*. When enabled you can use IPv6 addressing on any of the address-dependant components of the FortiGate unit, including security policies, interface addressing, DNS servers. IPv6 addressing can be configured on the web-based manager and in the CLI.

For further information on IPV6 in FortiOS, see “Internet Protocol version 6 (IPv6)” on page 235.

Example

This example adds an IPv6 address 2001:db8:0:1234:0:567:1:1 for the WAN1 interface as well as the administrative access to HTTPS and SSH. As a good practice, set the administrative access when you are setting the IP address for the port.

To add an IP address for the WAN1 interface - web-based manager

1 Go to *System* > *Network* > *Interface*.

2 Select WAN1 row and select *Edit*.

3 Select the *Addressing Mode* of *Manual*.

4 Enter the *IPv6 Address* of `2001:db8:0:1234:0:567:1:1`.

5 For *Administrative Access* select *HTTPS* and *SSH*.

6 Select *OK*.

To create IP address for the WAN1 interface - CLI

```
config system interface
  edit wan1
```

```
  config ipv6
    set ip6-address 2001:db8:0:1234:0:567:1:1
    set ip6-allowaccess https ssh
  end
end
```

Central management

Administering one or two FortiGate units is fairly simple enough, especially when they are in the same room or building. However, if you are administering many FortiGate units that may be located in locations in a large geographical area, or in the world, you will need a more efficient method of maintaining firmware upgrades, configuration changes and updates.

The FortiManager family of appliances supply the tools needed to effectively manage any size Fortinet security infrastructure, from a few devices to thousands of appliances. The appliances provide centralized policy-based provisioning, configuration, and update management. They also offer end-to-end network monitoring for added control. Managers can control administrative access and simplify policy deployment using role-based administration to define user privileges for specific management domains and functions by aggregating collections of Fortinet appliances and agents into independent management domains. By locally hosting security content updates for managed devices and agents, FortiManager appliances minimize Web filtering rating request response time and maximize network protection.

This chapter describes the basics of using FortiManager as an administration tool for multiple FortiGate units. It describes the basics of setting up a FortiGate unit in FortiManager, and some key management features you can use within FortiManager to manage the FortiGate unit. For full details and instructions on FortiManager, see the *FortiManager Administration Guide*.

This section includes the topics:

Adding a FortiGate to FortiManager

Before you can use the FortiManager unit to maintain a FortiGate, you need to add it to the FortiManager unit. To do this requires configuration on both the FortiGate and FortiManager. This section describes the basics to configure management using a FortiManager device. For more information on the interaction of FortiManager with the FortiGate unit, see the FortiManager documentation.

FortiGate configuration

These steps ensure that the FortiGate unit will be able to receive updated antivirus and IPS updates, and allow remote management through the FortiManager system. You can add a FortiGate unit whether it is running in either NAT mode or transparent mode. The FortiManager unit provides remote management of a FortiGate unit over TCP port 541.

If you have not already done so, register the FortiGate unit by visiting http://support.fortinet.com and select *Product Registration*. By registering your Fortinet unit, you will receive updates to threat detection and prevention databases (Antivirus, Intrusion Detection, etc.) and will also ensure your access to technical support.

You must enable the FortiGate management option so the FortiGate unit can accept management updates to firmware, antivirus signatures and IPS signatures.

To configure the FortiGate unit - web-based manager

1. Log in to the FortiGate unit.
2. Go to *System* > *Admin* > *Settings*.
3. Enter the *IP address* for the FortiManager.
4. Select *Send Request*.

The FortiManager ID appears in the Trusted FortiManager table, and can now be managed by the FortiManager unit, once you add it to the Device Manager.

As an additional security measure, you can also select *Registration Password* and enter a password to connect to the FortiManager in an upcoming FortiManager release.

To configure the FortiGate unit - CLI

```
config system central-mamagement
  set fmg <ip_address>
end
```

To use the registration password in an upcoming FortiManager release enter:

```
execute central-mgmt register-device <fmg-serial-no><fmg-register-password><fgt-usrname><fgt-password>
```

Configuring an SSL connection

With FortiManager 4.0 MR2 Patch 6 and FortiOS 4.0 MR3, you can configure an SSL connection between the two devices, and select the encryption level.

Use the following CLI commands in FortiOS to configure the encryption connection:

```
config central-management setting
  set status enable
  set enc-algorithm {default* | high | low | disable}
end
```

The default encryption automatically sets high and medium encryption algorithms. Algorithms used for high, medium, and low follows openssl definitions:

- ***High*** - Key lengths larger than 128 bits, and some cipher suites with 128-bit keys.

  Algorithms are: DHE-RSA-AES256-SHA:AES256-SHA:EDH-RSA-DES-CBC3-SHA:DES-CBC3-SHA:DES-CBC3-MD5:DHE-RSA-AES128-SHA:AES128-SHA
- ***Medium*** - Key strengths of 128 bit encryption.

  Algorithm are:RC4-SHA:RC4-MD5:RC4-MD

- ***Low*** - Key strengths of 64 or 56 bit encryption algorithms but excluding export cipher suites

  Algorithms: EDH-RSA-DES-CDBC-SHA; DES-CBC-SHA; DES-CBC-MD5.

FortiManager configuration

After enabling Central Management and indicating the FortiManager unit that will provide the management of the FortiGate unit, you can add it to the Device Manager in the FortiManager web-based manager.

To add the FortiGate unit to the Device Manager in FortiManager

1. Log in to the FortiManager unit.
2. Select the Device Manager tab.
3. Select *Add Device* from the top tool bar.
4. Enter the *IP address* of the FortiGate unit.
5. Enter the *Name* of the device.

   This can be the model name, or functional name, such as West Building, or Accounting Firewall.
6. Enter the remaining information as required.
7. Select *OK*.

Configuration through FortiManager

With the FortiManager system, you can monitor and configure multiple FortiGate units from one location and log in. Within the FortiManager system, you can view a FortiGate unit and it's web-based manager from the Device Manager. From there you can make the usual configuration updates and changes, without having to log in and out of multiple FortiGate units.

When under control of a FortiManager system, administrators will not be able to configure the FortiGate unit. When trying to change options, the FortiGate unit displays a message that it is configured through FortiManager, and any changes may be reverted.

FortiManager enables you to complete the configuration, by going to the Device Manager, selecting the FortiGate unit and using the same menu structure and pages as you would see in the FortiGate web-based manager. All changes to the FortiGate configuration are stored locally on the FortiManager unit until you synchronize with the FortiGate unit.

Global objects

If you are maintaining a number of FortiGate units within a network, many of the policies and configuration elements will be the same across the corporation. In these instances, the adding and editing of many of the same policies will be come a tedious and error-prone activity. With FortiManager global objects, this level of configuration is simplified.

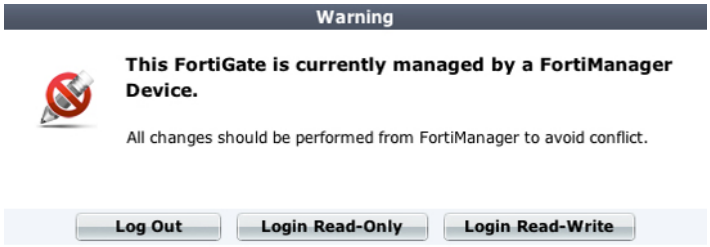
A global object is an object that is not associated specifically with one device or group. Global objects includes security policies, a DNS server, VPN, and IP pools.

The Global Objects window is where you can configure global objects and copy the configurations to the FortiManager device database for a selected device or a group of devices. You can also import configurations from the FortiManager device database for a selected device and modify the configuration as required.

When configuring or creating a global policy object the interface, prompts, and fields are the same as creating the same object on a FortiGate unit using the FortiGate web-based manager.

Locking the FortiGate web-based manager

When you use the FortiManager to manager multiple FortiGate units, a local FortiGate unit becomes locked from any configuration using the web-based manager by an administrator. When an administrator logs into the FortiGate unit, the following message appears:



If the administrator selects *Login Read Only*, an icon appears at the top of the web-based manager. All configuration options will only have a *Return* button, rather than the typical *OK*, *Apply* and *Cancel* buttons.

Figure 44: Read-only icon when under FortiManager management

Selecting Login Read-Write, a warning appears that any changes may cause the configuration between FortiManager and the FortiGate unit be become out of sync.

Firmware updates

FortiManager can also be the source where firmware updates are performed for multiple FortiGate units, saving time rather than upgrading each FortiGate unit individually.

The FortiManager unit stores local copies of firmware images by either downloading these images from the Fortinet Distribution Network (FDN) or by accepting firmware images that you upload from your management computer.

If you are using the FortiManager unit to download firmware images from the FDN, FortiManager units first validate device licenses. The FDN validates support contracts and provides a list of currently available firmware images. For devices with valid Fortinet Technical Support contracts, you can download new firmware images from the FDN, including release notes.

After firmware images have been either downloaded from the FDN or imported to the firmware list, you can either schedule or immediately upgrade/downgrade a device or group's firmware.

See the *FortiManager Administration Guide* for more information on updating the FortiGate firmware using the FortiManager central management.

FortiGuard

FortiManager can also connect to the FortiGuard Distribution Network to receive push updates for IPS signatures and antivirus definitions. These updates can then be used to update multiple FortiGate units throughout an organization. By the FortiManager as the host for updates, bandwidth use is minimized by downloading to one source instead of many.

To receive IPS and antivirus updates from FortiManager, indicate an alternate IP address on the FortiGate unit.

To configure updates from FortiManager

1. Go to *System* > *Config* > *FortiGuard*.
2. Select *AntiVirus and IPS Options* to expand the options.
3. Select the checkbox next to *Use override server address* and enter the IP address of the FortiManager unit.
4. Select *Apply*.

Backup and restore configurations

FortiManager stores configuration files for backup and restore purposes. FortiManager also enables you to save revisions of configuration files. Configuration backups occur automatically. Backups occur when the administrator logs out or the administrator login session expires (times out).

FortiManager also enables you to view differences between different configurations to view where changes have been made.

Administrative domains

FortiManager administrative domains enable the `admin` administrator to create groupings of devices for configured administrators to monitor and manage. FortiManager can manage a large number of Fortinet appliances. This enables administrators to maintain managed devices specific to their geographic location or business division. This also includes FortiGate units with multiple configured VDOMs.

Each administrator is tied to an administrative domain (ADOM). When that particular administrator logs in, they see only those devices or VDOMs configured for that administrator and ADOM. The one exception is the admin administrator account which can see and maintain all administrative domains and the devices within those domains.

Administrative domains are not enabled by default, and enabling and configuring the domains can only be performed by the admin administrator. The maximum number of administrative domains you can add depends on the FortiManager system model.

See the *FortiManager Administration Guide* for information on the maximums for each model.

Best practices

The FortiGate unit is installed, and traffic is flowing. With your network sufficiently protected, you can now fine tune the firewall for the best performance and efficiently. This chapter describes configuration options that can ensure your FortiGate unit is running at its best performance.

This section includes the topics on:

Hardware

Environmental specifications

Keep the following environmental specifications in mind when installing and setting up your FortiGate unit.

- Operating temperature: 32 to 104°F (0 to 40°C) (temperatures may vary, depending on the FortiGate model)
- If you install the FortiGate unit in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than room ambient temperature. Therefore, make sure to install the equipment in an environment compatible with the manufacturer's maximum rated ambient temperature.
- Storage temperature: -13 to 158°F (-25 to 70°C) (temperatures may vary, depending on the FortiGate model)
- Humidity: 5 to 90% non-condensing
- Air flow - For rack installation, make sure that the amount of air flow required for safe operation of the equipment is not compromised.
- For free-standing installation, make sure that the appliance has at least 1.5 in. (3.75 cm) of clearance on each side to allow for adequate air flow and cooling.

This device complies with part FCC Class A, Part 15, UL/CUL, C Tick, CE and VCCI. Operation is subject to the following two conditions:

- This device may not cause harmful interference, and
- This device must accept any interference received, including interference that may cause undesired operation.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

The equipment compliance with FCC radiation exposure limit set forth for uncontrolled Environment.

Risk of Explosion if battery is replaced by an incorrect type. Dispose of used batteries according to the instructions.

To reduce the risk of fire, use only No. 26 AWG or larger UL Listed or CSA Certified Telecommunication Line Cord.

Grounding

- Ensure the FortiGate unit is connected and properly grounded to a lightning and surge protector. WAN or LAN connections that enter the premises from outside the building should be connected to an Ethernet CAT5 (10/100 Mb/s) surge protector.
- Shielded Twisted Pair (STP) Ethernet cables should be used whenever possible rather than Unshielded Twisted Pair (UTP).
- Do not connect or disconnect cables during lightning activity to avoid damage to the FortiGate unit or personal injury.

Rack mount instructions

Elevated Operating Ambient - If installed in a closed or multi-unit rack assembly, the operating ambient temperature of the rack environment may be greater than room ambient. Therefore, consideration should be given to installing the equipment in an environment compatible with the maximum ambient temperature (Tma) specified by the manufacturer.

Reduced Air Flow - Installation of the equipment in a rack should be such that the amount of air flow required for safe operation of the equipment is not compromised.

Mechanical Loading - Mounting of the equipment in the rack should be such that a hazardous condition is not achieved due to uneven mechanical loading.

Circuit Overloading - Consideration should be given to the connection of the equipment to the supply circuit and the effect that overloading of the circuits might have on overcurrent protection and supply wiring. Appropriate consideration of equipment nameplate ratings should be used when addressing this concern.

Reliable Earthing - Reliable earthing of rack-mounted equipment should be maintained.

Particular attention should be given to supply connections other than direct connections to the branch circuit (e.g. use of power strips).

Shutting down

Always shut down the FortiGate operating system properly before turning off the power switch to avoid potential hardware problems.

To power off the FortiGate unit - web-based manager

1 Go to *System* > *Status*.

2 In the Unit Operation display, select Shutdown.

To power off the FortiGate unit

```
execute shutdown
```

Once completing this step you can safely disconnect the power cables from the power supply.

Performance

- Disable any management features you do not need. If you don't need SSH or SNMP disable them. SSH also provides another possibility for would-be hackers to infiltrate your FortiGate unit.
- Put the most used firewall rules to the top of the interface list.
- Log only necessary traffic. The writing of logs, especially if to an internal hard disk, slows down performance.
- Enable only the required application inspections.
- Keep alert systems to a minimum. If you send logs to a syslog server, you may not need SNMP or email alerts, making for redundant processing.
- Establish scheduled FortiGuard updates at a reasonable rate. Daily every 4-5 hours for most situations, or in more heavy-traffic situations, in the evening when more bandwidth can be available.
- Keep UTM profiles to a minimum. If you do not need a profile on a firewall rule, do not include it.
- Keep VDOMs to a minimum. On low-end FortiGate units, avoid using them if possible.
- Avoid traffic shaping if you need maximum performance. Traffic shaping, by definition, slows down traffic.

Firewall

- Avoid using the *All* selection for the source and destination addresses. Use addresses or address groups.
- Avoid using *Any* for the services.
- Use logging on a policy only when necessary. For example, you may want to log all dropped connections but be aware of the performance impact. However, use this sparingly to sample traffic data rather than have it continually storing log information you may not use.
- Use the comment field to input management data; who requested the rule, who authorized it, etc.
- Avoid FQDN addresses if possible. It can cause a performance impact on DNS queries and security impact from DNS spoofing.
- If possible, avoid port ranges on services for security reasons.
- Use groups whenever possible.
- To ensure that all AV push updates occur, ensure you have an AV profile enabled for UTM in a security policy.

Intrusion protection

- Create and use UTM profiles with specific signatures and anomalies you need per-interface and per-rule.
- Do not use predefined or generic profiles. While convenient to supply immediate protection, you should create profiles to suit your network environment.
- If you do use the default profiles, reduce the IPS signatures/anomalies enabled in the profile to conserver processing time and memory.
- If you are going to enable anomalies, make sure you tune thresholds according to your environment.
- If you need protection, but not audit information, disable the logging option.
- Tune the IP-protocol parameter accordingly.

Antivirus

- Enable only the protocols you need to scan. If you have antivirus scans occurring on the SMTP server, or using FortiMail, it is redundant to have it occur on the FortiGate unit as well.
- Reduce the maximum file size to be scanned. Viruses travel usually in small files of around 1 to 2 megabytes.
- Antivirus scanning within an HA cluster can impact performance.
- Enable grayware scanning on UTM profiles tied to internet browsing.
- Do not quarantine files unless you regularly monitor and review them. This is otherwise a waste of space and impacts performance.
- Use file patterns to avoid scanning where it is not required.
- Enable heuristics from the CLI if high security is required using the command `config antivirus heuristic`.

Web filtering

- Web filtering within an HA cluster impacts performance.
- Always review the DNS settings to ensure the servers are fast.
- Content block may cause performance overhead.
- Local URL filter is faster than FortiGuard web filter, because the filter list is local and the FortiGate unit does not need to go out to the Internet to get the information from a FortiGuard web server.

Email Filtering (Antispam)

- If possible use, a FortiMail unit. The antispam engines are more robust.
- Use fast DNS servers.
- Use specific UTM profiles for the rule that will use antispam.
- DNS checks may cause false positive with HELO DNS lookup.
- Content analysis (banned words) may impose performance overhead.

Security

- Use NTP to synchronize time on the FortiGate and the core network systems such as email servers, web servers and logging services.
- Enable log rules to match corporate policy. For example, log administration authentication events and access to systems from untrusted interfaces.
- Minimize adhoc changes to live systems if possible to minimize interruptions to the network.
- When not possible, create backup configurations and implement sound audit systems using FortiAnalyzer and FortiManager.
- If you only need to allow access to a system on a specific port, limit the access by creating the strictest rule possible.

FortiGuard

FortiGuard is a world-wide network of servers. The FortiGuard Distribution Network (FDN) of servers provides updates to antivirus, antispam and IPS definitions. Worldwide coverage of FortiGuard services is provided by FortiGuard service points. FortiGuard Subscription Services provide comprehensive Unified Threat Management (UTM) security solutions to enable protection against content and network level threats.

Fortinet employs people around the globe monitoring virus, spyware and vulnerability activities. As these various vulnerabilities are found, signatures are created and pushed to the subscribed FortiGate unit. The Global Threat Research Team enables Fortinet to deliver a combination of multi-layered security intelligence and provide true zero-day protection from new and emerging threats. FortiGuard services are continuously updated year round, 24x7x365.

The FortiGuard Network has data centers around the world located in secure, high availability locations that automatically deliver updates to the Fortinet security platforms to and protect the network with the most up-to-date information.

To ensure optimal response and updates, the FortiGate unit will contact a FortiGuard service point closest to the FortiGate installation, using the configured time zone information.

Every FortiGate unit includes a free 30-day FortiGuard trial license. FortiGuard license management is performed by Fortinet servers. The FortiGate unit automatically contacts a FortiGuard service point when enabling FortiGuard services. Contact Fortinet Technical Support to renew a FortiGuard license after the free trial.

This section includes the topics:

FortiGuard Services

The FortiGuard services provide a number of services to monitor world-wide activity and provide the best possible security. Services include:

- ***Antispam/Web Filtering***- The FortiGuard Antispam Service uses both a sender IP reputation database and a spam signature database, along with sophisticated spam filtering tools on Fortinet appliances and agents, to detect and block a wide range of spam messages. Updates to the IP reputation and spam signature databases are provided continuously via the global FortiGuard distribution network.
- ***Antivirus*** -The FortiGuard Antivirus Service provides fully automated updates to ensure protection against the latest content level threats. It employs advanced virus, spyware, and heuristic detection engines to prevent both new and evolving threats and vulnerabilities from gaining access to your network.

- ***Intrusion Prevention*** - The FortiGuard Intrusion Prevention Service uses a customizable database of more than 4000 known threats to stop attacks that evade conventional firewall defenses. It also provides behavior-based heuristics, enabling the system to recognize threats when no signature has yet been developed. It also provides more than 1000 application identity signatures for complete application control.
- ***Web Filtering*** - Web Filtering provides Web URL filtering to block access to harmful, inappropriate, and dangerous web sites that may contain phishing/pharming attacks, malware such as spyware, or objectionable content that can expose your organization to legal liability. Based on automatic research tools and targeted research analysis, real-time updates enable you to apply highly-granular policies that filter web access based on 78 web content categories, over 45 million rated web sites, and more than two billion web pages - all continuously updated.

Support Contract and FortiGuard Subscription Services

The *Support Contract* and *FortiGuard Subscription Services* sections are displayed in abbreviated form within the *License Information* widget. A detailed version is available by going to *System* > *Config* > *FortiGuard*.

The Support Contract area displays the availability or status of your FortiGate unit's support contract. The status displays can be either *Unreachable*, *Not Registered* or *Valid Contract*.

The FortiGuard Subscription Services area displays detailed information about your FortiGate unit's support contract and FortiGuard subscription services. On this page, you can also manually update the antivirus and IPS engines.

The status icons for each section Indicates the state of the subscription service. The icon corresponds to the availability description.

- **Gray (Unreachable)** – the FortiGate unit is not able to connect to service.
- **Orange (Not Registered)** – the FortiGate unit can connect, but not subscribed.
- **Yellow (Expired)** – the FortiGate unit had a valid license that has expired.
- **Green (Valid license)** – the FortiGate unit can connect to FDN and has a registered support contract. If the Status icon is green, the expiry date also appears.

FortiGuard Analysis Service Options

Go to *System* > *Config* > *FortiGuard*, and expand the *FortiGuard Analysis & Management Service Options*.

Account ID	Enter the name for the FortiGuard Analysis and Management Service that identifies the account. This is the same account information used when registering for the service.
To launch the service portal, please click here	Select to go directly to the FortiGuard Analysis and Management Service portal web site to view logs or configuration. You can also select this to register your FortiGate unit with the FortiGuard Analysis and Management Service.

Antivirus and IPS

The FortiGuard network is an always updating service. That is, Fortinet employs developers around the clock, monitoring for new and mutating virus and intrusion threats. This includes grayware and signatures for application control. There are two methods of updating the virus and IPS signatures on your FortiGate unit: manually or through push updates.

Antivirus and IPS Options

Go to *System* > *Config* > *FortiGuard*, and expand the *Antivirus and IPS Options* section to configure the antivirus and IPS options for connecting and downloading definition files.

Use override server address	Select to configure an override server if you cannot connect to the FDN or if your organization provides updates using their own FortiGuard server.
Allow Push Update	Select to allow updates sent automatically to your FortiGate unit when they are available.
Allow Push Update status icon	The status of the FortiGate unit for receiving push updates: • **Gray (Unreachable)** - the FortiGate unit is not able to connect to push update service • **Yellow (Not Available)** - the push update service is not available with current support license • **Green (Available)** - the push update service is allowed.
Use override push IP and Port	Available only if both *Use override server address* and *Allow Push Update* are enabled. Enter the IP address and port of the NAT device in front of your FortiGate unit. FDS will connect to this device when attempting to reach the FortiGate unit. The NAT device must be configured to forward the FDS traffic to the FortiGate unit on UDP port 9443.
Schedule Updates	Select this check box to enable updates to be sent to your FortiGate unit at a specific time. For example, to minimize traffic lag times, you can schedule the update to occur on weekends or after work hours. Note that a schedule of once a week means any urgent updates will not be pushed until the scheduled time. However, if there is an urgent update required, select the *Update Now* button.
Update Now	Select to manually initiate an FDN update.
Submit attack characteristics… (recommended)	Select to help Fortinet maintain and improve IPS signatures. The information sent to the FortiGuard servers when an attack occurs, can be used to keep the database current as variants of attacks evolve.

Manual updates

To manually update the signature definitions file, you need to first go to the Support web site at https://support.fortinet.com. Once logged in, select FortiGuard Service Updates from the Download area of the web page. The browser will present you the most current antivirus and IPS signature definitions which you can download.

Once downloaded to your computer, log into the FortiGate unit to load the definition file.

To load the definition file onto the FortiGate unit

1 Go to *System* > *Config* > *FortiGuard*.

2 Select the *Update* link for either *AV Definitions* or *IPS Definitions*.

3 Locate the downloaded file and select *OK*.

The upload may take a few minutes to complete.

Automatic updates

The FortiGate unit can be configured to request updates from the FortiGuard Distribution Network. You can configure this to be on a scheduled basis, or with push notifications.

Scheduling updates

Scheduling updates ensures that the virus and IPS definitions are downloaded to your FortiGate unit on a regular basis, ensuring that you do not forget to check for the definition files yourself. As well, by scheduling updates during off-peak hours, such as evenings or weekends, when network usage is minimal, ensures that the network activity will not suffer from the added traffic of downloading the definition files.

If you require the most up-to-date definitions as viruses and intrusions are found in the wild, the FortiGuard Distribution Network can push updates to the FortiGate units as they are developed. This ensures that your network will be protected from any breakouts of a virus within the shortest amount of time, minimizing any damaging effect that can occur. Push updates require that you have registered your FortiGate unit.

Once push updates are enabled, the next time new antivirus or IPS attack definitions are released, the FDN notifies all the FortiGate unit that a new update is available. Within 60 seconds of receiving a push notification, the unit automatically requests the update from the FortiGuard servers.

To enable scheduled updates - web-based manager

1 Go to *System* > *Config* > *FortiGuard*.

2 Click the Expand Arrow for *AntiVirus and IPS Options*.

3 Select the *Scheduled Update* check box.

4 Select the frequency of the updates and when within that frequency.

5 Select *Apply*.

To enable scheduled updates - CLI

```
config system autoupdate schedule
  set status enable
  set frequency {every | daily | weekly}
  set time <hh:mm>
  set day <day_of_week>
end
```

Push updates

Push updates enable you to get immediate updates when new virus or intrusions have been discovered and new signatures are created. This ensures that when the latest signature is available it will be sent to the FortiGate.

When a push notification occurs, the FortiGuard server sends a notice to the FortiGate unit that there is a new signature definition file available. The FortiGate unit then initiates a download of the definition file, similar to the scheduled update.

To ensure maximum security for your network, you should have a scheduled update as well as enable the push update, in case an urgent signature is created, and your cycle of the updates only occurs weekly.

To enable push updates - web-based manager

1 Got to *System* > *Config* > *FortiGuard*.

2 Click the Expand Arrow for *Antivirus and IPS Options*.

3 Select *Allow Push Update*.

4 Select *Apply*.

To enable push updates - CLI

```
config system autoupdate push-update
  set status enable
end
```

Push IP override

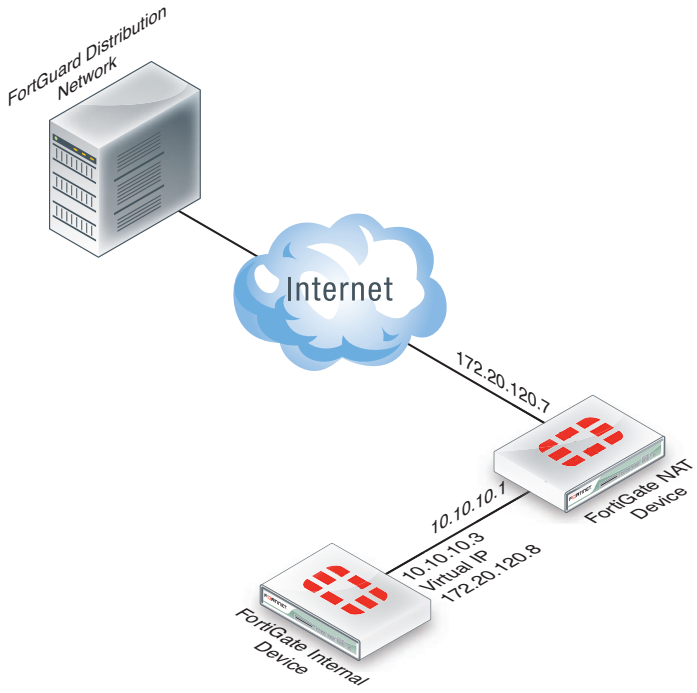
If the FortiGate unit is behind another NAT device (or another FortiGate unit), to ensure it receives the push update notifications, you need to use an override IP address for the notifications. To do this, you create a virtual IP to map to the external port of the NAT device.

Generally speaking, if there are two FortiGate devices as in the diagram below, the following steps need to be completed on the FortiGate NAT device to ensure the FortiGate unit on the internal network receives the updates:

- Add a port forwarding virtual IP to the FortiGate NAT device that connects to the Internet by going to *Firewall Objects* > *Virtual IP*.
- Add a security policy to the FortiGate NAT device that connects to the Internet that includes the port forwarding virtual IP.
- Configure the FortiGate unit on the internal network with an override push IP and port.

On the FortiGate internal device, the virtual IP is entered as the *Use push override IP* address.

Figure 45: Using a virtual IP for a FortiGate unit behind a NAT device



To enable push update override- web-based manager

1 Got to *System* > *Config* > *FortiGuard*.
2 Click the Expand Arrow for *Antivirus and IPS Options*.
3 Select *Allow Push Update*.
4 Select *Use push override IP*.
5 Enter the virtual IP address configured on the NAT device.
6 Select *Apply*.

To enable push updates - CLI

```
config system autoupdate push-update
  set status enable
  set override enable
  set address <vip_address>
end
```

Web filtering

The multiple FortiGuard data centers around the world hold the entire categorized URL database and receive rating requests from customer FortiGate units typically triggered by browser based URL requests. These rating requests are responded to with the categories stored for specific URLs, the requesting FortiGate unit will then use its own local profile configuration to determine what action is appropriate to the category, that is, to blocking, monitor or permit the request. Fortinet's development team has ensured that providing this powerful filtering capability is as simple as possible to enable.

Further, rating responses can also be cached locally on the FortiGate unit, providing a quicker response time, while easing load on the FortiGuard servers, aiding in a quicker response time for less common URL requests. This is a very effective method for common sites. Search engines and other frequently visited sites for your business can remain cached locally. Other sites less frequently visited, can be cached locally for a determined amount of time. For a site such as Google, the frequency of its access can keep it in the cache, other sites can remain in the cache up to 24 hours, or less depending on the configuration.

By default, the web filtering cache is enabled. The cache includes a time-to-live value, which is the amount of time a url will stay in the cache before expiring. You can change this value to shorten or extend the time between 300 and 86400 seconds.

Web Filtering and Email Filtering Options

Go to *System* > *Config* > *FortiGuard*, and expand arrow to view *Web Filtering* and *Email Filtering* options for setting the size of the caches and ports used.

Web Filter cache TTL	Set the Time To Live value. This is the number of seconds the FortiGate unit will store a blocked IP or URL locally, saving time and network access traffic, checking the FortiGuard server. Once the TTL has expired, the FortiGate unit will contact an FDN server to verify a web address. The TTL must be between 300 and 86400 seconds.
Antispam cache TTL	Set the Time To Live value. This is the number of seconds the FortiGate unit will store a blocked IP or URL locally, saving time and network access traffic, checking the FortiGuard server. Once the TTL has expired, the FortiGate unit will contact an FDN server to verify a web address. The TTL must be between 300 and 86400 seconds.
Port Section	Select the port assignments for contacting the FortiGuard servers. Select the *Test Availability* button to verify the connection using the selected port.
To have a URL's category rating re-evaluated, please click here.	Select to re-evaluate a URL's category rating on the FortiGuard Web Filter service.

URL verification

If you discover a URL - yours or one you require access to has been incorrectly flagged as an inappropriate site, you can ask the FortiGuard team to re-evaluate the site. To do this, go to *System* > *Config* > *FortiGuard*, select the blue arrow for *Web Filtering and Email Filtering Options* and select the link for re-evaluation.

To modify the web filter cache size - web-based manager

1. Got to *System* > *Config* > *FortiGuard*.
2. Click the Expand Arrow for *Web Filtering and Email Filtering Options*.
3. Enter the TTL value for the *Web filter cache*.
4. Select *Apply*.

To modify the web filter cache size - CLI

```
config system fortiguard
  set webfilter-cache-ttl <integer>
end
```

Further web filtering options can be configured to block specific URLs, and allow others through. These configurations are available through the *UTM* > *Web Filter* menu.

Email filtering

Similar to web filtering, FortiGuard data centers monitor and update email databases of known spam sources. With FortiGuard antispam enabled, the FortiGate unit verifies incoming email sender address and IPs against the database, and take the necessary action as defined within the antivirus profiles.

Further, spam source IP addresses can also be cached locally on the FortiGate unit, providing a quicker response time, while easing load on the FortiGuard servers, aiding in a quicker response time for less common email address requests.

By default, the antispam cache is enabled. The cache includes a time-to-live value, which is the amount of time an email address will stay in the cache before expiring. You can change this value to shorten or extend the time between 300 and 86400 seconds.

To modify the antispam filter cache size - web-based manager

1. Got to *System* > *Config* > *FortiGuard*.
2. Click the Expand Arrow for *Web Filtering and Email Filtering Options*.
3. Enter the TTL value for the *Antispam filter cache*.
4. Select *Apply*.

To modify the web filter cache size - CLI

```
config system fortiguard
  set antispam-cache-ttl <integer>
end
```

Further antispam filtering options can be configured to block, allow or quarantine, specific email addresses.

Security tools

The FortiGuard online center provides a number of online security tools that enable you to verify or check ratings of web sites, email addresses as well as check file for viruses. These features are available at http://www.fortiguard.com.

URL lookup

By entering a web site address, you can see if it has been rated and what category and classification it is filed as. If you find your web site or a site you commonly go to has been wrongly categorized, use this page to request the site to be re-evaluated.

http://www.fortiguard.com/webfiltering/webfiltering.html

IP and signature lookup

The IP and signature lookup enable you to check whether an IP address is blacklisted in the FortiGuard IP reputation database, or whether a URL or email address is in the signature database.

http://www.fortiguard.com/antispam/antispam.html

Online virus scanner

If you discover a suspicious file on your machine, or suspect that a program you downloaded from the internet might be malicious you can scan it using the FortiGuard online scanner. The questionable file can be uploaded from your computer to a dedicated server where it will be scanned using FortiClient Antivirus. Only one file of up to 1 MB can be checked at any one time. All files will be forwarded to our research labs for analysis.

http://www.fortiguard.com/antivirus/virus_scanner.html

Malware removal tools

Tools have been developed by FortiGuard Labs to disable and remove the specific malware and related variants. Some tools have been developed to remove specific malware, often tough to remove. A universal cleaning tool, FortiCleanup, is also available for download.

The FortiCleanup is a tool developed to identify and cleanse systems of malicious rootkit files and their associated malware. Rootkits consist of code installed on a system with kernel level privileges, often used to hide malicious files, keylog and thwart detection / security techniques. The aim of this tool is to reduce the effectiveness of such malware by finding and eliminating rootkits. The tool offers a quick memory scan as well as a full system scan. FortiCleanup will not only remove malicious files, but also can cleanse registry entries, kernel module patches, and other tricks commonly used by rootkits - such as SSDT hooks and process enumeration hiding.

A license to use these applications is provided free of charge, courtesy of Fortinet.

http://www.fortiguard.com/antivirus/malware_removal.html

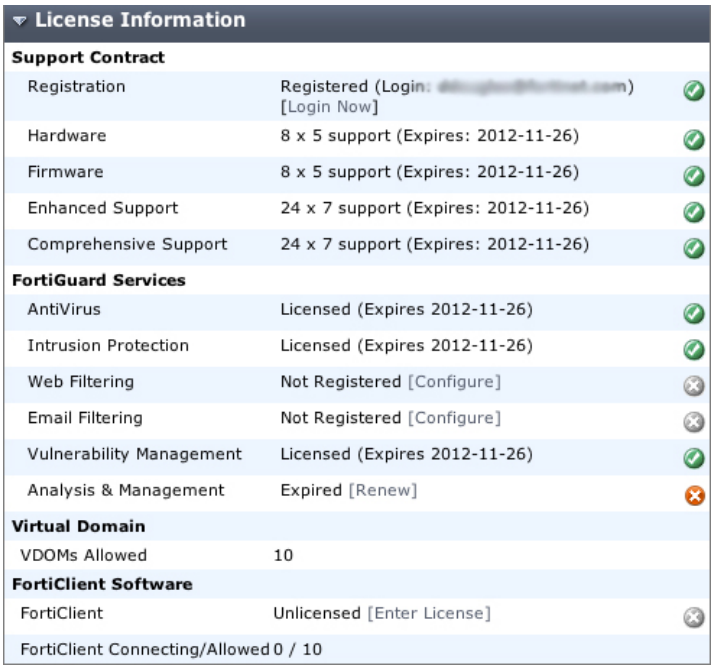
Troubleshooting

If you are not getting FortiGuard web filtering or antispam services, there are a few things to verify communication to the FortiGuard Distribution Network (FDN) is working. Before any troubleshooting, ensure that the FortiGate unit has been registered and you or your company, has subscribed to the FortiGuard services.

Web-based manager verification

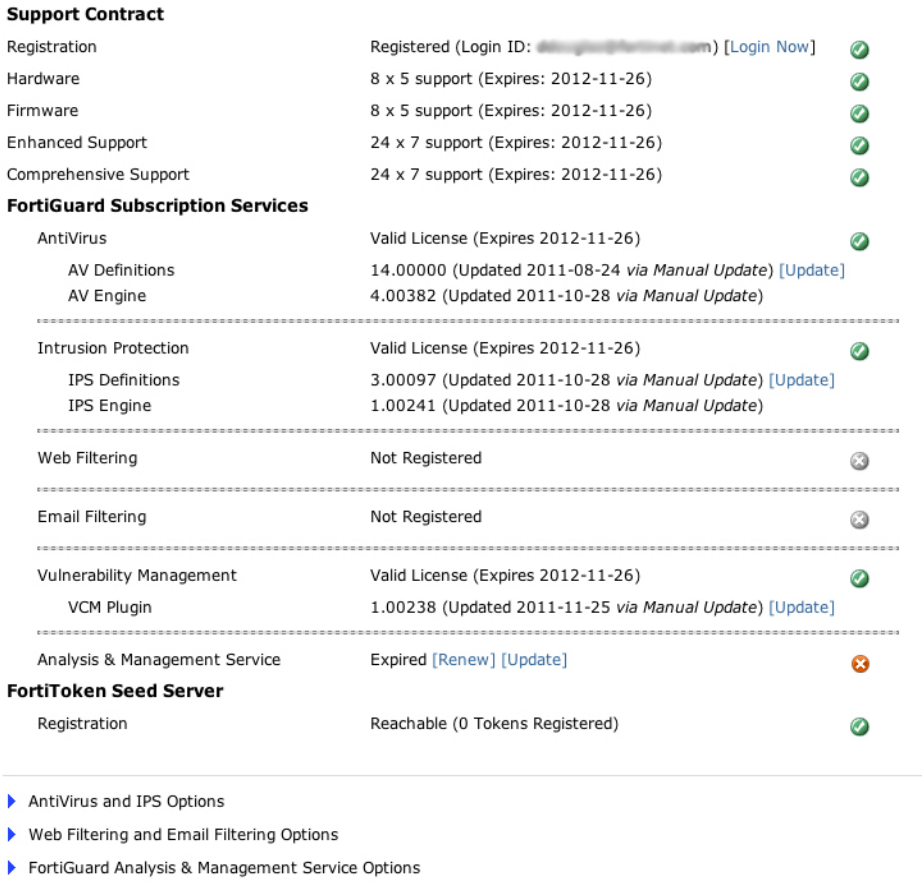
The simplest method to check that the FortiGate unit is communicating with the FDN, is to check the License *Information* dashboard widget. Any subscribed services should have a green check mark beside them indicating that connections are successful. Any other icon indicates a problem with the connection, or you are not subscribed to the FortiGuard services.

Figure 46: License Information widget showing FortiGuard availability



Alternatively, you can view the FortiGuard connection status by going to *System* > *Config* > *FortiGuard*.

Figure 47: FortiGuard availability



CLI verification

You can also use the CLI to see what FortiGuard servers are available to your FortiGate unit. Use the following CLI command to ping the FDN for a connection:

```
ping guard.fortinet.net
```

You can also use diagnose command to find out what FortiGuard servers are available:

```
diagnose debug rating
```

From this command, you will see output similar to the following:

```
Locale       : english
License      : Contract
Expiration   : Sun Jul 24 20:00:00 2011
Hostname     : service.fortiguard.net

--=- Server List (Tue Nov  2 11:12:28 2010) -=-

IP Weight    RTT Flags  TZ    Packets  Curr Lost Total Lost
69.20.236.180 0     10        -5      77200          0          42
69.20.236.179 0     12        -5      52514          0          34
66.117.56.42 0     32        -5      34390          0          62
80.85.69.38 50    164         0      34430          0       11763
208.91.112.194 81    223 D      -8      42530          0       8129
216.156.209.26 286    241 DI     -8      55602          0      21555
```

An extensive list of servers are available. Should you see a list of three to five available servers, the FortiGuard servers are responding to DNS replies to service.FortiGuard.net, but the INIT requests are not reaching FDS services on the servers.

The rating flags indicate the server status:

Table 17: FortiGuard debug rating flags

D	Indicates the server was found via the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them will be flagged with 'D' and will be used first for INIT requests before falling back to the other servers.
I	Indicates the server to which the last INIT request was sent
F	The server has not responded to requests and is considered to have failed.
T	The server is currently being timed.

The server list is sorted first by weight and then the server with the smallest RTT is put at the top of the list, regardless of weight. When a packet is lost, that is, no response in two seconds, it will be resent to the next server in the list. The top position in the list is selected based on RTT while the other list positions are based on weight.

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a faraway server, the weight is not allowed to dip below a base weight which is calculated as the difference in hours between the FortiGate unit and the server multiplied by 10. The further away the server is, the higher its base weight and the lower in the list it will appear.

Port assignment

FortiGate units contact the FortiGuard Distribution Network (FDN) for the latest list of FDN servers by sending UDP packets with typical source ports of 1027 or 1031, and destination ports of 53 or 8888. The FDN reply packets have a destination port of 1027 or 1031.

If your ISP blocks UDP packets in this port range, the FortiGate unit cannot receive the FDN reply packets. As a result, the FortiGate unit will not receive the complete FDN server list.

You can select a different source port range for the FortiGate unit to use. If your ISP blocks the lower range of UDP ports (around 1024), you can configure your FortiGate unit to use higher-numbered ports, using the CLI command…

```
config system global
  set ip-src-port-range <start port>-<end port>
end
```

…where the `<start port>` and `<end port>` are numbers ranging of 1024 to 25000.

For example, you could configure the FortiGate unit to not use ports lower than 2048 or ports higher than the following range:

```
config system global
  set ip-src-port-range 2048-20000
end
```

Trial and error may be required to select the best source port range. You can also contact your ISP to determine the best range to use.

Push updates might be unavailable if:

- there is a NAT device installed between the unit and the FDN
- your unit connects to the Internet using a proxy server.

Monitoring

With network administration, the first step is installing and configuring the FortiGate unit to be the protector of the internal network. Once the system is running efficiently, the next step is to monitor the system and network traffic, to tweak leaks and abusers as well as the overall health of the FortiGate unit(s) that provide that protection.

This chapter discusses the various methods of monitoring both the FortiGate unit and the network traffic through a range of different tools available within FortiOS.

This section includes the topics:

Dashboard

The FortiOS dashboard provides a location to view real-time system information. By default, the dashboard displays the key statistics of the FortiGate unit itself, providing the memory and CPU status, as well as the health of the ports, whether they are up or down and their throughput.

Widgets

Within the dashboard is a number of smaller windows, called widgets, that provide this status information. Beyond what is visible by default, you can add a number of other widgets that display other key traffic information including application use, traffic per IP address, top attacks, traffic history and logging statistics.

You will see when you log into the FortiGate unit, there are two separate dashboards. You can add multiple dashboards to reflect what data you want to monitor, and add the widgets accordingly. Dashboard configuration is only available through the web-based manager. Administrators must have read and write privileges to customize and add widgets when in either menu. Administrators must have read privileges if they want to view the information.

To add a dashboard and widgets

1 Go to *System* > *Dashboard*.

2 Select the *Dashboard* menu at the top of the window and select *Add Dashboard*.

3 Enter a name such as `Monitoring`.

4 Select the *Widget* menu at the top of the window.

5 From the screen, select the type of information you want to add.

6 When done, select the X in the top right of the widget.

Dashboard widgets provide an excellent method to view real-time data about the events occurring on the FortiGate unit and the network. For example, by adding the Network Protocol Usage widget, you can monitor the activity of various protocols over a selected span of time. Based on that information you can add or adjust traffic shaping and/or security policies to control traffic.

You can position widgets within the dashboard frame by clicking and dragging it to a different location.

FortiClient connections

The *License Information* widget includes information for the FortiClient connections. It displays the number of FortiClient connections allowed, and the number of users connecting. By selecting the Details link for the number of connections, you can view more information about the connecting user, including IP address, user name and type of operating system the user is connecting with.

sFlow

sFlow is a method of monitoring the traffic on your network to identify areas on the network that may impact performance and throughput. sFlow is described in http://www.sflow.org. FortiOS implements sFlow version 5. sFlow uses packet sampling to monitor network traffic. That is, an sFlow Agent captures packet information at defined intervals and sends them to an sFlow Collector for analysis, providing real-time data analysis. The information sent is only a sampling of the data for minimal impact on network throughput and performance.

The sFlow Agent is embedded in the FortiGate unit. Once configured, the FortiGate unit sends sFlow datagrams of the sampled traffic to the sFlow Collector, also called an sFlow Analyzer. The sFlow Collector receives the datagrams, and provides real-time analysis and graphing to indicate where potential traffic issues are occurring. sFlow Collector software is available from a number of third party software vendors.

sFlow data captures only a sampling of network traffic, not all traffic like the traffic logs on the FortiGate unit. Sampling works by the sFlow Agent looking at traffic packets when they arrive on an interface. A decision is made whether the packet is dropped, and sent on to its destination, or a copy is forwarded to the sFlow Collector. The sample used and its frequency are determined during configuration.

sFlow is not supported on virtual interfaces such as vdom link, ipsec, ssl.<vdom> or gre.

The sFlow datagram sent to the Collector contains the information:

- Packet header (e.g. MAC,IPv4,IPv6,IPX,AppleTalk,TCP,UDP, ICMP)
- Sample process parameters (rate, pool etc.)
- Input/output ports
- Priority (802.1p and TOS)
- VLAN (802.1Q)

- Source/destination prefix
- Next hop address
- Source AS, Source Peer AS
- Destination AS Path
- Communities, local preference
- User IDs (TACACS/RADIUS) for source/destination
- URL associated with source/destination
- Interface statistics (RFC 1573, RFC 2233, and RFC 2358)

sFlow agents can be added to any type of FortiGate interface. sFlow isn't supported on some virtual interfaces such as VDOM link, IPsec, gre, and ssl.<vdom>.

For more information on sFlow, Collector software and sFlow MIBs, visit www.sflow.org.

Configuration

sFlow configuration is available only from the CLI. Configuration requires two steps: enabling the sFlow Agent, and configuring the interface for the sampling information.

Enable sFlow

```
config system sflow
  set collector-ip <ip_address>
  set collector-port <port_number>
end
```

The default port for sFlow is UDP 6343. To configure in VDOM, use the commands:

```
config system vdom-sflow
  set vdom-sflow enable
  set collector-ip <ip_address>
  set collector-port <port_number>
end
```

Configure sFlow agents per interface.

```
config system interface
  edit <interface_name>
    set sflow-sampler enable
    set sample-rate <every_n_packets>
    set sample-direction [tx | rx | both]
    set polling-interval <seconds>
   end
```

Monitor menus

The *Monitor* menus enable you to view session and policy information and other activity occurring on your FortiGate unit. The monitors provide the details of user activity, traffic and policy usage to show live activity. Monitors are available for DHCP, routing, security policies, traffic shaping, a variety of UTM functionality, VPN, user, WiFi controllers and logging.

Logging

FortiOS provides a robust logging environment that enables you to monitor, store and report traffic information and FortiGate events including attempted log ins and hardware status. Depending on your requirements, you can log to a number of different hosts.

To configure logging in the web-based manager, go to *Log & Report* > *Log Config* > *Log Setting*.

To configure logging in the CLI use the commands `config log <log_location>`.

For details on configuring logging see the *Logging and Reporting Guide* and *FortiAnalyzer Administration Guide*.

FortiGate memory

Logs are saved to the internal memory by default. Inexpensive yet volatile, for basic event logs or verifying traffic, AV or spam patterns, logging to memory is a simple option. However, because logs are stored in the limited space of the internal memory, only a small amount is available for logs. As such logs can fill up and be overridden with new entries, negating the use of recursive data. This is especially true for traffic logs. Also, should the FortiGate unit be shut down or rebooted, all log information will be lost.

To change the logging options for memory, go to *Log&Report* > *Log Config* > *Log Setting*.

FortiGate hard disk

For those FortiGate units with an internal hard disk or SDHC card, you can store logs to this location. Efficient and local, the hard disk provides a convenient storage location. If you choose to store logs in this manner, remember to backup the log data regularly.

Configure log disk settings is performed in the CLI using the commands:

```
config log setting disk
  set status enable
end
```

Further options are available when enabled to configure log file sizes, and uploading/backup events.

As well, note that the write speeds of hard disks compared to the logging of ongoing traffic may cause the dropping of log messages. As such, it is recommended that traffic logging be sent to a FortiAnalyzer or other device meant to handle large volumes of data.

Syslog server

An industry standard for collecting log messages, for off site storage. In the web-based manager, you are able to send logs to a single syslog server, however in the CLI you can configure up to three syslog servers where you can also use multiple configuration options. For example, send traffic logs to one server, antivirus logs to another. The FortiGate unit sends Syslog traffic over UIDP port 514. Note that if a secure tunnel is configured for communication to a FortiAnalyzer unit, then Syslog traffic will be sent over an IPSec connection, using UPD 500/4500, protocol IP/50.

To configure a Syslog server in the web-based manager, go to Log&Report > log Config > Log Setting. In the CLI use the commands:

```
config log syslogd setting
  set status enable
end
```

Further options are available when enabled to configure a different port, facility and server IP address.

For Syslog traffic, you can identify a specific port/IP address for logging traffic. Configuration of these services is performed in the CLI, using the command set `source-ip`. When configured, this becomes the dedicated port to send this traffic over.

For example, to set the source IP of a Syslog server to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config log syslogd setting
  set status enable
  set source-ip 192.168.4.5
end
```

FortiGuard Analysis and Management service

The FortiGuard Analysis and Management Service is a subscription-based hosted service. With this service, you can have centralized management, logging, and reporting capabilities available in FortiAnalyzer and FortiManager platforms, without any additional hardware to purchase, install or maintain.

This service includes a full range of reporting, analysis and logging, firmware management and configuration revision history. It is hosted within the Fortinet global FortiGuard Network for maximum reliability and performance, and includes reporting, and drill-down analysis widgets makes it easy to develop custom views of network and security events.

The FortiGate unit sends log messages to the FortiGuard Analysis and Management service using TCP port 443. Configuration is available once a user account has been set up and confirmed. To enable the account on the FortiGate unit, go to *System* > *Maintenance* > *FortiGuard*, select the blue arrow to expand the option, and enter the account ID.

For FortiGuard Analysis and Management traffic, you can identify a specific port/IP address for logging traffic. Configuration of these services is performed in the CLI, using the command set `source-ip`. When configured, this becomes the dedicated port to send this traffic over.

For example, to set the source IP of the FortiGuard Analysis and Management server to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config log fortiguard setting
  set status enable
  set source-ip 192.168.4.5
end
```

From the FortiGate unit, you can configure the connection and sending of log messages to be sent over an SSL tunnel to ensure log messages are sent securely. To do this, use the CLI commands to enable the encrypted connection and define the level of encryption.

```
config log fortiguard setting
  set status enable
  set enc-alogorithm {default | high | low | disable}
end
```

For more information on each encryption level see “Configuring an SSL connection” on page 427.

FortiAnalyzer

The FortiAnalyzer family of logging, analyzing, and reporting appliances securely aggregate log data from Fortinet devices and other syslog-compatible devices. Using a comprehensive suite of easily-customized reports, users can filter and review records, including traffic, event, virus, attack, Web content, and email data, mining the data to determine your security stance and assure regulatory compliance. FortiAnalyzer also provides advanced security management functions such as quarantined file archiving, event correlation, vulnerability assessments, traffic analysis, and archiving of email, Web access, instant messaging and file transfer content.

The FortiGate unit sends log messages over UDP port 514 or OFTP (TCP 514). If a secure connection has been configured, log traffic is sent over UDP port 500/4500, Protocol IP/50. For more information on configuring a secure connection see "Sending logs using a secure connection" on page 426.

For FortiAnalyzer traffic, you can identify a specific port/IP address for logging traffic. Configuration of these services is performed in the CLI, using the command set `source-ip`. When configured, this becomes the dedicated port to send this traffic over.

For example, to set the source IP of a FortiAnalyzer unit to be on port 3 with an IP of 192.168.21.12, the commands are:

```
config log fortiguard setting
  set status enable
  set source-ip 192.168.21.12
end
```

Sending logs using a secure connection

From the FortiGate unit, you can configure the connection and sending of log messages over an SSL tunnel to ensure log messages are sent securely. To do this, use the CLI commands below to enable the encrypted connection and define the level of encryption.

You must configure the secure tunnel on ***both*** ends of the tunnel, the FortiGate unit and the FortiAnalyzer unit.

This configuration is for FortiAnalyzer OS version 4.0 MR2 or lower. For version 40 MR3, see "Configuring an SSL connection" on page 427.

To configure a secure connection to the FortiAnalyzer unit

On the FortiAnalyzer unit, enter the commands:

```
config log device
  edit <device_name>
    set secure psk
    set psk <name_of_IPSec_tunnel>
    set id <fortigate_device_name_on_the_fortianalyzer>
end
```

To configure a secure connection on the FortiGate unit

On the FortiGate CLI, enter the commands:

```
config log fortianalyzer setting
  set status enable
  set server <ip_address>
  set local
  set localid <name_of_IPSec_tunnel>
end
```

Configuring an SSL connection

With FortiAnalyzer 4.0 MR3 and FortiOS 4.0 MR3, you can configure an SSL connection between the two devices, and select the encryption level.

Use the CLI commands to configure the encryption connection:

```
config log fortianalyzer setting
  set status enable
  set enc-algorithm {default* | high | low | disable}
end
```

These commands are specific to OS versions 4.0 MR3 and higher. IPSec connections will still be possible between FortiOS 4.0 MR3 and FortiAnalyzer 4.0 MR2 and lower.

The default encryption automatically sets high and medium encryption algorithms. Algorithms used for high, medium, and low follows openssl definitions:

- ***High*** - Key lengths larger than 128 bits, and some cipher suites with 128-bit keys.

  Algorithms are: DHE-RSA-AES256-SHA:AES256-SHA:EDH-RSA-DES-CBC3-SHA:DES-CBC3-SHA:DES-CBC3-MD5:DHE-RSA-AES128-SHA:AES128-SHA
- ***Medium*** - Key strengths of 128 bit encryption.

  Algorithm are:RC4-SHA:RC4-MD5:RC4-MD
- ***Low*** - Key strengths of 64 or 56 bit encryption algorithms but excluding export cipher suites

  Algorithms: EDH-RSA-DES-CDBC-SHA; DES-CBC-SHA; DES-CBC-MD5.

If you want to use an IPSec tunnel to connect to the FortiAnalyzer unit, you need to first disable the enc-algorithm:

```
config log fortianalyzer setting
  set status enable
  set enc-algorithm disable
```

Then set the IPSec encryption:

```
  set encrypt enable
  set psksecret <preshared_IPSec_tunnel_key>
end
```

Alert email

As an administrator, you want to be certain you can respond quickly to issues occurring on your network or on the FortiGate unit. Alert email provides an efficient and direct method of notifying an administrator of events. By configuring alert messages, you can define the threshold when a problem becomes critical and needs attention. When this threshold is reached, the FortiGate unit will send an email to one or more individuals notifying them of the issue.

In the following example, the FortiGate unit is configured to send email to two administrators (admin1 and admin2) when multiple intrusions are detected every two minutes. The FortiGate unit has its own email address on the mail server.

To configure alert email - web-based manager

1 Go to *Log&Report* > *Log Config* > *Alert E-mail*.

2 Enter the information:

SMTP Server	Enter the address or name of the email server. For example, `smtp.example.com`.
Email from	fortigate@example.com
Email to	admin1@example.com admin2@example.com
Authentication	Enable authentication if required by the email server.
SMTP User	FortiGate
Password	**********
Interval Time	2

3 For the Interval Time, enter `2`.

4 Select *Intrusion Detected*.

5 Select *Apply*.

To configure alert email - CLI

```
config system alert email
  set port 25
  set server smtp.example.com
  set authenticate enable
  set username FortiGate
  set password *************
end
config alertemail setting
  set username fortigate@example.com
  set mailto1 admin1@example.com
  set mailto2 admin2@example.com
  set filter category
  set IPS-logs enable
end
```

SNMP

Simple Network Management Protocol (SNMP) enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. An SNMP manager, or host, is a typically a computer running an application that can read the incoming trap and event messages from the agent and send out SNMP queries to the SNMP agents. A FortiManager unit can act as an SNMP manager, or host, to one or more FortiGate units. FortiOS supports SNMP using IPv4 and IPv6 addressing.

By using an SNMP manager, you can access SNMP traps and data from any FortiGate interface or VLAN sub interface configured for SNMP management access. Part of configuring an SNMP manager is to list it as a host in a community on the FortiGate unit it will be monitoring. Otherwise the SNMP monitor will not receive any traps from that FortiGate unit, or be able to query that unit.

The FortiGate SNMP implementation is read-only. SNMP v1, v2c, and v3 compliant SNMP managers have read-only access to FortiGate system information through queries and can receive trap messages from the FortiGate unit.

To monitor FortiGate system information and receive FortiGate traps, you must first compile the Fortinet and FortiGate Management Information Base (MIB) files. A MIB is a text file that describes a list of SNMP data objects that are used by the SNMP manager. These MIBs provide information the SNMP manager needs to interpret the SNMP trap, event, and query messages sent by the FortiGate unit SNMP agent. FortiGate core MIB files are available on the Customer Support web site.

The Fortinet implementation of SNMP includes support for most of RFC 2665 (Ethernet-like MIB) and most of RFC 1213 (MIB II). For more information, see "Fortinet MIBs" on page 434. RFC support for SNMP v3 includes Architecture for SNMP Frameworks (RFC 3411), and partial support of User-based Security Model (RFC 3414).

SNMP traps alert you to events that occur such as an a full log disk or a virus detected. For more information about SNMP traps, see "Fortinet and FortiGate traps" on page 436.

SNMP fields contain information about the FortiGate unit, such as CPU usage percentage or the number of sessions. This information is useful for monitoring the condition of the unit on an ongoing basis and to provide more information when a trap occurs. For more information about SNMP fields, see "Fortinet and FortiGate MIB fields" on page 441.

The FortiGate SNMP v3 implementation includes support for queries, traps, authentication, and privacy. Authentication and encryption are configured in the CLI. See the `system snmp user` command in the *FortiGate CLI Reference*.

SNMP configuration settings

Before a remote SNMP manager can connect to the FortiGate agent, you must configure one or more FortiGate interfaces to accept SNMP connections by going to *System* > *Network* > *Interface*. Select the interface, and in the *Administrative Access*, select *SNMP*.

When the FortiGate unit is in virtual domain mode, SNMP traps can only be sent on interfaces in the management virtual domain. Traps cannot be sent over other interfaces.

IPv6 is supported for SNMP configuration on FortiGate units running FortiOS 4.0 MR3.

To configure SNMP settings, go to *System* > *Config* > *SNMP*.

SNMP Agent	Select to enable SNMP communication.
Description	Enter descriptive information about the FortiGate unit. The description can be up to 35 characters.
Location	Enter the physical location of the FortiGate unit. The system location description can be up to 35 characters long.
Contact	Enter the contact information for the person responsible for this FortiGate unit. The contact information can be up to 35 characters.
SNMP v1/v2c section To create a new SNMP community, see New SNMP Community page.	
Community Name	The name to identify the community.

Queries	Indicates whether queries protocols (v1 and v2c) are enabled or disabled. A green checkmark indicates queries are enabled; a gray x indicates queries are disabled. If one query is disabled and another one enabled, there will still be a green checkmark.
Traps	Indicates whether trap protocols (v1 and v2c) are enabled or disabled. A green checkmark indicates traps are enabled; a gray x indicates traps are disabled. If one query is disabled and another one enabled, there will still be a green checkmark.
Enable	Select the check box to enable or disable the community.
SNMP v3 section To create a new SNMP community, see Create New SNMP V3 User.	
User Name	The name of the SNMPv3 user.
Security Level	The security level of the user.
Notification Host	The IP address or addresses of the host.
Queries	Indicates whether queries are enabled or disabled. A green checkmark indicates queries are enabled; a gray x indicates queries are disabled.
New SNMP Community page	
Community Name	Enter a name to identify the SNMP community.
Hosts (section)	
IP Address	Enter the IP address and Identify the SNMP managers that can use the settings in this SNMP community to monitor the FortiGate unit. You can also set the IP address to 0.0.0.0 to so that any SNMP manager can use this SNMP community.
Interface	Optionally select the name of the interface that this SNMP manager uses to connect to the FortiGate unit. You only have to select the interface if the SNMP manager is not on the same subnet as the FortiGate unit. This can occur if the SNMP manager is on the Internet or behind a router. In virtual domain mode, the interface must belong to the management VDOM to be able to pass SNMP traps.
Delete	Removes an SNMP manager from the list within the *Hosts* section.
Add	Select to add a blank line to the Hosts list. You can add up to eight SNMP managers to a single community.
Queries (section)	
Protocol	The SNMP protocol. In the v1 row, this means that the settings are for SNMP v1. In the v2c row, this means that the settings are for SNMP v2c.

Port	Enter the port number (161 by default) that the SNMP managers in this community use for SNMP v1 and SNMP v2c queries to receive configuration information from the FortiGate unit. Select the *Enable* check box to activate queries for each SNMP version. **Note:** The SNMP client software and the FortiGate unit must use the same port for queries.
Enable	Select to enable that SNMP protocol
Traps (section)	
Protocol	The SNMP protocol. In the v1 row, this means that the settings are for SNMP v1. In the v2c row, this means that the settings are for SNMP v2c.
Local	Enter the remote port numbers (port 162 for each by default) that the FortiGate unit uses to send SNMP v1 or SNMP v2c traps to the SNMP managers in this community. Select the *Enable* check box to activate traps for each SNMP version. **Note:** The SNMP client software and the FortiGate unit must use the same port for traps.
Remote	Enter the remote port number (port 162 is default) that the FortiGate unit uses to send SNMP v1 or v2c traps to the SNMP managers in this community. **Note:** The SNMP client software and the FortiGate unit must use the same port for queries.
Enable	Select to activate traps for each SNMP version.
SNMP Event	Enable each SNMP event for which the FortiGate unit should send traps to the SNMP managers in this community. *CPU Overusage* traps sensitivity is slightly reduced, by spreading values out over 8 polling cycles. This prevents sharp spikes due to CPU intensive short-term events such as changing a policy. *Power Supply Failure* event trap is available only on some models. *AMC interfaces enter bypass mode* event trap is available only on models that support AMC modules.
Enable	Select to enable the SNMP event.
Create New SNMP V3 User	
User Name	Enter the name of the user.
Security Level	Select the type of security level the user will have.
Notification Host	Enter the IP address of the notification host. If you want to add more than one host, after entering the IP address of the first host, select the plus sign to add another host.
Enable Query	Select to enable or disable the query. By default, the query is enabled.
Port	Enter the port number in the field.
Events	Select the SNMP events that will be associated with that user.

Gigabit interfaces

When determining the interface speed of a FortiGate unit with a 10G interface, the IF-MIB.ifSpeed may not return the correct value. IF-MIB.ifSpeed is a 32-bit gauge used to report interface speeds in bits/second, and cannot convert to a 64-bit value. The 32-bit counter wrap the output too fast to be accurate.

In this case, you can use the value ifHighSpeed. It reports interface speeds in megabits/second. This ensures that 10Gb interfaces report the correct value.

SNMP agent

You need to first enter information and enable the FortiGate SNMP Agent. Enter information about the FortiGate unit to identify it so that when your SNMP manager receives traps from the FortiGate unit, you will know which unit sent the information.

To configure the SNMP agent - web-based manager

1 Go to *System* > *Config* > *SNMP*.
2 Select *Enable* for the *SNMP Agent*.
3 Enter a descriptive name for the agent.
4 Enter the location of the FortiGate unit.
5 Enter a contact or administrator for the SNMP Agent or FortiGate unit.
6 Select *Apply*.

To configure SNMP agent - CLI

```
config system snmp sysinfo
  set status enable
  set contact-info <contact_information>
  set description <description_of_FortiGate>
  set location <FortiGate_location>
end
```

SNMP community

An SNMP community is a grouping of devices for network administration purposes. Within that SNMP community, devices can communicate by sending and receiving traps and other information. One device can belong to multiple communities, such as one administrator terminal monitoring both a firewall SNMP and a printer SNMP community.

Add SNMP communities to your FortiGate unit so that SNMP managers can connect to view system information and receive SNMP traps.

You can add up to three SNMP communities. Each community can have a different configuration for SNMP queries and traps. Each community can be configured to monitor the FortiGate unit for a different set of events. You can also add the IP addresses of up to 8 SNMP managers to each community.

To add an SNMP v1/v2c community - web-based manager

When the FortiGate unit is in virtual domain mode, SNMP traps can only be sent on interfaces in the management virtual domain. Traps cannot be sent over other interfaces.

1 Go to System > Config > *SNMP.*
2 In the *SNMP v1/v2c* area, select *Create New*.

3 Enter a *Community Name*.

4 Enter the IP address and Identify the SNMP managers that can use the settings in this SNMP community to monitor the FortiGate unit.

5 Select the interface if the SNMP manager is not on the same subnet as the FortiGate unit.

6 Enter the *Port* number that the SNMP managers in this community use for SNMP v1 and SNMP v2c queries to receive configuration information from the FortiGate unit. Select the *Enable* check box to activate queries for each SNMP version.

7 Enter the Local and Remote port numbers that the FortiGate unit uses to send SNMP v1 and SNMP v2c traps to the SNMP managers in this community.

8 Select the *Enable* check box to activate traps for each SNMP version.

9 Select *OK*.

To add an SNMP v1/v2c community - CLI

```
config system snmp community
  edit <index_number>
    set events <events_list>
    set name <community_name>
    set query-v1-port <port_number>
    set query-v1-status {enable | disable}
    set query-v2c-port <port_number>
    set query-v2c-status {enable | disable}
    set status {enable | disable}
    set trap-v1-lport <port_number>
    set trap-v1-rport <port_number>
    set trap-v1-status {enable | disable}
    set trap-v2c-lport <port_number>
    set trap-v2c-rport <port_number>
    set trap-v2c-status {enable | disable}
end
```

To add an SNMP v3 community - web-based manager

1 Go to System > Config > *SNMP.*

2 In the *SNMP v3* area, select *Create New*.

3 Enter a *User Name*.

4 Select a *Security Level* and associated authorization algorithms.

5 Enter the IP address of the *Notification Host* SNMP managers that can use the settings in this SNMP community to monitor the FortiGate unit.

6 Enter the *Port* number that the SNMP managers in this community use to receive configuration information from the FortiGate unit. Select the *Enable* check box to activate queries for each SNMP version.

7 Select the *Enable* check box to activate traps.

8 Select *OK*.

To add an SNMP v3 community - CLI

```
config system snmp user
  edit <index_number>
    set security-level [auth-priv | auth-no-priv | no-auth-no-
       priv}
```

```
    set queries enable
    set query-port <port_number>
    set notify-hosts <ip_address>
    set events <event_selections>
end
```

Enabling on the interface

Before a remote SNMP manager can connect to the FortiGate agent, you must configure one or more FortiGate interfaces to accept SNMP connections.

To configure SNMP access - web-based manager

1. Go to *System* > *Network* > *Interface*.
2. Choose an interface that an SNMP manager connects to and select *Edit*.
3. In *Administrative Access*, select *SNMP*.
4. Select *OK*.

To configure SNMP access - CLI

```
config system interface
  edit <interface_name>
    set allowaccess snmp
end
```

When using the allowaccess command to add SNMP, you need to also include any other access for the interface. This command will only use what is entered. That is, if you had HTTPS and SSH enabled before, these will be disabled if only the above command is used. In this case, for the allow access command, enter `set allowaccess https ssh snmp`.

Fortinet MIBs

The FortiGate SNMP agent supports Fortinet proprietary MIBs as well as standard RFC 1213 and RFC 2665 MIBs. RFC support includes support for the parts of RFC 2665 (Ethernet-like MIB) and the parts of RFC 1213 (MIB II) that apply to FortiGate unit configuration.

There are two MIB files for FortiGate units - the Fortinet MIB, and the FortiGate MIB. The Fortinet MIB contains traps, fields and information that is common to all Fortinet products. The FortiGate MIB contains traps, fields and information that is specific to FortiGate units. Each Fortinet product has its own MIB. If you use other Fortinet products you will need to download their MIB files as well. Both MIB files are used for FortiOS and FortiOS Carrier; there are no additional traps for the Carrier version of the operating system.

The Fortinet MIB and FortiGate MIB along with the two RFC MIBs are listed in tables in this section. You can download the two FortiGate MIB files from Fortinet Customer Support. The Fortinet MIB contains information for Fortinet products in general. the Fortinet FortiGate MIB includes the system information for The FortiGate unit and version of FortiOS. Both files are required for proper SNMP data collection.

To download the MIB files

1. Login to the Customer Support web site at support.fortinet.com.
2. Go to *Download* > *Firmware Images*.
3. Select *FortiGate* > *v4.00* > *Core MIB*.

4 Select and download the Fortinet core MIB file.

5 Move up one directory level.

6 Select the firmware version, revision and patch (if applicable).

7 Select the *MIB* directory.

8 Select and download the Fortinet FortiGate MIB file.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIB to this database to have access to the Fortinet specific information.

There were major changes to the MIB files between v3.0 and v4.0. You need to use the new MIBs for v4.0 or you may mistakenly access the wrong traps and fields.

MIB files are updated for each version of FortiOS. When upgrading the firmware ensure that you updated the Fortinet FortiGate MIB file as well

Table 18: Fortinet MIBs

MIB file name or RFC	Description
FORTINET-CORE-MIB.mib	The Fortinet MIB includes all system configuration information and trap information that is common to all Fortinet products. Your SNMP manager requires this information to monitor FortiGate unit configuration settings and receive traps from the FortiGate SNMP agent. For more information, see “Fortinet and FortiGate traps” on page 436 and “Fortinet and FortiGate MIB fields” on page 441.
FORTINET-FORTIGATE-MIB.mib	The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units. Your SNMP manager requires this information to monitor FortiGate configuration settings and receive traps from the FortiGate SNMP agent. FortiManager systems require this MIB to monitor FortiGate units. For more information, see “Fortinet and FortiGate traps” on page 436 and “Fortinet and FortiGate MIB fields” on page 441.
RFC-1213 (MIB II)	The FortiGate SNMP agent supports MIB II groups with these exceptions. • No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10). • Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all FortiGate traffic activity. More accurate information can be obtained from the information reported by the Fortinet MIB.
RFC-2665 (Ethernet-like MIB)	The FortiGate SNMP agent supports Ethernet-like MIB information. FortiGate SNMP does not support for the dot3Tests and dot3Errors groups.

SNMP get command syntax

Normally, to get configuration and status information for a FortiGate unit, an SNMP manager would use an SNMP get commands to get the information in a MIB field. The SNMP get command syntax would be similar to:

```
snmpget -v2c -c <community_name> <address_ipv4> {<OID> |
   <MIB_field>}
```

…where…

`<community_name>` is an SNMP community name added to the FortiGate configuration. You can add more than one community name to a FortiGate SNMP configuration. The most commonly used community name is `public`.

`<address_ipv4>` is the IP address of the FortiGate interface that the SNMP manager connects to.

`{<OID> | <MIB_field>}` is the object identifier (OID) for the MIB field or the MIB field name itself.

The SNMP `get` command gets firmware version running on the FortiGate unit. The community name is `public`. The IP address of the interface configured for SNMP management access is `10.10.10.1`. The firmware version MIB field is `fgSysVersion` and the OID for this MIB field is `1.3.6.1.4.1.12356.101.4.1.1` The first command uses the MIB field name and the second uses the OID:

```
snmpget -v2c -c public 10.10.10.1 fgSysVersion
snmpget -v2c -c public 10.10.10.1 1.3.6.1.4.1.12356.101.4.1.1
```

Fortinet and FortiGate traps

An SNMP manager can request information from the Fortinet device's SNMP agent, or that agent can send traps when an event occurs. Traps are a method used to inform the SNMP manager that something has happened or changed on the Fortinet device.

To receive FortiGate device SNMP traps, you must load and compile the `FORTINET-CORE-MIB` and `FORTINET-FORTIGATE-MIB` files into your SNMP manager. Traps sent include the trap message as well as the FortiGate unit serial number (`fnSysSerial`) and hostname (`sysName`).

The tables in this section include information about SNMP traps and variables. These tables have been included to help you locate the object identifier number (OID), trap message, and trap description of the Fortinet trap or variable you need.

The name of the table indicates if the trap is found in the Fortinet MIB or the FortiGate MIB. The Trap Message column includes the message included with the trap as well as the SNMP MIB field name to help locate the information about the trap. Traps starting with `fn` such as `fnTrapCpuThreshold` are defined in the Fortinet MIB. Traps starting with `fg` such as `fgTrapAvVirus` are defined in the FortiGate MIB.

The object identifier (OID) is made up of the number at the top of the table with the index added to the end. For example if the OID is 1.3.6.1.4.1.12356.101.2.0 and the index is 4, the full OID is 1.3.6.1.4.1.12356.101.2.0.4. The OID and the name of the object are how SNMP managers refer to fields and traps from the Fortinet and FortiGate MIBs.

Indented rows are fields that are part of the message or table associated with the preceding row.

The tables include:

- Generic Fortinet traps (OID 1.3.6.1.4.1.12356.101.3.0)
- System traps (OID1.3.6.1.4.1.12356.1.3.0)

- FortiGate VPN traps (OID1.3.6.1.4.1.12356.1.3.0)
- FortiGate IPS traps (OID1.3.6.1.4.1.12356.1.3.0)
- FortiGate antivirus traps (OID1.3.6.1.4.1.12356.1.3.0)

- FortiGate HA traps (OID1.3.6.1.4.1.12356.1.3.0)

Table 19: Generic Fortinet traps (OID 1.3.6.1.4.1.12356.101.3.0)

Index	Trap message	Description
.1 .2 .3 .4	ColdStart WarmStart LinkUp LinkDown	Standard traps as described in RFC 1215.

Table 20: System traps (OID1.3.6.1.4.1.12356.1.3.0)

Index	Trap message	Description
.101	CPU usage high (fnTrapCpuThreshold)	CPU usage exceeds 80%. This threshold can be set in the CLI using `config system snmp sysinfo, set trap-high-cpu-threshold`.
.102	Memory low (fnTrapMemThreshold)	Memory usage exceeds 90%. This threshold can be set in the CLI using `config system snmp sysinfo, set trap-low-memory-threshold`.
.103	Log disk too full (fnTrapLogDiskThreshold)	Log disk usage has exceeded the configured threshold. Only available on devices with log disks. This threshold can be set in the CLI using `config system snmp sysinfo, set trap-log-full-threshold`.
.104	Temperature too high (fnTrapTempHigh)	A temperature sensor on the device has exceeded its threshold. Not all devices have thermal sensors. See manual for specifications.
.105	Voltage outside acceptable range (fnTrapVoltageOutOfRange)	Power levels have fluctuated outside of normal levels. Not all devices have voltage monitoring instrumentation.
.106	Power supply failure (fnTrapPowerSupplyFailure)	Power supply failure detected. Not available on all models. Available on some devices which support redundant power supplies.
.201	Interface IP change (fnTrapIpChange)	The IP address for an interface has changed. The trap message includes the name of the interface, the new IP address and the serial number of the Fortinet unit. You can use this trap to track interface IP address changes for interfaces with dynamic IP addresses set using DHCP or PPPoE.
.999	Diagnostic trap (fnTrapTest)	This trap is sent for diagnostic purposes. It has an OID index of `.999`.

Table 21: FortiGate VPN traps (OID1.3.6.1.4.1.12356.1.3.0)

Index	Trap message	Description
.301	VPN tunnel is up (fgTrapVpnTunUp)	An IPSec VPN tunnel has started.
.302	VPN tunnel down (fgTrapVpnTunDown)	An IPSec VPN tunnel has shut down.

Table 21: FortiGate VPN traps (OID1.3.6.1.4.1.12356.1.3.0)

Index	Trap message	Description
	Local gateway address (fgVpnTrapLocalGateway)	Address of the local side of the VPN tunnel. This information is associated with both of the VPN tunnel traps. (OID1.3.6.1.4.1.12356.101.12.3.2)
	Remote gateway address (fgVpnTrapRemoteGateway)	Address of remote side of the VPN tunnel. This information is associated with both of the VPN tunnel traps. (OID1.3.6.1.4.1.12356.101.12.3.2)

Table 22: FortiGate IPS traps (OID1.3.6.1.4.1.12356.1.3.0)

Index	Trap message	Description
.503	IPS Signature (fgTrapIpsSignature)	IPS signature detected.
.504	IPS Anomaly (fgTrapIpsAnomaly)	IPS anomaly detected.
.505	IPS Package Update (fgTrapIpsPkgUpdate)	The IPS signature database has been updated.
	(fgIpsTrapSigId)	ID of IPS signature identified in trap. (OID 1.3.6.1.4.1.12356.101.9.3.1)
	(fgIpsTrapSrcIp)	IP Address of the IPS signature trigger. (OID 1.3.6.1.4.1.12356.101.9.3.2)
	(fgIpsTrapSigMsg)	Message associated with IPS event. (OID 1.3.6.1.4.1.12356.101.9.3.3)

Table 23: FortiGate antivirus traps (OID1.3.6.1.4.1.12356.1.3.0)

Index	Trap message	Description
.601	Virus detected (fgTrapAvVirus)	The antivirus engine detected a virus in an infected file from an HTTP or FTP download or from an email message.
.602	Oversize file/email detected (fgTrapAvOversize)	The antivirus scanner detected an oversized file.
.603	Filename block detected (fgTrapAvPattern)	The antivirus scanner blocked a file that matched a known virus pattern.
.604	Fragmented file detected (fgTrapAvFragmented)	The antivirus scanner detected a fragmented file or attachment.
.605	(fgTrapAvEnterConserve)	The AV engine entered conservation mode due to low memory conditions.
.606	(fgTrapAvBypass)	The AV scanner has been bypassed due to conservation mode.
.607	(fgTrapAvOversizePass)	An oversized file has been detected, but has been passed due to configuration.
.608	(fgTrapAvOversizeBlock)	An oversized file has been detected, and has been blocked.
	(fgAvTrapVirName)	The virus name that triggered the event. (OID1.3.6.1.4.1.12356.101.8.3.1)

Table 24: FortiGate HA traps (OID1.3.6.1.4.1.12356.1.3.0)

Index	Trap message	Description
.401	HA switch (fgTrapHaSwitch)	The specified cluster member has switched from a slave role to a master role.
.402	HA State Change (fgTrapHaStateChange)	The trap sent when the HA cluster member changes its state.

Table 24: FortiGate HA traps (OID1.3.6.1.4.1.12356.1.3.0)

Index	Trap message	Description
.403	HA Heartbeat Failure (fgTrapHaHBFail)	The heartbeat failure count has exceeded the configured threshold.
.404	HA Member Unavailable (fgTrapHaMemberDown)	An HA member becomes unavailable to the cluster.
.405	HA Member Available (fgTrapHaMemberUp)	An HA member becomes available to the cluster.
	(fgHaTrapMemberSerial)	Serial number of an HA cluster member. Used to identify the origin of a trap when a cluster is configured. (OID1.3.6.1.4.1.12356.101.13.3.1)

Fortinet and FortiGate MIB fields

The FortiGate MIB contains fields reporting the current FortiGate unit status information. The following tables list the names of the MIB fields and describe the status information available for each one. You can view more details about the information available from all Fortinet and FortiGate MIB fields by compiling the `FORTINET-CORE-MIB.mib` and `FORTINET-FORTIGATE-MIB.mib` files into your SNMP manager and browsing the MIB fields on your computer.

To help locate a field, the object identifier (OID) number for each table of fields has been included. The OID number for a field is that field's position within the table, starting at 0. For example `fnSysVersion` has an OID of 1.3.6.1.4.1.12356.2.

Fortinet MIB

Table 25: OIDs for the Fortinet-Core-MIB

MIB Field	OID	Description
fnSystem	1.3.6.1.4.1.12356.100.1.1	
fnSysSerial	1.3.6.1.4.1.12356.100.1.1.1	Device serial number. This is the same serial number as given in the ENTITY-MIB tables for the base entity.
fnMgmt	.3.6.1.4.1.12356.100.1.2	
fnMgmtLanguage	1.3.6.1.4.1.12356.100.1.2.1	Language used for administration interfaces.
fnAdmin	1.3.6.1.4.1.12356.100.1.2.100	
fnAdminNumber	1.3.6.1.4.1.12356.100.1.2.100.1	The number of admin accounts in fnAdminTable.
fnAdminTable	1.3.6.1.4.1.12356.100.1.2.100.2	A table of administrator accounts on the device. This table is intended to be extended with platform specific information.
fnAdminEntry	1.3.6.1.4.1.12356.100.1.2.100.2.1	An entry containing information applicable to a particular admin account.

Table 25: OIDs for the Fortinet-Core-MIB

MIB Field	OID	Description
fnAdminIndex	1.3.6.1.4.1.12356.100.1.2.100.2.1.1	An index uniquely defining an administrator account within the fnAdminTable.
fmAdminName	1.3.6.1.4.1.12356.100.1.2.100.2.1.2	The user-name of the specified administrator account.
fnAddminAddrType	1.3.6.1.4.1.12356.100.1.2.100.2.1.3	The type of address stored in fnAdminAddr, in compliance with INET-ADDRESS-MIB
fnAdminAddr	1.3.6.1.4.1.12356.100.1.2.100.2.1.4	The address prefix identifying where the administrator account can be used from, typically an IPv4 address. The address type/format is determined by fnAdminAddrType.
fnAdminMask	1.3.6.1.4.1.12356.100.1.2.100.2.1.5	The address prefix length (or network mask) applied to the fgAdminAddr to determine the subnet or host the administrator can access the device from.
fnTraps	1.3.6.1.4.1.12356.100.1.3	
fnTrapsPrefix	1.3.6.1.4.1.12356.100.1.3.0	
fnTrapCpuThreshold	1.3.6.1.4.1.12356.100.1.3.0.101	Indicates that the CPU usage has exceeded the configured threshold.
fnTrapMemThreshold	1.3.6.1.4.1.12356.100.1.3.0.102	Indicates memory usage has exceeded the configured threshold.
fnTrapLogDiskThreshold	1.3.6.1.4.1.12356.100.1.3.0.103	Log disk usage has exceeded the configured threshold. Only available on devices with log disks.
fnTrapTempHigh	1.3.6.1.4.1.12356.100.1.3.0.104	A temperature sensor on the device has exceeded its threshold. Not all devices have thermal sensors. See manual for specifications.
fnTrapVoltageOutOfRange	1.3.6.1.4.1.12356.100.1.3.0.105	Power levels have fluctuated outside of normal levels. Not all devices have voltage monitoring instrumentation.

Table 25: OIDs for the Fortinet-Core-MIB

MIB Field	OID	Description
fnTrapPowerSupplyFailure	1.3.6.1.4.1.12356.100.1.3.0.106	Power supply failure detected. Not available on all models. Available on some devices which support redundant power supplies. See manual for specifications.
fnTrapIpChange	1.3.6.1.4.1.12356.100.1.3.0.201	Indicates that the IP address of the specified interface has been changed.
fnTrapTest	1.3.6.1.4.1.12356.100.1.3.0.999	Trap sent for diagnostic purposes by an administrator.
fnTrapObjects	1.3.6.1.4.1.12356.100.1.3.1	
fnGenTrapMsg	1.3.6.1.4.1.12356.100.1.3.1.1	Generic message associated with an event. The content will depend on the nature of the trap.
fnMIBConformance	1.3.6.1.4.1.12356.100.10	
fnSystemComplianceGroup	1.3.6.1.4.1.12356.100.10.1	Objects relating to the physical device.
fnMgmtComplianceGroup	1.3.6.1.4.1.12356.100.10.2	Objects relating the management of a device.
fnAdmincomplianceGroup	1.3.6.1.4.1.12356.100.10.3	Administration access control objects.
fnTrapsComplianceGroup	1.3.6.1.4.1.12356.100.10.4	Event notifications.
fnNotifObjectsCompliance Group	1.3.6.1.4.1.12356.100.10.5	Object identifiers used in notifications.
fnMIBCompliance	1.3.6.1.4.1.12356.100.10.100	Object identifiers used in notifications. Objects are required if their containing trap is implemented.

FortiGate MIB

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgModel	1.3.6.1.4.1.12356.101.1	
fgTraps	1.3.6.1.4.1.12356.101.2	
fgTrapPrefix	1.3.6.1.4.1.12356.101.2.0	
fgTrapVpnTunup	1.3.6.1.4.1.12356.101.2.0.301	Indicates that the specified VPN tunnel has been brought up.
fgTrapVpnTunDown	1.3.6.1.4.1.12356.101.2.0.302	The specified VPN tunnel has been brought down.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgTrapHaSwitch	1.3.6.1.4.1.12356.101.2.0.401	The specified cluster member has transitioned from a slave role to a master role.
fgTrapHaStateChange	1.3.6.1.4.1.12356.101.2.0.402	Trap being sent when the HA cluster member changes its state.
fgTrapHaBFail	1.3.6.1.4.1.12356.101.2.0.403	The heartbeat device failure count has exceeded the configured threshold.
fgTrapHaMemberDown	1.3.6.1.4.1.12356.101.2.0.404	The specified device (by serial number) is moving to a down state.
fgTrapHaMemberUp	1.3.6.1.4.1.12356.101.2.0.405	A new cluster member has joined the cluster.
fgTrapIpsSignature	1.3.6.1.4.1.12356.101.2.0.503	An IPS signature has been triggered.
fgTrapIpsAnomaly	1.3.6.1.4.1.12356.101.2.0.504	An IPS anomaly has been detected.
fgTrapIpsPkgUpdate	1.3.6.1.4.1.12356.101.2.0.505	The IPS signature database has been updated.
fgTrapAvVirus	1.3.6.1.4.1.12356.101.2.0.601	A virus has been detected by the antivirus engine.
fgTrapAvOversize	1.3.6.1.4.1.12356.101.2.0.602	An oversized file has been detected by the antivirus engine.
fgTrapAvPattern	1.3.6.1.4.1.12356.101.2.0.603	The antivirus engine has blocked a file because it matched a configured pattern.
fgTrapAvFragmented	1.3.6.1.4.1.12356.101.2.0.604	The antivirus engine has detected a fragmented file.
fgTrapAvEnterConserve	1.3.6.1.4.1.12356.101.2.0.605	The antivirus engine has entered conservation mode due to low memory conditions.
fgTrapAvBypass	1.3.6.1.4.1.12356.101.2.0.606	The antivirus engine has been bypassed due to conservation mode.
fgTrapAvOversizePass	1.3.6.1.4.1.12356.101.2.0.607	An oversized file has been detected, but has been passed due to configuration.
fgTrapAvOversizeBlock	1.3.6.1.4.1.12356.101.2.0.608	An oversized file has been detected and has been blocked.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgTrapFazDisconnect	1.3.6.1.4.1.12356.101.2.0.701	The device has been disconnected from the FortiAnalyzer.
Virtual Domains		
fgVirtualDomain	1.3.6.1.4.1.12356.101.3	
fgVdInfo	1.3.6.1.4.1.12356.101.3.1	
fgVdNumber	1.3.6.1.4.1.12356.101.3.1.1	The number of virtual domains in vdTable.
fgVdMaxVdoms	1.3.6.1.4.1.12356.101.3.1.2	The maximum number of virtual domains allowed on the device as allowed by hardware and/or licensing.
fgVdEnabled	1.3.6.1.4.1.12356.101.3.1.3	Whether virtual domains are enabled on this device.
fgVdTables	1.3.6.1.4.1.12356.101.3.2	
fgVdTable	1.3.6.1.4.1.12356.101.3.2.1	
fgVdEntry	1.3.6.1.4.1.12356.101.3.2.1.1	An entry containing information applicable to a particular virtual domain.
fgVdEntIndex	1.3.6.1.4.1.12356.101.3.2.1.1.1	Internal virtual domain index used to uniquely identify rows in this table. This index is also used by other tables referencing a virtual domain.
fgVdEntName	1.3.6.1.4.1.12356.101.3.2.1.1.2	The name of the virtual domain.
fgVdEntOpMode	1.3.6.1.4.1.12356.101.3.2.1.1.3	Operation mode of the virtual domain (NAT or transparent).
fgVdTpTable	1.3.6.1.4.1.12356.101.3.2.2	A table of virtual domains in transparent operation mode. This table has a dependent relationship with fgVdTable.
fgVdTpEntry	1.3.6.1.4.1.12356.101.3.2.2.1	An entry containing information applicable to a particular virtual domain in transparent mode.
fgVdTpMgmtAddrType	1.3.6.1.4.1.12356.101.3.2.2.1.1	The type of address stored in fgVdTpMgmtAddr, in compliance with INET-ADDRESS-MIB.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgVdTpMgmtAddr	1.3.6.1.4.1.12356.101.3.2.2.1.2	The management IP address of the virtual domain in transparent mode, typically an IPv4 address.The address type/format is determined by fgVdTpMgmtAddrType.
fgVdTpMgmtMask	1.3.6.1.4.1.12356.101.3.2.2.1.3	The address prefix length (or network mask) applied to the fgVdTpMgmtAddr.
System		
fgSystem	1.3.6.1.4.1.12356.101.4	
fgSystemInfo	1.3.6.1.4.1.12356.101.4.1	
fgSysVersion	1.3.6.1.4.1.12356.101.4.1.1	Firmware version.
fgSysMgmtVdom	1.3.6.1.4.1.12356.101.4.1.2	Index that identifies the management virtual domain. This index corresponds to the index used by fgVdTable.
fgSysCpuUsage	1.3.6.1.4.1.12356.101.4.1.3	Current CPU usage (percentage).
fgSysMemUsage	1.3.6.1.4.1.12356.101.4.1.4	Current memory usage (percentage).
fgSysMemCapacity	1.3.6.1.4.1.12356.101.4.1.5	Total physical RA installed (KB)
fgSysDiskUsage	1.3.6.1.4.1.12356.101.4.1.6	Current hard disk usage (MB), if disk is present.
fgSysDiskCapacity	1.3.6.1.4.1.12356.101.4.1.7	Total hard disk capacity (MB), if disk is present.
fgSysSesCount	1.3.6.1.4.1.12356.101.4.1.8	Number of active sessions on the device.
fgSysLowMemUsage	1.3.6.1.4.1.12356.101.4.1.9	Current lowmem utilization (percentage). Lowmem is memory available for the kernel's own data structures and kernel specific tables. The system can get into a bad state if it runs out of lowmem.
fgSysLowMemCapacity	1.3.6.1.4.1.12356.101.4.1.10	Total lowmem capacity (KB).
Firewall		
fgFirewal	1.3.6.1.4.1.12356.101.5	
fgFwPolicies	1.3.6.1.4.1.12356.101.5.1	
fgFwPolInfo	1.3.6.1.4.1.12356.101.5.1.1	
fgFwPolTables	1.3.6.1.4.1.12356.101.5.1.2	

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgFwPolStatsTable	1.3.6.1.4.1.12356.101.5.1.2.1	Security policy statistics table. This table has a dependent expansion relationship with fgVdTable. Only virtual domains with enabled policies are present in this table.
fgFwPolStatsEntry	1.3.6.1.4.1.12356.101.5.1.2.1.1	Security policy statistics on a virtual domain.
fgFwPolID	1.3.6.1.4.1.12356.101.5.1.2.1.1.1	Security policy ID. Only enabled policies are present in this table. Policy IDs are only unique within a virtual domain.
fgFwPolPktCount	1.3.6.1.4.1.12356.101.5.1.2.1.1.2	Number of packets matched to policy (passed or blocked, depending on policy action). Count is from the time the policy became active.
fgFwPolByteCount	1.3.6.1.4.1.12356.101.5.1.2.1.1.3	Number of bytes in packets matching the policy. See fgFwPolPktCount.
fgFwUsers	1.3.6.1.4.1.12356.101.5.2	
fgFwUserInfo	1.3.6.1.4.1.12356.101.5.2.1	
fgFwUserNumber	1.3.6.1.4.1.12356.101.5.2.1.1	The number of user accounts in fgFwUserTable.
fgFwUserAuthTimeout	1.3.6.1.4.1.12356.101.5.2.1.2	Idle period after which a firewall-authentication user's session is automatically expired.
fgFwUserTables	1.3.6.1.4.1.12356.101.5.2.2	
fgFwUserTable	1.3.6.1.4.1.12356.101.5.2.2.1	A list of local and proxy (Radius server) user accounts for use with firewall user authentication.
fgFwUserEntry	1.3.6.1.4.1.12356.101.5.2.2.1.1	An entry containing information applicable to a particular user account.
fgFwUserIndex	1.3.6.1.4.1.12356.101.5.2.2.1.1.1	An index for uniquely identifying the users in fgFwUserTable.
fgFwUserName	1.3.6.1.4.1.12356.101.5.2.2.1.1.2	User name of the specified account.
fgFwUserAuth	1.3.6.1.4.1.12356.101.5.2.2.1.1.3	Type of authentication the account uses (local, RADIUS, LDAP, etc.).

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgFwUserState	1.3.6.1.4.1.12356.101.5.2.2.1.1.4	Status of the user account (enabled/disabled).
fgFwUserVdom	1.3.6.1.4.1.12356.101.5.2.2.1.1.5	Virtual domain the user account exists in. This index corresponds to the index used in fgVdTable.
FortiManager and Administration		
fgMgmt	1.3.6.1.4.1.12356.101.6	
fgFmTrapPrefix	1.3.6.1.4.1.12356.101.6.0	
fgFmTrapDeployComplete	1.3.6.1.4.1.12356.101.6.0.1000	Indicates when deployment of a new configuration has been completed. Used for verification by FortiManager.
fgFmTrapDeployInProgress	1.3.6.1.4.1.12356.101.6.0.1002	Indicates that a configuration change was not immediate and that the change is currently in progress. Used for verification by FortiManager.
fgFmTrapConfChange	1.3.6.1.4.1.12356.101.6.0.1003	The device configuration has been changed by something other than the managing FortiManager unit.
fgFmTrapIfChange	1.3.6.1.4.1.12356.101.6.0.1004	Trap is sent to the managing FortiManager if an interface IP is changed.
fgAdmin	1.3.6.1.4.1.12356.101.6.1	
fgAdminOptions	1.3.6.1.4.1.12356.101.6.1.1	
fgAdminIdleTimeout	1.3.6.1.4.1.12356.101.6.1.1.1	Idle period after which an administrator is automatically logged out of the system.
fgAdminLcdProtection	1.3.6.1.4.1.12356.101.6.1.1.2	Status of the LCD protection (enabled/disabled).
fgAdminTables	1.3.6.1.4.1.12356.101.6.1.2	
fgAdminTable	1.3.6.1.4.1.12356.101.6.1.2.1	A table of administrator accounts on the device.
fgAdminEntry	1.3.6.1.4.1.12356.101.6.1.2.1.1	An entry containing information applicable to a particular admin account.
fgAdminVdom	1.3.6.1.4.1.12356.101.6.1.2.1.1.1	The virtual domain the administrator belongs to.
fgMgmtTrapObjects	1.3.6.1.4.1.12356.101.6.2	
fgManIfIp	1.3.6.1.4.1.12356.101.6.2.1	IP address of the interface listed in the trap.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgManIfMask	1.3.6.1.4.1.12356.101.6.2.2	Mask of subnet the interface belongs to.
Antivirus		
fgAntivirus	1.3.6.1.4.1.12356.101.8	
fgAvInfo	1.3.6.1.4.1.12356.101.8.1	
fgAvTables	1.3.6.1.4.1.12356.101.8.2	
fgAvStatsTable	1.3.6.1.4.1.12356.101.8.2.1	A table of Antivirus statistics per virtual domain.
fgAvStatsEntry	1.3.6.1.4.1.12356.101.8.2.1.1	Antivirus statistics for a particular virtual domain.
fgAvVirusDetected	1.3.6.1.4.1.12356.101.8.2.1.1.1	Number of virus transmissions detected in the virtual domain since start up.
fgAvVirusBlocked	1.3.6.1.4.1.12356.101.8.2.1.1.2	Number of virus transmissions blocked in the virtual domain since start up.
fgAvHTTPVirusDetected	1.3.6.1.4.1.12356.101.8.2.1.1.3	Number of virus transmissions over HTTP detected in the virtual domain since start up.
fgAvHTTPVirusBlocked	1.3.6.1.4.1.12356.101.8.2.1.1.4	Number of virus transmissions over HTTP blocked in the virtual domain since start up.
fgAvSMTPVirusDetected	1.3.6.1.4.1.12356.101.8.2.1.1.5	Number of virus transmissions over SMTP detected in the virtual domain since start up.
fgAvSMTPVirusBlocked	1.3.6.1.4.1.12356.101.8.2.1.1.6	Number of virus transmissions over SMTP blocked in the virtual domain since start up.
fgAvPOP3VirusDetected	1.3.6.1.4.1.12356.101.8.2.1.1.7	Number of virus transmissions over POP3 detected in the virtual domain since start up.
fgAvPOP3VirusBlocked	1.3.6.1.4.1.12356.101.8.2.1.1.8	Number of virus transmissions over POP3 blocked in the virtual domain since start up.
fgAvIMAPVirusDetected	1.3.6.1.4.1.12356.101.8.2.1.1.9	Number of virus transmissions over IMAP detected in the virtual domain since start up.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgAvIMAPVirusBlocked	1.3.6.1.4.1.12356.101.8.2.1.1.10	Number of virus transmissions over IMAP blocked in the virtual domain since start up.
fgAvFTPVirusDetected	1.3.6.1.4.1.12356.101.8.2.1.1.11	Number of virus transmissions over FTP detected in the virtual domain since start up.
fgAvFTPVirusBlocked	1.3.6.1.4.1.12356.101.8.2.1.1.12	Number of virus transmissions over FTP blocked in the virtual domain since start up.
fgAvIMVirusDetected	1.3.6.1.4.1.12356.101.8.2.1.1.13	Number of virus transmissions over IM protocols detected in the virtual domain since start up.
fgAvIMVirusBlocked	1.3.6.1.4.1.12356.101.8.2.1.1.14	Number of virus transmissions over IM protocols blocked in the virtual domain since start up.
fgAvNNTPVirusDetected	1.3.6.1.4.1.12356.101.8.2.1.1.15	Number of virus transmissions over NNTP detected in the virtual domain since start up.
fgAvNNTPVirusBlocked	1.3.6.1.4.1.12356.101.8.2.1.1.16	Number of virus transmissions over NNTP blocked in the virtual domain since start up.
fgAvOversizedDetected	1.3.6.1.4.1.12356.101.8.2.1.1.17	Number of over-sized file transmissions detected in the virtual domain since start up.
fgAvOversizedBlocked	1.3.6.1.4.1.12356.101.8.2.1.1.18	Number of over-sized file transmissions blocked in the virtual domain since start up.
fgAvTrapObjects	1.3.6.1.4.1.12356.101.8.3	
fgAvTrapVirName	1.3.6.1.4.1.12356.101.8.3.1	Virus name that triggered event.
IPS		
fgIps	1.3.6.1.4.1.12356.101.9	
fgIpsInfo	1.3.6.1.4.1.12356.101.9.1	
fgIpsTables	1.3.6.1.4.1.12356.101.9.2	
fgIpsStatsTable	1.3.6.1.4.1.12356.101.9.2.1	A table of IPS/IDS statistics per virtual domain.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgIpsStatsEntry	1.3.6.1.4.1.12356.101.9.2.1.1	IPS/IDS statistics for a particular virtual domain.
fgIpsIntrusionDetected	1.3.6.1.4.1.12356.101.9.2.1.1.1	Number of intrusions detected since start up in this virtual domain.
fgIpsIntrusionBlocked	1.3.6.1.4.1.12356.101.9.2.1.1.2	Number of intrusions blocked since start up in this virtual domain.
fgIpsCritSevDetections	1.3.6.1.4.1.12356.101.9.2.1.1.3	Number of critical severity intrusions detected since start up in this virtual domain.
fgIpsHighSevDetections	1.3.6.1.4.1.12356.101.9.2.1.1.4	Number of high severity intrusions detected since start up in this virtual domain.
fgIpsMedSevDetections	1.3.6.1.4.1.12356.101.9.2.1.1.5	Number of medium severity intrusions detected since start up in this virtual domain.
fgIpsLowSevDetections	1.3.6.1.4.1.12356.101.9.2.1.1.6	Number of low severity intrusions detected since start up in this virtual domain.
fgIpsInfoSevDetections	1.3.6.1.4.1.12356.101.9.2.1.1.7	Number of informational severity intrusions detected since start up in this virtual domain.
fgIpsSignatureDetections	1.3.6.1.4.1.12356.101.9.2.1.1.8	Number of intrusions detected by signature since start up in this virtual domain.
fgIpsAnomalyDetections	1.3.6.1.4.1.12356.101.9.2.1.1.9	Number of intrusions detected as anomalies since start up in this virtual domain.
fgIpsTrapObjects	1.3.6.1.4.1.12356.101.9.3	
fgIpsTrapSigId	1.3.6.1.4.1.12356.101.9.3.1	ID of IPS signature identified in trap.
fgIpsTrapSrcIp	1.3.6.1.4.1.12356.101.9.3.2	Source IP Address of the IPS signature trigger.
fgIpsTrapSigMsg	1.3.6.1.4.1.12356.101.9.3.3	Message associated with IPS event.

fgAppProxyPOP3	1.3.6.1.4.1.12356.101.10.102	
fgApPOP3UpTime	1.3.6.1.4.1.12356.101.10.102.1	Up time of the POP3 proxy, in seconds.
fgApPOP3MemUsage	1.3.6.1.4.1.12356.101.10.102.2	Memory usage of the POP3 Proxy (percentage of system total).
fgApPOP3StatsTable	1.3.6.1.4.1.12356.101.10.102.3	A table of POP3 proxy statistics per virtual domain.
fgApPOP3StatsEntry	1.3.6.1.4.1.12356.101.10.102.3.1	Proxy pop3 statistics for a particular virtual domain.
fgApPOP3ReqProcessed	1.3.6.1.4.1.12356.101.10.102.3.1.1	Number of requests in this virtual domain processed by the POP3 proxy since start up.
fgApPOP3SpamDetected	1.3.6.1.4.1.12356.101.10.102.3.1.2	Number of spam detected in this virtual domain by the POP3 Proxy since start up.
fgApPOP3Connections	1.3.6.1.4.1.12356.101.10.102.4	POP3 proxy current connections.
fgAppProxyIMAP	1.3.6.1.4.1.12356.101.10.103	
fgApIMAPUpTime	1.3.6.1.4.1.12356.101.10.103.1	Up time of the IMAP proxy, in seconds.
fgapIMAPMemUsage	1.3.6.1.4.1.12356.101.10.103.2	Memory utilization of the IMAP Proxy (as a percentage of the system total).
fgApIMAPStatsTable	1.3.6.1.4.1.12356.101.10.103.3	A table of IMAP proxy statistics per virtual domain.
fgApIMAPStatsEntry	1.3.6.1.4.1.12356.101.10.103.3.1	IMAP Proxy statistics for a particular virtual domain.
fgApIMAPReqProcessed	1.3.6.1.4.1.12356.101.10.103.3.1.1	Number of requests in this virtual domain processed by the IMAP proxy since start up.
fgApIMAPSpamDetected	1.3.6.1.4.1.12356.101.10.103.3.1.2	Number of spam detected in this virtual domain by the IMAP proxy since start up.
fgApIMAPConnections	1.3.6.1.4.1.12356.101.10.103.4	IMAP proxy current connections.
fgAppProxyNNTP	1.3.6.1.4.1.12356.101.10.104	
fgApNNTPUpTime	1.3.6.1.4.1.12356.101.10.104.1	Up time of the NNTP proxy, in seconds.
fgApNNTPMemUsage	1.3.6.1.4.1.12356.101.10.104.2	Memory utilization of the NNTP proxy, as a percentage of the system total.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgApNNTPStatsTable	1.3.6.1.4.1.12356.101.10.104.3	A table of NNTP proxy statistics per virtual domain.
fgApNNTPStatsEntry	1.3.6.1.4.1.12356.101.10.104.3.1	NNTP Proxy statistics for a particular virtual domain.
fgApNNTPReqProcessed	1.3.6.1.4.1.12356.101.10.104.3.1.1	Number of requests in the virtual domain processed by the NNTP proxy since start up.
fgApNNTPConnections	1.3.6.1.4.1.12356.101.10.104.4	NNTP proxy current connections.
fgAppProxyIM	1.3.6.1.4.1.12356.101.10.105	
fgApIMUpTime	1.3.6.1.4.1.12356.101.10.105.1	Up time of the IM proxy, in seconds.
fgApIMMemUsage	1.3.6.1.4.1.12356.101.10.105.2	IM Proxy memory usage, as a percentage of the system total.
fgApIMStatsTable	1.3.6.1.4.1.12356.101.10.105.3	A table of IM proxy statistics per virtual domain.
fgApIMStatsEntry	1.3.6.1.4.1.12356.101.10.105.3.1	IM Proxy statistics for a particular virtual domain.
fgApIMReqProcessed	1.3.6.1.4.1.12356.101.10.105.3.1.1	Number of requests in this virtual domain processed by the IM proxy since start up.
fgAppProxySIP	1.3.6.1.4.1.12356.101.10.106	
fgApSIPUpTime	1.3.6.1.4.1.12356.101.10.106.1	Up time of the SIP Proxy, in seconds.
fgApSIPMemUsage	1.3.6.1.4.1.12356.101.10.106.2	SIP Proxy memory utilization, as a percentage of the system total.
fgApSIPStatsTable	1.3.6.1.4.1.12356.101.10.106.3	A table of SIP proxy statistics per virtual domain.
fgApSIPStatsEntry	1.3.6.1.4.1.12356.101.10.106.3.1	SIP Proxy statistics for a particular virtual domain.
fgApSIPClientReg	1.3.6.1.4.1.12356.101.10.106.3.1.1	Number of client registration requests (Register and Options) in this virtual domain processed by the SIP proxy since start up.
fgApSIPCallHandling	1.3.6.1.4.1.12356.101.10.106.3.1.2	Number of call handling requests (Invite, Ack, Bye, Cancel and Refer) in this virtual domain processed by the SIP proxy since start up.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgApSIPServices	1.3.6.1.4.1.12356.101.10.106.3.1.3	Number of service requests (Subscribe, notify and Message) in this virtual domain processed by the SIP proxy since start up.
fgApSIPOtherReq	1.3.6.1.4.1.12356.101.10.106.3.1.4	Number of other sip requests in this virtual domain processed by the SIP proxy since start up.
fgAppScanUnit	1.3.6.1.4.1.12356.101.10.107	
fgAppSuNumber	1.3.6.1.4.1.12356.101.10.107.1	The number of scan units in the fgAppSuStatsTable.
fgAppSuStatsTable	1.3.6.1.4.1.12356.101.10.107.2	A table of scan unit statistics.
fgAppSuStatsEntry	1.3.6.1.4.1.12356.101.10.107.2.1	Statistics entry for a particular scan unit.
fgAppSuIndex	1.3.6.1.4.1.12356.101.10.107.2.1.1	Index that uniquely identifies a scan unit in the fgAppSuStatsTable.
fgAppSuFileScanned	1.3.6.1.4.1.12356.101.10.107.2.1.2	Number of files scanned by this scan unit.
fgAppVoIP	1.3.6.1.4.1.12356.101.10.108	
fgAppVoIPStatsTable	1.3.6.1.4.1.12356.101.10.108.1	A table of VoIP related statistics per virtual domain.
fgAppVoPStatsEntry	1.3.6.1.4.1.12356.101.10.108.1.1	VoIP statistics for a particular virtual domain.
fgAppVoIPConn	1.3.6.1.4.1.12356.101.10.108.1.1.1	The current number of VoIP connections on the virtual domain.
fgAppVoIPCallBlocked	1.3.6.1.4.1.12356.101.10.108.1.1.2	Number of VoIP calls blocked (SIP Invites blocked and SCCP calls blocked) in this virtual domain.
fgAppP2P	1.3.6.1.4.1.12356.101.10.109	
fgAppP2PStatsTable	1.3.6.1.4.1.12356.101.10.109.1	A table of P2P protocol related statistics per virtual domain.
fgAppP2PStatsEntry	1.3.6.1.4.1.12356.101.10.109.1.1	P2P statistics for a particular virtual domain.
fgAppP2PConnBlocked	1.3.6.1.4.1.12356.101.10.109.1.1.1	Number of P2P connections blocked in this virtual domain.
fgAppP2PProtoTable	1.3.6.1.4.1.12356.101.10.109.2	A table of peer to peer statistics per virtual domain per protocol. This table has a dependent expansion relationship with fgVdTable.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgAppP2PProtoEntry	1.3.6.1.4.1.12356.101.10.109.2.1	P2P statistics for a particular virtual domain and protocol.
fgAppP2PProtoEntProto	1.3.6.1.4.1.12356.101.10.109.2.1.1	P2P protocol this row of statistics is for, within the specified virtual domain.
fgAppP2PProtoEntBytes	1.3.6.1.4.1.12356.101.10.109.2.1.2	Number of bytes transferred through this virtual domain on this P2P protocol since last reset.
fgAppP2PProtoEntLastReset	1.3.6.1.4.1.12356.101.10.109.2.1.3	Time elapsed since the corresponding fgAppP2PProtEntBytes was last reset to 0.
fgAppIM	1.3.6.1.4.1.12356.101.10.110	
fgAppIMStatsTable	1.3.6.1.4.1.12356.101.10.110.1	A table of instant messaging statistics per virtual domain.
fgAppIMStatsEntry	1.3.6.1.4.1.12356.101.10.110.1.1	IM statistics for a particular virtual domain.
fgAppIMMessages	1.3.6.1.4.1.12356.101.10.110.1.1.1	Total number of IM messages processed in this virtual domain.
fgAppIMFileTransfered	1.3.6.1.4.1.12356.101.10.110.1.1.2	Number of files transferred through this virtual domain.
fgAppIMFileTxBlocked	1.3.6.1.4.1.12356.101.10.110.1.1.3	Number of blocked file transfers in this virtual domain.
fgAppIMConnBlocked	1.3.6.1.4.1.12356.101.10.110.1.1.4	Number of connections blocked in this virtual domain.
fgAppProxyFTP	1.3.6.1.4.1.12356.101.10.111	
fgApFTPUpTime	1.3.6.1.4.1.12356.101.10.111.1	Up time of the FTP proxy, in seconds.
fgApFTPMemUsage	1.3.6.1.4.1.12356.101.10.111.2	FTP Proxy memory utilization, as a percentage of the system total.
fgApFTPStatsTable	1.3.6.1.4.1.12356.101.10.111.3	A table of FTP proxy statistics per virtual domain.
fgApFTPStatsEntry	1.3.6.1.4.1.12356.101.10.111.3.1	FTP Proxy statistics for a particular virtual domain.
fgApFTPReqProcessed	1.3.6.1.4.1.12356.101.10.111.3.1.1	Number of requests in this virtual domain processed by the FTP proxy since start up.
fgApFTPConnections	1.3.6.1.4.1.12356.101.10.111.4	FTP proxy current connections.
fgAppExplicitProxy	1.3.6.1.4.1.12356.101.10.112	

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgExplicitProxyInfo	1.3.6.1.4.1.12356.101.10.112.1	
fgExplicitProxyUpTime	1.3.6.1.4.1.12356.101.10.112.1.1	Explicit proxy up-time (in seconds).
fgExplicitProxyMemUsage	1.3.6.1.4.1.12356.101.10.112.1.2	Explicit proxy memory usage (percentage of system total).
fgExplicitProxyRequests	1.3.6.1.4.1.12356.101.10.112.1.3	Explicit proxy total number of requests.
fgExplicitProxyStatsTable	1.3.6.1.4.1.12356.101.10.112.2	A table of explicit proxy statistics per virtual domain.
fgExplicitProxyStatsEntry	1.3.6.1.4.1.12356.101.10.112.2.1	Explicit proxy statistics for a particular virtual domain.
fgExplicitProxyUsers	1.3.6.1.4.1.12356.101.10.112.2.1.1	Number of current users in this virtual domain.
fgExplicitProxySessions	1.3.6.1.4.1.12356.101.10.112.2.1.2	Number of current sessions in this virtual domain.
fgExplicitProxyScanStatsTable	1.3.6.1.4.1.12356.101.10.112.3	A table of explicit proxy scan statistics per virtual domain.
fgExplicitProxyScanStatsEntry	1.3.6.1.4.1.12356.101.10.112.3.1	Explicit proxy scan statistics for a particular virtual domain.
fgExplicitProxyScanStatsDisp	1.3.6.1.4.1.12356.101.10.112.3.1.1	Disposition of an scan result.
fgExplicitProxyVirus	1.3.6.1.4.1.12356.101.10.112.3.1.2	Number of viruses in this virtual domain.
fgExplicitProxyBannedWords	1.3.6.1.4.1.12356.101.10.112.3.1.3	Number of elements containing banned words in this virtual domain.
fgExplicitProxyPolicy	1.3.6.1.4.1.12356.101.10.112.3.1.4	Number of elements violating policy (e.g. filename or file type rules) in this virtual domain.
fgExplicitProxyOversized	1.3.6.1.4.1.12356.101.10.112.3.1.5	Number of oversized elements in this virtual domain.
fgExplicitProxyArchNest	1.3.6.1.4.1.12356.101.10.112.3.1.6	Number of too deeply nested archives in this virtual domain.
fgExplicitProxyArchSize	1.3.6.1.4.1.12356.101.10.112.3.1.7	Number of archives that decompress beyond size limit in this virtual domain.
fgExplicitProxyArchEncrypted	1.3.6.1.4.1.12356.101.10.112.3.1.8	Number of encrypted archives in this virtual domain.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgExplicitProxyArchMultiPart	1.3.6.1.4.1.12356.101.10.112.3.1.9	Number of multipart archives in this virtual domain.
fgExplicitProxyArchUnsupported	1.3.6.1.4.1.12356.101.10.112.3.1.10	Number of archives with unsupported (but known) formats in this virtual domain.
fgExplicitProxyArchBomb	1.3.6.1.4.1.12356.101.10.112.3.1.11	Number of archive bombs in this virtual domain.
fgExplicitProxyArchCorrupt	1.3.6.1.4.1.12356.101.10.112.3.1.12	Number of corrupt archives in this virtual domain.
fgExplicitProxyScriptStatsTable	1.3.6.1.4.1.12356.101.10.112.4	A table of explicit proxy script filtering statistics per virtual domain.
fgExplicitProxyScriptStatsEntry	1.3.6.1.4.1.12356.101.10.112.4.1	Explicit proxy scan statistics for a particular virtual domain.
fgExplicitProxyFilteredApplets	1.3.6.1.4.1.12356.101.10.112.4.1.1	Number of applets filtered from files in this virtual domain.
fgExplicitProxyFilteredActiveX	1.3.6.1.4.1.12356.101.10.112.4.1.2	Number of ActiveX scripts filtered from files in this virtual domain.
fgExplicitProxyFilteredJScript	1.3.6.1.4.1.12356.101.10.112.4.1.3	Number of JScript scripts filtered from files in this virtual domain.
fgExplicitProxyFilteredJS	1.3.6.1.4.1.12356.101.10.112.4.1.4	Number of JavaScript scripts filtered from files in this virtual domain.
fgExplicitProxyFilteredVBS	1.3.6.1.4.1.12356.101.10.112.4.1.5	Number of Visual Basic scripts filtered from files in this virtual domain.
fgExplicitProxyFilteredOthScript	.3.6.1.4.1.12356.101.10.112.4.1.6	Number of other types of scripts filtered from files in this virtual domain.
fgExplicitProxyFilterStatsTable	1.3.6.1.4.1.12356.101.10.112.5	A table of explicit proxy policy enforcement statistics per virtual domain.
fgExplicitProxyFilterStatsEntry	1.3.6.1.4.1.12356.101.10.112.5.1	Explicit proxy scan statistics for a particular virtual domain.
fgExplicitProxyBlockedDLP	1.3.6.1.4.1.12356.101.10.112.5.1.1	Number of elements blocked due to Data Leak Prevention in this virtual domain.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgExplicitProxyBlockedConType	1.3.6.1.4.1.12356.101.10.112.5.1.2	Number of elements blocked due to Content-Type filtering rules in this virtual domain.
fgExplicitProxyExaminedURLs	1.3.6.1.4.1.12356.101.10.112.5.1.3	Number of URLs inspected against filtering rules in this virtual domain.
fgExplicitProxyAllowedURLs	1.3.6.1.4.1.12356.101.10.112.5.1.4	Number of URLs explicitly allowed due to filtering rules in this virtual domain.
fgExplicitProxyBlockedURLs	1.3.6.1.4.1.12356.101.10.112.5.1.5	Number of URLs explicitly blocked due to filtering rules in this virtual domain.
fgExplicitProxyLoggedURLs	1.3.6.1.4.1.12356.101.10.112.5.1.6	Number of URLs logged due to filtering rules in this virtual domain.
fgExplicitProxyOverriddenURLs	1.3.6.1.4.1.12356.101.10.112.5.1.7	Number of URLs access due to overriding filtering rules in this virtual domain.
fgAppWebCache	1.3.6.1.4.1.12356.101.10.113	
fgWebCacheInfo	1.3.6.1.4.1.12356.101.10.113.1	
fgWebCacheRAMLimit	1.3.6.1.4.1.12356.101.10.113.1.1	RAM available for web cache in bytes.
fgWebCacheRAMUsage	1.3.6.1.4.1.12356.101.10.113.1.2	RAM used by web cache in bytes.
fgWebCacheRAMHits	1.3.6.1.4.1.12356.101.10.113.1.3	Number of cache hits in RAM since last reset.
fgWebCacheRAMMisses	1.3.6.1.4.1.12356.101.10.113.1.4	Number of cache misses in RAM since last reset.
fgWebCacheRequests	1.3.6.1.4.1.12356.101.10.113.1.5	Number of cache requests since last reset.
fgWebCacheBypass	1.3.6.1.4.1.12356.101.10.113.1.6	Number of cache bypasses since last reset.
fgWebCacheUpTime	1.3.6.1.4.1.12356.101.10.113.1.7	Web Cache up-time (in seconds).
fgWebCacheDiskStatsTable	1.3.6.1.4.1.12356.101.10.113.2	A table of the Web Cache disk statistics per disk.
fgWebCacheDiskStatsEntry	1.3.6.1.4.1.12356.101.10.113.2.1	The Web Cache disk statistics for a particular disk.
fgWebCacheDisk	1.3.6.1.4.1.12356.101.10.113.2.1.1	The Web Cache Disk index.
fgWebCacheDiskLimit	1.3.6.1.4.1.12356.101.10.113.2.1.2	The about of storage (in bytes) available for the Web Cache on a particular disk.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgWebCacheDiskUsage	1.3.6.1.4.1.12356.101.10.113.2.1.3	The about of storage (in bytes) in use by the Web Cache on a particular disk.
fgWebCacheDiskHits	1.3.6.1.4.1.12356.101.10.113.2.1.4	The number of cache hits on a paricular disk.
fgWebCacheDiskMisses	1.3.6.1.4.1.12356.101.10.113.2.1.5	The number of cache misses on a paricular disk.
fgAppWanOpt	1.3.6.1.4.1.12356.101.10.114	
fgWanOptInfo	1.3.6.1.4.1.12356.101.10.114.1	
fgMemCacheLimit	1.3.6.1.4.1.12356.101.10.114.1.1	RAM available for mem cache in bytes.
fgMemCacheUsage	1.3.6.1.4.1.12356.101.10.114.1.2	RAM used by mem cache in bytes.
fgMemCacheHits	1.3.6.1.4.1.12356.101.10.114.1.3	Number of hits in mem cache since last reset.
fgMemCacheMisses	1.3.6.1.4.1.12356.101.10.114.1.4	Number of misses in mem cache since last reset.
fgByteCacheRAMLimit	1.3.6.1.4.1.12356.101.10.114.1.5	RAM available for byte cache in bytes.
fgByteCacheRAMUsage	1.3.6.1.4.1.12356.101.10.114.1.6	RAM used by byte cache in bytes.
fgWanOptUpTime	1.3.6.1.4.1.12356.101.10.114.1.7	Wan Optimization up-time (in seconds).
fgWanOptStatsTable	1.3.6.1.4.1.12356.101.10.114.2	A table of WAN optimization statistics per virtual domain.
fgWanOptStatsEntry	1.3.6.1.4.1.12356.101.10.114.2.1	WAN optimization statistics for a particular virtual domain.
fgWanOptTunnels	1.3.6.1.4.1.12356.101.10.114.2.1.1	Number of current tunnels in this virtual domain.
fgWanOptLANBytesIn	1.3.6.1.4.1.12356.101.10.114.2.1.2	Number of bytes received on LAN in last 5 seconds.
fgWanOptLANBytesOut	1.3.6.1.4.1.12356.101.10.114.2.1.3	Number of bytes sent on LAN in last 5 seconds.
fgWanOptWANBytesIn	1.3.6.1.4.1.12356.101.10.114.2.1.4	Number of bytes received on WAN in last 5 seconds.
fgWanOptWANBytesOut	1.3.6.1.4.1.12356.101.10.114.2.1.5	Number of bytes sent on WAN in last 5 seconds.
fgWanOptHistoryStatsTable	1.3.6.1.4.1.12356.101.10.114.3	A table of the WAN optimization history per protocol.
fgWanOptHistoryStatsEntry	1.3.6.1.4.1.12356.101.10.114.3.1	The WAN optimization history for a particular virtual domain, period, and protocol.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgWanOptHistPeriod	1.3.6.1.4.1.12356.101.10.114.3.1.1	WAN optimization table entry period.
fgWanOptProtocol	1.3.6.1.4.1.12356.101.10.114.3.1.2	Internal WAN optimization table entry protocol.
fgWanOptReductionRate	1.3.6.1.4.1.12356.101.10.114.3.1.3	Reduction rate achieved by WAN optimization.
fgWanOptLanTraffic	1.3.6.1.4.1.12356.101.10.114.3.1.4	Number of bytes transferred via LAN.
fgWanOptWanTraffic	1.3.6.1.4.1.12356.101.10.114.3.1.5	Number of bytes transferred via WAN.
fgWanOptTrafficStatsTable	1.3.6.1.4.1.12356.101.10.114.4	A table of the WAN optimization traffic for a particular virtual domain and protocol.
fgWanOptTrafficStatsEntry	1.3.6.1.4.1.12356.101.10.114.4.1	The WAN optimization history for a particular protocol.
fgWanOptLanInTraffic	1.3.6.1.4.1.12356.101.10.114.4.1.1	Amount of traffic received from the LAN by WAN optimization.
fgWanOptLanOutTraffic	1.3.6.1.4.1.12356.101.10.114.4.1.2	Amount of traffic sent to the LAN by WAN optimization.
fgWanOptWanInTraffic	1.3.6.1.4.1.12356.101.10.114.4.1.3	Amount of traffic received from the WAN by WAN optimization.
fgWanOptWanOutTraffic	1.3.6.1.4.1.12356.101.10.114.4.1.4	Amount of traffic sent to the WAN by WAN optimization.
fgWanOptDiskStatsTable	1.3.6.1.4.1.12356.101.10.114.5	A table of the Web Cache disk statistics per disk.
fgWanOptDiskStatsEntry	1.3.6.1.4.1.12356.101.10.114.5.1	The Web Cache disk statistics for a particular disk.
fgWanOptDisk	1.3.6.1.4.1.12356.101.10.114.5.1.1	The Web Cache Disk index.
fgWanOptDiskLimit	1.3.6.1.4.1.12356.101.10.114.5.1.2	The about of storage (in bytes) available for the Web Cache on a particular disk.
fgWanOptDiskUsage	1.3.6.1.4.1.12356.101.10.114.5.1.3	The about of storage (in bytes) in use by the Web Cache on a paricular disk.
fgWanOptDiskHits	1.3.6.1.4.1.12356.101.10.114.5.1.4	The number of cache hits on a paricular disk.
fgWanOptDiskMisses	1.3.6.1.4.1.12356.101.10.114.5.1.5	The number of cache misses on a paricular disk.
Protocol and Session Table		
fgInetProto	1.3.6.1.4.1.12356.101.11	
fgInetProtoInfo	1.3.6.1.4.1.12356.101.11.1	

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgInetProtoTables	1.3.6.1.4.1.12356.101.11.2	
fgIpSessTable	1.3.6.1.4.1.12356.101.11.2.1	
fgIpSessEntry	1.3.6.1.4.1.12356.101.11.2.1.1	Information on a specific session, including source and destination.
fgIpSessIndex	1.3.6.1.4.1.12356.101.11.2.1.1.1	An index value that uniquely identifies an IP session within the fgIpSessTable.
fgIpSessProto	1.3.6.1.4.1.12356.101.11.2.1.1.2	The protocol the session is using (IP, TCP, UDP, etc.).
fgIpSessFromAddr	1.3.6.1.4.1.12356.101.11.2.1.1.3	Source IP address (IPv4 only) of the session.
fgIpSessFromPort	1.3.6.1.4.1.12356.101.11.2.1.1.4	Source port number (UDP and TCP only) of the session.
fgIpSessToAddr	1.3.6.1.4.1.12356.101.11.2.1.1.5	Destination IP address (IPv4 only) of the session.
fgIpSessToPort	1.3.6.1.4.1.12356.101.11.2.1.1.6	Destination Port number (UDP and TCP only) of the session.
fgIpSessExp	1.3.6.1.4.1.12356.101.11.2.1.1.7	Number of seconds remaining before the session expires (if idle).
fgIpSessVdom	1.3.6.1.4.1.12356.101.11.2.1.1.8	Virtual domain the session is part of. This index corresponds to the index used by fgVdTable.
fgIpSessStatsTable	1.3.6.1.4.1.12356.101.11.2.2	IP session statistics table.
fgIpSessStatsEntry	1.3.6.1.4.1.12356.101.11.2.2.1	IP session statistics on a virtual domain.
fgIpSessNumber	1.3.6.1.4.1.12356.101.11.2.2.1.1	Current number of sessions on the virtual domain.
VPN		
fgVPN	1.3.6.1.4.1.12356.101.12	
fgVpnInfo	1.3.6.1.4.1.12356.101.12.1	
fgVpnTables	1.3.6.1.4.1.12356.101.12.2	
fgVpnDialupTable	1.3.6.1.4.1.12356.101.12.2.1	Dial-up VPN peers information.
fgVpnDialupEntry	1.3.6.1.4.1.12356.101.12.2.1.1	Dial-up VPN peer info.
fgVpnDialupIndex	1.3.6.1.4.1.12356.101.12.2.1.1.1	An index value that uniquely identifies an VPN dial-up peer within the fgVpnDialupTable.
fgVpnDialupGateway	1.3.6.1.4.1.12356.101.12.2.1.1.2	Remote gateway IP address of the tunnel.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgVpnDialupLifetime	1.3.6.1.4.1.12356.101.12.2.1.1.3	Tunnel life time (seconds) of the tunnel.
fgVpnDialupTimeout	1.3.6.1.4.1.12356.101.12.2.1.1.4	Time before the next key exchange (seconds) of the tunnel.
fgVpnDialupSrcBegin	1.3.6.1.4.1.12356.101.12.2.1.1.5	Remote subnet address of the tunnel.
fgVpnDialupSrcEnd	1.3.6.1.4.1.12356.101.12.2.1.1.6	Remote subnet mask of the tunnel.
fgVpnDialupDstAddr	1.3.6.1.4.1.12356.101.12.2.1.1.7	Local subnet address of the tunnel.
fgVpnDialupVdom	1.3.6.1.4.1.12356.101.12.2.1.1.8	Virtual domain tunnel is part of. This index corresponds to the index used by fgVdTable.
fgVpnDialupInOctets	1.3.6.1.4.1.12356.101.12.2.1.1.9	Number of bytes received on tunnel since instantiation.
fgVpnDialupOutOctets	1.3.6.1.4.1.12356.101.12.2.1.1.10	Number of bytes sent on tunnel since instantiation.
fgVpnTunTable	1.3.6.1.4.1.12356.101.12.2.2	Table of non-dial-up VPN tunnels.
fgVpnTunEntry	1.3.6.1.4.1.12356.101.12.2.2.1	Tunnel VPN peer info.
fgVpnTunEntIndex	1.3.6.1.4.1.12356.101.12.2.2.1.1	An index value that uniquely identifies a VPN tunnel within the fgVpnTunTable.
fgVpnTunEntPhase1Name	1.3.6.1.4.1.12356.101.12.2.2.1.2	Descriptive name of phase1 configuration for the tunnel.
fgVpnTunentPhase2Name	1.3.6.1.4.1.12356.101.12.2.2.1.3	Descriptive name of phase2 configuration for the tunnel.
fgVpnTunEntRemGwyIp	1.3.6.1.4.1.12356.101.12.2.2.1.4	IP of remote gateway used by the tunnel.
fgVpnTunEntRemGwyPort	1.3.6.1.4.1.12356.101.12.2.2.1.5	Port of remote gateway used by tunnel, if UDP.
fgVpnTunEntLocGwyIp	1.3.6.1.4.1.12356.101.12.2.2.1.6	IP of local gateway used by the tunnel.
fgVpnTunEntLocGwyPort	1.3.6.1.4.1.12356.101.12.2.2.1.7	Port of local gateway used by tunnel, if UDP.
fgVpnTunEntSelectorSrcBeginIP	1.3.6.1.4.1.12356.101.12.2.2.1.8	Beginning of address range of source selector.
fgVpnTunEntSelectorSrcEndIp	1.3.6.1.4.1.12356.101.12.2.2.1.9	End of address range of source selector.
fgVpnTunentSelectorSrcPort	1.3.6.1.4.1.12356.101.12.2.2.1.10	Source selector port.
fgVonTunEntSelectorDstBeginIp	1.3.6.1.4.1.12356.101.12.2.2.1.11	Beginning of address range of destination selector.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgVpnTunEntSelectorDstEndIp	1.3.6.1.4.1.12356.101.12.2.2.1.12	End of address range of destination selector.
fgVpnTunEntSelectorDstPort	1.3.6.1.4.1.12356.101.12.2.2.1.13	Destination selector port.
fgVpnTunEntSelectorProto	1.3.6.1.4.1.12356.101.12.2.2.1.14	Protocol number for selector.
fgVpnTunEntLifeSecs	1.3.6.1.4.1.12356.101.12.2.2.1.15	Lifetime of tunnel in seconds, if time based lifetime used.
fgVpnTunEntLifeBytes	1.3.6.1.4.1.12356.101.12.2.2.1.16	Lifetime of tunnel in bytes, if byte transfer based lifetime used.
fgVpnTunEntTimeout	1.3.6.1.4.1.12356.101.12.2.2.1.17	Timeout of tunnel in seconds.
fgVpnTunEntInOctets	1.3.6.1.4.1.12356.101.12.2.2.1.18	Number of bytes received on tunnel.
fgVpnTunEntOutOctets	1.3.6.1.4.1.12356.101.12.2.2.1.19	Number of bytes sent out on tunnel.
fgVpnTunEntStatus	1.3.6.1.4.1.12356.101.12.2.2.1.20	Current status of tunnel (up or down).
fgVpnTunEntVdom	1.3.6.1.4.1.12356.101.12.2.2.1.21	Virtual domain the tunnel is part of. This index corresponds to the index used by fgVdTable.
fgVpnSslStatsTable	1.3.6.1.4.1.12356.101.12.2.3	SSL VPN statistics table.
ffVpnSslStatsEntry	1.3.6.1.4.1.12356.101.12.2.3.1	SSL VPN statistics for a given virtual domain.
fgVpnSslState	1.3.6.1.4.1.12356.101.12.2.3.1.1	Whether SSL-VPN is enabled on this virtual domain.
fgVpnSslStatsLoginUsers	1.3.6.1.4.1.12356.101.12.2.3.1.2	The current number of users logged in through SSL-VPN tunnels in the virtual domain.
fgVpnSslStatsMaxUsers	1.3.6.1.4.1.12356.101.12.2.3.1.3	The maximum number of total users that can be logged in at any one time on the virtual domain.
fgVpnSslStatsActiveWebSessions	1.3.6.1.4.1.12356.101.12.2.3.1.4	The current number of active SSL web sessions in the virtual domain.
fgVpnSslStatsMaxWebSessions	1.3.6.1.4.1.12356.101.12.2.3.1.5	The maximum number of active SSL web sessions at any one time within the virtual domain.
fgVpnSslStatsActiveTunnels	1.3.6.1.4.1.12356.101.12.2.3.1.6	The current number of active SSL tunnels in the virtual domain.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgVpnSslStatsMaxTunnels	1.3.6.1.4.1.12356.101.12.2.3.1.7	The maximum number of active SSL tunnels at any one time in the virtual domain.
fgVpnSslTunnelTable	1.3.6.1.4.1.12356.101.12.2.4	A list of active SSL VPN tunnel entries.
fgVpnSslTunnelEntry	1.3.6.1.4.1.12356.101.12.2.4.1	An SSL VPN tunnel entry containing connection information and traffic statistics.
fgVpnSslTunnelIndex	1.3.6.1.4.1.12356.101.12.2.4.1.1	An index value that uniquely identifies an active SSL VPN tunnel within the fgVpnSslTunnelTable.
fgVpnSslTunnelVdom	1.3.6.1.4.1.12356.101.12.2.4.1.2	The index of the virtual domain this tunnel belongs to. This index corresponds to the index used by fgVdTable.
fgVpnSslTunnelUserName	1.3.6.1.4.1.12356.101.12.2.4.1.3	The user name used to authenticate the tunnel.
fgVpnbSslTunnelSrcIp	1.3.6.1.4.1.12356.101.12.2.4.1.4	The source IP address of this tunnel.
fgVpnSslTunnelIp	1.3.6.1.4.1.12356.101.12.2.4.1.5	The connection IP address of this tunnel.
fgVpnSslTunnelUpTime	1.3.6.1.4.1.12356.101.12.2.4.1.6	The up-time of this tunnel in seconds.
fgVpnSslTunnelBytesIn	1.3.6.1.4.1.12356.101.12.2.4.1.7	The number of incoming bytes of L2 traffic through this tunnel since it was established.
fgVpnSslTunnelBytesOut	1.3.6.1.4.1.12356.101.12.2.4.1.8	The number of outgoing bytes of L2 traffic through this tunnel since it was established.
fgVpnTrapObjects	1.3.6.1.4.1.12356.101.12.3	
fgVpnTrapLocalGateway	1.3.6.1.4.1.12356.101.12.3.2	Local gateway IP address. Used in VPN related traps.
fgVpnTrapRemoteGateway	1.3.6.1.4.1.12356.101.12.3.3	Remote gateway IP address. Used in VPN related traps.
High Availability		
fgHighAvailability	1.3.6.1.4.1.12356.101.13	
fgHaInfo	1.3.6.1.4.1.12356.101.13.1	
fgHaSystemMode	1.3.6.1.4.1.12356.101.13.1.1	High-availability mode (Standalone, A-A or A-P).

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgHaGroupId	1.3.6.1.4.1.12356.101.13.1.2	HA cluster group ID device is configured for.
fgHaPriority	1.3.6.1.4.1.12356.101.13.1.3	HA clustering priority of the device (default = 127).
fgHaOverride	1.3.6.1.4.1.12356.101.13.1.4	Status of a master override flag.
fgHaAutoSync	1.3.6.1.4.1.12356.101.13.1.5	Configuration of an automatic configuration synchronization (enabled or disabled).
fgHaSchedule	1.3.6.1.4.1.12356.101.13.1.6	Load-balancing schedule of cluster (in A-A mode).
fgHaGroupName	1.3.6.1.4.1.12356.101.13.1.7	Ha cluster group name.
fgHaTables	1.3.6.1.4.1.12356.101.13.2	
fgHaStatsTable	1.3.6.1.4.1.12356.101.13.2.1	Some useful statistics for all members of a cluster. This table is also available in standalone mode.
fgHaStatsEntry	1.3.6.1.4.1.12356.101.13.2.1.1	Statistics for a particular HA cluster's unit.
fgHaStatsIndex	1.3.6.1.4.1.12356.101.13.2.1.1.1	An index value that uniquely identifies an unit in the HA Cluster.
fgHaStatsSerial	1.3.6.1.4.1.12356.101.13.2.1.1.2	Serial number of the HA cluster member for this row.
fgHaStatsCpuUsage	1.3.6.1.4.1.12356.101.13.2.1.1.3	CPU usage of the specified cluster member (percentage).
fgHaStatsMemUsage	1.3.6.1.4.1.12356.101.13.2.1.1.4	Memory usage of the specified cluster member (percentage).
fgHaStatsNetUsage	1.3.6.1.4.1.12356.101.13.2.1.1.5	Network bandwidth usage of specified cluster member (kbps).
fgHaStatsSesCount	1.3.6.1.4.1.12356.101.13.2.1.1.6	Current session count of specified cluster member.
fgHaStatsPktCount	1.3.6.1.4.1.12356.101.13.2.1.1.7	Number of packets processed by the specified cluster member since start up.
fgHaStatsByteCount	1.3.6.1.4.1.12356.101.13.2.1.1.8	Number of bytes processed by the specified cluster member since start up.
fgHaStatsIdsCount	1.3.6.1.4.1.12356.101.13.2.1.1.9	Number of IDS/IPS events triggered on the specified cluster member since start up.

Table 26: OIDs for the Fortinet-FortiGate-MIB

MIB Field	OID	Description
fgHaStatsAvCount	1.3.6.1.4.1.12356.101.13.2.1.1.10	Number of anti-virus events triggered on the specified cluster member since start up.
fgHaStatsHostname	1.3.6.1.4.1.12356.101.13.2.1.1.11	Host name of the specified cluster member.

fgMIBCompliance	1.3.6.1.4.1.12356.101.100.100	Model and feature specific.

Multicast forwarding

Multicasting (also called IP multicasting) consists of using a single multicast source to send data to many receivers. Multicasting can be used to send data to many receivers simultaneously while conserving bandwidth and reducing network traffic. Multicasting can be used for one-way delivery of media streams to multiple receivers and for one-way data transmission for news feeds, financial information, and so on. Also RIPv2 uses multicasting to share routing table information.

A FortiGate unit can operate as a Protocol Independent Multicast (PIM) version 2 router. FortiGate units support PIM sparse mode (RFC 4601) and PIM dense mode (RFC 3973) and can service multicast servers or receivers on the network segment to which a FortiGate unit interface is connected. Multicast routing is not supported in transparent mode (TP mode).

To support PIM communications, the sending/receiving applications and all connecting PIM routers in between must be enabled with PIM version 2. PIM can use static routes, RIP, OSPF, or BGP to forward multicast packets to their destinations. To enable source-to-destination packet delivery, either sparse mode or dense mode must be enabled on the PIM-router interfaces. Sparse mode routers cannot send multicast messages to dense mode routers. In addition, if a FortiGate unit is located between a source and a PIM router, two PIM routers, or is connected directly to a receiver, you must create a security policy manually to pass encapsulated (multicast) packets or decapsulated data (IP traffic) between the source and destination.

A PIM domain is a logical area comprising a number of contiguous networks. The domain contains at least one Boot Strap Router (BSR), and if sparse mode is enabled, a number of Rendezvous Points (RPs) and Designated Routers (DRs). When PIM is enabled on a FortiGate unit, the FortiGate unit can perform any of these functions at any time as configured.

Sparse mode

Initially, all candidate BSRs in a PIM domain exchange bootstrap messages to select one BSR to which each RP sends the multicast address or addresses of the multicast group(s) that it can service. The selected BSR chooses one RP per multicast group and makes this information available to all of the PIM routers in the domain through bootstrap messages. PIM routers use the information to build packet distribution trees, which map each multicast group to a specific RP. Packet distribution trees may also contain information about the sources and receivers associated with particular multicast groups.

When a FortiGate unit interface is configured as a multicast interface, sparse mode is enabled on it by default to ensure that distribution trees are not built unless at least one downstream receiver requests multicast traffic from a specific source. If the sources of multicast traffic and their receivers are close to each other and the PIM domain contains a dense population of active receivers, you may choose to enable dense mode throughout the PIM domain instead.

An RP represents the root of a non-source-specific distribution tree to a multicast group. By joining and pruning the information contained in distribution trees, a single stream of multicast packets (for example, a video feed) originating from the source can be forwarded to a certain RP to reach a multicast destination.

Each PIM router maintains a Multicast Routing Information Base (MRIB) that determines to which neighboring PIM router join and prune messages are sent. An MRIB contains reverse-path information that reveals the path of a multicast packet from its source to the PIM router that maintains the MRIB.

To send multicast traffic, a server application sends IP traffic to a multicast group address. The locally elected DR registers the sender with the RP that is associated with the target multicast group. The RP uses its MRIB to forward a single stream of IP packets from the source to the members of the multicast group. The IP packets are replicated only when necessary to distribute the data to branches of the RP's distribution tree.

To receive multicast traffic, a client application can use Internet Group Management Protocol (IGMP) version 1 (RFC 1112), 2 (RFC 2236), or 3 (RFC 3376) control messages to request the traffic for a particular multicast group. The locally elected DR receives the request and adds the host to the multicast group that is associated with the connected network segment by sending a join message towards the RP for the group. Afterward, the DR queries the hosts on the connected network segment continually to determine whether the hosts are active. When the DR no longer receives confirmation that at least one member of the multicast group is still active, the DR sends a prune message towards the RP for the group.

Dense mode

The packet organization used in sparse mode is also used in dense mode. When a multicast source begins to send IP traffic and dense mode is enabled, the closest PIM router registers the IP traffic from the multicast source (S) and forwards multicast packets to the multicast group address (G). All PIM routers initially broadcast the multicast packets throughout the PIM domain to ensure that all receivers that have requested traffic for multicast group address G can access the information if needed.

To forward multicast packets to specific destinations afterward, the PIM routers build distribution trees based on the information in multicast packets. Upstream PIM routers depend on prune/graft messages from downstream PIM routers to determine if receivers are actually present on directly connected network segments. The PIM routers exchange state refresh messages to update their distribution trees. FortiGate units store this state information in a Tree Information Base (TIB), which is used to build a multicast forwarding table. The information in the multicast forwarding table determines whether packets are forwarded downstream. The forwarding table is updated whenever the TIB is modified.

PIM routers receive data streams every few minutes and update their forwarding tables using the source (S) and multicast group (G) information in the data stream. Superfluous multicast traffic is stopped by PIM routers that do not have downstream receivers—PIM routers that do not manage multicast groups send prune messages to the upstream PIM routers. When a receiver requests traffic for multicast address G, the closest PIM router sends a graft message upstream to begin receiving multicast packets.

FortiGate units operating in NAT mode can also be configured as multicast routers. You can configure a FortiGate unit to be a Protocol Independent Multicast (PIM) router operating in Sparse Mode (SM) or Dense Mode (DM).

Multicast IP addresses

Multicast uses the Class D address space. The 224.0.0.0 to 239.255.255.255 IP address range is reserved for multicast groups. The multicast address range applies to multicast groups, not to the originators of multicast packets. Table 27 lists reserved multicast address ranges and describes what they are reserved for:

Table 27: Reserved Multicast address ranges

Reserved Address Range	Use	Notes
224.0.0.0 to 224.0.0.255	Used for network protocols on local networks. For more information, see RFC 1700.	In this range, packets are not forwarded by the router but remain on the local network. They have a Time to Live (TTL) of 1. These addresses are used for communicating routing information.
224.0.1.0 to 238.255.255.255	Global addresses used for multicasting data between organizations and across the Internet. For more information, see RFC 1700.	Some of these addresses are reserved, for example, 224.0.1.1 is used for Network Time Protocol (NTP).
239.0.0.0 to 239.255.255.255	Limited scope addresses used for local groups and organizations. For more information, see RFC 2365.	Routers are configured with filters to prevent multicasts to these addresses from leaving the local system.

PIM Support

A FortiGate unit can be configured to support PIM using the `config router multicast` CLI command. When PIM is enabled, the FortiGate unit allocates memory to manage mapping information. The FortiGate unit communicates with neighboring PIM routers to acquire mapping information and if required, processes the multicast traffic associated with specific multicast groups.

The end-user multicast client-server applications must be installed and configured to initiate Internet connections and handle broadband content such as audio/video information.

Client applications send multicast data by registering IP traffic with a PIM-enabled router. An end-user could type in a class D multicast group address, an alias for the multicast group address, or a call-conference number to initiate the session.

Rather than sending multiple copies of generated IP traffic to more than one specific IP destination address, PIM-enabled routers encapsulate the data and use the one multicast group address to forward multicast packets to multiple destinations. Because one destination address is used, a single stream of data can be sent. Client applications receive multicast data by requesting that the traffic destined for a certain multicast group address be delivered to them — end-users may use phone books, a menu of ongoing or future sessions, or some other method through a user interface to select the address of interest.

A class D address in the 224.0.0.0 to 239.255.255.255 range may be used as a multicast group address, subject to the rules assigned by the Internet Assigned Numbers Authority (IANA). All class D addresses must be assigned in advance. Because there is no way to determine in advance if a certain multicast group address is in use, collisions may occur (to resolve this problem, end-users may switch to a different multicast address).

To configure a PIM domain

1. If you will be using sparse mode, determine appropriate paths for multicast packets.
2. Make a note of the interfaces that will be PIM-enabled. These interfaces may run a unicast routing protocol.
3. If you will be using sparse mode and want multicast packets to be handled by specific (static) RPs, record the IP addresses of the PIM-enabled interfaces on those RPs.
4. Enable PIM version 2 on all participating routers between the source and receivers. On FortiGate units, use the `config router multicast` command to set global operating parameters.
5. Configure the PIM routers that have good connections throughout the PIM domain to be candidate BSRs.
6. If sparse mode is enabled, configure one or more of the PIM routers to be candidate RPs.
7. If required, adjust the default settings of PIM-enabled interface(s).

Multicast forwarding and FortiGate units

In both transparent mode and NAT mode you can configure FortiGate units to forward multicast traffic.

For a FortiGate unit to forward multicast traffic you must add FortiGate multicast security policies. Basic multicast security policies accept any multicast packets at one FortiGate interface and forward the packets out another FortiGate interface. You can also use multicast security policies to be selective about the multicast traffic that is accepted based on source and destination address, and to perform NAT on multicast packets.

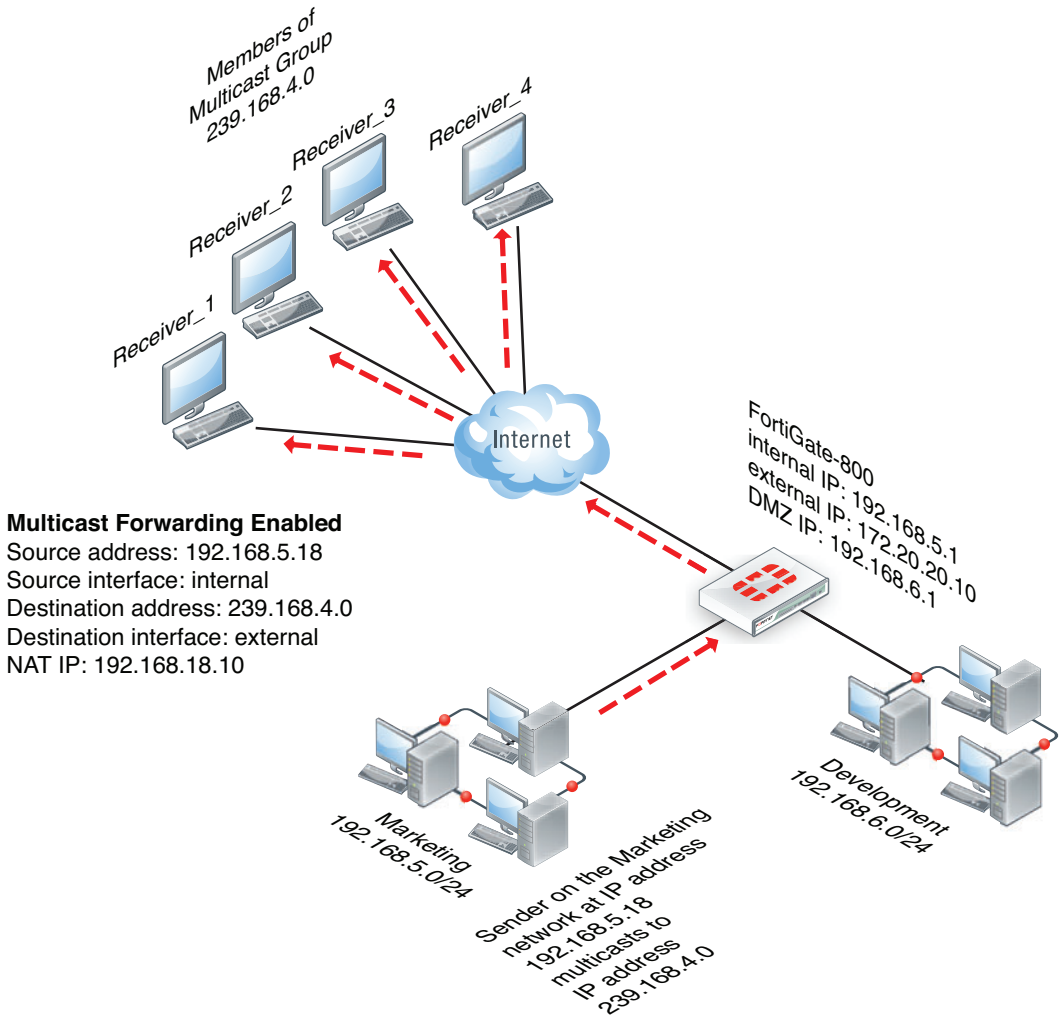
In the example shown in Figure 48, a multicast source on the Marketing network with IP address 192.168.5.18 sends multicast packets to the members of network 239.168.4.0. At the FortiGate unit, the source IP address for multicast packets originating from workstation 192.168.5.18 is translated to 192.168.18.10. In this example, the FortiGate unit is not acting as a multicast router.

Multicast forwarding and RIPv2

RIPv2 uses multicast to share routing table information. If your FortiGate unit is installed on a network that includes RIPv2 routers, you must configure the FortiGate unit to forward multicast packets so that RIPv2 devices can share routing data through the FortiGate unit. No special FortiGate configuration is required to share RIPv2 data, you can simply use the information in the following sections to configure the FortiGate unit to forward multicast packets.

RIPv1 uses broadcasting to share routing table information. To allow RIPv1 packets through a FortiGate unit you can add standard security policies. Security policies to accept RIPv1 packets can use the ANY predefined firewall service or the RIP predefined firewall service.

Figure 48: Example multicast network including a FortiGate unit that forwards multicast packets



Configuring FortiGate multicast forwarding

You configure FortiGate multicast forwarding from the Command Line Interface (CLI). Two steps are required:

- Adding multicast security policies
- Enabling multicast forwarding

  This second step is only required if your FortiGate unit is operating in NAT mode. If your FortiGate unit is operating in transparent mode, adding a multicast policy enables multicast forwarding.

Adding multicast security policies

You need to add security policies to allow packets to pass from one interface to another. Multicast packets require multicast security policies. You add multicast security policies from the CLI using the `config firewall multicast-policy` command. As with unicast security policies, you specify the source and destination interfaces and optionally the allowed address ranges for the source and destination addresses of the packets.

You can also use multicast security policies to configure source NAT and destination NAT for multicast packets. For full details on the config firewall multicast-policy command, see the *FortiGate CLI Reference*.

Keep the following in mind when configuring multicast security policies:

- The matched forwarded (outgoing) IP multicast source IP address is changed to the configured IP address.
- Source and Destination interfaces are optional. If left blank, then the multicast will be forwarded to ALL interfaces.
- Source and Destination addresses are optional. If left un set, then it will mean ALL addresses.
- The `nat` keyword is optional. Use it when source address translation is needed.

Enabling multicast forwarding

Multicast forwarding is disabled by default. In NAT mode you must use the `multicast-forward` keyword of the `system settings` CLI command to enable multicast forwarding. When `multicast-forward` is enabled, the FortiGate unit forwards any multicast IP packets in which the TTL is 2 or higher to all interfaces and VLAN interfaces except the receiving interface. The TTL in the IP header will be reduced by 1. Even though the multicast packets are forwarded to all interfaces, you must add security policies to actually allow multicast packets through the FortiGate. In our example, the security policy allows multicast packets received by the internal interface to exit to the external interface.

Enabling multicast forwarding is only required if your FortiGate unit is operating in NAT mode. If your FortiGate unit is operating in transparent mode, adding a multicast policy enables multicast forwarding.

Enter the following CLI command to enable multicast forwarding:

```
config system settings
     set multicast-forward enable
end
```

If multicast forwarding is disabled and the FortiGate unit drops packets that have multicast source or destination addresses.

You can also use the `multicast-ttl-notchange` keyword of the `system settings` command so that the FortiGate unit does not increase the TTL value for forwarded multicast packets. You should use this option only if packets are expiring before reaching the multicast router.

```
config system settings
  set multicast-ttl-notchange enable
end
```

In transparent mode, the FortiGate unit does not forward frames with multicast destination addresses. Multicast traffic such as the one used by routing protocols or streaming media may need to traverse the FortiGate unit, and should not be interfere with the communication. To avoid any issues during transmission, you can set up multicast security policies. These types of security policies can only be enabled using the CLI.

The CLI parameter multicast-skip-policy must be disabled when using multicast security policies. To disable enter the command

```
config system settings
  set multicast-skip-policy disable
end
```

In this simple example, no check is performed on the source or destination interfaces. A multicast packet received on an interface is flooded unconditionally to all interfaces on the forwarding domain, except the incoming interface.

To enable the multicast policy

```
config firewall multicast-policy
  edit 1
    set action accept
end
```

In this example, the multicast policy only applies to the source port of WAN1 and the destination port of Internal.

To enable the restrictive multicast policy

```
config firewall multicast-policy
  edit 1
    set srcintf wan1
    set dstinf internal
    set action accept
end
```

In this example, packets are allowed to flow from WAN1 to Internal, and sourced by the address 172.20.120.129.

To enable the restrictive multicast policy

```
config firewall multicast-policy
  edit 1
    set srcintf wan1
    set srcaddr 172.20.120.129 255.255.255.255
    set dstinf internal
    set action accept
end
```

This example shows how to configure the multicast security policy required for the configuration shown in Figure 48 on page 475. This policy accepts multicast packets that are sent from a PC with IP address 192.168.5.18 to destination address range 239.168.4.0. The policy allows the multicast packets to enter the internal interface and then exit the external interface. When the packets leave the external interface their source address is translated to 192.168.18.10

```
config firewall multicast-policy
  edit 5
    set srcaddr 192.168.5.18 255.255.255.255
```

```
    set srcintf internal
    set destaddr 239.168.4.0 255.255.255.0
    set dstintf external
    set nat 192.168.18.10
  end
```

This example shows how to configure a multicast security policy so that the FortiGate unit forwards multicast packets from a multicast Server with an IP 10.10.10.10 is broadcasting to address 225.1.1.1. This Server is on the network connected to the FortiGate DMZ interface.

```
config firewall multicast-policy
  edit 1
    set srcintf DMZ
    set srcaddr 10.10.10.10 255.255.255.255
    set dstintf Internal
    set dstaddr 225.1.1.1 255.255.255.255
    set action accept
  edit 2
    set action deny
end
```

Multicast routing examples

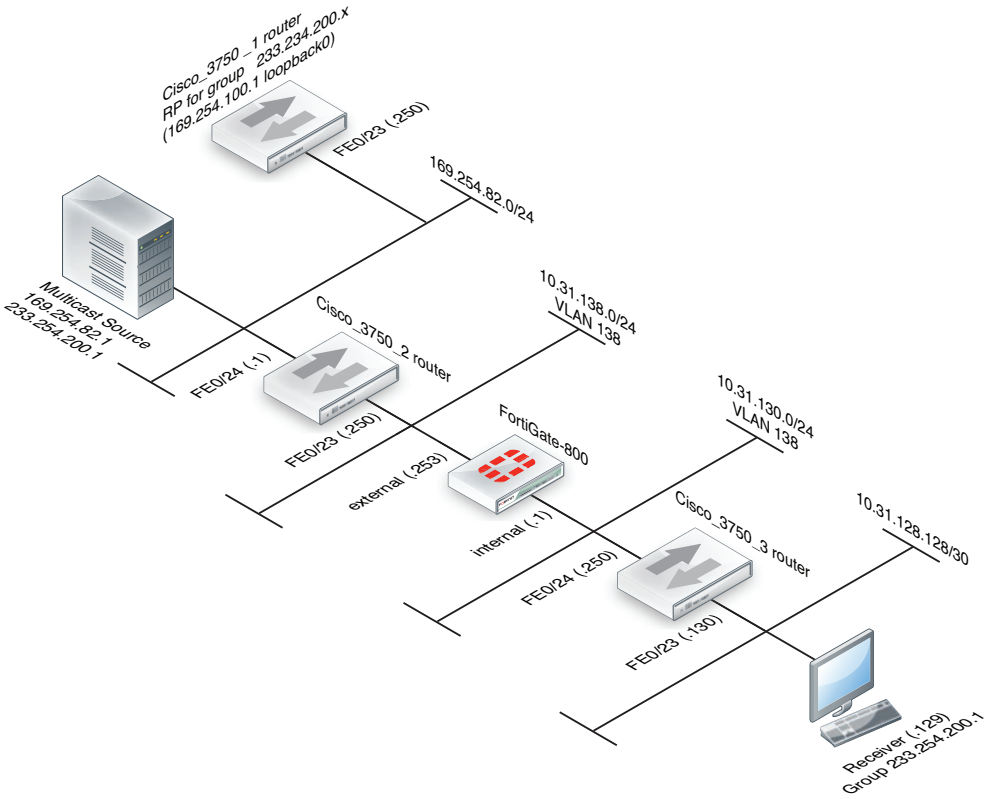
This section contains the following multicast routing configuration examples and information:

- Example FortiGate PIM-SM configuration using a static RP
- FortiGate PIM-SM debugging examples
- Example multicast destination NAT (DNAT) configuration
- Example PIM configuration that uses BSR to find the RP

Example FortiGate PIM-SM configuration using a static RP

The example Protocol Independent Multicast Sparse Mode (PIM-SM) configuration shown in Figure 49 has been tested for multicast interoperability using PIM-SM between Cisco 3750 switches running 12.2 and a FortiGate-800 running FortiOS v3.0 MR5 patch 1. In this configuration, the receiver receives the multicast stream when it joins the group 233.254.200.1.

Figure 49: Example FortiGate PIM-SM topology



The configuration uses a statically configured rendezvous point (RP) which resides on the Cisco_3750_1. Using a bootstrap router (BSR) was not tested in this example. See “Example PIM configuration that uses BSR to find the RP” on page 491 for an example that uses a BSR.

Configuration steps

The following procedures show how to configure the multicast configuration settings for the devices in the example configuration.

- Cisco_3750_1 router configuration
- Cisco_3750_2 router configuration
- To configure the FortiGate-800 unit
- Cisco_3750_3 router configuration

Cisco_3750_1 router configuration

```
version 12.2
!
hostname Cisco-3750-1
!
switch 1 provision ws-c3750-24ts

ip access-list standard Source-RP
 permit 233.254.200.0 0.0.0.255
```

To configure the FortiGate-800 unit

1 Configure the internal and external interfaces.

```
config system interface
  edit internal
    set vdom root
    set ip 10.31.130.1 255.255.255.0
    set allowaccess ping https
    set type physical
  next
  edit external
    set vdom root
      set ip 10.31.138.253 255.255.255.0
      set allowaccess ping
      set type physical
    end
  end
```

2 Add a firewall address for the RP.

```
config firewall address
  edit RP
    set subnet 169.254.100.1/32
  end
```

3 Add standard security policies to allow traffic to reach the RP.

```
config firewall policy
  edit 1
    set srcintf internal
    set dstintf external
    set srcaddr all
    set dstaddr RP
```

```
    set action accept
    set schedule always
    set service ANY
  next
  edit 2
    set srcintf external
    set dstintf internal
    set srcaddr RP
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  end
```

4 Add the multicast security policy.

```
config firewall multicast-policy
  edit 1
    set dstaddr 233.254.200.0 255.255.255.0
    set dstintf internal
    set srcaddr 169.254.82.0 255.255.255.0
    set srcintf external
  end
```

5 Add an access list.

```
config router access-list
  edit Source-RP
    config rule
      edit 1
        set prefix 233.254.200.0 255.255.255.0
        set exact-match disable
      next
    end
```

6 Add some static routes.

```
config router static
  edit 1
    set device internal
    set gateway 10.31.130.250
  next
  edit 2
    set device external
    set dst 169.254.0.0 255.255.0.0
    set gateway 10.31.138.250
  next
```

7 Configure multicast routing.

```
 config router multicast
  config interface
    edit internal
      set pim-mode sparse-mode
        config igmp
          set version 2
        end
    next
      edit external
        set pim-mode sparse-mode
```

```
        config igmp
        set version 2
      end
    next
  end
set multicast-routing enable
  config pim-sm-global
    config rp-address
      edit 1
        set ip-address 169.254.100.1
        set group Source-RP
      next
```

Cisco_3750_3 router configuration

```
version 12.2

```

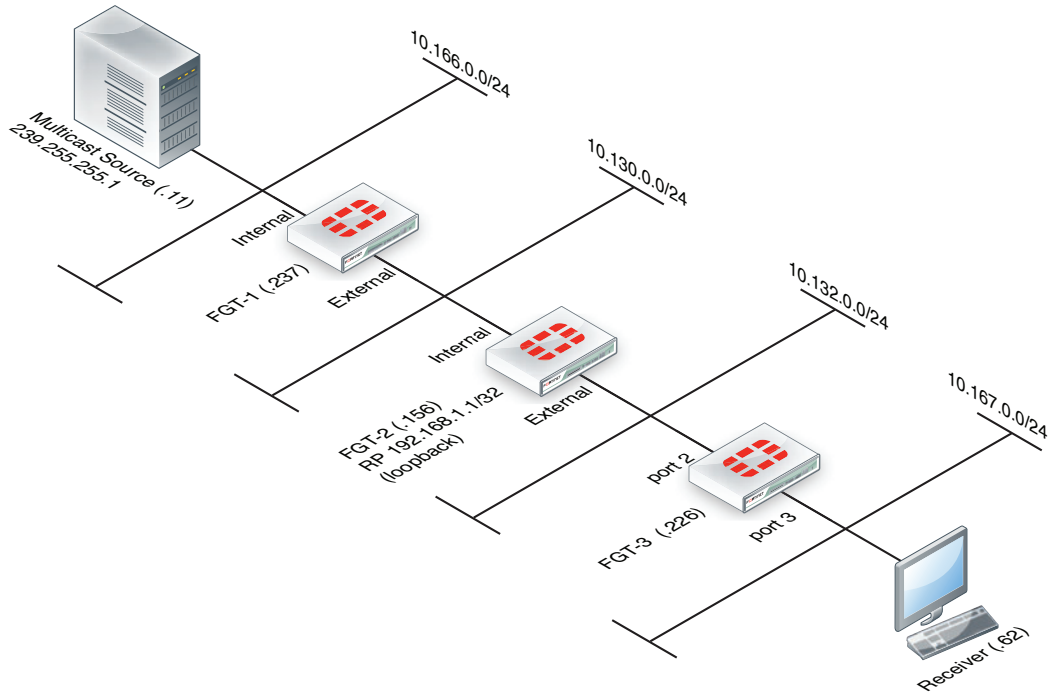
FortiGate PIM-SM debugging examples

Using the example topology shown in Figure 50 you can trace the multicast streams and states within the three FortiGate units (FGT-1, FGT-2, and FGT-3) using the debug commands described in this section. The command output in this section is taken from FortiGate unit when the multicast stream is flowing correctly from source to receiver.

Figure 50: PIM-SM debugging topology



Checking that the receiver has joined the required group

From the last hop router, FGT-3, you can use the following command to check that the receiver has correctly joined the required group.

```
FGT-3 # get router info multicast igmp groups
IGMP Connected Group Membership
Group Address    Interface            Uptime   Expires  Last
   Reporter
239.255.255.1    port3                00:31:15 00:04:02
   10.167.0.62
```

Only 1 receiver is displayed for a particular group, this is the device that responded to the IGMP query request from the FGT-3. If a receiver is active the expire time should drop to approximately 2 minutes before being refreshed.

Checking the PIM-SM neighbors

Next the PIM-SM neighbors should be checked. A PIM router becomes a neighbor when the PIM router receives a PIM hello. Use the following command to display the PIM-SM neighbors of FGT-3.

```
FGT-3 # get router info multicast pim sparse-mode neighbour
Neighbor          Interface          Uptime/Expires    Ver   DR
```

```
Address Priority/Mode
10.132.0.156      port2              01:57:12/00:01:33 v2    1 /
```

Checking that the PIM router can reach the RP

The rendezvous point (RP) must be reachable for the PIM router (FGT-3) to be able to send the *,G join to request the stream. This can be checked for FGT-3 using the following command:

```
FGT-3 # get router info multicast pim sparse-mode rp-mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4, Static
    RP: 192.168.1.1
         Uptime: 07:23:00
```

Viewing the multicast routing table (FGT-3)

The FGT-3 unicast routing table can be used to determine the path taken to reach the RP at 192.168.1.1. You can then check the stream state entries using the following commands:

```
FGT-3 # get router info multicast pim sparse-mode table
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 1
(S,G,rpt) Entries: 1
FCR Entries: 0
```

(*,*,RP) Entries	This state may be reached by general joins for all groups served by a specified RP.
(*,G) Entries	State that maintains the RP tree for a given group.
(S,G) Entries	State that maintains a source-specific tree for source S and group G.
(S,G,rpt) Entries	State that maintains source-specific information about source s on the RP tree for G. For example, if a source is being received on the source-specific tree, it will normally have been pruned off the RP tree.
FCR	The FCR state entries are for tracking the sources in the <*, G> when <S, G> is not available for any reason, the stream would typically be flowing when this state exists.

Breaking down each entry in detail:

```
(*, 239.255.255.1)
RP: 192.168.1.1
RPF nbr: 10.132.0.156
RPF idx: port2
Upstream State: JOINED
 Local:
     port3
 Joined:
 Asserted:
FCR:
```

The RP will always be listed in a *,G entry, the RPF neighbor and interface index will also be shown. In this topology these are the same in all downstream PIM routers. The state is active so the upstream state is joined.

In this case FGT-3 is the last hop router so the IGMP join is received locally on port3. There is no PIM outgoing interface listed for this entry as it is used for the upstream PIM join.

```
(10.166.0.11, 239.255.255.1)
RPF nbr: 10.132.0.156
RPF idx: port2
SPT bit: 1
Upstream State: JOINED
 Local:
 Joined:
 Asserted:
 Outgoing:
     port3
```

This is the entry for the SPT, no RP IS listed. The S,G stream will be forwarded out of the stated outgoing interface.

```
(10.166.0.11, 239.255.255.1, rpt)
RP: 192.168.1.1
RPF nbr: 10.132.0.156
RPF idx: port2
Upstream State: NOT PRUNED
 Local:
 Pruned:
 Outgoing:
```

The above S,G,RPT state is created for all streams that have both a S,G and a *,G entry on the router. This is not pruned in this case because of the topology, the RP and source are reachable over the same interface.

Although not seen in this scenario, assert states may be seen when multiple PIM routers exist on the same LAN which can lead to more than one upstream router having a valid forwarding state. Assert messages are used to elect a single forwarder from the upstream devices.

Viewing the PIM next-hop table

The PIM next-hop table is also very useful for checking the various states, it can be used to quickly identify the states of multiple multicast streams

```
FGT-3 # get router info multicast pim sparse-mode next-hop
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination    Type  Nexthop   Nexthop       Nexthop  Metric Pref
Refcnt
                       Num     Addr            Ifindex
_____________________________________________________________________
10.166.0.11     ..S.  1         10.132.0.156    9 21     110    3
192.168.1.1     .R..  1         10.132.0.156    9 111    110    2
```

Viewing the PIM multicast forwarding table

Also you can check the multicast forwarding table showing the ingress and egress ports of the multicast stream.

```
FGT-3 # get router info multicast table

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL threshold)

(10.166.0.11, 239.255.255.1), uptime 04:02:55, stat expires
00:02:25
Owner PIM-SM, Flags: TF
  Incoming interface: port2
  Outgoing interface list:
    port3 (TTL threshold 1)
```

Viewing the kernel forwarding table

Also the kernel forwarding table can be verified, however this should give similar information to the above command:

```
FGT-3 # diag ip multicast mroute
grp=239.255.255.1 src=10.166.0.11 intf=9 flags=(0x10000000)[  ]
status=resolved
        last_assert=2615136 bytes=1192116 pkt=14538 wrong_if=0
num_ifs=1
        index(ttl)=[6(1),]
```

Viewing the multicast routing table (FGT-2)

If you check the output on FGT-2 there are some small differences:

```
FGT-2 # get router info multicast pim sparse-mode table
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 1
(S,G,rpt) Entries: 1
FCR Entries: 0

(*, 239.255.255.1)
RP: 192.168.1.1
RPF nbr: 0.0.0.0
RPF idx: None
Upstream State: JOINED
 Local:
 Joined:
     external
 Asserted:
FCR:
```

The `*,G` entry now has a joined interface rather than local because it has received a PIM join from FGT-3 rather than a local IGMP join.

```
(10.166.0.11, 239.255.255.1)
RPF nbr: 10.130.0.237
RPF idx: internal
SPT bit: 1
Upstream State: JOINED
```

```
 Local:
 Joined:
     external
 Asserted:
 Outgoing:
     external
```

The S,G entry shows that we have received a join on the external interface and the stream is being forwarded out of this interface.

```
(10.166.0.11, 239.255.255.1, rpt)
RP: 192.168.1.1
RPF nbr: 0.0.0.0
RPF idx: None
Upstream State: PRUNED
 Local:
 Pruned:
 Outgoing:
     External
```

The S,G,RPT is different from FGT-3 because FGT-2 is the RP, it has pruned back the SPT for the RP to the first hop router.

Viewing the multicast routing table (FGT-1)

FGT-1 again has some differences with regard to the PIM-SM states, there is no *,G entry because it is not in the path of a receiver and the RP.

```
FGT-1_master #  get router info multicast pim sparse-mode table
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 0
(S,G) Entries: 1
(S,G,rpt) Entries: 1
FCR Entries: 0
```

Below the S,G is the SPT termination because this FortiGate unit is the first hop router, the RPF neighbor always shows as 0.0.0.0 because the source is local to this device. Both the joined and outgoing fields show as external because the PIM join and the stream is egressing on this interface.

```
(10.166.0.11, 239.255.255.1)
RPF nbr: 0.0.0.0
RPF idx: None
SPT bit: 1
Upstream State: JOINED
 Local:
 Joined:
     external
 Asserted:
 Outgoing:
     external
```

The stream has been pruned back from the RP because the end-to-end SPT is flowing, there is no requirement for the stream to be sent to the RP in this case.

```
(10.166.0.11, 239.255.255.1, rpt)
RP: 0.0.0.0
RPF nbr: 10.130.0.156
```

```
RPF idx: external
Upstream State: RPT NOT JOINED
 Local:
 Pruned:
Outgoing:
```

Example multicast destination NAT (DNAT) configuration

The example topology shown in Figure 51 and described below shows how to configure destination NAT (DNAT) for two multicast streams. Both of these streams originate from the same source IP address, which is 10.166.0.11. The example configuration keeps the streams separate by creating 2 multicast NAT policies.

In this example the FortiGate units in Figure 51 have the following roles:

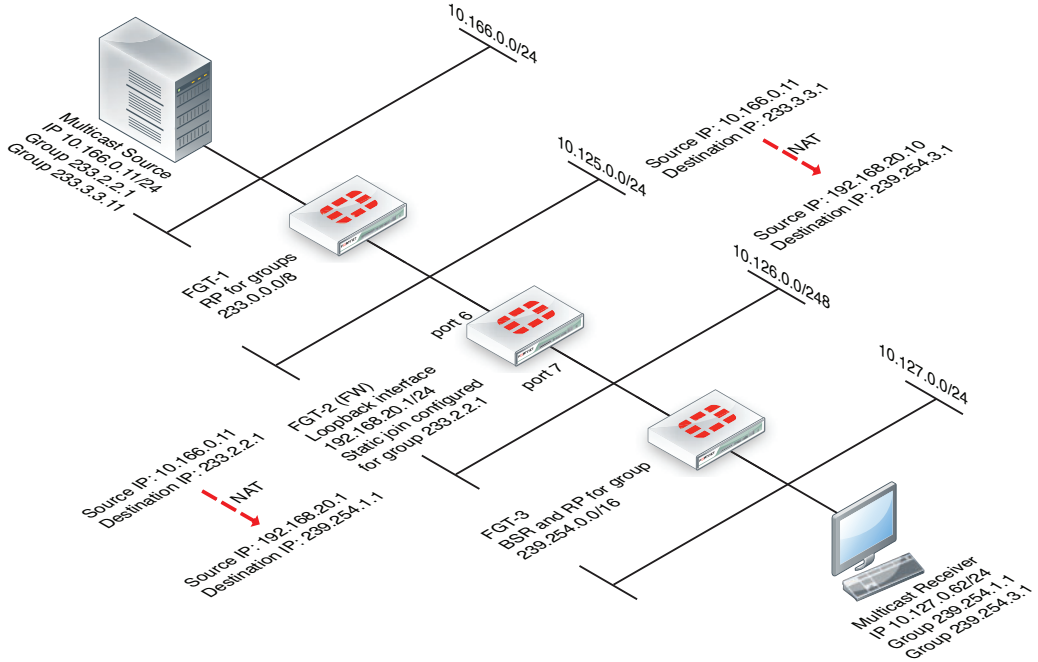
- FGT-1 is the RP for dirty networks, 233.0.0.0/8.
- FGT-2 performs all firewall and DNAT translations.
- FGT-3 is the RP for the clean networks, 239.254.0.0/16.
- FGT-1 and FGT-3 are functioning as PM enabled routers and could be replaced can be any PIM enabled router.

This example only describes the configuration of FGT-2.

FGT-2 performs NAT so that the receivers connected to FGT-3 receive the following translated multicast streams.

- If the multicast source sends multicast packets with a source and destination IP of 10.166.0.11 and 233.2.2.1; FGT-3 translates the source and destination IPs to 192.168.20.1 and 239.254.1.1
- If the multicast source sends multicast packets with a source and destination IP of 10.166.0.11 and 233.3.3.1; FGT-3 translates the source and destination IPs to 192.168.20.10 and 239.254.3.1

Figure 51: Example multicast DNAT topology



To configure FGT-2 for DNAT multicast

1 Add a loopback interface. In the example, the loopback interface is named loopback.

```
config system interface
  edit loopback
    set vdom root
    set ip 192.168.20.1 255.255.255.0
    set type loopback
  next
end
```

2 Add PIM and add a unicast routing protocol to the loopback interface as if it was a normal routed interface. Also add static joins to the loopback interface for any groups to be translated.

```
config router multicast
  config interface
    edit loopback
      set pim-mode sparse-mode
        config join-group
          edit 233.2.2.1
          next
          edit 233.3.3.1
          next
        end
    next
```

3 In this example, to add firewall multicast policies, different source IP addresses are required so you must first add an IP pool:

```
config firewall ippool
      edit Multicast_source
            set endip 192.168.20.20
            set interface port6
            set startip 192.168.20.10
      next
end
```

4 Add the translation security policies.

Policy 2, which is the source NAT policy, uses the actual IP address of port6. Policy 1, the DNAT policy, uses an address from the IP pool.

```
config firewall multicast-policy
  edit 1
    set dnat 239.254.3.1
    set dstaddr 233.3.3.1 255.255.255.255
    set dstintf loopback
    set nat 192.168.20.10
    set srcaddr 10.166.0.11 255.255.255.255
    set srcintf port6
  next
```

```
edit 2
  set dnat 239.254.1.1
  set dstaddr 233.2.2.1 255.255.255.255
  set dstintf loopback
  set nat 192.168.20.1
  set srcaddr 10.166.0.11 255.255.255.255
  set srcintf port6
next
```

5 Add a firewall multicast policy to forward the stream from the loopback interface to the physical outbound interface.

This example is an any/any policy that makes sure traffic accepted by the other multicast policies can exit the FortiGate unit.

```
config firewall multicast-policy
  edit 3
    set dstintf port7
    set srcintf loopback
  next
```

Example PIM configuration that uses BSR to find the RP

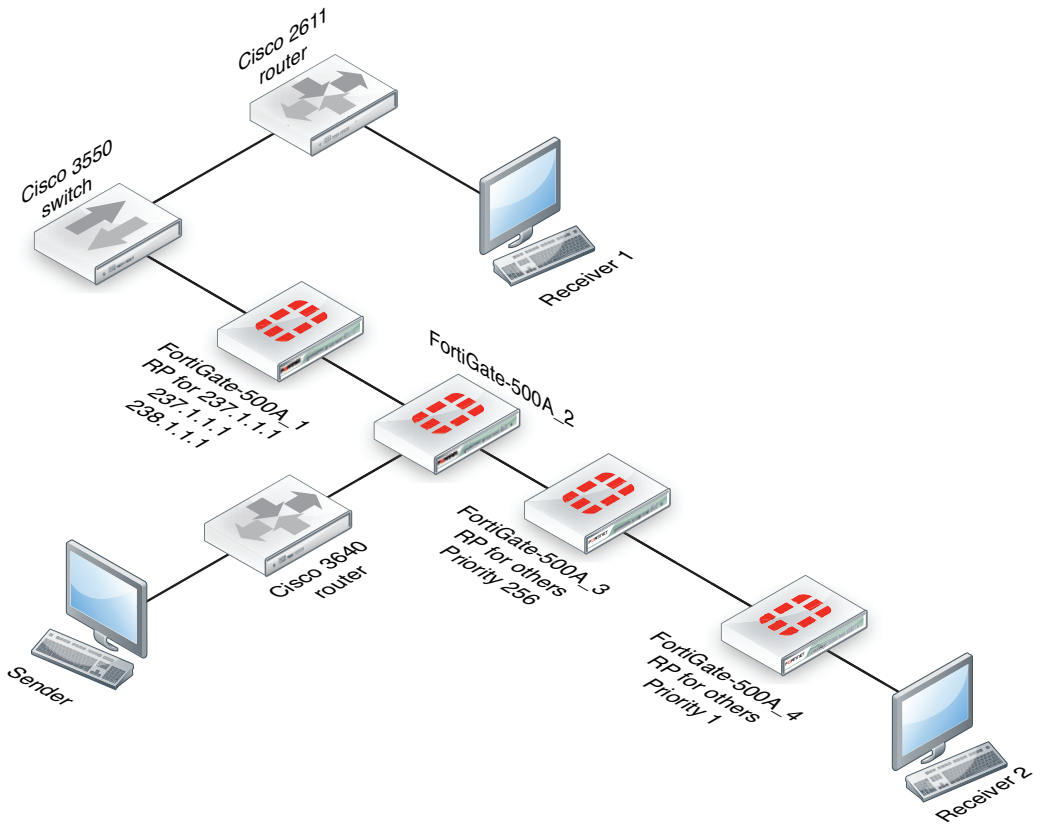
This example shows how to configure a multicast routing network for a network consisting of four FortiGate-500A units (FortiGate-500A_1 to FortiGate-550A_4, see Figure 52). A multicast sender is connected to FortiGate-500A_2. FortiGate-500A_2 forwards multicast packets in two directions to reach Receiver 1 and Receiver 2.

The configuration uses a Boot Start Router (BSR) to find the Rendezvous Points (RPs) instead of using static RPs. Under interface configuration, the loopback interface `lo0` must join the 236.1.1.1 group (source).

This example describes:

- Commands used in this example
- Configuration steps
- Example debug commands

Figure 52: PIM network topology using BSR to find the RP



Commands used in this example

This example uses CLI commands for the following configuration settings:

- Adding a loopback interface (lo0)
- Defining the multicast routing
- Adding the NAT multicast policy

Adding a loopback interface (lo0)

Where required, the following command is used to define a loopback interface named `lo0`.

```
config system interface
  edit lo0
    set vdom root
    set ip 1.4.50.4 255.255.255.255
    set allowaccess ping https ssh snmp http telnet
    set type loopback
  next
end
```

Defining the multicast routing

In this example, the following command syntax is used to define multicast routing. The example uses a Boot Start Router (BSR) to find the Rendezvous Points (RPs) instead of using static RPs. Under interface configuration, the loopback interface `lo0` must join the 236.1.1.1 group (source).

```
config router multicast
  config interface
    edit port6
      set pim-mode sparse-mode
    next
    edit port1
      set pim-mode sparse-mode
    next
    edit lo0
      set pim-mode sparse-mode
      set rp-candidate enable
        config join-group
          edit 236.1.1.1
          next
        end
      set rp-candidate-priority 1
    next
  end
set multicast-routing enable
  config pim-sm-global
    set bsr-allow-quick-refresh enable
    set bsr-candidate enable
    set bsr-interface lo0
    set bsr-priority 200
  end
end
```

Adding the NAT multicast policy

In this example, the incoming multicast policy does the address translation. The NAT address should be the same as the IP address of the of loopback interface. The DNAT address is the translated address, which should be a new group.

```
config firewall multicast-policy
  edit 1
    set dstintf port6
    set srcintf lo0
  next
  edit 2
    set dnat 238.1.1.1
    set dstintf lo0
    set nat 1.4.50.4
    set srcintf port1
next
```

Configuration steps

In this sample, FortiGate-500A_1 is the RP for the group 228.1.1.1, 237.1.1.1, 238.1.1.1, and FortiGate-500A_4 is the RP for the other group which has a priority of1. OSPF is used in this example to distribute routes including the loopback interface. All firewalls have full mesh security policies to allow any to any.

- In the FortiGate-500A_1 configuration, the NAT policy translates source address 236.1.1.1 to 237.1.1.1
- In the FortiGate-500A_4, configuration, the NAT policy translates source 236.1.1.1 to 238.1.1.1
- Source 236.1.1.1 is injected into network as well.

The following procedures include the CLI commands for configuring each of the FortiGate units in the example configuration.

To configure FortiGate-500A_1

1 Configure multicast routing.

```
config router multicast
  config interface
    edit port5
      set pim-mode sparse-mode
    next
    edit port4
      set pim-mode sparse-mode
    next
    edit lan
      set pim-mode sparse-mode
    next
    edit port1
      set pim-mode sparse-mode
    next
    edit lo999
      set pim-mode sparse-mode
    next
    edit lo0
      set pim-mode sparse-mode
      set rp-candidate enable
      set rp-candidate-group 1
    next
  end
set multicast-routing enable
  config pim-sm-global
    set bsr-candidate enable
    set bsr-interface lo0
  end
end
```

2 Add multicast security policies.

```
config firewall multicast-policy
  edit 1
    set dstintf port5
    set srcintf port4
  next
  edit 2
    set dstintf port4
    set srcintf port5
  next
  edit 3
  next
end
```

3 Add router access lists.

```
config router access-list
  edit 1
    config rule
      edit 1
        set prefix 228.1.1.1 255.255.255.255
        set exact-match enable
      next
      edit 2
        set prefix 237.1.1.1 255.255.255.255
        set exact-match enable
      next
      edit 3
        set prefix 238.1.1.1 255.255.255.255
        set exact-match enable
      next
    end
  next
end
```

To configure FortiGate-500A_2

1 Configure multicast routing.

```
config router multicast
  config interface
    edit "lan"
      set pim-mode sparse-mode
    next
    edit "port5"
      set pim-mode sparse-mode
    next
    edit "port2"
      set pim-mode sparse-mode
    next
    edit "port4"
      set pim-mode sparse-mode
    next
    edit "lo_5"
      set pim-mode sparse-mode
        config join-group
          edit 236.1.1.1
          next
        end
      next
    end
  set multicast-routing enable
end
```

2 Add multicast security policies.

```
config firewall multicast-policy
  edit 1
    set dstintf lan
    set srcintf port5
  next
```

```
    edit 2
      set dstintf port5
      set srcintf lan
    next
    edit 4
      set dstintf lan
      set srcintf port2
    next
    edit 5
      set dstintf port2
      set srcintf lan
    next
    edit 7
      set dstintf port1
      set srcintf port2
    next
    edit 8
      set dstintf port2
      set srcintf port1
      next
      edit 9
      set dstintf port5
      set srcintf port2
    next
    edit 10
      set dstintf port2
      set srcintf port5
    next
    edit 11
      set dnat 237.1.1.1
      set dstintf lo_5
      set nat 5.5.5.5
      set srcintf port2
    next
    edit 12
      set dstintf lan
      set srcintf lo_5
    next
    edit 13
      set dstintf port1
      set srcintf lo_5
    next
    edit 14
      set dstintf port5
      set srcintf lo_5
    next
    edit 15
      set dstintf port2
      set srcintf lo_5
    next
    edit 16
    next
  end
```

To configure FortiGate-500A_3

1 Configure multicast routing.

```
config router multicast
  config interface
    edit port5
      set pim-mode sparse-mode
    next
    edit port6
      set pim-mode sparse-mode
    next
    edit lo0
      set pim-mode sparse-mode
      set rp-candidate enable
      set rp-candidate-priority 255
    next
    edit lan
      set pim-mode sparse-mode
    next
  end
set multicast-routing enable
  config pim-sm-global
    set bsr-candidate enable
    set bsr-interface lo0
  end
end
```

2 Add multicast security policies.

```
config firewall multicast-policy
  edit 1
    set dstintf port5
    set srcintf port6
  next
  edit 2
    set dstintf port6
    set srcintf port5
  next
  edit 3
    set dstintf port6
    set srcintf lan
  next
  edit 4
    set dstintf lan
    set srcintf port6
  next
  edit 5
    set dstintf port5
    set srcintf lan
  next
  edit 6
    set dstintf lan
    set srcintf port5
  next
end
```

To configure FortiGate-500A_4

1 Configure multicast routing.

```
config router multicast
  config interface
    edit port6
      set pim-mode sparse-mode
    next
    edit lan
      set pim-mode sparse-mode
    next
    edit port1
      set pim-mode sparse-mode
    next
    edit lo0
      set pim-mode sparse-mode
      set rp-candidate enable
        config join-group
          edit 236.1.1.1
          next
        end
      set rp-candidate-priority 1
    next
  end
set multicast-routing enable
  config pim-sm-global
    set bsr-allow-quick-refresh enable
    set bsr-candidate enable
    set bsr-interface lo0
    set bsr-priority 1
  end
end
```

2 Add multicast security policies.

```
config firewall policy
  edit 1
    set srcintf lan
    set dstintf port6
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
  edit 2
    set srcintf port6
    set dstintf lan
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
```

```
edit 3
  set srcintf port1
  set dstintf port6
  set srcaddr all
  set dstaddr all
  set action accept
  set schedule always
  set service ANY
next
edit 4
  set srcintf port6
  set dstintf port1
  set srcaddr all
  set dstaddr all
  set action accept
  set schedule always
  set service ANY
next
edit 5
  set srcintf port1
  set dstintf lan
  set srcaddr all
  set dstaddr all
  set action accept
  set schedule always
  set service ANY
next
edit 6

Virtual LANs

Virtual Local Area Networks (VLANs) multiply the capabilities of your FortiGate unit, and can also provide added network security. Virtual LANs (VLANs) use ID tags to logically separate devices on a network into smaller broadcast domains. These smaller domains forward packets only to devices that are part of that VLAN domain. This reduces traffic and increases network security.

A Local Area Network (LAN) is a group of connected computers and devices that are arranged into network broadcast domains. A LAN broadcast domain includes all the computers that receive a packet broadcast from any computer in that broadcast domain. A switch will automatically forward the packets to all of its ports; in contrast, routers do not automatically forward network broadcast packets. This means routers separate broadcast domains. If a network has only switches and no routers, that network is considered one broadcast domain, no matter how large or small it is. Smaller broadcast domains are more efficient because fewer devices receive unnecessary packets. They are more secure as well because a hacker reading traffic on the network will have access to only a small portion of the network instead of the entire network's traffic.

Virtual LANs (VLANs) use ID tags to logically separate a LAN into smaller broadcast domains. Each VLAN is its own broadcast domain. Smaller broadcast domains reduce traffic and increase network security. The IEEE 802.1Q standard defines VLANs. All layer-2 and layer-3 devices along a route must be 802.1Q-compliant to support VLANs along that route. For more information, see "VLAN switching and routing" on page 504 and "VLAN layer-3 routing" on page 507.

VLANs reduce the size of the broadcast domains by only forwarding packets to interfaces that are part of that VLAN or part of a VLAN trunk link. Trunk links form switch-to-switch or switch-to-router connections, and forward traffic for all VLANs. This enables a VLAN to include devices that are part of the same broadcast domain, but physically distant from each other.

VLAN ID tags consist of a 4-byte frame extension that switches and routers apply to every packet sent and received in the VLAN. Workstations and desktop computers, which are commonly originators or destinations of network traffic, are not an active part of the VLAN process. All the VLAN tagging and tag removal is done after the packet has left the computer. For more information, see "VLAN ID rules" on page 504.

Any FortiGate unit without VDOMs enabled can have a maximum of 255 interfaces in transparent operating mode. The same is true for any single VDOM. In NAT mode, the number can range from 255 to 8192 interfaces per VDOM, depending on the FortiGate model. These numbers include VLANs, other virtual interfaces, and physical interfaces. To have more than 255 interfaces configured in transparent operating mode, you need to configure multiple VDOMs that enable you to divide the total number of interfaces over all the VDOMs.

One example of an application of VLANs is a company's accounting department. Accounting computers may be located at both main and branch offices. However, accounting computers need to communicate with each other frequently and require increased security. VLANs allow the accounting network traffic to be sent only to accounting computers and to connect accounting computers in different locations as if they were on the same physical subnet.

This guide uses the term "packet" to refer to both layer-2 frames and layer-3 packets.

VLAN ID rules

Layer-2 switches and layer-3 devices add VLAN ID tags to the traffic as it arrives and remove them before they deliver the traffic to its final destination. Devices such as PCs and servers on the network do not require any special configuration for VLANs. Twelve bits of the 4-byte VLAN tag are reserved for the VLAN ID number. Valid VLAN ID numbers are from 1 to 4094, while 0 is used for high priority frames, and 4095 is reserved.

On a layer-2 switch, you can have only one VLAN subinterface per physical interface, unless that interface is configured as a trunk link. Trunk links can transport traffic for multiple VLANs to other parts of the network.

On a FortiGate unit, you can add multiple VLANs to the same physical interface. However, VLAN subinterfaces added to the same physical interface cannot have the same VLAN ID or have IP addresses on the same subnet. You can add VLAN subinterfaces with the same VLAN ID to different physical interfaces.

Creating VLAN subinterfaces with the same VLAN ID does not create any internal connection between them. For example a VLAN ID of 300 on port1 and VLAN ID of 300 on port2 are allowed, but they are not connected. Their relationship is the same as between any two FortiGate network interfaces.

VLAN switching and routing

VLAN switching takes place on the OSI model layer-2, just like other network switching. VLAN routing takes place on the OSI model layer-3. The difference between them is that during VLAN switching, VLAN packets are simply forwarded to their destination. This is different from VLAN routing where devices can open the VLAN packets and change their VLAN ID tags to route the packets to a new destination.

VLAN layer-2 switching

Ethernet switches are layer-2 devices, and generally are 802.1Q compliant. Layer 2 refers to the second layer of the seven layer Open Systems Interconnect (OSI) basic networking model; the Data Link layer. FortiGate units act as layer-2 switches or bridges when they are in transparent mode. The units simply tag and forward the VLAN traffic or receive and remove the tags from the packets. A layer-2 device does not inspect incoming packets or change their contents; it only adds or removes tags and routes the packet.

A VLAN can have any number of physical interfaces assigned to it. Multiple VLANs can be assigned to the same physical interface. Typically two or more physical interfaces are assigned to a VLAN, one for incoming and one for outgoing traffic. Multiple VLANs can be configured on one FortiGate unit, including trunk links.

Layer-2 VLAN example

To better understand VLAN operation, this example shows what happens to a data frame on a network that uses VLANs.

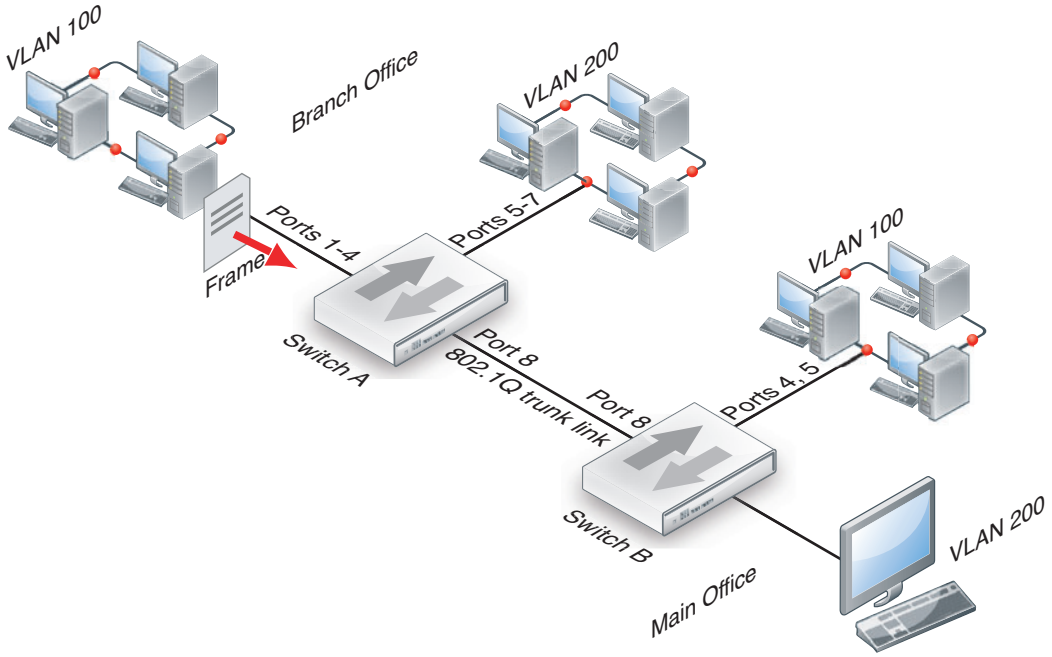
The network topology consists of two 8-port switches that are configured to support VLANs on a network. Both switches are connected through port 8 using an 802.1Q trunk link. Subnet 1 is connected to switch A, and subnet 2 is connected to switch B. The ports on the switches are configured as follows.

Table 28: How ports and VLANs are used on Switch A and B

Switch	Ports	VLAN
A	1 - 4	100
A	5 - 7	200
A & B	8	Trunk link
B	4 - 5	100
B	6	200

In this example, switch A is connected to the Branch Office and switch B to the Main Office.

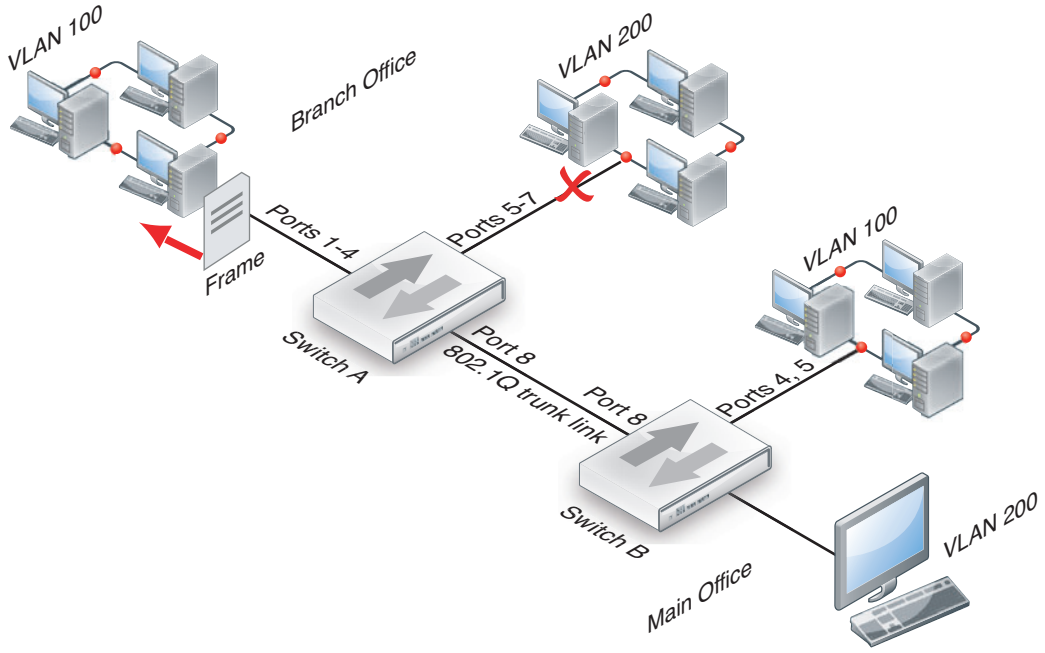
1 A computer on port 1 of switch A sends a data frame over the network.



2 Switch A tags the data frame with a VLAN 100 ID tag upon arrival because port 1 is part of VLAN 100.

3 Switch A forwards the tagged data frame to the other VLAN 100 ports — ports 2 through 4. Switch A also forwards the data frame to the 802.1Q trunk link (port 8) so other parts of the network that may contain VLAN 100 groups will receive VLAN 100 traffic.

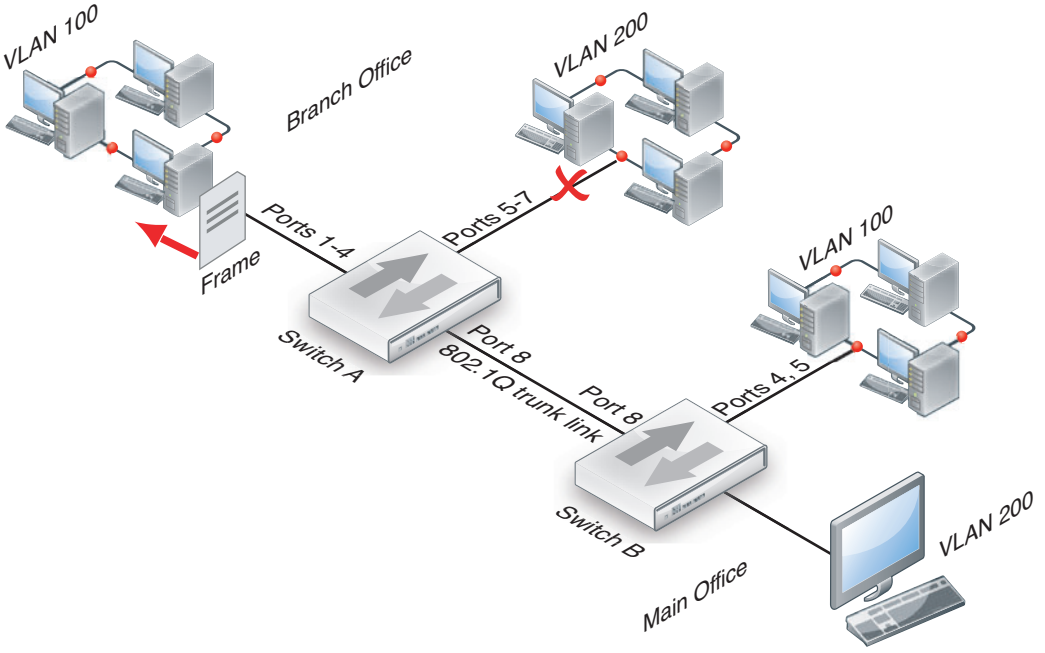
This data frame is not forwarded to the other ports on switch A because they are not part of VLAN 100. This increases security and decreases network traffic.



4 Switch B receives the data frame over the trunk link (port 8).

5 Because there are VLAN 100 ports on switch B (ports 4 and 5), the data frame is forwarded to those ports. As with switch A, the data frame is not delivered to VLAN 200.

If there were no VLAN 100 ports on switch B, the switch would not forward the data frame and it would stop there.



6 The switch removes the VLAN 100 ID tag before it forwards the data frame to an end destination.

The sending and receiving computers are not aware of any VLAN tagging on the data frames that are being transmitted. When any computer receives that data frame, it appears as a normal data frame.

VLAN layer-3 routing

Routers are layer-3 devices. Layer 3 refers to the third layer of the OSI networking model, the Network layer. FortiGate units in NAT mode act as layer-3 devices. As with layer 2, FortiGate units acting as layer-3 devices are 802.1Q-compliant.

The main difference between layer-2 and layer-3 devices is how they process VLAN tags. Layer-2 switches just add, read and remove the tags. They do not alter the tags or do any other high-level actions. Layer-3 routers not only add, read and remove tags but also analyze the data frame and its contents. This analysis allows layer-3 routers to change the VLAN tag if it is appropriate and send the data frame out on a different VLAN.

In a layer-3 environment, the 802.1Q-compliant router receives the data frame and assigns a VLAN ID. The router then forwards the data frame to other members of the same VLAN broadcast domain. The broadcast domain can include local ports, layer-2 devices and layer-3 devices such as routers and firewalls. When a layer-3 device receives the data frame, the device removes the VLAN tag and examines its contents to decide what to do with the data frame. The layer-3 device considers:

- source and destination addresses
- protocol
- port number.

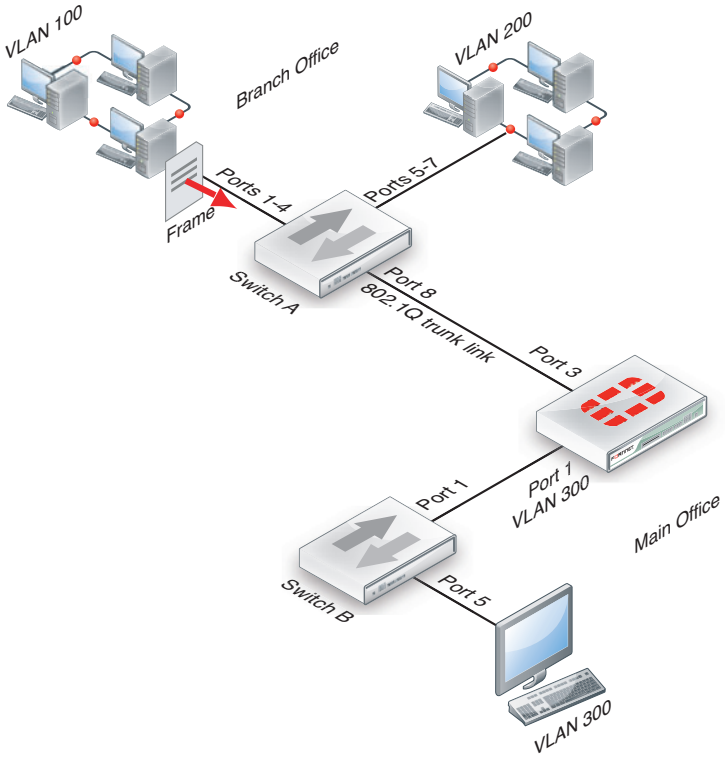
The data frame may be forwarded to another VLAN, sent to a regular non-VLAN-tagged network or just forwarded to the same VLAN as a layer-2 switch would do. Or, the data frame may be discarded if the proper security policy has been configured to do so.

Layer-3 VLAN example

In this example, switch A is connected to the Branch Office subnet, the same as subnet 1 in the layer-2 example. In the Main Office subnet, VLAN 300 is on port 5 of switch B. The FortiGate unit is connected to switch B on port 1 and the trunk link connects the FortiGate unit's port 3 to switch A. The other ports on switch B are unassigned.

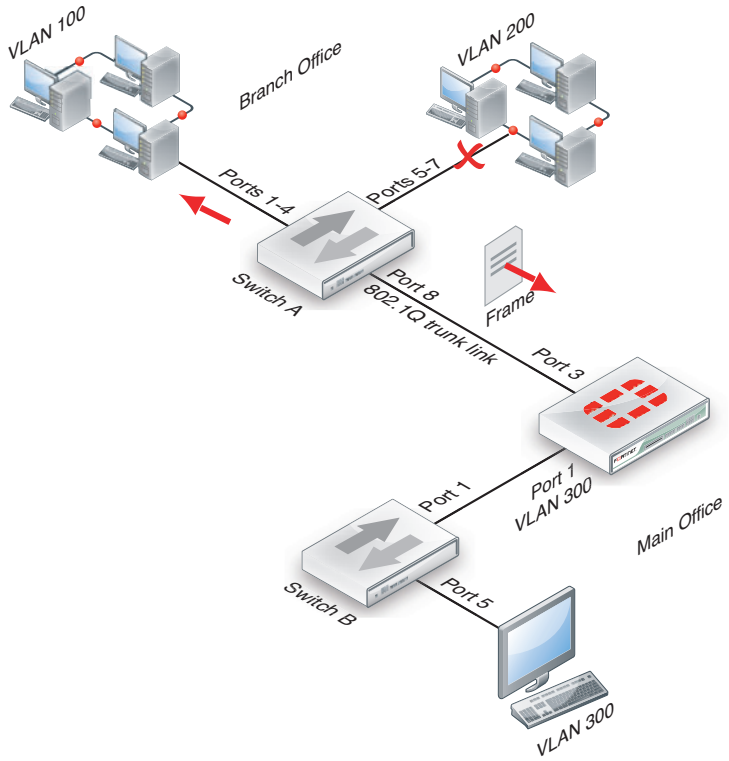
This example explains how traffic can change VLANs originating on VLAN 100 and arriving at a destination on VLAN 300. Layer-2 switches alone cannot accomplish this, but a layer-3 router can.

1 The VLAN 100 computer at the Branch Office sends the data frame to switch A, where the VLAN 100 tag is added.



2 Switch A forwards the tagged data frame to the FortiGate unit over the 802.1Q trunk link, and to the VLAN 100 interfaces on Switch A.

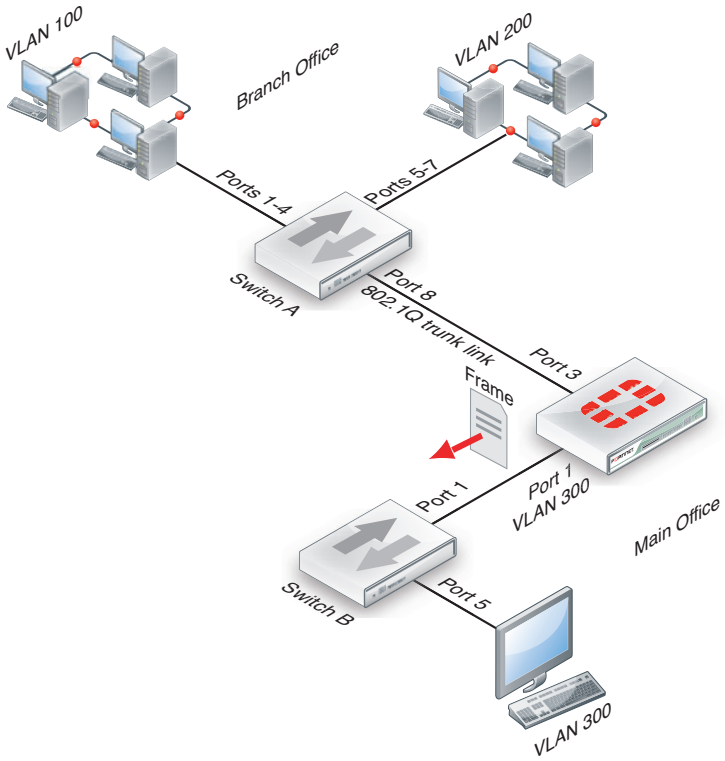
Up to this point everything is the same as in the layer-2 example.



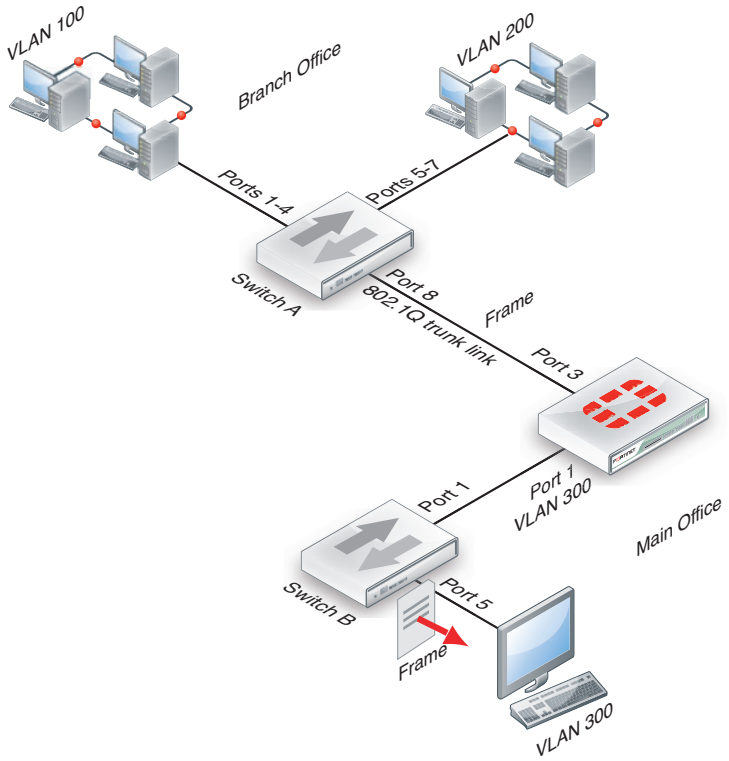
3 The FortiGate unit removes the VLAN 100 tag, and inspects the content of the data frame. The FortiGate unit uses the content to select the correct security policy and routing options.

4 The FortiGate unit's security policy allows the data frame to go to VLAN 300 in this example. The data frame will be sent to all VLAN 300 interfaces, but in the example there is only port 1 on the FortiGate unit. Before the data frame leaves, the FortiGate unit adds the VLAN ID 300 tag to the data frame.

This is the step that layer 2 cannot do. Only layer 3 can retag a data frame as a different VLAN.



5 Switch B receives the data frame, and removes the VLAN ID 300 tag, because this is the last hop, and forwards the data frame to the computer on port 5.



In this example, a data frame arrived at the FortiGate unit tagged as VLAN 100. After checking its content, the FortiGate unit retagged the data frame for VLAN 300. It is this change from VLAN 100 to VLAN 300 that requires a layer-3 routing device, in this case the FortiGate unit. Layer-2 switches cannot perform this change.

VLANs in NAT mode

In NAT mode the FortiGate unit functions as a layer-3 device. In this mode, the FortiGate unit controls the flow of packets between VLANs, but can also remove VLAN tags from incoming VLAN packets. The FortiGate unit can also forward untagged packets to other networks, such as the Internet.

In NAT mode, the FortiGate unit supports VLAN trunk links with IEEE 802.1Q-compliant switches, or routers. The trunk link transports VLAN-tagged packets between physical subnets or networks. When you add VLAN sub-interfaces to the FortiGate unit physical interfaces, the VLANs have IDs that match the VLAN IDs of packets on the trunk link. The FortiGate unit directs packets with VLAN IDs to sub-interfaces with matching IDs.

You can define VLAN sub-interfaces on all FortiGate physical interfaces. However, if multiple virtual domains are configured on the FortiGate unit, you will have access to only the physical interfaces on your virtual domain. The FortiGate unit can tag packets leaving on a VLAN subinterface. It can also remove VLAN tags from incoming packets and add a different VLAN tag to outgoing packets.

Normally in VLAN configurations, the FortiGate unit's internal interface is connected to a VLAN trunk, and the external interface connects to an Internet router that is not configured for VLANs. In this configuration the FortiGate unit can apply different policies for traffic on each VLAN interface connected to the internal interface, which results in less network traffic and better security.

Adding VLAN subinterfaces

A VLAN subinterface, also called a VLAN, is a virtual interface on a physical interface. The subinterface allows routing of VLAN tagged packets using that physical interface, but it is separate from any other traffic on the physical interface.

Adding a VLAN subinterface includes configuring:

- Physical interface
- IP address and netmask
- VLAN ID
- VDOM

Physical interface

The term VLAN subinterface correctly implies the VLAN interface is not a complete interface by itself. You add a VLAN subinterface to the physical interface that receives VLAN-tagged packets. The physical interface can belong to a different VDOM than the VLAN, but it must be connected to a network router that is configured for this VLAN. Without that router, the VLAN will not be connected to the network, and VLAN traffic will not be able to access this interface. The traffic on the VLAN is separate from any other traffic on the physical interface.

When you are working with interfaces on your FortiGate unit, use the *Column Settings* on the Interface display to make sure the information you need is displayed. When working with VLANs, it is useful to position the *VLAN ID* column close to the IP address. If you are working with VDOMs, including the *Virtual Domain* column as well will help you troubleshoot problems more quickly.

To view the Interface display, go to *System* > *Network* > *Interface*.

IP address and netmask

FortiGate unit interfaces cannot have overlapping IP addresses. The IP addresses of all interfaces must be on different subnets. This rule applies to both physical interfaces and to virtual interfaces such as VLAN subinterfaces. Each VLAN subinterface must be configured with its own IP address and netmask pair. This rule helps prevent a broadcast storm or other similar network problems.

If you are unable to change your existing configurations to prevent IP overlap, enter the CLI command `config system global` and `set ip-overlap enable` to allow IP address overlap. If you enter this command, multiple VLAN interfaces can have an IP address that is part of a subnet used by another interface. This command is recommended for advanced users only.

VLAN ID

The VLAN ID is part of the VLAN tag added to the packets by VLAN switches and routers. The VLAN ID is a number between 1 and 4094 that allow groups of IP addresses with the same VLAN ID to be associated together. VLAN ID 0 is used only for high priority frames, and 4095 is reserved.

All devices along a route must support the VLAN ID of the traffic along that route. Otherwise, the traffic will be discarded before reaching its destination. For example, if your computer is part of VLAN_100 and a co-worker on a different floor of your building is also on the same VLAN_100, you can communicate with each other over VLAN_100, only if all the switches and routers support VLANs and are configured to pass along VLAN_100 traffic properly. Otherwise, any traffic you send your co-worker will be blocked or not delivered.

VDOM

If VDOMs are enabled, each VLAN subinterface must belong to a VDOM. This rule also applies for physical interfaces.

Interface-related CLI commands require a VDOM to be specified, regardless of whether the FortiGate unit has VDOMs enabled.

VLAN subinterfaces on separate VDOMs cannot communicate directly with each other. In this situation, the VLAN traffic must exit the FortiGate unit and re-enter the unit again, passing through firewalls in both directions. This situation is the same for physical interfaces.

A VLAN subinterface can belong to a different VDOM than the physical interface it is part of. This is because the traffic on the VLAN is handled separately from the other traffic on that interface. This is one of the main strengths of VLANs.

The following procedure will add a VLAN subinterface called `VLAN_100` to the FortiGate internal interface with a VLAN ID of 100. It will have an IP address and netmask of `172.100.1.1/255.255.255.0`, and allow HTTPS, PING, and TELNET administrative access. Note that in the CLI, you must enter "`set type vlan`" before setting the vlanid, and that the allowaccess protocols are lower case.

To add a VLAN subinterface in NAT mode - web-based manager

1 If *Current VDOM* appears at the bottom left of the screen, select *Global* from the list of VDOMs.

2 Go to *System* > *Network* > *Interface*.

3 Select *Create New* to add a VLAN subinterface.

4 Enter the following:

VLAN Name	VLAN_100
Type	VLAN
Interface	internal
VLAN ID	100
Addressing Mode	Manual
IP/Netmask	172.100.1.1/255.255.255.0
Administrative Access	HTTPS, PING, TELNET

5 Select *OK*.

To view the new VLAN subinterface, select the expand arrow next to the parent physical interface (the internal interface). This will expand the display to show all VLAN subinterfaces on this physical interface. If there is no expand arrow displayed, there are no subinterfaces configured on that physical interface.

For each VLAN, the list displays the name of the VLAN, and, depending on column settings, its IP address, the Administrative access you selected for it, the VLAN ID number, and which VDOM it belongs to if VDOMs are enabled.

To add a VLAN subinterface in NAT mode - CLI

```
config system interface
  edit VLAN_100
    set interface internal
    set type vlan
    set vlanid 100
    set ip 172.100.1.1 255.255.255.0
    set allowaccess https ping telnet
end
```

Configuring security policies and routing

Once you have created a VLAN subinterface on the FortiGate unit, you need to configure security policies and routing for that VLAN. Without these, the FortiGate unit will not pass VLAN traffic to its intended destination. Security policies direct traffic through the FortiGate unit between interfaces. Routing directs traffic across the network.

Configuring security policies

Security policies permit communication between the FortiGate unit's network interfaces based on source and destination IP addresses. Interfaces that communicate with the VLAN interface need security policies to permit traffic to pass between them and the VLAN interface.

Each VLAN needs a security policy for each of the following connections the VLAN will be using:

- from this VLAN to an external network
- from an external network to this VLAN
- from this VLAN to another VLAN in the same virtual domain on the FortiGate unit
- from another VLAN to this VLAN in the same virtual domain on the FortiGate unit.

The packets on each VLAN are subject to antivirus scans and other UTM measures as they pass through the FortiGate unit.

Configuring routing

As a minimum, you need to configure a default static route to a gateway with access to an external network for outbound packets. In more complex cases, you will have to configure different static or dynamic routes based on packet source and destination addresses.

As with firewalls, you need to configure routes for VLAN traffic. VLANs need routing and a gateway configured to send and receive packets outside their local subnet just as physical interfaces do. The type of routing you configure, static or dynamic, will depend on the routing used by the subnet and interfaces you are connecting to. Dynamic routing can be routing information protocol (RIP), border gateway protocol (BGP), open shortest path first (OSPF), or multicast.

If you enable SSH, PING, TELNET, HTTPS and HTTP on the VLAN, you can use those protocols to troubleshoot your routing and test that it is properly configured. Enabling logging on the interfaces and using CLI diagnose commands such as `diagnose sniff packet <interface_name>` can also help locate any possible configuration or hardware issues.

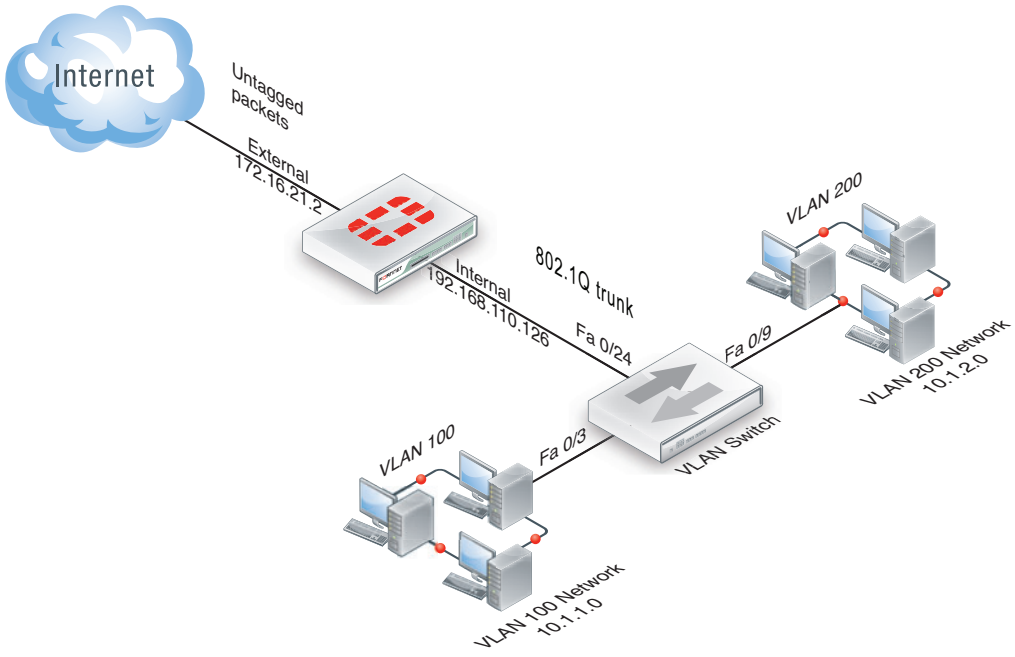
Example VLAN configuration in NAT mode

In this example two different internal VLAN networks share one interface on the FortiGate unit, and share the connection to the Internet. This example shows that two networks can have separate traffic streams while sharing a single interface. This configuration could apply to two departments in a single company, or to different companies.

There are two different internal network VLANs in this example. VLAN_100 is on the 10.1.1.0/255.255.255.0 subnet, and VLAN_200 is on the 10.1.2.0/255.255.255.0 subnet. These VLANs are connected to the VLAN switch, such as a Cisco 2950 Catalyst switch.

The FortiGate internal interface connects to the VLAN switch through an 802.1Q trunk. The internal interface has an IP address of 192.168.110.126 and is configured with two VLAN subinterfaces (VLAN_100 and VLAN_200). The external interface has an IP address of 172.16.21.2 and connects to the Internet. The external interface has no VLAN subinterfaces on it.

Figure 53: FortiGate unit with VLANs in NAT mode



When the VLAN switch receives packets from VLAN_100 and VLAN_200, it applies VLAN ID tags and forwards the packets of each VLAN both to local ports and to the FortiGate unit across the trunk link. The FortiGate unit has policies that allow traffic to flow between the VLANs, and from the VLANs to the external network.

This section describes how to configure a FortiGate-800 unit and a Cisco Catalyst 2950 switch for this example network topology. The Cisco configuration commands used in this section are IOS commands.

It is assumed that both the FortiGate-800 and the Cisco 2950 switch are installed and connected and that basic configuration has been completed. On the switch, you will need to be able to access the CLI to enter commands. Refer to the manual for your FortiGate model as well as the manual for the switch you select for more information.

It is also assumed that no VDOMs are enabled.

General configuration steps

The following steps provide an overview of configuring and testing the hardware used in this example. For best results in this configuration, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1 Configure the FortiGate unit
   - Configure the external interface
   - Add two VLAN subinterfaces to the internal network interface
   - Add firewall addresses and address ranges for the internal and external networks
   - Add security policies to allow:
     - the VLAN networks to access each other
     - the VLAN networks to access the external network.

2 Configure the VLAN switch

Configure the FortiGate unit

Configuring the FortiGate unit includes:

- Configure the external interface
- Add VLAN subinterfaces
- Add the firewall addresses
- Add the security policies

Configure the external interface

The FortiGate unit's external interface will provide access to the Internet for all internal networks, including the two VLANs.

To configure the external interface - web-based manager

1 Go to *System* > *Network* > *Interface*.

2 Select *Edit* for the external interface.

3 Enter the following information and select *OK*:

Addressing mode	Manual
IP/Netmask	172.16.21.2/255.255.255.0

To configure the external interface - CLI

```
config system interface
  edit external
    set mode static
    set ip 172.16.21.2 255.255.255.0
end
```

Add VLAN subinterfaces

This step creates the VLANs on the FortiGate unit internal physical interface. The IP address of the internal interface does not matter to us, as long as it does not overlap with the subnets of the VLAN subinterfaces we are configuring on it.

The rest of this example shows how to configure the VLAN behavior on the FortiGate unit, configure the switches to direct VLAN traffic the same as the FortiGate unit, and test that the configuration is correct.

Adding VLAN subinterfaces can be completed through the web-based manager, or the CLI.

To add VLAN subinterfaces - web-based manager

1 Go to *System* > *Network* > *Interface*.

2 Select *Create New*.

3 Enter the following information and select *OK*:

Name	VLAN_100
Interface	internal
VLAN ID	100
Addressing mode	Manual
IP/Netmask	10.1.1.1/255.255.255.0
Administrative Access	HTTPS, PING, TELNET

4 Select *Create New*.

5 Enter the following information and select *OK*:

Name	VLAN_200
Interface	internal
VLAN ID	200
Addressing mode	Manual
IP/Netmask	10.1.2.1/255.255.255.0
Administrative Access	HTTPS, PING, TELNET

To add VLAN subinterfaces - CLI

```
config system interface
  edit VLAN_100
    set vdom root
    set interface internal
    set type vlan
    set vlanid 100
    set mode static
    set ip 10.1.1.1 255.255.255.0
    set allowaccess https ping telnet
  next
  edit VLAN_200
    set vdom root
```

```
    set interface internal
    set type vlan
    set vlanid 200
    set mode static
    set ip 10.1.2.1 255.255.255.0
    set allowaccess https ping telnet
end
```

Add the firewall addresses

You need to define the addresses of the VLAN subnets for use in security policies. The FortiGate unit provides one default address, “all”, that you can use when a security policy applies to all addresses as a source or destination of a packet. However, using “all” is less secure and should be avoided when possible.

In this example, the “_Net” part of the address name indicates a range of addresses instead of a unique address. When choosing firewall address names, use informative and unique names.

To add the firewall addresses - web-based manager

1 Go to *Firewall Objects* > *Address* > *Address*.

2 Select *Create New*.

3 Enter the following information and select *OK*:

Address Name	VLAN_100_Net
Type	Subnet / IP Range
Subnet / IP Range	10.1.1.0/255.255.255.0

4 Select *Create New*.

5 Enter the following information and select *OK*:

Address Name	VLAN_200_Net
Type	Subnet / IP Range
Subnet / IP Range	10.1.2.0/255.255.255.0

To add the firewall addresses - CLI

```
config firewall address
  edit VLAN_100_Net
    set type ipmask
    set subnet 10.1.1.0 255.255.255.0
  next
  edit VLAN_200_Net
    set type ipmask
    set subnet 10.1.2.0 255.255.255.0
end
```

Add the security policies

Once you have assigned addresses to the VLANs, you need to configure security policies for them to allow valid packets to pass from one VLAN to another and to the Internet.

You can customize the Security Policy display by including some or all columns, and customize the column order onscreen. Due to this feature, security policy screenshots may not appear the same as on your screen.

If you do not want to allow all services on a VLAN, you can create a security policy for each service you want to allow. This example allows all services.

To add the security policies - web-based manager

1 Go to *Policy* > *Policy* > *Policy*.

2 Select *Create New*.

3 Enter the following information and select *OK*:

Source Interface/Zone	VLAN_100
Source Address	VLAN_100_Net
Destination Interface/Zone	VLAN_200
Destination Address	VLAN_200_Net
Schedule	Always
Service	ANY
Action	ACCEPT
Enable NAT	Enable

4 Select *Create New*.

5 Enter the following information and select *OK*:

Source Interface/Zone	VLAN_200
Source Address	VLAN_200_Net
Destination Interface/Zone	VLAN_100
Destination Address	VLAN_100_Net
Schedule	Always
Service	ANY
Action	ACCEPT
Enable NAT	Enable

6 Select *Create New*.

7 Enter the following information and select *OK*:

Source Interface/Zone	VLAN_100
Source Address	VLAN_100_Net

Destination Interface/Zone	external
Destination Address	all
Schedule	Always
Service	ANY
Action	ACCEPT
Enable NAT	Enable

8 Select *Create New*.

9 Enter the following information and select *OK*:

Source Interface/Zone	VLAN_200
Source Address	VLAN_200_Net
Destination Interface/Zone	external
Destination Address	all
Schedule	Always
Service	ANY
Action	ACCEPT
Enable NAT	Enable

To add the security policies - CLI

```
config firewall policy
  edit 1
    set srcintf VLAN_100
    set srcaddr VLAN_100_Net
    set dstintf VLAN_200
    set dstaddr VLAN_200_Net
    set schedule always
    set service ANY
    set action accept
    set nat enable
    set status enable
  next
  edit 2
    set srcintf VLAN_200
    set srcaddr VLAN_200_Net
    set dstintf VLAN_100
    set dstaddr VLAN_100_Net
    set schedule always
    set service ANY
    set action accept
    set nat enable
    set status enable
  next
  edit 3
    set srcintf VLAN_100
    set srcaddr VLAN_100_Net
```

```
    set dstintf external
    set dstaddr all
    set schedule always
    set service ANY
    set action accept
    set nat enable
    set status enable
  next
  edit 4
    set srcintf VLAN_200
    set srcaddr VLAN_200_Net
    set dstintf external
    set dstaddr all
    set schedule always
    set service ANY
    set action accept
    set nat enable
    set status enable
end
```

Configure the VLAN switch

On the Cisco Catalyst 2950 Catalyst VLAN switch, you need to define VLANs 100 and 200 in the VLAN database, and then add a configuration file to define the VLAN subinterfaces and the 802.1Q trunk interface.

One method to configure a Cisco switch is to connect over a serial connection to the console port on the switch, and enter the commands at the CLI. Another method is to designate one interface on the switch as the management interface and use a web browser to connect to the switch's graphical interface. For details on connecting and configuring your Cisco switch, refer to the installation and configuration manuals for the switch.

The switch used in this example is a Cisco Catalyst 2950 switch. The commands used are IOS commands. Refer to the switch manual for help with these commands.

To configure the VLAN subinterfaces and the trunk interfaces

Add this file to the Cisco switch:

```
!
interface FastEthernet0/3
  switchport access vlan 100
!
interface FastEthernet0/9
  switchport access vlan 200
!
interface FastEthernet0/24
  switchport trunk encapsulation dot1q
  switchport mode trunk
!
```

The switch has the configuration:

Port 0/3	VLAN ID 100
Port 0/9	VLAN ID 200
Port 0/24	802.1Q trunk

To complete the setup, configure devices on VLAN_100 and VLAN_200 with default gateways. The default gateway for VLAN_100 is the FortiGate VLAN_100 subinterface. The default gateway for VLAN_200 is the FortiGate VLAN_200 subinterface.

Test the configuration

Use diagnostic commands, such as `tracert`, to test traffic routed through the FortiGate unit and the Cisco switch.

Testing traffic from VLAN_100 to VLAN_200

In this example, a route is traced between the two internal networks. The route target is a host on VLAN_200.

Access a command prompt on a Windows computer on the VLAN_100 network, and enter the following command:

```
C:\>tracert 10.1.2.2
Tracing route to 10.1.2.2 over a maximum of 30 hops:
  1   <10 ms   <10 ms   <10 ms  10.1.1.1
  2   <10 ms   <10 ms   <10 ms  10.1.2.2
Trace complete.
```

Testing traffic from VLAN_200 to the external network

In this example, a route is traced from an internal network to the external network. The route target is the external network interface of the FortiGate-800 unit.

From VLAN_200, access a command prompt and enter this command:

```
C:\>tracert 172.16.21.2
Tracing route to 172.16.21.2 over a maximum of 30 hops:
  1   <10 ms   <10 ms   <10 ms  10.1.2.1
  2   <10 ms   <10 ms   <10 ms  172.16.21.2
Trace complete.
```

VLANs in transparent mode

In transparent mode, the FortiGate unit behaves like a layer-2 bridge but can still provide services such as antivirus scanning, web filtering, spam filtering and intrusion protection to traffic. There are some limitations in transparent mode in that you cannot use SSL VPN, PPTP/L2TP VPN, DHCP server, or easily perform NAT on traffic. The limits in transparent mode apply to IEEE 802.1Q VLAN trunks passing through the unit.

VLANs and transparent mode

You can insert the FortiGate unit operating in transparent mode into the VLAN trunk without making changes to your network. In a typical configuration, the FortiGate unit internal interface accepts VLAN packets on a VLAN trunk from a VLAN switch or router connected to internal network VLANs. The FortiGate external interface forwards VLAN-tagged packets through another VLAN trunk to an external VLAN switch or router and on to external networks such as the Internet. You can configure the unit to apply different policies for traffic on each VLAN in the trunk.

To pass VLAN traffic through the FortiGate unit, you add two VLAN subinterfaces with the same VLAN ID, one to the internal interface and the other to the external interface. You then create a security policy to permit packets to flow from the internal VLAN interface to the external VLAN interface. If required, you create another security policy to permit packets to flow from the external VLAN interface to the internal VLAN interface. Typically in transparent mode, you do not permit packets to move between different VLANs. Network protection features, such as spam filtering, web filtering and anti-virus scanning, are applied through the UTM profiles specified in each security policy, enabling very detailed control over traffic.

When the FortiGate unit receives a VLAN-tagged packet at a physical interface, it directs the packet to the VLAN subinterface with the matching VLAN ID. The VLAN tag is removed from the packet, and the FortiGate unit then applies security policies using the same method it uses for non-VLAN packets. If the packet exits the FortiGate unit through a VLAN subinterface, the VLAN ID for that subinterface is added to the packet and the packet is sent to the corresponding physical interface. For a configuration example, see “Example of VLANs in transparent mode” on page 525.

There are two essential steps to configure your FortiGate unit to work with VLANs in transparent mode:

- Add VLAN subinterfaces
- Create security policies

You can also configure the protection profiles that manage antivirus scanning, web filtering and spam filtering. For more information on UTM profiles, see “UTM Guide” on page 877.

Add VLAN subinterfaces

The VLAN ID of each VLAN subinterface must match the VLAN ID added by the IEEE 802.1Q-compliant router or switch. The VLAN ID can be any number between 1 and 4094, with 0 being used only for high priority frames and 4095 being reserved. You add VLAN subinterfaces to the physical interface that receives VLAN-tagged packets.

For this example, we are creating a VLAN called internal_v225 on the internal interface, with a VLAN ID of 225. Administrative access is enabled for HTTPS and SSH. VDOMs are not enabled.

To add VLAN subinterfaces in transparent mode - web-based manager

1 Go to *System* > *Network* > *Interface*.

2 Select *Create New*.

3 Enter the following information and select *OK*.

Name	internal_v225
Type	VLAN
Interface	internal

VLAN ID	225
Ping Server	not enabled
Administrative Access	Enable HTTPS, and SSH. These are very secure access methods.
Description	VLAN 225 on internal interface

The FortiGate unit adds the new subinterface to the interface that you selected.

Repeat steps 2 and 3 to add additional VLANs. You will need to change the *VLAN ID*, *Name*, and possibly *Interface* when adding additional VLANs.

To add VLAN subinterfaces in transparent mode - CLI

```
config system interface
  edit internal_v225
    set interface internal
    set vlanid 225
    set allowaccess HTTPS SSH
    set description "VLAN 225 on internal interface"
    set vdom root
end
```

Create security policies

In transparent mode, the FortiGate unit performs antivirus and antispam scanning on each VLAN's packets as they pass through the unit. You need security policies to permit packets to pass from the VLAN interface where they enter the unit to the VLAN interface where they exit the unit. If there are no security policies configured, no packets will be allowed to pass from one interface to another.

To add security policies for VLAN subinterfaces - web based manager

1. Go to *Firewall Objects* > *Address* > *Address*.
2. Select *Create New* to add firewall addresses that match the source and destination IP addresses of VLAN packets.
3. Go to *Policy* > *Policy* > *Policy*.
4. Select *Create New*.
5. From the Source Interface/Zone list, select the VLAN interface where packets enter the unit.
6. From the Destination Interface/Zone list, select the VLAN interface where packets exit the unit.
7. Select the Source and Destination Address names that you added in step 2.
8. Select *Protection Profile*, and select the profile from the list.
9. Configure other settings as required.
10. Select *OK*.

To add security policies for VLAN subinterfaces - CLI

```
config firewall address
edit incoming_VLAN_address
  set associated-interface <incoming_VLAN_interface>
  set type ipmask
  set subnet <IPv4_address_mask)
```

```
next
edit outgoing_VLAN_address
   set associated-interface <outgoing_VLAN_interface>
   set type ipmask
   set subnet <IPv4_address_mask>
next
end
config firewall policy
edit <unused_policy_number>
   set srcintf <incoming_VLAN_interface>
   set srcaddr incoming_VLAN_address
   set destintf <outgoing_VLAN_interface>
   set destaddr outgoing_VLAN_address
   set service <protocol_to_allow_on VLAN>
   set action ACCEPT
   set profile-status enable
   set profile <selected_profile>
next
end
end
```

Example of VLANs in transparent mode

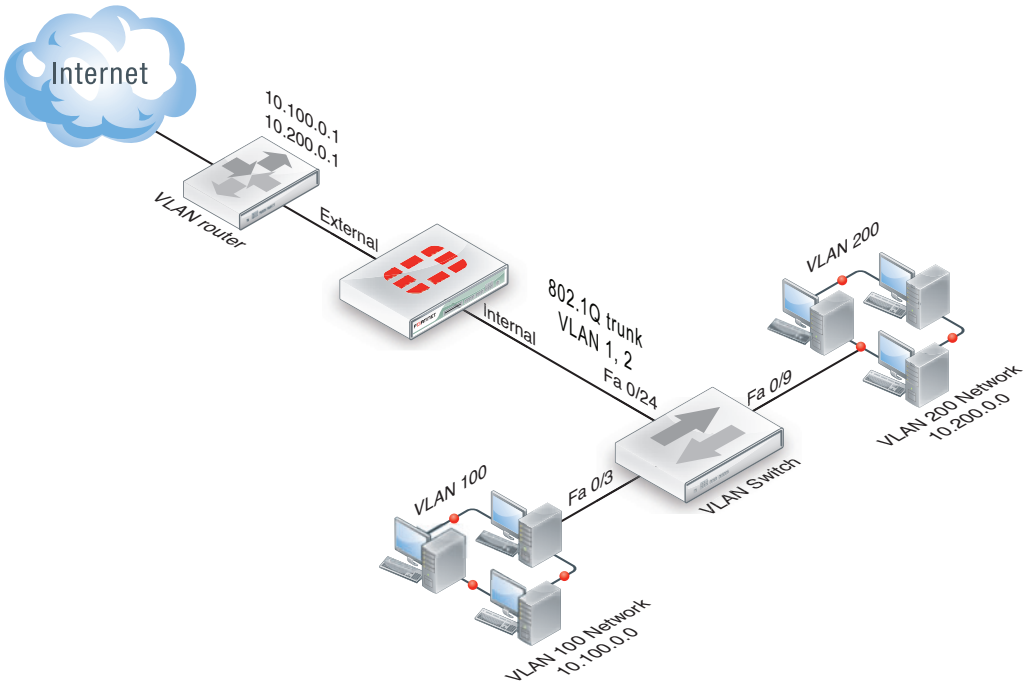
In this example, the FortiGate unit is operating in transparent mode and is configured with two VLANs: one with an ID of 100 and the other with ID 200. The internal and external physical interfaces each have two VLAN subinterfaces, one for VLAN_100 and one for VLAN_200.

The IP range for the internal VLAN_100 network is 10.100.0.0/255.255.0.0, and for the internal VLAN_200 network is 10.200.0.0/255.255.0.0.

The internal networks are connected to a Cisco 2950 VLAN switch, which combines traffic from the two VLANs onto one the FortiGate unit internal interface. The VLAN traffic leaves the FortiGate unit on the external network interface, goes on to the VLAN switch, and on to the Internet. When the FortiGate units receives a tagged packet, it directs it from the incoming VLAN subinterface to the outgoing VLAN subinterface for that VLAN.

This section describes how to configure a FortiGate-800 unit, Cisco switch, and Cisco router in the network topology shown in Figure 180.

Figure 54: VLAN transparent network topology



General configuration steps

The following steps summarize the configuration for this example. For best results, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1 Configure the FortiGate unit which includes
   - Adding VLAN subinterfaces
   - Adding the security policies
2 Configure the Cisco switch and router

Configure the FortiGate unit

The FortiGate unit must be configured with the VLAN subinterfaces and the proper security policies to enable traffic to flow through the FortiGate unit.

Add VLAN subinterfaces

For each VLAN, you need to create a VLAN subinterface on the internal interface and another one on the external interface, both with the same VLAN ID.

To add VLAN subinterfaces - web-based manager

1 Go to *System* > *Network* > *Interface*.
2 Select *Create New*.

3 Enter the following information and select *OK*:

Name	VLAN_100_int
Interface	internal
VLAN ID	100

4 Select *Create New*.

5 Enter the following information and select *OK*:

Name	VLAN_100_ext
Interface	external
VLAN ID	100

6 Select *Create New*.

7 Enter the following information and select *OK*:

Name	VLAN_200_int
Interface	internal
VLAN ID	200

8 Select *Create New*.

9 Enter the following information and select *OK*:

Name	VLAN_200_ext
Interface	external
VLAN ID	200

To add VLAN subinterfaces - CLI

```
config system interface
  edit VLAN_100_int
    set status down
    set type vlan
    set interface internal
    set vlanid 100
  next
  edit VLAN_100_ext
    set status down
    set type vlan
    set interface external
    set vlanid 100
  next
  edit VLAN_200_int
    set status down
    set type vlan
    set interface internal
    set vlanid 200
  next
```

```
edit VLAN_200_ext
  set status down
  set type vlan
  set interface external
  set vlanid 200
end
```

Add the security policies

Security policies allow packets to travel between the VLAN_100_int interface and the VLAN_100_ext interface. Two policies are required; one for each direction of traffic. The same is required between the VLAN_200_int interface and the VLAN_200_ext interface, for a total of four required security policies.

To add the security policies - web-based manager

1 Go to *Policy* > *Policy* > *Policy.*

2 Select *Create New*.

3 Enter the following information and select *OK*:

Source Interface/Zone	VLAN_100_int
Source Address	all
Destination Interface/Zone	VLAN_100_ext
Destination Address	all
Schedule	Always
Service	ANY
Action	ACCEPT

4 Select *Create New*.

5 Enter the following information and select *OK*:

Source Interface/Zone	VLAN_100_ext
Source Address	all
Destination Interface/Zone	VLAN_100_int
Destination Address	all
Schedule	Always
Service	ANY
Action	ACCEPT

6 Go to *Policy* > *Policy* > *Policy*.

7 Select *Create New*.

8 Enter the following information and select *OK*:

Source Interface/Zone	VLAN_200_int
Source Address	all
Destination Interface/Zone	VLAN_200_ext
Destination Address	all
Schedule	Always
Service	ANY
Action	ACCEPT
Enable NAT	enable

9 Select *Create New*.

10 Enter the following information and select *OK*:

Source Interface/Zone	VLAN_200_ext
Source Address	all
Destination Interface/Zone	VLAN_200_int
Destination Address	all
Schedule	Always
Service	ANY
Action	ACCEPT

To add the security policies - CLI

```
config firewall policy
  edit 1
    set srcintf VLAN_100_int
    set srcaddr all
    set dstintf VLAN_100_ext
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
  edit 2
    set srcintf VLAN_100_ext
    set srcaddr all
    set dstintf VLAN_100_int
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
  edit 3
    set srcintf VLAN_200_int
    set srcaddr all
    set dstintf VLAN_200_ext
```

```
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
  edit 4
    set srcintf VLAN_200_ext
    set srcaddr all
    set dstintf VLAN_200_int
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  end
```

Configure the Cisco switch and router

This example includes configuration for the Cisco Catalyst 2900 ethernet switch, and for the Cisco Multiservice 2620 ethernet router. If you have access to a different VLAN enabled switch or VLAN router you can use them instead, however their configuration is not included in this document.

Configure the Cisco switch

On the VLAN switch, you need to define VLAN_100 and VLAN_200 in the VLAN database and then add a configuration file to define the VLAN subinterfaces and the 802.1Q trunk interface.

Add this file to the Cisco switch:

```
interface FastEthernet0/3
 switchport access vlan 100
!
interface FastEthernet0/9
 switchport access vlan 200
!
interface FastEthernet0/24
 switchport trunk encapsulation dot1q
 switchport mode trunk
!
```

The switch has the following configuration:

Port 0/3	VLAN ID 100
Port 0/9	VLAN ID 200
Port 0/24	802.1Q trunk

Configure the Cisco router

You need to add a configuration file to the Cisco Multiservice 2620 ethernet router. The file defines the VLAN subinterfaces and the 802.1Q trunk interface on the router. The 802.1Q trunk is the physical interface on the router.

The IP address for each VLAN on the router is the gateway for that VLAN. For example, all devices on the internal VLAN_100 network will have 10.100.0.1 as their gateway.

Add this file to the Cisco router:

```
!
interface FastEthernet0/0
!
interface FastEthernet0/0.1
 encapsulation dot1Q 100
 ip address 10.100.0.1 255.255.255.0
!
interface FastEthernet0/0.2
 encapsulation dot1Q 200
 ip address 10.200.0.1 255.255.255.0
!
```

The router has the following configuration:

Port 0/0.1	VLAN ID 100
Port 0/0.2	VLAN ID 200
Port 0/0	802.1Q trunk

Test the configuration

Use diagnostic network commands such as traceroute (`tracert`) and ping to test traffic routed through the network.

Testing traffic from VLAN_100 to VLAN_200

In this example, a route is traced between the two internal networks. The route target is a host on VLAN_200. The Windows traceroute command `tracert` is used.

From VLAN_100, access a Windows command prompt and enter this command:

```
C:\>tracert 10.1.2.2
Tracing route to 10.1.2.2 over a maximum of 30 hops:
  1   <10 ms   <10 ms   <10 ms  10.1.1.1
  2   <10 ms   <10 ms   <10 ms  10.1.2.2
Trace complete.
```

Troubleshooting VLAN issues

Several problems can occur with your VLANs. Since VLANs are interfaces with IP addresses, they behave as interfaces and can have similar problems that you can diagnose with tools such as ping, traceroute, packet sniffing, and diag debug.

Asymmetric routing

You might discover unexpectedly that hosts on some networks are unable to reach certain other networks. This occurs when request and response packets follow different paths. If the FortiGate unit recognizes the response packets, but not the requests, it blocks the packets as invalid. Also, if the FortiGate unit recognizes the same packets repeated on multiple interfaces, it blocks the session as a potential attack.

This is asymmetric routing. By default, the FortiGate unit blocks packets or drops the session when this happens. You can configure the FortiGate unit to permit asymmetric routing by using the following CLI commands:

```
config vdom
  edit <vdom_name>
    config system settings
    set asymroute enable
  end
end
```

If VDOMs are enabled, this command is per VDOM. You must set it for each VDOM that has the problem. If this solves your blocked traffic issue, you know that asymmetric routing is the cause. But allowing asymmetric routing is not the best solution, because it reduces the security of your network.

For a long-term solution, it is better to change your routing configuration or change how your FortiGate unit connects to your network. The Asymmetric Routing and Other FortiGate Layer-2 Installation Issues technical note provides detailed examples of asymmetric routing situations and possible solutions.

If you enable asymmetric routing, antivirus and intrusion prevention systems will not be effective. Your FortiGate unit will be unaware of connections and treat each packet individually. It will become a stateless firewall.

Layer-2 and Arp traffic

By default, FortiGate units do not pass layer-2 traffic. If there are layer-2 protocols such as IPX, PPTP or L2TP in use on your network, you need to configure your FortiGate unit interfaces to pass these protocols without blocking. Another type of layer-2 traffic is ARP traffic. For more information on ARP traffic, see “ARP traffic” on page 532.

You can allow these layer-2 protocols using the CLI command:

```
config vdom
  edit <vdom_name>
    config system interface
    edit <name_str>
    set l2forward enable
  end
end
```

where `<name_str>` is the name of an interface.

If VDOMs are enabled, this command is per VDOM. You must set it for each VDOM that has the problem. If you enable layer-2 traffic, you may experience a problem if packets are allowed to repeatedly loop through the network. This repeated looping, very similar to a broadcast storm, occurs when you have more than one layer-2 path to a destination. Traffic may overflow and bring your network to a halt. You can break the loop by enabling Spanning Tree Protocol (STP) on your network’s switches and routers. For more information, see “STP forwarding” on page 1262.

ARP traffic

Address Resolution Protocol (ARP) packets are vital to communication on a network, and ARP support is enabled on FortiGate unit interfaces by default. Normally you want ARP packets to pass through the FortiGate unit, especially if it is sitting between a client and a server or between a client and a router.

ARP traffic can cause problems, especially in transparent mode where ARP packets arriving on one interface are sent to all other interfaces including VLAN subinterfaces. Some layer-2 switches become unstable when they detect the same MAC address originating on more than one switch interface or from more than one VLAN. This instability can occur if the layer-2 switch does not maintain separate MAC address tables for each VLAN. Unstable switches may reset and cause network traffic to slow down considerably.

Multiple VDOMs solution

By default, physical interfaces are in the root domain. If you do not configure any of your VLANs in the root VDOM, it will not matter how many interfaces are in the root VDOM.

The multiple VDOMs solution is to configure multiple VDOMs on the FortiGate unit, one for each VLAN. In this solution, you configure one inbound and one outbound VLAN interface in each VDOM. ARP packets are not forwarded between VDOMs. This configuration limits the VLANs in a VDOM and correspondingly reduces the administration needed per VDOM.

As a result of this configuration, the switches do not receive multiple ARP packets with duplicate MACs. Instead, the switches receive ARP packets with different VLAN IDs and different MACs. Your switches are stable.

However, you should ***not*** use the multiple VDOMs solution under any of the following conditions:

- you have more VLANs than licensed VDOMs
- you do not have enough physical interfaces

Instead, use one of two possible solutions, depending on which operation mode you are using:

- In NAT mode, you can use the `vlan forward` CLI command.
- In transparent mode, you can use the `forward-domain` CLI command. But you still need to be careful in some rare configurations.

Vlanforward solution

If you are using NAT mode, the solution is to use the `vlanforward` CLI command for the interface in question. By default, this command is enabled and will forward VLAN traffic to all VLANs on this interface. When disabled, each VLAN on this physical interface can send traffic only to the same VLAN. There is no ”cross-talk” between VLANs, and ARP packets are forced to take one path along the network which prevents the multiple paths problem.

In the following example, `vlanforward` is disabled on port1. All VLANs configured on port1 will be separate and will not forward any traffic to each other.

```
config system interface
  edit port1
    set vlanforward disable
end
```

Forward-domain solution

If you are using transparent mode, the solution is to use the `forward-domain` CLI command. This command tags VLAN traffic as belonging to a particular collision group, and only VLANs tagged as part of that collision group receive that traffic. It is like an additional set of VLANs. By default, all interfaces and VLANs are part of forward-domain collision group 0. The many benefits of this solution include reduced administration, the need for fewer physical interfaces, and the availability of more flexible network solutions.

In the following example, forward-domain collision group 340 includes VLAN 340 traffic on port1 and untagged traffic on port 2. Forward-domain collision group 341 includes VLAN 341 traffic on port 1 and untagged traffic on port 3. All other interfaces are part of forward-domain collision group 0 by default. This configuration separates VLANs 340 and 341 from each other on port 1, and prevents the ARP packet problems from before.

Use these CLI commands:

```
config system interface
  edit port1
  next
  edit port2
    set forward_domain 340
  next
  edit port3
    set forward_domain 341
  next
  edit port1-340
    set forward_domain 340
    set interface port1
    set vlanid 340
  next
  edit port1-341
    set forward_domain 341
    set interface port1
    set vlanid 341
end
```

You may experience connection issues with layer-2 traffic, such as ping, if your network configuration has:

- packets going through the FortiGate unit in transparent mode more than once
- more than one forwarding domain (such as incoming on one forwarding domain and outgoing on another)
- IPS and AV enabled.

Now IPS and AV is applied the first time packets go through the FortiGate unit, but not on subsequent passes. Only applying IPS and AV to this first pass fixes the network layer-2 related connection issues.

NetBIOS

Computers running Microsoft Windows operating systems that are connected through a network rely on a WINS server to resolve host names to IP addresses. The hosts communicate with the WINS server by using the NetBIOS protocol.

To support this type of network, you need to enable the forwarding of NetBIOS requests to a WINS server. The following example will forward NetBIOS requests on the internal interface for the WINS server located at an IP address of 192.168.111.222.

```
config system interface
  edit internal
    set netbios_forward enable
    set wins-ip 192.168.111.222
end
```

These commands apply only in NAT mode. If VDOMs are enabled, these commands are per VDOM. You must set them for each VDOM that has the problem.

STP forwarding

The FortiGate unit does not participate in the Spanning Tree Protocol (STP). STP is an IEEE 802.1 protocol that ensures there are no layer-2 loops on the network. Loops are created when there is more than one route for traffic to take and that traffic is broadcast back to the original switch. This loop floods the network with traffic, reducing available bandwidth to nothing.

If you use your FortiGate unit in a network topology that relies on STP for network loop protection, you need to make changes to your FortiGate configuration. Otherwise, STP recognizes your FortiGate unit as a blocked link and forwards the data to another path. By default, your FortiGate unit blocks STP as well as other non-IP protocol traffic.

Using the CLI, you can enable forwarding of STP and other layer-2 protocols through the interface. In this example, layer-2 forwarding is enabled on the external interface:

```
config system interface
  edit external
    set l2forward enable
    set stpforward enable
end
```

By substituting different commands for `stpforward enable`, you can also allow layer-2 protocols such as IPX, PPTP or L2TP to be used on the network. For more information, see “Layer-2 and Arp traffic” on page 532.

Too many VLAN interfaces

Any virtual domain can have a maximum of 255 interfaces in transparent mode. This includes VLANs, other virtual interfaces, and physical interfaces. NAT mode supports from 255 to 8192 depending on the FortiGate model. This total number of interfaces includes VLANs, other virtual interfaces, and physical interfaces.

Your FortiGate unit may allow you to configure more interfaces than this. However, if you configure more than 255 interfaces, your system will become unstable and, over time, will not work properly. As all interfaces are used, they will overflow the routing table that stores the interface information, and connections will fail. When you try to add more interfaces, an error message will state that the maximum limit has already been reached.

If you see this error message, chances are you already have too many VLANs on your system and your routing has become unstable. To verify, delete a VLAN and try to add it back. If you have too many, you will not be able to add it back on to the system. In this case, you will need to remove enough interfaces (including VLANs) so that the total number of interfaces drops to 255 or less. After doing this, you should also reboot your FortiGate unit to clean up its memory and buffers, or you will continue to experience unstable behavior.

To configure more than 255 interfaces on your FortiGate unit in transparent mode, you have to configure multiple VDOMs, each with many VLANs. However, if you want to create more than the default 10 VDOMs (or a maximum of 2550 interfaces), you must buy a license for additional VDOMs. Only FortiGate models 3000 and higher support more than 10 VDOMs.

With these extra licenses, you can configure up to 500 VDOMs, with each VDOM containing up to 255 VLANs in transparent mode. This is a theoretical maximum of over 127 500 interfaces. However, system resources will quickly get used up before reaching that theoretical maximum. To achieve the maximum number of VDOMs, you need to have top-end hardware with the most resources possible.

In NAT mode, if you have a top-end model, the maximum interfaces per VDOM can be as high as 8192, enough for all the VLANs in your configuration.

Your FortiGate unit has limited resources, such as CPU load and memory, that are divided between all configured VDOMs. When running 250 or more VDOMs, you may need to monitor the system resources to ensure there is enough to support the configured traffic processing.

PPTP and L2TP

A virtual private network (VPN) is a way to use a public network, such as the Internet, as a vehicle to provide remote offices or individual users with secure access to private networks. FortiOS supports the Point-to-Point Tunneling Protocol (PPTP), which enables interoperability between FortiGate units and Windows or Linux PPTP clients. Because FortiGate units support industry standard PPTP VPN technologies, you can configure a PPTP VPN between a FortiGate unit and most third-party PPTP VPN peers.

This section describes how to configure PPTP and L2TP VPNs as well as PPTP passthrough.

This section includes the topics:

How PPTP VPNs work

The Point-to-Point Tunneling Protocol enables you to create a VPN between a remote client and your internal network. Because it is a Microsoft Windows standard, PPTP does not require third-party software on the client computer. As long as the ISP supports PPTP on its servers, you can create a secure connection by making relatively simple configuration changes to the client computer and the FortiGate unit.

PPTP uses Point-to-Point protocol (PPP) authentication protocols so that standard PPP software can operate on tunneled PPP links. PPTP packages data in PPP packets and then encapsulates the PPP packets within IP packets for transmission through a VPN tunnel.

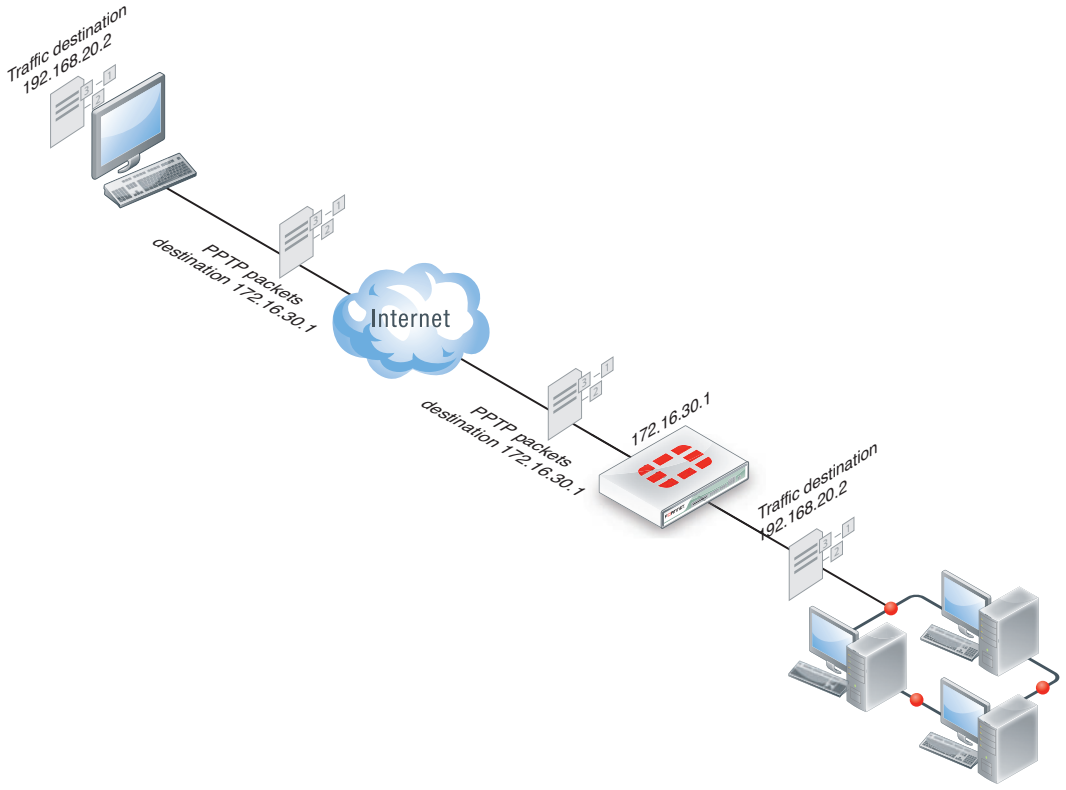
When the FortiGate unit acts as a PPTP server, a PPTP session and tunnel is created as soon as the PPTP client connects to the FortiGate unit. More than one PPTP session can be supported on the same tunnel. FortiGate units support PAP, CHAP, and plain text authentication. PPTP clients are authenticated as members of a user group.

Traffic from one PPTP peer is encrypted using PPP before it is encapsulated using Generic Routing Encapsulation (GRE) and routed to the other PPTP peer through an ISP network. PPP packets from the remote client are addressed to a computer on the private network behind the FortiGate unit. PPTP packets from the remote client are addressed to the public interface of the FortiGate unit. See Figure 55 on page 538.

PPTP control channel messages are not authenticated, and their integrity is not protected. Furthermore, encapsulated PPP packets are not cryptographically protected and may be read or modified unless appropriate encryption software such as Secure Shell (SSH) or Secure File Transfer Protocol (SFTP) is used to transfer data after the tunnel has been established.

As an alternative, you can use encryption software such as Microsoft Point-to-Point Encryption (MPPE) to secure the channel. MPPE is built into Microsoft Windows clients and can be installed on Linux clients. FortiGate units support MPPE.

Figure 55: Packet encapsulation



In Figure 55, traffic from the remote client is addressed to a computer on the network behind the FortiGate unit. When the PPTP tunnel is established, packets from the remote client are encapsulated and addressed to the FortiGate unit. The FortiGate unit forwards disassembled packets to the computer on the internal network.

When the remote PPTP client connects, the FortiGate unit assigns an IP address from a reserved range of IP addresses to the client PPTP interface. The PPTP client uses the assigned IP address as its source address for the duration of the connection.

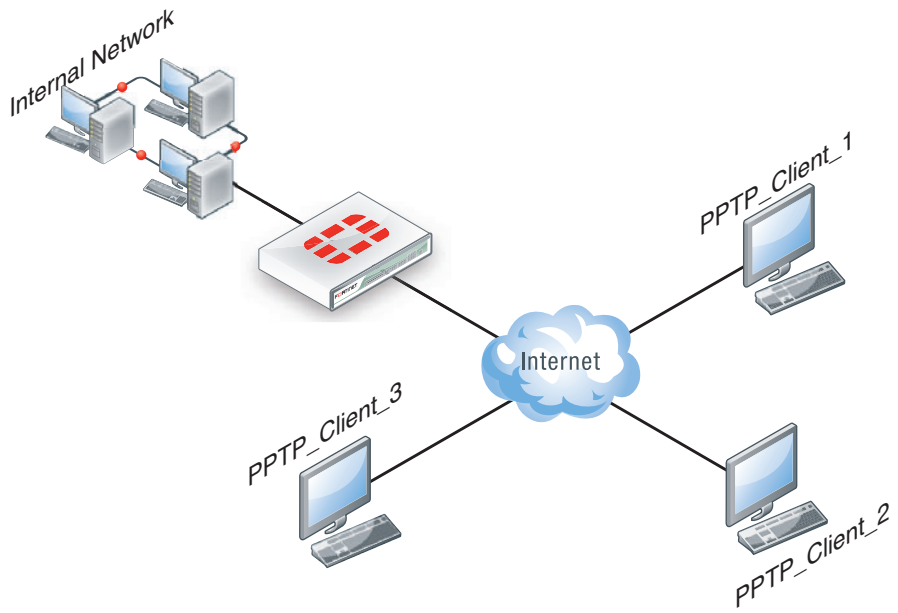
When the FortiGate unit receives a PPTP packet, the unit disassembles the PPTP packet and forwards the packet to the correct computer on the internal network. The security policy and protection profiles on the FortiGate unit ensure that inbound traffic is screened and processed securely.

PPTP clients must be authenticated before a tunnel is established. The authentication process relies on FortiGate user group definitions, which can optionally use established authentication mechanisms such as RADIUS or LDAP to authenticate PPTP clients. All PPTP clients are challenged when a connection attempt is made.

FortiGate unit as a PPTP server

In the most common Internet scenario, the PPTP client connects to an ISP that offers PPP connections with dynamically-assigned IP addresses. The ISP forwards PPTP packets to the Internet, where they are routed to the FortiGate unit.

Figure 56: FortiGate unit as a PPTP server



If the FortiGate unit will act as a PPTP server, there are a number of steps to complete:

- Configure user authentication for PPTP clients.
- Enable PPTP.
- Specify the range of addresses that are assigned to PPTP clients when connecting
- Configure the security policy.

Configuring user authentication for PPTP clients

To enable authentication for PPTP clients, you must create user accounts and a user group to identify the PPTP clients that need access to the network behind the FortiGate unit. Within the user group, you must add a user for each PPTP client.

You can choose to use a plain text password for authentication or forward authentication requests to an external RADIUS, LDAP, or TACACS+ server. If password protection will be provided through a RADIUS, LDAP, or TACACS+ server, you must configure the FortiGate unit to forward authentication requests to the authentication server.

This example creates a basic user/password combination.

Configuring a user account

To add a local user - web-based manager

1 Go to *User* > *User* > *User* and select *Create New*
2 Enter a *User Name*.
3 Enter a *Password* for the user. The password should be at least six characters.
4 Select *OK*.

To add a local user - CLI

```
config user local
  edit <username>
    set type password
    set passwd <password>
end
```

Configuring a user group

To ease configuration, create user groups that contain users in similar categories or departments.

To create a user group - web-based manager

1 Go to *User* > *User Group* > *User Group* and select *Create New*.
2 Enter a *Name* for the group.
3 Select the *Type* of *Firewall*.
4 From the *Available Users* list, select the required users and select the right-facing arrow to add them to the *Members* list.
5 Select *OK*.

To create a user group - CLI

```
config user group
  edit <group_name>
    set group-type firewall
    set members <user_names>
end
```

Enabling PPTP and specifying the PPTP IP address range

The PPTP address range specifies the range of addresses reserved for remote PPTP clients. When a PPTP client connects to the FortiGate unit, the client is assigned an IP address from this range. Afterward, the FortiGate unit uses the assigned address to communicate with the PPTP client.

The address range that you reserve can be associated with private or routable IP addresses. If you specify a private address range that matches a network behind the FortiGate unit, the assigned address will make the PPTP client appear to be part of the internal network.

PPTP requires two IP addresses, one for each end of the tunnel. The PPTP address range is the range of addresses reserved for remote PPTP clients. When the remote PPTP client establishes a connection, the FortiGate unit assigns an IP address from the reserved range of IP addresses to the client PPTP interface or retrieves the assigned IP address from the PPTP user group. If you use the PPTP user group, you must also define the FortiGate end of the tunnel by entering the IP address of the unit in *Local IP* (web-based manager) *or* `local-ip` (CLI). The PPTP client uses the assigned IP address as its source address for the duration of the connection.

PPTP configuration is only available through the CLI. In the example below, PPTP is enabled with the use of an IP range of `182.168.1.1` to `192.168.1.10` for addressing.

The start and end IPs in the PPTP address range must be in the same 24-bit subnet, for example, 192.168.1.1 - 192.168.1.254.

```
config vpn pptp
  set status enable
  set ip-mode range
  set eip 192.168.1.10
  set sip 192.168.1.1
end
```

In this example, PPTP is enabled with the use of a user group for addressing, where the IP address of the PPTP server is `192.168.1.2` and the user group is `hr_admin`.

```
config vpn pptp
  set status enable
  set ip-mode range
  set local-ip 192.168.2.1
  set usrgrp hr_admin
end
```

Adding the security policy

The security policy specifies the source and destination addresses that can generate traffic inside the PPTP tunnel and defines the scope of services permitted through the tunnel. If a selection of services are required, define a service group.

To configure the firewall for the PPTP tunnel - web-based manager

1 Go to *Policy* > *Policy* > *Policy* and select *Create New*.

2 Complete the following and select *OK*:

Source Interface/Zone	The FortiGate interface connected to the Internet.
Source Address	Select the name that corresponds to the range of addresses that you reserved for PPTP clients
Destination Interface/Zone	The FortiGate interface connected to the internal network.
Destination Address	Select the name that corresponds to the IP addresses behind the FortiGate unit
Schedule	always
Service	ANY
Action	ACCEPT

Do not select identity-based policy, as this will cause the PPTP access to fail. Authentication is configured in the PPTP configuration setup.

To configure the firewall for the PPTP tunnel - CLI

```
config firewall policy
  edit 1
    set srcintf <interface to internet>
    set dstintf <interface to internal network>
    set srcaddr <reserved_range>
    set dstaddr <internal_addresses>
    set action accept
    set schedule always
    set service ANY
end
```

Configuring the FortiGate unit for PPTP VPN

To arrange for PPTP packets to pass through the FortiGate unit to an external PPTP server, perform the following tasks in the order given:

- Configure user authentication for PPTP clients.
- Enable PPTP on the FortiGate unit and specify the range of addresses that can be assigned to PPTP clients when they connect.
- Configure PPTP pass through on the FortiGate unit.

Configuring the FortiGate unit for PPTP pass through

To forward PPTP packets to a PPTP server on the network behind the FortiGate unit, you need to perform the following configuration tasks on the FortiGate unit:

- Define a virtual IP address that points to the PPTP server.

- Create a security policy that allows incoming PPTP packets to pass through to the PPTP server.

The address range is the external (public) ip address range which requires access to the internal PPTP server through the FortiGate virtual port-forwarding firewall.
IP addresses used in this document are fictional and follow the technical documentation guidelines specific to Fortinet. Real external IP addresses are not used.

Configuring a virtual IP address

The virtual IP address will be the address of the PPTP server host.

To define a virtual IP for PPTP pass through - web-based manager

1 Go to *Firewall Objects* > *Virtual IP* > *Virtual IP*.
2 Select *Create New*.
3 Enter the name of the VIP, for example, `PPTP_Server`.
4 Select the *External Interface* where the packets will be received for the PPTP server.
5 Enter the *External IP Address* for the VIP.
6 Select *Port Forwarding*.
7 Set the *Protocol* to *TCP*.
8 Enter the *External Service Port* of `1723`, the default for PPTP.
9 Enter the *Map to Port* to `1723`.
10 Select *OK*.

To define a virtual IP for PPTP pass through - web-based manager

```
config firewall vip
  edit PPTP_Server
    set extinf <interface>
    set extip <ip_address>
    set portforward enable
    set protocol tcp
    set extport 1723
    set mappedport 1723
end
```

Configuring a port-forwarding security policy

To create a port-forwarding security policy for PPTP pass through you must first create an address range reserved for the PPTP clients.

To create an address range - web-based manager

1 Go to *Firewall Objects* > Address > *Address* and select *Create New*.
2 Enter a *Name* for the range, for example, `External_PPTP`.
3 Select a *Type* of *Subnet/IP Range*.
4 Enter the IP address range.
5 Select the *Interface* to the Internet.
6 Select *OK*.

To create an address range - CLI

```
config firewall address
  edit External_PPTP
    set iprange <ip_range>
    set start-ip <ip_address>
    set end-ip <ip_address>
    set associated-interface <internet_interface>
end
```

With the address set, you can add the security policy.

To add the security policy - web-based manager

1 Go to *Policy* > *Policy* > *Policy* and select *Create New*.

2 Complete the following and select *OK*:

Source Interface/Zone	The FortiGate interface connected to the Internet.
Source Address	Select the address range created in the previous step.
Destination Interface/Zone	The FortiGate interface connected to the PPTP server.
Destination Address	Select the VIP address created in the previous steps.
Schedule	always
Service	PPTP
Action	ACCEPT

To add the security policy - CLI

```
config firewall policy
  edit <policy_number>
    set srcintf <interface to internet>
    set dstintf <interface to PPTP server>
    set srcaddr <address_range>
    set dstaddr <PPTP_server_address>
    set action accept
    set schedule always
    set service PPTP
end
```

Testing PPTP VPN connections

To confirm that a PPTP VPN between a local network and a dialup client has been configured correctly, at the dialup client, issue a ping command to test the connection to the local network. The PPTP VPN tunnel initializes when the dialup client attempts to connect.

Logging VPN events

PPTP VPN, activity is logged when enabling VPN logging. The FortiGate unit connection events and tunnel status (up/down) are logged.

To log VPN events

1 Go to *Log&Report* > *Log Config* > *Log Setting*.

2 Enable the storage of log messages to one or more locations.

3 Select *L2TP/PPTP/PPPoE* service event.

4 Select *Apply*.

To view event logs

1 Go to *Log&Report* > *Log & Archive Access* > *Event Log*.

2 If the option is available from the Log Type list, select the log file from disk or memory.

Configuring L2TP VPNs

This section describes how to configure a FortiGate unit to establish a Layer Two Tunneling Protocol (L2TP) tunnel with a remote dialup client. The FortiGate implementation of L2TP enables a remote dialup client to establish an L2TP tunnel with the FortiGate unit directly.

According to RFC 2661, an Access Concentrator (LAC) can establish an L2TP tunnel with an L2TP Network Server (LNS). In a typical scenario, the LAC is managed by an ISP and located on the ISP premises; the LNS is the gateway to a private network. When a remote dialup client connects to the Internet through the ISP, the ISP uses a local database to establish the identity of the caller and determine whether the caller needs access to an LNS through an L2TP tunnel. If the services registered to the caller indicate that an L2TP connection to the LNS is required, the ISP LAC attempts to establish an L2TP tunnel with the LNS.

A FortiGate unit can be configured to act as an LNS. The FortiGate implementation of L2TP enables a remote dialup client to establish an L2TP tunnel with the FortiGate unit directly, bypassing any LAC managed by an ISP. The ISP must configure its network access server to forward L2TP traffic from the remote client to the FortiGate unit directly whenever the remote client requires an L2TP connection to the FortiGate unit.

When the FortiGate unit acts as an LNS, an L2TP session and tunnel is created as soon as the remote client connects to the FortiGate unit. The FortiGate unit assigns an IP address to the client from a reserved range of IP addresses. The remote client uses the assigned IP address as its source address for the duration of the connection.

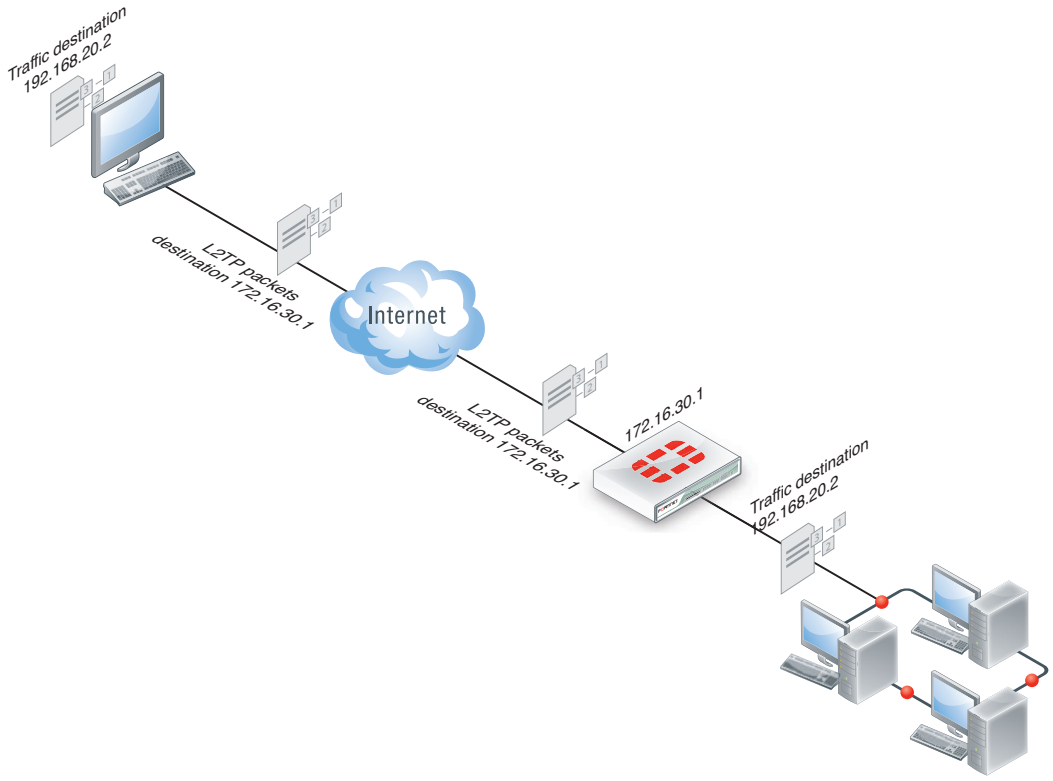
More than one L2TP session can be supported on the same tunnel. FortiGate units can be configured to authenticate remote clients using a plain text user name and password, or authentication can be forwarded to an external RADIUS or LDAP server. L2TP clients are authenticated as members of a user group.

FortiGate units support L2TP with Microsoft Point-to-Point Encryption (MPPE) encryption only. Later implementations of Microsoft L2TP for Windows use IPSec and require certificates for authentication and encryption. If you want to use Microsoft L2TP with IPSec to connect to a FortiGate unit, the IPSec and certificate elements must be disabled on the remote client

Traffic from the remote client must be encrypted using MPPE before it is encapsulated and routed to the FortiGate unit. Packets originating at the remote client are addressed to a computer on the private network behind the FortiGate unit. Encapsulated packets are addressed to the public interface of the FortiGate unit. See Figure 57.

When the FortiGate unit receives an L2TP packet, the unit disassembles the packet and forwards the packet to the correct computer on the internal network. The security policy and protection profiles on the FortiGate unit ensure that inbound traffic is screened and processed securely.

Figure 57: L2TP encapsulation

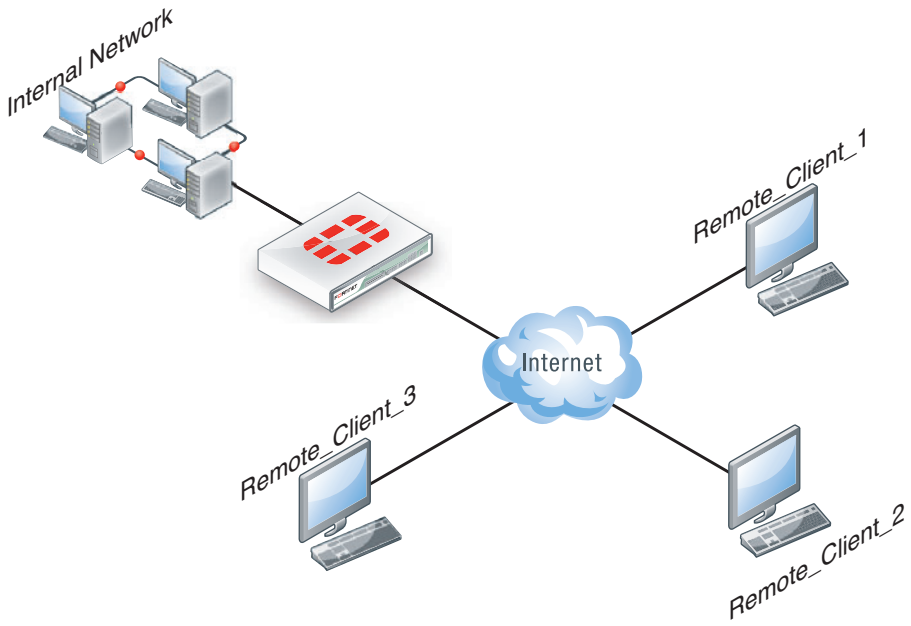


Fortinet units cannot deliver non-IP traffic such as Frame Relay or ATM frames encapsulated in L2TP packets — FortiGate units support the IPv4 and IPv6 addressing schemes only.

Network topology

The remote client connects to an ISP that determines whether the client requires an L2TP connection to the FortiGate unit. If an L2TP connection is required, the connection request is forwarded to the FortiGate unit directly.

Figure 58: Example L2TP configuration



L2TP infrastructure requirements

- The FortiGate unit must be operating in NAT mode and have a static public IP address.
- The ISP must configure its network access server to forward L2TP traffic from remote clients to the FortiGate unit directly.
- The remote client must not generate non-IP traffic (Frame Relay or ATM frames).
- The remote client includes L2TP support with MPPE encryption. If the remote client includes Microsoft L2TP with IPSec, the IPSec and certificate components must be disabled.

L2TP configuration overview

To configure a FortiGate unit to act as an LNS, you perform the following tasks on the FortiGate unit:

- Create an L2TP user group containing one user for each remote client.
- Enable L2TP on the FortiGate unit and specify the range of addresses that can be assigned to remote clients when they connect.
- Define firewall source and destination addresses to indicate where packets transported through the L2TP tunnel will originate and be delivered.
- Create the security policy and define the scope of permitted services between the source and destination addresses.
- Configure the remote clients.

Authenticating L2TP clients

L2TP clients must be authenticated before a tunnel is established. The authentication process relies on FortiGate user group definitions, which can optionally use established authentication mechanisms such as RADIUS or LDAP to authenticate L2TP clients. All L2TP clients are challenged when a connection attempt is made.

To enable authentication, you must create user accounts and a user group to identify the L2TP clients that need access to the network behind the FortiGate unit.

You can choose to use a plain text password for authentication or forward authentication requests to an external RADIUS or LDAP server. If password protection will be provided through a RADIUS or LDAP server, you must configure the FortiGate unit to forward authentication requests to the authentication server.

Enabling L2TP and specifying an address range

The L2TP address range specifies the range of addresses reserved for remote clients. When a remote client connects to the FortiGate unit, the client is assigned an IP address from this range. Afterward, the FortiGate unit uses the assigned address to communicate with the remote client.

The address range that you reserve can be associated with private or routable IP addresses. If you specify a private address range that matches a network behind the FortiGate unit, the assigned address will make the remote client appear to be part of the internal network.

To enable L2TP and specify the L2TP address range, use the `config vpn l2tp` CLI command.

The following example shows how to enable L2TP and set the L2TP address range using a starting address of `192.168.10.80` and an ending address of `192.168.10.100` for an existing group of L2TP users named `L2TP_users`:

```
config vpn l2tp
  set sip 192.168.10.80
  set eip 192.168.10.100
  set status enable
  set usrgrp L2TP_users
end
```

Defining firewall source and destination addresses

Before you define the security policy, you must define the source and destination addresses of packets that are to be transported through the L2TP tunnel:

- For the source address, enter the range of addresses that you reserved for remote L2TP clients (for example `192.168.10.[80-100]`).
- For the destination address, enter the IP addresses of the computers that the L2TP clients need to access on the private network behind the FortiGate unit (for example, `172.16.5.0/24` for a subnet, or `172.16.5.1` for a server or host, or `192.168.10.[10-15]` for an IP address range).

To define the firewall source address

1. Go to *Firewall Objects* > *Address* and select *Create New*.
2. In the *Address Name* field, type a name that represents the range of addresses that you reserved for remote clients (for example, `Ext_L2TPrange`).
3. In *Type*, select *Subnet / IP Range*.
4. In the *Subnet / IP Range* field, type the corresponding IP address range.

5 In *Interface*, select the FortiGate interface that connects to the clients.

This is usually the interface that connects to the Internet.

6 Select *OK*.

To define the firewall destination address

1 Go to *Firewall Objects* > *Address* and select *Create New*.

2 In the *Address Name* field, type a name that represents a range of IP addresses on the network behind the FortiGate unit (for example, `Int_L2TPaccess`).

3 In *Type*, select *Subnet / IP Range*.

4 In the *Subnet / IP Range* field, type the corresponding IP address range.

5 In *Interface*, select the FortiGate interface that connects to the network behind the FortiGate unit.

6 Select *OK*.

Adding the security policy

The security policy specifies the source and destination addresses that can generate traffic inside the L2TP tunnel and defines the scope of services permitted through the tunnel. If a selection of services are required, define a service group.

To define the traffic and services permitted inside the L2TP tunnel

1 Go to *Policy* > *Policy* > *Policy* and select *Create New*.

2 Enter these settings in particular:

Source Interface/Zone	Select the FortiGate interface to the Internet.
Source Address	Select the name that corresponds to the range of addresses that you reserved for L2TP clients (for example, `Ext_L2TPrange`).
Destination Interface/Zone	Select the FortiGate interface to the internal (private) network.
Destination Address	Select the name that corresponds to the IP addresses behind the FortiGate unit (for example, `Int_L2TPaccess`).
Service	Select ANY, or if selected services are required instead, select the service group that you defined previously.
Action	Select ACCEPT.

3 You may enable NAT, a protection profile, and/or event logging, or select *Enable Identity Based Policy* to add authentication or shape traffic. For more information on identity based policies, see the *Firewall* chapter of the handbook.

4 Select *OK*.

Configuring a Linux client

The following procedure outlines how to install L2TP client software and run an L2TP tunnel on a Linux computer. Obtain an L2TP client package that meets your requirements (for example, `rp-l2tp`). If needed to encrypt traffic, obtain L2TP client software that supports encryption using MPPE.

To establish an L2TP tunnel with a FortiGate unit that has been set up to accept L2TP connections, you can obtain and install the client software following these guidelines:

1. If encryption is required but MPPE support is not already present in the kernel, download and install an MPPE kernel module and reboot your computer.
2. Download and install the L2TP client package.
3. Configure an L2TP connection to run the L2TP program.
4. Configure routes to determine whether all or some of your network traffic will be sent through the tunnel. You must define a route to the remote network over the L2TP link and a host route to the FortiGate unit.
5. Run `l2tpd` to start the tunnel.

Follow the software supplier's documentation to complete the steps.

To configure the system, you need to know the public IP address of the FortiGate unit, and the user name and password that has been set up on the FortiGate unit to authenticate L2TP clients. Contact the FortiGate administrator if required to obtain this information.

Monitoring L2TP sessions

You can display a list of all active sessions and view activity by port number. By default, port 1701 is used for L2TP VPN-related communications. If required, active sessions can be stopped from this view. Use the Top Sessions Dashboard Widget.

Testing L2TP VPN connections

To confirm that a VPN between a local network and a dialup client has been configured correctly, at the dialup client, issue a ping command to test the connection to the local network. The VPN tunnel initializes when the dialup client attempts to connect.

Logging L2TP VPN events

You can configure the FortiGate unit to log VPN events. For L2TP VPNs, connection events and tunnel status (up/down) are logged.

To log VPN events - web-based manager

1. Go to *Log&Report* > *Log Config* > *Log Setting*.
2. Enable the storage of log messages to one or more locations.
3. Select *Enable*, and then select *L2TP/PPTP/PPPoE service event*.
4. Select *Apply*.

To log VPN events - CLI

```
config log memory setting
  set diskfull overright
  set status enable
end
config log eventfilter
  set ppp
end
```

Session helpers

The FortiOS firewall can analyze most TCP/IP protocol traffic by comparing packet header information to security policies. This comparison determines whether to accept or deny the packet and the session that the packet belongs to.

Some protocols include information in the packet body (or payload) that must be analyzed to successfully process sessions for this protocol. For example, the SIP VoIP protocol uses TCP control packets with a standard destination port to set up SIP calls. But the packets that carry the actual conversation can use a variety of UDP protocols with a variety of source and destination port numbers. The information about the protocols and port numbers used for a SIP call is contained in the body of the SIP TCP control packets. To successfully process SIP VoIP calls, FortiOS must be able to extract information from the body of the SIP packet and use this information to allow the voice-carrying packets through the firewall.

FortiOS uses session helpers to analyze the data in the packet bodies of some protocols and adjust the firewall to allow those protocols to send packets through the firewall.

This section includes the topics:

Viewing the session helper configuration

You can view the session helpers enabled on your FortiGate unit in the CLI using the commands below. The following output shows the first two session helpers. The number of session helpers can vary to around 20.

```
show system session-helper
  config system session-helper
    edit 1
      set name pptp
      set port 1723
      set protocol 6
    end
    next
      set name h323
      set port 1720
      set protocol 6
    next
    end
    .
    .
```

The configuration for each session helper includes the name of the session helper and the port and protocol number on which the session helper listens for sessions. Session helpers listed on protocol number 6 (TCP) or 17 (UDP). For a complete list of protocol numbers see: Assigned Internet Protocol Numbers.

For example, the output above shows that FortiOS listens for PPTP packets on TCP port 1723 and H.323 packets on port TCP port 1720.

If a session helper listens on more than one port or protocol the more than one entry for the session helper appears in the `config system session-helper` list. For example, the pmap session helper appears twice because it listens on TCP port 111 and UDP port 111. The rsh session helper appears twice because it listens on TCP ports 514 and 512.

Changing the session helper configuration

Normally you will not need to change the configuration of the session helpers. However in some cases you may need to change the protocol or port the session helper listens on.

Changing the protocol or port that a session helper listens on

Most session helpers are configured to listen for their sessions on the port and protocol that they typically use. If your FortiGate unit receives sessions that should be handled by a session helper on a non-standard port or protocol you can use the following procedure to change the port and protocol used by a session helper. The following example shows how to change the port that the pmap session helper listens on for Sun RPC portmapper TCP sessions. By default pmap listens on TCP port 111.

To change the port that the pmap session helper listens on to TCP port 112

1 Confirm that the TCP pmap session helper entry is 11 in the session-helper list:

```
show system session-helper 11
  config system session-helper
    edit 11
      set name pmap
      set port 111
      set protocol 6
    next
  end
```

2 Enter the following command to change the TCP port to 112.

```
config system session-helper
  edit 11
    set port 112
  end
```

3 The pmap session helper also listens on UDP port 111. Confirm that the UDP pmap session helper entry is 12 in the session-helper list:

```
show system session-helper 12
  config system session-helper
    edit 12
      set name pmap
      set port 111
      set protocol 17
    next
  end
```

4 Enter the following command to change the UDP port to 112.

```
config system session-helper
  edit 12
    set port 112
  end
end
```

Use the following command to set the h323 session helper to listen for ports on the UDP protocol.

To change the protocol that the h323 session helper listens on

1 Confirm that the h323 session helper entry is 2 in the session-helper list:

```
show system session-helper 2
  config system session-helper
    edit 2
      set name h323
      set port 1720
      set protocol 6
    next
  end
```

2 Enter the following command to change the protocol to UDP.

```
config system session-helper
  edit 2
    set protocol 17
  end
end
```

If a session helper listens on more than one port or protocol, then multiple entries for the session helper must be added to the session helper list, one for each port and protocol combination. For example, the rtsp session helper listens on TCP ports 554, 7070, and 8554 so there are three rtsp entries in the session-helper list. If your FortiGate unit receives rtsp packets on a different TCP port (for example, 6677) you can use the following command to configure the rtsp session helper to listen on TCP port 6677.

To configure a session helper to listen on a new port and protocol

```
config system session-helper
  edit 0
    set name rtsp
    set port 6677
    set protocol 6
end
```

Disabling a session helper

In some cases you may need to disable a session helper. Disabling a session helper just means removing it from the session-helper list so that the session helper is not listening on a port. You can completely disable a session helper by deleting all of its entries from the session helper list. If there are multiple entries for a session helper on the list you can delete one of the entries to prevent the session helper from listening on that port.

To disable the mgcp session helper from listening on UDP port 2427

1 Enter the following command to find the mgcp session helper entry that listens on UDP port 2427:

```
show system session-helper
  .
  .
  .
edit 19
  set name mgcp
  set port 2427
  set protocol 17
next
  .
  .
  .
```

2 Enter the following command to delete session-helper list entry number 19 to disable the mgcp session helper from listening on UDP port 2427:

```
config system session-helper
  delete 19
```

By default the mgcp session helper listens on UDP ports 2427 and 2727. The previous procedure shows how to disable the mgcp protocol from listening on port 2427. The following procedure completely disables the mgcp session helper by also disabling it from listening on UDP port 2727.

To completely disable the mgcp session helper

1 Enter the following command to find the mgcp session helper entry that listens on UDP port 2727:

```
show system session-helper
  .
  .
  .
edit 20
  set name mgcp
  set port 2727
  set protocol 17
```

```
next
  .
  .
  .
```

2 Enter the following command to delete session-helper list entry number 20 to disable the mgcp session helper from listening on UDP port 2727:

```
config system session-helper
  delete 20
```

DCE-RPC session helper (dcerpc)

Distributed Computing Environment Remote Procedure Call (DCE-RPC) provides a way for a program running on one host to call procedures in a program running on another host. DCE-RPC (also called MS RPC for Microsoft RPC) is similar to ONC-RPC. Because of the large number of RPC services, for example, MAPI, the transport address of an RPC service is dynamically negotiated based on the service program's universal unique identifier (UUID). The Endpoint Mapper (EPM) binding protocol in FortiOS maps the specific UUID to a transport address.

To accept DCE-RPC sessions you must add a security policy with service set to any or to the DEC-RPC pre-defined service (which listens on TCP and UDP ports 135). The dcerpc session helper also listens on TCP and UDP ports 135.

The session allows FortiOS to handle DCE-RPC dynamic transport address negotiation and to ensure UUID-based security policy enforcement. You can define a security policy to permit all RPC requests or to permit by specific UUID number.

In addition, because a TCP segment in a DCE-RPC stream might be fragmented, it might not include an intact RPC PDU. This fragmentation occurs in the RPC layer; so FortiOS does not support parsing fragmented packets.

DNS session helpers (dns-tcp and dns-udp)

FortiOS includes two DNS session helpers, dns-tcp, a session helper for DNS over TCP, and dns-udp, a session helper for DNS over UDP. The DNS session helpers monitor DNS query and reply packets and close sessions if the DNS flag indicates the packet is a reply message.

To accept DNS sessions you must add a security policy with service set to any or to the DNS pre-defined service (which listens on TCP and UDP ports 53). The dns-udp session helper also listens on UDP port 53. By default the dns-tcp session helper is disabled. If needed you can use the following command to enable the dns-tcp session helper to listen for DNS sessions on TCP port 53:

```
config system session-helper
  edit 0
    set name dns-tcp
    set port 53
    set protocol 6
end
```

File transfer protocol (FTP) session helper (ftp)

The FTP session helper monitors PORT, PASV and 227 commands and NATs the IP addresses and port numbers in the body of the FTP packets and opens ports on the FortiGate unit as required.

To accept FTP sessions you must add a security policy with service set to any or to the FTP, FTP_Put, and FTP_GET pre-defined services (which all listen on TCP port 21).

H.245 session helpers (h245I and h245O)

H.245 is a control channel protocol used for H.323 and other similar communication sessions. H.245 sessions transmit non-telephone signals. H.245 sessions carry information needed for multimedia communication, such as encryption, flow control jitter management and others.

FortiOS includes two H.245 sessions helpers, h245I which is for H.245 call in and h245O which is for H.245 call out sessions. There is no standard port for H.245. By default the H.245 sessions helpers are disabled. You can enable them as you would any other session helper. When you enable them, you should specify the port and protocol on which the FortiGate unit receives H.245 sessions.

H.323 and RAS session helpers (h323 and ras)

The H.323 session helper supports secure H.323 voice over IP (VoIP) sessions between terminal endpoints such as IP phones and multimedia devices. In H.323 VoIP networks, gatekeeper devices manage call registration, admission, and call status for VoIP calls. The FortiOS h323 session helper supports gatekeepers installed on two different networks or on the same network.

To accept H.323 sessions you must add a security policy with service set to any or to the H323 pre-defined service (which listens on TCP port numbers 1720 and 1503 and on UDP port number 1719). The h323 session helper listens on TCP port 1720.

The ras session helper is used with the h323 session helper for H.323 Registration, Admission, and Status (RAS) services. The ras session helper listens on UDP port 1719.

Alternate H.323 gatekeepers

The h323 session helper supports using H.323 alternate gatekeepers. All the H.323 end points must register with a gatekeeper through the Registration, Admission, and Status (RAS) protocol before they make calls. During the registration process, the primary gatekeeper sends Gatekeeper Confirm (GCF) and Registration Confirm (RCF) messages to the H.323 end points that contain the list of available alternate gatekeepers.

The alternate gatekeeper provides redundancy and scalability for the H.323 end points. If the primary gatekeeper fails the H.323 end points that have registered with that gatekeeper are automatically registered with the alternate gatekeeper. To use the H.323 alternate gatekeeper, you need to configure security policies that allow H.323 end points to reach the alternate gatekeeper.

Media Gateway Controller Protocol (MGCP) session helper (mgcp)

The Media Gateway Control Protocol (MGCP) is a text-based application layer protocol used for VoIP call setup and control. MGCP uses a master-slave call control architecture in which the media gateway controller uses a call agent to maintain call control intelligence, while the media gateways perform the instructions of the call agent.

To accept MGCP sessions you must add a security policy with service set to any or to the MGCP pre-defined service (which listens on UDP port numbers 2427 and 2727). The h323 session helper also listens on UDP port numbers 2427 and 2727.

The MGCP session helper does the following:

- VoIP signalling payload inspection. The payload of the incoming VoIP signalling packet is inspected and malformed packets are blocked.
- Signaling packet body inspection. The payload of the incoming MGCP signaling packet is inspected according to RFC 3435. Malformed packets are blocked.
- Stateful processing of MGCP sessions. State machines are invoked to process the parsed information. Any out-of-state or out-of-transaction packet is identified and properly handled.
- MGCP Network Address Translation (NAT). Embedded IP addresses and ports in packet bodies is properly translated based on current routing information and network topology, and is replaced with the translated IP address and port number, if necessary.
- Manages pinholes for VoIP traffic. To keep the VoIP network secure, the IP address and port information used for media or signalling is identified by the session helper, and pinholes are dynamically created and closed during call setup.

ONC-RPC portmapper session helper (pmap)

Open Network Computing Remote Procedure Call (ONC-RPC) is a widely deployed remote procedure call system. Also called Sun RPC, ONC-RPC allows a program running on one host to call a program running on another. The transport address of an ONC-RPC service is dynamically negotiated based on the service's program number and version number. Several binding protocols are defined for mapping the RPC program number and version number to a transport address.

To accept ONC-RPC sessions you must add a security policy with service set to any or to the ONC-RPC pre-defined service (which listens on TCP and UDP port number 111). The RPC portmapper session helper (called pmap) handles the dynamic transport address negotiation mechanisms of ONC-RPC.

PPTP session helper for PPTP traffic (pptp)

The PPTP session help supports port address translation (PAT) for PPTP traffic. PPTP provides IP security at the Network Layer. PPTP consists of a control session and a data tunnel. The control session runs over TCP and helps in establishing and disconnecting the data tunnel. The data tunnel handles encapsulated Point-to-Point Protocol (PPP) packets carried over IP.

To accept PPTP sessions that pass through the FortiGate unit you must add a security policy with service set to any or to the PPTP pre-defined service (which listens on IP port 47 and TCP port 1723). The pptp session helper listens on TCP port 1723.

PPTP uses TCP port 1723 for control sessions and Generic Routing Encapsulation (GRE) (IP protocol 47) for tunneling the encapsulated PPP data. The GRE traffic carries no port number, making it difficult to distinguish between two clients with the same public IP address. PPTP uses the source IP address and the Call ID field in the GRE header to identify a tunnel. When multiple clients sharing the same IP address establish tunnels with the same PPTP server, they may get the same Call ID. The call ID value can be translated in both the control message and the data traffic, but only when the client is in a private network and the server is in a public network.

PPTP clients can either directly connect to the Internet or dial into a network access server to reach the Internet. A FortiGate unit that protects PPTP clients can translate the clients' private IP addresses to a pool of public IP addresses using NAT port translation (NAT-PT). Because the GRE traffic carries no port number for address translation, the pptp session helper treats the Call ID field as a port number as a way of distinguishing multiple clients.

After the PPTP establishing a TCP connection with the PPTP server, the client sends a start control connection request message to establish a control connection. The server replies with a start control connection reply message. The client then sends a request to establish a call and sends an outgoing call request message. FortiOS assigns a Call ID (bytes 12-13 of the control message) that is unique to each PPTP tunnel. The server replies with an outgoing call reply message that carries its own Call ID in bytes 12-13 and the client's call ID in bytes 14-15. The pptp session helper parses the control connection messages for the Call ID to identify the call to which a specific PPP packet belongs. The session helper also identifies an outgoing call request message using the control message type field (bytes 8-9) with the value 7. When the session helper receives this message, it parses the control message for the call ID field (bytes 12-13). FortiOS translates the call ID so that it is unique across multiple calls from the same translated client IP. After receiving outgoing call response message, the session helper holds this message and opens a port that accepts GRE traffic that the PPTP server sends. An outgoing call request message contains the following parts:

- The protocol used for the outgoing call request message (usually GRE)
- Source IP address (PPTP server IP)
- Destination IP address (translated client IP)
- Destination port number (translated client call ID)

The session helper identifies an outgoing call reply message using the control message type field (bytes 8-9) with the value 8. The session helper parses these control messages for the call ID field (bytes 12-13) and the client's call ID (bytes 14-15). The session helper then uses the client's call ID value to find the mapping created for the other direction, and then opens a pinhole to accept the GRE traffic that the client sends.

An outgoing call reply message contains the following parts:

- Protocol used for the outgoing call reply message (usually GRE)
- Source IP address (PPTP client IP)
- Destination IP address (PPTP server IP)
- Destination port number (PPTP server Call ID)

Each port that the session opens creates a session for data traffic arriving in that direction. The session helper opens the following two data sessions for each tunnel:

- Traffic from the PPTP client to the server, using the server's call ID as the destination port
- Traffic from the PPTP server to the client, using the client's translated call ID as the destination port

The default timeout value of the control connection is 30 minutes. The session helper closes the pinhole when the data session exceeds the timeout value or is idle for an extended period.

Remote shell session helper (rsh)

Using the remote shell program (RSH), authenticated users can run shell commands on remote hosts. RSH sessions most often use TCP port 514. To accept RSH sessions you must add a security policy with service set to any or to the RSH pre-defined service (which listens on TCP port number 514).

FortiOS automatically invokes the rsh session helper to process all RSH sessions on TCP port 514. The rsh session helper opens ports required for the RSH service to operate through a FortiGate unit running NAT or transparent and supports port translation of RSH traffic.

Real-Time Streaming Protocol (RTSP) session helper (rtsp)

The Real-Time Streaming Protocol (RTSP) is an application layer protocol often used by SIP to control the delivery of multiple synchronized multimedia streams, for example, related audio and video streams. Although RTSP is capable of delivering the data streams itself it is usually used like a network remote control for multimedia servers. The protocol is intended for selecting delivery channels (like UDP, multicast UDP, and TCP) and for selecting a delivery mechanism based on the Real-Time Protocol (RTP). RTSP may also use the SIP Session Description Protocol (SDP) as a means of providing information to clients for aggregate control of a presentation consisting of streams from one or more servers, and non-aggregate control of a presentation consisting of multiple streams from a single server.

To accept RTSP sessions you must add a security policy with service set to any or to the RTSP pre-defined service (which listens on TCP ports 554, 770, and 8554 and on UDP port 554). The rtsp session helper listens on TCP ports 554, 770, and 8554.

The rtsp session help is required because RTSP uses dynamically assigned port numbers that are communicated in the packet body when end points establish a control connection. The session helper keeps track of the port numbers and opens pinholes as required. In Network Address Translation (NAT) mode, the session helper translates IP addresses and port numbers as necessary.

In a typical RTSP session the client starts the session (for example, when the user selects the Play button on a media player application) and establishes a TCP connection to the RTSP server on port 554. The client then sends an OPTIONS message to find out what audio and video features the server supports. The server responds to the OPTIONS message by specifying the name and version of the server, and a session identifier, for example, 24256-1.

The client then sends the DESCRIBE message with the URL of the actual media file the client wants to play. The server responds to the DESCRIBE message with a description of the media in the form of SDP code. The client then sends the SETUP message, which specifies the transport mechanisms acceptable to the client for streamed media, for example RTP/RTCP or RDT, and the ports on which it receives the media.

In a NAT configuration the rtsp session helper keeps track of these ports and addresses translates them as necessary. The server responds to the SETUP message and selects one of the transport protocols. When both client and server agree on a mechanism for media transport the client sends the PLAY message, and the server begins streaming the media.

Session Initiation Protocol (SIP) session helper (sip)

The sip session helper is described in “The SIP session helper” on page 2536.

Trivial File Transfer Protocol (TFTP) session helper (tftp)

To accept TFTP sessions you must add a security policy with service set to any or to the TFTP pre-defined service (which listens on UDP port number 69). The TFTP session helper also listens on UTP port number 69.

TFTP initiates transfers on UDP port 69, but the actual data transfer ports are selected by the server and client during initialization of the connection. The tftp session helper reads the transfer ports selected by the TFTP client and server during negotiation and opens these ports on the firewall so that the TFTP data transfer can be completed. When the transfer is complete the tftp session helper closes the open ports.

Oracle TNS listener session helper (tns)

The Oracle Transparent Network Substrate (TNS) listener listens on port TCP port 1521 for network requests to be passed to a database instance. The Oracle TNS listener session helper (tns) listens for TNS sessions on TCP port 1521. TNS is a foundation technology built into the Oracle Net foundation layer and used by SQLNET.

Advanced concepts

This chapter provides configuration concepts and techniques to enhance your network security.

This section includes the topics:

Dual internet connections

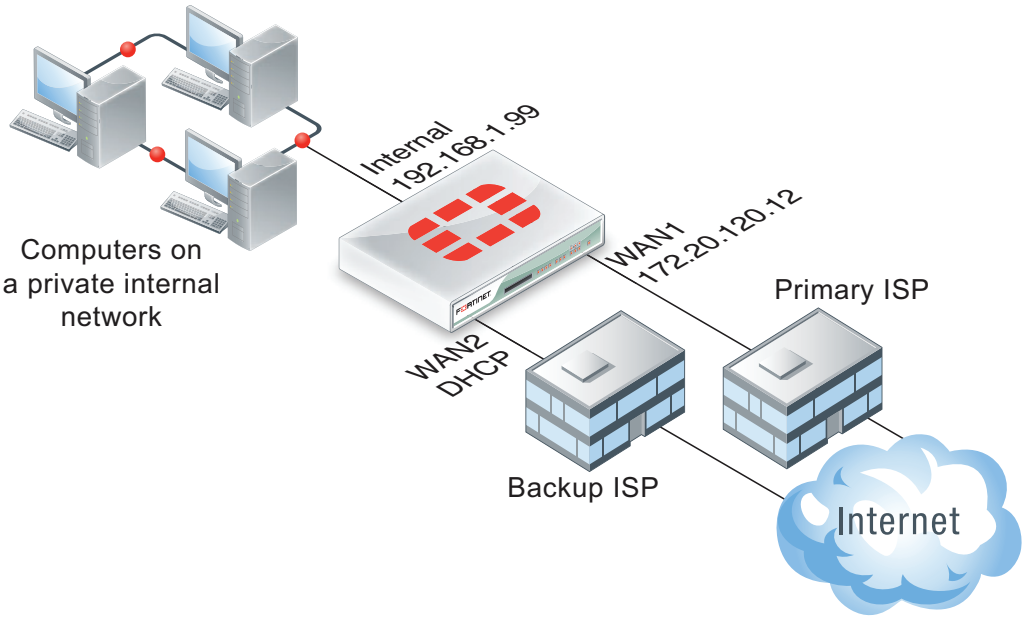
Dual internet connection, dual WAN, or redundant internet connection refers to using two FortiGate interfaces to connect to the Internet. Dual internet connections can be used in three ways:

- redundant interfaces, should one interface go down, the second automatically becomes the main internet connection
- for load sharing to ensure better throughput.
- a combination of redundancy and load sharing.

Redundant interfaces

Redundant interfaces, ensures that should your internet access be no longer available through a certain port, the FortiGate unit will use an alternate port to connect to the Internet.

Figure 59: Configuring redundant interfaces



In this scenario, two interfaces, WAN1 and WAN2 are connected to the Internet using two different ISPs. WAN1 is the primary connection. In an event of a failure of WAN1, WAN2 automatically becomes the connection to the Internet. For this configuration to function correctly, you need to configure three specific settings:

- configure a ping server to determine when the primary interface (WAN1) is down and when the connection returns
- configure a default route for each interface.
- configure security policies to allow traffic through each interface to the internal network.

Ping server

Adding a ping server is required for routing fail over traffic. A ping server will confirm the connectivity of the device's interface

To add a ping server - web-based manager

1. Go to *Router* > *Static* > *Settings* and select *Create New*.
2. Select the *Interface* that will send ping requests.
3. For the *Ping Server* field, enter the IP address of a server that the FortiGate unit will send ping requests to. This is typically a next hop router or gateway device.
4. Select the *Detect Protocol* type.
5. For the *Ping Interval* field, enter the number of seconds to send ping requests.
6. For the *Failover Threshold*, enter the number of lost pings is acceptable before the port is determined to be down.
7. Select *OK*.

To add a ping server - CLI

```
config router gwdetect
  edit wan1
    set server <ISP_IP_address>
    set failtime <failure_count>
    set interval <seconds>
end
```

Routing

You need to configure a default route for each interface and indicate which route is preferred by specifying the distance. The lower distance is declared active and placed higher in the routing table.

When you have dual WAN interfaces that are configured to provide fail over, you might not be able to connect to the backup WAN interface because the FortiGate unit may not route traffic (even responses) out of the backup interface. The FortiGate unit performs a reverse path lookup to prevent spoofed traffic. If no entry can be found in the routing table which sends the return traffic out the same interface, then the incoming traffic is dropped.

To configure the routing of the two interfaces - web-based manager

1. Go to *Router* > *Static* > *Static Route* and select *Create New*.
2. Set the *Destination IP/Mask* to the address and netmask to 0.0.0.0/0.0.0.0.
3. Select the *Device* to the primary connection, *WAN1*.
4. Enter the *Gateway* address.
5. Select *Advanced*.
6. Set the *Distance* to `10`.
7. Select *OK*.
8. Repeat steps 1 through 7 setting the *Device* to *WAN2* and a *Distance* of `20`.

To configure the routing of the two interfaces - CLI

```
config router static
  edit 1
    set dst 0.0.0.0 0.0.0.0
    set device WAN1
    set gateway 0.0.0.0 0.0.0.0
    set distance 10
  next
  edit 1
    set dst <ISP_Address>
    set device WAN2
    set gateway <gateway_address>
    set distance 20
  next
end
```

Security policies

When creating security policies, you need to configure duplicate policies to ensure that after traffic fails over WAN1, regular traffic will be allowed to pass through WAN2 as it did with WAN1. This ensures that fail-over will occur with minimal affect to users. For more information on creating security policies see the *Firewall* Guide.

Load sharing

Load sharing enables you to use both connections to the internet at the same time, but do not provide fail over support. When configuring for load sharing, you need to ensure routing is configured for both external ports, for example, WAN1 and WAN2, have static routes with the same distance and priority.

Further configuration can be done using Equal Cost Multiple Path (ECMP). For more information on ECMP and load sharing, see the *Advanced Routing* Guide.

Link redundancy and load sharing

In this scenario, both links are available to distribute Internet traffic over both links. Should one of the interfaces fail, the FortiGate unit will continue to send traffic over the other active interface. Configuration is similar to the Redundant interfaces configuration, with the main difference being that the configured routes should have equal distance settings.

This means both routes will remain active in the routing table. To make one interface the preferred interface, use a default policy route to indicate the interface that is preferred for accessing the Internet. If traffic matches the security policy, the policy overrides all entries in the routing table, including connected routes. You may need to add a specific policy routes that override these default policy routes.

To redirect traffic over the secondary interface, create policy routes to direct some traffic onto it rather than the primary interface. When adding the policy route, only define the outgoing interface and leave the gateway blank. This ensures that the policy route will not be active when the link is down.

Single firewall vs. multiple virtual domains

A typical FortiGate setup, with a small to mid-range appliance, enables you to include a number of subnets on your network using the available ports and switch interfaces. This can potentially provide a means of having three or more mini networks for the various groups in a company. Within this infrastructure, multiple network administrators have access to the FortiGate to maintain security policies.

However, the FortiGate unit may not have enough interfaces to match the number of departments in the organization. If the FortiGate unit it running in transparent mode however, there is only one interface, and multiple network branches through the FortiGate are not possible.

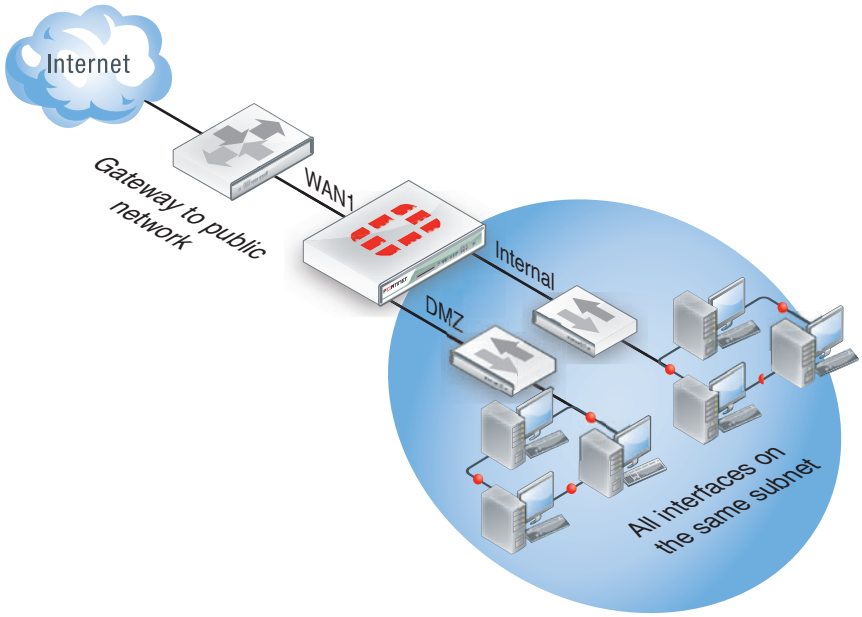
A FortiGate unit with Virtual Domains (VDOMs) enabled, provides a means to provide the same functionality in transparent mode as a FortiGate in NAT mode. VDOMs are a method of dividing a FortiGate unit into two or more virtual units that function as multiple independent units. VDOMs can provide separate security policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network. For administration, an administrator can be assigned to each VDOM, minimizing the possibility of error or fouling network communications.

By default, your FortiGate unit supports a maximum of 10 VDOMs. For FortiGate models 3000 and higher, you can purchase a license key to increase the number of VODMs to 25, 50, 100 or 250.

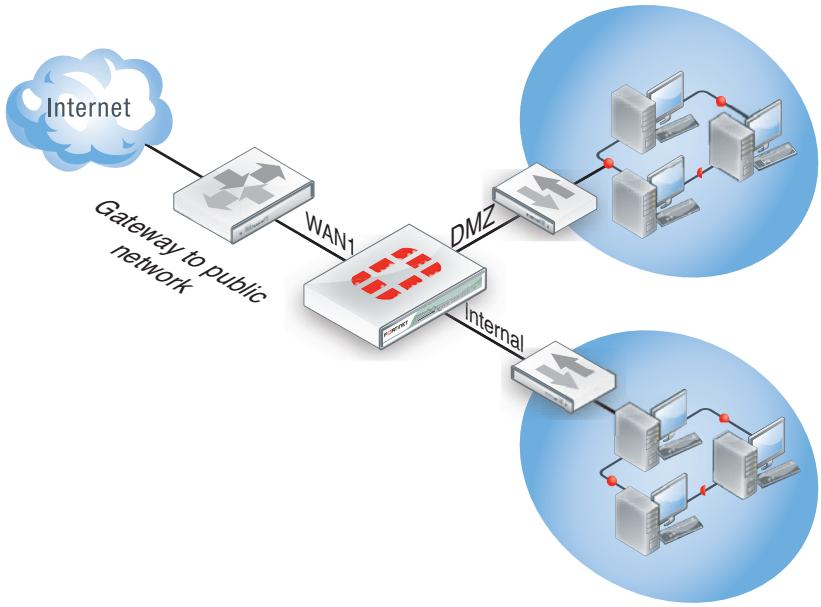
The FortiGate-20C and 30B and FortiWifi-20C and 30B do not support VDOMs.

Single firewall vs. vdoms

When VDOMs are not enabled, and the FortiGate unit is in transparent mode, all the interfaces on your unit become broadcast interfaces. The problem is there are no interfaces free for additional network segments.



A FortiGate with three interfaces means only limited network segments are possible without purchasing more FortiGate devices.



With multiple VDOMs you can have one of them configured in transparent mode, and the rest in NAT mode. In this configuration, you have an available transparent mode FortiGate unit you can drop into your network for troubleshooting, and you also have the standard.

This example shows how to enable VDOMs on the FortiGate unit and the basic and create a VDOM accounting on the DMZ2 port and assign an administrator to maintain the VDOM. First enable Virtual Domains on the FortiGate unit.

To enable VDOMs - web-based manager

1 Go to *System* > *Dashboard* > *Status*.

2 In the *System Information* widget, select *Enable* for *Virtual Domain.*

The FortiGate unit logs you out. Once you log back in, you will notice that the menu structure has changed. This reflects the global settings for all Virtual Domains.

To enable VDOMs - CLI

```
config system global
  set vdom-admin enable
end
```

Next, add the VDOM called accounting.

To add a VDOM - web-based manager

1 Go to *System* > *VDOM* > *VDOM*, and select *Create New*.

2 Enter the VDOM name `accounting`.

3 Select *OK*.

To add a VDOM - CLI

```
config vdom
  edit <new_vdom_name>
end
```

With the Virtual Domain created, you can assign a physical interface to it, and assign it an IP address.

To assign physical interface to the accounting Virtual Domain - web-based manager

1 Go to *System* > *Network* > *Interface*.
2 Select the DMZ2 port row and select *Edit*.
3 For the *Virtual Domain* drop-down list, select *accounting*.
4 Select the *Addressing Mode* of *Manual*.
5 Enter the IP address for the port of 10.13.101.100/24.
6 Set the *Administrative Access* to *HTTPS* and *SSH*.
7 Select *OK*.

To assign physical interface to the accounting Virtual Domain - CLI

```
config global
  config system interface
    edit dmz2
      set vdom accounting
      set ip 10.13.101.100/24
      set allowaccess https ssh
    next
end
```

Modem

FortiGate units support the use of wireless, 3G and 4G modems connected using the USB port or, if available, the express card slot. Modem access provides either primary or secondary (redundant) access to the Internet. For FortiGate units that do not include an internal modem (those units with an “M” designation), the modem interface will not appear in the web-based manager until enabled in the CLI. To enable the modem interface enter the CLI commands:

```
config system modem
  set status enable
end
```

Once enabled, modem options become available by going to *System* > *Network* > *Interface.*

The modem interface is only available when the FortiGate unit is in NAT mode.

Configuring the modem settings is a matter of entering the ISP phone number, user name and password. Depending on the modem, additional information may need to be supplied such as product identifiers, and initialization strings.

The FortiGate unit includes a number of common modems within its internal database. You can view these by selecting the *Configure Modem* link on the *Modem Settings* page. If your modem is not on the list, select *Create New* to add the information. This information is stored on the device, and will remain after a reboot.

Fortinet has an online database of modem models and configuration settings through FortiGuard. A subscription to the FortiGuard services is not required to access the information. As models are added, you can select the *Configure Modem* link and select *Update Now* to download new configurations.

USB modem port

Each USB modem has a specific dial-out ttyusb port. This will be indicated with the documentation for your modem. To enable the correct USB port, use the CLI commands:

```
config system modem
  set wireless-port {ttyusb0 | ttyusb1 | ttyusb2}
end
```

To test the port, use the diagnose command:

```
diagnose sys modem com /ttyusb1
```

The ttyusb1 will be the value of your USB port selected. The response will be:

```
Serial port: /dev/ttyusb1
Press Ctrl+W to exit.
```

If the port does not respond the output will be:

```
Can not open modem device '/dev/ttyusb1' : Broken pipe
```

Modes

The FortiGate unit allows for two modes of operation for the modem; stand alone and redundant. In stand alone mode, the modem connects to a dialup ISP account to provide the connection to the Internet. In redundant mode, the modem acts as a backup method of connecting to the Internet, should the primary port for this function fails.

Configuring either stand alone or redundant modes are very similar. The primary difference is the selection of the interface that the modem will replace in the event of it failing, and the configuration of a PING server to monitor the chosen interface.

Configuring stand alone mode

Configuring stand alone mode is a matter of configuring the modem information and the dialing mode. The dial mode is either *Always Connect* or *Dial on Demand*. Selecting *Always Connect* ensures that once the modem has connected, it remains connected to the ISP. Selecting *Dial on Demand*, the modem only calls the ISP if packets are routed to the modem interface. Once sent, the modem will disconnect after a specified amount of time.

To configure standalone mode as needed - web-based manager

1. Go to *System* > *Network* > *Modem*.
2. Select the *Mode* of *Standalone*.
3. Select the *Dial Mode* of *Dial on Demand*.
4. Enter the Idle *Timeout* of `2` minutes.
5. Select the number of redials the modem attempts if connection fails to 5.
6. Select *Apply*.

To configure standalone mode as needed- CLI

```
config system modem
  set mode standalone
  set auto-dial enable
  set idle-timer 2
  set redial 5
end
```

Configuring redundant mode

Redundant mode provides a backup to an interface, typically to the Internet. If that interface fails or disconnects, the modem automatically dials the configured phone number(s). Once connected, the FortiGate unit routes all traffic to the modem interface until the monitored interface is up again. The FortiGate unit pings the connection to determine when it is back online.

For the FortiGate to verify when the interface is back up, you need to configure a Ping server for that interface. You will also need to configure security policies between the modem interface and the other interfaces of the FortiGate unit to ensure traffic flow.

To configure redundant mode as needed - web-based manager

1. Go to *System* > *Network* > *Modem*.
2. Select the *Mode* of *Redundant*.
3. Select the interface the modem takes over from if it fails.
4. Select the *Dial Mode* of *Dial on Demand*.
5. Enter the *Idle Timeout* of 2 minutes.
6. Select the number of redials the modem attempts if connection fails to 5.
7. Select *Apply*.

To configure standalone mode as needed- CLI

```
config system modem
  set mode redundant
  set interface wan1
  set auto-dial enable
  set idle-timer 2
  set redial 5
end
```

Ping server

Adding a ping server is required for routing fail over traffic. A ping server will confirm the connectivity of the device's interface. You can only configure the ping server in the CLI.

To add a ping server - CLI

```
config router gwdetect
  edit wan1
    set server <ISP_IP_address>
    set failtime <failure_count>
    set interval <seconds>
end
```

Additional modem configuration

The CLI provides additional configuration options when setting up the modem options including adding multiple ISP dialing and initialization options and routing. For more information, see the *CLI Reference*.

Modem interface routing

The modem interface can be used in FortiOS as a dedicated interface. Once enabled and configured, you can use it in security policies and define static and dynamic routing. Within the CLI commands for the modem, you can configure the distance and priority of routes involving the modem interface. The CLI commands are:

```
config sysetm modem
  set distance <route_distance>
  set priority <priority_value>
end
```

For more information on the routing configuration in the CLI, see the *CLI Reference*. For more information on routing and configuring routing, see the *Advanced Routing* Guide.

DHCP servers and relays

A DHCP server provides an address to a client on the network, when requested, from a defined address range.

DHCP server options are not available in transparent mode.

An interface cannot provide both a server and a relay for connections of the same type (regular or IPSec). However, you can configure a Regular DHCP server on an interface only if the interface is a physical interface with a static IP address. You can configure an IPSec DHCP server on an interface that has either a static or a dynamic IP address.

You can configure one or more DHCP servers on any FortiGate interface. A DHCP server dynamically assigns IP addresses to hosts on the network connected to the interface. The host computers must be configured to obtain their IP addresses using DHCP.

If an interface is connected to multiple networks via routers, you can add a DHCP server for each network. The IP range of each DHCP server must match the network address range. The routers must be configured for DHCP relay.

You can configure a FortiGate interface as a DHCP relay. The interface forwards DHCP requests from DHCP clients to an external DHCP server and returns the responses to the DHCP clients. The DHCP server must have appropriate routing so that its response packets to the DHCP clients arrive at the unit.

DHCP Server configuration

To add a DHCP server, go to *System* > *Network* > *DHCP Server*, select *Create New* and complete the following:

Interface Name	Select an interface from the drop-down list.
Mode	Select the type of DHCP server.
Enable	Select to enable the DHCP server.

Type	Select the type of *DHCP* server. You cannot configure a regular DHCP server on an interface that has a dynamic IP address.
DHCP Server IP	Enter the IP address for the relay DHCP server. This appears only when *Mode* is *Relay*.
IP Range	Enter the start and end for the range of IP addresses that this DHCP server assigns to DHCP clients.
Network Mask	Enter the netmask of the addresses that the DHCP server assigns.
Default Gateway	Enter the IP address of the default gateway that the DHCP server assigns to DHCP clients.
DNS Service	Select to use either a specific DNS server or the system's DNS settings. You can add multiple DNS servers by selecting the plus sign (+) beside *DNS Server 1*. For more information see DNS services and DNS server.
DNS Server 0	Enter the DNS server.
DNS Server 1	Enter the second DNS server. If you need to add more DNS servers, select the plus sign (+).
IP Reservation	Select to match an IP address from the DHCP server to a specific client or device using its MAC address. In a typical situation, an IP address is assigned ad hoc to a client, and that assignment times out after a specific time of inactivity from the client, known as the lease time. To ensure a client or device always has the same IP address, that is, there is no lease time, use IP reservation.
Add from DHCP Client List	If the client is currently connected and using an IP address from the DHCP server, you can select this option to select the client from the list.
Advanced section of the New DHCP Service page	
Domain	Enter the domain that the DHCP server assigns to clients.
Lease Time	Set the length of time an IP address remains assigned to a client. Once the lease expires, the address is released for allocation to the next client request for an IP address. To set the lease to never expire, select *Unlimited*.

IP Assignment Mode	Configure how the IP addresses for an IPSec DHCP server are assigned to dialup IPSec VPN users. These options are available when the DHCP server type is *IPsec*. Select: • *Server IP Range* - The IPSec DHCP server will assign the IP addresses as specified in *IP Range*, and *Exclude Ranges*. • *User-group defined method* - The IP addresses will be assigned by a user group used to authenticate the user. The user group is used to authenticate XAUTH users. When *User-group defined method* is selected, the *IP Range* fields are greyed out, and the *Exclude Ranges* table and controls are not visible.
WINS Server 0 **WINS Server 1**	Add the IP addresses of one or two WINS servers that the DHCP server assigns to DHCP clients.
Options	When adding a DHCP server, you have the ability to include DHCP codes and options. The DHCP options are BOOTP vendor information fields that provide additional vendor-independent configuration parameters to manage the DHCP server. For example, you may need to configure a FortiGate DHCP server that gives out a separate option as well as an IP address. For example, an environment that needs to support PXE boot with Windows images. The option numbers and codes are specific to the particular application. The documentation for the application will indicate the values to use. Option codes are represented in a option value/HEX value pairs. The option is a value 1 and 255. You can add up to three DHCP code/option pairs per server.
Exclude Ranges	Enter a range of IP addresses from the IP range that should not be assigned. This option is only available when the DHCP type is *IPsec*, and the *IP Assignment Mode* is *Server IP range*.
Match VCI	.Select when connecting a FortiAP unit to the FortiGate. In the field that appears when selected, enter the FortiAP model number as the Vendor Class Identifier (VCI).

Service

On FortiGate-50 and FortiGate-60 series units, a DHCP server is configured, by default on the Internal interface:

IP Range	192.168.1.110 to 192.168.1.210
Netmask	255.255.255.0
Default gateway	192.168.1.99
Lease time	7 days
DNS Server 1	192.168.1.99

These settings are appropriate for the default Internal interface IP address of 192.168.1.99. If you change this address to a different network, you need to change the DHCP server settings to match.

Reserving IP addresses for specific clients

Within the DHCP pool of addresses, you can ensure certain computers will always have the same address. This can be to ensure certain users always have an IP address when connecting to the network, or if you want a device that connects occasionally to have the same address for monitoring its activity or use.

In the example below, the IP address 172.20.120.129 will be matched to MAC address 00:1f:5c:b8:03:57. This configuration is now only available in the CLI.

To configure IP reservation - CLI

```
config system dhcp reserved-address
  edit 1
    set ip 172.20.120.129
    set mac 00:1f:5c:b8:03:57
end
```

Alternatively, after the FortiGate unit assigns an address, you can go to *System* > *Monitor* > *DHCP Monitor*, locate the particular user. Select the check box for the user and select *Add to Reserved*.

DHCP options

When adding a DHCP server, you have the ability to include DHCP codes and options. The DHCP options are BOOTP vendor information fields that provide additional vendor-independent configuration parameters to manage the DHCP server. For example, you may need to configure a FortiGate DHCP server that gives out a separate option as well as an IP address. For example, an environment that needs to support PXE boot with Windows images.

The option numbers and codes are specific to the particular application. The documentation for the application will indicate the values to use. Option codes are represented in a option value/HEX value pairs. The option is a value 1 and 255.

You can add up to three DHCP code/option pairs per DHCP server.

To configure option 252 with value http://192.168.1.1/wpad.dat - web-based manager

1. Go to *System* > *Network* > *DHCP Server* and select *Create New*.
2. Select a *Mode* of *Server*.
3. Select the blue arrow to expand the *Advanced* options.
4. Select *Options*.
5. Enter a *Code* of `252`.
6. Enter the *Options* of `687474703a2f2f3139322e3136382e312e312f777061642e646174`.

In the CLI, use the commands:

```
config system dhcp server
  edit <server_entry_number>
    set option1 252
       687474703a2f2f3139322e3136382e312e312f777061642e646174
end
```

For detailed information about DHCP options, see RFC 2132, DHCP Options and BOOTP Vendor Extensions.

DHCP Monitor

To view information about DHCP server connections, go to *System* > *Monitor* > *DHCP Monitor*. On this page, you can also add IP address to the reserved IP address list.

Assigning IP address by MAC address

To prevent users in the from changing their IP addresses and causing IP address conflicts or unauthorized use of IP addresses, you can bind an IP address to a specific MAC address using DHCP.

Use the CLI to reserve an IP address for a particular client identified by its device MAC address and type of connection. The DHCP server then always assigns the reserved IP address to the client. The number of reserved addresses that you can define ranges from 10 to 200 depending on the FortiGate model.

In the example below, the IP address 10.10.10.55 for User1 is assigned to MAC address 00:09:0F:30:CA:4F.

To assign an IP address to a specific MAC address

```
config system dhcp reserved-address
  edit User1
    set ip 10.10.10.55
    set mac 00:09:0F:30:CA:4F
    set type regular
end
```

DNS services

A DNS server is a public service that converts symbolic node names to IP addresses. A Domain Name System (DNS) server implements the protocol. In simple terms, it acts as a phone book for the Internet. A DNS server matches domain names with the computer IP address. This enables you to use readable locations, such as fortinet.com when browsing the Internet. FortiOS supports DNS configuration for both IPv4 and IPv6 addressing.

The FortiGate unit includes default DNS server addresses. However, these should be changed to those provided by your Internet Service Provider. The defaults are DNS proxies and are not as reliable as those from your ISP.

Within FortiOS, there are two DNS configuration options; each provide a specific service, and can work together to provide a complete DNS solution.

DNS queries

Basic DNS queries are configured on interfaces that connect to the Internet. When a web site is requested, for example, the FortiGate unit will look to the configured DNS servers to provide the IP address to know which server to contact to complete the transaction.

DNS server addresses are configured by going to *System* > *Network* > *DNS*. Here you specify the DNS server addresses. Typically, these addresses are supplied by your ISP. An additional option is available if you have local Microsoft domains on the network, by entering a domain name in the *Local Domain Name* field.

In a situation where all three fields are configured, the FortiGate unit will first look to the local domain. If no match is found, a request is sent to the external DNS servers.

If virtual domains are enabled, you create a DNS database in each VDOM. All of the interfaces in a VDOM share the DNS database in that VDOM.

Additional DNS CLI configuration

Further options are available from the CLI with the command `config system dns`. Within this command you can set the following commands:

- `dns-cache-limit` - enables you to set how many DNS entries are stored in the cache. Entries that remain in the cache provide a quicker response to requests than going out to the Internet to get the same information.
- `dns-cache-ttl` - enables you to set how long entries remain in the cache in seconds, between 60 and 86,400 (24 hours).
- `cache-notfound-responses` - when enabled, any DNS requests that are returned with NOTFOUND can be stored in the cache.
- `source-ip` - enables you to define a dedicated IP address for communications with the DNS server.

DNS server

You can also create local DNS servers for your network. Depending on your requirements, you can manually maintain your entries (master DNS server), or use it as a jumping point, where the server refers to an outside source (slave DNS server). A local master DNS server works similarly to the DNS server addresses configured in *System* > *Network* > *DNS*, but all entries must be added manually. This enables you to add a local DNS server to include specific URL/IP address combinations.

The DNS server options are not visible in the web-based manager by default. To enable the server, go to *System* > *Admin* > *Settings* and select *DNS Database*.

While a master DNS server is an easy method of including regularly used addresses to save on going to an outside DNS server, it is not recommended to make it the authoritative DNS server. IP addresses may change, and maintaining any type of list can quickly become labor-intensive.

A FortiGate master DNS server is best set for local services. For example, if your company has a web server on the DMZ that is accessed by internal employees as well as external users, such as customers or remote users. In this situation, the internal users when accessing the site would send a request for website.example.com, that would go out to the DNS server on the web, to return an IP address or virtual IP. With an internal DNS, the same site request is resolved internally to the internal web server IP address, minimizing inbound/outbound traffic and access time.

As a slave, DNS server, the FortiGate server refers to an external or alternate source as way to obtain the url/IP combination. This useful if there is a master DNS server for a large company where a list is maintained. Satellite offices can then connect to the master DNS server to obtain the correct addressing.

The DNS server entries does not allow CNAME entries, as per rfc 1912, section 2.4.

To configure a master DNS server - web-based manager

1 Go to *System* > *Network* > *DNS Server*, and select *Create New*.

2 Select the *Type* of *Master*.

3 Select the *View* as *Shadow*.

The view is the accessibility of the DNS server. Selecting *Public*, external users can access, or use, the DNS server. Selecting *Shadow*, only internal users can use it.

4 Enter the DNS *Zone*, for example, `WebServer`.

5 Enter the domain name for the zone, for example `example.com`.

6 Enter the hostname of the DNS server, for example, `Corporate`.

7 Enter the contact address for the administrator, for example, admin@example.com.

8 Set *Authoritative* to *Disable*.

9 Select *OK*.

10 Enter the DNS entries for the server by selecting *Create New*.

11 Select the *Type*, for example, *Address (A)*.

12 Enter the *Hostname*, for example `web.example.com`.

13 Enter the remaining inform ai ton, which varies depending on the *Type* selected.

14 Select *OK*.

To configure a DNS server - CLI

```
config system dns-database
  edit WebServer
    set domain example.com
    set type master
    set view shadow
    set ttl 86400
    set primary-name corporate
    set contact admin@exmple.com
    set authoritative disable
      config dns-entry
        edit 1
          set hostname web.example.com
          set type A
          set ip 192.168.21.12
          set status enable
    end
end
```

Recursive DNS

You can set an option to ensure these types of DNS server is not the authoritative server. When configured, the FortiGate unit will check its internal DNS server (Master or Slave). If the request cannot be fulfilled, it will look to the external DNS servers. This is known as a split DNS configuration.

You can also have the FortiGate unit look to an internal server should the Master or Slave not fulfill the request by using the CLI commands:

```
config system dns-database
  edit example.com
    ...
    set view shadow
end
```

For this behavior to work completely, for the external port, you must set the DNS query for the external interface to be recursive. This option is configured in the CLI only.

To set the DNS query

```
config system dns-server
  edit wan1
    set mode recursive
end
```

Dynamic DNS

If your ISP changes the your external IP address on a regular basis, and you have a static domain name, you can configure the external interface to use a dynamic DNS service to ensure external users and/or customers can always connect to your company firewall.

To configure dynamic DNS in the web-based manager, go to *System* > *Network* > *DNS*, select *Use DDNS*, and enter the relevant information for the interface communicating to the server, and which server to use, and relevant information.

To configure dynamic DNS in the CLI use the commands below. Within the CLI you can configure a DDNS for each interface. Only the first configured port appears in the web-based manager. Additional commands vary with the DDNS server you select.

```
config system ddns
edit <instance_value>
    set monitor-interface <external_interface>
    set ddns-server <ddns_server_selection>
end
```

Aggregate Interfaces

Link aggregation (IEEE 802.3ad) enables you to bind two or more physical interfaces together to form an aggregated (combined) link. This new link has the bandwidth of all the links combined. If a link in the group fails, traffic is transferred automatically to the remaining interfaces with the only noticeable effect being a reduced bandwidth.

This is similar to redundant interfaces with the major difference being that a redundant interface group only uses one link at a time, where an aggregate link group uses the total bandwidth of the functioning links in the group, up to eight.

Support of the IEEE standard 802.3ad for link aggregation is available on some models.

An interface is available to be an aggregate interface if:

- it is a physical interface, not a VLAN interface or subinterface
- it is not already part of an aggregate or redundant interface
- it is in the same VDOM as the aggregated interface. Aggregate ports cannot span multiple VDOMs.
- it does not have an IP address and is not configured for DHCP or PPPoE
- it is not referenced in any security policy, VIP, IP Pool or multicast policy
- it is not an HA heartbeat interface
- it is not one of the FortiGate-5000 series backplane interfaces

Some models of FortiGate units do not support aggregate interfaces. In this case, the aggregate option is not an option in the web-based manager or CLI. As well, you cannot create aggregate interfaces from the interfaces in a switch port.

To see if a port is being used or has other dependencies, use the following diagnose command:

```
diagnose sys checkused system.interface.name <interface_name>
```

When an interface is included in an aggregate interface, it is not listed on the *System* > *Network* > *Interface* page. Interfaces will still appear in the CLI, although configuration for those interfaces will not take affect. You cannot configure the interface individually and it is not available for inclusion in security policies, VIPs, IP pools, or routing.

Example

This example creates an aggregate interface on a FortiGate-3810A using ports 4-6 with an internal IP address of 10.13.101.100, as well as the administrative access to HTTPS and SSH.

To create an aggregate interface - web-based manager

1. Go to *System* > *Network* > *Interface* and select *Create New*.
2. Enter the Name as `Aggregate`.
3. For the *Type*, select *802.3ad Aggregate*.

   If this option does not appear, your FortiGate unit does not support aggregate interfaces.
4. In the *Available Interfaces* list, select port 4, 5 and 6 and move it to the *Selected Interfaces* list.
5. Select the *Addressing Mode* of *Manual*.
6. Enter the IP address for the port of 10.13.101.100/24.
7. For *Administrative Access* select HTTPS and SSH.
8. Select *OK*.

To create aggregate interface - CLI

```
config system interface
  edit Aggregate
    set type aggregate
    set member port4 port5 port6
    set vdom root
    set ip 172.20.120.100/24
    set allowaccess https ssh
  end
```

IP addresses for self-originated traffic

On the FortiGate unit, there are a number of protocols and traffic that is specific to the internal workings of FortiOS. For many of these traffic sources, you can identify a specific port/IP address for this self-originating traffic. The following traffic can be configured to a specific port/IP address:

- SNMP
- Syslog
- alert email
- FortiManager connection IP
- FortiGuard services
- FortiAnalyzer logging
- NTP

- DNS
- Authorization requests such as RADIUS
- FSSO

Configuration of these services is performed in the CLI. In each instance, there is a command set `source-ip`. For example, to set the source IP of NTP to be on the DMZ1 port with an IP of 192.168.4.5, the commands are:

```
config system ntp
  set ntpsyn enable
  set syncinterval 5
  set source-ip 192.168.4.5
end
```

To see which services are configured with source-ip settings, use the get command:

```
get system source-ip status
```

The output will appear similar to the sample below:

```
NTP: x.x.x.x
DNS: x.x.x.x
SNMP: x.x.x.x
Central Management: x.x.x.x
FortiGuard Updates (AV/IPS): x.x.x.x
FortiGuard Queries (WebFilter/SpamFilter): x.x.x.x
```

Administration for schools

For system administrator in the school system it is particularly difficult to maintain a network and access to the Internet. There are potential legal liabilities if content is not properly filtered and children are allowed to view pornography and other non-productive and potentially dangerous content. For a school, too much filtering is better than too little. This section describes some basic practices administrators can employ to help maintain control without being too draconian for access to the internet.

Security policies

The default security policies in FortiOS allow all traffic on all ports and all IP addresses. Not the most secure. While applying UTM profiles can help to block viruses, detect attacks and prevent spam, this doesn't provide a solid overall security option. The best approach is a layered approach; the first layer being the security policy.

When creating outbound security policies, you need to know the answer to the question "What are the students allowed to do?" The answer is surf the web, connect to FTP sites, send/receive email, and so on.

Once you know what the students need to do, you can research the software used and determine the ports the applications use. For example, if the students only require web surfing, then there are only two ports (80 - HTTP and 443 - HTTPS) needed to complete their tasks. Setting the security policies to only allow traffic through two ports (rather than all 65,000), this will significantly lower any possible exploits. By restricting the ports to known services, mean s stopping the use of proxy servers, as many of them operate on a non-standard port to hide their traffic from URL filtering or HTTP inspection.

DNS

Students should not be allowed to use whatever DNS they want. this opens another port for them to use and potentially smuggle traffic on. The best approach is to point to an internal DNS server and only allow those devices out on port 53. Its the same approach one would use for SMTP. Only allow the mail server to use port 25 since nothing else should be sending email.

If there is no internal DNS server, then the list of allowed DNS servers they can use should be restrictive. One possible exploit would be for them to set up their own DNS server at home that serves different IPs for known hosts, such as having Google.com sent back the IP for playboy.com.

Encrypted traffic (HTTPS)

Generally speaking, students should not be allowed to access encrypted web sites. Encrypted traffic cannot be sniffed, and therefore, cannot be monitored. HTTPS traffic should only be allowed when necessary. Most web sites a student needs to access are HTTP, not HTTPS. Due to the nature of HTTPS protocol, and the fact that encryption is an inherent security risk to your network, its use should be restricted.

Adding a security policy that encompasses a list of allowed secure sites will ensure that any HTTPS sites that are required are the only sites a student can go to.

FTP

For the most part, students should not be using FTP. FTP is not HTTP or HTTPS so you cannot use URL flitting to restrict where they go. This can be controlled with destination IPs in the security policy. With a policy that specifically outlines which FTP addresses are allowed, all other will be blocked.

Example security policies

Given these requirements, an example set of security policies could look like the following illustration. In a large setup, all the IPs for the students are treated by one of these four policies.

Figure 60: Simple security policy setup

	Seq. No.	ID	Source	Destination	Schedule	Service	Action	Status
☐	1	2	Student PCs	Allowed Websites	always	HTTPS	✓	☑
☐	2	3	Student PCs	all	always	HTTP	✓	☑
☐	3	4	Student PCs	Allowed DNS	always	DNS	✓	☑
☐	4	5	Student PCs	Allowed FTP	always	FTP	✓	☑
☐	5		all	all	always	ANY	⊘	Implicit

The last policy in the list, included by default, is a deny policy.This adds to the potential of error that could end up allowing unwanted traffic to pass. The deny policy ensures that any traffic making it to this point is stopped. It can also help in further troubleshooting by viewing the logs for denied traffic.

With these policies in place, even before packet inspection occurs, the FortiGate, and the network are fairly secure. Should any of the UTM profiles fail, there is still a basic level of security.

UTM Profiles

In FortiOS 4.0 MR2, the protection profiles have been broken into individual profiles. Each UTM feature is now its own component, which can make setting up network security easier.

Antivirus profiles

Antivirus screening should be enabled for any service you have enabled in the security policies. In the case above, HTTP, FTP, as well as POP3 and SMTP (assuming there is email access for students). There is not a virus scan option for HTTPS, because the content is encrypted. Generally speaking, most of the network traffic will be students surfing the web.

To configure antivirus profiles in the web-based manager, go to *UTM Profiles* > *Antivirus* > *Profile*, or use the CLI commands under `config antivirus profile`.

Web filtering

The actual filtering of URLs - sites and content - should be performed by FortiGuard. It is easier and web sites are constantly being monitored, and new ones reviewed and added to the FortiGuard databases every day. The FortiGuard categories provide an extensive list of offensive, and non-productive sites.

As well, there are additional settings to include in a web filtering profile to best contain a student's web browsing.

- Web URL filtering should be enabled to set up exemptions for web sites that are blocked or reasons other than category filtering. It also prevents the us of IP addresses to get around web filtering.
- Block invalid URLs - HTTPS only. This option inspects the HTTPS certificate and looks at the URL to ensure it's valid. It is common for proxy sites to create an HTTPS certificate with a garbage URL. If the site is legitimate, it should be set up correctly. If the site approach to security is to ignore it, then their security policy puts your network at risk and the site should be blocked.

Web filtering options are configured in the web-based manager by going to *UTM Profiles* > *Web filter* > *Profile*, or in the CLI under `config webfilter profile`.

Advanced options

There are a few Advanced options to consider for a web filtering profile:

- Enable *Provide details for blocked HTTP 4xx and 5xx errors*. Under normal circumstances there are exploits that can be used with 400 and 500 series messages to access the web site. While most students probably won't know how to do this, there is no harm in being cautious. It only takes one.
- Enable *Rate Images by URL*. This option only works with Google images. It examines the URL that the images is stored at to get a rating on it, then blocks or allows the image based on the rating of the originating URL. It does not inspect the image contents. Most image search engines to a prefect and pass the images directly to the browser.
- Enable *Block HTTP redirects by rating*. An HTTP redirect is one method of getting around ratings. Go to one web site that has an allowed rating, and it redirects to another web site that may want blocked.

Categories and Classifications

For the selection of what FortiGuard categories and classifications that should be blocked, that is purely based on the school system and its Internet information policy.

Email Filtering

Other than specific teacher-led email inboxes, there is no reason why a student should be able to access, read or send personal email. Ports for POP3, SMTP and IMAP should not be opened in a security policies.

IPS

The intrusion protection profiles should be used to ensure the student PCs are not vulnerable to attacks, nor do you want students making attacks. As well, IPS can do more than simple vulnerability scans. With a FortiGuard subscription, IPS signatures are pushed to the FortiGate unit. New signatures are released constantly for various intrusions as they are discovered.

FortiOS includes a number of predefined IPS sensors that you can enable by default. Selecting the all_default signature is a good place to start as it includes the major signatures.

To configure IPS sensors in the web-based manager, go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor*, on the CLI use commands under `config ips sensor`.

Application control

Application control uses IPS signatures to limit the use of instant messaging and peer-to-peer applications which can lead to possible infections on a student's PC. FortiOS includes a number of pre-defined application categories. To configure and maintain application control profiles in the web-based manager, go to *UTM Profiles* > *Application Control* > *Application Control List*. In the CLI use commands under `config application list`.

Some applications to consider include proxies, botnets, toolbars and P2P applications.

Logging

Turn on all logging - every option in this section should be enabled. This is not where you decide what you are going to log. It is simply defining what the UTM profiles can log.

Logging everything is a way to monitor traffic on the network, see what student's are utilizing the most, and locate any potential holes in your security plan. As well, keeping this information may help to prove negligence later in necessary.

Tag management

Tag management provide a method of categorizing, or labelling objects within FortiOS using keywords. You can give the following elements a "tag", similar to a keyword:

- IPS signature
- application signature
- security policy
- firewall address

Tagging is way to organize the various elements, especially if you have a large number of addresses, security policies to manage and keep track of. Tagging enables you to break these elements into groups, but each element can belong to more than one group. Tags help you find elements which have something in common, be it a group, user or location. This is very similar to tagging found on photo sharing sites.

To use tagging, you need to enable it for 1U FortiGate units. It is enabled by default on all 2U FortiGate units and blades.

To enable tagging - web-based manager

1 Go to *System* > *Admin* > *Settings*.

2 Select *Object Tagging and Coloring*.

3 Select *Apply*.

To enable tagging - CLI

```
config system settings
  set gui-object-tags
end
```

Adding and removing tags

You add and remove tags when you create the various elements. For example, when adding a firewall address, a section below the Interface selection enables you to add tags for that element, such as the department, region, or really, anything to help identify the element. When editing, applied tags appear as well.

Figure 61: Adding tags to a new address.

To remove a tag, in the element, click the tag in the Applied Tags list.

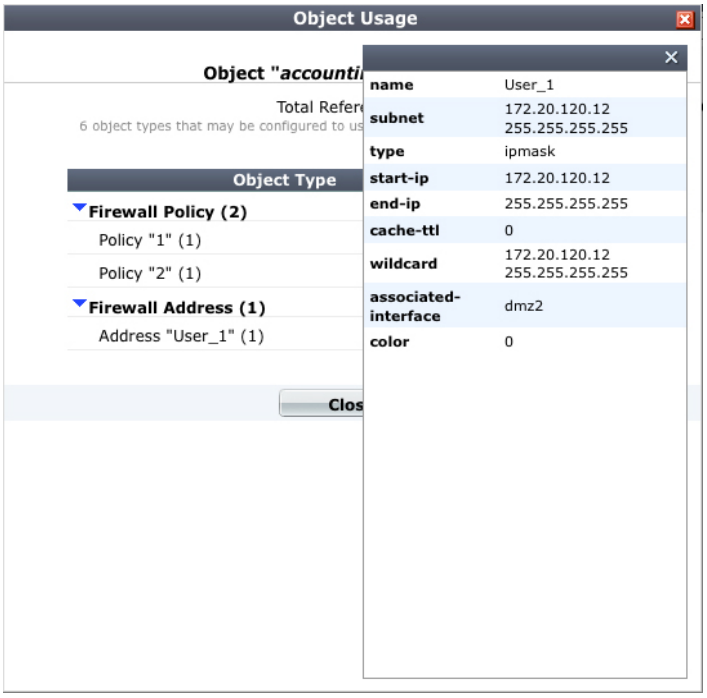
Reviewing tags

Tags can be reviewed in one location by going to *System* > *Config* > *Tag* Management. In this screen, all tags used appear. The visual size of the tag name indicates the usage; the bigger the size, the more it is used. By hovering over the keyword, a fly out indicates how many times it has been used.

To see where it was used, click the keyword. An *Object Usage* window displays all the reference categories where the keyword was used, and the number of times. Selecting the expand arrow further details its use.

Further, for security policies for example, you can select the *View* icon and see the details of the particular element. If need be, select the Edit icon to modify the element.

Figure 62: Viewing the address information for a tagged object



Tagging guidelines

Given the ease that tags can be added to elements in FortiOS, it makes sense to jump right in and begin applying tags to elements and object. However, this type of methodology will lead to problems down the road as new elements are added.

A methodology should be considered and developed before applying tags. This doesn't mean you need to develop an entire thesaurus or reference guide for all possibilities of tags. However, taking some time to develop a methodology for the keywords you intend to use will benefit later when new security policies, addresses, and so on are added. Some things to consider when developing a tag list:

- the hierarchy used for the organization such as region, city location, building location
- department names and if short forms or long forms are used
- will acronyms be used or terms spelled out.
- how granular will the tagging be

As tags are added, previously used tags appear so there is an opportunity to use previously used tags. However, you want to avoid a situation where both accounting and acct are both options. This is also important if there are multiple administrators in different locations to ensure consistency.

At any time, you can change or even remove tags. It is best to do a bit of planning ahead of time to avoid unnecessary work later on.

Software switch

A software switch, or soft switch, is a virtual switch that is implemented at the software, or firmware level, rather than the hardware level. Adding a software switch can be used to simplify communication between devices connected to different FortiGate interfaces. For example, using a software switch you can place the FortiGate interface connected to an internal network on the same subnet as your wireless interfaces. Then devices on the internal network can communicate with devices on the wireless network without any additional configuration such as additional security policies, on the FortiGate unit.

It can also be useful if you require more hardware ports on for the switch on a FortiGate unit. For example, if your FortiGate unit has a 4-port switch, WAN1, WAN2 and DMZ interfaces, and you need one more port, you can create a soft switch that can include the 4-port switch and the DMZ interface all on the same subnet. These types of applications also apply to wireless interfaces and virtual wireless interfaces and physical interfaces such as those with FortiWiFi and FortiAP unit.

Similar to a hardware switch, a software switch functions like a single interface. A software switch has one IP address; all of the interfaces in the software switch are on the same subnet. Traffic between devices connected to each interface are not regulated by security policies, and traffic passing in and out of the switch are affected by the same policy.

There are a few things to consider when setting up a software switch:

- Ensure you create a back up of the configuration.
- Ensure you have at least one port or connection such as the console port to connect to the FortiGate unit. If you accidentally combine too many ports, you will need a way to undo any errors.
- The ports that you include must not have any link or relation to any other aspect of the FortiGate unit. For example, DHCP servers, security policies, and so on.

To create a software switch - web-based manager

1. Go to *System* > *Network* > *Interface* and select *Create New*.
2. Enter a *Name* for the switch.
3. Set *Type* to *Software Switch*.
4. Select the interfaces to add to the switch.
5. Enter an *IP address*.
6. Select *OK*.

To create a software switch - CLI

```
config system switch-interface
  edit <switch-name>
    set type switch
    set member <interface_list>
end
config system interface
  edit <switch_name>
  set ip <ip_address>
  set allowaccess https ssh ping
end
```

Soft switch example

For this example, the wireless interface (WiFi) needs to be on the same subnet as the DMZ1 interface to facilitate wireless syncing from an iPhone and a local computer. The synching between two subnets is problematic. By putting both interfaces on the same subnet the synching will work. The software switch will accomplish this.

In this example, the soft switch includes a wireless interface. Remember to configure any wireless security before proceeding. If you leave this interface open without any password or other security, it leaves open access to not only the wireless interface, but any other interfaces and devices connected within the software switch.

Clear the interfaces and back up the configuration

First, ensure that the interfaces are not being used with any other security policy or other use on the FortiGate unit. Check the WiFi and DMZ1 ports to ensure DHCP is not enabled on the interface and there are no other dependencies with these interfaces.

Next, save the current configuration, in the event something doesn't work, recovery can be quick.

To back up the configuration

Go to *System* > *Dashboard* > *Status*.

1. In the *System Information* widget, select *Backup* in the *System Configuration* row.
2. Select *Backup* from the backup window.
3. Select the location to save the configuration file.

Merge the interfaces

The plan is to merge the WiFi port and DMZ1 port. This will create a software switch with a name of "synchro" with an IP address of 10.10.21.12. The steps will create the switch, add the IP and then set the administrative access for HTTPS, SSH and Ping.

To merge the interfaces - web-based manager

1. Go to *System* > *Network* > *Interface* and select *Create New*.
2. Enter the *Name* of `syncrho`.
3. Select the *Type* of *Software Switch*.
4. From the *Available Interfaces* list, select *DMZ1* and select the *Right arrow* to move it to the *Selected Interfaces* list.
5. Repeat the above step for the *WiFi* interface.
6. Enter the *IP/Netmask* of `10.10.21.12/255.255.255.0`.
7. For the Administrative Access, select *HTTPS, PING* and *SSH*.
8. Select *OK*.

To merge the interfaces - CLI

```
config system switch-interface
  edit synchro
    set type switch
    set member dmz1 wifi
end
config system interface
```

```
    edit synchro
    set ip 10.10.21.12
    set allowaccess https ssh ping
  end
```

Final steps

With the switch set up, you can now add security policies, DHCP servers an any other configuration that you would normally do to configure interfaces on the FortiGate unit.

Replacement messages list

The replacement message list in *System* > *Config* > *Replacement Message*.

The replacement messages list enables you to view and customize replacement messages. Use the expand arrow beside each type to display the replacement messages for that category. Select the *Edit* icon beside each replacement message to customize that message for your requirements.

If you are viewing the replacement messages list in a VDOM, any messages that have been customized for that VDOM are displayed with a Reset icon that you can use to reset the replacement message to the global version.

For connections requiring authentication, the FortiGate unit uses HTTP to send an authentication disclaimer page for the user to accept before a security policy is in effect. Therefore, the user must initiate HTTP traffic first in order to trigger the authentication disclaimer page. Once the disclaimer is accepted, the user can send whatever traffic is allowed by the security policy.

Replacement message images

You can add images to replacement messages to:

- disclaimer pages
- login pages
- declined disclaimer pages
- login failed page
- login challenge pages
- keepalive pages

Image embedding is also available to the endpoint NAC download portal and recommendation portal replacement messages, as well as HTTP replacement messages.

Supported image formats are GIF, JPEG, TIFF and PNG. The maximum file size supported is 6000 bytes.

Adding images to replacement messages

To upload an image for use in a message

1. Go to *System* > *Config* > *Replacement Message*.
2. Select *Manage Images* at the top of the page.
3. Select *Create New*.
4. Enter a *Name* for the image.
5. Select the *Content Type*.
6. Select *Browse* to locate the file and select *OK*.

The image that you include in a replacement message, must have the following html:

```
<img src=%%IMAGE: <config_image_name>%% size=<bytes> >
```

For example:

```
<img src=%%IMAGE: logo_hq%% size=4272>
```

Modifying replacement messages

Replacement messages can be modified to include a message or content that suits your organization.

Use the expand arrows to view the replacement message list for a given category. Messages are in HTML format. For descriptions of the replacement message tags, see Replacement message tags.

To change a replacement message, go to *System* > *Config* > *Replacement Message* and expand the replacement message category to access the replacement message that you want to modify. Select the message and select *Edit*.

Within the message edit screen, the Allowed Formats line indicates whether the content can be HTML code or simple text. indicates what type of format the replacement message is in, Text or HTML. For example, the HTTP virus replacement message's format is HTTP and the Email file block replacement message is Text. The *Size* indicates the maximum number of characters allowed in the message.

Replacement message tags

Replacement messages can include replacement message tags, or variables. When users receive the message, the message tag is replaced with content relevant to the message. The table lists the replacement message tags that you can use.

Table 29: Replacement message tags

Tag	Description
%%AUTH_LOGOUT%%	The URL that will immediately delete the current policy and close the session. Used on the auth-keepalive page.
%%AUTH_REDIR_URL%%	The auth-keepalive page can prompt the user to open a new window which links to this tag.
%%CATEGORY%%	The name of the content category of the web site.
%%DEST_IP%%	The IP address of the request destination from which a virus was received. For email this is the IP address of the email server that sent the email containing the virus. For HTTP this is the IP address of web page that sent the virus.
%%DURATION%% (FortioS Carrier only)	The amount of time in the reporting period. This is user defined in the protection profile.
%%EMAIL_FROM%%	The email address of the sender of the message from which the file was removed.
%%EMAIL_TO%%	The email address of the intended receiver of the message from which the file was removed.
%%FAILED_MESSAGE%%	The failed to login message displayed on the auth-login-failed page.

Table 29: Replacement message tags (Continued)

Tag	Description
%%FILE%%	The name of a file that has been removed from a content stream. This could be a file that contained a virus or was blocked by antivirus file blocking. %%FILE%% can be used in virus and file block messages.
%%FORTIGUARD_WF%%	The FortiGuard - Web Filtering logo.
%%FORTINET%%	The Fortinet logo.
%%LINK%%	The link to the FortiClient Host Security installs download for the Endpoint Control feature.
%%HTTP_ERR_CODE%%	The HTTP error code. “404” for example.
%%HTTP_ERR_DESC%%	The HTTP error description.
%%KEEPALIVEURL%% (FortiOS Carrier only)	auth-keepalive-page automatically connects to this URL every %%TIMEOUT%% seconds to renew the connection policy.
%%MMS_SENDER%% (FortiOS Carrier only)	Senders MSISDN from message header.
%%MMS_RECIPIENT%% (FortiOS Carrier only)	Recipients MSISDN from message header.
%%MMS_SUBJECT%% (FortiOS Carrier only)	MMS Subject line to help with message identity.
%%MMS_HASH_CHECKSUM%%	Value derived from hash calculation - will only be shown on duplicate message alerts.
%%MMS_THRESH%%	Mass MMS alert threshold that triggered this alert.
%%NIDSEVENT%%	The IPS attack message. %%NIDSEVENT%% is added to alert email intrusion messages.
%%NUM_MSG%% (FortiOS Carrier only)	The number of time the device tried to send the message with banned content within the reporting period.
%%OVERRIDE%%	The link to the FortiGuard Web Filtering override form. This is visible only if the user belongs to a group that is permitted to create FortiGuard web filtering overrides.
%%OVRD_FORM%%	The FortiGuard web filter block override form. This tag must be present in the FortiGuard Web Filtering override form and should not be used in other replacement messages.
%%PROTOCOL%%	The protocol (http, ftp, pop3, imap, or smtp) in which a virus was detected. %%PROTOCOL%% is added to alert email virus messages.
%%QUARFILENAME%%	The name of a file that has been removed from a content stream and added to the quarantine. This could be a file that contained a virus or was blocked by antivirus file blocking. %%QUARFILENAME%% can be used in virus and file block messages. Quarantining is only available on FortiGate units with a local disk.

Table 29: Replacement message tags (Continued)

Tag	Description
%%QUOTA_INFO%%	Display information about the traffic shaping quota setting that is blocking the user. Used in traffic quota control replacement messages.
%%QUESTION%%	Authentication challenge question on auth-challenge page. Prompt to enter username and password on auth-login page.
%%SERVICE%%	The name of the web filtering service.
%%SOURCE_IP%%	The IP address of the request originator who would have received the blocked file. For email this is the IP address of the user's computer that attempted to download the message from which the file was removed.
%%TIMEOUT%%	Configured number of seconds between authentication keepalive connections. Used on the auth-keepalive page.
%%URL%%	The URL of a web page. This can be a web page that is blocked by web filter content or URL blocking. %%URL%% can also be used in http virus and file block messages to be the URL of the web page from which a user attempted to download a file that is blocked.
%%VIRUS%%	The name of a virus that was found in a file by the antivirus system. %%VIRUS%% can be used in virus messages

Mail replacement messages

The FortiGate unit sends the mail replacement messages to email clients using IMAP, POP3, or SMTP when an event occurs such as antivirus blocking a file attached to an email that contains a virus. Email replacement messages are text messages.

If the FortiGate unit supports SSL content scanning and inspection these replacement messages can also be added to IMAPS, POP3S, and SMTPS email messages.

Table 30: Mail replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Virus message	*Virus Scan* (any email protocol within an antivirus profile)	If a match is detected, the infected file from the email message is deleted and replaced with the message.
File block message	*File Filter* (file filter list selected within the antivirus profile)	If a match is detected, the incoming file is blocked and triggers this message.
Oversized file message	*Oversized File/Email* set to *Block* (within protocol options list)	If a match is detected, the file is removed and replaced with this message.
Fragmented email	*Allow Fragmented Emails* (an exception: this is not enabled)	If a match is detected, the fragmented email is blocked and this replacement message replaces the first fragment of the fragmented email.

Table 30: Mail replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Data leak prevention message	A rule is set to *Block* (DLP sensor)	If a match is detected, the FortiGate unit blocks messages and this replacement message is sent to the sender.
Subject of data leak prevention message	*Block*, *Ban*, *Ban Sender*, *Quarantine IP address*, and *Quarantine interface* (DLP sensor)	This replacement message is added to the subject field of all email messages when a match is found.
Banned by data leak prevention message	A rule is set to *Ban* (DLP sensor)	Replaces a blocked email message and replaces any additional email messages that the banned user sends until they are removed from the banned user list.
Sender banned by data leak prevention message	A rule set to *Ban Sender* (DLP sensor)	Replaces a blocked email message with this message and replaces any additional email messages that the banned user sends until the user is removed from the banned user list.
Virus message (splice mode)	Splice mode	If the antivirus system detects a virus in an SMTP email message, then the FortiGate FortiGate unit aborts the SMTP session and returns a 554 SMTP error message to the sender that is included in the message.
File block message (splice mode)	Splice mode	If the antivirus file filter deleted a file from an SMTP email message, the FortiGate unit aborts the SMTP session and returns a 554 SMTP error message to the sender that is included in the message.
Oversized file message (splice mode)	Splice mode AND *Oversized File/Email* is set to *Block* (protocol option list)	If the FortiGate unit blocks an oversize SMTP email message, the FortiGate unit aborts the SMTP session and returns a 554 SMTP error message to the sender that is included in the message.

HTTP replacement messages

The FortiGate unit sends the HTTP replacement messages listed in the following table to web browsers using the HTTP protocol when an event occurs such as antivirus blocking a file that contains a virus in an HTTP session. HTTP replacement messages are HTML pages.

If the FortiGate unit supports SSL content scanning and inspection, and if under HTTPS in the protocol option list has Enable Deep Scan enabled, these replacement messages can also replace web pages downloaded using the HTTPS protocol.

Table 31: HTTP replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Virus message	*Virus Scan* for HTTP or HTTPS (antivirus profile)	Displays a web page in the client's browser when an entry in the selected file filter list matches HTTP GET. The FortiGate unit blocks the file being downloaded using HTTP GET.
Infection cache message	Client comforting (web filter profile)	This message is triggered only after the blocked URL is attempted for a second time.
File block message	*File Filter* for HTTP or HTTPS (antivirus profile)	Displays in the client's browser when an entry in the selected file filter list matches HTTP GET and the FortiGate unit blocks that file that is being downloaded.
Oversized file message	*Oversized File/Email set to Block* for HTTP or HTTPS (protocol options list)	The FortiGate unit blocks an oversized file that is being downloaded that uses a HTTP GET and replaces the file with this web page that is displayed by the client browser.
Data leak prevention message	A rule is set to *Block* (DLP sensor)	If the FortiGate unit blocks a page/file that the user loads using HTTP GET with this web page, the message appears. This message appears if the FortiGate unit also blocks the user that is sending information using HTTP POST.
Banned by data leak prevention message	A rule is set to *Ban* (DLP sensor)	This message replaces a blocked web page or file. This message also replaces any additional web pages or files that the banned user attempts to access until the user is removed from the banned user list.
Banned word message	Banned word's score (web filter profile)	If the banned word's score exceeds the threshold set in the web filter profile, the page is blocked and the blocked page is replaced with this message.
Content-type block message	N/A	Email headers include information about content types such as image for pictures, and so on. If a specific content-type is blocked, the blocked message is replaced with this web page message.
URL block message	Web URL Filtering (web filter profile)	This message replaces a web page that the FortiGate unit blocked.

Table 31: HTTP replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Archive block message	A DLP sensor has, in a sensor filter, *Archive* set to *Full* or *Summary*	This message displays in the client's browser when archive HTTP downloads are blocked by the FortiGate unit.
Web Filter error message	*Allow Websites When a Rating Error Occurs* option in *Advanced Filter*, in a web filter profile	This message displays in the clients browser when there are HTTP web filter errors.
Client block	*File Filter* for HTTP or HTTPS (antivirus profile)	This message displays in the client's browser when a file that is being uploaded by an HTTP POST is blocked by the FortiGate unit.
Client anti-virus	*Virus Scan* for HTTP or HTTPS (antivirus profile)	This message displays in a client's browser when an infected file that is being uploaded using FTP PUT is detected by the FortiGate unit.
Client filesize	*Oversized File/Email* set to *Block* for HTTP or HTTPS (protocol options list)	If an oversized file is being uploaded using FTP PUT, and the FortiGate unit blocks the file that is being uploaded, this message replaces the web page.
Client banned word	Web Content filtering (this is in the CLI)	This message displays in a client's browser when the FortiGate unit blocks a web page that is being uploaded with an HTTP PUT and contains content that matches an entry in the Web Content Filter list.
Client archive block	`set archive-log {corrupted encrypted mailbomb multipart nested unhandled]` (`config antivirus profile`, under `config` **setting in the** CLI)	This message displays when a user is attempting to upload a banned archived file.
POST block	*HTTP POST Action* is set to *Block* (profile)	This message displays this web page when the FortiGate unit blocks a HTTP POST.

Invalid certificate block	When `block` is set in:
	`smtps-client-cert-request`
	`ftps-client-cert-request`
	`https-client-cert-request`
	(CLI)
		This message displays when a request for a certificate is determined by the FortiGate unit to be invalid and blocks the certificate.

Web Proxy replacement messages

The FortiGate unit sends Web Proxy replacement messages listed in the table below when a web proxy event occurs that is detected and matches the web proxy configuration. These replacement messages are web pages that appear within your web browser.

The following web proxy replacement messages require an identity-based security policy so that the web proxy is successful. You can also enable FTP-over-HTTP by selecting the *FTP* option in *System* > *Network* > *Explicit Proxy*.

Table 32: Web Proxy replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Web proxy access denied	Web Proxy (default action set to Deny)	This message displays when both of the following are true, as well as when there is no web proxy policy defined: • no web proxy policy is defined ***OR*** no existing policy matches the incoming request • default action is set to Deny (*System* > *Network* > *Explicit Proxy*) **Note:** The default action is ignored when there is at least one web policy defined.
Web proxy login challenge	N/A	This replacement message is triggered by a log in, and is always sent to the client's browser with it is triggered; however, some browsers (Internet Explorer and Firefox) are unable to display this replacement message.
Web proxy login fail	N/A	If a user name and password authentication combination is entered, and is accepted as incorrect, this replacement message appears.
Web proxy authorization fail	N/A	If a username and password is entered and is correct, this message appears. However, if the following is true, this message also appears: • The user is not allowed to view the request resources, (for example, in an Fortinet Single Sign On Agent setup and the authentication passes), and the username and password combo is correct, but the user group does not match a user group defined in the security policy.

Table 32: Web Proxy replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Web proxy HTTP error	N/A	This message is triggered whenever there is a web proxy HTTP error. This message forwards the actual servers' error message and a web proxy internal error message, for example, error 404: web page is not found.
Web proxy user-limit (CLI only)	`user-limit` (`config system replacemsg webproxy`)	This message is triggered when a web proxy user has met the threshold that is defined in global resources or vdom resources.

FTP Proxy replacement message

The FortiGate unit sends the FTP proxy replacement message whenever a user access the FTP proxy. The replacement message is a banner-message that contains only text.

FTP replacement messages

The FortiGate unit sends the FTP replacement messages listed in the table below to FTP clients when an event occurs such as antivirus blocking a file that contains a virus in an FTP session. FTP replacement messages are text messages.

Table 33: FTP replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Virus message	Virus Scan for FTP (antivirus profile)	If a match is detected and the infected file is deleted when being downloaded using FTP, the FortiGate unit sends this message to the FTP client.
Blocked message	File Filter for FTP (antivirus profile)	If a match is detected and a file that is being downloaded uses FTP, and the FortiGate unit blocks the download, the FortiGate unit sends this message to the FTP client.
Oversized message	*Oversized File/Email* set to *Block* for FTP (antivirus profile)	If an oversize file that is being downloaded using FTP is blocked, the FortiGate unit sends this message to the FTP client.
DLP message	A rule set to *Block* (DLP sensor)	This replacement message replaces a blocked FTP download.

Table 33: FTP replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
DLP ban message	A rule set to *Ban* (blocks an FTP session)	If a match is detected, and is using protocols such as FTP PUT and FTP GET, this replacement message displays. This message is displayed whenever the banned user attempts to access, until the user is removed from the banned user list.
Archive block	A DLP rule has *Archived* enabled, *Action* is set to *Block,* and *All-FTP* (file transfers) is also selected.	If a match is detected, and a file is being transferred, this replacement message displays. This message is displayed whenever a file is being transferred over FTP, and that DLP rule has archiving enabled as well as *Action* set to *Block*.

NNTP replacement messages

The FortiGate unit sends the NNTP replacement messages listed in the following table to NNTP clients when an event occurs such as antivirus blocking a file attached to an NNTP message that contains a virus. NNTP replacement messages are text messages.

Table 34: NNTP replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Virus message	*Virus Scan* for NNTP (antivirus profile)	If a match is detected, and an infected file is attached to an NNTP message, and the FortiGate unit deletes the NNTP message, the FortiGate unit sends the replacement message to the client.
Blocked message	*File Filter* for NNTP (antivirus profile)	This message is sent to the client when a file attached to an NNTP message is blocked by the FortiGate unit.
Oversized message	*Oversized File/Email* set to *Block* for NNTP (protocol options list)	If the FortiGate unit removes an oversized file from an NNTP message, this message is sent instead.
Data Leak prevention message	A rule set to *Block* (DLP sensor)	If the FortiGate unit blocks an NNTP message, the message is replaced with this replacement message.

Table 34: NNTP replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Subject of data leak prevention message	*Block*, *Ban*, *Quarantine IP address*, and *Quarantine interface* (DLP sensor)	This message is added to the subject field of all NNTP messages.
Banned by data leak prevention message	A rule set to *Ban* (DLP sensor)	If a match is detected, this message replaces a blocked NNTP message. This message also replaces any additional NNTP messages that the banned user sends until the user is removed from the banned user list.

Alert Mail replacement messages

The FortiGate unit adds the alert mail replacement messages listed in the following table to alert email messages sent to administrators.

If you enable the option *Send alert email for logs based on severity*, whether or not replacement messages are sent by alert email depends on how you set the alert email in *Minimum log level*.

Table 35: Alert mail replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Virus message	*Virus detected* (alert email message) AND *Virus Scan* (antivirus profile)	If a match is detected, this message displays. **Note:** Both options/settings must be enabled for this replacement message to appear.
Block message	*Virus detected* (alert email messages) AND *File Filter* (antivirus profile)	This message displays when if the FortiGate unit blocks a file. **Note:** Both options/settings must be enabled for this replacement message to appear.
Intrusion message	*Intrusion detected* (alert email message) AND IPS sensor or DoS sensor is enabled	If a match is detected, as well as an attack, this message displays. **Note:** Both options/settings must be enabled for this replacement message to appear.
Critical event message	*Send alert email for logs based on severity* AND *Minimum log level* set to *Alert* or *Emergency* (alert email message)	Whenever a critical level event log message is generated, this message is sent; however, unless you configure an alert email message with both of the said options enabled, this is message does not appear.

Table 35: Alert mail replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Disk full message	*Disk Usage* (alert email message)	If the disk usage reaches the percentage configured in the alert email notification settings, this replacement message displays.

Spam replacement messages

The FortiGate unit adds the Spam replacement messages listed in the following table to SMTP server responses if the email message is identified as spam and the spam action is discard. If the FortiGate unit supports SSL content scanning and inspection these replacement messages can also be added to SMTPS server responses.

Table 36: Spam replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Email IP	*IP address BWL check* (for any email protocol within an email filter profile)	If a match is detected to the last hop IP address, then this message is added.
DNSBL/ORDBL	`spamrbl` (CLI) (for any email protocol within an email filter profile)	If the FortiGate unit identifies the email message as spam, this message is added.
HELO/EHLO domain	*HELO DNS lookup* (for any email protocol within an email filter profile)	If the FortiGate unit identifies an email message as spam, this message is added. **Note:** *HELO DNS lookup* is not available for SMTPS.
Email address	*E-mail Address BWL check* (for any email protocol within an email filter profile)	If the FortiGate unit identifies an email message as spam, this message is added.
Mime header	`spamhdr check` (CLI) (for any email protocol within an email filter profile)	If the FortiGate unit identifies an email message as spa, this message is added.
Returned email domain	*Return e-mail DNS check* (for any email protocol within an email filter profile)	If the FortiGate unit identifies an email message as spam, this message is added.

Table 36: Spam replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Banned word	*Banned word check* (for any email protocol within an email filter profile)	If the FortiGate unit identifies an email message as spam, this message is added.
Spam submission message	Any email filtering option for any email protocol within an email filter profile	If the FortiGate unit identifies an email message as spam, it adds this message. **Note:** Email Filtering adds this message to all email tagged as spam. The message describes a button that the recipient of the message can select to submit the email signatures to the FortiGuard Antispam service if the email was incorrectly tagged as spam (a false positive).

Administration replacement message

If you enter the following CLI command the FortiGate unit displays the *Administration Login Disclaimer* whenever an administrator logs into the FortiGate unit's web-based manager or CLI.

```
config system global
  set access-banner enable
end
```

The web-based manager administrator login disclaimer contains the text of the Login Disclaimer replacement message as well as Accept and Decline buttons. The administrator must select accept to login.

Authentication replacement messages

The FortiGate unit uses the text of the authentication replacement messages listed in Authentication replacement messages for various user authentication HTML pages that are displayed when a user is required to authenticate because a security policy includes at least one identity-based policy that requires firewall users to authenticate.

These replacement message pages are for authentication using HTTP and HTTPS. You cannot customize the firewall authentication messages for FTP and Telnet.

The authentication login page and the authentication disclaimer include replacement tags and controls not found on other replacement messages.

Users see the authentication login page when they use a VPN or a security policy that requires authentication. You can customize this page in the same way as you modify other replacement messages.

There are some unique requirements for these replacement messages:

- The login page must be an HTML page containing a form with ACTION="/" and METHOD="POST"

- The form must contain the following hidden controls:
  - `<INPUT TYPE="hidden" NAME="%%MAGICID%%" VALUE="%%MAGICVAL%%">`
  - `<INPUT TYPE="hidden" NAME="%%STATEID%%" VALUE="%%STATEVAL%%">`
  - `<INPUT TYPE="hidden" NAME="%%REDIRID%%" VALUE="%%PROTURI%%">`
- The form must contain the following visible controls:
  - `<INPUT TYPE="text" NAME="%%USERNAMEID%%" size=25>`
  - `<INPUT TYPE="password" NAME="%%PASSWORDID%%" size=25>`

Example

The following is an example of a simple authentication page that meets the requirements listed above.

```
<HTML><HEAD><TITLE>Firewall Authentication</TITLE></HEAD>
<BODY><H4>You must authenticate to use this service.</H4>

<FORM ACTION="/" method="post">
<INPUT NAME="%%MAGICID%%" VALUE="%%MAGICVAL%%" TYPE="hidden">

<TABLE ALIGN="center" BGCOLOR="#00cccc" BORDER="0"
CELLPADDING="15" CELLSPACING="0" WIDTH="320"><TBODY>

<TR><TH>Username:</TH>
<TD><INPUT NAME="%%USERNAMEID%%" SIZE="25" TYPE="text"> </TD></TR>

<TR><TH>Password:</TH>
<TD><INPUT NAME="%%PASSWORDID%%" SIZE="25" TYPE="password">
</TD></TR>

<TR><TD COLSPAN="2" ALIGN="center" BGCOLOR="#00cccc">
<INPUT NAME="%%STATEID%%" VALUE="%%STATEVAL%%" TYPE="hidden">
<INPUT NAME="%%REDIRID%%" VALUE="%%PROTURI%%" TYPE="hidden">
<INPUT VALUE="Continue" TYPE="submit"> </TD></TR>

</TBODY></TABLE></FORM></BODY></HTML>
```

Table 37: Authentication replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Disclaimer page	*Enable Disclaimer and Redirect URL to* (identity-based security policy)	After a firewall user authenticates with the FortiGate unit using HTTP or HTTPS, this message, which is a disclaimer page, displays. **Note:** The CLI includes `auth-disclaimer-page-1`, `auth-disclaimer-page-2`, and `auth-disclaimer-page-3` that you can use to increase the size of the authentication disclaimer page replacement message.

Table 37: Authentication replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Declined disclaimer page	N/A	When a firewall user selects the button on the Disclaimer page to decline access through the FortiGate unit, the *Declined disclaimer page* (replacement message) is displayed.
Login page	N/A	The HTML page displayed for firewall users who are required to authenticate using HTTP or HTTPS before connecting through the FortiGate FortiGate unit.
Login failed page	N/A	The HTML page displayed if firewall users enter an incorrect user name and password combination.
Success message	N/A	The page displays when a user authenticates for a Telnet session.
Login challenge page	N/A	The HTML page displayed if firewall users are required to answer a question to complete authentication. The page displays the question and includes a field in which to type the answer. This feature is supported by RADIUS and uses the generic RADIUS challenge-access auth response. Usually, challenge-access responses contain a Reply-Message attribute that contains a message for the user (for example, “Please enter new PIN”). This message is displayed on the login challenge page. The user enters a response that is sent back to the RADIUS server to be verified. The Login challenge page is most often used with RSA RADIUS server for RSA SecurID authentication. The login challenge appears when the server needs the user to enter a new PIN. You can customize the replacement message to ask the user for a SecurID PIN.

Table 37: Authentication replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message

Keepalive page	`config system global`
	`  set auth-keepalive enable`
	`end`
		The HTML page displayed with firewall authentication keepalive is enabled using the following command:
		Authentication keepalive keeps authenticated firewall sessions from ending when the authentication timeout ends. Go to *User* > *Options* to set the *Authentication Timeout*.

FortiToken page	*Two-factor authentication* is enabled	The message displays when the token password code is required as part of a user's login credentials when that user has two-factor authentication enabled.
Email token page	*Two-factor authentication* is enabled and *Email to* is also enabled	The message displays when the token password code has been emailed to a user and is required as part of a user's login credentials when that user has two-factor authentication enabled.
SMS token page	*Two-factor authentication* is enabled and *SMS* is also enabled	The message displays when the token password code has been sent to a user's mobile phone, and that code must be included in a user's login credentials when that user has two-factor authentication enabled.

Captive Portal Default replacement messages

The Captive Portal Default replacement messages are used for wireless authentication only. You must have a VAP interface with the security set as captive portal to trigger these replacement messages.

Table 38: Captive Portal Default replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Disclaimer page	VAP interface that has captive portal set	*The message is a disclaimer agreement; if the user who is trying to access a web site that is not under the control of the network access provider and is given a choice to either agree to the terms and continue or not gain access to the site.*
Declined disclaimer page	VAP interface that has captive portal set	*Appears when the user who did not agree to the terms in the Disclaimer page message.*
Login page	VAP interface that has captive portal set	*The message is an authentication page.*

Table 38: Captive Portal Default replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Login failed page	VAP interface that has captive portal set	*The message that appears when the user has failed to log in.*

FortiGuard Web Filtering replacement messages

The FortiGate unit sends the FortiGuard Web Filtering replacement messages listed in the table to web browsers using the HTTP protocol when FortiGuard web filtering blocks a URL, provides details about blocked HTTP 4xx and 5xx errors, and for FortiGuard overrides. FortiGuard Web Filtering replacement messages are HTTP pages.

If the FortiGate unit supports SSL content scanning and inspection and if *Protocol Recognition* > *HTTPS Content Filtering Mode* is set to Deep Scan in the antivirus profile, these replacement messages can also replace web pages downloaded using the HTTPS protocol.

Table 39: FortiGuard Web Filtering replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
URL block message	`config ftgd-wf set options` (under `config webfilter profile`) for HTTP or HTTPS	This message replaces a web page that is blocked by the FortiGate unit.
HTTP error message	*Provide details for blocked HTTP 4xx and 5xx errors* for HTTP or HTTPS (web filter profile)	This message replaces a web page that is blocked.
FortiGuard Web Filtering override form	`ovrd-perm` in `config webfilter profile`	If FortiGuard Web Filtering blocks a web page in this category, this message displays a web page. By using this web page, users can authenticate to get access to the page. Overrides are configured within the CLI using the `ovrd-perm` value in the `config webfilter profile` command. **Note:** Do not remove the `%%OVRD_FORM%%` tag. This tag provides the form used to initiate an override if FortiGuard Web Filtering blocks access to a web page.

Table 39: FortiGuard Web Filtering replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
FortiGuard Web Filtering quota expired message	*Enforced Quota* (web filter profile)	This message is added when a match is detected regarding FortiGuard quota.
FortiGuard Webfiltering warning portal message	*Warning* (action) for a filter in a web filter profile	This message replaces the blocked web page. The user can either select *Proceed* or *Cancel*, to proceed to the web site or cancel and return back to the previous web site. If they select *Proceed*, and filter category *Require additional Authentication to proceed* is enabled in the web filter profile, the user is required to log in.

IM and P2P replacement messages

The FortiGate unit sends the IM and P2P replacement messages listed in Table 40 to IM and P2P clients using AIM, ICQ, MSN, or Yahoo! Messenger when an event occurs such as antivirus blocking a file attached to an email that contains a virus. IM and P2P replacement messages are text messages.

Table 40: IM and P2P replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
File block message	*File Filter* for IM (application control list)	If a file that matches an entry in the selected file filter list for IM is deleted, this message replaces the file.
File name block message	*File Filter* antivirus for IM (application control list)	If a file name matches an entry in the selected file filter list, and is deleted, this message replaces it.
Virus message	*Virus Scan* for IM (application control list)	If an infected file is deleted, this message replaces the file.
Oversized file message	*Oversized File/Email* set to *Block* for IM (protocol options list)	If an oversized file is removed, this message replaces it.
Data leak prevention message	A rule set to *Block* (DLP sensor)	If a blocked IM or P2P message is blocked, this message replaces it.

Table 40: IM and P2P replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Banned by data leak prevention message	A rule set to *Ban* (DLP sensor)	If an IM or P2P message is blocked, this message replaces it with this message. This message also replaces any additional messages that the banned user sends until they are removed from the banned user list.
Voice chat block message	*Block Audio* for AIM, ICQ, MSN, or Yahoo! (application control list)	If a match is detected, this message displays.
Video chat block message	`set block`-video enable in either AIM, ICQ, MSN, or Yahoo application list entries.	If a match is detected, this message displays.
Photo share block message	`block-photo` for MSN or Yahoo! (CLI) (application control list)	If a match is detected, this message displays.

Endpoint NAC replacement messages

The FortiGate unit sends one of the following messages to non-compliant users who attempt to use a security policy in which Endpoint NAC is enabled.

Table 41: Endpoint NAC replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Endpoint NAC Download Portal	*Quarantine Hosts to User Portal (Enforce compliance)*	The user can download the FortiClient Endpoint Security application installer. If you modify this message, be sure to retain the %%LINK%% tag which provides the download URL for the FortiClient installer.
Endpoint NAC Recommendation Portal	*Notify Hosts to Install FortiClient (Warn only)* (Endpoint profile)	The user can either download the FortiClient Endpoint Security application installer or select the *Continue to* link to access their desired destination. If you modify this message, be sure to retain both the %%LINK%% tag which provides the download URL for the FortiClient installer and the %%DST_ADDR%% link that contains the URL that the user requested.
Endpoint NAC Block Page	N/A	This message appears when FortiClient is opened before FortiClient has time to see the HTTP message.

Table 41: Endpoint NAC replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Endpoint NAC Recommendation Block Page	`set recommendation-disclaimer enable` (CLI)	This message displays when it is recommended that the endpoint be compliant so that the user may gain access to the network. Select Continue to link to access the desired destination. If you modify this message, be sure to retain both the %%LINK%% tag which provides the download URL for the FortiClient installer and the %%DST_ADDR%% link that contains the URL that the user requested.
Endpoint NAC Feature Block Page	N/A	This message displays when endpoint security is required and the FortiClient security check failed.
Endpoint NAC Recommendation Feature Block Page	FortiClient's antivirus settings enabled	This message displays when endpoint security is required and the FortiClient security check failed.Select Continue to link to access the desired destination.

NAC quarantine replacement messages

The page that is displayed for the user depends on whether NAC quarantine blocked the user because a virus was found, a DoS sensor detected an attack, an IPS sensor detected an attack, or a DLP rule with action set to *Quarantine IP address* or *Quarantine Interface* matched a session from the user.

The default messages inform the user of why they are seeing this page and recommend they contact the system administrator. You can customize the pages as required, for example to include an email address or other contact information or if applicable a note about how long the user can expect to be blocked.

Table 42: NAC quarantine replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
Virus Message	*Quarantine Virus Sender* (antivirus profile; the FortiGate unit adds a source IP address or FortiGate interface to the banned user list)	The FortiGate unit displays this message as a web page when the blocked user attempts to connect through the FortiGate unit using HTTP on port 80 or when any user attempts to connect through a FortiGate interface added to the banned user list using HTTP on port 80.

Table 42: NAC quarantine replacement messages (Continued)

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
DoS Message	`attack` or `interface` (CLI) (DoS sensor) AND applied to a DoS security policy	For a DoS Sensor the CLI `quarantine` option set to `attacker` or `interface` and the DoS Sensor added to a DoS security policy adds a source IP, a destination IP, or FortiGate interface to the banned user list. The FortiGate unit displays this message as a web page when the blocked user attempts to connect through the FortiGate unit using HTTP on port 80 or when any user attempts to connect through a FortiGate interface added to the banned user list using HTTP on port 80. This replacement message is not displayed if `quarantine` is set to `both`.
IPS Message	*Quarantine Attackers* (IPS sensor)	This message displays if *Quarantine Attackers* enabled in an IPS sensor filter or override and the IPS sensor applied to a security policy adds a source IP address, a destination IP address, or a FortiGate interface to the banned user list. The FortiGate unit displays this message as a web page when the blocked user attempts to connect through the FortiGate unit using HTTP on port 80 or when any user attempts to connect through a FortiGate interface added to the banned user list using HTTP on port 80. This message is not displayed if *method* is set to *Attacker and Victim IP Address*.
DLP Message	*Action* set to *Quarantine IP address* OR *Quarantine Interface* (DLP sensor)	This message displays if *Action* set to *Quarantine IP address* or *Quarantine Interface* in a DLP sensor adds a source IP address or a FortiGate interface to the banned user list. The FortiGate unit displays this message as a web page when the blocked user attempts to connect through the FortiGate unit using HTTP on port 80 or when any user attempts to connect through a FortiGate interface added to the banned user list using HTTP on port 80.

Traffic quota control replacement messages

When user traffic is going through the FortiGate unit and it is blocked by traffic shaping quota controls, users see the *Traffic shaper block message* or the *Per IP traffic shaper block message* when they attempt to connect through the FortiGate unit using HTTP.

The traffic quota HTTP pages should contain the %%QUOTA_INFO%% tag to display information about the traffic shaping quota setting that is blocking the user.

SSL VPN replacement message

The SSL VPN login replacement message is an HTML replacement message that formats the FortiGate SSL VPN portal login page. You can customize this replacement message according to your organization's needs. The page is linked to FortiGate functionality and you must construct it according to the following guidelines to ensure that it will work.

- The login page must be an HTML page containing a form with `ACTION="%%SSL_ACT%%" and METHOD="%%SSL_METHOD%%"`
- The form must contain the `%%SSL_LOGIN%%` tag to provide the login form.
- The form must contain the `%%SSL_HIDDEN%%` tag.

MM1 replacement messages

MM1 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile. The replacement messages for MM1 are listed in Table 43.

You must have *Remove Blocked* selected within the MMS profile if you want to remove the content that is intercepted during MMS scanning on the FortiGate unit.

Table 43: MM1 replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM1 send-req virus message	*Virus Scan* (MMS profile)	This message is sent to the client when a virus is detected within multiple messages during the scan of the client's m-send.req HTTP post request.
MM1 send-req file block message	*Virus Scan* (MMS profile)	This message is sent to the client when during the scan of the client's m-send.req HTTP post request a banned file was found in multiple messages, the file is blocked and this message is sent to the client.
MM1 send-req carrier end point filter message	*Carrier end-point filter* for (MMS profile)	This message is sent to the client when, during the scan of the client's m-send.req HTTP post request, a banned user and/or recipient was being contacted.
MM1 send-req content checksum block message	*Content checksum* (MMS profile)	This message is sent to the client when, during the scan of the client's m-send.req HTTP post request, banned content was found.

Table 43: MM1 replacement messages (Continued)

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM1 send-req banned word message	*Banned Word Check* (Email filter profile)	This message is sent to the client when, during the scan of the client's m-send.req HTTP post request, banned words were found in multiple messages.
MM1 send-req flood message	*Message flood threshold* (MMS profile)	This message is sent to the client when, during the scan of the client's m-send.req HTTP post request, multiple messages that were being sent to a mobile device were flagged as message floods.
MM1 send-req duplicate message	*MMS Bulk Email Filtering Detection* AND *MMS Notifications* (MMS profile)	This message is sent to the client when, during the scan of the client's m-send.req HTTP post request, multiple messages that were being sent to a mobile device were flagged as duplicates.
MM1 send request flood alert message	*MMS Bulk Email Filtering Detection* AND *MMS Notifications* (MMS profile)	This is sent when a mass MMS flood event is detected by FortiOS Carrier. This message is in an email format, with to, from and subject line included.
MM1 send request duplicate alert message	*MMS Bulk Email Filter* AND *MMS Notifications* (MMS profile)	This message is sent when a mass MMS duplicate message event is detected by FortiOS Carrier. This message is in an email format, with to, from and subject line included as well as the hash checksum.
MM1 send-conf virus message	*Virus Scan* (MMS profile)	This message is sent to confirm that a message that has been sent was blocked because it contains a banned file. FortiOS Carrier quarantines the banned file.
MM1 send-conf file block message	*File Filter* (MMS profile)	This message is sent to confirm that a message that was previously sent was blocked because it contains a banned file. FortiOS Carrier quarantines the banned file.

Table 43: MM1 replacement messages (Continued)

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM1 send-conf carrier end point filter message	*MMS Address Translation* AND *Carrier End Point Block* (MMS profile)	This message is sent to notify the person that sent a message that it was blocked because the sender or recipient is banned. FortiOS Carrier determined that the content was not acceptable because the m-send-req messages contained blocked carrier end points.
MM1 send-conf content checksum block message	*MMS Content Checksum* (with the MMS content checksum list included in MMS profile)	This message is sent to notify the person that sent a message, that message was blocked because the actual message contains banned content. FortiOS Carrier determined that the content was not acceptable because the m-send-req messages contained content checksum blocked payloads.
MM1 send-conf flood message	*MMS Bulk Email Filtering Detection* AND *MMS Notification* (MMS profile)	This message is sent to notify the person that sent a message that it was blocked because the sender has been banned for sending too many messages. FortiOS Carrier determined that the content was not acceptable because the m-send-req messages were flagged as flood messages.
MM1 send-conf duplicate message	*MMS Bulk Email Filtering Detection* AND *MMS Notifications* (MMS profile)	This message is sent to notify the person that sent a message that it was blocked because the content within the message has been sent too many times. FortiOS Carrier determined that the content was not acceptable because the m-send-req messages were flagged as duplicate messages.
MM1 send-conf banned word message	*Banned Word Check* (Email Filter profile) AND *MMS Notifications* (MMS profile	This message is sent to notify the person that sent a message that it was blocked because it contained a banned word. FortiOS Carrier determined that the content was not acceptable because the m-retrieve-conf messages contained a banned word.

Table 43: MM1 replacement messages (Continued)

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM1 send-conf virus message	*Virus Scan* (MMS profile)	This message is sent to notify the person that sent a message that is was infected with a virus. FortiOS Carrier determined that the content was not acceptable because the m-retrieve-conf message for retrieval contained a virus. FortiOS Carrier also quarantines the virus.
MM1 retrieve-conf virus message	*File Filter* (MMS profile)	This message is sent to notify the person that was retrieving the message, that it contained a file which contained a virus. FortiOS Carrier determined that the content was not acceptable because the m-retrieve-conf message for retrieval contained a virus. FortiOS Carrier also quarantines the file
MM1 retrieve-conf file block message	*File Filter* AND *MMS Notifications* (MMS Profile)	This message is sent to notify the person that was retrieving the message was blocked because it contains a banned file. FortiOS Carrier determined that the content was not acceptable because the m-retrieve-conf message contained a banned file. FortiOS Carrier also quarantines the file.
MM1 retrieve-conf carrier endpoint filter message	*Carrier Endpoint Block* AND *MMS Notifications* (MMS profile)	This message is sent to notify the person that was retrieving the message, that it was blocked because the sender or recipient is banned. FortiOS Carrier determined that the content was not acceptable because the m-retrieve-conf message contained blocked carrier end points.
MM1 retrieve-conf content checksum block message	*MMS Content Checksum* AND *MMS Notifications* (MMS profile)	This message is sent to notify the person that was retrieving the message, that is was blocked because it contained banned content. FortiOS Carrier determined that the content was not acceptable because the m-retrieve-conf message contained content checksum blocked payloads.

Table 43: MM1 replacement messages (Continued)

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM1 retrieve-conf flood message	*MMS Bulk Email Filtering Detection* AND *MMS Notifications* (MMS profile)	This message is sent to notify the person that was retrieving the message, that it was blocked because the sender was banned for sending too many messages. FortiOS Carrier determined that the content was not acceptable because the m-retrieve-conf message was flagged as flood.
MM1 retrieve-conf duplicate message	*MMS Bulk Email Filtering Detection* AND *MMS Notifications* (MMS profile)	This message is sent to notify the person that was retrieving the message, that it was blocked because the message content was sent too many times. FortiOS Carrier determined that the content was not acceptable because the m-retrieve-cof message contained blocked content.
MM1 retrieve-conf banned word message	*Banned Word Check* (Email filter profile) AND *MMS Notifications* (MMS profile)	This message is sent to notify the person that was retrieving the message, that it was blocked because it contained a banned word. FortiOS Carrier determined that the content was not acceptable because the m-retrieve-conf message contained a banned word.

MM3 replacement messages

MM3 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile. The replacement messages for MM3 are listed in Table 44.

You must have *Remove Blocked* selected within the MMS profile if you want to remove the content that is intercepted during MMS scanning on the unit.

Table 44: MM3 replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM3 virus message	*Virus Scan* (MMS profile)	This message is sent when an MM3 message contains a virus. FortiOS Carrier quarantines the file.
MM3 file block message	*File Filter* (MMS profile)	This message is sent when an MM3 message contains a blocked file. FortiOS Carrier quarantines the file.
MM3 carrier end point filter message	*Carrier End Point Block* (MMS profile)	This message is sent when an MM3 message contains a banned sender or recipient is blocked by FortiOS Carrier.
MM3 content checksum block message	*MMS Content Checksum* (MMS profile)	This message is sent when an MM3 message contains banned contain and is blocked by FortiOS Carrier.
MM3 banned word message	*Banned Word Check* (Email Filter profile) AND *MMS Notifications* (MMS profile	This message is sent when an MM3 message contains a banned word.
MM3 flood alert message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when an MM3 message is scanned and found to have mass MMS flood. This replacement message is in the form of an email, containing from, to and subject lines.
MM3 duplicate alert message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when an MM3 message is found to have duplicate messages. This message is in the form of an email, containing form, to, subject, and hash checksum.
MM3 virus notification message	*Virus Scan* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device sending messages are found to contain a virus.
MM3 file block notification message	*File Filter* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device sending the messages are found to contain banned files.
MM3 carrier end point filter notification message	*Carrier End Point Block* (MMS profile)	This message is sent when the mobile device has sent messages that contain a banned or recipient.

Table 44: MM3 replacement messages (Continued)

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM3 content checksum block notification message	*MMS Content Checksum* (MMS profile)	This messages is sent when the mobile device has messages that contain banned content.
MM3 banned word notification message	*Banned Word Check* (Email Filter profile) AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent messages containing banned words.
MMS flood notification message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when the mobile device has sent messages that were flagged as floods.
MM3 duplication notification message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when the mobile device has sent messages that were flagged as duplicates.

MM4 replacement messages

MM4 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile. The replacement messages for MM1 are listed in Table 45.

Table 45: MM4 replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM4 virus message	*Virus Scan* (MMS profile)	This message is sent when the person has sent a message containing a file to a recipient, and that file was blocked because it contained a virus. FortiOS Carrier quarantines the file.
MM4 file block message	*File Filter* (MMS profile)	This message is sent when the person that has sent a message was blocked because it contains a banned file. FortiOS Carrier quarantines the file.
MM4 carrier end point filter message	*Carrier End Point Block* (MMS profile)	This message is sent when the message is blocked because the sender or recipient is banned.
MM4 content checksum block message	*MMS Content Checksum* (MMS profile)	This message is sent when the message is blocked because it contains banned content.
MM4 flood message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when a message is blocked because the sender is banned for sending too many messages.
MM4 duplicate message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when that message is blocked. FortiOS Carrier blocked it because that message body was sent too many times.
MM4 banned word message	*Banned Word Check* (Email Filter profile) AND *MMS Notifications* (MMS profile	This message is sent when a message is blocked. FortiOS Carrier blocked the message because it contains a banned word.
MM4 virus notification message	*Virus Scan* AND *MMS Notifications* (MMS profile)	This replacement message is sent when the mobile device has sent messages containing a virus.
MM4 file block notification message	*File Filter* AND M*MS Notifications* (MMS profile)	This message is sent when the mobile device has sent messages containing banned files.

Table 45: MM4 replacement messages (Continued)

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM4 carrier end point notification message	*Carrier End Point Block* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent messages that contain a banned sender.
MM4 content checksum block notification message	*MMS Content Checksum* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent message that contain banned content.
MM4 flood notification message	*MMS Bulk Email Filtering Detection* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent messages that were flagged as floods.
MM4 duplication notification message	*MMS Bulk Email Filtering Detection* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent messages there were flagged as duplicates.
MM4 banned word notification message	*Banned Word Check* (Email Filter profile)AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent messages that contain banned words.
MM4 flood alert message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when a mass MMS flood is detected. This replacement message is in an email message format, with to, from and subject lines.
MM4 duplicate alert message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when a mass MMS duplicates is detected. This replacement message is in an email message format, with to, from, subject, and hash checksum lines.

MM7 replacement messages

MM7 replacement messages are sent when, during MMS content scanning, FortiOS Carrier detects, for example a virus, using the MMS profile. The replacement messages for MM7 are listed in Table 46.

Table 46: MM7 replacement messages

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM7 virus message	*Virus Scan* (MMS profile)	This message is sent when a person has sent a message and FortiOS Carrier blocked the message because it contained a virus. FortiOS Carrier quarantines the file.
MM7 file block message	*File Filter* (MMS profile)	This message is sent when a person has sent a message and FortiOS Carrier blocked the message because it contained a banned file. FortiOS Carrier quarantines the file.
MM7 carrier end point filter message	*Carrier End Point Block* (MMS profile)	This message is sent when FortiOS Carrier detected that the message sent contained a banned sender or recipient. The message was blocked by FortiOS Carrier.
MM7 content checksum block message	*MMS Content Checksum* (MMS profile)	This message is sent when FortiOS Carrier detected that the message contained banned content. The message was blocked by FortiOS Carrier.
MM7 banned word message	*Banned Word Check* (Email Filter profile)	This message is sent when a message that a person sent was blocked because it contains a banned word.
MM7 virus notification message	*Virus Scan* AND *MMS Notifications* (MMS profile)	This replacement message is sent when the mobile device has sent messages that contain a virus.
MM7 file block notification message	*File Filter* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent messages containing banned files.
MM7 carrier end point filter notification message	*Carrier End Point Block* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent messages that contain a banned sender or recipient.
MM7 content checksum block notification message	*MMS Content Checksum* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent messages that contain banned content.

Table 46: MM7 replacement messages (Continued)

Replacement Message name	Enabled options/settings that triggers the replacement message	Reason for sending or displaying the replacement message
MM7 banned word notification message	*Banned Word Check* (Email Filter profile) AND *MMS Notifications* (MMS profile	This message is sent when the mobile device sent message containing banned words.
MM7 flood notification message	*MMS Bulk Email Filtering Detection* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device sent messages that were flagged as flood.
MM7 duplicate notification message	*MMS Bulk Email Filtering Detection* AND *MMS Notifications* (MMS profile)	This message is sent when the mobile device has sent message that were flagged as duplicates.
MM7 flood alert message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when a mass MMS flood is detected. This replacement message is in an email message format, with to, from and subject lines.
MM7 duplicate alert message	*MMS Bulk Email Filtering Detection* (MMS profile)	This message is sent when a mass MMS duplicates is detected. This message is in an email message format, with to, form, subject, and hash checksum lines.

MMS replacement messages

The MMS replacement message is sent when a section of an MMS message has been replaced because it contains a blocked file. This replacement message is in HTML format.

The message text is:

```
<HTML><BODY>This section of the message has been replaced because
it contained a blocked file</BODY></HTML>
```

Replacement message groups

You configure the default replacement message group from *System* > *Config* > *Replacement Message Group* in FortiOS Carrier. All new replacement message groups that you add inherit from the default group. Modifying messages in the default group automatically changes any messages that are unmodified in the other groups.

If you enable virtual domains (VDOMs) on the FortiGate unit, replacement message groups are configured separately for each virtual domain. Each virtual domain has its own default replacement message group, configured from *System* > *Config* > *Replacement Message Group*.

When you modify a message in a replacement message group, a Reset icon appears beside the message in the group. You can select this Reset icon to reset the message in the replacement message group to the default version.

All MM1/4/7 notification messages (and MM1 retrieve-conf messages) can contain a SMIL layer and all MM4 notification messages can contain an HTML layer in the message. These layers can be used to brand messages by using logos uploaded to the FortiGate unit via the 'Manage Images' link found on the replacement message group configuration page.

Disk

To view the status and storage information of the local disk on your FortiGate unit, go to *System* > *Config* > *Advanced*. The *Disk* menu appears only on FortiGate units with an internal hard or flash disk.

Formatting the disk

The internal disk of the FortiGate unit (if available) can be formatted by going to *System* > *Config* > *Disk* and selecting *Format*.

Formatting the disk will erase all data on it, including databases for antivirus and IPS; logs, quarantine files, and WAN optimization caches. The FortiGate unit requires a reboot once the disk has been formatted.

Setting space quotas

If the FortiGate unit has an internal hard or flash disk, you can allocate the space on the disk for specific logging and archiving, and WAN optimization. By default, the space is used on an as required basis. As such, a disk can fill up with basic disk logging, leaving less potential space for quarantine.

By going to *System* > *Config* > *Disk*, you can select the *Edit* icon for *Logging and Archiving* and *WAN Optimization & Web Cache* and define the amount of space each log, archive and WAN optimization has on the disk.

CLI Scripts

To upload bulk CLI commands and scripts, go to *System* > *Config* > *Advanced*.

Scripts are text files containing CLI command sequences. Scripts can be used to deploy identical configurations to many devices. For example, if all of your devices use identical security policies, you can enter the commands required to create the security policies in a script, and then deploy the script to all the devices which should use those same settings.

Use a text editor such as Notepad or other application that creates simple text files. Enter the commands in sequence, with each line as one command, similar to examples throughout the FortiOS documentation set.

If you are using a FortiGate unit that is not remotely managed by a FortiManager unit or the FortiGuard Analysis and Management Service, the scripts you upload are executed and discarded. If you want to execute a script more than once, you must keep a copy on your management PC.

If your FortiGate unit is configured to use a FortiManager unit, you can upload your scripts to the FortiManager unit, and run them from any FortiGate unit configured to use the FortiManager unit. If you upload a script directly to a FortiGate unit, it is executed and discarded.

If your FortiGate unit is configured to use FortiGuard Analysis and Management Service, scripts you upload are executed and stored. You can run uploaded scripts from any FortiGate unit configured with your FortiGuard Analysis and Management Service account. The uploaded script files appear on the FortiGuard Analysis and Management Service portal web site.

Uploading script files

After you have created a script file, you can then upload it through *System* > *Config* > *Advanced*. When a script is uploaded, it is automatically executed.

Commands that require the FortiGate unit to reboot when entered in the command line will also force a reboot if included in a script.

To execute a script

1. Go to *System* > *Config* > *Advanced*.
2. Verify that *Upload Bulk CLI Command File* is selected.
3. Select *Browse* to locate the script file.
4. Select *Apply*.

If the FortiGate unit is not configured for remote management, or if it is configured to use a FortiManager unit, uploaded scripts are discarded after execution. Save script files to your management PC if you want to execute them again later.

If the FortiGate unit is configured to use the FortiGuard Analysis and Management Service, the script file is saved to the remote server for later reuse. You can view the script or run it from the FortiGuard Analysis and Management Service portal web site.

Rejecting PING requests

The factory default configuration of your FortiGate unit allows the default external interface to respond to ping requests. Depending on the model of your FortiGate unit the actual name of this interface will vary. For the most secure operation, you should change the configuration of the external interface so that it does not respond to ping requests. Not responding to ping requests makes it more difficult for a potential attacker to detect your FortiGate unit from the Internet. One such potential threat are Denial of Service (DoS) attacks.

A FortiGate unit responds to ping requests if ping administrative access is enabled for that interface.

To disable ping administrative access - web-based manager

1. Go to *System* > *Network* > *Interface*.
2. Choose the external interface and select *Edit*.
3. Clear the *Ping Administrative Access* check box.
4. Select *OK*.

In the CLI, when setting the allowaccess settings, by selecting the access types and not including the PING option, that option is then not selected. In this example, only HTTPS is selected.

To disable ping administrative access - CLI

```
config system interface
  edit external
    set allowaccess https
end
```

Opening TCP 113

Although seemingly contrary to conventional wisdom of closing ports from hackers, this port, which is used for ident requests, should be opened.

Port 113 initially was used as an authentication port, and later defined as an identification port (see RFC 1413). Some servers may still use this port to help in identifying users or other servers and establish a connection. Because port 113 receives a lot of unsolicited traffic, many routers, including on the FortiGate unit, close this port.

The issue arises in that unsolicited requests are stopped by the FortiGate unit, which will send a response saying that the port is closed. In doing so, it also lets the requesting server know there is a device at the given address, and thus announcing its presence. By enabling traffic on port 113, requests will travel to this port, and will most likely, be ignored and never responded to.

By default, the ident port is closed. To open it, use the following CLI commands:

```
config system interface
  edit <port_name>
    set inden_accept enable
end
```

You could also further use port forwarding to send the traffic to a non-existent IP address and thus never have a response packet sent.

Obfuscate HTTP headers

The FortiGate unit can obfuscate the HTTP header information being sent to external web servers to better cloak the source. By default this option is not enabled. To obfuscate HTTP headers, use the following CLI command:

```
config system global
  set http-obfucate {none | header-only | modified | no-error}
end
```

Where:

`none` — do not hide the FortiGate web server identity.

`header-only` — hides the HTTP server banner.

`modified` — provides modified error responses.

`no-error` — suppresses error responses.

Chapter 4 Logging and Reporting

This FortiOS Handbook chapter contains the following sections:

Logging overview provides general information about logging. We recommend that you begin with this chapter as it contains information for both beginners and advanced users as well.

Log devices provides information about how to configure your chosen log device. Configuring multiple FortiAnalyzer units or Syslog servers is also included.

Logging FortiGate activity provides information about the different log types and subtypes, and how to enable logging of FortiGate features.

The SQLite log database provides information about SQLite statements as well as examples that you can use to base your own custom datasets on.

Log message usage provides general information about log messages, such as what is a log header. Detailed examples of each log type are discussed as well. For additional information about all log messages recorded by a FortiGate unit running FortiOS 4.0 and higher, see the *FortiGate Log Message Reference*.

Reports provides information about how to configure reports if you have logged to a the FortiGate unit's hard disk SQL database.

Logging overview

This section explains what logging is in relation to your FortiGate unit, what a log message is, and log management practices. These practices can help you to improve and grow your logging requirements.

This section also includes information concerning log management practices that help you to improve and grow your logging requirements.

The following topics are included in this section:

What is logging?

Logging records the traffic passing through the FortiGate unit to your network and what action the FortiGate unit took during its scanning process of the traffic. This recorded information is called a log message.

After a log message is recorded, it is stored within a log file which is then stored on a log device. A log device is a central storage location for log messages. The FortiGate unit supports several log devices, such as a FortiGuard Analysis and Management Service, and the FortiAnalyzer unit. A FortiGate unit's system memory and local disk can also be configured to store logs, and because of this, are also considered log devices.

You must subscribe to FortiGuard Analysis and Management Service so that you can configure the FortiGate unit to send logs to a FortiGuard Analysis server.

How the FortiGate unit records log messages

The FortiGate unit records log messages in a specific order, storing them on a log device. The order of how the FortiGate unit records log messages is as follows:

1. Incoming traffic is scanned
2. During the scanning process, the FortiGate unit performs necessary actions, and simultaneously are recorded
3. Log messages are sent to the log device

Example: How the FortiGate unit records a DLP event

1. The FortiGate unit receives incoming traffic and scans for any matches associated within its firewall policies containing a DLP sensor.
2. A match is found; the DLP sensor, dlp_sensor, had a rule within it called All-HTTP with the action Exempt applied to the rule. The sensor also has Enable Logging selected, which indicates to the FortiGate unit that the activity should be recorded and placed in the DLP log file.

3 The FortiGate unit exempts the match, and places the recorded activity (the log message) within the DLP log file.

4 According to the log settings that were configured, logs are stored on the FortiGate unit's local hard drive. The FortiGate unit places the DLP log file on the local hard drive.

Log messages

Log messages are recorded information containing specific details about what is occurring on your network. Within each log message there are fields. A field is two pieces of information that explain a specific part of the log message. For example, the action field contains login (action=login).

The fields within the log message are arranged into two groups; one group, which is first, is called the log header, and the second group is the log body, which contains all other fields. A log header from the FortiGate unit appears as follows when viewed in the Raw format:

```
2011-01-08 12:55:06 log_id=24577 type=dlp subtype=dlp pri=notice
vd=root
```

The log body appears as follows when viewed in the Raw format:

```
policyid=1 identidx=0 serial=73855 src="10.10.10.1" sport=1190
src_port=1190 srcint=internal dst="192.168.1.122" dport=80
dst_port=80 dst_int="wan1" service="https" status="detected"
hostname="example.com" url="/image/trees_pine_forest/" msg="data
leak detected(Data Leak Prevention Rule matched)" rulename="All-
HTTP" action="log-only" severity=1
```

Logs from other devices, such as the FortiAnalyzer unit and Syslog server, contain a slightly different log header. For example, when viewing FortiGate log messages on the FortiAnalyzer unit, the log header contains the following log fields when viewed in the Raw format:

```
itime=1302788921 date=20110401 time=09:04:23
devname=FG50BH3G09601792 device_id=FG50BH3G09601792
log_id=0100022901 type=event subtype=system pri=notice vd=root
```

Within the log header, there is a type field, and this field indicates the type of log file the log message is put into after it is recorded. The log header also contains the log_id field. The log_id field contains the unique identification number that is associated with that particular log message. For example, 32001. All log messages have a unique number that helps to identify them within their log file.

The log header also contains information about the log severity level and is indicated in the pri field. This information is important because the severity level indicates various severities that are occurring. For example, if the pri field contains alert, you need to take immediate action with regards to what occurred. There are six log severity levels.

The log severity level is the level at which the FortiGate unit records logs at. The log severity level is defined when configuring the logging location. The FortiGate unit logs all messages at and above the logging severity level you select. For example, if you select Error, the unit logs Error, Critical, Alert, and Emergency level messages.

Table 47: Log severity levels

Levels	Description
0 - Emergency	The system has become unstable.

Table 47: Log severity levels

Levels	Description
1 - Alert	Immediate action is required.
2 - Critical	Functionality is affected.
3 - Error	An error condition exists and functionality could be affected.
4 - Warning	Functionality could be affected.
5 - Notification	Information about normal events.
6 - Information	General information about system operations.

The Debug severity level, not shown in Table 47, is rarely used. It is the lowest log severity level and usually contains some firmware status information that is useful when the FortiGate unit is not functioning properly. Debug log messages are only generated if the log severity level is set to Debug. Debug log messages are generated by all types of FortiGate activities.

The log body contains the rest of the information of the log message, and this information is unique to the log message itself. There are no two log message bodies that are alike, however, there may be the same fields in most log message bodies, such as the srcintf log field or identidix log field.

For detailed information on all log messages, see the *FortiGate Log Message Reference*.

Explanation of a log message

The following is a detailed explanation of the fields within a log message. It explains the log header fields, as well as the log body fields of a DLP log message.

Log header:

```
2011-01-04 12:55:06 log_id=24577 type=dlp subtype=dlp pri=notice
vd=root
```

date=(2010-08-03)	The year, month and day of when the event occurred in yyyy-mm-dd format.
time=(12:55:06)	The hour, minute and second of when the event occurred in the format hh:mm:ss.
log_id=(24577)	A five-digit unique identification number. The number represents that log message and is unique to that log message. This five-digit number helps to identify the log message.
type=(dlp)	The section of system where the event occurred.
subtype=(dlp)	The subtype category of the log message. See Table 47 on page 626.
pri=(notice)	The severity level of the event. See Table 47 on page 626.
vd=(root)	The name of the virtual domain where the action/event occurred in. If no virtual domains exist, this field always contains root.

Log body:

```
policyid=1 identidx=0 serial=73855 src="10.10.10.1" sport=1190
src_port=1190 srcint=internal dst="192.168.1.122" dport=80
dst_port=80 dst_int="wan1" service="https" status="detected"
hostname="example.com" url="/image/trees_pine_forest/" msg="data
leak detected(Data Leak Prevention Rule matched)" rulename="All-
HTTP" action="log-only" severity=1
```

policyid=(1)	The ID number of the firewall policy that applies to the session or packet. Any policy that is automatically added by the FortiGate will have an index number of zero.
identidx=(0)	The identity-based policy identification number. This field displays zero if the firewall policy does not use an identity-based policy; otherwise, it displays the number of the identity-based policy entry that the traffic matched. This number is not globally unique, it is only locally unique within a given firewall policy.
serial=(73855)	The serial number of the firewall session of which the event happened.
src=(10.10.10.1)	The source IP address.
sport=(1190)	The source port number.
src_port=(1190)	The source port number.
srcint=(internal)	The source interface name.
dst=(192.168.1.122)	The destination IP address.
dport=(80)	The destination port number.
dst_port=(80)	The destination port number.
dst_int=(wan1)	The destination interface name.
service=(https)	The IP network service that applies to the session or packet. The services displayed correspond to the services configured in the firewall policy.
status=(detected)	The action the FortiGate unit took.
hostname=(example.com)	The home page of the web site.
url=(/image/trees_pine_forest/)	The URL address of the web page that the user was viewing.
msg=(data leak detected(Data Leak Prevention Rule matched)	Explains the FortiGate activity that was recorded. In this example, the data leak that was detected matched the rule, All-HTTP, in the DLP sensor.
rulename=(All-HTTP)	The name of the DLP rule within the DLP sensor.
action=(log-only)	The action that was specified within the rule. In some rules within sensors, you can specify content archiving. If no action type is specified, this field display log-only.
severity=(1)	The level of severity for that specific rule.

Explanation of a debug log message

Debug log messages are only generated if the log severity level is set to Debug. The Debug severity level is the lowest log severity level and is rarely used. This severity level usually contains some firmware status information that is useful when the FortiGate unit is not functioning properly. Debug log messages are generated by all types of FortiGate features.

The following is an example of a debug log message:

```
2010-01-25 17:25:54 log_id=93000 type=webfilter subtype=urlfilter
pri=debug msg="found in cache"
```

Table 48: Explanation of an example of a Debug log message

date=(2010-01-25)	The year, month and day of when the event occurred in the format yyyy-mm-dd.
time=(17:25:54)	The hour, minute and second of when the event occurred in the format hh:mm:ss.
log_id=(93000)	A five-digit unique identification number. The number represents that log message and is unique to that log message. This five-digit number helps to identify the log message.
type=(webfilter)	The section of system where the event occurred. There are eleven log types in FortiOS 4.0.
subtype=(urlfilter)	The subtype of the log message. This represents a policy applied to the FortiGate feature in the firewall policy.
pri=(debug)	The severity level of the event. There are six severity levels to specify.
msg=("found in cache")	Explains the activity or event that the FortiGate unit recorded.

Viewing log messages

There are two viewing options, Format and Raw. When you download the log messages from within the Log Access menu, you are downloading log messages that will be viewed in the Raw format. The Raw format displays logs as they appear within the log file. You can view logs messages in the Raw format using a text editor, such as Notepad. Format is in a more readable format, and you can easily filter information when viewing log messages this way. The Format view is what you see when viewing logs in the web-based manager, in *Log&Report* > *Log Access*.

You can also view log messages in the Log Viewer table. The table displays the fields that are within the log message, similar to Raw, but not all fields display. If you want to view the details of a log message, you should use the Raw format. For more information, see "Viewing log messages and archives" on page 664.

The web-based manager is not the only place to view log messages. You can also view log messages from the CLI. For more information about viewing log messages, see "Viewing log messages and archives" on page 664.

Log files

Each log message that is recorded by the FortiGate unit is put into a log file. The log file contains the log messages that belong to that log type, for example, traffic log messages are put in the traffic log file.

When downloading the log file from *Log&Report* > *Log Access*, the file name indicates the log type and the device on which it is stored on. This name is in the format <logtype>log<logdevice_logtype>.log. For example, tlog0100.log. The log device and log type part are in numerical format. In the example, tlog0100.log, 01 indicates that the traffic log file was stored on the unit's local hard drive and 00 indicates that it is a traffic log file.

The log devices that are indicated in a log file's name are as follows:

- 00 – indicates that the logs are stored on memory
- 01 – indicates that the logs are stored on the unit's local hard drive
- 02 – indicates that the logs are stored on a FortiAnalyzer unit
- 04 – indicates that the logs are stored on the FortiGuard Analytics server

The log type number that comes after the log device number in the log file's name is as follows:

00 – traffic log	01 – event log
02 – antivirus	03 – web filter
04 – IDS or attack log	05 – spam log or email filter log
06 – content	09 – DLP log
10 – Application control log	

In Table 49, each of the five log files are explained.

Table 49: Log Types based on network traffic

Log Type	File name	Description
Traffic	tlog.log	The traffic log records all traffic to and through the FortiGate interface.
Event	elog.log	The event log records management and activity events. For example, when an administrator logs in or logs out of the web-based manager.

Table 49: Log Types based on network traffic

Log Type	File name	Description
UTM	ulog.log	The UTM log file contains all UTM-related log messages, such as antivirus and attack. The following explains the log messages that are included in the UTM log file: Antivirus – records virus incidents in Web, FTP, and email traffic. Web – records HTTP FortiGate log rating errors including web content blocking actions that the FortiGate unit performs Attack – records attacks that are detected and prevented by the FortiGate unit Email Filter – records blocking of email address patterns and content in SMTP, IMAP, and POP3 traffic Application Control – records data detected by the FortiGate unit and the action taken against the network traffic depending on the application that is generating the traffic, for example, instant messaging software, such as MSN Messenger Data Leak Prevention – records log data that is considered sensitive and that should not be made public. This log also records data that a company does not want entering their network
DLP archive	clog.log	The DLP archive log, or clog.log, records the following log messages: email messages (using protocols such as SMTP or POP3) FTP events quarantine IPS packet instant messaging VoIP
Netscan	nlog.log	The Network Vulnerability Scan log records vulnerabilities during the scanning of the network.

Best Practices: Log management

When the FortiGate unit records FortiGate activity, valuable information is collected that provides insight into how to better protect network traffic against attacks, including misuse and abuse. There is a lot to consider before enabling logging on a FortiGate unit, such as what FortiGate activities to enable and which log device is best suited for your network's logging needs. A plan can help you in deciding the FortiGate activities to log, a log device, as well as a backup solution in the event the log device fails.

This plan should provide you with an outline, similar to the following:

- what FortiGate activities you want and/or need logged (for example, DLP archives)
- the logging device best suited for your network
- if you want or require archival of log files

- ensuring logs are not lost in the event a failure occurs.

After the plan is implemented, you need to manage the logs and be prepared to expand on your log setup when the current logging requirements are outgrown. Good log management practices help you with these tasks.

Log management practices help you to improve and manage logging requirements. Logging is an ever-expanding tool that can seem to be a daunting task to manage. The following management practices will help you when issues arise, or your logging setup needs to be expanded.

1. Revisit your plan on a yearly basis to verify that your logging needs are being met by your current log setup. For example, your company or organization may require archival logging, but not at the very beginning. Archival logs are stored on either a FortiGate unit's local hard drive, a FortiAnalyzer unit, or a FortiGuard Analysis server.
2. Configure an alert message that will notify you of activities that are important to be aware about. For example, a branch office does not have a FortiGate administrator so you need to know, at all times, that the IPSec VPN tunnel is up and running. An alert email notification message can be configured for sending only IPSec tunnel errors.
3. Ensure that your backup solution is up-to-date. If you have recently expanded your log setup, you should also review your backup solution. The backup solution provides a way to ensure that all logs are not lost in the event that the log device fails or issues arise with the log device itself.

The SQLite log database

The SQLite log database is used to store logs generated by most FortiGate units with hard drives. SQLite is an embedded Relational Database Management System (RDBMS). SQLite supports most of the SQL-92 standard for Structured Query Language (SQL). SQLite is designed for managing data in RDBMS.

Reports include datasets and these datasets use SQL statements to retrieve the log information needed for reports. A large set of datasets are pre-defined on FortiGate units, however, you can create custom datasets but SQL knowledge is required.

This section explains how to create the statements that you can then use in datasets. This section also includes examples of SQL statements that you can use to base your own custom datasets on.

If you require more information, see the technical note *SQL Log Database Query*, which includes information about SQL on the FortiAnalyzer unit.

The following topics are included in this section:

SQL logging is enabled by default on models that support the local SQLite database, and are running FortiOS 4.0 MR3 or higher.

If you have disabled SQL logging and have factory defaults on the FortiGate unit, and then upgrade, the upgrade will not automatically enable SQL logging.

If you are formatting a disk that contains more than just logs, all information on the disk will be lost.

SQL overview

The syntax for SQL queries is based on the SQLite3 syntax (see http://www.sqlite.org/lang.html for more information).

There is an additional convenience macro, F_TIMESTAMP, that allows you to easily specify a time interval for the query. It takes this form: `F_TIMESTAMP(base_timestring, unit, relative value)`. For example, `F_TIMESTAMP('now','hour','-23')` means “last 24 hours” or that the hour in the timestamp is 23 less than now. The FortiGate unit will automatically translate the macro into SQLite3 syntax.

You can use the following CLI commands to write SQL statements to query the SQLite database.

```
config report dataset
  edit <dataset_name>
    set query <sql_statement>
    next
  end
```

For more information about specific examples that are used in creating custom datasets, see the "SQLite statement examples" on page 634.

SQLite database tables

The FortiGate unit creates a database table for each log type, when log data is recorded. If the FortiGate unit is not recording log data, it does not create log tables for that device.

The command syntax, `get report database schema`, allows you to view all the tables, column names and types that are available to use when creating SQL statements for datasets.

If you want to view the size of the database, as well as the log database table entries, use the `get log sql status` command. This command displays the amount of free space that is available as well as the first log database entry time and date and the last log database entry time and date.

The output of the `get log sql status` command contains information similar to the following:

```
Database size: 104856576
Free size in database: 670004416
Entry number:
  Event: 1263
  Traffic: 254039
  Attack: 4
  Antivirus: 8
  WebFilter: 5291
  DLP: 76544
  Application Control: 68103
  Netscan: 75
Total: 405331
First entry time: 2011-03-21 08:25:55
Last entry time: 2011-04-21 09:10:55
```

SQLite statement examples

The following examples help to explain SQL statements and how they are configured within a dataset. Datasets contain SQL statements which are used to query the SQL database.

Distribution of Applications by Type in the last 24 hours

This dataset is created to show the distribution of the type of applications that were used, and will use the application control logs to get this information.

CLI commands

```
config report dataset
```

```
    edit "appctrl.Dist.Type.last24h"
      set query "select app_type, count(*) as totalnum from
          app_control_log where timestamp >=
          F_TIMESTAMP('now','hour','-23') and (app_type is not null
          and app_type!='N/A') group by app_type order by totalnum
          desc"
next
```

Explanation about the parts of the statement

- `edit "appctrl.Dist.Type.last24h"` - creates a new dataset with descriptive title.
- `F_TIMESTAMP('now','hour','-23')` - the F_TIMESTAMP macro covers the last 24 hours (from now until 23 hours ago).
- The application control module classifies each firewall session in `app_type`. One firewall session may be classified to multiple app_types. For example, an HTTP session can be classified to: HTTP and Facebook, as well as others.
- Some app/app_types may not be able to detected, then the 'app_type' field may be null or 'N/A'. These will be ignored by this query.
- The result is ordered by the total session number of the same `app_type`. The most frequent app_types will appear first.

Top 10 Application Bandwidth Usage Per Hour Summary

This dataset is created to show the bandwidth used by the top ten applications. Application control logs are used to gather this information.

CLI commands

```
config report dataset
  edit "appctrl.Count.Bandwidth.Top10.Apps.last24h"
    set query "select (timestamp-timestamp%3600) as hourstamp,
        (CASE WHEN app!=\'N/A\' and app!=\'\' then app ELSE service
        END) as appname, sum(sent+rcvd) as bandwidth from
        traffic_log where timestamp >=
        F_TIMESTAMP(\'now\',\'hour\',\'-23\') and (appname in
        (select (CASE WHEN app!=\'N/A\' and app!=\'\' then app ELSE
        service END) as appname from traffic_log where timestamp >=
        F_TIMESTAMP(\'now\',\'hour\',\'-23\')  group by appname
        order by sum(sent+rcvd) desc limit 10)) group by hourstamp,
        appname order by hourstamp desc"
next
```

Explanation about the parts of the statement

- `(timestamp-timestamp%3600) as hourstamp` - this calculates an "hourstamp" to indicate bandwidth per hour.
- `(CASE WHEN app!=\'N/A\' and app!=\'\' then app ELSE service END) as appname` - use the app as 'appname', or if it's undefined, use the service instead.
- `appname in (select (CASE WHEN app!=\'N/A\' and app!=\'\' then app ELSE service END) as appname from traffic_log where timestamp >= F_TIMESTAMP(\'now\',\'hour\',\'-23\')  group by appname order by sum(sent+rcvd) desc limit 10)` - selects the top 10 apps using most bandwidth

- `order by hourstamp desc` - this orders the results by descending hourstamp
- `LIMIT 10` - this lists only the top 10 applications.

Example of how to create a dataset containing attack name instead of attack ID

If you want to create a dataset that contains the attack name instead of the attack ID, use the following as a basis.

```
config report dataset
  edit top_attacks_1hr
    set log-type attack
    set time-period last-n-hours
    set period-last-n 1
    set query "SELECT attack_id, COUNT( * ) AS totalnum FROM
       $log WHERE $filter and attack_id IS NOT NULL GROUP BY
       attack_id ORDER BY totalnum DESC LIMIT 10"
  end
```

Troubleshooting SQL issues

If the query is unsuccessful, an error message appears in the results window indicating the cause of the problem. The following are issues that may arise when creating statements for datasets that query the SQL database.

SQL statement syntax errors

Here are some example error messages and possible causes:

`You have an error in your SQL syntax (remote/MySQL)` or `ERROR: syntax error at or near... (local/PostgreSQL)`

- Verify that the SQL keywords are spelled correctly, and that the query is well-formed.
- Table and column names are demarked by grave accent (`) characters. Single (') and double (") quotation marks will cause an error.

`No data is covered.`

- The query is correctly formed, but no data has been logged for the log type. Verify that you have configured the FortiGate unit to save that log type. On the Log Settings page, make sure that the log type is checked.

Connection problems

If well formed queries do not produce results, and logging is turned on for the log type, there may be a database configuration problem with the remote database.

Ensure that:

- MySQL is running and using the default port 3306.

- You have created an empty database and a user who has read/write permissions for the database.

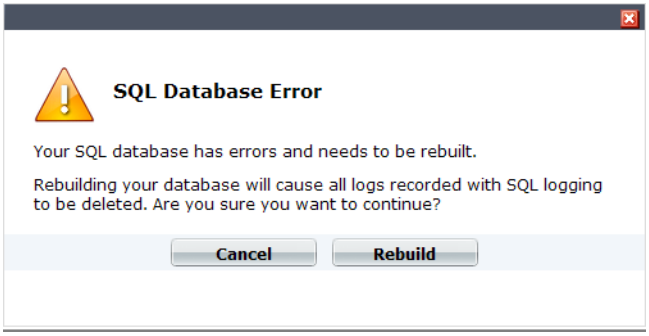
  Here is an example of creating a new MySQL database named fazlogs, and adding a user for the database:

```
#Mysql –u root –p
mysql> Create database fazlogs;
mysql> Grant all privileges on fazlogs.* to 'fazlogger'@'*'
identified by 'fazpassword';
mysql> Grant all privileges on fazlogs.* to
'fazlogger'@'localhost' identified by 'fazpassword';
```

SQL database error

You may encounter the following error message (Figure 63) after upgrading or downgrading the FortiGate unit's firmware image.

Figure 63: Example of an SQL database error message that appears after logging in to the web-based manager



The error message indicates that the SQL database is corrupted and cannot be updated with the SQL schemas any more. When you see this error message, you can do one of the following:

- select *Cancel* and back up all log files; then select *Rebuild* to rebuild the database
- select *Rebuild* only after verifying that all log files are backed up to a safe location.

When you select *Cancel*, no logging is recorded by the FortiGate unit regardless of the log settings that are configured on the unit. When you select *Rebuild*, all logs are lost because the SQL database is erased and then rebuilt again. Logging resumes after the SQL database is rebuilt.

If you want to view the database's errors, use the `diag debug sqldb-error-read` command in the CLI. This command indicates exactly what errors occurred, and what tables contain those errors.

Log files are backed up using the `execute log backup {alllogs | logs}` command in the CLI. You must use the text variable when backing up log files because the text variable allows you to view the log files outside the FortiGate unit. When you back up log files, you are really just copying the log files from the database to a specified location, such as a TFTP server.

Log devices

The FortiGate unit supports a variety of logging devices, including the FortiGuard Analysis and Management Service. This provides great flexibility when choosing a log device for the first time, as well as when logging requirements change.

This section explains how to configure your chosen log device, as well as how to configure multiple FortiAnalyzer units or Syslog servers. This section also includes how to log to a FortiGuard Analysis server, which is available if you subscribed to the FortiGuard Analysis and Management Service.

The following topics are included in this section:

- Choosing a log device
- Example: Setting up a log device and backup solution
- Configuring the FortiGate unit to store logs on a log device
- Troubleshooting issues
- Testing FortiAnalyzer and FortiGuard Analysis server connections
- Connecting to a FortiAnalyzer unit using Automatic Discovery
- Uploading logs to a FortiAnalyzer or a FortiGuard Analysis server

You may need to reschedule uploading or rolloing of log files because the size of log files is reduced in FortiOS 4.0 MR1 and higher. Reduction in size provides more storage room for larger amounts of log files on log devices.

Choosing a log device

When you have developed a plan that meets your logging needs and requirements, you need to select the log device that is appropriate for that plan. A log device must be able to store all the logs you need, and if you require archiving those logs, you must consider what log devices support this option.

During this process of deciding what log device meets your needs and requirements, you must also figure out how to provide a backup solution in the event the log device that the FortiGate unit is sending logs to has become unavailable. A backup solution should be an important part of your log setup because it helps you to maintain all logs and prevents lost logs, or logs that are not sent to the log device. For example, a daily backup of log files to the FortiAnalyzer unit occurs at 5 pm.

Log devices provide a central location for storing logs recorded by the FortiGate unit. The following are log devices that the FortiGate unit supports:

- FortiGate system memory
- Hard disk or AMC
- SQL database (for FortiGate units that have a hard disk)
- FortiAnalyzer unit
- FortiGuard Analysis server (part of FortiGuard Analysis and Management Service)
- Syslog server

- NetIQ WebTrends server

These logs devices, except for the FortiGate system memory and local hard disk, can also be used as a backup solution. For example, you configure logging to the FortiGate unit's local disk, but also configure logging to a FortiGuard Analysis server and archive logs to both the FortiGuard Analysis server and a FortiAnalyzer unit.

If you are formatting a disk that contains more than just logs, all information on the disk will be lost.

Example: Setting up a log device and backup solution

The following is an example of how to set up a log device and backup solution when you are integrating them into your network. This example does not include how to enable FortiGate activities for logging.

Your company has received a FortiAnalyzer unit and three new Syslog server software licenses. You install the FortiAnalyzer unit in as stated in its install guide, and you also install the Syslog server software on three servers.

To setup a log device and backup solution

1 On the FortiGate unit, log in to the CLI.

2 Enter the following to configure the FortiGate unit to send logs to the FortiAnalyzer unit.

```
config log fortianalyzer setting
  set status enable
  set ips-archive enable
  set server 172.16.120.154
  set address-mode static
  set upload-option realtime
end
```

3 Enter the following commands for the first Syslog server:

```
config log syslogd setting
  set status enable
  set server 192.168.16.121
  set reliable enable
  set csv enable
  set facility local1
  set source-ip
end
```

4 Enter the following for the second Syslog server:

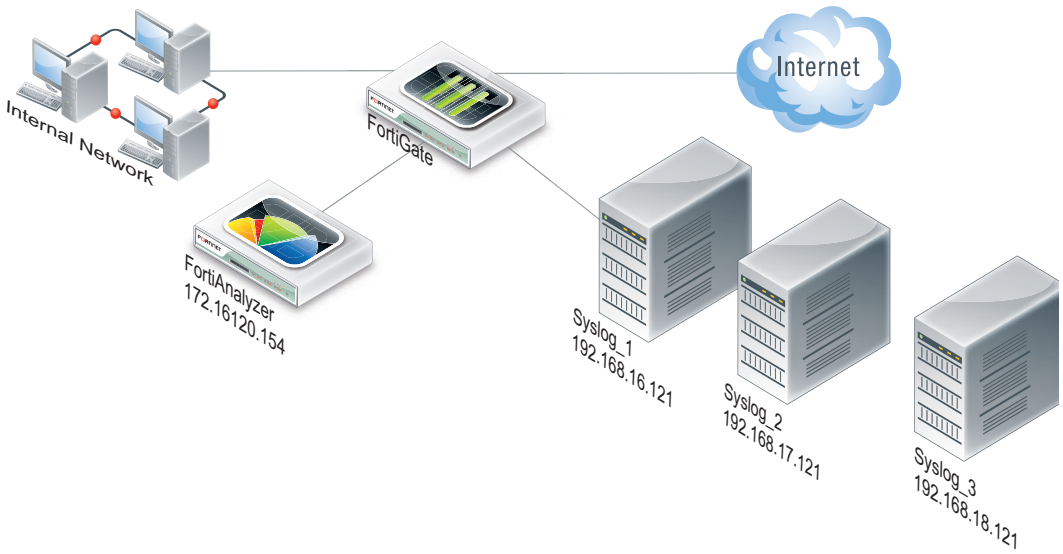
```
config log syslogd2 setting
  set status enable
  set server 192.168.17.125
  set reliable enable
  set csv enable
  set facility local2
  set source-ip
end
```

5 Enter the following for the third Syslog server:

```
config log syslogd setting
  set status enable
```

```
    set server 192.168.16.121
    set reliable enable
    set csv enable
    set facility local3
    set source-ip
  end
```

Figure 64: Example of an integrated FortiAnalyzer unit and Syslog servers in a network



Configuring the FortiGate unit to store logs on a log device

After setting up and integrating your log device into the network, you can now configure the log device's settings for logging FortiGate activities. If you have multiple FortiAnalyzer units or Syslog servers, you must configure them in the CLI. For more information, see "Logging to multiple FortiAnalyzer units or Syslog servers" on page 38.

This topic includes the following:

If you experience issues, see "Troubleshooting issues" on page 650. This topic may not contain all the information you may need when troubleshooting a logging issue; if the topic cannot help you, see the Troubleshooting chapter in the *FortiOS Handbook.*

Logging to the FortiGate unit's system memory

The system memory displays recent log entries and stores all log types, which includes archives and traffic logs. When the system memory is full, the FortiGate unit overwrites the oldest messages. All log entries stored in system memory are cleared when the FortiGate unit restarts.

By default, logging to memory is enabled.

When a hard disk is not present on a FortiGate unit, real-time logging is enabled by default. Real-time logging is recording activity as it happens.

To send logs to the unit's system memory- web-based manager

1 Go to *Log&Report* > *Log Config* > *Log Setting*.
2 In the *Logging and Archiving* section, select the check box beside *Memory*.
3 Select a log level from the *Minimum log level* drop-down list.
4 Select *Apply*.

The FortiGate unit logs all messages at and above the logging severity level you select. If you want to archive IPS logs, use the CLI to enable this log.

To send logs to the unit's system memory - CLI

1 Log in to the CLI.
2 Enter the following command syntax:

```
config log memory setting
  set diskfull <overwrite>
  set ips-archive {enable | disable}
  set status {enable | disable}
end
config log memory global-setting
  set max-size <byte_size>
  set full-final-warning-threshold <integer>
  set full-first-warning-threshold <integer>
  set full-second-warning-threshold <interger>
end
```

Use the `config log memory filter` command to disable the FortiGate features you do not want to log. By default, most FortiGate features are enabled in the `config log memory filter` command.

Logging to the FortiGate unit's hard disk

If your FortiGate unit contains a hard disk, you can configure the FortiGate unit to store logs on the disk. When configuring logging to a hard disk, you can also configure uploading of those logs to a FortiAnalyzer unit or to a FortiGuard Analysis server. If you want to upload the logs to a FortiAnalyzer unit or to a FortiGuard Analysis server, see "Uploading logs to a FortiAnalyzer or a FortiGuard Analysis server" on page 652.

When the FortiGate unit does not have a hard disk, real-time logging is enabled by default. Real-time logging is recording activity as it happens. Real-time logging is enabled only in the CLI and you must format the disk (if not already formatted) before first use.

When logging to the unit's hard disk, you must also enable SQL logging, which is enabled only in the CLI. For more information, see "Enabling SQL logging" on page 662.

You must include a storage location, or logs will not be recorded. If your FortiGate unit has an SQLite log database, you must enable SQL logging as well. For more information about how to configure SQL logging, see "Enabling SQL logging" on page 662.

If you have disabled SQL logging and have factory defaults on the FortiGate unit, and then upgrade, the upgrade will not automatically enable SQL logging.

To log to the hard disk on a FortiGate unit - CLI

1 Log in to the CLI.

2 Enter the following command syntax:

```
config log disk setting
  set status {enable | disable}
  set ips-archive {enable | disable}
  set dlp-archive-quota <integer>
  set max-log-file-size <size>
  set storage <storage_location>
  set diskfull {nolog | overwrite}
  set report-quota <integer>
  set log-quota <quota_size>
  set dlp-archive-quota <quota_size>
  set report-quota (quota_size>
  set upload {enable | disable}
  set upload-format {compact | text}
  set sql-max-size <maximum_size>
  set sql-max-size-action {overwrite | nolog}
  set sql-oldest-entry <integer>
  set drive-standby-time
  set full-first-warning-threshold
  set full-second-warning-threshold
  set full-final-warning-threshold
  set ms-per-transaction <integer>
  set rows-per-transaction <integer>
end
```

Use the `config log disk filter` command to disable the FortiGate features you do not want to log. By default, most FortiGate features are enabled in the `config log disk filter` command.

Logging to a FortiAnalyzer unit

A FortiAnalyzer unit can log all FortiGate activity that is available for logging, including archiving. You can also configure the FortiGate unit to upload logs on a regular basis to the FortiAnalyzer unit.

When logging to a FortiAnalyzer unit, you do not need a hard drive to configure logging to a FortiAnalyzer unit. Encryption is supported by default and logs are sent using IPsec or SSL VPN. When the FortiAnalyzer unit and FortiGate unit have SSL encryption, both must choose a setting for the `enc-algorithm` command for encryption to take place. By default, this is enabled and the default setting is SSL communication with high and medium encryption algorithms. The setting that you choose must be the same for both.

If you are using the FortiGate and FortiAnalyzer-VM images, and these are evaluation software, you will only be able to use low encryption.

The following procedure assumes that you have only one FortiAnalyzer unit to configure. If you are configuring more than one FortiAnalyzer unit, you must configure the other units in the CLI. Use the procedures in "Logging to multiple FortiAnalyzer units or Syslog servers" on page 38 to configure multiple FortiAnalyzer units.

If you want to connect to a FortiAnalyzer unit using automatic discovery, see "Connecting to a FortiAnalyzer unit using Automatic Discovery" on page 41. If you are going to connect to the FortiAnalyzer using the automatic discovery feature, see "Connecting to a FortiAnalyzer unit using Automatic Discovery" on page 652.

To send logs to a FortiAnalyzer unit

1 Log in to the CLI.

2 Enter the following command syntax:

```
config log fortianalyzer setting
  set status {enable | disable}
  set server <ip_address>
  set address-mode {auto-discovery | static}
  set use-hdd {enable | disable}
  set enc-algorithm {enable | disable}
  set localid <id_number>
  set conn-timeout <seconds>
  set roll-schedul {daily | weekly}
  set roll-time <hh:mm>
  set diskfull {nolog | overwrite}
  set monitor-keepalive-period <seconds>
  set monitor-failure-retry-period <seconds>
  set upload
  end
```

3 To send logs remotely to the FortiAnalyzer unit, use the following command syntax:

```
config log remote setting
  set status enable
  set destination FAZ
end
```

The `remote` command appears only after configuring logging to a FortiAnalyzer unit. It is also available if you configure logging to a ForrtiGuard Analysis server.

Logging to a FortiGuard Analysis server

You can configure logging to a FortiGuard Analysis server after registering for the FortiGuard Analysis and Management Service. The following procedure assumes that you have already configured the service account ID in *System* > *Maintenance* > *FortiGuard*.

Logging to a FortiGuard Analysis server is configured in the CLI. Uploading logs to the FortiGuard Analysis server is configured in both the web-based manager and the CLI. For more information about uploading logs to a FortiGuard Analysis server, see "Uploading logs to a FortiAnalyzer or a FortiGuard Analysis server" on page 652.

The following assumes that you have already configured the FortiGuard Analysis and Management Service account ID information in *System* > *Maintenance* > *FortiGuard*.

To send logs to a FortiGuard Analysis server - CLI

1 Log in to the CLI.

2 Enter the following command syntax:

```
config log fortiguard setting
  set status {enable | disable}
  set quotafull {nolog | overwrite}
end
```

3 To send logs remotely to the FortiGuard Analysis server, use the following command syntax:

```
config log remote setting
  set status enable
  set destination FAZ
end
```

The remote command appears only after configuring logging to a FortiGuard Analysis server. This command is also available if you configure logging to a FortiAnalyzer unit.

Logging to a Syslog server

The Syslog server is a remote computer running syslog software. Syslog is a standard for forwarding log messages in an IP network. Syslog servers capture log information provided by network devices.

The following procedure configures one Syslog server. You can configure up to three Syslog servers. Use the procedure in "Configuring multiple Syslog servers" on page 39 to configure multiple Syslog servers.

To send logs to a syslog server - web-based manager

1 Go to *Log&Report* > *Log Config* > *Log Setting*.

2 In the *Logging and Archiving* section, select the check box beside *Syslog*.

After you select the check box, the *Syslog* options appear.

3 Enter the appropriate information for the following:

IP/FDQN	Enter the domain name or IP address of the syslog server.
Port	Enter the port number for communication with the syslog server, usually port 514.
Minimum log level	Select a log level the FortiGate unit will log all messages at and above that logging severity level.
Facility	Facility indicates to the syslog server the source of a log message. By default, the FortiGate reports facility as local7. You can change the Facility if you want to distinguish log messages from different FortiGate units.
Enable CSV Format	Select to have logs formatted in CSV format. When you enable CSV format, the FortiGate unit produces the log in Comma Separated Value (CSV) format. If you do not enable CSV format, the FortiGate unit produces plain text files.

4 Select *Apply*.

To log to a Syslog server - CLI

1 Log in to the CLI.

2 Enter the following command syntax:

```
config log syslogd setting
  set status {enable | disable}
  set server <address_ipv4>
  set port <port_integer>
  set csv {enable | disable}
  set facility {alert | audit | auth | authpriv | clock | cron
     | daemon | ftp | kernel | local0 | local1 | local2 |
     local3 | local4 | local5 | local6 | local7 | lpr | mail |
     news | ntp | syslog | user | uucp}
end
```

Enabling reliable syslog

The reliable syslog feature is based on RFC 3195. Reliable syslog logging uses TCP, which ensures that connections are set up, including packets transmitted.

There are several profiles available for reliable syslog, but only the RAW profile is currently supported on the FortiGate unit. The RAW profile is designed to provide a high-performance, low-impact footprint using essentially the same format as the existing UDP-based syslog service. The reliable syslog feature is available on FortiGate units running FortiOS 4.0 MR1 or higher.

When you enable reliable syslog in the CLI, TCP is used. The default setting, `disable`, uses UDP. TCP ensures that packets are transmitted easily, as well as connections are set up.

The reliable Syslog feature automatically resets the port number to TCP 601. This is based on the recommendation in RFC 3195.

The following procedure assumes that you have already configured the Syslog server.

To enable reliable syslog

1 Log in to the CLI.

2 Enter the following command syntax:

```
config log syslogd setting
  set status enable
  set reliable enable
end
```

Logging to a WebTrends server

A WebTrends server is a remote computer, similar to a Syslog server, running NetIQ WebTrends firewall reporting server. FortiGate log formats comply with WebTrends Enhanced Log Format (WELF) and are compatible with NetIQ WebTrends Security Reporting Center and Firewall Suite 4.1.

To send logs to a WebTrends server, log in to the CLI and enter the following commands:

```
config log webtrends setting
  set server <address_ip4>
  set status {disable | enable}
end
```

Example

This example shows how to enable logging to and set an IP address for a remote NetIQ WebTrends server.

```
config log webtrends settings
  set status enable
  set server 172.25.82.145
end
```

Logging to multiple FortiAnalyzer units or Syslog servers

FortiOS 4.0 allows you to configure multiple FortiAnalyzer units or multiple Syslog servers, ensuring that all logs are not lost in the event one of them fails.

You can configure multiple FortiAnalyzer units or Syslog servers within the CLI.

This topic includes the following:

Configuring multiple FortiAnalyzer units

Fortinet recommends that you contact a FortiAnalyzer administrator first, to verify that the IP addresses of the FortiAnalyzer units you want to send logs to are correct and that all FortiAnalyzer units are currently installed with FortiAnalyzer 4.0 firmware.

If VDOMs are enabled, you can configure multiple FortiAnalyzer units or Syslog servers for each VDOM.

The following procedure does not contain how to enable logging of FortiGate features within the CLI. Most FortiGate features are, by default, enabled within the `log filter` command in the CLI. You should disable the FortiGate features that you do not want logged within the `log filter` command.

If you want to test the FortiAnalyzer unit's connection to the FortiGate unit, see "Testing the FortiAnalyzer configuration" on page 651.

To enable logging to multiple FortiAnalyzer units

1 Log in to the CLI.

2 Enter the following commands, using `encrypt` and `psksecret` if you want to encrypt the connection:

```
config log fortianalyzer setting
  set status enable
  set server <faz_ip address>
  set encrypt [disable | enable]
  set psksecret <password>
  set localid <identification_ipsectunnel>
  set conn-timeout <value_seconds>
end
```

3 Enter the following commands for the second FortiAnalyzer unit, using `encrypt` and `psksecret` if you want to encrypt the connection:

```
config log fortianalyzer2 setting
  set status {disable | enable}
  set server <fortianalyzer_ipv4>
  set encrypt [disable | enable]
```

```
    set psksecret <password>
    set localid <identification_ipsectunnel>
    set ver-1 {disable | enable}
    set conn-timeout <value_seconds>
  end
```

4 Enter the following commands for the last FortiAnalyzer unit, using `encrypt` and `psksecret` if you want to encrypt the connection:

```
config log fortianalyzer3 setting
  set status enable
  set server <faz_ip address>
  set encrypt [disable | enable]
  set psksecret <password>
  set localid <identification_ipsectunnel>
  set conn-timeout <value_seconds>
end
```

Configuring multiple Syslog servers

When configuring multiple Syslog servers (or one Syslog server), you can configure reliable delivery of log messages from the Syslog server. Configuring of reliable delivery is available only in the CLI.

If VDOMs are enabled, you can configure multiple FortiAnalyzer units or Syslog servers for each VDOM.

The following procedure does not contain how to enable logging of FortiGate features within the CLI. Most FortiGate features are, by default, enabled within the `log filter` command in the CLI. You should disable the FortiGate features that you do not want logged within the `log filter` command.

To enable logging to multiple Syslog servers

1 Log in to the CLI.

2 Enter the following commands:

```
config log syslogd setting
  set csv {disable | enable}
  set facility <facility_name>
  set port <port_integer>
  set reliable {disable | enable}
  set server <ip_address>
  set status {disable | enable}
end
```

3 Enter the following commands to configure the second third Syslog server:

```
config log syslogd2 setting
  set csv {disable | enable}
  set facility <facility_name>
  set port <port_integer>
  set reliable {disable | enable}
  set server <ip_address>
  set status {disable | enable}
end
```

4 Enter the following commands to configure the third Syslog server:

```
config log syslogd3 setting
  set csv {disable | enable}
```

```
    set facility <facility_name>
    set port <port_integer>
    set reliable {disable | enable}
    set server <ip_address>
    set status {disable | enable}
  end
```

Example of configuring multiple FortiAnalyzer units

The IT department at your organization's headquarters discovers that their one and only FortiAnalyzer unit is not working properly; however, it is soon up and running again. When it is working properly again, your department's managers realize that two day's worth of logs are lost. Your IT manager asks you to install and configure two FortiAnalyzer units onto the network so that logs are not lost again.

In this example, you have already installed and configured the two FortiAnalyzer units and are now ready to configure sending logs from the FortiGate unit to the two FortiAnalyzer units.

The three units are named as follows: FortiAnalyzer_Main (main log storage unit), FortiAnalyzer_1 (first back up), and FortiAnalyzer_2 (second back up).

To configure logging to multiple FortiAnalyzer units

1. Verify that FortiAnalyzer_Main configuration is correct and communication between the FortiGate unit and FortiAnalyzer_Main is working properly.

   You can do this by using Test Connectivity from the FortiGate unit. See "Testing the FortiAnalyzer configuration" on page 41.
2. Go to *System* > *Dashboard* > *Status* and locate the CLI console widget.
3. Log in to the CLI using the CLI Console widget on the Status page.
4. Enter the following command syntax for FortiAnalyzer_1:

```
config log fortianalyzer2 setting
  set status enable
  set server 10.10.20.125
  set encrypt enable
  set psksecret it123456
  set localid ipsec_vpn1
  set conn-timeout 1200
  set max-buffer-size 800
end
```

5. Enter the following command syntax for FortiAnalyzer_2:

```
config log fortianalyzer3 setting
  set status enable
  set server 10.10.22.120
  set encrypt enable
  set psksecret it123456
  set localid ipsec_vpn1
  set conn-timeout 1200
  set max-buffer-size 800
end
```

6. Enter the following command syntax to log the FortiGate features:

```
config log fortianalyzer2 filter
```

```
get log fortianalyzer filter
```

The `get log fortianalyzer filter` displays the FortiGate features that are enabled by default.

7 Enter the following variables to disable the four FortiGate features that you do not want:

```
  set wanopt-traffic disable
  set netscan disable
  set vulnerability disable
end
```

8 Repeat steps 6 and 7 for FortiAnalyzer_2.

Logs are now configured to go to multiple FortiAnalyzer units.

Troubleshooting issues

From time to time, issues may arise due to connectivity or logging has stopped altogether. The following provides information on troubleshooting these issues.

Unable to connect to a supported log device

After configuring logging to a supported log device, and you have tested the connection, you find you cannot connect. Use the following to help you find out what happened and resolve the issue:

- verify that the information you entered is correct; it could be a simple mistake within the IP address or you did not select *Apply* on the Log Settings page which would not apply the settings.
- use `execute ping` to see if you can ping to the log device; if unable to ping to the log device check to see if the log device itself working and that it is on the network.
- if the unit has stopped logging, see "FortiGate unit has stopped logging" on page 650.

FortiGate unit has stopped logging

If your FortiGate unit contains an SQL database, and when you log into the web-based manager and you see an SQL database error message, it is because the SQL database has become corrupted. You must make sure to back up your logs at that point and then rebuild the database.

If the FortiGate unit stopped logging to a device, test the connection between both the FortiGate unit and device using the `execute ping` command. The log device may have been turned off, is upgrading to a new firmware version, or just not working properly. After determining that there are no logs being sent, see "Unable to connect to a supported log device" on page 650.

Testing FortiAnalyzer and FortiGuard Analysis server connections

When you want to verify that the connection between a FortiAnalyzer unit and a FortiGate unit is successful, or a FortiGate unit and a FortiGuard Analysis server, you can use the *Test Connectivity* button.

This topic contains the following:

Testing the FortiAnalyzer configuration

After configuring FortiAnalyzer settings, you can test the connection between the FortiGate unit and the FortiAnalyzer unit to ensure the connection is working properly. This enables you to view the connection settings between the FortiGate unit and the FortiAnalyzer unit.

To test the connection

1 Go to *Log&Report* > *Log Config* > *Log Setting.*

2 In the *Logging and Archiving* section, under *Upload logs remotely*, select *Test Connectivity* beside the FortiAnalyzer unit's *IP address* field.

When you select *Test Connectivity*, a window appears with general information about the FortiAnalyzer unit, disk space available and used on the FortiAnalyzer unit, as well as privileges that the FortiGate unit while connected to the FortiAnalyzer unit.

3 Select *Close* when you are done viewing the connection status and general information.

Testing the FortiGuard Analysis server configuration

After configuring logging to a FortiGuard Analysis server, you can verify that they connection is working properly by selecting *Test Connectivity* which is located beside the *Account ID* field.

Similar to *Test Connectivity* for FortiAnalyzer, this information includes your contract's expiry date as well as daily volume and disk quota amounts.

To test the connection

1 Go to *Log&Report* > *Log Config* > *Log Setting.*

2 In the *Logging and Archiving* section, under *Upload logs remotely*, select *Test Connectivity* beside the *Account ID* field.

3 Select *Close* when you are done viewing the connection status and general information.

Using diag sys logdisk usage

The `diag sys logdisk usage` command allows you to view detailed information about how much space is currently being used for logs. This is useful when you see a high percentage, such as 92 percent for the disk's capacity. The FortiGate unit uses only 75 percent of the available disk capacity to avoid a high storage amount so when there is a high percentage, it refers to the percentage of the 75 percent that is available. For example, 92 percent of the 75 percent is available.

The following is an example of what you may see when you use `diag sys logdisk usage` command on a unit with no VDOMs configured:

```
diag sys logdisk usage
```

The following appears:

```
Total HD usage: 176MB/3011 MB
Total HD logging space: 22583MB
Total HD logging space for each vdom: 22583MB
HD logging space usage for vdom "root": 30MB/22583MB
```

Connecting to a FortiAnalyzer unit using Automatic Discovery

Automatic Discovery is a method of establishing a connection to a FortiAnalyzer unit by using the FortiGate unit to find a FortiAnalyzer unit on the network. The Fortinet Discovery Protocol (FDP) is used to locate the FortiAnalyzer unit. Both units must be on the same subnet to use FDP, and they must also be able to connect using UDP.

When you select Automatic Discovery, the FortiGate unit uses HELLO packets to locate any FortiAnalyzer units that are available on the network within the same subnet. When the FortiGate unit discovers the FortiAnalyzer unit, the FortiGate unit automatically enables logging to the FortiAnalyzer unit and begins sending log data.

To connect using automatic discovery

1 Log in to the CLI.

2 Enter the following command syntax:

```
config log fortianalyzer setting
  set status {enable | disable}
  set server <ip_address>
  set gui-display {enable | disable}
  set address-mode auto-discovery
end
```

If your FortiGate unit is in Transparent mode, the interface using the automatic discovery feature will not carry traffic. For more information about how to enable the interface to also carry traffic when using the automatic discovery feature, see the Fortinet Knowledge Base article, Fortinet Discovery Protocol in Transparent mode.

The FortiGate unit searches within the same subnet for a response from any available FortiAnalyzer units

Uploading logs to a FortiAnalyzer or a FortiGuard Analysis server

You can upload logs that are stored on the FortiGate unit's local disk to a FortiAnalyzer unit or to a FortiGuard Analysis server. This provides a way to back up your logs to another storage location. You can upload all types of log files.

You need to have access to both the CLI and the web-based manager when configuring uploading of logs. The upload time and interval settings can only be done in the CLI; however, for uploading of logs to a FortiAnalyzer unit, you can modify the upload time and interval settings from the web-based manager after you have configured it in the CLI.

Uploading logs to an AMC disk is no longer available.

To upload logs to a FortiGuard Analysis server

1 Go to *Log&Report* > *Log Config* > *Log Setting*.

2 In the *Logging and Archiving* section, select the check box beside *Upload logs remotely*.

3 Select *FortiGuard Analysis and Management Service (Daily at 00:00)*.

4 Enter the account ID in the *Account ID* field.

5 Select *Apply*.

6 To configure the daily upload time, log in to the CLI.

7 Enter the following to configure when the upload occurs, and the time when the unit uploads the logs:

```
config log fortiguard setting
  set upload-interval {daily | weekly | monthly}
  set upload-time <hh:mm>
end
```

To upload logs to a FortiAnalyzer unit

1 Go to *Log&Report* > *Log Config* > *Log Settings*.

2 In the *Logging and Archiving* section, select the check box beside *Upload logs remotely*.

3 Select *FortiAnalyzer (Daily at 00:60)*.

4 Enter the FortiAnalyzer unit's IP address in the *IP Address* field.

5 To configure the daily upload time, log in to the CLI.

6 Enter the following to configure when the upload occurs, and the time when the unit uploads the logs:

```
config log fortianalyzer setting
  set upload-interval {daily | weekly | monthly}
  set upload-time <hh:mm>
end
```

7 To change the upload time, in the web-based manager, select *Change* beside the upload time period, and then make the changes in the Upload Schedule window. Select *OK*.

Logging FortiGate activity

The FortiGate unit, depending on its configuration, can have a lot of network activity flowing through it. The FortiGate unit provides settings to record the activity, referred to in this document as log settings.

This section explains the FortiGate activity that can be logged, as well as how to log FortiGate activity. This section includes how to configure an alert notification email, filtering and customizing the display of logs messages on the web-based manager, as well as viewing quarantined files.

The following topics are included in this section:

Logs

Logs record FortiGate activity, providing detailed information about what is happening on your network. This recorded activity is found in log files, which are stored on a log device. However, logging FortiGate activity requires configuring certain settings so that the FortiGate unit can record the activity. These settings are often referred to as log settings, and are found in most UTM features, such as profiles, and include the event log settings, found on the Event Log page.

Log settings provide the information that the FortiGate unit needs so that it knows what activities to record. This topic explains what activity each log file records, as well as additional information about the log file, which will help you determine what FortiGate activity the FortiGate unit should record.

This topic includes the following:

Traffic

Traffic logs record the traffic that is flowing through your FortiGate unit. Since traffic needs firewall policies to properly flow through the unit, this type of logging is also referred to as firewall policy logging. Firewall policies control all traffic that attempts to pass through the FortiGate unit, between FortiGate interfaces, zones and VLAN sub-interfaces.

Logging traffic works in the following way:

- firewall policy has logging enabled on it (Log Allowed Traffic or Log Violation Traffic)
- packet comes into an inbound interface
- a possible log packet is sent regarding a match in the firewall policy, such as URL filter
- traffic log packet is sent, per firewall policy
- packet passes and is sent out an interface

Traffic log messages are stored in the traffic log file. Traffic logs can be stored any log device, even system memory.

If you have enabled and configured WAN Optimization, you can enable logging of this activity in the CLI using the `config wanopt setting` command. These logs contain information about WAN Optimization activity and are found in the traffic log file. When configuring logging of this activity, you must also enable logging within the security policy itself, so that the activity is properly recorded.

Other Traffic

The traffic log also records interface traffic logging, which is referred to as other traffic. Other traffic is enabled only in the CLI. When enabled, the FortiGate unit records traffic activity on interfaces as well as firewall policies. Logging other traffic puts a significant system load on the FortiGate unit and should be used only when necessary.

Logging other traffic works in the following way:

- firewall policy has logging enabled on it (Log Allowed Traffic or Log Violation Traffic) and other-traffic
- packet comes into an interface
- interface log packet is sent to the traffic log that is enabled on that particular interface
- possible log packet is sent regarding a match in the firewall policy, such as URL filter
- interface log packet is sent to the traffic log if enabled on that particular interface
- packet passes and is sent out an interface
- interface log packet is sent to traffic (if enabled) on that particular interface

Event

The event log records administration management as well as FortiGate system activity, such as when a configuration has changed, admin login, or high availability (HA) events occur. Event logs are an important log file to record because they record FortiGate system activity, which provides valuable information about how your FortiGate unit is performing.

Event logs help you in the following ways:

- keep track of configuration setting changes
- IPsec negotiation, SSL VPN and tunnel activity
- quarantine events, such as banned users

- system performance
- HA events and alerts
- firewall authentication events
- wireless events on models with WiFi capabilities
- activities concerning modem and internet protocols L2TP, PPP and PPPoE
- VIP activities
- AMC disk's bypass mode
- VoIP activities that include SIP and SCCP protocols.

The FortiGate unit records event logs only when events are enabled.

Data Leak Prevention

Data Leak Prevention logs, or DLP logs, provide valuable information about the sensitive data trying to get through to your network as well as any unwanted data trying to get into your network. The DLP rules within a DLP sensor can log the following traffic types:

- email (SMTP, POP3 or IMAP; if SSL content SMTPS, POP3S, and IMAPS)
- HTTP
- HTTPS
- FTP
- NNTP
- IM

A DLP sensor must have log settings enabled for each DLP rule and compound rule, as well as applied to a firewall policy so that the FortiGate unit records this type of activity. A DLP sensor can also contain archiving options, which these logs are then archived to the log device.

NAC Quarantine

Within the DLP sensor, there is an option for enabling NAC Quarantine. The NAC Quarantine option allows the FortiGate unit to record details of DLP operation that involve the ban and quarantine actions, and sends these to the event log file. The NAC Quarantine option must also be enabled within the Event Log settings. When enabling NAC quarantine within a DLP Sensor, you must enable this in the CLI because it is a CLI-only command.

Application control

Application control logs provide detailed information about the traffic that an application is generating, such as Skype. The application control feature controls the flow of traffic from a specific application, and the FortiGate unit examines this traffic for signatures that the application generates.

The log messages that are recorded provide information such as the type of application being used (for example P2P software), and what type of action the FortiGate unit took. These log messages can also help you to determine the top ten applications that are being used on your network. This feature is called application control monitoring and you can view the information from a widget on the Executive Summary page.

The application control list that is used must have *Enabled Logging* selected within the list, as well as logging enabled within each application entry. Each application entry can also have packet logging enabled. Packet logging for application control records the packet when an application type is identified, similar to IPS packet logging.

Logging of application control activity can only be recorded when an application control list is applied to a firewall policy, regardless of whether or not logging is enabled within the application control list.

Antivirus

Antivirus logs are recorded when, during the antivirus scanning process, the FortiGate unit finds a match within the antivirus profile, which includes the presence of a virus or grayware signature. Antivirus logs provide a way to understand what viruses are trying to get in, as well as additional information about the virus itself, without having to go to the FortiGuard Center and do a search for the detected virus. The link is provided within the log message itself.

These logs provide valuable information about:

- name of the detected virus
- name of the oversized file or infected file
- action the FortiGate unit took, for example, a file was blocked
- URL link to the FortiGuard Center which gives detailed information about the virus itself

The antivirus profile must have log settings enabled within it so that the FortiGate unit can record this activity, as well as having the antivirus profile applied to a firewall policy.

Web Filter

Web filter logs record HTTP traffic activity. These log messages provide valuable and detailed information about this particular traffic activity on your network. Web filtering activity is important to log because it can inform you about:

- what types of web sites are employees accessing
- if users try to access a banned web site and how often this occurs
- network congestion due to employees accessing the Internet at the same time
- alerts you to web-based threats when users surf non-business-related web sites

Web Filter logs are an effective tool to help you determine if you need to update your web filtering settings within a web filter profile due to unforeseen web-based threats, or network congestion. These logs also inform you about web filtering quotas that were configured for filtering HTTP traffic as well.

You must configure log settings within the web filter profile as well as apply it to a firewall policy so that the FortiGate unit can record web filter logs.

IPS (attack)

IPS logs, also referred to as attack logs, record attacks that occurred against your network. Attack logs contain detailed information about whether the FortiGate unit protected the network using anomaly-based defense settings or signature-based defense settings, as well as what the attack was.

The IPS or attack log file is especially useful because the log messages that are recorded contain a link to the FortiGuard Center, where you can find more information about the attack. This is similar to antivirus logs, where a link to the FortiGuard Center is provided as well and informs you of the virus that was detected by the FortiGate unit.

An IPS sensor with log settings enabled must be applied to a firewall policy so that the FortiGate unit can record the activity.

Packet logs

When you enable packet logging within an IPS signature override or filter, the FortiGate unit examines network packets, and if a match is found, saves them to the attack log. Packet logging is designed to be used as a diagnostic tool that can focus on a narrow scope of diagnostics, rather than a log that informs you of what is occurring on your network.

You should use caution when enabling packet logging, especially within IPS filters. Filter configuration that contains thousands of signatures could potentially cause a flood of saved packets, which would take up a lot of storage space on the log device. This would also take a great deal of time to sort through all the log messages, as well as consume considerable system resources to process.

You can archive packets, however, you must enable this option on the Log Setting page. If your log configuration includes multiple FortiAnalyzer units, packet logs are only sent to the primary, or first FortiAnalyzer unit. Sending packet logs to the other FortiAnalyzer units is not supported.

Email filter

Email filter logs, also referred to as spam filter logs, records information regarding the content within email messages. For example, within an email filter profile, a match is found that finds the email message to be considered spam.

Email filter logs are recorded when the FortiGate unit finds a match within the email filter profile and logging settings are enabled within the profile.

Archives (DLP)

Recording DLP logs for network use is called DLP archiving. The DLP engine examines email, FTP, IM, NNTP, and web traffic. Archived logs are usually saved for historical use and can be accessed at any time. IPS packet logs can also be archived, within the Log Settings page.

You can use the two default DLP sensors that were configured specifically for archiving log data, Content_Archive and Content_Summary. They are available in *UTM* > *Data Leak Prevention* > *Sensor*. Content_Archive provides full content archiving, while Content_Summary provides summary archiving.

You must enable the archiving to record log archives. Logs are not archived unless enabled, regardless of whether or not the DLP sensor for archiving is applied to the firewall policy.

Network scan

Network scan logs are recorded when a scheduled scan of the network occurs. These log messages provide detailed information about the network's vulnerabilities regarding software as well as the discovery of any vulnerabilities.

A scheduled scan must be configured, as well as logging enabled within the Event Log settings, for the FortiGate unit to record these log messages.

Configuring logging of FortiGate activity on your FortiGate unit

There are many FortiGate activities that you can enable logging for on your FortiGate unit. Most are configured in the UTM menu; however, there are some activities that require configuration from other locations. For example, enabling events is done from *Log&Report* > *Log Config* > *Log Setting*.

When you are ready to enable logging of the FortiGate activities you have chosen, you must apply them to a firewall policy. When applied to a firewall policy, the FortiGate unit determines whether to record the activity or event based on what is applied on the firewall policy and configured within the Log Config page.

The following explains how to enable and configure logging on your FortiGate unit.

This topic includes the following:

Enabling logging within a firewall policy

You must enable logging within a firewall policy, as well as the options that are applied to a firewall policy, such as UTM features. Event logs are enabled within the Event Log page.

To enable logging within an existing firewall policy

1. Go to *Firewall* > *Policy* > *Policy*.
2. Expand to reveal the policy list of a policy.
3. Select the firewall policy you want to enable logging on and then select *Edit*.
4. To log all general firewall policy traffic, select the check box beside *Log Allowed Traffic*.
5. On the firewall policy's page, select the check box beside *UTM*.
6. Select the protocol option list from the drop-down list beside *Protocol Options*.

   By default, the *Protocol Options* check box is selected. You must choose a list from the drop-down list.
7. For each row under *UTM*, select the check box beside each of the profiles and/or sensors that you want applied to the policy; then select the profile or sensor from the drop-down list as well.
8. To apply other options, such as application lists, repeat step 7 and choose the option from the drop-down list.
9. Select *OK*.

You need to set the logging severity level to *Notification* when configuring a logging location to record traffic log messages.

Enabling logging of events

The event log records management and activity events, such as when a configuration has changed, admin login, or high availability (HA) events occur.

When you are logged in to VDOMs, certain options may not be available, such as VIP ssl event or CPU and memory usage events. You can enable event logs only when you are logged in to a VDOM; you cannot enable event logs in the root VDOM.

To enable the event logs

1. Go to *Log&Report* > *Log Config* > *Log Setting*.

2 In the *Event Log Settings* section, select the check box beside *Enable*.

3 Select one or more of the following:

System activity event	All system-related events, such as ping server failure and gateway status.
IPSec negotiation event	All IPSec negotiation events, such as process and error reports.
DHCP service event	All DHCP-events, such as the request and response log.
L2TP/PPTP/PPPoE service event	All protocol-related events, such as manager and socket create processes.
Admin event	All administration events, such as user logins, resets, and configuration updates.
HA activity event	All high availability events, such as link, member, and stat information.
Firewall authentication event	All firewall-related events, such as user authentication.
Pattern update	All pattern update events, such as antivirus and IPS pattern updates and update failures.
Configuration event	All configuration changes
GTP service event (FortiOS Carrier only)	All GTP service events.
Notification event	All notification events.
MMS statistics event (FortiOS Carrier only)	All MMS statistics events.
Explicit web proxy event	All explicit web proxy events.
SSL VPN user authentication event	All administrator events related to SSL VPN, such as SSL configuration and CA certificate loading and removal.
SSL VPN administration event	All administration events related to SSL VPN, such as SSL configuration and CA certificate loading and removal.
SSL VPN session event	All session activity such as application launches and blocks, timeouts, verifications and so on.
VIP ssl event	All server-load balancing events that are happening during SSL session, especially details about handshaking.
VIP server health monitor event	All related VIP server health monitor events that occur when the VIP health monitor is configured, such as an interface failure.
WiFi activity event	All WiFi activities, such as Rogue AP.

CPU & memory usage (every 5 min)	Real-time CPU and memory events only, at 5-minute intervals.
VoIP event	All VoIP activity, such as SIP and SCCP violations.
AMC interface enters bypass mode event	All AMC interface bypass mode events that occur.
NAC Quarantine event	All endpoint activity that have quarantined hosts when Endpoint NAC is checking hosts.
DNS lookup	All lookups that are DNS-related.

4 Select *Apply*.

5 Select *OK*.

Enabling SQL logging

SQL logging is enabled by default on the FortiGate unit; however, if you have disabled SQL logging and have factory defaults on the FortiGate unit, and then you upgrade the FortiGate unit, the upgrade will not automatically enable SQL logging. When this occurs, use the following procedure to enable SQL logging.

The following procedure enables all logs except for DLP archives.

To enable SQL logging

1 Log in to the CLI.

2 Enter the following command syntax:

```
config log disk setting
  config sql-logging
    set app-crtl enable
    set attack enable
    set dlp enable
    set event enable
    set netscan enable
    set spam enable
    set traffic enable
    set virus enable
    set webfilter enable
  end
```

Configuring IPS packet logging

IPS packet log messages are recorded in the attack log file. You must enable packet logging within the IPS sensor's filter itself because the FortiGate unit will not log the IPS packets with only logging enabled within the IPS sensor or the filter itself.

To configure IPS packet logging

1 Go to *UTM* > *Intrusion Protection* > *IPS Sensor*.

2 Select the IPS sensor that you want to enable IPS packet logging on, and then select *Edit*.

3 Within the sensor, select the filter to enable IPS packet logging for and then select *Edit*.

4 In *Signature Settings*, select *Enable all* for *Packet Logging*.

5 Select *OK*.

6 Repeat steps 3 to 5 for each filter that you want IPS packet logging enabled for.

If you want to configure the packet quota, number of packets that are recorded before alerts and after attacks, use the following procedure.

To configure additional settings for IPS packet logging

1 Log in to the CLI.

2 Enter the following to start configuring additional settings:

```
config ips settings
    set ips-packet quota <integer>
    set packet-log-history <integer>
    set packet-log-post-attack <integer>
end
```

Configuring NAC quarantine logging

NAC quarantine logging is enabled within the Event Log settings page. However, you must have a NAC profile applied to a firewall policy for the FortiGate unit to record these log messages.

To configure NAC quarantine logging

1 Go to *Log&Report* > *Log Config* > *Log Setting*.

2 If not enabled, select the check box beside *Enable* which is located in the Event Log Settings section of the page.

3 If not already enabled, select *NAC Quarantine event*.

4 Select *Apply*.

5 Go to *Firewall* > *Policy* > *Policy*.

6 Select the firewall policy that you want to apply the NAC profile to, and then select *Edit*.

7 Within the UTM section, select the check box beside *Enable Endpoint NAC* and then select the endpoint profile from the drop-down list.

8 To add a disclaimer, select the check box beside *Enable Disclaimer*, and then enter the comment in the *Comments (maximum 63 characters)* field.

9 Select *OK*.

10 Log in to the CLI.

11 Enter the following to enable NAC quarantine in the DLP sensor:

```
config dlp sensor
  edit <dlp_sensor_name>
    set nac-quar-log enable
  end
```

Viewing log messages and archives

Depending on the log device, you may be able to view logs within the web-based manager or CLI on the FortiGate unit. If you have configured a FortiAnalyzer unit, local hard disk, or system memory, you can view log messages from within the web-based manager or CLI. If you have configured either a Syslog or WebTrends server, you will not be able to view log messages from the unit's web-based manager or CLI. The unit also does not currently support viewing logs from FortiGuard Analysis and Management Service from within the web-based manager or CLI.

Log messages and log archives can be viewed from the Log & Archive Access menu. Archived logs are stored on FortiAnalyzer units, a FortiGate unit's local disk or system memory, and a FortiGuard Analysis server. The Log & Archive Access menu displays the archived logs only when archiving is enabled and logs are being archived by the unit. The submenus are based on the log file, for example the UTM log file, which contains log messages that contain information regarding UTM activity, such as virus activity and application control activity. Viewing log archives is the same as viewing log messages, for example, *Log& Report* > *Log & Archive Access* > *E-mail Archive*.

From the Log & Archive Access menu, you can view detailed information about the log message in a log view table, located (by default) at the bottom of the page. Each page contains this log message viewer table, as well as the option of downloading the raw log file. Raw log format is how the log message displays in the log file, and contains sometimes contains additional log fields that are not present in the log message viewer table on the page. When viewing log messages on the web-based manager, you are viewing them in Formatted format.

Viewing logs in Raw format allows you to view all log fields, as well as making a log file available regardless of whether you are archiving logs or not. You download the log file by selecting *Download Raw Log*. The log file is named in the following format: <log_type><log_number><log_subtype_number>.log. For example, clog0112.log, which is the archive log downloaded. The time period is the day and month of when the log was downloaded, not the time period of the log messages within the file itself.

You do not have to view log messages from only the web-based manager. You can view log messages from the CLI as well using the `execute log display` command. This command allows you to see specific log messages that you already configured within the `execute log filter` command. The `execute log filter` command configures what log messages you will see, how many log messages you can view at one time (a maximum of 1000 lines of log messages), and the type of log messages you can view. For example, log messages from the DLP log file.

This topic contains the following:

Viewing log messages from the web-based manager and CLI

If you have configured logging to a FortiAnalyzer unit, FortiGate unit's local disk or system memory, you can view log messages from either the web-based manager or CLI. The following procedures explain how to view log messages from the Log Access menu in the web-based manager, and how to view log messages from within the CLI.

If the FortiGate unit is running FortiOS 4.0 MR2 or lower, when viewing log messages in the Raw format in *Memory*, the ten-digit log ID number is used; however, when viewing the same log messages, in Raw format, in *Disk*, the five-digit log ID number is used (except for traffic logs which have only one-digit log IDs). This five-digit log identification number is used because of log size reduction that occurred in FortiOS 4.0 MR1.

To view log messages from the web-based manager

1 Go to *Log&Report* > *Log & Archive Access*.

2 Select the log menu that you want to view log messages in.

For example, the attack log messages in *Log&Report* > *Log & Archive Access* > *Traffic Log*.

3 Within the page, use any one of the following to view each log message:

- *Download Raw Log* – downloads the log file to your PC. See "Downloading log messages and viewing them from your computer" on page 667.
- *Column Settings* – customize what columns display on the page. See "Customizing the display of log messages" on page 668
- *Filter Settings* – filter the information within the page. See "Customizing the display of log messages" on page 668
- *Detailed Information* – display the log table on the right side of the page, at the bottom (default), or hide the log table. See

4 To display current log messages on the page, select *Refresh*.

To view log messages from the CLI

1 Enter the following to configure how the log messages will be displayed, as well as what log messages you want to display:

```
execute log filter category <category_number>
execute log filter start-line <line_number>
execute log filter view-lines <lines_per_view>
```

2 Enter the following to display the logs messages within the CLI:

```
execute log display
```

3 Log messages appear and stop when the maximum number of view-lines is reached.

Example: Viewing DLP log messages from the CLI

The following is an example of viewing DLP log messages from the CLI.

To view log messages from the CLI - example

1 Enter the following to configure the display of the DLP log messages:

```
execute log filter category 9
execute log filter start-line 1
execute log filter view-lines 20
```

2 Enter the following to view DLP log messages:

```
  execute log display
600 logs found
20 logs returned
```

The first 20 log messages from the DLP log file display.

Quarantine

Within the Log & Archive Access menu, you can view detailed information about each quarantined file. The information can either be sorted or filtered, depending on what you want to view.

You must enable quarantine settings within an antivirus profile and the destination must be configured in the CLI using the `config antivirus quarantine` command. The destination can be either a FortiAnalyzer unit or local disk.

Sort the files by file name, date, service, status, duplicate count (DC), or time to live (TTL). Filter the list to view only quarantined files with a specific status or from a specific service.

On *Log&Report* > *Log & Archive Access* > *Quarantine*, the file quarantine list displays the following information about each quarantined file.

Quarantine page

Lists all files that are considered quarantined by the unit. On this page you can filter information so that only specific files are displayed on the page.

Source	Either *FortiAnalyzer* or *Local disk*, depending where you configure to quarantined files to be stored.
Sort by	Sort the list. Choose from: *Status*, *Service*, *File Name*, *Date*, *TTL*, or *Duplicate Count*. Select *Apply* to complete the sort.
Filter	Filter the list. Choose either *Status* (infected, blocked, or heuristics) or *Service* (IMAP, POP3, SMTP, FTP, HTTP, IM, or NNTP). Select *Apply* to complete the filtering. Heuristics mode is configurable through the CLI only. If your unit supports SSL content scanning and inspection Service can also be IMAPS, POP3S, SMTPS, or HTTPS. For more information, see the UTM chapter of the FortiOS Handbook.
Apply	Select to apply the sorting and filtering selections to the list of quarantined files.
Delete	Select to delete the selected files.
Page Controls	Use the controls to page through the list.
Remove All Entries	Removes all quarantined files from the local hard disk. This icon only appears when the files are quarantined to the hard disk.
File Name	The file name of the quarantined file.
Date	The date and time the file was quarantined, in the format dd/mm/yyyy hh:mm. This value indicates the time that the first file was quarantined if duplicates are quarantined.
Service	The service from which the file was quarantined (HTTP, FTP, IMAP, POP3, SMTP, IM, NNTP, IMAPS, POP3S, SMTPS, or HTTPS).
Status	The reason the file was quarantined: *infected*, *heuristics*, or *blocked*.

Status Description	Specific information related to the status, for example, “File is infected with “W32/Klez.h”” or “File was stopped by file block pattern.”
DC	Duplicate count. A count of how many duplicates of the same file were quarantined. A rapidly increasing number can indicate a virus outbreak.
TTL	Time to live in the format hh:mm. When the TTL elapses, the FortiGate unit labels the file as EXP under the TTL heading. In the case of duplicate files, each duplicate found refreshes the TTL. The TTL information is not available if the files are quarantined on a FortiAnalyzer unit.
Upload status	*Y* indicates the file has been uploaded to Fortinet for analysis, *N* indicates the file has not been uploaded. This option is available only if the FortiGate unit has a local hard disk.
Download	Select to download the corresponding file in its original format. This option is available only if the FortiGate unit has a local hard disk.
Submit	Select to upload a suspicious file to Fortinet for analysis. This option is available only if the FortiGate unit has a local hard disk.

Downloading log messages and viewing them from your computer

You can view log messages in Raw format by downloading them from the web-based manager to your computer. The log file that is downloaded contains all the log messages that were recorded by the unit. When you are ready to view log messages in their Raw format, use a text editor, such as Notepad.

The following procedures can be used when you want to view log archives in Raw format.

To download log messages

1. Go to *Log&Report* > *Log & Archive Access* and then select the submenu that you want to download log messages from.

   For example, *Log&Report* > *Log & Archive Access* > *UTM Log*
2. Within the page, select *Download Raw Log*.
3. Save the log file to your computer.

To view downloaded log messages

1. On your computer, locate the log file.
2. Open the log file with a text editor.
3. Scroll up and down to view each log message within the file.

Viewing log messages using the log table

You can view log messages using the log table, located at the bottom of the page within the Log & Archive Access menu. The log table can be positioned on the page either at the right or at the bottom. You can also hide the log table as well.

To view log messages using the log table

1. Go to *Log&Report* > *Log & Archive Access*.
2. Select the submenu that you want to access logs from.

   For example, DLP log messages in *Log&Report* > *Log & Archive Access* > *UTM Log*.

3 From within the page, select inside the row of the log message that you want to view.

The log message row is highlighted and the log message appears in the log view table, located at the bottom of the page.

4 To close the table, select the arrow beside *Detailed Information* and then select *Hidden*.

5 To view the next log message from the table, use your keyboard's up and down arrows, or select the next log message row.

6 To view the log table at the right side of the page, select the arrow beside *Detailed Information* and then select *On Right*.

Monitoring the recording activity of logs on the FortiGate unit

When viewing the logs messages, you may want to know the activity of what is being recorded by the FortiGate unit. You can view this information in a user-friendly way by going to *Log&Report* > *Monitor* > *Logging Monitor*. The information displays in a bar chart on the page.

The Logging Monitor allows you to view the log file entries that have been recorded by the unit on a daily basis. For example, on Monday the Logging Monitor shows there are 20 entries. The information on the page is not saved when the week is up; it resets the information every week.

You can view detailed information about the log entries by selecting a bar in the chart; the Log Activity for <day> appears to show a break down of the log entries for that day. You can select Return to go back to the Logging Monitor page at any time.

Customizing the display of log messages

After the configuration is completed, and logging of FortiGate activities begins, you can customize and filter the log messages you see in the Log Access menu. Filtering and customizing the display provides a way to view specific log information without scrolling through pages of log messages to find the information.

Filtering information is similar to customizing, however, filtering allows you to enter specific information that indicates what should appear on the page. For example, including only log messages that appeared on April 4 between the hours of 8:00 and 8:30 am.

Customizing log messages allows you to remove or add columns to the page, allowing you to view certain information. The most columns represent the fields from within a log message, for example, the user column represents the user field, as well as additional information. If you want to reset the customized columns on the page to their defaults, you can within *Column Settings* by selecting *Default*.

The following is an example of how to filter and customize the display of application control log messages. Use the following example to help you to filter and customize the display of log messages in the web-based manager.

Filtering and customizing application control log messages example

The following example displays all application control log messages that do not contain the source IP address 10.10.10.1, as well as not displaying the Message, Date and Time columns on the page.

To filter and customize log messages

1 Go to *Log&Report* > *Log & Archive Access* > *UTM Log*.

2 On the page, select *Column Settings*.
3 In the *Show these fields in this order*, remove each of the following by selecting the column name and then using the <- arrow:
   - *Message*
   - *Date*
   - *Time*
4 Select *OK*.
5 Select *Filter Settings*.
6 In *Filters*, select *Add new filter*.
7 In the *Field* drop-down list, select *UTM (type)*, and in *UTM Type*, select *Application Control* and use the -> arrow to move it to the other column.
8 Select *Add new filter*.
9 In the *Field* drop-down list, select *Src*, enter 10.10.10.1 in the field and then select the check box beside *NOT*.
10 Select *OK*.

Alert email messages

Alert email messages provide notification about activities or events logged. These email messages also provide notification about log severities that are recorded, such as a critical or emergency.

You can send alert email messages to up to three email addresses. Alert messages are also logged and can be viewed from the Log Access menu. Alert messages are recorded in the event-system log file.

This topic contains the following:

Configuring an alert email message

You can use the alert email feature to monitor logs for log messages, and to send email notification about a specific activity or event logged. For example, you require notification about administrators logging in and out. You can also base alert email messages on the severity levels of the logs. The FortiGate unit does not currently support SSL/TLS connections for SMTP servers, so you must choose an SMTP server that does not need SSL/TLS when configuring the SMTP server settings.

Before configuring alert email, you must configure at least one DNS server if you are configuring with an Fully Qualified Domain Server (FQDN). The FortiGate unit uses the SMTP server name to connect to the mail server, and must look up this name on your DNS server. You can also specify an IP address.

To configure an alert email message

1 Go to *Log&Report* > *Log Config* > *Alert E-mail*.

2 On the Alert E-mail page, enter the information for the SMTP server.

If the SMTP user requires authentication, enter the information after selecting the check box beside *Enable*.

The FortiGate unit currently does not support SSL/TLS connections with email servers, for example, Gmail. You must use an SMTP server that does not need an SSL/TLS connection.

3 Select *Apply* to apply the SMTP server information.

4 To verify these settings are correct, select *Test Connectivity*.

5 To send an alert email message based on a log's severity, select *Send to alert email for logs based on severity*, and then select a severity from the *Minimum log level* drop-down list.

6 To send an alert email message based on different activities, such as an administrator logging in and out, select from the following options:

Interval Time (1-9999 minutes)	Enter the minimum time interval between consecutive alert emails. Use this to rate-limit the volume of alert emails.
Intrusion detected	Select if you require an alert email message based on attempted intrusion detection.
Virus detected	Select if you require an alert email message based on virus detection.
Web access blocked	Select if you require an alert email message based on blocked web sites that were accessed.
HA status changes	Select if you require an alert email message based on HA status changes.
Violation traffic detected	Select if you require an alert email message based on violated traffic that is detected by the FortiGate unit.
Firewall authentication failure	Select if you require an alert email message based on firewall authentication failures.
SSL VPN login failure	Select if you require an alert email message based on any SSL VPN logins that failed.
Administrator login/logout	Select if you require an alert email message based on whether administrators log in or out.
IPSec tunnel errors	Select if you require an alert email message based on whether there is an error in the IPSec tunnel configuration.
L2TP/PPTP/PPPoE errors	Select if you require an alert email message based on errors that occurred in L2TP, PPTP, or PPPoE.
Configuration changes	Select if you require a1n alert email message based on any changes made to the FortiGate configuration.
FortiGuard license expiry time (1-100 days)	Enter the number of days before the FortiGuard license expiry time notification is sent.

Disk usage (1-99%)	Enter a number for the disk usage threshold, in percent.
FortiGuard log quota usage	Select if you require an alert email message based on the FortiGuard Analysis server log disk quota getting full.

7 Select *Apply*.

The default minimum log severity level is Alert. If the FortiGate unit collects more than one log message before an interval is reached, the FortiGate unit combines the messages and sends out one alert email.

Configuring an alert email for notification of FortiGuard license expiry

You can configure an alert email to notify you prior to when the FortiGuard license will actually expire. By sending this type of alert email, users are reminded sooner about their license requiring renewal soon, rather than later.

To configure an alert email for notification of FortiGuard license expiry - web-based manager

1 Go to *Log&Report* > *Log Config* > *Alert Email*.

2 Configure the SMTP server, email from and to fields, and if applicable, authentication.

3 Verify that *Select Send Alert email* is selected.

4 Select the check box beside *FortiGuard license expiry time:* ***n*** *(1-100 days)*.

The default for the expiry time is 15 days. This means that 15 days before the actual expiry date, an alert message is sent informing you that your license will expire in 15 days.

5 Enter a number for the number of days prior to the expiry date in the field provided.

For example, you want to be notified five days before the expiry date (December 31), an email is sent to the specified email address on December 27, five days before December 31.

6 Select *Apply*.

If you have configured FortiGate system memory as your log device, logging alert email notifications for FortiGuard license expiry requires you to enable event and admin in the log memory filter command. Use the following procedure when you want to log this event and if your log device is system memory. If you have enabled system memory on a FortiGate unit that has a local disk, you do not have to use the following procedure.

All other log devices, including the FortiGate unit's local disk, log alert messages by default. You can find the alert email logs within the event-system log file.

To configure logging of an alert email notification of FortiGuard license expiry (memory only)- CLI

1 Log in to the CLI.

2 To enable logging of an alert email notification using system memory, enter the following command syntax:

```
config log memory setting
  set status enable
end
config log memory filter
  set event enable
```

```
  set admin enable
end
```

Log message usage

FortiGate log messages present detailed accounts of an event or activity that happened on your network recorded by the FortiGate unit. These log messages provide valuable information about your network that inform you about attacks, misuse and abuse, and traffic activity that may provide useful when troubleshooting an issue, testing a configuration setting, or verifying that a setting is working properly.

If you require information about specific log messages, such as log message 32001, see the *FortiGate Log Message Reference*.

This section explains how to use logs when troubleshooting, as well as verify settings and testing purposes.

The following topics are included in this section:

Using log messages to help when issues arise

Log messages are very useful when an issue arises, such as when an SSL VPN tunnel does down. Log messages can help you when locating the problem, and can provide a starting point to go towards solving the problem. They can also indicate that an issue has arisen. For example, when an SSL VPN connection is not working properly, an easy way to find out what happened is to go directly to the log messages and view the ones for SSL VPN, in the event log.

HA log messages indicate lost neighbor information

When the FortiGate unit is in HA mode, you may notice the following log messages within the event log:

```
2011-04-16 11:05: 34 device_id=FG50B11111111 log_id=35001
type=event subtype=ha pri=critical vd=root msg= "HA slave
heartbeat interface internal lost neighbor information"
```

OR

```
2011-04-16 11:16 11:05: 40 device_id=FG50B11111111 log_id=35001
type=event subtype=ha pri=critical vd=root msg= "Virtual cluster 1
of group 0 detected new joined HA member"
```

OR

```
2011-04-16 11:16 11:05: 40 device_id=FG50B11111111 log_id=35001
type=event subtype=ha pri=critical vd=root msg= "HA master
heartbeat interface internal get peer information"
```

The log messages occur within a given time, and indicate that the units within the cluster are not aware of each other anymore. These log messages provide the information you need to fix the problem.

Alert email test configuration issues example

You have just configured the settings for an alert email message that will be sent to your inbox whenever web access is blocked, violation traffic is detected, and IPSec tunnel errors. You select *Test Connectivity* to test the configuration; however, there is no test email in your inbox.

You immediately go to the log messages to see what is going on.

1 *Log&Report* > *Log Access* > *Event*.

2 The following message appears in the *Message* field: Failed to send alert email from mail.example.com.

Raw format of the log message in the email:

```
2011-04-05 13:34:31 log_id=0100200003 type=event subtype=system
vd=root pri=notice user=system ui=system action=alert-email
status=failure count=5 msg="Failed to send alert email from
mail.example.com to myemailaddress@example.com"
```

The above log message indicates that the alert email message could not be sent to your inbox. You must verify the SMTP server, and if incorrect, enter the correct SMTP server and try again.

3 If you get the following log message, it means that the address you entered in the SMTP server field was not correct. You need to verify that it is the correct address.

```
2011-04-05 13:34:31 log_id=200003 type=event subtype=system
vd=root pri=notice user="system" ui="system" action="unknown"
status="failure" msg="Can't resolve the IP address of
mail.example.com" vd=root pri=notice
```

An alert email log message is not recorded if the alert email configuration is correct. If it is correct, you should see a test alert email message in your inbox and no log messages concerning alert email configuration settings, similar to those in this example.

How to use log messages to help verify settings and for testing purposes

You can use log message to verify settings, as well as for testing connections. The following are examples that explain various situations where you can use log message to verify settings within a feature, and also for testing purposes.

Verifying to see if a network scan was performed example

When you have configured an asset for a scan and a schedule for when to scan, you may want to verify that the asset is working properly. The log file that records network scanning is the netscan log.

You have just configured an asset to scan. You verify the scan by selecting *Discover Assets* on the Asset page (*Endpoint* > *Network Vulnerability Scan* > *Asset*). After the scan is complete, you view the netscan logs. The following four log messages appear:

4097

This log message indicates that the scanned was performed.

```
2011-04-05 13:34:31 log_id=4097 type=netscan subtype=discovery
pri=notice vd=root action=scan start=1275363661 end=1275363719
engine=1.053 plugin=1.098
```

4100

Both these log messages indicate that the scan discovered two separate service-detection events.

```
2011-04-05 13:34:31 log_id=4100 type=netscan subtype=discovery
pri=notice vd=root action=service-detection ip=10.10.20.3
service=microsoft-ds proto=tcp prot=445

2011-04-05 13:34:31 log_id=4100 type=netscan subtype=discovery
pri=notice vd=root action=service-detection ip=10.10.20.3
service=netbios-ssn proto=tcp port=139
```

4099

This log message indicates that the scan discovered a host, and explains the host's operating system, family that the OS belongs to, the type of generation, and the vendor or company that created the OS.

```
2010-04-05 13:34:31 log_id=1600004099 type=netscan
subtype=discovery pri=notice vd=root action=host-detection
ip=10.10.20.3 os="Windows XP" os_family="Windows"
os_gen="NT/2K/XP" os_vendor="Microsoft"
```

Testing for the FortiGuard license expiry log message example

You recently configured an alert message that would notify when the FortiGuard Analysis service license expires. You know that the expiry date is 2010-08-30, but want to verify that the alert message will notify you both by email and by log message, so you entered 100 days. You made sure that the log configuration includes logging alert messages as well.

After a while, you receive an alert email message in your inbox stating the following:

```
Message meets Alert condition
date=2011-06-08 time=11:55:52 devname=FG50BH3G09601792
device_id=FG50BH3G09601792 log_id=0104032014 type=event
subtype=admin  pri=warning vd=root msg="FortiGuard analysis
service license will expire in 82 day(s)"
```

You go to *Log&Report* > *Log Access* > *Event* to view the license expiry log message using a filter on the Message column:

1. In *Log&Report* > *Log Access* > *Event*, select the filter icon beside the *Message* column's name.
2. In the Edit Filters window, select the check box beside *Enable*.
3. In the *Text* field, enter the sentence found in the alert email message: FortiGuard analysis service license will expire in 82 day(s).
4. Select *OK*.

   The following log message appears in the first line on the first page of the Event page (Raw format):

   ```
   2011-06-03 13:55:22 log_id=32014 type=event subtype=admin
   pri=warning vd=root msg="FortiGuard analysis service license
   will expire in 82 day(s)"
   ```

Using diag log test to verify logs are sent to a log device

After setting up a log device, you may want to verify that everything is working properly, including sending of logs to the log device. The diag log test command is used to create various test logs.

```
diag log test
```

The command can also be used when a Syslog server is not receiving certain logs. When the command is entered in the CLI, an output similar to the following appears below the line:

```
generating a system event message with level – warning
generating an infected virus message with level – warning
generating a blocked virus message with level – warning
generating a URL block message with level – warning
generating a DLP message with level – warning
generating an attack detection message with level – warning
generating an application control IM message with level –
information
generating an antispam message with level – notification
generating an allowed traffic message with level – notice
generating a wanopt traffic log message with level – notification
generating a HA event message with level – warning
generating netscan log messages with level – notice
generating a VOIP event message with level – information
generating authentication event messages
```

These log messages can be viewed from the Log Access menu. The following is a test log message that may be generated and recorded by the FortiGate unit. It is shown as it would be displayed in Raw format in system memory.

```
2011-08-10 09:34:22 log_id=0508020480 type=emailfilter
subtype=smtp pri=notice policyid=12345 identidx=67890 serial=312
user="user" group="group" vd="root" src=1.1.1.1 sport=2560
src_port=2560 src_int="lo" dst=2.2.2.2 dport=5120 dst_port=5120
dst_int="eth0" service=mm1 carrier_ep="carrier endpoint"
profile="N/A" profilegroup="N/A" profiletype="N/A" status=detected
from="from@xxx.com" to="to@xxx.com" tracker="Tracker"
msg="SpamEmail"
```

Reports

Reports provide a way to analyze log data without manually going through a large amount of logs to get to the information you need. This section explains how to configure a FortiOS report and how to modify the existing default FortiOS UTM report. The FortiOS default UTM report is a report that gathers UTM activity information and compiles it into a report. This section also explains how to view these reports.

The following topics are included in this section:

- FortiOS reports
- Configuring a FortiOS report
- Viewing reports

You can only configure reports if the FortiGate unit has a hard disk and SQL logging is enabled.

Configuring reports from other log devices, such as a Syslog server, are not supported. If you want to configure a report from logs stored on a FortiAnalyzer unit, you must go directly to the FortiAnalyzer unit itself; starting in FortiOS 4.0 MR3, support for configuring a FortiAnalyzer schedule is no longer available.
From FortiOS 4.0 MR3 and onward, executive summary reports are no longer supported and existing summary reports are not carried forward.

FortiOS reports

Reports provide a clear, concise overview of what is happening on your network based on log data, without manually going through large amounts of logs. Reports can be configured on a FortiGate unit or a FortiAnalyzer unit. However, in this document only FortiOS reports are explained. FortiOS reports are the reports that are generated on the FortiGate unit. FortiAnalyzer reports are configured on a FortiAnalyzer unit and for information about those reports, see the *FortiAnalyzer Administration Guide*.

FortiOS reports are configured from logs stored on the FortiGate unit's hard drive. These reports, generated by the FortiGate unit itself, provide a central location for both configuring and generating reports. A default FortiOS report, called the FortiGate UTM Daily Activity Report, is available for you to modify to your requirements. The default report provides a way to quickly and easily set up your own report from within the web-based manager. The default FortiOS report is a report that compiles UTM activity from various UTM-related logs, such as virus and attack logs.

FortiOS reports consist of multiple parts, regardless of whether its the default FortiOS report or a report that you have configured from scratch, and these parts are configured separately and added to the layout. These parts of a FortiOS report are:

- charts (including datasets within the charts themselves)
- themes (including styles which are within the themes themselves)
- images

- layout

Charts are used to display the log information in a clear and concise way using graphs and tables. Charts contain datasets, which are SQLite queries and help the FortiGate unit to add specific log information into the chart using the log information that is stored in the SQLite database on the local hard disk. If you want to configure a chart, you must configure the dataset first. Datasets are required for each chart, and if there is no dataset included in a chart, the chart will not be saved.

Themes provide a one-step style application for report layouts. Themes contain various styles, including styles for the table of contents, headings, headers and footers, as well as the margins of the report's pages. Themes are applied to layouts. The styles that are applied to themes are configured separately.

You can easily upload your company or organization's logo to use within a report. By uploading your company or organization's logo and applying it to a report, you provide a personalized report that is recognizable as your company or organization's report. The image must be in JPEG, JPG or PNG format.

Layouts provide a way to incorporate the charts, images, and themes that are configured to create a formatted report. A layout is used as a template by the FortiGate unit to compile and then generate the report.

You can reset the reports you have configured, as well as the default FortiOS report you modified, to default settings. When you reset reports to default settings, any configured reports that you created from scratch are lost. The `execute report-config reset` command resets the reports to default settings. If you are going to reset the reports to their default settings, you should back up the current configuration file before doing so, in the event you want to revert back to the reports you previously created and/or modified.

Configuring a FortiOS report

The following explains how to configure a FortiOS report as well as how to modify the existing default FortiOS report.

This topic contains the following:

You can only configure reports if the FortiGate unit has a hard disk and SQL logging is enabled.

Modifying the default FortiOS report

The default FortiOS report can be modified so that it meets your requirements for a report. This default report is located in *Log&Report* > *Report Access*.

The default report is broken up into the following submenus:

- Cover Page
- Bandwidth and Application Usage
- Web Usage
- Emails
- Threats

- VPN Usage

Each submenu is a page of the default FortiOS report. For example, the Bandwidth and Application Usage is the page in the report that contains information regarding bandwidth usage for WAN Opt and web cache, as well as application usage. These pages can be removed or modified, or new pages added by selecting *Options*. This allows you to configure when the report will be generated, whether it will include a table of contents, and whether to add or removed a page from the layout. When you add a new page to the layout, it becomes a submenu in *Log&Report* > *Report Access*.

Each page can be modified to suite your requirements for a default report, or removed. You can also add pages to the report. Adding or removing pages is done by selecting *Options* in Edit mode. The Edit mode allows you to modify the default report. The View mode is the mode when you first access the pages, and when you are viewing the saved changes to the default report.

The FortiOS default report contains information about the FortiGate unit in two text boxes, one on the cover page and one as an appendix that comes at the end of the generated report. The appendix is located in the VPN Usage page.

After generating a report, you can view it from the Historical Reports page by selecting *Historical Reports*. You must be in View mode to view generated reports.

Example for creating a new default report from the existing default report

The following is an example of how to create a new default from the existing FortiOS default report. The new default report will be generated on a daily basis, and include only email activity information and application usage.

To modify the cover page of the layout

1. Go to *Log&Report* > *Report Access* > *Cover Page*.
2. Select *Edit*.

   The Editing Section: Cover Page page appears.
3. Within the *FortiGate UTM* text box, select inside the box so that the cursor appears; delete *FortiGate UTM* and enter `CompanyX`.
4. Within the *Daily Activity Report* text box, delete *Daily Activity Report* and enter `Email, Traffic and Application Usage Activity Report`.
5. Select *Save* to save the current changes.

The following assumes that you are still in Editing mode.

To remove and add pages within the report

1. In the Cover Page page, select *Options*.

   When you select *Options*, the Report Options window appears. This window provides the settings for adding or removing pages, scheduling when the report generates, and whether to include a table of contents or not.
2. In the Report Options window, under *Sections*, select the check boxes beside *VPN Usage*, *Threats*, and *Web Usage*.
3. Select *Delete*.

   This removes these three submenus from the Report Access menu.
4. Rename the Bandwidth and Application Usage to Application Usage by selecting Bandwidth and Application Usage, and then removing Bandwidth from the name.

5 Press Enter on your keyboard to apply the new name.
6 Select *Create New*.
7 Enter `Traffic Usage`.
   This will add the new Traffic Usage submenu to the list.
8 Select *OK*.
9 Select *Save*.

To configure email addresses and enable sending the report attached in an email

1 In the Report Options window, select the check box beside *Email Generated Reports*.
   The *Email Recipients* table appears.
2 Select within the table below the title *Add Email Recipient*; the blinking cursor appears, allowing you to enter the first email address.
3 Enter the first email address.
4 On your keyboard, press Enter to add another row so that you can add another email address.
5 Repeat steps 2 to 4 until all email addresses are included.
6 Select *OK* to save the email addresses.

The following adds the charts and text to the Emails page in *Log&Report* > *Report Access* > *Emails*.

To modify the information in the Email, Traffic and Application Usage page

1 Go to *Log&Report* > *Report Access* > *Application Usage*.
2 On the page, select *Edit*.
3 Remove the bandwidth usage information from the page.
   This is done by moving your mouse over the top right-hand corner of a text box and then selecting the red x that appears.
4 Go to *Log&Report* > *Report Access* > *Traffic Usage.*
5 In *Text*, (located in the right-hand pane of the page), drag *H1* icon onto the page.
   A text box appears.
6 Enter the chart heading's name in the text box, `Top Users By Bandwidth`.
   The heading style automatically configures for you as you type.
7 In *Text*, drag *T* icon onto the page.
   The *T* icon allows you to enter sentences or phrases in a normal font style, with a smaller font size than is available with *H1* or *H2*.
8 Enter the following in the text box: The top users by bandwidth for today.
9 In *Chart* (located in the right-hand pane of the page), drag the bar chart onto the page.
   The Chart Chooser window appears.
10 Select *Traffic* in the right-hand column, and then select *traffic.bandwidth.user*; select *OK* to put the chart on the page.

11 Repeat steps 5 to 10 to add each of the following charts with a description of each chart, to the page:
   - *traffic.sessions.app_cats*
   - *traffic.sessions.users*
   - *traffic.bandwith.users*
   - *traffic.bandwith.app_cats*

12 Select *Save* to save the current changes.

The following assumes that you are still editing the report. You will be configuring when the FortiGate unit generates the default report as well as including a table of contents.

To configure the report schedule and include a table of contents

1 On the page your in, select *Options*.
2 In the Report Options window, select *Daily* for *Schedule Type*.
3 Enter `08:30` in *Time*.
4 Verify that the check box is selected beside *Include Table of Contents*; if the check box is not selected, select it.
5 Select *OK*.
6 Select *Save* to save the current changes.
7 To generate the report immediately, select *Run*.

   The report is generated and appears in the Historical Reports list on the Historical Reports page.

The FortiGate unit generates the report at the scheduled time.

If you want to have an on-demand report, you must select *Demand* from the drop-down list in *Schedule Type*.

Configuring charts, datasets, themes and styles for a report

If you want to create a report from scratch, you must configure it within the CLI. The CLI contains default summary and themes, as well as default charts and datasets. All of these can be modified or created from scratch.The following explains how to configure these parts for a report.

This topic contains the following:

Configuring datasets

You must configure datasets because they are required when configuring a chart. You can use the default datasets that are available when configuring a chart. Datasets require knowledge of SQL because the logs are stored in an SQLite database. You can view the SQLite schema using the `get report database schema` CLI command syntax.

If you are creating a chart from scratch, you must create a dataset for that chart. The chart cannot be configured without a dataset.

Use the following to configure a dataset that will be applied to a chart.

```
config report dataset
  edit <report_dataset>
    set query <SQL_statement>
    config field
      edit <field_id>
        set displayname <string>
        set type {text | integer | date | ip}
      next
    end
  end
```

If you need more information about queries required for datasets, see "The SQLite log database" on page 633.

Configuring themes

When you are configuring a layout for a report, you can also add a theme. A theme is a group of settings that create the general style of a report. For example, the styles that are applied to the table of contents section of the report. Themes are configured only in the CLI.

You may want to configure your own styles for a theme, such as the type of alignment for the text. Styles are configured within the CLI, and you can also customize the default styles as well.

Use the following procedure to configure a theme for a report, which can then be applied to a report's layout.

To configure a theme for a report

1 Log in to the CLI.

2 Enter the following command syntax:

```
config report theme
  edit <theme_name>
    set column-count [ 1 | 2 | 3]
    set default-html-style <string>
    set default-pdf-style <string>
    set graph-chart-style <string>
    set heading1-style <string>
    set heading2-style <string>
    set heading3-style <string>
    set heading4-style <string>
    set hline-style <string>
    set image-style <string>
    set normal-text-style <string>
    set page-footer-style <string>
    set page-header-style <string>
    set page-orient {landscape | portrait}
    set page-style <string>
    set report-subtitle-style <string>
    set report-title-style <string>
    set table-chart-caption-style <string>
    set table-chart-even-row-style <string>
    set table-chart-head-style <string>
    set table-chart-odd-row-style <string>
```

```
    set table-chart-style <string>
    set toc-heading1-style <string>
    set toc-heading2-style <string>
    set toc-heading3-style <string>
    set toc-heading4-style <string>
    set toc-title-style <string>
end
```

3 To choose a style for any one of the above commands, except for `column-count` and `page-orient`, enter `?` to view the available choices.

4 To change the style of any one of the above commands, except for `column-count` and `page-orient`, go to "Configuring styles" on page 683.

Configuring styles

You can customize the default styles or create your own styles for reports. There are default styles and summary styles to choose from. Default styles use a default style scheme, and the summary styles are for summary reports that contain one or two pages with a small graph or table.

To customize an existing style

1 Log in to the CLI.

2 Enter the following command syntax:

```
config report style
  edit style <style_name>
```

For example `default.graph`.

3 To view a list of available styles, enter `?` after entering `edit`.

To create a new style

1 Log in to the CLI.

2 Enter the following command syntax:

```
config report style
  edit <new_style_name>
    set options {align | border | color | column | font | margin
       | padding | size | text }
    set align {center | justify | left | right}
    set bg-color {colour_name1 | color_name2 | color_name3 | …}
    set border-bottom <border width_pixels> <border_style_{solid
       | dotted | dashed}> <border_color>
    set border-left <border width_pixels> <border_style_{solid |
       dotted | dashed}> <border_color>
    set border-right <border width_pixels> <border_style_{solid
       | dotted | dashed}> <border_color>
    set border-top <border width_pixels> <border_style_{solid |
       dotted | dashed}> <border_color>
    set column-gap <pixels>
    set column-span {all |none}
    set fg-color <color>
    set font-family {Arial | Courier | Helvetica | Times |
       Verdana}
    set font-size {xx-small | x-small | small | medium | large |
       x-large | xx-large | <pixels>}
```

```
    set font-style {italic | normal}
    set font-weight {bold | normal}
    set height <pixels or percentage>
    set line-height <pixels or percentage>
    set margin-bottom <pixels>
    set margin-left <pixels>
    set margin-right <pixels>
    set margin-top <pixels>
    set padding-bottom <pixels>
    set padding-left <pixels>
    set padding-right <pixels>
    set padding-top <pixels>
    set width <pixels or percentage>
end
```

Example of a style for a theme

The following example shows how to configure a specific style that is then applied to a theme.

```
config report style
  edit style_1
    set options align color font margin text
    set align center
    set bg-color navy
    set fg-color white
    set font-family Verdana
    set font-size medium
    set font-weight bold
    set line-height 100
    set margin-bottom 20
    set margin-left 20
    set margin-right 30
    set margin-top 50
  end
config report theme
  edit theme_1
  set column-count 2
  set page-style style_1
  end
```

Configuring a report layout

After you have configured a theme and style, as well as your custom datasets and charts, you can then put them all together in a layout. Similar to the default FortiOS report's layout, you must specify the page orientation, footers and headers, as well as the style of these footers and headers.

A layout includes a scheduled time period so that the report will be generated at a specific time. For example, a weekly report is generated every Thursday at 4:00 p.m.

The report layout can also include email addresses of people that you want the generated report to be sent to. The generated report is immediately sent to the

To configure a report's layout

1 Log in to the CLI.

2 Enter the following to configure the layout:

```
config report layout
  edit <layout_name>
    set title <text>
    set cutoff-option {run-time | custom}
    set cutoff-time {time_str>
    set cache-time-out <seconds>
    set email-recipients <email_addr1, email_addr2, …>
    set email-send {enable | disable}
    set description <text>
    set format {html | pdf}
    set schedule-type {demand | once | daily | weekly}
    set time <hh:mm>
    set day {sunday | monday | tuesday | wednesday | thursday |
       friday | saturday}
    set style-theme <theme_name>
    set options {include-table-of-contents | auto-numbering-
       heading | view-chart-as-heading | show-html-navbar-
       before-heading1}
  config page
    set paper {A4 | letter}
    set column-break-before {heading1 | heading2 | heading3}
    set options {header-on-first-page | footer-on-first-page}
    set style <style_name>
  config body-item
    edit <item_id>
    set type {text | image | chart | misc}
    set description <text>
    set style <style_name>
    set text-component {heading1 | heading2 | heading3 | normal
       | text}
    set content <text>
    set img-src <text>
    set chart <chart_name>
    set chart-options {hide-title | include-no-data | show-
       caption}
    set parameter1 <value_str>
  end
end
```

Charts

Charts are used to display the log information in a clear and concise way using a graph. The information for charts is gathered from the log tables in the SQLite database.

When you need to find information about a default chart or a chart that was created from scratch you can use the `get` command in the following way.

```
config report chart
  edit <chart_name>
    get
```

The information that displays is similar to the following:

```
name: web.allowed-request.sites.user
policy: 0
type: graph
period: last7d
```

```
drill-down-chart: (null)
comments: (null)
dataset: web.allowed-request.sites.user
category: webfilter
favorite: no
graphy-type: bar
style: auto
dimension: 3D
  x-series
    caption: (null)
    databind: field(1)
    is-category: yes
    label-angle: 45-degree
    unit: (null)
  y-series
    caption: Requests
    databind: field(2)
    extra-y: disable
    group: (null)
    label-angle: horizontal
    unit: (null)
title: Top Allowed Web Sites for User by Request
legend: enable
```

This information provides what the time period of the chart is, the title that will display for that chart (in the example, title is `Top Allowed Web Sites for User by Request`), as well as the dataset that is included with the chart. The chart may also include a drill-down chart to be used in a HTML report, where you can view additional detailed information. This is the same drill-down feature that is available in most monitoring pages, such as in *Log&Report* > *Monitor* > *Logging Monitor*, where you select a bar on a specific day and view the activity of each log type that was recorded.

When you need to view information about a dataset, as well as what log table is used to gather that information, you can use the `get` command in the following way:

```
config report dataset
  edit <dataset_name>
    get
```

The information that displays is similar to the following:

```
name: appcrtl.Count.Bandwidth.Top10.Apps
policy: 0
query: select (timestampe-timestamp%3600) as hourstamp, (CASE
   WHEN app!='N/A' and app!=' ' then app ELSE service END) as
   appname, sum(sent+rcvd) as bandwidth from traffic_log where
   timestamp between ###start_time### and ###end_time### and
   (appname in (select (CASE WHEN app!='N/A' and app!='N/A' and
   app!=' ' then app END ELSE service END) as appname from
   traffic_log where timestamp between ###start_time### and
   ###end_time### group by appname order by sum(sent+rcvd) desc
   limit 10)) group by hourstamp, appname order by hourstamp
   desc field
```

In the example output, you can see that the log table used to gather the information is from the traffic log table indicated by the `from traffic_log` in the query statement.

Charts that are used in reports do not have “last24h” in the name, however, these charts are carried forward and are not usually used in FortiOS 4.0 MR3 and higher.

Adding charts to the layout

Charts are added to the report's layout using the `config body-item` command.

Before configuring a chart for a report, you may want to see the list of available default charts in the CLI, using the `config report chart` command. You can create your own chart; however, you must use either a default dataset or create your own dataset. SQL knowledge is required when configuring a dataset.

You should verify that the datasets you want to use are configured and available before configuring a chart because a chart cannot be configured without a dataset. For information about configure datasets, see "Configuring datasets" on page 681.

The following explains how to add a chart to a report layout.

To add a chart to a report layout

1 Log in to the CLI.

2 Enter the following to access the report layout:

```
config report layout
  edit <layout_name>
```

3 Enter the following to add the chart to the layout:

```
    config body-item
      edit 1
        set type chart
        set chart <chart_name>
        set chart-options {hide-title | include-no-data | show-
            caption}
      end
```

Configuring a chart

The following explains how to configure a chart from scratch.

To create a new chart

1 Log in to the CLI.

2 Enter the following to create a new chart:

```
config report chart
  edit <chart_name>
    set type {graph | table}
    set period {last24h | last7d}
    set drill-down-chart <name_drill_down_chart>
    set comments <text>
    set dataset <dataset_name>
    set category {app-crtl | attack | dlp | event | misc | spam
       | traffic | virus | vulnerability | webfilter}
    set favorite {yes | no}
    set graph-type {pie | flow | bar | line | none}
    set style {auto | manual}
    set title <title_chart>
    set legend {enable | disable}
  config x-series
      set caption <text>
      set databind <value_expression>
      set is-category {yes | no}
      set label-angle {45-degree | horizontal | vertical}
```

```
        set scale-format {HH-MM | MM-DD | YYYY | YYYY-MM | YYYY-
           MM-DD| YYYY-MM-DD HH | YYYY-MM-DD-HH-MM}
        set scale-number-of-step <scale_totalnum>
        set scale-origin {max | min}
        set scale-start <time&date>
        set scale-step <integer>
        set scale-type <datetime>
        set scale-unit {day | hour | minute | month | year}
        set unit <integer>
      end
    config y-series
        set caption <text>
        set databind <value_expression>
        set extra-y {enable | disable}
        set group <y-series_group>
        set label-angle {45-degree | horizontal | vertical}
        set unit <integer>
      end
    end
```

Importing images for the report

Images can be imported for use in reports. The supported images are JPEG, JPG and PNG.

To import images for the report

1. Go to *Log&Report* > *Report Access* > *Report*.
2. Select *Edit* on the Viewing default layout page.
3. In *Image*, drag the image icon to the page.

   The Graphic Chooser window appears.

All pages, except for the Table of Contents page, can import an image.

4. In the Graphic Chooser window, select *Upload*.
5. Locate the image file and then select *OK*.

Viewing reports

Generated reports are viewed from the Historical Reports page in *Log&Report* > *Report Access* > *Report*.

Historical Reports page

Displays each generated report. Reports are removed using the *Delete* icon. You can view either HTML reports or PDF reports directly from this page. A HTML report opens up in a separate window, while a PDF report opens within the Disk page.

Return to Layout	Select to return to the report layout page, Viewing default layout.

Delete	Removes one, multiple or all reports from the list. If you select the check box in the check box column, you can remove all reports from the list at one time.
Report File	The name of the report file, which includes the date and time. Note: To view a HTML report, select the name in this column. The HTML report appears in a separate window.
Started	The time when the report began generating. This format includes the date and is displayed in this type of format, yyyy-mm-dd hh:mm:ss. The hour is in the 24 hour format.
Finished	The time when the report stopped generating. This format includes the date and is displayed in this type of format, yyyy-mm-dd hh:mm:ss. The hour is in the 24 hour format.
Size (bytes)	The size of the report file, in bytes.
Other Formats	Displays PDF formatted generated reports. Select the format in this column to view the report in PDF.

Report example

The following is an example of a report created from within the CLI. The type of report is what is know as “a report created from scratch” because you are configuring the style, theme, layout and if applicable, the datasets for charts. In the following report, no datasets are configured.

Report for analyzing web activity on the FortiGate unit

Your manager wants to view the web activity on the network. The following example configures a report from scratch, and uses the existing web filter charts. This example also includes how to add email addresses and enable sending the report by email.

Configuring the style

The style of the web activity report must include the company’s font and image. The following procedures will create a style for:

- footers and headers
- the pages within the report
- cover page
- charts
- table of contents headings and title
- page headings

To configure the footers and headers

1 Log in to the CLI.

2 Enter the following to configure a style:

```
config report style
  edit web-footerheader
    set options align font
    set align center
    set font-size xx-small
```

```
    set font-family Arial
    set font-weight normal
    set font-style normal
next
```

To configure the pages

After entering next, enter the following for the margins and columns:

```
edit web-pages
    set options align margin column
    set align justify
    set margin-top 5
    set margin-bottom 5
    set margin-right 6
    set margin-left 7
    set column-gap 3
    set column-span all
next
```

To configure the table of contents headings and title

After entering next in the above procedure, enter the following to configure the table of contents headings and title

```
edit web-toc-title
  set options align font
  set font-family Arial
  set font-weight bold
  set font-style normal
  set font-size x-large
  set align center
next
  edit web-toc-heading1
    set options align font
    set font-family Arial
    set font-weight bold
    set font-size large
    set font-style normal
    set align left
  next
    edit web-toc-heading2
      set options align font
      set font-family Arial
      set font-size medium
      set font-style normal
      set font-weight bold
      set align left
    next
    edit web-toc-heading3
      set options align font
      set font-family Arial
      set font-size medium
      set font-style italic
      set font-weight bold
      set align left
  next
```

To configure the page headings

After entering next in the above procedure, enter the following to configure the page headings:

```
    edit web-page-heading1
      set options align font
        set font-family Arial
        set font-size large
        set font-style normal
        set font-weight bold
        set align left
      next
        edit web-page-heading2
          set options align font
          set font-family Arial
          set font-size medium
          set font-style normal
          set font-weight bold
        next
          edit web-page-heading3
            set options align font
            set font-family Arial
            set font-size medium
            set font-style italic
            set font-weight bold
          next
```

To configure the chart style

After entering next in the above procedure, enter the following to configure the style of the font and alignment of the chart:

```
  edit web-chart
    set options align font
    set font-family Arial
    set font-size small
    set font-style normal
    set font-weight bold
    set align left
  next
```

To configure the cover page

After entering next in the above procedure, enter the following to configure the style of the cover page of the report:

```
  edit web-cover
    set options align font
    set font-family Arial
    set font-size xx-large
    set font-style normal
    set font-weight bold
    set align center
  end
end
```

Configuring the theme

The theme applies the styles that were configured in the procedures in "Configuring styles" on page 683. The theme will then be applied to the report's layout.

To configure a theme

Enter the following to configure a theme:

```
config report theme
  edit web-theme
    set column-count 2
    set default-pdf-style web-cover
    set graph-chart-style web-chart
    set page-orient landscape
    set page-style web-pages
    set table-chart-style web-chart
    set toc-title-style web-toc-title
    set toc-heading1-style web-toc-heading1
    set toc-heading2-style web-toc-heading2
    set toc-heading3-style web-toc-heading3
    set heading1-style web-heading1
    set heading2-style web-heading2
    set heading3-style web-heading3
    set page-footer-style web-footerheader
    set page-header-style web-footerheader
    set report-title-style web-cover
  end
```

Uploading the company graphic for the report

You need to upload the company graphic for the report. You must use the web-based manager to upload the image to the FortiGate unit so that it can be used in the web activity report.

To upload the company graphic

1. Log in to the web-based manager.
2. Go to *Log&Report* > *Report Access* > *Cover Page*.
3. Select *Edit*.
4. In the Edit Section: Cover Page page, select and drag the image icon onto the page.

   The Graphic Chooser window appears.
5. In the Graphic Chooser window, select *Upload*.
6. Browse and locate the company's image file.

   The image file immediately uploads to the FortiGate unit.
7. Select the image and then select *OK* to save the image.
8. In the Edit Section: Cover Page, select *Save* to save the uploaded image.

Modifying the time period for the charts

The charts that will be used for the report must be modified to gather information over the past seven days. The charts that will be modified are:

- web-allowed-request.sites.user
- web.blocked-request.sites.user

- web.blocked-request.web_cats
- web.bandwidth.sites.user
- web.bandwidth.stream-sites.user
- web.bandwidth.stream-sites

To modify the time period for the charts

1 In the CLI, enter the following:

```
config report chart
```

2 Enter the following to modify the time period of each chart:

```
    edit web.allowed-request.sites.user
      set period last7d
    next
    edit web.blocked-request.sites.user
      set period last7d
    next
    edit web.blocked-requests.web_cats
      set period last7d
    next
    edit web.bandwidth.sites.
      set period last7d
    next
    edit web.bandwidth.stream-sites.user
      set period last7d
    next
    edit web.bandwidth.stream-sites
      set period last7d
    end
  end
end
```

Configuring the layout

The layout of the report includes who will be receiving the report by email, as well as style and when the report will be generated by the FortiGate unit.

To configure layout

1 Log into the CLI.

2 Enter the following to configure the layout:

```
config report layout
  edit web-activity-layout
    set cutoff-option custom
    set cutoff-time 04:50
    set day monday
    set description "Web activity report for the week of March
       7"
    set format pdf
    set options include-table-of-contents
    set style-theme web-theme
    set subtitle "Web Activity Report"
    set time 08:30
    set title "Web Activity Report for March 7"
    set email-send enable
```

```
  set email-recipients user1@example.com, user2@example.com
next
config body-item
  edit 1
    set type image
    set img-src image_company.jpg
  next
  edit 2
    set content “Web Activity: Blocked and Allowed Requested
       Web Sites”
    set style web-heading1
  next
  edit 3
    set content “The blocked and allowed web sites that were
       requested by users over the last seven days”
  next
  edit 4
    set type chart
    set chart web.allowed-request.sites.user
    set description “Allowed Web Sites Requested by Users”
    set style web-heading2
  next
  edit 5
    set type chart
    set chart web.blocked-request.sites.user
    set description “Blocked Web Sites Requested by User”
    set style web-heading2
  next
  edit 6
    set type chart
    set chart web.blocked-requests.web_cats
    set description “Blocked Web Sites Requested, per-Web
       Filter Category”
    set style web-heading2
  next
  edit 7
    set description “Web Bandwidth Activity”
    set style web-heading1
  next
  edit 8
    set content “The bandwidth that was used for web activity
       for the last seven days”
  next
  edit 9
    set type chart
    set chart web.bandwidth.sites.user
    set description “Bandwidth Used per User”
    set style web-heading2
  next
  edit 10
    set type chart
    set chart web.bandwidth.stream-sites.user
    set description “Bandwidth Used for Web Streaming per
       User”
```

```
      set style web-heading2
    next
    edit 11
      set type chart
      set chart web.bandwidth.stream-sites
      set description “Bandwidth Used for Web Streaming”
      set style web-heading2
    end
    config paage
      set options footer-on-first-page
      set paper letter
      set column-break-before heading1
    end
end
```

Chapter 5 Troubleshooting

•

This handbook chapter describes concepts of troubleshooting and solving issues that may occur with FortiGate units.

This FortiOS Handbook chapter contains the following chapters:

Life of a Packet explains the different layers and modules a packet goes through in FortiOS, including the order of operations.

Troubleshooting process walks you through best practice concepts of FortiOS troubleshooting.

Troubleshooting tools describes some of the basic commands and parts of FortiOS that can help you with troubleshooting.

Technical Support Organization Overview describes how Fortinet Support operates, what they will need from you if you contact them, and what you can expect in general.

Troubleshooting common issues walks you through how to troubleshoot some common issues you may have, and some more in-depth coverage of other issues.

Troubleshooting advanced walks through some more advanced features including traffic shaping, user logons, and VPN.

Troubleshooting ‘get’ commands provides a list of diagnostic commands that can help you troubleshoot your FortiOS unit.

Troubleshooting bootup and FSSO addresses potential problems your unit may have when booting up. Also covered is troubleshooting an FSSO installation. The format is an easy to follow step by step question and answer format.

Life of a Packet

Directed by security policies, a FortiGate unit screens network traffic from the IP layer up through the application layer of the TCP/IP stack. This chapter provides a general, high-level description of what happens to a packet as it travels through a FortiGate security system.

The FortiGate unit performs three types of security inspection:

- stateful inspection, that provides individual packet-based security within a basic session state
- flow-based inspection, that buffers packets and uses pattern matching to identify security threats
- proxy-based inspection, that reconstructs content passing through the FortiGate unit and inspects the content for security threats.

Each inspection component plays a role in the processing of a packet as it traverses the FortiGate unit en route to its destination. To understand these inspections is the first step to understanding the flow of the packet.

This section contains the following topics:

Stateful inspection

With stateful inspection, the FortiGate unit looks at the first packet of a session to make a security decision. Common fields inspected include TCP SYN and FIN flags to identity the start and end of a session, the source/destination IP, source/destination port and protocol. Other checks are also performed on the packed payload and sequence numbers to verify it as a valid communication and that the data is not corrupted or poorly formed.

What makes it stateful is that one or both ends must save information about the session history in order to communicate. In stateless communication, only independent requests and responses are used, that do not depend on previous data. For example, UDP is stateless by nature because it has no provision for reliability, ordering, or data integrity.

The FortiGate unit makes the decision to drop, pass or log a session based on what is found in the first packet of the session. If the FortiGate unit decides to drop or block the first packet of a session, then all subsequent packets in the same session are also dropped or blocked without being inspected. If the FortiGate unit accepts the first packet of a session, then all subsequent packets in the same session are also accepted without being inspected.

Connections over connectionless

A connection is established when two end points use a protocol to establish connection through use of various methods such as segment numbering to ensure data delivery, and handshaking to establish the initial connection. Connections can be stateful because they record information about the state of the connection. Persistent connections reduce request latency because the end points do not need to re-negotiate the connection multiple times, but instead just send the information without the extra overhead. By contrast, connectionless communication does not keep any information about the data being sent or the state. It is based on an autonomous response/reply that is independent of other responses/replies that may have gone before. One example of connectionless communication is IP.

Benefits of connections over connectionless include being able to split data up over multiple packets, the data allows for a best-effort approach, and once the connection is established subsequent packets are not required to contain the full addressing information which saves on bandwidth. Connections are often reliable network services since acknowledgements can be sent when data is recieved.

What is a session?

A session is established on an existing connection, for a defined period of time, using a determined type of communication or protocol. Sessions can have specific bandwidth , and time to live (TTL) parameters.

You can compare a session to a conversation. A session is established when one end point initiates a request by establishing a TCP connection on a particular port, the receiving end is listening on that port, and replies. You could telent to port 80 even though telnet normally uses port 23, because at this level, the application being used cannot be determined.

However, the strong points of sessions and stateful protocols can also be their weak points. Denial of service (DoS) attacks involve creating so many sessions that the connection state information tables are full and the unit will not accept additional sessions.

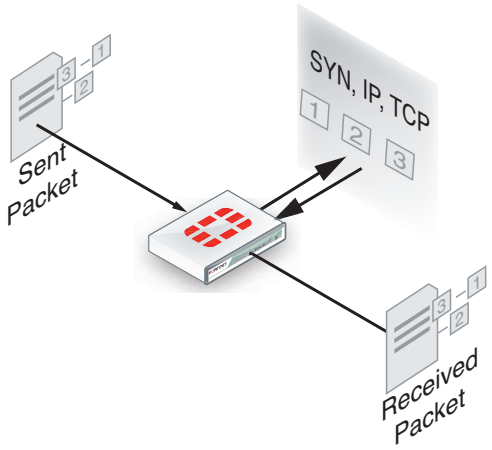
Differences between connections and sessions

In almost all cases, established sessions are stateful and all involve connections. However, some types of connections, such as UDP, are stateless, and are not sessions.

This means that not all traffic can be inspected by stateful inspection, because some of it is stateless. For example IP packets are stateless. Communications using HTTP are stateless, but HTTP often uses cookies to store persistent data in a way that approaches stateful.

Stateful inspection of sessions has the benefit of being able to apply the initial connection information to the packets that follow — the end points of the session will remain the same as will the protocol for example. That information can be examined for the first packet of the session and if it is malicious or not appropriate, the whole session an be dropped without committing significant resources.

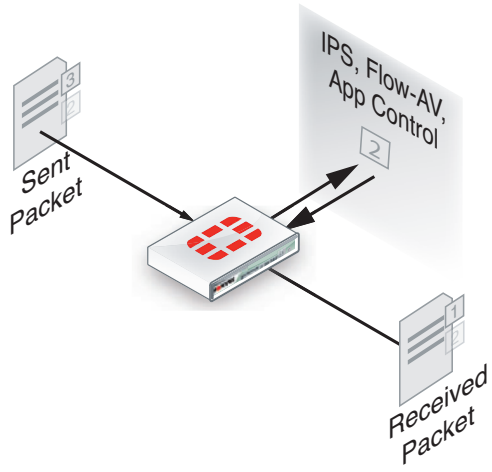
Figure 65: Stateful inspection of packets through the FortiGate unit



Flow inspection

With flow inspection, the FortiGate unit samples multiple packets in a session and multiple sessions, and uses a pattern matching engine to determine the kind of activity that the session is performing and to identify possible attacks or viruses. For example, if application control is operating, flow inspection can sample network traffic and identify the application that is generating the activity. Flow-based antivirus can sample network traffic and determine if the content of the traffic contains a virus, IPS can sample network traffic and determine if the traffic constitutes an attack. The security inspection occurs as the data is passing from its source to its destination. Flow inspection identifies and blocks security threats in real time as they are identified.

Figure 66: Flow inspection of packets through the FortiGate unit



Flow-based inspection typically requires less processing than proxy-based inspection, and therefore flow-based antivirus performance can be better than proxy-based antivirus performance. However, some threats can only be detected when a complete copy of the payload is obtained so, proxy-based inspection tends to be more accurate and complete than flow-based inspection.

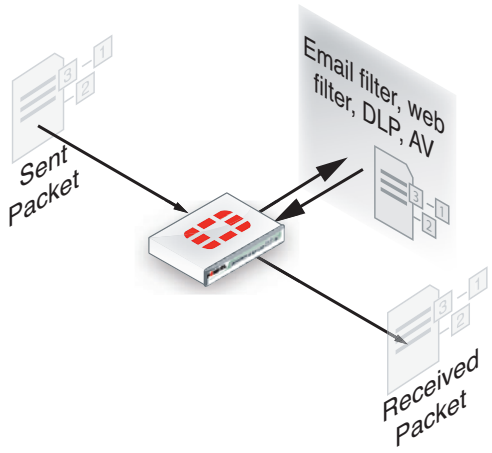
Proxy inspection

With flow inspection, the FortiGate unit will pass all the packets between the source and destination, and keeps a copy of the packets in its memory. It then uses a reconstruction engine to build the content of the original traffic. The security inspection occurs after the data has passed from its source to its destination.

Proxy inspection examines the content contained a content protocol session for security threats. Content protocols include the HTTP, FTP, and email protocols. Security threats can be found in files and other content downloaded using these protocols. With proxy inspection, the FortiGate unit downloads the entire payload of a content protocol session and re-constructs it. For example, proxy inspection can reconstruct an email message and its attachments. After a satisfactory inspection the FortiGate unit passes the content on to the client. If the proxy inspection detects a security threat in the content, the content is removed from the communication stream before the it reaches its destination. For example, if proxy inspection detects a virus in an email attachment, the attachment is removed from the email message before its sent to the client. Proxy inspection is the most thorough inspection of all, although it requires more processing power, and this may result in lower performance.

If you enable ICAP in a security policy, HTTP traffic intercepted by the policy is transferred to the ICAP servers in the ICAP profile added to the policy. The FortiGate unit is the surrogate, or “middle-man”, and carries the ICAP responses from the ICAP server to the ICAP client; the ICAP client then responds back, and the FortiGate unit determines the action that should be taken with these ICAP responses and requests.

Figure 67: Proxy inspection of packets through the FortiGate unit



Comparison of inspection layers

The three inspection methods each have their own strengths and weaknesses. The following table looks at all three methods side-by-side.

Table 50: Inspection methods comparison

Feature	Stateful	Flow	Proxy
Inspection unit per session	first packet	selected packets	complete content

Feature	Stateful	Flow	Proxy
Memory, CPU required	low	medium	high
Level of threat protection	good	better	best
Authentication	yes		
IPsec and SSL VPN	yes		
Antivirus protection		on some models	yes
Application control		yes	some
Delay in traffic			small
Reconstruct entire content			yes

FortiOS functions and security layers

Within these security inspection types, FortiOS functions map to different inspections. The table below outlines when actions are taken as a packet progresses through its life within a FortiGate unit.

Table 51: FortiOS security functions and security layers

Security Function	Stateful	Flow	Proxy
Firewall	ü		
IPsec VPN	ü		
Traffic Shaping	ü		
User Authentication	ü		
Management Traffic	ü		
SSL VPN	ü		
Intrusion Prevention		ü	
Flow-based Antivirus		ü	
Application Control		ü	
VoIP inspection			ü
Proxy Antivirus			ü
Email Filtering			ü
Web Filtering (Antispam)			ü
Data Leak Prevention			ü

Packet flow

After the FortiGate unit's external interface receives a packet, the packet proceeds through a number of steps on its way to the internal interface, traversing each of the inspection types, depending on the security policy and UTM profile configuration. The diagram in Figure 68 on page 704 is a high level view of the packet's journey.

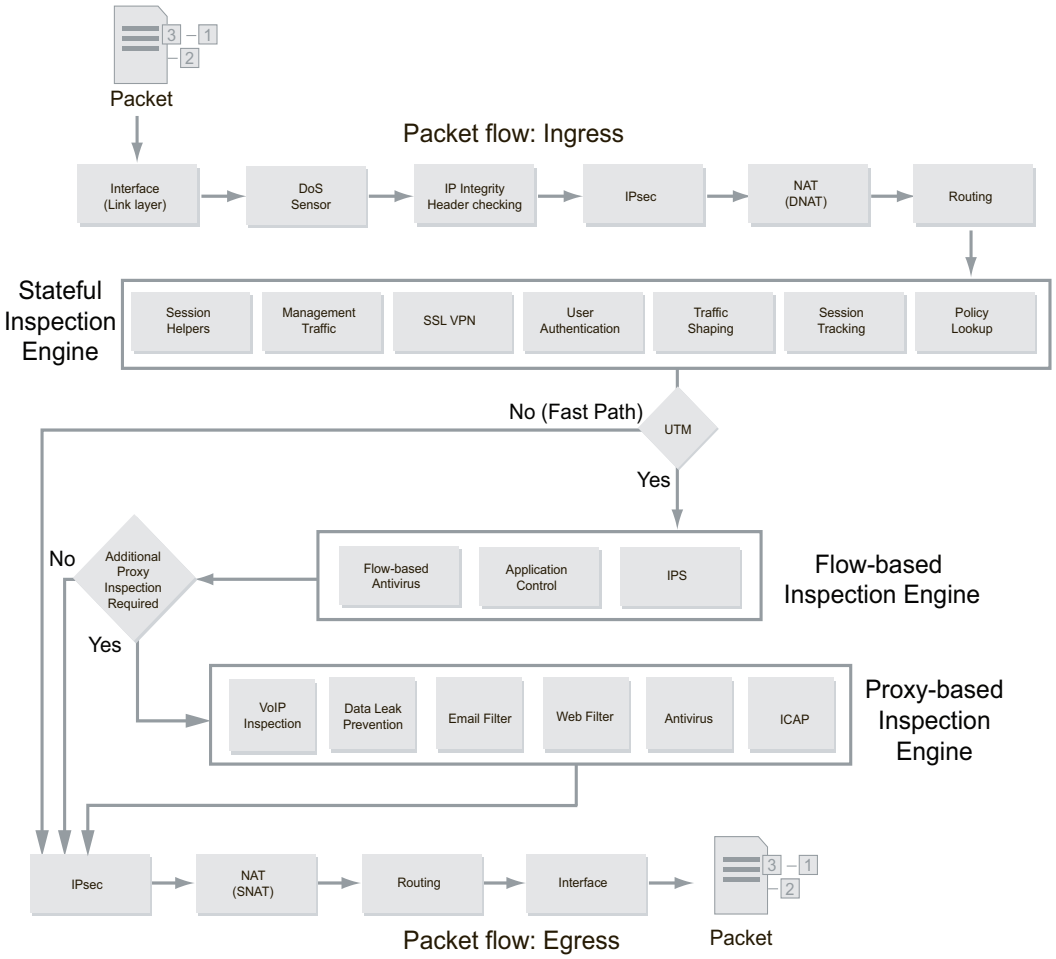
The description following is a high-level description of these steps as a packet enters the FortiGate unit towards its destination on the internal network. Similar steps occur for outbound traffic.

Packet inspection (Ingress)

In the diagram in Figure 68 on page 704, in the first set of steps (ingress), a number of header checks take place to ensure the packet is valid and contains the necessary information to reach its destination. This includes:

- Packet verification - during the IP integrity stage, verification is performed to ensure that the layer 4 protocol header is the correct length. If not, the packet is dropped.
- Session creation - the FortiGate unit attempts to create a session for the incoming data
- IP stack validation for routing - the firewall performs IP header length, version and checksum verifications in preparation for routing the packet.
- Verifications of IP options - the FortiGate unit validates the rouging information

Figure 68: Packet flow



Interface

Ingress packets are received by a FortiGate interface.The packet enters the system, and the interface network device driver passes the packet to the Denial of Service (DoS) sensors, if enabled, to determine whether this is a valid information request or not.

DoS sensor

DoS scans are handled very early in the life of the packet to determine whether the traffic is valid or is part of a DoS attack. Unlike signature-based IPS which inspects all the packets within a certain traffic flow, the DoS module inspects all traffic flows but only tracks packets that can be used for DoS attacks (for example TCP SYN packets), to ensure they are within the permitted parameters. Suspected DoS attacks are blocked, other packets are allowed.

IP integrity header checking

The FortiGate unit reads the packet headers to verify if the packet is a valid TCP, UDP, ICMP, SCTP or GRE packet. The only verification that is done at this step to ensure that the protocol header is the correct length. If it is, the packet is allowed to carry on to the next step. If not, the packet is dropped.

IPsec

If the packet is an IPsec packet, the IPsec engine attempts to decrypt it. The IPsec engine applies the correct encryption keys to the IPsec packet and sends the unencrypted packet to the next step. IPsec is bypassed when for non-IPsec traffic and for IPsec traffic that cannot be decrypted by the FortiGate unit.

Destination NAT (DNAT)

The FortiGate unit checks the NAT table and determines the destination IP address for the traffic. This step determines whether a route to the destination address actually exists.

For example, if a user's browser on the internal network at IP address 192.168.1.1 visited the web site www.example.com using NAT, after passing through the FortiGate unit the source IP address becomes NATed to the FortiGate unit external interface IP address. The destination address of the reply back from www.example.com is the IP address of the FortiGate unit internal interface. For this reply packet to be returned to the user, the destination IP address must be destination NATed to 192.168.1.1.

DNAT must take place before routing so that the FortiGate unit can route packets to the correct destination.

Routing

The routing step determines the outgoing interface to be used by the packet as it leaves the FortiGate unit. In the previous step, the FortiGate unit determined the real destination address, so it can now refer to its routing table and decide where the packet must go next.

Routing also distinguishes between local traffic and forwarded traffic and selects the source and destination interfaces used by the security policy engine to accept or deny the packet.

Policy lookup

The policy look up is where the FortiGate unit reviews the list of security policies which govern the flow of network traffic, from the first entry to the last, to find a match for the source and destination IP addresses and port numbers. The decision to accept or deny a packet, after being verified as a valid request within the stateful inspection, occurs here. A denied packet is discarded. An accepted packet will have further actions taken. If IPS is enabled, the packet will go to Flow-based inspection engine, otherwise it will go to the Proxy-based inspection engine.

If no other UTM options are enabled, then the session was only subject to stateful inspection. If the action is accept, the packet will go to Source NAT to be ready to leave the FortiGate unit.

Session tracking

Part of the stateful inspection engine, session tracking maintains session tables that maintain information about sessions that the stateful inspection module uses for maintaining sessions, NAT, and other session related functions.

User authentication

User authentication added to security policies is handled by the stateful inspection engine, which is why Firewall authentication is based on IP address. Authentication takes place after policy lookup selects a security policy that includes authentication. This is also known as identify-based policies. Authentication also takes place before UTM features are applied to the packet.

Management traffic

This local traffic is delivered to the FortiGate unit TCP/IP stack and includes communication with the web-based manager, the CLI, the FortiGuard network, log messages sent to FortiAnalyzer or a remote syslog server, and so on. Management traffic is processed by applications such as the web server which displays the FortiOS web-based manager, the SSH server for the CLI or the FortiGuard server to handle local FortiGuard database updates or FortiGuard Web Filtering URL lookups.

SSL VPN traffic

For local SSL VPN traffic, the internal packets are decrypted and are routed to a special interface. This interface is typically called ssl.root for decryption. Once decrypted, the packets go to policy lookup.

Session helpers

Some protocols include information in the packet body (or payload) that must be analyzed to successfully process sessions for this protocol. For example, the SIP VoIP protocol uses TCP control packets with a standard destination port to set up SIP calls. To successfully process SIP VoIP calls, FortiOS must be able to extract information from the body of the SIP packet and use this information to allow the voice-carrying packets through the firewall.

FortiOS uses session helpers to analyze the data in the packet bodies of some protocols and adjust the firewall to allow those protocols to send packets through the firewall.

Flow-based inspection engine

Flow-based inspection is responsible for IPS, application control, flow-based antivirus scanning and VoIP inspection. Packets are sent to flow-based inspection if the security policy that accepts the packets includes one or more of these UTM features.

Flow-based antivirus scanning is only available on some FortiGate models.

Once the packet has passed the flow-based engine, it can be sent to the proxy inspection engine or egress.

Proxy-based inspection engine

The proxy inspection engine is responsible for carrying out antivirus protection, email filtering (antispam), web filtering and data leak prevention. The proxy engine will process multiple packets to generate content before it is able to make a decision for a specific packet.

IPsec

If the packet is transmitted through an IPsec tunnel, it is at this stage the encryption and required encapsulation is performed. For non-IPsec traffic (TCP/UDP) this step is bypassed.

Source NAT (SNAT)

When preparing the packet to leave the FortiGate unit, it needs to NAT the source address of the packet to the external interface IP address of the FortiGate unit. For example, a packet from a user at 192.168.1.1 accessing www.example.com is now using a valid external IP address as its source address.

Routing

The final routing step determines the outgoing interface to be used by the packet as it leaves the FortiGate unit.

Egress

Upon completion of the scanning at the IP level, the packet exits the FortiGate unit.

Example 1: client/server connection

The following example illustrates the flow of a packet of a client/web server connection with authentication and FortiGuard URL and antivirus filtering.

This example includes the following steps:

Initiating connection from client to web server

1. Client sends packet to web server.
2. Packet intercepted by FortiGate unit interface.

   2.1 Link level CRC and packet size checking. If the size is correct, the packet continues, otherwise it is dropped.
3. DoS sensor - checks are done to ensure the sender is valid and not attempting a denial of service attack.
4. IP integrity header checking, verifying the IP header length, version and checksums.
5. Next hop route
6. Policy lookup
7. User authentication
8. Proxy inspection

   8.1 Web Filtering

   8.2 FortiGuard Web Filtering URL lookup

   8.3 Antivirus scanning
9. Source NAT

10 Routing

11 Interface transmission to network

12 Packet forwarded to web server

Response from web server

1 Web Server sends response packet to client.

2 Packet intercepted by FortiGate unit interface

2.1 Link level CRC and packet size checking.

3 IP integrity header checking.

4 DoS sensor.

5 Proxy inspection

5.1 Antivirus scanning.

6 Source NAT.

7 Stateful Policy Engine

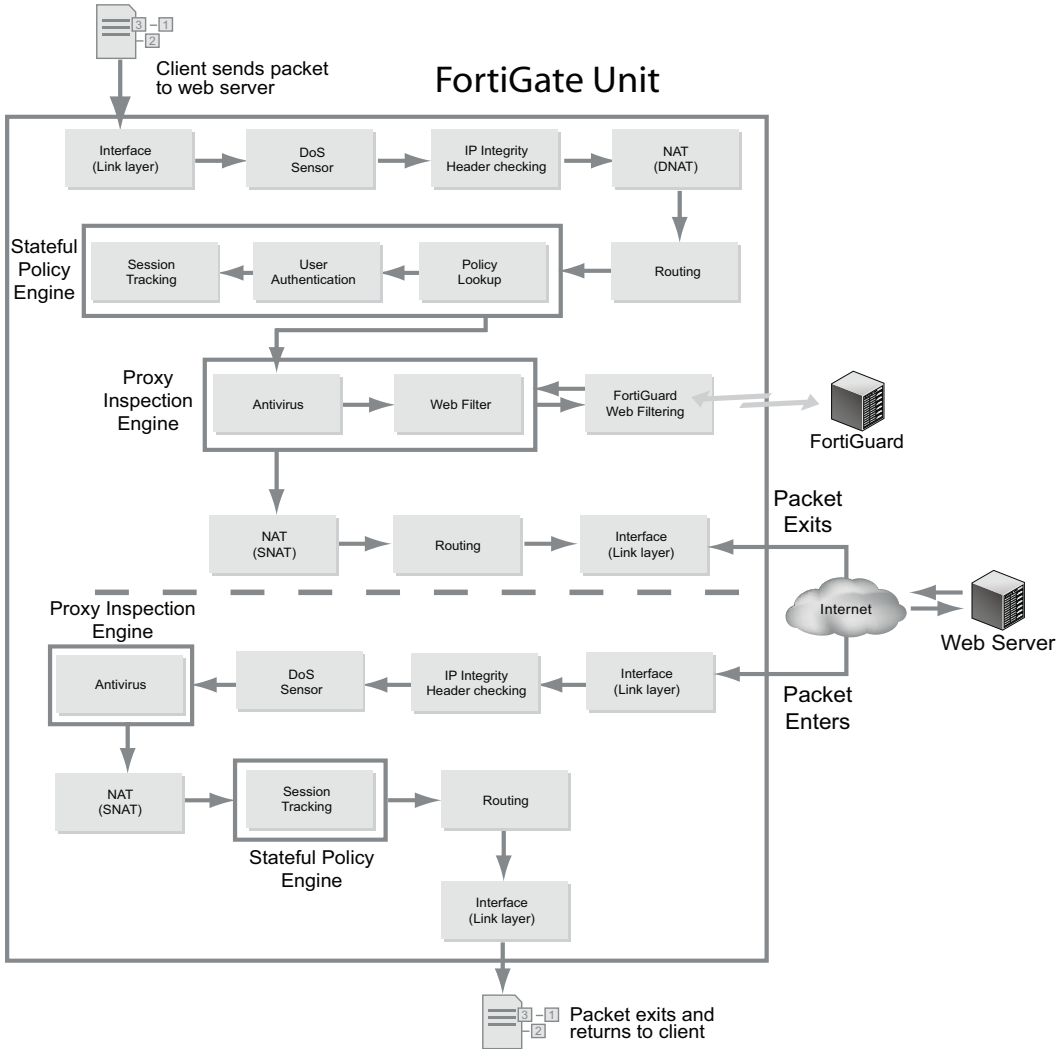
7.1 Session Tracking

8 Next hop route

9 Interface transmission to network

10 Packet returns to client

Figure 69: Client/server connection



Example 2: Routing table update

The following example illustrates the flow of a packet when there is a routing table update. As this is low level, there is no UTM involved.This example includes the following steps:

1. FortiGate unit receives routing update packet
2. Packet intercepted by FortiGate unit interface

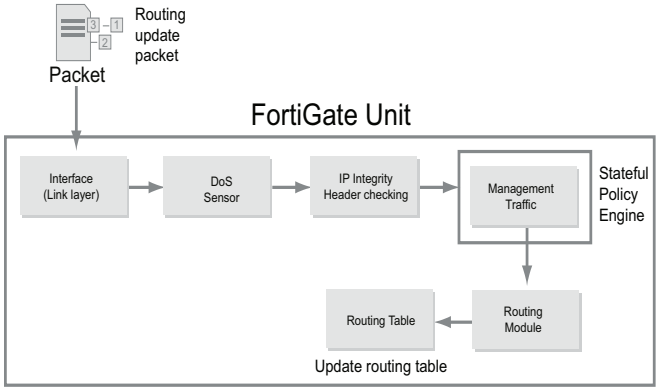
   2.1 Link level CRC and packet size checking. If the size is correct, the packet continues, otherwise it is dropped.
3. DoS sensor - checks are done to ensure the sender is valid and not attempting a denial of service attack.
4. IP integrity header checking, verifying the IP header length, version and checksums.
5. Stateful policy engine

   5.1 Management traffic (local traffic)

6 Routing module

6.1 Update routing table

Figure 70: Routing table update



Example 3: Dialup IPsec VPN with application control

This example includes the following steps:

1 FortiGate unit receives IPsec packet from Internet

2 Packet intercepted by FortiGate unit interface

2.1 Link level CRC and packet size checking. If the size is correct, the packet continues, otherwise it is dropped.

3 DoS sensor - checks are done to ensure the sender is valid and not attempting a denial of service attack.

4 IP integrity header checking, verifying the IP header length, version and checksums.

5 IPsec

5.1 Determines that packet matched IPsec phase 1 configuration

5.2 Unencrypted packet

6 Next hop route

7 Stateful policy engine

7.1 Session tracking

8 Flow inspection engine

8.1 IPS

8.2 Application control

9 Source NAT

10 Routing

11 Interface transmission to network

12 Packet forwarded to internal server

Response from server

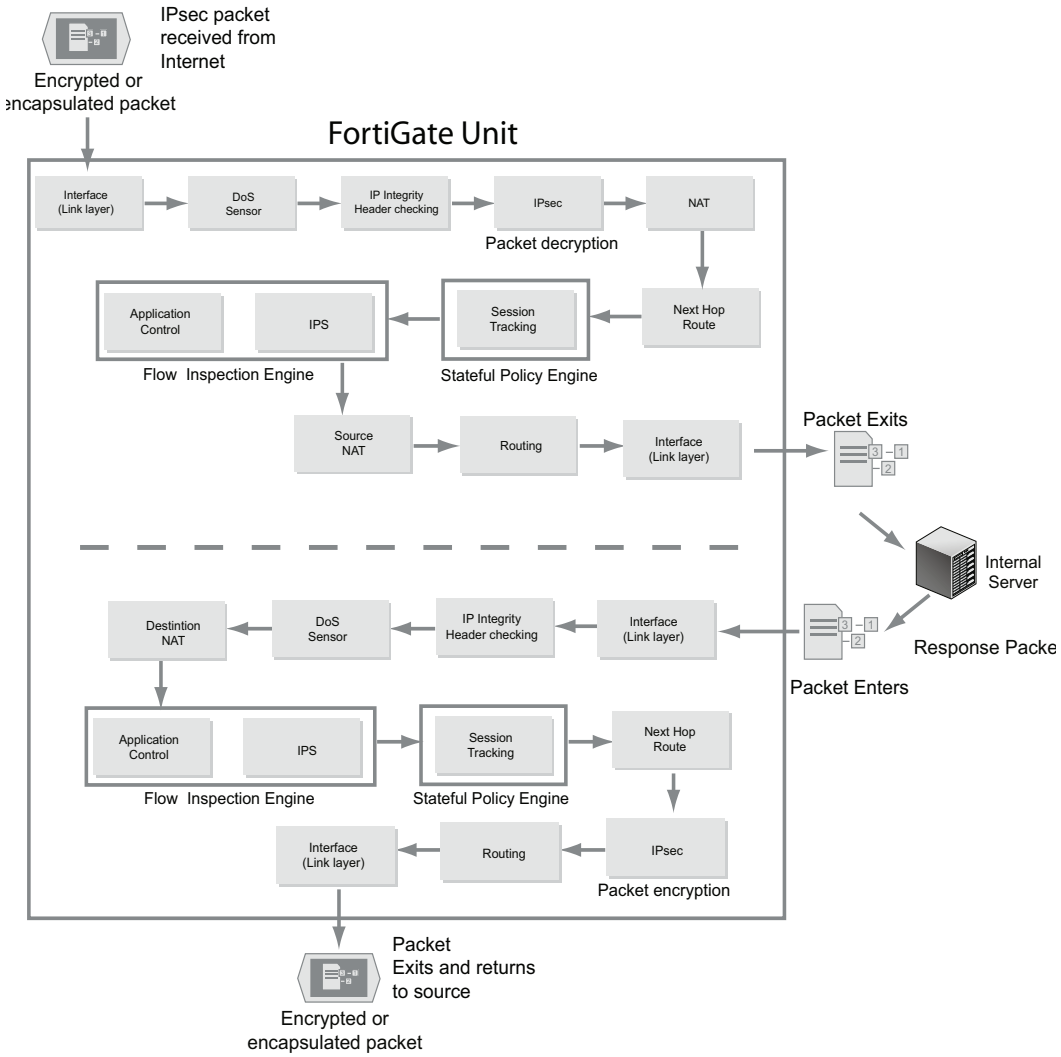
1 Server sends response packet

2 Packet intercepted by FortiGate unit interface

2.1 Link level CRC and packet size checking

3 IP integrity header checking.
4 DoS sensor
5 Flow inspection engine
  5.1 IPS
  5.2 Application control
6 Stateful policy engine
  6.1 Session tracking
7 Next hop route
8 IPsec
  8.1 Encrypts packet
9 Routing
10 Interface transmission to network
11 Encrypted Packet returns to internet

Figure 71: Dialup IPsec with application control



Troubleshooting process

Before you begin troubleshooting anything but the most minor issues, you need to prepare. Doing so will shorten the time to solve your issue. This section helps to explain how you prepare before troubleshooting, as well as creating a troubleshooting plan and contacting support.

This section contains the following topics:

Establish a baseline

FortiGate units operate at all layers of the OSI model. For this reason troubleshooting problems can become complex. If you establish a normal operation parameters, or baseline, for your system before the problem occurs it will help reduce the complexity when you are troubleshooting.

Many of the guiding questions in the following sections are some form of comparing the current problem situation to normal operation on your FortiGate unit. For this reason it is a best practice that you know what your normal operating status is, and have a record of it you can refer to. This can easily be accomplished by monitoring the system performance with logs, SNMP tools, or regularly running information gathering commands and saving the output. This regular operation data will show trends, and enable you to see when changes happen and there may be a problem.

Back up your FortiOS configuration on a regular basis. This is a good practice for everyday as well as when troubleshooting. You can restore the backed up configuration when needed and save the time and effort of re-creating it from the factory default settings.

Some basic commands you can use to obtain normal operating data for your system:

`get system status`	Displays versions of firmware and FortiGuard engines, and other system information.
`diagnose firewall statistic show`	Displays the amount of network traffic broken down into categories such as email, VoIP, TCP, UDP, IM, Gaming, P2P, and Streaming.
`get router info routing-table all`	Displays all the routes in the routing table including their type, source, and other useful data.
`get ips session`	Displays memory used and max available to IPS as well and counts.
`get webfilter ftgd-statistics`	Displays list of FortiGuard related counts of status, errors, and other data.

These commands are just a sample. Feel free to include any extra information gathering commands that apply to your system. For example if you have active VPN connections, record information about them using the `get vpn *` series of commands. See "Troubleshooting 'get' commands" on page 805.

For an extensive snapshot of your system, run the CLI command used by TAC to gather extensive information about a system — `exec tac report`. It runs many diagnose commands that are for specific configurations. This means no matter what features you are using, this command will record their current state. Then if you need to perform troubleshooting at a later date, you can run the same command again and compare the differences to quickly locate suspicious output you can investigate. See "exec tac report" on page 806.

Define the problem

Before starting to troubleshooting a problem, ask the following questions:

- What is the problem?

  Do not assume that the problem is being experienced is the actual problem. First determine that the problem does not lie elsewhere before starting to troubleshoot the FortiGate device.
- Has it ever worked before?

  If the device never worked from the first day, you may not want to spend time troubleshooting something that could well be defective. See "Troubleshooting bootup and FSSO" on page 871.
- Can the problem be reproduced at will or is it intermittent?

  If the problem is intermittent, it may be dependent on system load. Also an intermittent problem can be very difficult to troubleshoot due to the difficulty reproducing the issue.
- What has changed?

  Do not assume that nothing has changed in the network. Use the FortiGate event log to see if any configuration changes were made. The change could be in the operating environment, for example, a gradual increase in load as more sites are forwarded through the firewall.

  If something has changed, see what the affect is if the change is rolled back.
- Determine the scope of the problem - after you have isolated the problem what applications, users, devices, and operating systems does it effect?

Before you can solve a problem, you need to understand it. Often this step can be the longest in this process.

Ask questions such as:

- What is not working? Be specific.
- Is there more than one thing not working?
- Is it partly working? If so, what parts are working?
- Is it a connectivity issue for the whole device, or is there an application that isn't reaching the Internet?

Be as specific as possible with your answers, even if it takes awhile to find the answers.

These questions will help you define the problem. Once the problem is defined, you can search for a solution and then create a plan on how to solve it.

Gathering Facts

Fact gathering is an important part of defining the problem. Record the following information as it affects your problem:

- Where did the problem occur?
- When did the problem occur and to whom?
- What components are involved?
- What is the affected application?
- Can the problem be traced using a packet sniffer?
- Can the problem be traced in the session table?
- Can log files be obtained that indicate a failure has occurred?

Answers to these questions will help you narrow down the problem, and what you have to check during your troubleshooting. The more things you can eliminate, the fewer things you need to check during troubleshooting. For this reason, be as specific and accurate as you can while gathering facts.

Search for a solution

An administrator can save time and effort during the troubleshooting process by first checking if the issue has been experienced before. Several self-help resources are available to provide valuable information about FortiOS technical issues, including:

Technical Documentation

Installation Guides, Administration Guides, Quick Start Guides, and other technical documents are available online at the following URL:

http://docs.fortinet.com

Release Notes

Issues that are uncovered after the technical documentation has been published will often be listed in the Release Notes that accompany the device.

Knowledge Base

The Fortinet Knowledge Base provides access to a variety of articles, white papers, and other documentation providing technical insight into a range of Fortinet products. The Knowledge Base is available online at the following URL:

http://kb.fortinet.com

Fortinet Technical Discussion Forums

An online technical forums allow administrators to contribute to discussions about issues related to their Fortinet products. Searching the forum can help the administrator identify if an issue has been experienced by another user. The support forums can be accessed at the following URL:

http://support.fortinet.com/forum

Fortinet Training Services Online Campus

The Fortinet Training Services Online Campus hosts a collection of tutorials and training materials which can be used to increase knowledge of the Fortinet products.

http://campus.training.fortinet.com

Create a troubleshooting plan

Once you have defined the problem, and searched for a solution you can create a plan to solve that problem. Even if your search didn't find a solution to your problem you may have found some additional things to check to further define your problem.

The plan should list all the possible causes of the problem that you can think of, and how to test for each possible cause.

Your troubleshooting plan will act as a checklist so that you know what you have tried and what is left to check. This is important to have if more than one person will be doing the troubleshooting. Without a written plan, people will become easily confused and steps will be skipped. Also if you have to hand over the problem to someone else, providing them with a detailed list of what data has been gathered and what solutions have been already tried demonstrates a good level of professionalism.

Be ready to add to your plan as needed. After you are part way through, you may discover that you forgot some tests or a test you performed discovered new information. This is normal.

Also if you contact support, they will require information about your problem as well as what you have already tried to fix the problem. This should all be part of your plan.

Providing Supporting Elements

If the Fortinet Technology Assistance Center (TAC) needs to be contacted to help you with your issue, be prepared to provide the following information:

- The firmware build version (use the `get system status` command)
- A network topology diagram
- A recent configuration file
- Optionally, a recent debug log
- Tell the support team what troubleshooting steps have already been performed and the results.

Do not provide the output from exec tac report unless Support requests it. The output from that command is very large and is not required in many cases.

For additional information about contacting Fortinet Customer Support, see "Technical Support Organization Overview" on page 751.

All of this is your troubleshooting plan.

Obtain any required additional equipment

You may require additional networking equipment, computers, or other equipment to test your solution.

Normally network administrators have additional networking equipment available either to loan you, or a lab where you can bring the FortiGate unit to test.

If you do not have access to equipment, check for shareware applications that can perform the same task. Often there are software solutions when hardware is too expensive.

Ensure you have administrator level access to required equipment

Before troubleshooting your FortiGate unit, you will need administrator access to the equipment. If you are a client on a FortiGate unit with virtual domains enabled, often you can troubleshoot within your own VDOM. However, you should inform your FortiGate unit's super admin that you will be doing troubleshooting.

Also, you may need access to other networking equipment such as switches, routers, and servers to help you test. If you do not normally have access to this equipment, contact your network administrator for assistance.

Contact Fortinet customer support for assistance

You have defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point if the problem has not been solved, its time to contact Fortinet Customer Support for assistance.

For more information, see "Technical Support Organization Overview" on page 751.

Troubleshooting tools

FortiOS provides a number of tools that help with troubleshooting both hardware and software issues. These tools include diagnostics and ports; ports are used when you need to understand the traffic coming in or going out on a specific port, for example, UDP 53, which is used by the FortiGate unit for DNS lookup and RBL lookup.

This section also contains information about troubleshooting FortiGuard issues.

This section contains the following topics:

FortiOS diagnostics

A collection of diagnostic commands are available in FortiOS for troubleshooting and performance monitoring. While some of these areas have web-based manager areas, all have relevant CLI commands with the main commands listed in this section.

Within the CLI commands, the two main groups of diagnostic commands are `get` and `diagnose` commands. Both commands display information about system resources, connections, and settings that enable you to locate and fix problems, or to monitor system performance.

The one exception to these two main groups it the command `exec tac report`. This is an execute command that runs an exhaustive series of diagnostic commands. It runs commands that are only needed if you are using certain features like HA, VPN tunnels, or a modem. The report takes a few minutes to complete due to the amount of output generated. If you have your CLI output logged to a file, you can run this command to familiarize yourself with the CLI commands involved. Do not include the output from this command in FortiCare tickets unless it is specifically requested. See "exec tac report" on page 806.

When you call Fortinet Customer Support, you will be asked to provide information about your unit and its current state using the output from these CLI commands.

This topic includes diagnostics commands to help with:

- Flow trace
- Packet sniffing and packet capture
- Debug command
- Other commands

Additional diagnostic commands are covered in "Troubleshooting 'get' commands" on page 805, and commands related to specific features are covered in the chapter for that specific feature. For example in-depth diagnostics for dynamic routing are covered in the dynamic routing chapter.

Check date and time

The system date and time are important for FortiGuard services, when logging events, and when sending alerts. The wrong time will make the log entries confusing and difficult to use.

Use Network Time Protocol (NTP) to set the date and time if possible. This is an automatic method that does not require manual intervention. However, you must ensure the port is allowed through the firewalls on your network. FortiToken synchronization requires NTP in many situations.

How to check the date and time - web-based manager

1 **Go to *System Information* > *System Time* on the dashboard.**

Follow *System* > *Dashboard* > *Status* to the dashboard. Then in the System Information widget, check the date and time. Alternately, you can check the date and time using the CLI commands `execute date` and `execute time`.

2 **If required, select *Change* to adjust the date and time settings.**

To make changes to the date and time, select Change. Then you can set the time zone, date and time, and select NTP usage. In the CLI, use the following commands to change the date and time:

```
config system global
  set timezone (use ? to get a list of IDs and descriptions of
     their timezone)
  set
config system ntp
  config ntpserver
  edit 1
    set server "ntp1.fortinet.net"
  next
  edit 2
    set server "ntp2.fortinet.net"
  next
end
set ntpsync enable
set syncinterval 60
end
```

Resource usage

Each program running on a computer has one or more processes associated with it. For example if you open a Telnet program, it will have an associated telnet process. The same is true in FortiOS. All the processes have to share the system resources in FortiOS including memory and CPU.

Monitor the CPU/memory usage of internal processes using the following command:

```
get system performance top <delay> <max_lines>
```

The data listed includes the name of the daemon, the process ID, whether the process is sleeping or running, the CPU percentage being used, and the memory percentage being used. See "Check CPU and memory resources" on page 772.

How to troubleshoot high memory usage

FortiOS has limited system resources such as memory. All the processes running, share that memory. Depending on their workload each process will use more or less as needed, usually more in high traffic situations. If some processes use all the available memory, other processes will have no memory available and not be able to function.

When high memory usage happens, you may experience services that appear to freeze up and connections are lost or new connections are refused.

If you are seeing high memory usage in the system resources widget, it could mean that the unit is dealing with high traffic volume, which may be causing the problem, or it could be when the unit is dealing with connection pool limits affecting a single proxy. If the unit is receiving large volumes of traffic on a specific proxy, it is possible that the unit will exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, problems may occur.

Use the following CLI command, which uses the antivirus failopen feature. Setting it to idledrop will drop connections based on the clients that have the most connections open. This helps to determine the behavior of the FortiGate antivirus system if it becomes overloaded in high traffic.

```
config system global
  set av_failopen idledrop
end
```

How to troubleshoot high CPU usage

FortiOS has many features. If many of them are used at the same time, it can quickly use up all the CPU resources. When this happens, you will experience connection related problems stemming from the FortiOS unit trying to manage its workload by refusing new connections, or even more aggressive methods.

Some examples of features that are CPU intensive are VPN high level encryption, having all traffic undergo all possible scanning, logging all traffic, and packets, and dashboard widgets that frequently update their data.

1 **Determine how high the CPU usage is currently.**

There are two main ways to do this. The easiest is to go to System > Dashboard and look at the resource monitor. This is a dial gauge that displays a percentage use for the CPU. If its at the red-line, you should take action. The other method is to use the Dashboard CLI widget to enter `diag sys top`.

Sample output:

```
Run Time: 13 days, 13 hours and 58 minutes
0U, 0S, 98I; 123T, 25F, 32KF
newcli   903     R       0.5       5.5
```

```
sshd      901      S        0.5       4.0
```

Where the codes displayed on the second output line mean the following:

- `U` is % of user space applications using CPU. In the example, `0U` means 0% of the user space applications are using CPU.
- `S` is % of system processes (or kernel processes) using CPU. In the example, `0S` means 0% of the system processes are using the CPU.
- `I` is % of idle CPU. In the example, `98I` means the CPU is 98% idle.
- `T` is the total FortiOS system memory in Mb. In the example, `123T` means there are 123 Mb of system memory.
- `F` is free memory in Mb. In the example, `25F` means there is 25 Mb of free memory.
- `KF` is the total shared memory pages used. In the example, `32KF` means the system is using 32 shared memory pages.

Each additional line of the command output displays information for each of the processes running on the FortiGate unit. For example, the third line of the output is:

```
newcli    903      R        0.5       5.5
```

Where:

- `newcli` is the process name. Other process names can include `ipsengine`, `sshd`, `cmdbsrv`, `httpsd`, `scanunitd`, and `miglogd`.
- `903` is the process ID. The process ID can be any number.
- `R` is the current state of the process. The process state can be:
- `R` running
- `S` sleep
- `Z` zombie
- `D` disk sleep.
- `0.5` is the amount of CPU that the process is using. CPU usage can range from 0.0 for a process that is sleeping to higher values for a process that is taking a lot of CPU time.
- `5.5` is the amount of memory that the process is using. Memory usage can range from 0.1 to 5.5 and higher.

Enter the following single-key commands when `diagnose sys top` is running:

- Press `q` to quit and return to the normal CLI prompt.
- Press `p` to sort the processes by the amount of CPU that the processes are using.
- Press `m` to sort the processes by the amount of memory that the processes are using.

2 **Determine what features are using most of the CPU resources.**

There is a command in the CLI to let you see the top few processes currently running that use the most CPU resources. The CLI command get system performance top outputs a table of information. You are interested in the second most right column — CPU usage by percentage. If the top few entries are using most of the CPU, note which processes they are and investigate those features to try and reduce their CPU load. Some examples of processes you will see are

- ipsengine — the IPS engine that scans traffic for instrusions
- scanunitd — antivirus scanner
- httpsd — secure HTTP
- iked — internet key exchange (IKE) in use with IPsec VPN tunnels
- newcli — active whenever you are accessing the CLI
- sshd — there are active secure socket connections
- cmdbsrv — the command database server application

Go to the features that are at the top of the list and look for evidence of them overusing the CPU. Generally the monitor for a feature is a good place to start.

3 **Check for unnecessary CPU "wasters".**

These are some best practises that will reduce your CPU usage, even if you are not experiencing high CPU usage. Note that if you require a feature this section tell you to turn off, ignore it.

- Use hardware acceleration wherever possible to offload tasks from the CPU. Offloading tasks such as encryption frees up the CPU for other tasks.
- Avoid the use of GUI widgets that require computing cycles, such as the Top Sessions widget. These widgets are constantly polling the system for their information which uses CPU and other resources.
- Schedule antivirus, IPS, and firmware updates during off peak hours. Usually these don't consume CPU resources but they can disrupt normal operation.
- Check the log levels and which events are being logged. This is the severity of the messages that are recorded. Consider going up one level to reduce the amount of logging. Also if there are events you do not need to monitor, remove them from the list.
- Log to disk instead of memory. Logging to memory quickly uses up resources. Logging to local disk is fast and doesn't take much CPU.
- If the disk is almost full, transfer logs or data off the disk to free up space. When a disk is almost full it consumes a lot of resources to find the free space and organize the files.
- If you have packet logging enabled, consider disabling it. When its enabled it records every packet that comes through that policy.
- Halt all sniffers and traces.
- Ensure you are not scanning traffic twice. If traffic enters the FortiGate unit on one interface, goes out another, and then comes back in again that traffic does not need to be rescanned. Doing so is a waste of resources. However, ensure that traffic truly is being scanned once.
- Reduce the session timers to close unused sessions faster. To do this in the CLI enter the following commands and values. These values reduce the values from defaults. Note that `tcp-timewait` has 10 seconds added by the system by default.

```
config system global
  set tcp-halfclose-timer 30
  set tcp-halfopen-timer 30
  set tcp-timewait-timer 0 set udp-idle-timer 60
end
```

- Remove dns-udp firewall session helper (number 14) if not used.
- Do not enable “nice to have” features.

4 **When CPU usage is under control, use SNMP to monitor CPU usage. Alternately, use logging to record CPU and memory usage every 5 minutes.**

Once things are back to normal, you should set up a warning system to alert you of future CPU overusage. A common method to do this is with SNMP. SNMP monitors many values on the FortiOS and allows you to set high water marks that will generate events. You run an application on your computer to watch for and record these events. Go to *System* > *Config* > *SNMP* to enable and configure an SNMP community. If this method is too complicated, you can use logging to record CPU usage every 5 minutes. However this method will not alert you to problems; it will just record them as they happen.

Proxy operation

Monitor proxy operations using the following command:

```
diag test application <application> <option>
```

The `<application>` value can include the following:

`ftpd` ftp proxy

`http` http proxy

`im` im proxy

`imap`i map proxy

`ipsengine` ips sensor

`ipsmonitor` ips monitor

`pop3` pop3 proxy

`smtp` smtp proxy

`urlfilter` urlfilter daemon

The `<option>` value for use with this command can include:

`1` Dump Memory Usage

`2` Drop all connections

`4` Display connection state *

`44` Display info per connection *

`444` Display connections per state *

`5` Toggle AV Bypass mode

`6` Toggle Print Stat mode every ~40 seconds

`7` Toggle Backlog Drop

`8` Clear stats

`88` Toggle statistic recording - stats cleared

`9` Toggle Accounting info for display

`99` Restart proxy

These commands, except for the ones identified with an "*", should only be used under the guidance of Fortinet Support.

Hardware NIC

Monitor hardware network operations using the following command:

```
diag hardware deviceinfo nic <interface>
```

The information displayed by this command is important as errors at the interface are indicative of data link or physical layer issues which may impact the performance of the FortiGate unit.

The following is sample output when `<interface>` = `internal`:

```
System_Device_Name  port5
Current_HWaddr      00:09:0f:68:35:60
Permanent_HWaddr    00:09:0f:68:35:60
Link                up
Speed               100
Duplex              full
[……]
Rx_Packets=5685708
Tx_Packets=4107073
Rx_Bytes=617908014
Tx_Bytes=1269751248
Rx_Errors=0
Tx_Errors=0
Rx_Dropped=0
Tx_Dropped=0
[…..]
```

Hardware troubleshooting

The `diag hardware deviceinfo nic` command displays a list of hardware related error names and values. The following table explains the items in the list and their meanings.

Table 52: Possible hardware errors and meanings

Field	Definition
Rx_Errors = rx error count	Bad frame was marked as error by PHY.
Rx_CRC_Errors + Rx_Length_Errors - Rx_Align_Errors	This error is only valid in 10/100M mode.
Rx_Dropped or Rx_No_Buffer_Count	Running out of buffer space.

Table 52: Possible hardware errors and meanings

Field	Definition
Rx_Missed_Errors	Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count). Only valid in 1000M mode, whichis marked by PHY.
Tx_Errors = Tx_Aborted_Errors	ECOL (Excessive Collisions Count). Only valid in half-duplex mode.
Tx_Window_Errors	LATECOL (Late Collisions Count). Late collisions are collisions that occur after 64-byte time into the transmission of the packet while working in 10 to100Mb/s data rate and 512-byte timeinto the transmission of the packet while working in the 1000Mb/s data rate. This register only increments if transmits are enabled and the device is in half-duplex mode.
Rx_Dropped	See Rx_Errors.
Tx_Dropped	Not defined.
Collisions	Total number of collisions experienced by the transmitter. Valid in half-duplex mode.
Rx_Length_Errors	Transmission length error.
Rx_Over_Errors	Not defined.
Rx_CRC_Errors	Frame CRC error.
Rx_Frame_Errors	Same as Rx_Align_Errors. This error is only valid in 10/100M mode.
Rx_FIFO_Errors	Same as Rx_Missed_Errors - a missed packet count.
Tx_Aborted_Errors	See Tx_Errors.
Tx_Carrier_Errors	The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register is not valid in internal SerDes 1 mode (TBI mode for the 82544GC/EI) and is only valid when the Ethernet controller is operating at full duplex.
Tx_FIFO_Errors	Not defined.
Tx_Heartbeat_Errors	Not defined.
Tx_Window_Errors	See LATECOL.
Tx_Single_Collision_Frames	Counts the number of times that a successfully transmitted packed encountered a single collision. The value only increments if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Multiple_Collision_Frames	A Multiple Collision Count which counts the number of times that a transmit encountered more than one collision but less than 16. The value only increments if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Deferred	Counts defer events. A defer event occurs when the transmitter cannot immediately send a packet due to the medium being busy because another device is transmitting, the IPG timer has not expired, half-duplex deferral events are occurring, XOFF frames are being received, or the link is not up. This register only increments if transmits are enabled. This counter does not increment for streaming transmits that are deferred due to TX IPG.
Rx_Frame_Too_Longs	The Rx frame is over size.

Table 52: Possible hardware errors and meanings

Field	Definition
Rx_Frame_Too_Shorts	The Rx frame is too short.
Rx_Align_Errors	This error is only valid in 10/100M mode.
Symbol Error Count	Counts the number of symbol errors between reads - SYMERRS. The count increases for every bad symbol received, whether or not a packet is currently being received and whether or not the link is up. This register only increments in internal SerDes mode.

The counters displayed depend on the type of the NIC interface. Please see the following website for more information:
`http://kc.forticare.com/default.asp?id=1979&Lang=1&SID=`

Conserve mode

The FortiOS antivirus and IPS systems operate in one of two modes, depending on the available shared memory. If the shared memory utilization is below a defined upper threshold, the system is in non-conserve mode. If shared memory usage goes above this threshold, the system enters conserve mode and remains in this state until the shared memory usage drops below a second threshold, slightly lower than the original. These thresholds are non-configurable; the threshold above which the system enters conserve mode is 80 percent, the system will not go back to non-conserve mode until the shared memory usage goes below 70 percent.

When does it happen

Conserve mode occurs under high usage and traffic conditions. It is expected to be a temporary condition that is self-correcting when bursty traffic subsides. When it occurs, users will not be able to open any new sessions until the old ones are closed. This means they will not be able to open new web browser pages, download new files, or other activities over the network. It is possible that communications sessions such as VoIP calls will be cutoff.

When in conserve mode, any new sessions are ignored (no SYN-ACK from the FortiGate unit) or passed without being scanned.

The following is sample output from the event log when entering conserve mode.

```
66 2008-04-16 14:01:31 critical The system has entered system
  conserve mode
```

Antivirus failopen

Antivirus failopen is a safeguard feature that determines the behavior of the FortiGate unit antivirus system if it becomes overloaded in high traffic.

When does it happen

When there is high network traffic volume, it may cause low memory situations or it may limit the connection pool for a single proxy. If a FortiGate unit is receiving large volumes of traffic on a specific proxy (such as iked, the IPsec vpn IKE proxy), it is possible that the unit will exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, problems may occur. The connection pool is a reserved number of connections that a proxy has available to use. This is intended to reserve connections so no single proxy can consume all the resources.

The feature is configurable only though the CLI.

```
config system global
  set av_failopen {off|one-shot|pass |idledrop}
end
```

`av-failopen-session` controls the behavior when the proxy connection pool is exhausted. Again in this case, the FortiGate unit does not send the SYN-ACK. Failopen is only available on FortiGate models 300A and higher. On other lower FortiGate models, the failopen action is configured to pass.

The `set av-failopen` command has the following four options:

- off

  If the FortiGate unit enters conserve mode, the antivirus system will stop accepting new AV sessions but will continue to process current active sessions.

- one-shot

  If the FortiGate unit enters conserve mode, all subsequent connections bypass the antivirus system but current active sessions will continue to be processed. One-shot is similar to pass but will not automatically turn off once the condition causing av-failopen has stopped.

- idledrop

  When configured in this mode, the antivirus failopen mechanism will drop connections based on the clients that have the most open connections.

- pass

  Pass becomes the default setting when the `av-failopen-session` command has been run. If the system enters conserve mode, connections bypass the antivirus system until the system enters non-conserve mode again. Current active sessions will continue to be processed.

The one-shot and pass options do not content filter traffic. Therefore, the data stream could contain malicious content.

Traffic trace

Traffic tracing allows a specific packet stream to be followed. This is useful to confirm packets are taking the route you expected on your network.

View the characteristics of a traffic session though specific security policies using:

```
diag sys session
```

Trace per-packet operations for flow tracing using:

```
diag debug flow
```

Trace per-Ethernet frame using:

```
diag sniffer packet
```

Session table

A session is a communication channel between two devices or applications across the network. Sessions enable FortiOS to inspect and act on a sequential group of packets in a session all together instead of inspecting each packet individually. Each of these sessions has an entry in the session table that includes important information about the session.

Use as a tool

Session tables are useful troubleshooting tools because they allow you to verify connections that you expect to see open. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer, on port 80, to the IP for the Fortinet website. Another troubleshooting method is if there are too many sessions for FortiOS to process, you can examine the session table for evidence why this is happening.

The FortiGate session table can be viewed from either the CLI or the web-based manager. The most useful troubleshooting data comes from the CLI. The session table in web-based manager also provides some useful summary information, particularly the current policy number that the session is using.

Web-based manager session information

In the web-based manager there are actually two places to view session information — the policy session monitor, and the dashboard Top Sessions Widget.

Top Sessions widget

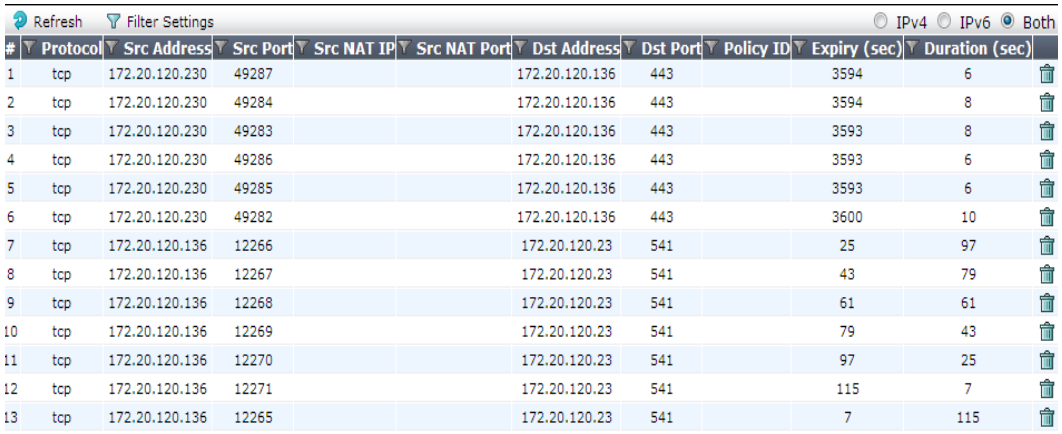
In Web Config, click *Add Content* and select *Top Sessions*. In the *Top Sessions* pane, click the *Details* link. (If there are not enough entries in the session table, try browsing to a different web site and re-examine the table.) The *Policy ID* shows which security policy matches the session. The sessions that do not have a *Policy ID* entry originate from the FortiGate device

Session monitor

The session monitor is the session table. It lists the protocol used, source and destination addresses, source and destination ports, what policy ID was matched (if any), how long until the session expires, and how long it has been established.

If there is no policy ID listed in the session entry, the traffic originated from the FortiGate unit. Otherwise all sessions must match a security policy to pass through the FortiGate unit.

As there are potentially many sessions active at one time, there are different methods you can use to filter unimportant sessions out of your search. The easiest filter is to display only IPv4 or IPv6 sessions. By default both are displayed. For this option, you must have IPv6 displayed (to enable go to *System* > *Admin* > *Settings*).



Refresh Filter Settings IPv4 IPv6 Both

#	Protocol	Src Address	Src Port	Src NAT IP	Src NAT Port	Dst Address	Dst Port	Policy ID	Expiry (sec)	Duration (sec)
1	tcp	172.20.120.230	49287			172.20.120.136	443		3594	6
2	tcp	172.20.120.230	49284			172.20.120.136	443		3594	8
3	tcp	172.20.120.230	49283			172.20.120.136	443		3593	8
4	tcp	172.20.120.230	49286			172.20.120.136	443		3593	6
5	tcp	172.20.120.230	49285			172.20.120.136	443		3593	6
6	tcp	172.20.120.230	49282			172.20.120.136	443		3600	10
7	tcp	172.20.120.136	12266			172.20.120.23	541		25	97
8	tcp	172.20.120.136	12267			172.20.120.23	541		43	79
9	tcp	172.20.120.136	12268			172.20.120.23	541		61	61
10	tcp	172.20.120.136	12269			172.20.120.23	541		79	43
11	tcp	172.20.120.136	12270			172.20.120.23	541		97	25
12	tcp	172.20.120.136	12271			172.20.120.23	541		115	7
13	tcp	172.20.120.136	12265			172.20.120.23	541		7	115

How to find which security policy a specific connection is using

Every program and device on your network must have a communication channel, or session, open to pass information. The FortiGate unit manages these sessions with its many features from traffic shaping, to antivirus scanning, and even blocking known bad web sites. Each session has an entry in the session table. In the web , you can use the Session Monitor or Top Session widget to view session information.

You may want to find information for a specific session, say a secure web browser session, for troubleshooting. For example if that web browser session is not working properly, you can check the session table to ensure the session is still active, and that it is going to the proper address. It can also tell you the security policy number it matches, so you can check what is happening in that policy.

1 **Know your connection information.**

You need to be able to identify the session you want. For this you need the source IP address (usually your computer), the destination IP address if you have it, and the port number which is determined by the program being used. Some commons ports are:

- port 80 (HTTP for web browsing),
- port 22 (SSH used for secure login and file transfers)
- port 23 (telnet for a text connection)
- port 443 (HTTPS for secure web browsing

2 **Find your session and policy ID.**

Follow *Policy* > *Monitor* > *Session Monitor* to the session table monitor. Find your session by finding your source IP address, destination IP address if you have it, and port number. The policy ID is listed after the destination information. If the list of sessions is very long, you can filter the list to make it easier to find your session.

3 **When there are many sessions, use a filter to help you find your session.**

If there are multiple pages of sessions it is difficult to find a single session. To help you in your search you can use a filter to block out sessions that you don't want. Select the filter icon next to Src Address. In the window that pops up, enter your source IP address and select Apply. Now only sessions that originate from your IP address will be displayed in the session table. If the list is still too long, you can do the same for the Src port. That will make it easy to find your session and the security policy ID. When you are finished remember to clear the filters.

CLI session information

The session table output from the CLI (`diag sys session list`) is very verbose. Even on a system with a small amount of traffic, displaying the session table will generate a large amount of output. For this reason, filters are used to display only the session data of interest.

You can filter a column in the web-based manager by clicking the funnel icon on the column heading or from the CLI by creating a filter.

An entry is placed in the session table for each traffic session passing through a security policy. The following command will list the information for a session in the table:

```
diag sys session list
```

For extended information about all aspects of sessions, see "get system session-info full-stat" on page 842.

Sample Output:

```
FGT# diag sys session list
```

```
session info: proto=6 proto_state=05 expire=89 timeout=3600
  flags=00000000 av_idx=0 use=3
bandwidth=204800/sec    guaranteed_bandwidth=102400/sec
  traffic=332/sec prio=0  logtype=session ha_id=0 hakey=4450
tunnel=/
state=log shape may_dirty
statistic(bytes/packets/err): org=3408/38/0 reply=3888/31/0
  tuples=2
orgin->sink: org pre->post, reply pre->post oif=3/5
  gwy=192.168.11.254/10.0.5.100
hook=post dir=org act=snat 10.0.5.100:1251-
  >192.168.11.254:22(192.168.11.105:1251)
hook=pre dir=reply act=dnat 192.168.11.254:22-
  >192.168.11.105:1251(10.0.5.100:1251)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 domain_info=0 auth_info=0 ftgd_info=0 ids=0x0 vd=0
  serial=00007c33 tos=ff/ff
```

Since output can be verbose, the filter option allows specific information to be displayed, for example:

```
diag sys session filter <option>
```

The `<option>` values available include the following:

`clear`	clear session filter
`dport`	destination port
`dst`	destination IP address
`negate`	inverse filter
`policy`	policy ID
`proto`	protocol number
`sport`	source port
`src`	source IP address
`vd`	index of virtual domain. -1 matches all

Even though UDP is a sessionless protocol, the FortiGate unit still keeps track of the following two different states:

- UDP reply not seen with a value of 0
- UDP reply seen with a value of 1

The following illustrates FW session states from the session table:

State	Meaning
log	Session is being logged.
local	Session is originated from or destined for local stack.
ext	Session is created by a firewall session helper.

State	Meaning
may_dirty	Session is created by a policy. For example, the session for `ftp control channel` will have this state but `ftp data channel` will not. This is also seen when NAT is enabled.
ndr	Session will be checked by IPS signature.
nds	Session will be checked by IPS anomaly.
br	Session is being bridged (TP) mode.

Firewall session setup rate

The number of sessions that can be established in a set period of time is useful information. A session is an end-to-end TCP/IP connection for communication with a limited lifespan. If you record the setup rate during normal operation, when you experience problems you have that setup rate with the current number to see if its very different. While this will not solve your problems, it can be a useful step to help you define your problem.

A reduced firewall session setup rate could be the result of a number of things from a lack of system resources on the FortiGate unit, to reaching the limit of your session count for your VDOM.

To view your session setup rate - web-based manager

1 Got to *System* > *Dashboard* > *Dashboard*.

2 Maximize the *Top Sessions* widget.

3 Read the *New Sessions per Second* value displayed at the bottom of the widget.

If the *Top Sessions* widget is not visible on your dashboard, go to the + *Widget* button at the top of the window. When a window pops up, select *Top Sessions* for it to be added to the dashboard.

To view your session setup rate method 1- CLI

```
FGT# get sys performance status
CPU states: 0% user 0% system 0% nice 100% idle
Memory states: 10% used
Average network usage: 0 kbps in 1 minute, 0 kbps in 10 minutes,
13 kbps in 30 minutes
Average sessions: 31 sessions in 1 minute, 30 sessions in 10
minutes, 31 sessions in 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 44 days, 18 hours, 42 minutes
```

The information you are looking for is the Average sessions section, highlighted in the above output. In this example you can see there were 31 sessions in 1 minute, or an average of 0.5 sessions per second. The values for 10 minutes and 30 minutes allow you to take a longer average for a more reliable value if your FortiGate unit is working at maximum capacity. The smallest FortiGate unit can have 1 000 sessions established per second across the unit.

Remember that session setup rate is a global command. If you have multiple VDOMs configured with many sessions in each one, the session setup rate per VDOM will be slower than if there were no VDOMs configured.

Finding object dependencies

An administrator may not be permitted to delete a configuration object if there are other configuration objects that depend on it. This command identifies other objects which depend on or *make reference to* the configuration object in question. If an error is displayed that an object is in use and cannot be deleted, this command can help identify the source of the problem.

Another use is if you have a virtual interface with objects that depend on it, you need to find and remove those dependencies before you delete that interface.

CLI method

When running multiple VDOMs, this command is run in the Global configuration only and it searches for the named object both in the Global and VDOM configuration most recently used:

```
diag sys checkused <path.object.mkey>
```

For example, to verify which objects are referred to in a security policy with an ID of 1, enter the command as follows:

```
diag sys checkused firewall.policy.policyid 1
```

To check what is referred to by interface `port1`, enter the following command:

```
diag sys checkused system.interface.name port1
```

To show all the dependencies for an interface, enter the command as follows:

```
diag sys checkused system.interface.name <interface name>
```

Sample Output:

```
entry used by table firewall.address:name '10.98.23.23_host'
entry used by table firewall.address:name 'NAS'
entry used by table firewall.address:name 'all'
entry used by table firewall.address:name 'fortinet.com'
entry used by table firewall.vip:name 'TORRENT_10.0.0.70:6883'
entry used by table firewall.policy:policyid '21'
entry used by table firewall.policy:policyid '14'
entry used by table firewall.policy:policyid '19'
```

In this example, the interface has dependent objects, including four address objects, one VIP, and three security policies.

Web-based manager method

In the web-based manager, the object dependencies for an interface can be easily checked and removed.

To remove interface object dependencies - web-based manager

1 Go to *System* > *Interface*.

The number in the *Ref.* column is the number of objects that refer to this interface.

2 Select the number in the *Ref.* column for the desired interface.

A Window listing the dependencies will appear.

3 Use these detailed entries to locate and remove object references to this interface.

The trash can icon will change from gray when all object dependencies have been removed.

4 Remove the interface by selecting the check box for the interface, and select *Delete*.

Flow trace

To trace the flow of packets through the FortiGate unit, use the following command:

```
diag debug flow trace start
```

Follow packet flow by setting a flow filter using this command:

```
diag debug flow filter <option>
```

Filtering options include the following:

`addr`	IP address
`clear`	clear filter
`daddr`	destination IP address
`dport`	destination port
`negate`	inverse filter
`port`	port
`proto`	protocol number
`saddr`	source IP address
`sport`	source port
`vd`	index of virtual domain, -1 matches all

Enable the output to be displayed to the CLI console using the following command:

```
diag debug flow show console
```

`diag debug flow` output is recorded as event log messages and are sent to a FortiAnalyzer unit if connected. ***Do not let this command run longer than necessary since it generates significant amounts of data***.

Start flow monitoring with a specific number of packets using this command:

```
diag debug flow trace start <N>
```

Stop flow tracing at any time using:

```
diag debug flow trace stop
```

The following is an example of the flow trace for the device at the following IP address: `203.160.224.97`

```
diag debug enable
diag debug flow filter addr 203.160.224.97
diag debug flow show console enable
diag debug flow show function-name enable
diag debug flow trace start 100
```

Flow trace output example - HTTP

Connect to the web site at the following address to observe the debug flow trace. The display may vary slightly:

```
http://www.fortinet.com
```

Comment: SYN packet received:

```
id=20085 trace_id=209 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

SYN sent and a new session is allocated:

```
id=20085 trace_id=209 func=resolve_ip_tuple line=2799
msg="allocate a new session-00000e90"
```

Lookup for next-hop gateway address:

```
id=20085 trace_id=209 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.11.254 via port6"
```

Source NAT, lookup next available port:

```
id=20085 trace_id=209 func=get_new_addr line=1219
msg="find SNAT: IP-192.168.11.59, port-31925"
direction"
```

Matched security policy. Check to see which policy this session matches:

```
id=20085 trace_id=209 func=fw_forward_handler line=317
msg="Allowed by Policy-3: SNAT"
```

Apply source NAT:

```
id=20085 trace_id=209 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

SYN ACK received:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6, 203.160.224.97:80-
>192.168.11.59:31925) from port6."
```

Found existing session ID. Identified as the reply direction:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, reply
```

```
direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=210 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Lookup for next-hop gateway address for reply traffic:

```
id=20085 trace_id=210 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.3.221 via port5"
```

ACK received:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, original
direction"
```

Apply source NAT:

```
id=20085 trace_id=211 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from client:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
original direction"
```

Apply source NAT:

```
id=20085 trace_id=212 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from server:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
203.160.224.97:80->192.168.11.59:31925) from port6."
```

Match existing session in reply direction:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=213 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Flow trace output example - IPsec (policy-based)

```
id=20085 trace_id=1 msg="vd-root received a packet(proto=1,
  10.72.55.240:1->10.71.55.10:8) from internal."
id=20085 trace_id=1 msg="allocate a new session-00001cd3"
id=20085 trace_id=1 msg="find a route: gw-66.236.56.230 via

  original direction"
id=20085 trace_id=2 msg="enter IPsec ="encrypted, and send to
  15.215.225.22 with source 66.236.56.226" tunnel-RemotePhase1"
id=20085 trace_id=2 msgid=20085 trace_id=2 msg="send to
  66.236.56.230 via intf-wan1"
```

Packet sniffing and packet capture

FortiOS devices can sniff packets using commands in the CLI or capture packets using the web-based manager. The differences between the two methods are not large.

Packet sniffing in the CLI is well suited for spot checking traffic from the CLI, but if you have complex filters to enter it can be a lot of work to enter them each time. You can also save the sniffing output; however, you must log to a file and then analyze the file later by hand.

Packet capture in the web-based manager makes it easy to set up multiple filters at once and just run one or two as you need them. You also have controls to start and stop capturing as you wish. Packet capture output is downloaded to your local computer as a *.pcap file which requires a third party application to read the file, such as Wireshark. This method is useful to send Fortinet support information to help resolve an issue.

Features	Packet sniffing	Packet capture
Command location	CLI	web-based manager
Third party software required	puTTY to log plaintext output	Wireshark to read *.pcap files
Read output in plain text file	yes	no
Read output as *.pcap file using Wireshark	no	yes
Easily configure single quick and simple filter	yes	no

Features	Packet sniffing	Packet capture
Record packet interface	yes	no
Configure complex sniffer filters on multiple interface	no	yes
sniff IPv6	hard	easy
sniff non-IP packets	no	yes
Filter packets by protocol and/or port	easy	easy
Filter packets by source and/or destination address	easy	easy

Packet sniffing

Before you start sniffing packets on the CLI, you should be prepared to capture the output to a file — there can be huge amounts of data that you will not be able to see without saving it to a file. One method is to use a terminal program like puTTY to connect to the FortiGate unit's CLI. Then once the packet sniffing count is reached you can end the session and analyze the output in the file.

Details within packets passing through particular interfaces can be displayed using the packet sniffer with the following command:

```
diag sniffer packet <interface> <filter> <verbose> <count>
```

The `<interface>` value is required, with the rest being optional. If not included the default values will be `"none" 4 0` .

For example the simplest valid sniffer command would be:

```
diag sniffer packet any
```

The `<interface>` value can be any physical or virtual interface name. Use *any* to sniff packets on all interfaces.

The `<filter>` value limits the display of packets using filters, including Berkeley Packet Filtering (BPF) syntax. The `<filter>` value must be enclosed in quotes.

```
'[[src|dst] host <host_name_or_IP1>] [[src|dst] host
   <host_name_or_IP2>] [[arp|ip|ip6|gre|esp|udp|tcp] [port_no]]
   [[arp|ip|ip6|gre|esp|udp|tcp] [port_no]]'
```

If a second host is specified in the filter, only the traffic between the two hosts will be displayed. Optionally, you can use logical OR to match only one of the hosts, or match one of multiple protocols or ports. When defining a port, there are up to two parts — protocol and port number.

For example, to display UDP 1812 traffic or TCP 8080 traffic, use the following:

```
'udp port 1812 or tcp port 8080'
```

To display all IP traffic that has a source of 192.168.1.2 and a destination of 192.168.2.3:

```
'ip src host 192.168.1.2 and dst host 192.168.2.3'
```

The `<verbose>` option allows different levels of information to be displayed. The verbose levels include:

`1` Print header of packets

2 Print header and data from the IP header of the packets

3 Print header and data from the Ethernet header of the packets

4 Print header of packets with interface name

5 Print header and data from ip of packets with interface name

6 Print header and data from ethernet of packets with interface name

The `<count>` value indicates the number of packets to sniff before stopping. If this variable is not included, or is set to zero, the sniffer will run until you manually halt it with Ctrl-C.

Packet capture

FortiOS 4.0 MR3 Patch 2 introduced packet capture to the web-based manager. To configure packet capture filters, go to *System* > *Config* > *Advanced*.

When you add a packet capture filter, enter the following information and select *OK*.

Interface	Select the interface to sniff from the dropdown menu. You must select one interface. You cannot change the interface without deleting the filter and creating a new one, unlike the other fields.
Max Packets to Capture	Enter the number of packets to capture before the filter stops. This number cannot be zero. You can halt the capturing before this number is reached.
Source Address	Enter the source address as an IP address and netmask. This field cannot be empty and it cannot be a hostname. To capture traffic from all source addresses enter 0.0.0.0/0.0.0.0.
Source Port(s)	Enter one or more ports to capture on the source interface. Separate multiple ports with commas. Enter a range using a dash without spaces, for example 88-90.
Destination Address	Enter the destination address as an IP address and netmask. This field cannot be empty and it cannot be a hostname. To capture traffic from all destination addresses enter 0.0.0.0/0.0.0.0.
Destination Port(s)	Enter one or more ports to capture on the source interface. Separate multiple ports with commas. Enter a range using a dash without spaces, for example 88-90.
Protocol	Select a protocol to capture from the drop down list. Or select ALL from the list to capture all protcols.

Interface	Select the interface to sniff from the dropdown menu. You must select one interface. You cannot change the interface without deleting the filter and creating a new one, unlike the other fields.
Include IPv6 packets	Select this option if you are troubleshooting IPv6 networking, or if your network uses IPv6. Otherwise, leave it disabled.
Capture Non-IP packets	The protocols available in the list are all IP based except for ICMP (ping). To capture non-IP based packets select this feature. Some examples of non-IP packets include IPsec, IGMP, ARP, and as mentioned ICMP.

If you select a filter and go back to edit it, you have the added option of starting and stopping packet capture in the edit window, or downloading the captured packets. You can also see the filter status and the number of packets captured.

You can also select the filter and select *Start* to start capturing packets. While the filter is running, you will see the number of captured packets increasing until it reaches the max packet count or you select *Stop*. While the filter is running you cannot download the output file.

When the packet capture is complete, you can select *Download* to send the packet capture filter captured packets to your local computer as a *.pcap file. To read this file format, you will need to use Wireshark or a similar third party application. Using this tool you will have extensive analytics available to you and the full contents of the packets that were captured.

FA2 and NP2 based interfaces

Many Fortinet products contain network processors. Some of these products contain FortiAccel (FA2) network processors while others contain NP2 network processors. Network processor features, and therefore offloading requirements, vary by network processor model.

When using the FA2- and NP2-based interfaces, only the initial session setup will be seen through the `diag debug flow` command. If the session is correctly programmed into the ASIC (fastpath), the debug flow command will no longer see the packets arriving at the CPU. If the NP2 functionality is disabled, the CPU will see all the packets, however, this should only be used for troubleshooting purposes.

First, obtain the NP2 and port numbers with the following command:

```
diag npu np2 list
```

Sample output:

```
ID PORTS
-- -----
0 port1
0 port2
0 port3
0 port4
ID PORTS
-- -----
1 port5
```

```
1 port6
1 port7
1 port8
ID PORTS
-- -----
2 port9
2 port10
2 port11
2 port12
ID PORTS
-- -----
3 port13
3 port14
3 port15
3 port16
```

Run the following commands:

```
diag npu np2 fastpath disable 0
```

(where `0` is the NP2 number)

Then, run this command:

```
diag npu np2 fastpath-sniffer enable port1
```

Sample output:

```
NP2 Fast Path Sniffer on port1 enabled
```

This will cause all traffic on *port1* of NP2 0 to be sent to the CPU meaning a standard sniffer trace can be taken and other diag commands should work if it was a standard CPU driven port.

These commands are only for the newer NP2 interfaces. FA2 interfaces are more limited as the sniffer will only capture the initial packets before the session is offloaded into HW (FA2). The same holds true for the `diag debug flow` command as only the session setup will be shown, however, this is usually enough for this command to be useful.

Debug command

Debug output provides continuous, real-time event information. Debugging output continues until it is explicitly stopped or until the unit is rebooted. Debugging output can affect system performance and will be continually generated even though output might not be displayed in the CLI console.

Debug information displayed in the console will scroll in the console display and may prevent CLI commands from being entered, for example, the command to disable the debug display. To turn off debugging output as the display is scrolling by, press the ↑ key to recall the recent diag debug command, press backspace, and type “0”, followed by *Enter*.

Debug output display is enabled using the following command:

```
diag debug enable
```

When finished examining the debug output, disable it using:

```
diag debug disable
```

Once enabled, indicate the debug information that is required using this command:

```
diag debug <option> <level>
```

Debug command options include the following:

`application`	method of debugging output from many FortiGate daemons
`authd`	configure FSSO or clear authentication daemon
`cli`	configure cli debug level
`console`	configure console settings for debugging
`crashlog`	get or clear the crash log info
`disable`	halt debug output
`enable`	start outputting filtered debug output
`flow`	trace packet flow in kernel
`info`	show active debug level settings
`kernel`	configure kernel and ha debug levels
`rating`	display website rating server list and information
`report`	report for tech support
`reset`	reset all debug level to default

The debug level can be set at the end of the command. Typical values are 2 and 3, for example:

```
diag debug application DHCPS 2
diag debug application spamfilter 2
```

Fortinet support will advise which debugging level to use.

Timestamps can be enabled to the debug output using the following command:

```
diag debug console timestamp enable
```

Debug output example

This example shows the IKE negotiation for a secure logging connection from a FortiGate unit to a FortiAnalyzer system.

```
diag debug reset
diag debug application ike 3 192.168.11.2
diag debug enable
```

Sample Output:

```
FGh_FtiLog1: IPsec SA connect 0 192.168.11.2-
   >192.168.10.201:500, natt_mode=0 rekey=0 phase2=FGh_FtiLog1
FGh_FtiLog1: using existing connection, dpd_fail=0
FGh_FtiLog1: found phase2 FGh_FtiLog1
FGh_FtiLog1: IPsec SA connect 0 192.168.11.2 ->
   192.168.10.201:500 negotiating
FGh_FtiLog1: overriding selector 225.30.5.8 with 192.168.11.2
FGh_FtiLog1: initiator quick-mode set pfs=1536...
FGh_FtiLog1: try to negotiate with 1800 life seconds.
```

```
FGh_FtiLog1: initiate an SA with selectors:
   192.168.11.2/0.0.0.0->192.168.10.201, ports=0/0,
   protocol=0/0
Send IKE Packet(quick_outI1):192.168.11.2:500(if0) ->
   192.168.10.201:500, len=348
Initiator: sent 192.168.10.201 quick mode message #1 (OK)
FGh_FtiLog1: set retransmit: st=168, timeout=6.
```

In this example:

`192.168.11.2->192.168.10.201:500`	Source and Destination gateway IP address
`dpd_fail=0`	Found existing Phase 1
`pfs=1536...`	Create new Phase 2 tunnel

Other commands

ARP table

To view the ARP cache, use the following command:

```
get sys arp
```

To view the ARP cache in the system, use this command:

```
diag ip arp list
```

Sample output:

```
index=14 ifname=internal 224.0.0.5 01:00:5e:00:00:05
  state=00000040 use=72203 confirm=78203 update=72203 ref=1
index=13 ifname=dmz 192.168.3.100 state=00000020 use=1843
  confirm=650179 update=644179 ref=2      ? VIP
index=13 ifname=dmz 192.168.3.109 02:09:0f:78:69:ff
  state=00000004 use=71743 confirm=75743 update=75743 ref=1
index=14 ifname=internal 192.168.11.56 00:1c:23:10:f8:20
  state=00000004 use=10532 confirm=10532 update=12658 ref=4
```

To remove the ARP cache, use this command:

```
execute clear system arp table
```

To remove a single ARP entry, use:

```
diag ip arp delete <interface name> <IP address>
```

To remove all entries associated with a particular interface, use this command:

```
diag ip arp flush <interface name>
```

To add static ARP entries, use the following command:

```
config system arp-table
```

Time and date settings

Check time and date settings for log message timestamp synchronization (the Fortinet support group may request this) and for certificates that have a time requirement to check for validity. Use the following commands:

```
execute time
current time is: 12:40:48
last ntp sync:Thu Mar 16 12:00:21 2006
execute date
current date is: 2006-03-16
```

To force synchronization with an NTP server, toggle the following command:

```
set ntpsync enable/disable
```

If all devices have the same time, it helps to correlate log entries from different devices.

IP address

There may be times when you want to verify the IP addresses assigned to the FortiGate unit interfaces are what you expect them to be. This is easily accomplished from the CLI using the following command.

```
diag ip address list
```

The output from this command lists the IP address and mask if available, the index of the interface (a sort of ID number) and the devname is the name of the interface. While physical interface names are set, virtual interface names can vary. Listing all the virtual interface names is a good use of this command. For vsys_ha and vsys_fgfm, the IP addresses are the local host — these are internally used virtual interfaces.

```
# diag ip address list
IP=10.31.101.100->10.31.101.100/255.255.255.0 index=3
devname=internal
IP=172.20.120.122->172.20.120.122/255.255.255.0 index=5
devname=wan1
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=8 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=11 devname=vsys_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=vsys_fgfm
```

Other related commands include flushing the IP addresses (`diag ip address flush`), which will force a reload of the IP addresses. This can be useful if you think an IP address is wrong and don't want to reboot the unit. You can add or delete a single IP address (`diag ip address add <ipv4_addr>` or `diag ip address delete <ipv4_addr>`).

For more information on useful diagnostic commands, see "Troubleshooting 'get' commands" on page 805and "Troubleshooting common issues" on page 763.

FortiGate ports

In the TCP and UDP stacks, there are 65 535 ports available for applications to use when communicating with each other. Many of these ports are commonly known to be associated with specific applications or protocols. These known ports can be useful when troubleshooting your network.

Use the following ports while troubleshooting the FortiGate device:

Port(s)	Functionality
UDP 53	DNS lookup, RBL lookup
UDP 53 or UDP 8888	FortiGuard Antispam or Web Filtering rating lookup
UDP 53 (default) or UDP 8888 and UDP 1027 or UDP 1031	FDN Server List - source and destination port numbers vary by originating or reply traffic. See the article “How do I troubleshoot performance issues when FortiGuard Web Filtering is enabled?” in the Knowledge Base.
UDP 123	NTP Synchronization
UDP 162	SNMP Traps
UDP 514	SYSLOG - All FortiOS versions can use syslog to send log messages to remote syslog servers. FortiOS v2.80 and v3.0 can also view logs stored remotely on a FortiAnalyzer unit.
TCP 22	Configuration backup to FortiManager unit or FortiGuard Analysis and Management Service.
TCP 25	SMTP alert email, encrypted virus sample auto-submit
TCP 389 or TCP 636	LDAP or PKI authentication
TCP 443	FortiGuard Antivirus or IPS update - When requesting updates from a FortiManager unit instead of directly from the FDN, this port must be reconfigured as TCP 8890.
TCP 443	FortiGuard Analysis and Management Service
TCP 514	FortiGuard Analysis and Management Service log transmission (OFTP)
TCP 541	SSL Management Tunnel to FortiGuard Analysis and Management Service (FortiOS v3.0 MR6 or later)
TCP 514	Quarantine, remote access to logs and reports on a FortiAnalyzer unit, device registration with FortiAnalyzer units (OFTP)
TCP 1812	RADIUS authentication
TCP 8000 and TCP 8002	FSSO
TCP 10151	FortiGuard Analysis and Management Service contract validation

Diagnostic commands

FortiAnalyzer/FortiManager ports

If you have a FortiAnalyzer unit or FortiManager unit on your network you may need to use the following ports for troubleshooting network traffic.

Functionality	Port(s)
DNS lookup	UDP 53
NTP synchronization	UDP 123
Windows share	UDP 137-138
SNMP traps	UDP 162
Syslog, log forwarding	UDP 514
Log and report upload	TCP 21 or TCP 22
SMTP alert email	TCP 25
User name LDAP queries for reports	TCP 389 or TCP 636
RVS update	TCP 443
RADIUS authentication	TCP 1812
Log aggregation client	TCP 3000

For more information about FortiAnalyzer/FortiManager ports, see the Fortinet Knowledge Base at the following address: `http://kc.forticare.com/default.asp?SID=&Lang=1&id=773`.

FortiGuard troubleshooting

The FortiGuard service provides updates to Antivirus, IPSec, Webfiltering, and more. The FortiGuard Distribution System (FDS) involves a number of servers across the world that provide updates to your FortiGate unit. Problems can occur both with connection to FDS, and its configuration on your local FortiGate unit. Some of the more common troubleshooting methods are listed here including

- Troubleshooting process for FortiGuard updates
- FortiGuard server settings
- FortiGuard URL rating

Troubleshooting process for FortiGuard updates

The following process are the logical steps to take when troubleshooting FortiGuard update problems. This includes antivirus (AV), intrusion protection services (IPS), antispam (AS), and web filtering (WB).

1 Does the device have a valid licence that includes these services?

Each device requires a valid FortiGuard license to access updates for some or all of these services. You can verify the support contract status for your devices at the Fortinet Support website — https://support.fortinet.com/.

2 If the device is part of an HA cluster, do all members of the cluster have the same level of support?

   As with the previous step, you can verify the support contract status for all the devices in your HA cluster at the Fortinet Support website.

3 Have services been enabled on the device?

   To see the FortiGuard information and status for a device, in the web-based manager go to *System* > *Config* > *FortiGuard*. On that page you can verify the status of each component, and if required enable each service. If there are problems, see the FortiGuard section of the FortiOS Handbook.

4 Is the device able to communicate with FortiGuard servers?

   At *System* > *Config* > *FortiGuard* you can also attempt to update AV and IPS, or test the availability of WF and AS default and alternate ports. If there are problems, see the FortiGuard section of the FortiOS Handbook.

5 Is there proper routing to reach the FortiGuard servers?

   Ensure there is a static or dynamic route that enables your ForitGate unit to reach the FortiGuard servers. Usually a generic default route to the internet is enough, but you may need to verify this if your network is complex.

6 Are there issues with DNS?

   An easy way to test this is to attempt a traceroute from behind the FortiGate unit to an external network using the FQDN for a location. If the traceroute FQDN name does not resolve, you have general DNS problems. See "DNS settings" on page 771.

7 Is there anything upstream that might be blocking FortiGuard traffic, either on the network or ISP side?

   Many firewalls block all ports by default, and often ISPs block ports that are low. There may be a firewall between the FortiGate unit and the FortiGuard servers that is blocking the traffic. FortiGuard uses port 53 by default, so if it is being blocked you need to either open a hole for it, or change the port it is using.

8 Is there an issue with source ports?

   It is possible that ports used to contact FortiGuard are being changed before reaching FortiGuard or on the return trip before reaching your FortiGate unit. A possible solution for this is to use a fixed-port at NATd firewalls to ensure the port remains the same. Packet sniffing can be used to find more information on what is happening with ports. See "Perform a sniffer trace" on page 780.

9 Are there security policies that include antivirus?

   If no security policies include antivirus, the antivirus databse will not be updated. If antivirus is included, only the database type used will be updated.

FortiGuard server settings

Your local FortiGate unit connects to remote FortiGuard servers get updates to FortiGuard information such as new viruses that may have been found or other new threats. This section demonstrates ways to display information about FortiGuard server information on your FortiGate unit, and how to use that information and update it to fix potential problems. This includes

- Displaying the server list
- Sorting the server list
- Calculating weight

Displaying the server list

The `get webfilter status` command shows the list of FDS servers the FortiGate unit is using to send web filtering requests. Rating requests are only sent to the server on the top of the list in normal operation. Each server is probed for Round Trip Time (RTT) every two minutes.

You can optionally add a refresh rate to the end of this command and that will determine how often the server list will be refreshed.

Rating may not be enabled on your FortiGate unit.

```
get webfilter status
```

Sample Output:

```
Locale       : english
License      : Contract
Expiration   : Thu Oct  9 02:00:00 2011
Hostname     : fortiguard.example.com
-=- Server List (Mon Feb 18 12:55:48 2008) -=-
```

IP	Weight	RTT	Flags	TZ	Packets	CurrLost	TotalLost
a.b.c.d	0	1	DI	2	1926879	0	11176
10.1.101.1	10	329		1	10263	0	633
10.2.102.2	20	169		0	16105	0	80
10.3.103.3	20	182		0	6741	0	776
10.4.104.4	20	184		0	5249	0	987
10.5.105.5	25	181		0	12072	0	178

Output Details

Hostname is the name of the FortiGuard server the FortiGate unit will attempt to contact. The Server List includes the IP addresses of alternate servers if the first entry cannot be reached. In this example the IP addresses are not public addresses

The following flags in `get webfilter status` indicate the server status:

- `D` - the server was found through the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them will be flagged with D and will be used first for INIT requests before falling back to the other servers.
- `I` - the server to which the last INIT request was sent.
- `F` - the server has not responded to requests and is considered to have failed.
- `T` - the server is currently being timed.

Sorting the server list

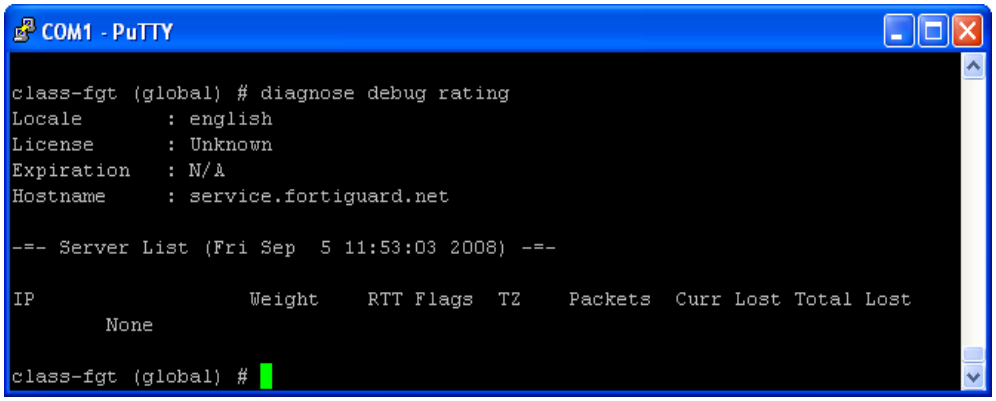
The server list is sorted first by weight. The server with the smallest RTT is put at the top of the list, regardless of weight. When a packet is lost (there has been no response in 2 seconds), it will be resent to the next server in the list. Therefore, the top position in the list is selected based on RTT while the other list positions are based on weight.

Calculating weight

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a remote server, the weight is not allowed to dip below a base weight, calculated as the difference in hours between the FortiGate unit and the server times 10. The further away the server is, the higher its base weight and the lower in the list it will appear.

The output for the `diag debug rating` command will vary based on the state of the FortiGate device.

The following output is from a FortiGate device that has no DNS resolution for `service.fortiguard.net`.



If only three IP addresses appear with the `D` flag, it means that DNS is good but probably the FortiGuard ports 53 and 8888 are blocked.

When the license is expired, an INIT request will be sent every 10 minutes for up to six attempts. If a license is not found after this limit is reached, the INIT requests will be sent every day.

A low source port number may appear which means that ports 1024 and 1025 could be blocked on the path to the FDS. Increase the source port on the FortiGate device with the following commands:

```
config sys global
set ip-src-port-range  <start-end> (Default 1024-25000)
```

Be careful moving ports like this as it may cause some services to stop working if they can't access their original ports. If you make this change, ensure all services that use ports are checked and updated to new port numbers if needed.

FortiGuard URL rating

The following commands can be used to troubleshoot issues with FortiGuard URL ratings:

```
diag debug enable
diag debug application urlfilter -1
```

Sample output:

```
id=93000 msg="pid=57 urlfilter_main-723 in main.c received
   pkt:count=91, a=/tmp/.thttp.socket/21" id=22009
   msg="received a request /tmp/.thttp.socket, addr_len=21: d=
   ="www.goodorg.org:80, id=12853, vfid=0, type=0,
   client=192.168.3.90, url=/" id=99501 user="N/A"
   src=192.168.3.90 sport=1321 dst=<dest_ip> dport=80
   service="http" cat=43 cat_desc="Organisation"
   hostname="www.goodorg.org" url="/" status=blocked msg="URL
   belongs to a denied category in policy"
```

Sample output:

```
id=22009 msg="received a request /tmp/.thttp.socket,
   addr_len=21: d=pt.dnstest.google.com:80, id=300, vfid=0,
   type=0, client=192.168.3.12, url=/gen_204"
id=93003 user="N/A" src=192.168.3.12 sport=21715 dst=<dest_ip>
   dport=80 service="http" cat=41 cat_desc="Search Engines"
   hostname="pt.dnstest.google.com" url="/gen_204"
   status=passthrough msg="URL belongs to an allowed category in
   the policy"
```

Table 53: Breakdown of sample output parts from URL rating command

id=93000 `msg="pid=57 urlfilter_main-723 in main.c received pkt:count=91, a=/tmp/.thttp.socket/21"`	The process ID (PID) is listed along with the function in the file running (main.c). Then it lists the number of packets received and the associated socket where the packets came from.
id=22009 `msg="received a request /tmp/.thttp.socket, addr_len=21: d= ="www.goodorg.org:80, id=12853, vfid=0, type=0, client=192.168.3.90, url=/"`	Received a request on a particular socket (/tmp/.thttp.socket). The website to be rated is “www.goodorg.org:80” and the client browser that wants the verification is 192.169.3.90.
id=99501 `user="N/A" src=192.168.3.90 sport=1321 dst=<dest_ip> dport=80 service="http" cat=43 cat_desc="Organisation" hostname="www.goodorg.org" url="/" status=blocked msg="URL belongs to a denied category in policy"`	No user associated with this source address (192.168.3.90) and port (1321). The destination IP is unknown and the port is the standard HTTP port 80, which is confirmed by service=http. The cat keyword gives the category of the URL being checked, which turns out to be an organization. This is confirmed by the hostname of “goodorg.org”. The status is stated as blocked with the reason stated as “URL belongs to a denied category in policy”.

Technical Support Organization Overview

This section explains how Fortinet's technical support works, as well as how you can easily create an account to get technical support for when issues arise that you cannot solve yourself.

This section contains the following topics:

Fortinet Global Customer Services Organization

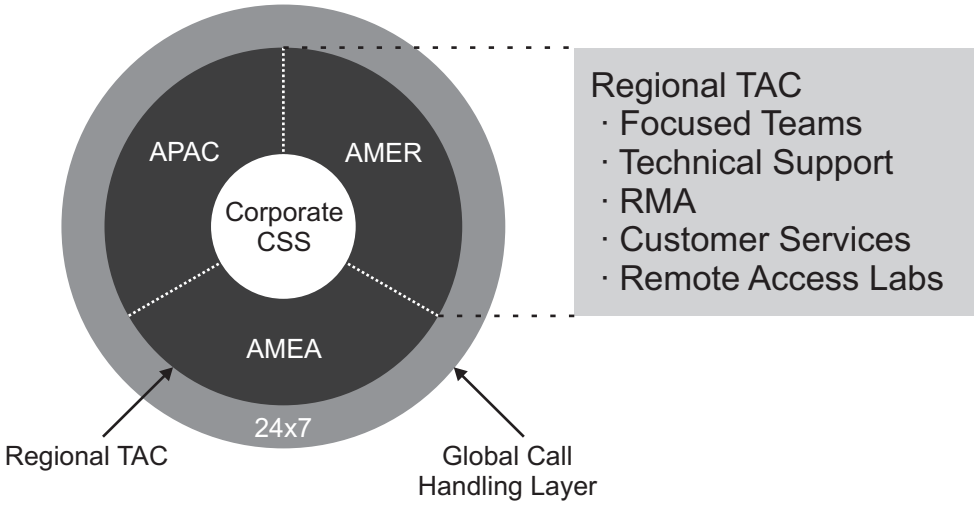
The Fortinet Global Customer Services Organization is composed of three regional *Technical Assistance Centers* (TAC):

- The Americas (AMER)
- Europe, Middle East, and Africa (EMEA)
- Asia Pacific (APAC)

The regional TACs are contacted through a global call center. Incoming service requests are then routed to the appropriate TAC.

Each regional TAC delivers technical support to the customers in its regions during its hours of operation. These TACs also combine to provide seamless, around-the-clock support for all customers.

Figure 72: Fortinet regions and TAC.

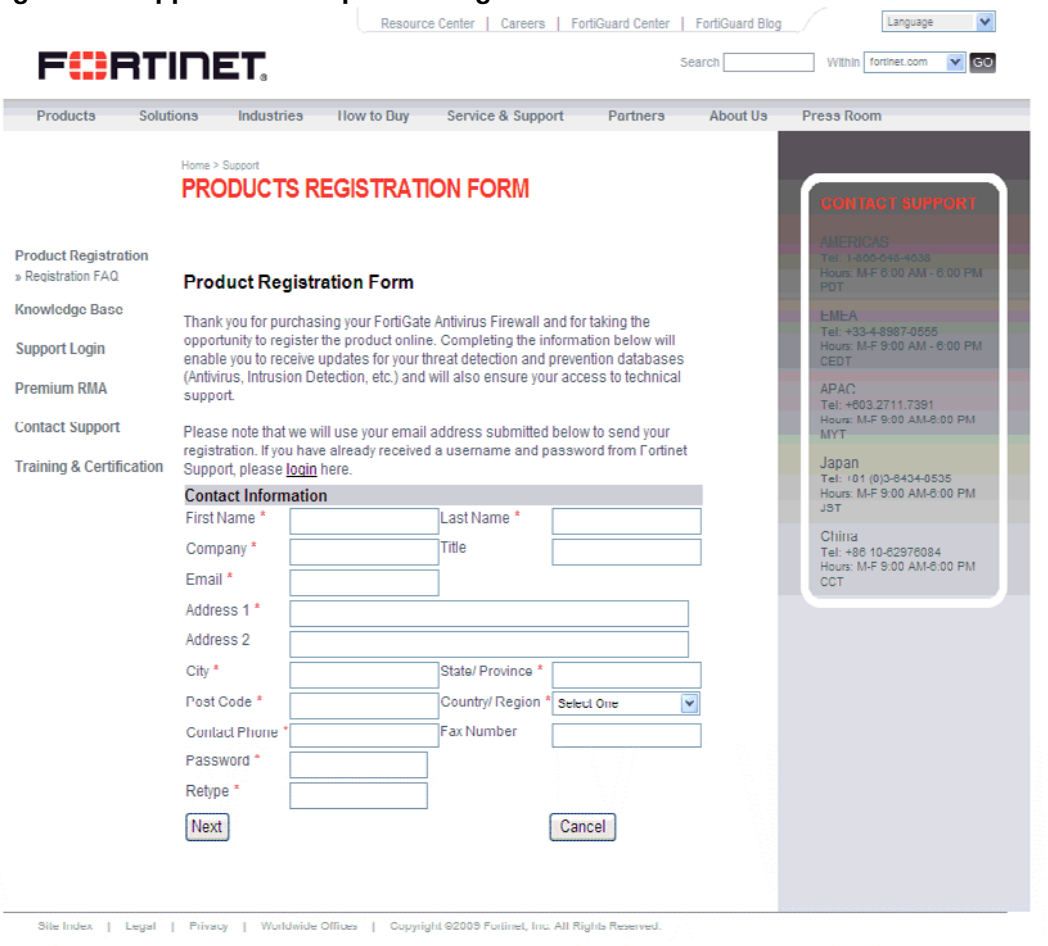


Creating an account

To receive technical support and service updates, Fortinet products in the organization must be registered. The **Product Registration Form** on the support website will allow the registration to be completed online.

Creating an account on the support website is the first step in registering products

Figure 73: Support account product registration form



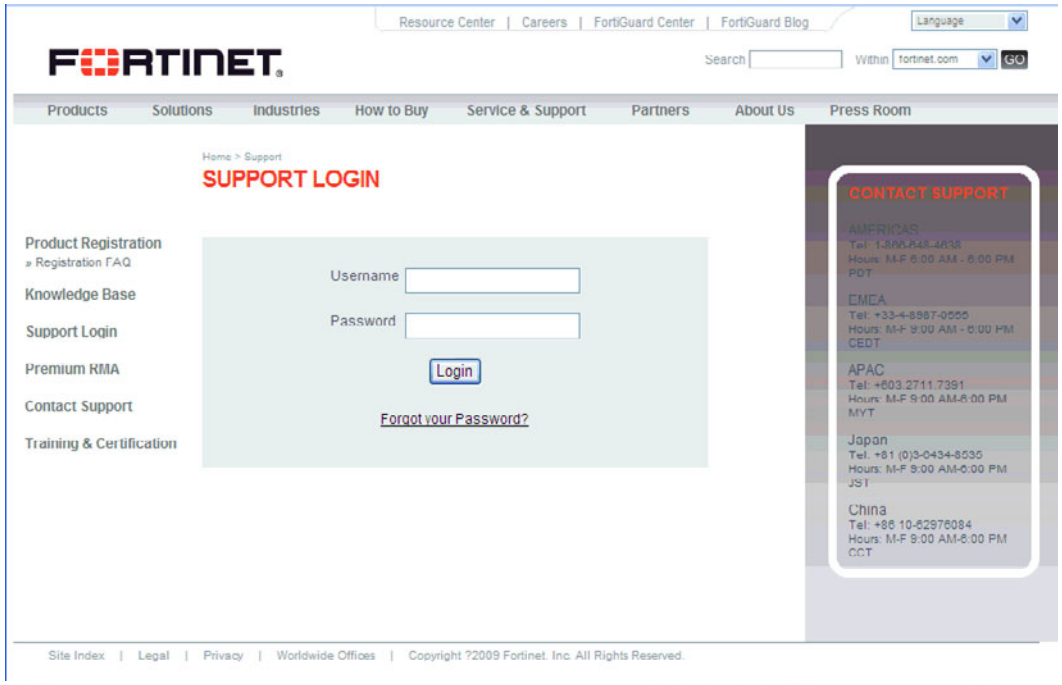
Once the account has been created, the *Product Registration Form* will be displayed and the product details can be provided. Alternately, the product registration can be completed at a later time.

Registering a device

Complete the following steps when registering a device for support purposes:

1 Log in using the *Username* and *Password* defined when the account was created

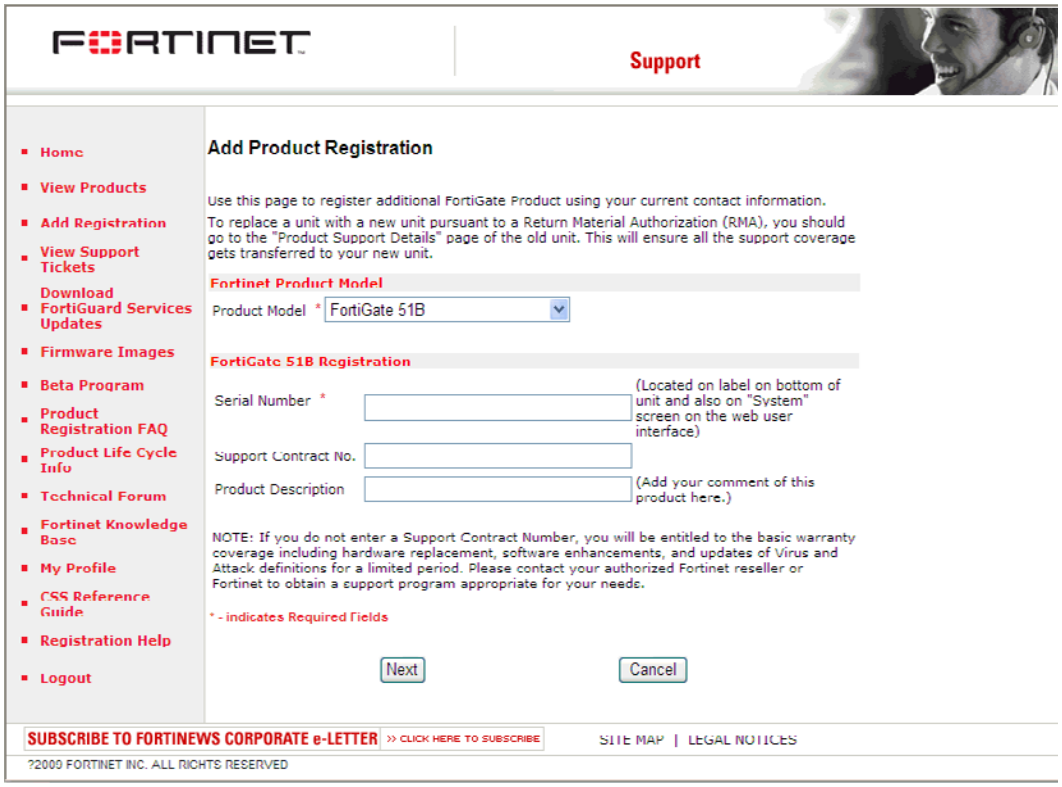
Figure 74: Support account login screen.



2 Select *Add Registration* on the left-hand side.

3 Select *New Fortinet Product/License Registration.*

Figure 75: Adding a product to a support account



4 Select the appropriate *Product Model*.

5 Enter the *Serial Number*.

6 Enter the *Support Contract No*. provided by Fortinet when the support contract was purchased.

7 In the *Product Description* field, explain where this unit is physically located.

8 Click *Next* and accept the *End User License Agreement* (EULA) to complete the registration.

Reporting problems

Problems can be reported to a Fortinet Technical Assistance Center in the following ways:

- By logging an online ticket
- By phoning a technical support center

Logging online tickets

Problem reporting methods differ depending on the type of customer.

Fortinet partners

Fortinet Partners are entitled to priority web-based technical support. This service is designed for partners who provide initial support to their customers and who need to open a support ticket with Fortinet on their behalf. We strongly encourage submission and follow up of support tickets using this service.

The support ticket can be submitted after logging into the partner website using one of the following links using FortiPartner account details:

`http://partners.fortinet.com`

This link will redirect to the general *Partner Extranet* website. Click *Support* > *Online Support Ticket*.

`https://www.forticare.com:1443/customersupport/login/partnerlogin.aspx`

This link redirects to the *Partner Online Support Ticket* section also known as *FortiCare*.

The Partner Online Support Ticket section is accessed through HTTPS on port 1443. Ensure that the firewall allows external access this port. Also, a customer's Fortinet device must have a valid support contract to be able submit the support request as a Partner.

Fortinet customers

Fortinet customers should complete the following steps to report a technical problem online:

1 Log in to the support web site at the following address with the account credentials used when the account was created:

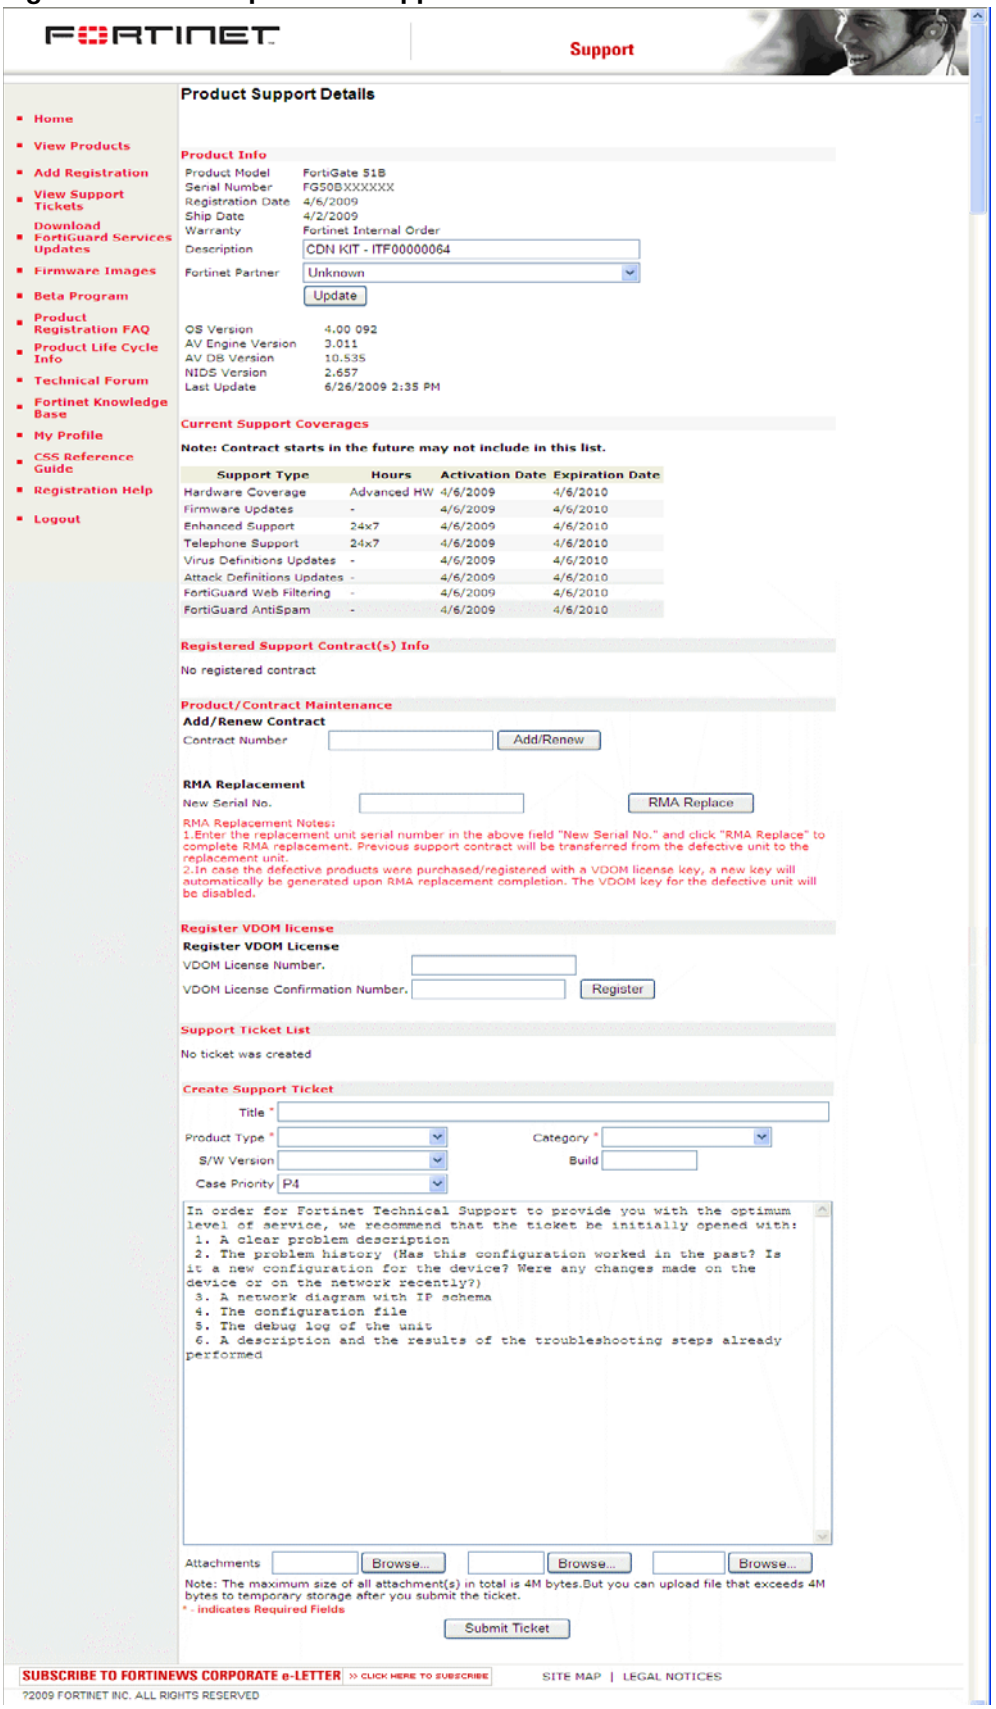
`https://support.fortinet.com`

2 Click *View Products*.

3 In the *Products List*, select the product that is causing the problem.

4 Complete the *Create Support Ticket* fields.

Figure 76: Account products support details



Following up on online tickets

Perform the following steps to follow up on an existing issue.

Partners should log into the following web site:

```
http://partners.fortinet.com
```

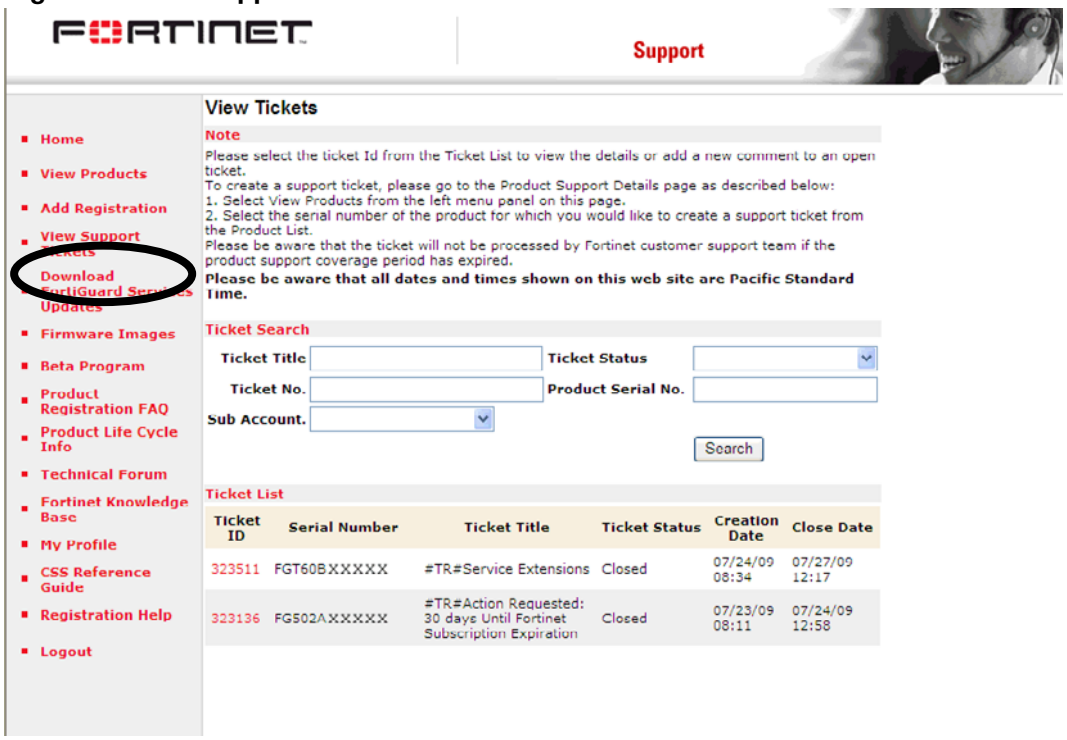
Customers should log into the following site:

```
http://support.fortinet.com.
```

1 Log in with the account credentials used when the account was created.

2 Click *View Support Tickets* on the left-hand side. Use the *Search* fields on the *View Tickets* form to locate the tickets assigned to the account.

Figure 77: View support tickets for this account



3 Select the appropriate ticket number. Closed tickets cannot be updated. A new ticket must be submitted if it concerns the same problem.

4 Add a *New Comment* or *Attachment*.

5 Click *Submit* when complete.

Every web ticket update triggers a notification to the ticket owner, or ticket queue supervisor.

Telephoning a technical support center

The Fortinet Technical Assistance Centers can also be contacted by phone.

Americas

- Telephone: 1-866-648-4638
- Hours: Monday to Friday 6:00 AM to 6:00 PM (Pacific Daylight Time)

EMEA

- Telephone: +33-4-898-0555

  If a support call is placed outside of EMEA business hours (Monday to Friday 9:00 AM to 6:00 PM (Central European Daylight Time)), priority 1 issues will be transferred to another Fortinet Technical Solutions center according to the *Follow the Sun* policy, meaning wherever it's daylight, that TAC will be taking all support calls.
- Hours: Monday to Friday 9:00 AM to 6:00 PM (Central European Daylight Time)

APAC

- Telephone: +603-2711-7391
- Hours: Monday to Friday 9:00 AM to 6:00 PM (Malaysia Time)

Assisting technical support

The more information that can be provided to Fortinet technical support, the better they can assist in resolving the issue. Every new support request should contain the following information:

- A valid contact name, phone number, and email address.
- A clear and accurate problem description.
- A detailed network diagram with complete IP address schema.
- The configuration file, software version, and build number of the Fortinet device.
- Additional log files such as *Antivirus* log, *Attack* log, *Event* log, *Debug* log or similar information to include in the ticket as an attachment. If a third-party product is involved, for example, email server, FTP server, router, or switch, please provide the information on its software revision version, configuration, and brand name.

  The following *Knowledge Base* article provides an example of what type of technical information and network diagram details should be submit to receive the quickest resolution time to a problem:

  `http://kb.forticare.com/default.asp?id=1068&SID=&Lang=1`

Support priority levels

Fortinet technical support assigns the following priority levels to support cases:

Priority 1

This **Critical** priority is assigned to support cases in which:

- The network or system is down causing customers to experience a total loss of service.
- There are continuous or frequent instabilities affecting traffic-handling capability on a significant portion of the network.
- There is a loss of connectivity or isolation to a significant portion of the network.
- This issue has created a hazard or an emergency.

Priority 2

This **Major** priority is assigned to support cases in which:

- The network or system event is causing intermittent impact to end customers.
- There is a loss of redundancy.
- There is a loss of routine administrative or diagnostic capability.
- There is an inability to deploy a key feature or function.
- There is a partial loss of service due to a failed hardware component.

Priority 3

This **Medium** priority is assigned to support cases in which:

- The network event is causing only limited impact to end customers.
- Issues seen in a test or pre-production environment exist that would normally cause adverse impact to a production network.
- The customer is making time sensitive information requests.
- There is a successful workaround in place for a higher priority issue.

Priority 4

This **Minor** priority is assigned to support cases in which:

- The customer is making information requests and asking standard questions about the configuration or functionality of equipment.

Customers must report Priority 1 and 2 issues by phone directly to the Fortinet EMEA Support Center.

For lower priority issues, you may submit an assistance request (ticket) via the web system.

The web ticket system also provides a global overview of all ongoing support requests.

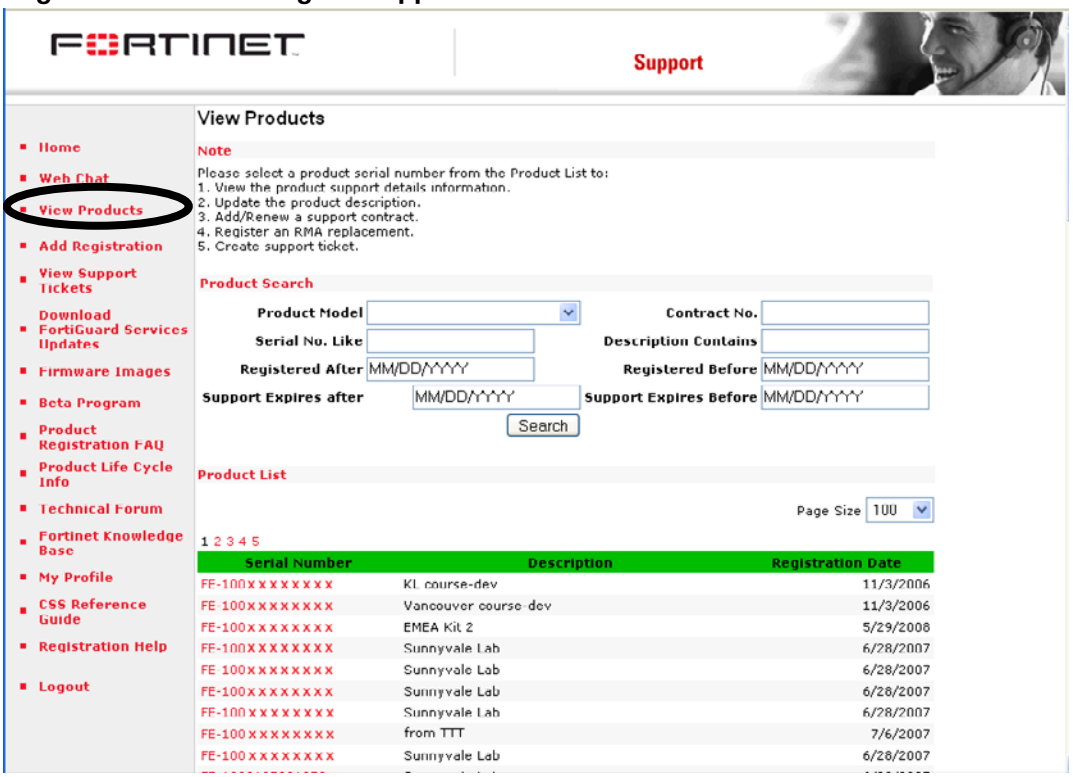
Return material authorization process

In some cases hardware issues are experienced and a replacement unit must be sent. This is referred to as a Return Material Authorization (RMA). In these cases or RMAs, the support contract must be moved to the new device. Customers can move the support contract from the failing production unit to the new device through the support web site.

To move the support contract to a new device

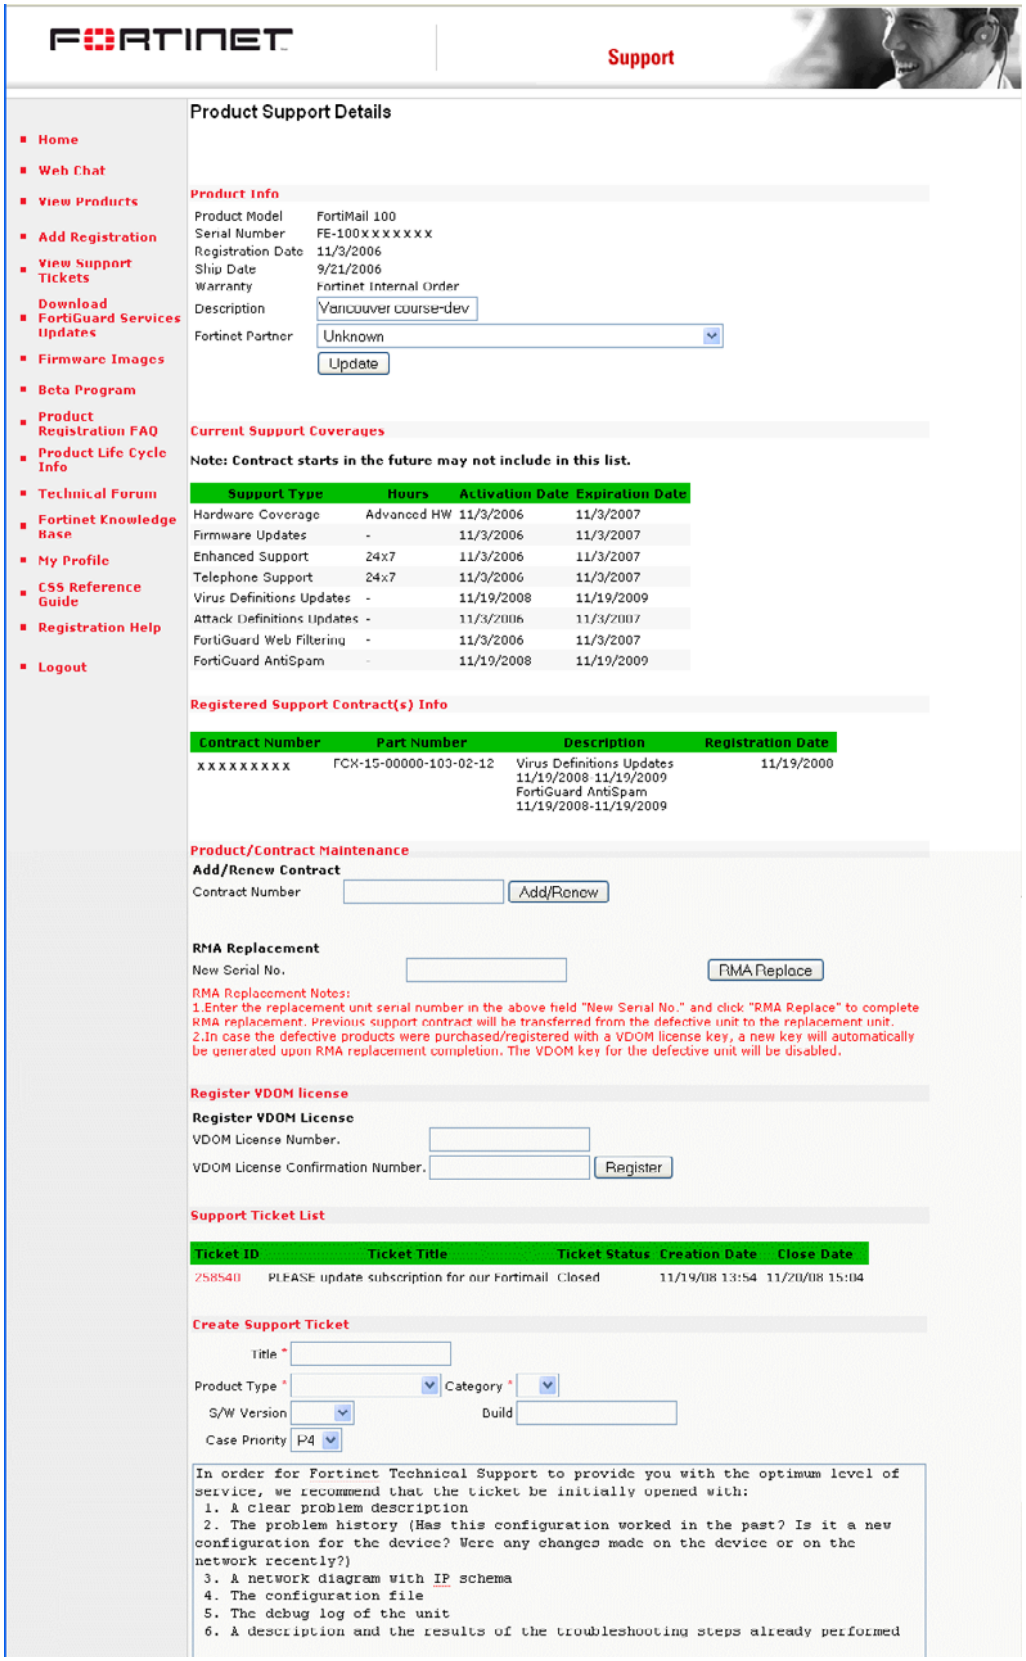
1. Log in to the support web site with the credentials indicated when the account was created.
2. From *View Products*, locate the serial number of the defective unit from the list of devices displayed for the account

Figure 78: From Moving the support to a new unit.



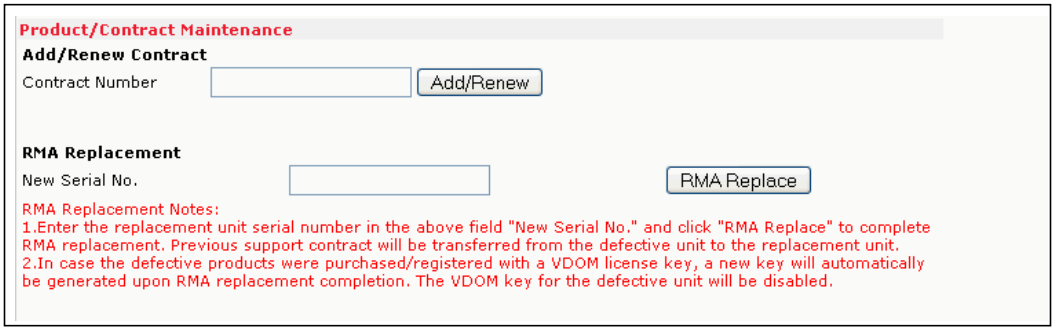
The *Product Support Details* for the selected device will be displayed.

Figure 79: Support details for a registered product



3 In the *RMA Replacement* section of the *Product Support Details* page, enter the serial number of the replacement device and click *RMA Replace.*

Figure 80: RMA Replacement section of Product Support Details



This will transfer the support contract from the defective unit to the new unit with the serial number provided.

Troubleshooting common issues

Connectivity problems can be caused by a number of reasons including hardware problems such as cabling or interfaces, routing problems, firewall configuration problems, and more. Connectivity problems can vary from total lack of connection, to some applications not working or some users having problems, to streaming video or VoIP connections being too slow to be useful.

These general troubleshooting tips provide a starting point for you to determine why your network is behaving unexpectedly. This section includes general troubleshooting methods. More in depth coverage of these topics, such as transparent mode and firewall sessions, can be found in the FortiGate Fundamentals handbook chapter.

If you are experience problems when starting your FortiGate unit, see "FortiGate unit bootup issues" on page 871.

This section contains the following topics:

How to troubleshoot cabling

An integral part of setting up networking hardware is connecting it to the network via network cables. When you have connection problems, it may be a cabling issue.

1 **Ensure devices are powered on and booted up.**

   If a device is powered off, it will appear as if the cabling has a problem. To this end, ensure that the device at each end of the cabling connection has powered on, and has completed booting up. Its possible during boot up that a diagnostic on the network interface may appear as an outage.

2 **Look for the connection LEDs to light up.**

   When you plug a network cable into a FortiGate unit and the other end is connected to a functioning network device, the ForitGate unit has LEDs that light up to indicate if there is a good connection on that interface and what the configured speed is for that interface. If there are no lights, there are cable problems of some kind.

3 **Ensure the cable is completely inserted into the jack.**

   While most network cables have the tab that clicks when the cable is fully inserted into the jack, some cables do not. These cables make it more difficult to determine if the cable is properly inserted into the jack. The best way to verify this is to watch the LED connection lights while you wiggle the cable. If they blink on and off, the cable is not properly inserted. If this is the case, you may have to try a different cable.

4 **Ensure you are using the proper cable type.**

There are different types of ethernet network cable with the main difference being the wiring — is it a crossover or patch cable? However there are even different accepted cross-over wiring orders, so its possible that with two cross over cables, one may not work. Also if the cable is hand-made instead of purchased, there are multiple places for problems — cable rating (Cat5, Cat5e, Cat6), bad connections in the ends, cable too long, or even breaks in the cable wiring.

5 **Try using a different cable.**

When all else fails, try a different cable. It is possible there are breaks in the wires, or the cable was wired differently than you expect. Changing to a new cable will quickly let you know if the cable was bad.

6 **Check the interfaces are connected.**

Use the CLI command `get hardware nic <interface_name>` to check the interface with the connectivity problems. For example checking wan1 would be get hardware nic wan1. In the output of this command look for a line that states `Link: up`. If the Link is down, it is a physical connection problem. If the Link is up, it is an internal problem.

7 **Try connecting to a different network device.**

It is possible there is a problem with the configuration of the device you are trying to connect to. If it has a dead interface for example, even if everything else is working you will not see the LED connection lights on the FortiGate unit. If you have tried everything else, try connecting to a different network device.

How to troubleshoot no Internet connection

The most common use of FortiGate units is to connect internal networks to the Internet. Sometimes when you think you should be able to connect to the Internet, you can't.

If you have not already done so, you may want to try "How to troubleshoot cabling" on page 763 before trying these other things.

1 **Run ping to an external domain name.**

On your FortiGate unit, enter the CLI command `execute ping www.fortinet.com`. This will determine two things: if you have a connection to the Fortinet web site or not, and if your DNS service is working. If DNS is not working, you will see a message telling you it was unable to resolve the domain name (FQDN). If you see this error, ensure you have valid DNS entries (System > Network > DNS), and ensure the security policies allow DNS packets through the firewall. If you do not have a connection, continue to the following steps.

2 **Check the modem status.**

Almost all internal networks connect to the Internet through a modem. The modem converts the network traffic from your ISPs format to ethernet traffic that your network can understand. The modem can be a cable modem, DSL, ADSL, a 3G cellular modem, or even a serial port modem. In all cases, you need to verify that the modem is working properly, and that you have its configuration information properly recorded. You should always run the `diagnose sys modem detect` CLI command after connecting the modem to your FortiGate unit, and you can view the modem configuration by using the `get system modem` command. It is possible your ISP is having connection problems. If you have modem problems, contact your ISP or modem documentation for help.

3 **Check the default route.**

For network traffic to find its way across the network, it must have a route. Without a route, the traffic doesn't know where to go. Ensure there is a valid static route on your FortiGate unit that will direct outbound traffic to the Internet. Ensure the proper interface is used, and that the gateway used does exist. Also ensure the default route admin distance is lower than other routes you may have configured.

4 **Check DHCP settings.**

If you are using DHCP for any computers trying to connect to the Internet, the settings may have problems. If your computers are having IP address or DNS problems, its possibly DHCP server related. Things to check include the range of addresses, the DHCP server is assigned to the correct interface, and any overrides are assigned to the proper IP and MAC address. It is also possible there is an interface waiting for a DHCP server that isn't there.

5 **Check the interface settings.**

Typically the FortiGate unit interface connected to the Internet is Wan1 or Wan2. Ensure that interface has an IP address and subnet mask, that the IP address exists on the subnet the interface is connected to, and check that both the admin and link status are up. If everything else is working but the admin status is down, the interface will not work. If your FortiGate unit interfaces are labelled port1, port2, and so on consider setting alias names for the interfaces based on their function. This will save you time when troubleshooting.

6 **Check the firewall settings for the interfaces.**

For traffic to flow between two FortiGate unit interfaces, there must be a security policy to allow that traffic. Check there is a policy to allow traffic between your two interfaces. Also check that the policy is not restricting traffic to a specific time of day, specific users, or such. If those restrictions exist, and you remove them for testing remember to put them back in place.

7 **Check the firewall settings for basic networking protocols.**

It is common practice to have a DENY security policy at the top of the list that will block unwanted protocols. If this type of policy exists on your ForitGate unit, consider disabling it to check if it is preventing access to the Internet. If it is the problem, go through the list of blocked protocols and remove any common internet protocols needed for common traffic such as FTP, HTTP, HTTPS, PING, DNS, and so on.

8 **Check the logs.**

If you cannot find the source of a problem, before you contact support you should always check your logs. The easiest log to start with is the event log. This log records major events that happen on the FortiGate unit such as configuration changes, failed logins, FortiGuard and firmware updates, and critical problems. These log messages may help you identify the problem, and give a place to start trying to fix it. Other logs such as UTM, traffic, and vulnerability logs may prove useful but they are more specific and complex. If you do not have logging configured, go to *Log&Report* > *Log Config* > *Log Setting*. Select *Memory* and a minimum log level of Information. Select *Event Logging*, and *Enable All*. This will start logging events on your FortiGate unit and give you a valuable troubleshooting tool.

9 **Perform a packet capture on the traffic.**

If everything else looks properly configured, try capturing packets from the traffic to get a better idea what is happening at the low level. To enable packet capturing on the web-based interface go to *System* > *Config* > *Advanced*. Select *Create New* to create a packet capture filter by selecting the interface, protocol, and source and destination address and port. When you run the capture filter it will capture packets that match, and save them to a *.pcap file on your local computer, named for the interface. To read this file, you must use a third-party application such as Wireshark. This will show you the packet source, destination, protocol, and other information that may help you solve your connection issues.

10 **Contact support.**

If you have gone through all these steps, and you have not determined why you have no Internet connection it is time to contact support. Remember to tell support everything you have tried up to this point to ensure they do not duplicate work you have already done.

How to troubleshoot intermittent connection problems

You have an Internet connection that works, but from time to time you are unable to access the Internet for a period of time before it starts working again. This type of problem can be annoying because it is unpredictable. Here are some things to try.

1 **Check the cabling.**

Often this problem is a bad cable with a bad connector or a loose wire. If you are in doubt, try a new cable. See “How to troubleshoot cabling” on page 763.

2 **Check the information on the Dashboard.**

The dashboard (*System* > *Dashboard* > *Status*) has a number of useful widgets that display useful system information. Most useful are the System Resources Widget which shows the CPU and memory usage, the Top Sessions widget with not only lists the addresses with the most open connections but also lists the total sessions, and the Log and Archive Statistics widget that lists many details about DLP archive, and Log.

3 **Check your DNS information.**

If DNS can not resolve domain names, you will not be able to connect to Internet resources. The two places to check DNS entries are the two main entries for the FortiGate unit (*System* > *Network* > *DNS*) and any interface or wireless SSID where you have the choice to use the system DNS or enter a separate value. You can also check your ISP DNS information to confirm it is correct and current.

4 **Check the session table and new sessions.**

For a new connection to the Internet you must be able to create a new session. Intermittent connection problems may mean the session table is full, or the FortiGate unit is unable to create more sessions for some reason. A common reason is if the session table is full, and the FortiGate unit goes into conserve mode where no new sessions are created. To determine this, you can check the log messages for “conserve” and “failover” messages, or you can go to *Policy* > *Monitor* > *Session Table* to see the session setup rate and the number of current sessions. If the setup rate is very low or there are only a handful of sessions, it is not likely a failover problem.

How to troubleshoot a connection in Transparent mode

Transparent mode behaves differently from NAT/Route mode. Unless specifically stated, all FortiOS documentation refers to NAT/Route mode by default.

In Transparent mode, all interfaces are bridged to each other—traffic is sent out over all interfaces at once. The FortiGate unit essentially becomes a layer-2 switch, where in NAT/Route mode it is a layer-3 router. This difference extends to troubleshooting.

Before troubleshooting Transparent mode, you should try "How to troubleshoot cabling" on page 763 and "How to troubleshoot no Internet connection" on page 764.

1 **Check the interfaces are connected.**

   Use the CLI command `get hardware nic <interface_name>` to check the interface with the connectivity problems. For example, checking wan1 would be get hardware nic wan1. In the output of this command look for a line that states `Link: up`. If the Link is down, it is a physical connection problem. If the Link is up, it is an internal problem.

2 **Check the bridge table.**

   The bridge table is important when in Transparent mode. If a MAC is not in the bridge table, then packets to that MAC will be blocked. This may appear as traffic going to a MAC with no reply traffic coming back. In this situation, check the bridge table to ensure the MACs involved are in the table. Use the CLI command `diag netlink brctl name host root.b` to check the bridge table associated with the root VDOM. The root VDOM exists no matter if VDOMs are enabled or not. This command lists MAC addresses in the table. If your device's address is not listed, that means the FortiGate unit cannot find the device when it floods its interfaces. Ensure your device cabling is properly connected to the active network.

3 **Check the session table.**

   The session table has an entry for each active session on the FortiGate unit. If your device's MAC address is in the bridging table, the next place to look is the session table. Go to *Policy* > *Monitor* > *Session Monitor*. If there are many sessions, filter them based on the source IP address of your device. If there are no sessions listed for your device, security policies may be blocking it. You can also run the CLI command `get test app proxyworker 4` to see the active sessions and related errors for the various proxies. For more information, see "Check number of sessions used by UTM proxy" on page 783.

4 **Three things to check if you are running HA.**

Ensure Bridge Protocol Data Units (BPDUs) are forwarded between HA units. BPDU messages are exchanged across bridges to detect loops in a network topology, but HA units sharing the same MAC address can cause problems with BPDUs. This is not an issue if HA units are directly connected.

Configure multiple redundant interfaces to the switch when operating in active-passive HA mode. In an HA cluster, virtual MAC addresses are used so if there is a failover, the new primary unit will have the same virtual MAC and IP address as the primary unit that failed. The problem is that switches usually see this as the same MAC on multiple interfaces on the same subnet, which is usually associated with a hacker masquerading on the network.

Form the HA cluster carefully. As the cluster is being configured, the network interfaces will momentarily lose connectivity as the FGCP assigns virtual MACs to the interfaces. If this is the case, try deleting the arp table on your management computer using the command “arp -d”. If the priorities of the subordinate units are not lower than the primary unit, the cluster may take longer to determine the primary unit and lost connectivity for a longer period as a result. Also if you power on a secondary unit first, it will become the primary, and then when you power on the intended primary there will be a switchover. This should be avoided.

5 **Capture packets for in-depth information.**

If you have checked the bridge and session tables without finding the problem, the next step is to capture some packets. Captured packets to and from an IP address can tell you exactly what is going on at a lower level than most other troubleshooting methods. To enable packet capturing on the FortiGate unit’s web-based interface, go to *System* > *Config* > *Advanced*. Select *Create New* to create a packet capture filter by selecting the interface, protocol, and source and destination address and port. When you run the capture filter it will capture packets that match the filter, and save them to a *.pcap file on your local computer, named for the interface. To read this file, you must use a third-party application such as Wireshark. This will show you the packet source, destination, protocol, and other information that may help you solve your connection issues.

Common issues and questions

The general troubleshooting tips include, and can help answer the following questions.

1 “Check hardware connections” on page 770

Are all the cables and interfaces connected properly?

Is the LED for the interface green?

2 “Check FortiOS network settings” on page 770

If you are having problems connecting to the management interface, is your protocol enabled on the interface?

Is there an IP address on the interface?

3 “Check CPU and memory resources” on page 772

Is your CPU running at almost 100 percent usage?

Are you running low on memory?

4 "Check modem status" on page 773
Is the modem connected?
Are there PPP issues?

5

6 "Run ping and traceroute" on page 773
Are you experiencing complete packet loss?

7 "Check the logs" on page 777

8 "Verify the contents of the routing table (in NAT mode)" on page 778
Are there routes in the routing table for default and static routes?
Do all connected subnets have a route in the routing table?
Does a route wrongly have a higher priority than it should?

9 "Check the bridging information in Transparent mode" on page 778
Are you having problems in transparent mode?

10 "Perform a sniffer trace" on page 780
Is traffic entering the FortiGate unit and does it arrive on the expected interface?
Is the ARP resolution correct for the next-hop destination?
Is the traffic exiting the FortiGate unit to the destination as expected?
Is the traffic being sent back to the originator?

11 "Debug the packet flow" on page 782
Is the traffic entering or leaving the FortiGate unit as expected?

12 "Check number of sessions used by UTM proxy" on page 783
Have you reached the maximum number of sessions for a protocol?
Are new sessions not starting for a certain protocol?

13 "Examine the firewall session list" on page 787
Are there active firewall sessions?

14 "Checking wireless information" on page 788

For troubleshooting tips for specific non-connectivity areas, see "Troubleshooting advanced" on page 789.

In addition to these steps, you may find other diagnose commands useful. See "Other diagnose commands" on page 788.

Check hardware connections

If there is no traffic flowing from the FortiGate unit, it may be a hardware problem.

To check hardware connections

- ensure the network cables are properly plugged into the interfaces
- ensure there are connection lights for the network cables on the unit
- change the cable if the cable or its connector are damaged or you are unsure about the cable's type or quality—such as straight through or crossover, or possibly exposed wires at the connector.
- connect the FortiGate unit to different hardware
- ensure the link status is set to *Up* for the interface, see *Status* > *Network* > *Interface*. The link status is based on the physical connection and cannot be set in FortiOS

If any of these solve the problem, it was a hardware connection problem. You should still perform some basic software connectivity tests to ensure complete connectivity. It might also be that the interface is disabled, or have its Administrative Status set Down.

To enable an interface - web-based manager

1. Using the web-based management interface, go to *System* > *Network* > *Interface*.
2. Select and edit the interface to enable, such as *port1*.
3. Find *Administrative Status* at the bottom of the screen, and select *Up*.
4. Select *Apply*.

To enable an interface - CLI

```
config system interface
  edit port1
    set status enable
  next
end
```

Check FortiOS network settings

FortiOS network settings are present in both the web-based manager interface and the CLI. The following information includes troubleshooting and best practice information. The network settings include:

- Interface settings
- DNS settings
- DHCP Server settings

Interface settings

If you can access the FortiGate unit with the management cable only, the first step is to display the interface settings. To display the settings for the internal interface, use the following CLI command:

```
FGT# show system interface internal
```

or for a complete listing of all the possible interface settings, use the following CLI command:

```
config system interface
  edit internal
  get
```

```
end
```

Check the interface settings to ensure they are not preventing traffic. Specific things to check include (web-based manager names are shown, CLI names may vary slightly):

- **Link Status —** Down until a valid cable is plugged into this interface, after which it will be *Up*. The Link Status is shown physically by the connection LED for the interface — if it lights up green, it is a good connection. If Link Status is down, the interface does not work. Link Status is also displayed on the *System* > *Network* > *Interface* screen by default.
- **Addressing mode —** do not use *DHCP* if you don't have a DHCP server — you will not be able to logon to an interface in DHCP mode as it will not have an IP address.
- **IP/Netmask —** an interface needs an IP address to be able to connect to other devices. Ensure there is a valid IP address in this field. The one exception is if *DHCP* is enabled for this interface to get its IP address from an external DHCP server.
- **IPv6 address —** unless specifically stated all IP addresses are IPv4. The same protocol must be used by both ends to complete the connection. Ensure both this interface and the remote connection are both using IPv4 or both using IPv6 addressing.
- **Administrative access —** If no protocols are selected, you will have to use the local management cable to connect to the unit. If you are using IPv6, configure the IPv6 administrative access protocols.
- **Administrative status —** set to *Up* or interface will not work.

DNS settings

While this section is not complicated, many networking problems can be traced back to DNS problems. Things to check in this area include:

- Are there values for both primary and secondary entries?
- Is the local domain name correct?
- Are you using IPv6 addressing? If so, are the IPv6 DNS settings correct?
- Are you using Dynamic DNS (DDNS)? If so, it is using the correct server, credentials, and interface?
- Can you contact both DNS servers to verify the servers are operational?
- If an interface addressing mode is set to DHCP and is set to override the internal DNS, is that interface receiving a valid DNS entry from the DHCP server — is it a reasonable address and can it be contacted to verify its operational?
- Are there any DENY security policies that need to allow DNS?
- Can any internal device perform a successful traceroute to a location using the FQDN? See "Traceroute" on page 775.

DHCP Server settings

DHCP Servers are common on internal and wireless networks. If the a DHCP server is not configured properly it can cause problems. Things to check in this area include:

- Is the DHCP server entry set to *Relay*? If so, verify there is another DHCP server to relay the requests to. Otherwise, it should be set to *Server*.
- Is the DHCP server enabled?

- Is the range of IP addresses this DHCP server uses valid? Are those addresses in use by other devices? If one or more devices are using IP addresses in this range, you can use the IP reservation feature to ensure the DHCP server does not use these addresses.
- Is there a gateway entry? Include a gateway entry to ensure clients of this server have a default route.
- Is the system DNS setting being used? The best practice is to whenever possible use the system DNS to avoid confusion. However, the option to specify up to three custom DNS servers is available, and all three entries should be used for redundancy.

There are some situations, such as a new wireless interface, or during the initial FortiGate unit configuration, where interfaces override the system DNS entries. When this happens, it often shows up as intermittent Internet connectivity. To fix the problem, go to the problem interface and ensure its set to use the system DNS entries.

Check CPU and memory resources

System resources are shared but a number of processes running at the same time on the FortiGate unit. If one of these processes consumes nearly all the resources.

A quick way to monitor CPU and memory usage is on the System Dashboard using the System Resources widgets. They have both a visual gauge and a percent number displayed to show you the usage.

To check the system resources on your FortiGate unit, run the CLI command

```
FGT# get system performance status
```

This command provides a quick and easy snapshot of the FortiGate.

The first line of output shows the CPU usage by category. A FortiGate that is doing nothing will look like:

```
CPU states: 0% user 0% system 0% nice 100% idle
```

However, if your network is running slow you might see something like:

```
CPU states: 1% user 98% system 0% nice 1% idle
```

This line shows that all the CPU is used up by system processes. Normally this should not happen as it shows the FortiGate is overloaded for some reason. If you see this overloading, you should investigate farther as its possible a process such as scanunitid is using all the resources to scan traffic in which case you need to reduce the amount of traffic being scanned by blocking unwanted protocols, configuring more security policies to limit scanning to certain protocols, or similar actions. It is also possible that a hacker has gained access to your network and is overloading it with malicious activity such as running a spam server or using zombie PCs to attack other networks on the Internet. You can get additional CPU related information with the CLI command `get system performance top`. This command shows you all the top processes running on the FortiGate unit (names on the left) and their CPU usage. If a process is using most of the CPU cycles, investigate it to determine if its normal activity.

The second line of output from `get system performance status` shows the memory usage. Memory usage should not exceed 90 percent. If memory is too full some processes will not be able to function properly. For example if the system is running low on memory, antivirus scanning will go into failopen mode where it will start dropping connections or bypass the antivirus system.

The other lines of output such as network usage, average session setup rate, and viruses caught, IPS attacks blocked can also help you determine why system resource usage it high. For example, if network usage is high it will result in high traffic processing on the FortiGate, or if the session setup rate is very low or zero the proxy may be overloaded and not able to do its job.

Check modem status

Sometimes the modem may not work properly, or the unit may not be detecting the modem. Use the following diagnostic commands to help you troubleshoot issues with the modem.

```
diagnose sys modem {cmd | com | detect | history | wireless-id}
```

You should always run the following diagnose command after inserting the USB modem into the unit:

```
diagnose sys modem detect
```

You can view the modem configuration by using the `get system modem` command. You can also view the modem's vendor identification as well as the custom product identification number from the information output from the `get system modem` command.

When the modem is not being detected by the unit, use the following command:

```
diagnose sys modem wireles-id
```

When there are connectivity issues, use the following to help you resolve them:

- `diag debug enable` – activates the debug on the console
- `diag debug application modemd` – dumps communication between the modem and the unit
- `diag debug application pppd` – dumps the PPP negotiating messages.
- `execute modem dial` – displays modem debug output

The modem diagnose output should not contain any error on the way to initializing. You should also verify the number that is used to dial with your ISP.

Run ping and traceroute

Ping and traceroute are useful tools in network troubleshooting. Alone, either one can determine network connectivity between two points. However, ping can be used to generate simple network traffic to view with diagnose commands on the FortiGate unit. This combination can be a very powerful one in locating network problems.

In addition to their normal uses, ping and traceroute can tell you if your computer or network device has access to a domain name server (DNS). While both tools can use IP addresses alone, they can also use domain names for devices. This is an added troubleshooting feature that can be useful in determining why particular services, such as email or web browsing, may not be working properly.

If ping does not work, you likely have it disabled on at least one of the interface settings, and security policies for that interface.

Both ping and traceroute require particular ports to be open on firewalls, or they cannot function. Since you typically use these tools to troubleshoot, you can allow them in the security policies and on interfaces only when you need them, and otherwise keep the ports disabled for added security.

Ping

The ping command sends a very small packet to the destination, and waits for a response. The response has a timer that may expire, indicating the destination is unreachable. The behavior of ping is very much like a sonar ping from a submarine, where the command gets its name.

Ping is part of Layer-3 on the OSI Networking Model. Ping sends Internet Control Message Protocol (ICMP) “echo request” packets to the destination, and listens for “echo response” packets in reply. However, many public networks block ICMP packets because ping can be used in a denial of service (DoS) attack (such as Ping of Death or a smurf attack), or by an attacker to find active locations on the network. By default, FortiGate units have ping enabled and broadcast-forward is disabled on the external interface.

What ping can tell you

Beyond the basic connectivity information, ping can tell you the amount of packet loss (if any), how long it takes the packet to make the round trip, and the variation in that time from packet to packet.

If there is some packet loss detected, you should investigate:

- possible ECMP, split horizon, network loops
- cabling to ensure no loose connections
- verify which security policy was used (use the packet count column on the *Policy* > *Policy* page)

If there is total packet loss, you should investigate:

- **hardware —** ensure cabling is correct, and all equipment between the two locations is accounted for
- **addresses and routes —** ensure all IP addresses and routing information along the route is configured as expected
- **firewalls —** ensure all firewalls, including FortiGate unit security policies allow PING to pass through

How to use ping

Ping syntax is the same for nearly every type of system on a network.

To ping from a FortiGate unit

1. Connect to the CLI either through telnet or through the CLI widget on the web-based manager dashboard.
2. Enter `exec ping 10.11.101.101` to send 5 ping packets to the destination IP address. There are no options for this command.

   Output appears as:

```
Head_Office_620b # exec ping 10.11.101.101
PING 10.11.101.101 (10.11.101.101): 56 data bytes
64 bytes from 10.11.101.101: icmp_seq=0 ttl=255 time=0.3 ms
64 bytes from 10.11.101.101: icmp_seq=1 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=2 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=3 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=4 ttl=255 time=0.2 ms

--- 10.11.101.101 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
```

```
round-trip min/avg/max = 0.2/0.2/0.3 ms
```

To ping from an MS Windows PC

1 Open a command window.
   - In Windows XP, select *Start* > *Run*, enter cmd, and select *OK*.
   - In Windows 7, select the Start icon, enter cmd in the search box,and select cmd.exe from the list.

2 Enter `ping 10.11.101.100` to ping the default internal interface of the FortiGate unit with four packets.

   Other options include:
   - `-t` to send packets until you press “Control-C”
   - `-a` to resolve addresses to domain names where possible
   - `-n X` to send X ping packets and stop

   Output appears as:

```
C:\>ping 10.11.101.101

Pinging 10.11.101.101 with 32 bytes of data:
Reply from 10.11.101.101: bytes=32 time=10ms TTL=255
Reply from 10.11.101.101: bytes=32 time<1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255

Ping statistics for 10.11.101.101:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 10ms, Average = 3ms
```

To ping from a Linux PC

1 Go to a shell prompt.

2 Enter “`/bin/etc/ping 10.11.101.101`”.

Traceroute

Where ping will only tell you if it reached its destination and came back successfully, traceroute will show each step of its journey to its destination and how long each step takes. If ping finds an outage between two points, traceroute can be used to locate exactly where the problem is.

What is traceroute

Traceroute works by sending ICMP packets to test each hop along the route. It will send out three packets, and then increase the time to live (TTL) setting by one each time. This effectively allows the packets to go one hop farther along the route. This is the reason why most traceroute commands display their maximum hop count before they start tracing the route — that is the maximum number of steps it will take before declaring the destination unreachable. Also the TTL setting may result in steps along the route timing out due to slow responses. There are many possible reasons for this to occur.

Traceroute by default uses UDP datagrams with destination ports numbered from 33434 to 33534. The traceroute utility usually has an option to specify use of ICMP echo request (type 8) instead, as used by the Windows tracert utility. If you have a firewall and if you want traceroute to work from both machines (Unix-like systems and Windows) you will need to allow both protocols inbound through your FortiGate security policies (UDP with ports from 33434 to 33534 and ICMP type 8).

You can also use the packet count column of the *Policy* > *Policy* > *Policy* page to track traceroute packets. This allows you to verify the connection, but also confirm which security policy the traceroute packets are using.

What traceroute can tell you

ping and traceroute have similar functions — to verify connectivity between two points. The big difference is that traceroute shows you each step of the way, where ping doesn't. Also, ping and traceroute use different protocols and ports, so one may succeed where the other fails.

You can verify your DNS connection using traceroute. If you enter an FQDN instead of an IP address for the traceroute, DNS will try to resolve that domain name. If the name does not get resolved, you know you have DNS issues.

How to use traceroute

The traceroute command varies slightly between operating systems. Note that in MS Windows the command name is shortened to "`tracert`". Also, your output will list different domain names and IP addresses along your route.

To use traceroute on an MS Windows PC

1. Open a command window.
   - In Windows XP, select *Start* > *Run*, enter cmd, and select *OK*.
   - In Windows 7, select the Start icon, enter cmd in the search box,and select cmd.exe from the list.
2. Enter "`tracert fortinet.com`" to trace the route from the PC to the Fortinet web site.

Output will appear as:

```
C:\>tracert fortinet.com

Tracing route to fortinet.com [208.70.202.225]
over a maximum of 30 hops:
1    <1 ms    <1 ms    <1 ms  172.20.120.2
2    66 ms    24 ms    31 ms 209-87-254-xxx.storm.ca
[209.87.254.221]
3    52 ms    22 ms    18 ms  core-2-g0-0-1104.storm.ca
[209.87.239.129]

Trace complete.
```

The first, or the left column, is the hop count, which cannot go over 30 hops. When that number is reached, the traceroute ends.

The second, third, and fourth columns display how much time each of the three packets takes to reach this stage of the route. These values are in milliseconds and normally vary quite a bit. Typically a value of `<1ms` indicates a local connection.

The fifth, or the column farthest to the right, is the domain name of that device and its IP address or possibly just the IP address.

To perform a traceroute on a Linux PC

1 Go to a command line prompt.

2 Enter "`/bin/etc/traceroute fortinet.com`".

The Linux traceroute output is very similar to the MS Windows tracert output.

Check the logs

This step in troubleshooting can be forgotten, but its an important one. Logging records the traffic passing through the FortiGate unit to your network and what action the FortiGate unit took during its scanning process of the traffic. This recorded information is called a log message.

When you configure FortiOS initially, log as much information as you can. If needed, logging of unused features can be turned off or scaled back if too the logs generate are too large.

As with most troubleshooting steps, before you can determine if the logs indicate a problem, you need to know what logs result from normal operation. Without a baseline it is difficult to properly troubleshoot.

When troubleshooting with log files:

- compare current logs to a recorded baseline of normal operation
- if needed increase the level of logging (such as from Warning to Information) to obtain more information

When increasing logging levels, ensure that alert email is configured and both disk usage and log quota are selected. This ensures you will be notified if the increased logging causes problems. You can also use Logging Monitor (located in *Log&Report* > *Monitor* > *Logging Monitor*) to determine the activities that generate the most log entries.

- check all logs to ensure important information is not overlooked

- filter or order log entries based on different fields (such as level, service, or IP address) to look for patterns that may indicate a specific problem (such as frequent blocked connections on a specific port for all IP addresses)
- use log reporting to help you visualize large amounts of log data — go to *Log&Report* > *Report Access* > *Cover Page*, select *Option*, and configure the date, time, and contents of the log report. You also have the option to email generated log reports to an administrator.

Logs will help identify and locate any problems, but they will not solve the problems. The job of logs is to speed up your problem solving and save you time and effort.

For more information on Logging and Log Reports, see the Logging and Reporting handbook chapter.

Verify the contents of the routing table (in NAT mode)

When you have some connectivity, or possibly none at all a good place to look for information is the routing table.

The routing table is where all the currently used routes are stored for both static and dynamic protocols. If a route is in the routing table, it saves the time and resources of a lookup. If a route is not used for a while and a new route needs to be added, the oldest least used route is bumped if the routing table is full. This ensures the most recently used routes stay in the table. If your FortiGate unit is in Transparent mode, you are unable to perform this step.

If the FortiGate is running in NAT mode, verify that all desired routes are in the routing table: local subnets, default routes, specific static routes, and dynamic routing protocols.

To check the routing table in the web-based manager, use the Routing Monitor by going to *System* > *Routing* > *Monitor*.

In the CLI, use the command `get router info routing-table all`. Sample output:

```
FGT# get router info routing-table all

Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type
2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-
IS inter area
       * - candidate default

S*      0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C       10.31.101.0/24 is directly connected, internal
C       172.20.120.0/24 is directly connected, wan1
```

Check the bridging information in Transparent mode

When FortiOS is in Transparent mode, the unit acts like a bridge sending all incoming traffic out on the other interfaces. The bridge is between interfaces on the FortiGate unit.

What checking the bridging information can tell you

Each bridge listed is a link between interfaces. Where traffic is flowing between interfaces, you expect to find bridges listed. If you are having connectivity issues, and there are no bridges listed that is a likely cause. Check for the MAC of the interface or device in question.

How to check the bridging information

To list the existing bridge instances on the FortiGate unit, use the following command:

```
diagnose netlink brctl list
```

Sample Output:

```
#diagnose netlink brctl list
list bridge information
1. root.b fdb: size=256  used=6    num=7    depth=2    simple=no
Total 1 bridges
```

How to display forwarding domain information

Forwarding domains, or collision domains, are used in routing to limit where packets are forwarded on the network. Layer-2 broadcasts are limited to the same group. By default, all interfaces are in group 0. For example, if the FortiGate unit has 12 interfaces, only two may be in the same forwarding domain which will limit packets that are broadcast to only those two interfaces. This reduces traffic on the rest of the network.

Collision domains prevent the forwarding of ARP packets to all VLANs on an interface. Without collision domains, duplicate MAC addresses on VLANs may cause ARP packets to be duplicated. Duplicate ARP packets can cause some switches to reset.

It is important to know what interfaces are part of which forwarding domains as this determines which interfaces can communicate with each other.

To manually configure forwarding domains in transparent mode, use the FortiOS CLI command `config interface edit <intf_name> set forward-domain <int>`

To display the information for forward domains

```
diagnose netlink brctl domain <name> <id>
```

where `<name>` is the name of the forwarding domain to display.

Sample Output

```
diagnose netlink brctl domain ione 101
show bridge root.b ione forward domain.
id=101 dev=trunk_1 6
```

To list the existing bridge MAC table, use the following command:

```
diagnose netlink brctl name host <name>
```

Sample Output

```
show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
```

```
Bridge root.b host table

port no  device  devname   mac addr           ttl   attributes
2        7       wan2      02:09:0f:78:69:00  0     Local Static
5        6       vlan_1    02:09:0f:78:69:01  0     Local Static
3        8       dmz       02:09:0f:78:69:01  0     Local Static
4        9       internal  02:09:0f:78:69:02  0     Local Static
3        8       dmz       00:80:c8:39:87:5a  194
4        9       internal  02:09:0f:78:67:68  8
1        3       wan1      00:09:0f:78:69:fe  0     Local Static
```

To list the existing bridge port list, use this command:

```
diagnose netlink brctl name port <name>
```

Sample Output:

```
show bridge root.b data port.
trunk_1  peer_dev=0
internal  peer_dev=0
dmz  peer_dev=0
wan2  peer_dev=0
wan1  peer_dev=0
```

Perform a sniffer trace

When troubleshooting networks and routing in particular, it helps to look inside the headers of packets to determine if they are traveling along the route you expect that they are. Packet sniffing can also be called a network tap, packet capture, or logic analyzing.

If your FortiGate unit has NP2 interfaces that are offloading traffic, this will change the sniffer trace. Before performing a trace on any NP2 interfaces, you should disable offloading on those interfaces.

What can sniffing packets tell you

If you are running a constant traffic application such as ping, packet sniffing can tell you if the traffic is reaching the destination, what the port of entry is on the FortiGate unit, if the ARP resolution is correct, and if the traffic is being sent back to the source as expected.

Sniffing packets can also tell you if the FortiGate unit is silently dropping packets for reasons such as Reverse Path Forwarding (RPF), also called Anti Spoofing, which prevents an IP packet from being forwarded if its Source IP does not either belong to a locally attached subnet (local interface), or be part of the routing between the FortiGate unit and another source (static route, RIP, OSPF, BGP). Note that RPF can be disabled by turning on asymmetric routing in the CLI (`config system setting, set asymetric enable`), however this will disable stateful inspection on the FortiGate unit and cause many features to be turned off.

If you configure virtual IP addresses on your FortiGate unit, it will use those addresses in preference to the physical IP addresses. You will notice this when you are sniffing packets because all the traffic will be using the virtual IP addresses. This is due to the ARP update that is sent out when the VIP address is configured.

How do you sniff packets

The general form of the internal FortiOS packet sniffer command is:

```
diag sniffer packet <interface_name> <'filter'> <verbose>
   <count>
```

To stop the sniffer, type `CTRL+C`.

<interface_name>	The name of the interface to sniff, such as "port1" or "internal". This can also be "any" to sniff all interfaces.
<'filter'>	What to look for in the information the sniffer reads. "none" indicates no filtering, and all packets will be displayed as the other arguments indicate. The filter must be inside single quotes (‘).
<verbose>	The level of verbosity as one of: **1 -** print header of packets **2 -** print header and data from IP of packets **3 -** print header and data from Ethernet of packets
<count>	The number of packets the sniffer reads before stopping. If you do not put a number here, the sniffer will run forever unit you stop it with <CTRL C>.

For a simple sniffing example, enter the CLI command `diag sniffer packet port1 none 1 3`. This will display the next three packets on the port1 interface using no filtering, and using verbose level 1. At this verbosity level you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets, and 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diag sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh
   3177924955 ack 1854307757

0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh
   1854307757 ack 3177925808

0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh
   4225311614 ack 3314279933
```

For a more advanced example of packet sniffing, the following commands will report packets on any interface travelling between a computer with the host name of "PC1" and the computer with the host name of "PC2". With verbosity 4 and above, the sniffer trace will display the interface names where traffic enters or leaves the FortiGate unit. Remember to stop the sniffer, type `CTRL+C`.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2>" 4
```

or

```
FGT# diagnose sniffer packet any "(host <PC1> or host <PC2>) and
   icmp" 4
```

The following sniffer CLI command includes the ARP protocol in the filter which may be useful to troubleshoot a failure in the ARP resolution (for instance PC2 may be down and not responding to the FortiGate ARP requests).

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2> or
   arp" 4
```

Debug the packet flow

Traffic should come in and leave the FortiGate unit. If you have determined that network traffic is not entering and leaving the FortiGate unit as expected, debug the packet flow.

Debugging can only be performed using CLI commands. Debugging the packet flow requires a number of debug commands to be entered as each one configures part of the debug action, with the final command starting the debug.

If your FortiGate unit has FortiASIC NP2 interface pairs that are offloading traffic, this will change the packet flow. Before performing the debug on any NP2 interfaces, you should disable offloading on those interfaces.

The following configuration assumes that PC1 is connected to the internal interface of the FortiGate unit and has an IP address of 10.11.101.200. PC1 is the host name of the computer.

To debug the packet flow in the CLI, enter the following commands:

```
FGT# diag debug disable
FGT# diag debug flow filter add <PC1>
FGT# diag debug flow show console enable
FGT# diag debug flow trace start 100
FGT# diag debug enable
```

The `start 100` argument in the above list of commands will limit the output to 100 packets from the flow. This is useful for looking at the flow without flooding your log or display with too much information.

To stop all other debug activities, enter the command:

```
FGT# diag debug flow trace stop
```

The following is an example of debug flow output for traffic that has no matching security policy, and is in turn blocked by the FortiGate unit. The denied message indicates the traffic was blocked.

```
id=20085 trace_id=319 func=resolve_ip_tuple_fast line=2825
   msg="vd-root received a packet(proto=6,
   192.168.129.136:2854->192.168.96.153:1863) from port3."

id=20085 trace_id=319 func=resolve_ip_tuple line=2924
   msg="allocate a new session-013004ac"

id=20085 trace_id=319 func=vf_ip4_route_input line=1597
   msg="find a route: gw-192.168.150.129 via port1"

id=20085 trace_id=319 func=fw_forward_handler line=248 msg="
   Denied by forward policy check"
```

Check number of sessions used by UTM proxy

Each FortiGate model has a set limit on the maximum number of sessions the UTM proxy supports. The UTM proxy handles all the traffic for the following protocols HTTP, SMTP, POP3, IMAP, FTP, and NNTP. If the proxy for a protocol fills up its session table, the FortiGate unit will enter conserve mode where it behaves differently until entries and memory free up again.

Conserve or failopen mode

Once you reach the limit, depending on your FortiGate unit's conserve mode configuration, no new sessions are created until an old ones end. You can configure your FortiGate unit's behavior when memory is running low or the proxy connection limit has been reached. There are two related commands for this in the CLI:

```
config system global
  set av-failopen-session {enable | disable}
  set av-failopen { idledrop | off | one-shot | pass}
end
```

`av-failopen-session` must be enabled to set the behavior for these conditions. When it is enabled, and a proxy for a protocol runs out of room in its session table that protocol goes into failopen mode and behaves as defined in the `av-failopen` command.

`av-failopen` determines the behavior of the proxy until entries are free in the session table again for that proxy.

- **idledrop —** This option removes idle sessions from the session table, starting with the clients that have the most sessions currently open. This method assumes that idle sessions are not being used and it will not cause problems to close these sessions. This is usually true, but some applications may have problems with this and start either complaining about not having or being able to open a session. If this occurs, try another method to check if this is really the problem. This is a secure option as no unscanned traffic is allowed to pass.
- **off —** This option turns off accepting any new AV sessions, but will continue to process any existing AV sessions that are currently active. All the protocols listed (HTTP, SMTP, POP3, IMAP, FTP, and NNTP) are scanned by FortiGate Antivirus. If AV scanning is enabled, av-failopen off is selected, and the proxy session table fills up no new sessions of that type will be accepted. For example, if POP3 session table is filled and email AV scanning is enabled, no more POP3 connections will be allowed until the session table gets some free space. This is a secure option because no unscanned traffic is allowed to pass.
- **one-shot —** When memory is low, bypass the antivirus system. The name one-shot comes from the fact that once you are in one-shot av-failopen mode, you must set av-failopen to either pass or off to restart AV scanning. This is a very unsecure option because it allows all traffic without AV scanning, and it never reverts to normal without manual assistance.
- **pass —** When memory is low, bypass the antivirus system much as one-shot. The difference is that when memory is freed up, the system will start AV scanning automatically again. This is an unsecure option because it allows traffic to pass without AV scanning. However, it is better than one-shot because it automatically restarts AV scanning when possible.

If the proxy session table is full for one or more protocols and your FortiGate unit enters into conserve or failopen mode, it will appear as if you have lost connections, network services are intermittent or non-existent, and yet other services work normally for a while until their sessions end and they join the queue of session starved applications.

Checking sessions in use

To make troubleshooting this type of problem easier, sessions are broken down by which protocol they use. This provides you with statistics and errors specific to one of the protocols.

Due to the amount of output from this command, you should connect to the CLI with a terminal program, such as puTTY, that logs output. Otherwise, you will likely not be able to access all the output information from the command.

In the following output, only the HTTP entries are displayed. The other protocols have been removed in an attempt to shorten the output. There will be separate entries for each supported protocol (HTTP, SMTP, POP3, IMAP, FTP, and NNTP) in each section of the output.

For more information on session statistics, see "Session table" on page 728.

To check sessions in use and related errors - CLI

```
FGT# # get test app proxyworker 4

The output from this command falls into the following sections:

- **HTTP Common current connections —** There is an entry for each protocol that displays the connections currently used, and the maximum connections allowed. This maximum is for the UTM proxy which means all the protocols connections combined cannot be larger than this number. To support this, note that the maximum session count for each protocol is the same. You may also see a line titled `Max Concurrent Connections` for each protocol. This number is the maximum connections of this type allowed at one time. If VDOMs are enabled, this value is defined either on the global or per-VDOM level at *VDOM* > *Global Resources* or in the CLI at `config system resource-limits`.
- **Worker Stat —** This is statistics about the UTM proxy including how long it has been running, and how many errors it has found.
- **HTTP Stat —** This section includes statistics about the HTTP protocol proxy. This is a very extensive list covering errors, web responses, and any UTM positive matches. There are similar sections for each protocol, but the specific entries in each vary based on what UTM scanning is looking for in each — spam control for email, file transfer blocking for FTP, and so on.
- **Worker Accounting —** Lists accounting information about the UTM proxy such as polling statistics, how many sessions were scanned, and how many were just accepted. This information can tell you if expect AV scanning is taking place or not. Under normal operation there should be no errors or fails.
- **HTTP Accounting —** The accounting sections for each protocol provide information about successful session creation, failures, how many sessions are being scanned or filtered, and how many are client or server originated. If setup_fail is larger than zero, run the command again to see if it is increasing quickly. If it is, your FortiGate unit may be in conserve mode.

Related commands

To clear the UTM proxy statistics

```
# get test app proxyworker 8
```

To drop all idle connections

```
# get test app proxyworker 222
```

To display statistics per VDOM

```
# get test app proxyworker 4444
```

For additional related commands, see "get test" on page 853.

Examine the firewall session list

One further step is to examine the firewall session. The firewall session list displays all the sessions the FortiGate unit has open. You will be able to see if there are strange patterns such as no sessions apart from the internal network, or all sessions are only to one IP address.

When examining the firewall session list in the CLI, filters may be used to reduce the output. In the web-based manager, the filters are part of the interface.

To examine the firewall session list - web-based manager

1 Go to *System* > *status* > *Dashboard* > *Top Sessions*.

This widget can display information as either a bar graph or a table.

2 Select *Detach*, and then *Details*.

3 Expand the session window to full screen to display the information.

4 Change filters, view associated security policy, column ordering, and so on to analyze the sessions in the table.

5 Select the delete icon to terminate the session.

To examine the firewall session list - CLI

When examining the firewall session list, there may be too many sessions to display. In this case it will be necessary to limit or filter the sessions displayed by source or destination address, or NATed address or port. If you want to filter by more than one of these, you need to enter a separate line for each value.

The following example shows filtering the session list based on a source address of 10.11.101.112.

```
FGT# diag sys session filter src 10.11.101.112
FGT# diag sys session list
```

The following example shows filtering the session list based on a destination address of 172.20.120.222.

```
FGT# diag sys session filter dst 172.20.120.222
FGT# diag sys session list
```

To clear all sessions corresponding to a filter - CLI

```
FGT# diag sys session filter dst 172.20.120.222
FGT# diag sys session clear
```

Check source NAT information

Remember NAT when troubleshooting connections. NAT is especially important if you are troubleshooting from the remote end of the connection outside the FortiGate unit firewall. On the dashboard session list, pay attention to *Src address after NAT*, and *Src port after NAT*. These columns display the IP and port values after NAT has been applied.

The NAT values can be helpful to ensure they are the values you expect, and to ensure the remote end of the sessions can see the expected IP address and port number.

When displaying the session list in the CLI, you can match the NATed source address (`nsrc`) and port (`nport`). This can be useful if multiple internal IP addresses are NATed to a common external facing source IP address.

```
FGT# diag sys session filter nsrc 172.20.120.122
FGT# diag sys session filter nport 8888
```

```
FGT# diag sys session list
```

Checking wireless information

Wireless connections, stations, and interfaces have different issues that other physical interfaces.

Troubleshooting station connection issue

To check whether station entry is created on Access Control:

```
FG600B3909600253 # diagnose wireless-controller wlac -d sta
* vf=0 wtp=70 rId=2 wlan=open ip=0.0.0.0 mac=00:09:0f:db:c4:03
rssi=0 idle=148 bw=0 use=2
 vf=0 wtp=70 rId=2 wlan=open ip=172.30.32.122
mac=00:25:9c:e0:47:88 rssi=-40 idle=0 bw=9 use=2
```

Enable diagnostic for particular station

This example uses the station MAC address to find where it is failing:

```
FG600B3909600253 # diagnose wireless-controller wlac sta_filter
00:25:9c:e0:47:88 1
Set filter sta 00:25:9c:e0:47:88 level 1
FG600B3909600253 # 71419.245 <ih> IEEE 802.11 mgmt::disassoc <==

```

Other diagnose commands

Diagnose commands are a series of commands available on all FortiGate units. These commands can help you troubleshoot network activity. The packet sniffer mentioned earlier is only one of many useful diagnose commands.

For additional diagnostic commands, see “Troubleshooting ‘get’ commands” on page 805.

Troubleshooting advanced

There are issues other than connectivity that require troubleshooting. These are more advanced issues that may require investigating a number of different issues before the problem is solved.

The advanced troubleshooting sections include, and can help answer the following questions:

- "Traffic shaping issues" on page 789

  Is an application or user consuming all your network bandwidth?

  Do some applications need more bandwidth than they are getting?

  Is less bandwidth allowed than expected on a connection?

  Are sessions or packets being dropped?

- "User and administrator logon issues" on page 793

  Are one or more of your users unable to log on to the network?

  Are one or more of your users unable to initiate VPN connections?

  Are you having problems logging in to administrator accounts?

- "IPsec VPN issues" on page 797

  Are VPN negotiations slow?

  Are VPN connections not completing the initial Phase 1 handshake?

  Is the IPsec VPN tunnel down?

For connectivity troubleshooting tips, see "Troubleshooting common issues" on page 763.

In addition to these steps, you may find diagnose commands useful. See "Other diagnose commands" on page 803.

Traffic shaping issues

Traffic shaping, or Internet Traffic Management Practices (ITMP), is often thought of as a preventative measure, but it can also be used effectively in troubleshooting when you have some application or some user consuming all the bandwidth.

This topic includes the following:

- Use traffic shapers to limit traffic in testing and network simulations
- Monitoring traffic
- Displaying configured traffic shaping
- Troubleshooting protocols and users using traffic shaping
- Displaying current bandwidth and dropped packets for a traffic shaper

Use traffic shapers to limit traffic in testing and network simulations

Some applications require a minimum bandwidth to function properly. One example of this is VoIP — even if the packets are high priority, if too few are delivered the call quality suffers. When signs like this happen and you suspect it is a lack of bandwidth that is causing the problem, you can use traffic shapers to help confirm your problem.

One of the hardest parts of troubleshooting is reproducing the problem consistently, especially if the problem is intermittent. The understood best practice is to set up a test network to try and reproduce the behavior you have been seeing on your network so you will not be interrupting business.

Traffic shapers allow you to limit the bandwidth over a connection. This, in turn, allows you to simulate limited bandwidth to different parts of the network. You can experiment with your traffic shaper settings to discover at what point VoIP calls, for example, are unacceptably poor quality, and then you know were to set your lowest VoIP guaranteed minimum level. This can be done for many different applications, computers on the network, or users or user groups.

Monitoring traffic

Traffic shaping is best used with a traffic monitor, such as the Traffic History widget that is available on the Dashboard. Configure two — one to watch the internal interface and another for the external interface. Run these monitors for a while before trying the traffic shaping procedures to get a feel for your bandwidth usage.

To configure two traffic history monitors - web-based management

1. Go to *System* > *Dashboard* > *Status*.
2. Select *Widget* > *Traffic History*.
3. Select the edit icon in the widget's menu bar.
4. Name the widget Internal, and select the Internal interface to monitor.
5. Enable *Refresh*, and select *OK*.
6. Repeat steps 2 through 5 selecting and naming this second monitor external.

Let the monitors run for a while to display network traffic before starting troubleshooting. The times you start and stop traffic on the FortiGate unit is displayed in the monitors. It may be advisable to take screen captures of the monitors at each stage for easier comparison later.

Displaying configured traffic shaping

It can be difficult to either find the traffic shaping settings that are needed, or to see all the settings in one place. Both of these can be accomplished through CLI commands.

```
# diagnose firewall shaper traffic-shaper { list | stats | state }
```

This CLI diagnose command provides information about shared traffic shaper.

- ***list —*** Lists all the configured shared traffic-shapers. This is the same as going to *Firewall* > *Traffic Shapers* > *Shared* in the web-based manager. However, you can specify additional parameters to narrow down the traffic shapers that are matched. For example if you add `policy 7 ipv4`, it will only display traffic shapers that are associated with security policy number seven and then only the IPv4 traffic numbers. You must specify either `ipv4` or `ipv6` since security policies can be either IPv4 or IPv6. Apart from current-bandwidth and packets dropped, all the information is from the configuration.

Sample output:

```
# diag firewall shaper traffic-shaper list policy 4 ipv4

name traffic_test_app
maximum-bandwidth 12 KB/sec
guaranteed-bandwidth 0 KB/sec
current-bandwidth 0 B/sec
priority 3
policy 4
packets dropped 0
```

- ***stats —*** Display statistics for the traffic shaper. Add `list` to the command to view the stats. The stats are very brief — number of shapers, number of IPv4 shapers, number of IPv6 shapers, and number of packets dropped. Or, you can wipe the stats by adding the word `clear` on the end of the command. This will remove all store statistics and start fresh.
- ***state —*** Displays the total number of global traffic shapers. This is useful if VDOMs are enabled on your FortiGate unit as it will list all traffic shapers on your FortiGate unit. This command has no additional arguments.

Troubleshooting protocols and users using traffic shaping

To find a protocol or user who is using all the bandwidth, create two security policies and have them handle all the traffic on the network — one has all the users or protocols in it and the other has none to start with. The first security policy will have traffic shaping applied to all its members, so the problem will go away. However, to locate the offender, move users or protocols from the first policy with traffic shaping to the second policy that has no traffic shaping. It is easy to see who the offender is because when that protocol or user is moved to the unlimited policy, the bandwidth usage will sky rocket again. Once you have found the offender, you can either finish checking all the others, or assume that one was the only problem and put the regular security policies back in place.

One way to accomplish this test is create a VDOM, and funnel all traffic through the VDOM using an inbound and outbound inter-VDOM links. This will allow you to keep most of your security policies in place and create the new traffic shaping policies in the new VDOM. Once the test is finished, you simply delete the VDOM and its configuration.

To create a traffic shaping security policy to limit FTP bandwidth usage

1 Go to *Firewall* > *Traffic Shaper* > *Shared*.

2 Select *Create New*.

3 Enter the following information and select *OK*.

Name	traffic_app_test
Apply Shaper	Per Policy
Maximum Bandwidth	Enable and enter 100.
Guaranteed Bandwidth	Disable
Traffic Priority	Medium

4 Go to *Firewall* > *Policy* > *Policy*.

The following steps will override any existing security policies. ***Do not perform these steps on a live network without notifying users first***. Optionally, use the VDOM method mentioned earlier to limit disruption of users.

5 Select *Create New*.
6 Select any and all for source and destination interfaces and addresses.
7 Select *always* for *schedule.*
8 For service, select *Multiple* and enter all the FTP related entries.
9 Select *ACCEPT* for *Action*.
10 Enable NAT.
11 Enable *Traffic Shaping*, and select *traffic_test_app*.
12 Select *OK*.
13 Select the new security policy in the list.
14 Select *Move*, and insert it before Seq. No. 1.
15 Repeat steps 5 through 10, but for service select all services.

   This works because the first policy will catch all FTP traffic first before it gets to this policy.

16 Select *OK*.
17 Select the new security policy in the list.
18 Select *Move*, and insert it below Seq. No. 1.

This procedure creates two security policies that will catch all the traffic — the first one catches all FTP traffic and limits its bandwidth, and the second one matches everything else. If FTP is found to not be the problem, it is easy to remove FTP from the first policy and add a different protocol or group of protocols to see if they are responsible.

Once the bandwidth consuming protocol is discovered, it can be traffic shaped using security policies (clone existing policies and change the first one to only apply to that protocol with the traffic shaping applied), users can be informed to limit their use of that protocol or application, or that protocol could be blocked completely.

Using traffic shaping to troubleshoot users

Troubleshooting users with traffic shaping is very much like troubleshooting protocols. The difference is that the list of users is changed instead of the list of services.

Displaying current bandwidth and dropped packets for a traffic shaper

If you believe the wrong amount of traffic is going through a specific traffic shaper, you may want to see how much traffic is going through.

```
FGT # get firewall shaper traffic

[myTrafficShaper]
maximum-bandwidth: 1200 KB/sec
guaranteed-bandwidth:     100 KB/sec
current-bandwidth:      227328 B/sec
priority: medium
packets dropped: 25
```

This command is per-VDOM, so if VDOMs are enabled ensure you are in the correct VDOM before running the command.

`myTrafficShaper` is a shared traffic shaper. Some of the output displayed has different meanings depending how this shaper is applied. If this shaper is applied to only one security policy, then the numbers displayed are for the traffic flowing through that one security policy. But if this shaper is applied to multiple policies, the `current-bandwidth` and `packets dropped` will be combined for all instances, and will be less useful for troubleshooting.

For this reason, if possible, either create multiple copies of the traffic shaper with different names to allow for easier troubleshooting, or if possible disable all security policies but one until you get the information you need.

Traffic shaper drops packets

If `packets dropped` is above zero, that means the maximum-bandwidth was reached and traffic was dropped to stay at or under the limit. To prevent dropped packets, increase the `maximum-bandwidth` or create a new traffic shaper for this traffic. If the traffic must never be dropped, consider increasing the `priority` to high or not using a traffic shaper at all for this traffic.

No effect for shaper priority change

If changing the `priority` does not affect which traffic is being dropped first when the `maximum-bandwidth` level is reached, it may be that the traffic is going through a virtual interfaces do not have priority queues, only physical interfaces have multiple queues for priority traffic. Examples of virtual interfaces include inter-VDOM links, VLANs, aggregated links, and redundant links.

User and administrator logon issues

Few problems are more troublesome for users or administrators than when they are unable to log onto the company network. There are a number of potential reasons for these problems. Once the reason for the issues are found, the administrator should follow the appropriate policies to resolve the problems, notifying affected users if warranted.

Administrator logon issues can be more serious. However, in most cases if remote admin access is not available the console interface is still available. Many problems such as limited IP address access, limited protocol access, and so on are not an issue when using the console interface.

This topic includes the following:

User logon issues

This topic includes the following:

Use correct username and password combination for user

This may be obvious, but it should be the first thing to check. While there are valid reasons for a user to forget their information or enter the wrong information, they may be trying to use the information of another user to gain illegal access to the company network. If this is the case, you do not want to waste time on any additional troubleshooting. Also if this is the case it will generally be a single user with problems instead of a group of users.

Check authentication security policies

One or more security policies allow or deny a user group access to the network. If one or more users have authentication problems, it is possible there were firewall changes or the user may have had their group memberships recently changed resulting in changes to network access.

To check the security policies that apply to the group test

1 Go to *User* > *User Group* > *User Group*.

2 Expand *Firewall* if required.

You should pay attention to the user groups that include the affected user or users. Take special attention if multiple affected users are all part of one group.

3 Go to *Policy* > *Policy* > *Policy*.

Ensure the *Authentication* column is visible. If not, do the following to show the column:

- Select *Column Settings.*
- Move *Authentication* to the list on the right.
- Move the *Authentication* entry to your preferred place in the list using the *Move up* and *Move down* buttons.
- Select *OK*.

4 Locate one or more authentication policies that authenticate the user group or groups this user belongs to as noted earlier. The user group or groups that a security policy authenticates will appear in the Authentication column.

5 Edit these security policies to inspect the details of the security policy or policies to determine what methods of authentication are required, and other relevant information.

6 Either adjust the requirements to enable user access, move user to their own group with a new security policy to troubleshoot the problems without affecting other users, or use the information in the policy to farther troubleshoot the user problems.

Use proper two-factor authentication code (FortiToken or delivered code)

When two-factor authentication is enabled for a user or admin account, the user requires more than just their username and password to logon. They require a certificate, a FortiToken device, or an authentication code sent either as email or a text message. When in place, this information is prompted for on the logon screen no matter if the user is connecting with FortiClient, VPN, or other logon screen. If there is no prompt for your token code, two-factor authentication is not enabled and not required.

It is possible with no prompt that two-factor authentication may be enabled using certificates.

To verify there is a certificate to authenticate

1 Go to *User* > *User Group* > *User Group*.

2 Expand *Firewall* if required.

You should pay attention to the user groups that include the affected user or users. Take special attention if multiple affected users are all part of one group.

3 Go to *Policy* +> *Policy* > *Policy*.

Ensure the Authentication column is visible. If not, do the following to show the column:

- Select *Column Settings.*
- Move *Authentication* to the list on the right.
- Move the *Authentication* entry to your preferred place in the list using the *Move up* and *Move down* buttons.
- Select *OK*.

4 Locate one or more authentication policies that authenticate the user group or groups this user belongs to as noted earlier. The user group or groups that a security policy authenticates will appear in the Authentication column.

5 Edit these security policies to look for any that use certificate authentication.

Identify which certificate is required, and ensure the user has that certificate installed on their system.

User credentials must exist on the remote server (remote authentication)

Before configuring FSSO or the FortiGate unit for remote authentication, the user credentials must exist on the remote server.

When FSSO is being configured, it must be able to contact the remote authentication server, such as Windows AD server, for user login information.

Administrator logon issues

In addition to the common user issues such as security policies, administrators have some unique problems users do not experience. Some common administrator access issues include:

- Allow access for interface is not enabled
- Trusted hosts for admin account will not allow current IP
- FortiGate asking for password when creating a remotely authenticated administrator account

Allow access for interface is not enabled

Each interface in FortiOS has a set of administrator access protocols — HTTP, HTTPS, SSH, TELNET, PING, and SNMP. These are the methods an administrator can use to connect to FortiOS, and any or all of them may be disabled on any interface.

IPv4 protocols are treated differently from IPv6 protocols an must be enabled separately. This provides added security.

When a FortiGate unit is shipped, all access on external interfaces is disabled by default except for PING for troubleshooting purposes. This means any attempt by an administrator to logon over a dmz interface will be blocked by default.

The following procedures demonstrate enabling full access on dmz interface. For security purposes, you should only enable access that is required. If you open access for troubleshooting, remember to disable it afterwards. Failure to do so will leave a gap in your security that hackers may be able to exploit.

To enable administrator access on the dmz interface - web-based manager

1. Log on as administrator.
2. Go to *System* > *Network* > *Interface*, select the dmz interface, and select *Edit*.
3. Under *Administrative Access*, select HTTPS, PING, HTTP, SSH, SNMP, and TELNET.
4. If you use IPv6, select the above protocols to be used for IPv6 administrative access.
5. Select *OK*.
6. Repeat for each interface where administrative access is required.

To enable administrator access on the dmz interface - CLI

```
config system interface
  edit dmz
    set allowaccess HTTPS PING HTTP SSH SNMP TELNET
    set allowaccess6 HTTPS PING HTTP SSH SNMP TELNET
  next
end
```

Trusted hosts for admin account will not allow current IP

A trusted host is a location that is secure where an administrator is allowed to logon. For example on a secure network an administrator would be able to logon from an internal subnet but not from the Internet.

If external administrator logon is required, a secure VPN tunnel can be established with a set IP address or range of addresses that are entered as a trusted host address.

Trusted host logon issues occur when an administrator attempts to logon from an IP address that is not included in the trusted host list.

To verify trusted host logon issues - web-based manager

1. Record the IP address where the administrator is attempting to logon to the FortiGate unit.
2. Logon to the FortiGate unit using a working admin account.
3. Go to *System* > *Admin*> *Administrators*.
4. Select the admin account in question and select *Edit*.
5. Compare the listed trusted hosts to the IP address the attempted logon is coming from. If there is a match, the problem is not due to trusted hosts.
6. If there is no match and the new address is valid (secure), add it to the list of trusted hosts.
7. Select *OK*.

If the problem was due to trusted hosts, the admin account will be able to logon now.

To verify trusted host logon issues - CLI

1 Record the IP address where the administrator is attempting to logon to the FortiGate unit.

2 Log on to the FortiGate unit using the console connection for your FortiGate unit.

3 Enter the following CLI commands:

```
config system admin
  edit <admin_account>
  get
```

This will display all the settings for this admin account, including trusted hosts

4 Compare the listed trusted hosts to the IP address the attempted logon is coming from. If there is a match, the problem is not due to trusted hosts.

5 If there is no match and the new address is valid (secure), add it to the list of trusted hosts using the following CLI commands:

```
  set trusthost3 <ipv4_addr> <ipv4_netmask>
next
end
```

Use the numbered trusthost that follows the last configured trusthost. For example if trusthost, trusthost1, and trusthost2 are in use you will use trusthost3.

If the problem was due to trusted hosts, the admin account will be able to log on now.

FortiGate asking for password when creating a remotely authenticated administrator account

Local administrator accounts require you to enter a password so the administrator can be locally authenticated when logging on. A remote administrator account uses a remote authentication server to authenticate the administrator when logging on instead of using a local password.

When you are creating a remote administrator account, if you leave out the password you will not be able to create the administrator account. This password field is a required field.

For remote administrator accounts, the password field is backup password. During normal operations this account will authenticate remotely. However, if the authentication server is not reachable, authentication will occur at the local level instead to ensure administrator access is available.

IPsec VPN issues

VPN problems are more complex than many networking issues because of the layers of configuration required.

In general when troubleshooting IPsec VPN connections you should check:

- Is the tunnel up? If not, check phase 1 and phase 2 settings
- Are packets using the proper route? See “Verify the contents of the routing table (in NAT mode)” on page 778.
- Is there a proper security policy for the tunnel? See “Examine the firewall session list” on page 787.

This topic focuses on the following VPN tunnel related issues:

- VPN negotiations appear to be slow

VPN negotiations appear to be slow

Possible causes of slow VPN negotiations include the following:

Many VPN negotiations take time

When a VPN connection is being negotiated, it takes a while to establish the connection. The upper limit on the number of VPN IKE negotiations is roughly 60 per second. This assumes there are no problems with the negotiations. Large installations may notice this time as a delay. For example, if there are 1000 connections to negotiate it would take roughly 17 seconds. This amount of delay cannot be improved upon.

Keep VPN information up to date

Many failed negotiations will result in longer delays. Possible out of date information can include changed routing information, computer for failed negotiations include

Check for routing problems

Routing problems on your network will increase delays as well. Problems such as split horizon and asymmetric routing will cause problems for all network traffic, including VPN negotiating.

For example, if you run the CLI command `diag ip route list`, the IPsec phase1 route entry should be before the system default entry. Otherwise, it is possible all traffic is wrongly using the system default route.

If you use the phase 1 CLI command `set default-go` but don't have a static route entry, traffic coming through the tunnel will use the system default route.

To solve this problem, add a static route for the appropriate VPN destination subnet before the system default in the table. This will provide a more specific match that will use the route you want.

Limit number of P1 proposals

If there are a number of P1 proposal combinations on each end, it may take a while to negotiate the connection. Every combination may be tried. For example if each end has two proposals that will result in four attempts, three results in nine, and five in 25.

VPN tunnel proposal will not connect

When attempting to establish a VPN tunnel, both ends must have at least one proposal that matches. This will be the settings they use to establish the tunnel and additional security and protocols.

Ensure you are not using a loopback for the local VPN interface. If you are, the tunnel will not be established.

The Local Interface field in Phase 1 VPN configuration should not be configured to point to a loopback interface. By design, the IPsec tunnel will not be established.

Each end of the attempted connection may have multiple protocols configured. While this gives a broader range of settings for a better chance of a match, it can result in long rambling attempts to connect that are difficult to troubleshoot.

Best practices are to set the proposal information on each end to exactly the same and it will match with only one proposal definition required. However, frequently you do not have access to both ends of the proposed tunnel and instead have to match the other end.

If you are trying to offload VPN processing to a network processing unit (NPU), remember that only SHA1 authentication is supported. For high levels of authentication such as SHA256, SHA384, and SHA512 hardware offloading is not an option — all VPN processing must be done in software.

To determine what the other end of the VPN tunnel is proposing

1 Start a terminal program such as puTTY and set it to log all output.

When necessary refer to the logs to locate information when output is verbose.

2 Log on to the FortiGate unit using a super_admin account.

3 Enter the following CLI commands.

4 Display all the possible IKE error types and the number of times they have occurred:

```
diag vpn ike errors
```

5 Check for existing debug sessions:

```
diag debug info
```

If a debug session is running, to halt it enter:

```
diag debug disable
```

6 Confirm your proposal settings:

```
diag vpn ike config list
```

7 If your proposal settings do not match what you expect, make a change to it and save it to force an update in memory. If that fixes the problem, stop here.

8 List the current vpn filter:

```
diag vpn ike filter
```

9 If all fields are set to any, there are no filters set and all VPN ike packets will be displayed in the debug output. If your system has only a few VPNs, skip setting the filter.

If your system has many VPN connections this will result in very verbose output and make it very difficult to locate the correct connection attempt.

10 Set the VPN filter to display only information from the destination IP address for example 10.10.10.10 :

```
diag vpn ike log-filter dst-addr4 10.10.10.10
```

To add more filter options, enter them one per line as above. Other filter options are displayed in Table 54.

Table 54: Filter options for diag vpn ike filter

clear	Erases the current filter.
dst-addr6	The IPv6 destination address range to filter by.
dst-port	The destination port range to filter by.
interface	Interface that IKE connection is negotiated over.

Table 54: Filter options for diag vpn ike filter

list	Displays the current filter.
name	The phase1 name to filter by.
negate	Negate the specified filter parameter.
src-addr4	The IPv4 source address range to filter by.
src-addr6	The IPv6 source address range to filter by.
src-port	The source port range to filter by.
vd	Index of virtual domain. 0 matches all.

11 Start debugging:

```
diag debug app ike 255
diag debug enable
```

12 Have the remote end attempt a VPN connection.

If the remote end attempts the connection, they become the initiator. This situation makes it easier to debug VPN tunnels because then you have the remote information and all of your local information. by initiate the connection, you will not see the other end's information.

13 If possible go to the web-based manager on your FortiGate unit, go to the VPN monitor and try to bring the tunnel up.

14 Stop the debug output:

```
diag debug disable
```

15 Go back through the output to determine what proposal information the initiator is using, and how it is different from your VPN P1 proposal settings.

Things to look for in the debug output of attempted VPN connections are shown in Table 55.

Table 55: Important terms to look for in VPN debug output

`initiator`	Starts the VPN attempt, in the above procedure that is the remote end.
`responder`	Answers the initiator's request.
`local ID`	In aggressive mode, this is not encrypted.
`error no SA proposal chosen`	There was no proposal match — there was no encryption-authentication pair in common, usually occurs after a long list of proposal attempts.
`R U THERE and R U THERE ack`	dead peer detection (dpd), also known as dead gateway detection — after three failed attempts to contact the remote end it will be declared dead, no farther attempts will be made to contact it.
`negotiation result`	Lists the proposal settings that were agreed on.
`SA_life_soft and SA_life_hard`	Negotiating a new security association (SA) key, and the key life.

Table 55: Important terms to look for in VPN debug output

`R U THERE`	This is the keep alive message. The reply is R U THERE ack. If you see this, it means Phase 1 was successful.
`tunnel up`	The negotiation was successful, the VPN tunnel is operational.

VPN Tunnel up but no traffic going over it

You can see in the VPN monitor that your tunnel is up, but the packet or byte count isn't is still at zero even though you are sending packets.

Some possible causes include:

- **NAT issues** — for single hops, you do not want to enable NAT on an IPsec policy, but for return packets from multiple hops you may need incoming NAT turned on or the packets won't know how to return.
- **Routing** — if you have default routing, it may not be enough if you are trying to reach a computer two or more hops away over the VPN tunnel. In that case, include a specific route for that subnet you are attempting to contact.
- **Check IP address of tunnel** — confirm the IP address of the tunnel ends as its possible they were assigned addresses you were not expecting.
- **Security policy** — you need a security policy to handle VPN traffic, either route based or policy based. Ensure if you specify a range of IP addresses that the VPN tunnel is part of that range.

Other useful VPN IKE related commands

There are a series of useful diagnose commands for VPN IKE.

They all start with `diag vpn ike <arg>`. Table 56 lists options for `<arg>`.

Table 56: List of arguments for diag vpn ike CLI command

`config list`	Lists all the IKE configurations.
`counts`	Displays list of IKE objects and their current, maximum, and total counts. For example: crypto.md5: now 0 max 1 total 24
`crypto`	Either sets or displays hardware or software crypto settings. `crypto hardware` - use hardware crypto (where possible) `crypto software` - use software crypto `status` - show number of hardware and software crypto objects

`filter`
`log filter`
`log-filter`
	Sets the IKE filter. See Table 54 on page 799.

`gateway`	Displays VPN IKE gateways. Optionally clear or flush (same result) the gateways in memory.

Table 56: List of arguments for diag vpn ike CLI command

`restart`	Restarts the IKE daemon. This is useful if during troubleshooting you discover that settings in memory do not match what you set. All VPN connections will be lost when restarting. If you have active VPN connections, give those connections sufficient notice to close gracefully.
`routes list`	Displays all routes in memory for IKE VPN tunnels.
`status`	Displays status of IKE objects. `detailed` - lists vdom, name, version, IKE SA, and IPsec SA `summary` - lists number of IKE SA and IPsec SA objects

Logging

The following contains information regarding troubleshooting logging issues on the unit.

This topic contains the following:

Cannot log to a supported log device

If you are unable to log to a log device that is supported by the FortiGate unit, try the following:

- verify that the information you entered is correct; it could be a simple mistake within the IP address or you did not select *Apply* on the Log Settings page which would not apply the settings.
- use `execute ping` to see if you can ping to the log device; if unable to ping to the log device check to see if the log device itself working.
- if the unit has stopped logging, see "The FortiGate unit stopped logging: what happened?" on page 802.

The alert email did not send an email to the email address

Verify that the alert email configuration settings are correct; an alert email will not be sent if the email address requires authentication and *Authentication* and its settings are not configured. Use *Test Connectivity* after verifying the alert email configuration settings see if a test alert email is sent to the address or addresses.

The FortiGate unit stopped logging: what happened?

If your FortiGate unit contains an SQL database, and when you log into the web-based manager you see an SQL database error message, it is because the SQL database has become corrupted. You must make sure to back up your logs at that point and then rebuild the database.

If the FortiGate unit stopped logging to a device, test the connection between both the FortiGate unit and device using the `execute ping` command. The log device may have been turned off, is upgrading to a new firmware version, or just not working properly. After determining that there are no logs being sent, see "Cannot log to a supported log device" on page 802.

Other diagnose commands

Diagnose and get commands are available on all FortiGate units. They can help you troubleshoot network activity. The `diag debug` command mentioned earlier is only one of many useful diagnose commands.

For additional diagnostic commands, see “Troubleshooting ‘get’ commands” on page 805.

Troubleshooting ‘get’ commands

This section lists CLI `get` commands that you can use to troubleshoot problems with your FortiGate unit. This is not an exhaustive list, the grammar of the commands will change without notice, and this list does not include any diagnose commands.

Each CLI command includes its scope when VDOMs are enabled on the FortiGate unit as either VDOM or global. This indicates where in the CLI you must be to run the command. For more detailed information on the areas of FortiOS these commands relate to, see the corresponding sections in the FortiOS Handbook.

This section contains the following topics:

exec tac report

Displays in-depth debugging information including hardware and software status as well as information, configuration, and debug outputs.

This command runs a series of other CLI get, show, and diagnose commands that include:

```
get system status
get system performance status
show system interface
diagnose ip address list
show full-configuration system dns
show full-configuration system global
show full-configuration system settings
diagnose hardware lspci -v
get hardware memory
get hardware memory
diagnose hardware sysinfo shm
diagnose ip arp list
get router info kernel
diagnose ip router command show show int
diagnose ipv6 neighbor-cache list
diagnose ipv6 route list
diagnose ipv6 ipv6-tunnel list
diagnose ipv6 sit-tunnel list
diagnose ips anomaly list
diagnose ips anomaly status
diagnose ips dissector status
diagnose ips packet status
diagnose ips raw status
get ips session
diagnose sys session6 stat (similar ipv4 outupt from get system
    session-info full-stat)
get system auto-update status
get system auto-update versions
diagnose test update info
diagnose sys flash list
diagnose sys logdisk smart
diagnose sys logdisk status
diagnose sys ha status
diagnose sys ha showcsum
diagnose sys ha hadiff status
diagnose sys ha dump 1 - 8
get sys session-info statistics (similar output to get system
    session-info full-stat)
```

Syntax

```
exec tac report
```

Parameters

None.

Usage/Remarks

This command provides extremely detailed information about your FortiGate unit. Fortinet support may request that you run this command and send them the output when they are troubleshooting a FortiGate problem with you.

When you run this command, it will take a few minutes to collect and display all the information. Your console program (telnet, ssh, or other such program) should log the output to file. Otherwise, the output will scroll by too fast to see.

No output is listed for this command because the output is extensive, and many of the commands from this report are described elsewhere in this section.

Do not include the output from this command in FortiCare tickets unless it is specifically requested by support personnel.

Scope: Global

get firewall iprope appctrl

Displays the list of applications defined in the application control list.

Syntax

```
get firewall iprope appctrl list
get firewall iprope appctrl status
```

Parameters

None.

Usage/Remarks

Use this command to view the rules defined for peer to peer, or the status of those rules.

Scope: Vdom

Output Example

```
FGT # get firewall iprope appctrl list
   app-id=17953      list-id=2004  action=Pass
   app-id=17954      list-id=2004  action=Pass
   app-id=17956      list-id=2004  action=Pass
   app-id=17957      list-id=2004  action=Pass
   app-id=107347980  list-id=2004  action=Pass
   app-id=108855300  list-id=2004  action=Pass
   app-id=109051910  list-id=2004  action=Pass
   app-id=109051912  list-id=2004  action=Pass

FGT # get firewall iprope appctrl status
   appctrl table 3 list 1 app 1083 shaper 0
```

Keyword/Variable	Description
list	Display all the application IDs, which list they are in by ID, and the action taken for each application.
status	Displays the number of ipropes for application control tables, lists, applications, and traffic shapers.

get firewall iprope list

Displays the rules defined in the selected policy group. If no parameter is entered, all the rules of every policy group are displayed. The information is extensive details about the selected firewall policy.

Syntax

```
get firewall iprope list <policy group number>
```

Parameters

<policy group >	The number of the policy group as defined in the web-based manager, in *Policy* > *Policy* > *Policy*.

Usage/Remarks

Use this command to view the view the rules defined for a policy group. This is useful to understand the behavior of the policy group per protocol.

The policy group number is easiest to find by just running this command without the number (get firewall iprope list) and finding the group that includes your policy. For example if you have a traffic shaper for your security policy called shaper_test, look for that information in one of the policy group entries to ensure it is the correct one. After that you can use the policy group number to limit the output to only the group you want.

Scope: Vdom

Output Example

```
FGT # get firewall iprope list 0020005
policy flag (10809): log redir d_rm master
flag2 (0): shapers:
shaper_test(3/12800/64000)/shaper_test(3/12800/64000) per_ip=
imflag: sockport: 0 action: accept index: 1
schedule(always) group=00200005 av=00004e20 au=00000000 host=0
split=00000000
chk_client_info=0x0 app_list=0 ips_view=0 misc=0 grp_info=0 seq=0
hash=0
  tunnel=
zone(0): ->zone(0):
source(0):
dest(0):
source wildcard(0):
destination wildcard(0):
vip(2): 2 1
service(4):
[1:0x0:0/(0,65535)->(8,8)]
[6:0x0:0/(0,65535)->(443,443)]
[6:0x0:0/(0,65535)->(22,22)]
[6:0x0:0/(0,65535)->(80,80)]
nat(0):
```

```
mms: 0 0
```

policy flag (10809): log redir d_rm master	A series of options that are either on or off, including — log, redir, d_rm, master, pol_stats, auth, a_i, nlb, and nat. The number (10809) represents what flags are used. Using 10809 as an example, log redir, d_rm, and master flags are set.
flag2 (0): shapers: shaper_test(3/12800/64000)/shaper_test(3/12800/64000) per_ip=	Flags for various things including fc_chk and disclaim. Shapers lists the configured traffic shapers by name, separated for shared and per ip shapers.
imflag: sockport: 0 action: accept index: 1	action — This is the action the firewall policy will take, defined as one of ACCEPT, DENY, IPSEC, or SSL-VPN.
tunnel=	
source(0): dest(0):	The source or destination IP address or IP address range. For example an entry of `0.0.0.0-255.255.255.255` would be an address of `all`.
service(4):	This is a list of the services for this policy. The number is the number of services with entries that immediately follow.
[1:0x0:0/(0,65535)->(8,8)]	The first service entry, in this case from a list of four. It covers all ports on the source that are going to port 8 on the destination. If there was a range of ports, for example port 8000-8888, the entry would be ->(8000,8888).
nat(0):	
mms: 0 0	These values are only used for MMS related firewall entries. Only FortiOS Carrier support MMS traffic.

get firewall proute

Displays configured policy routes.

Syntax

```
get firewall proute
```

Parameters

None.

Usage/Remarks

Use this command to view the policy routes configured on this FortiGate unit's current VDOM.

Scope: Vdom

Output Example

```
FGT # get firewall proute

list route policy info(vf=root):

iff=12 src=10.10.10.0/255.255.255.0 tos=0x00 tos_mask=0x00
dst=10.10.11.0/255.255.255.0 protocol=11 port=1:65535
oif=13 gwy=0.0.0.0
```

Keyword/Variable	Description
vf	The current virtual domain (VDOM). All policy routes for this VDOM are displayed.
iff	Incoming interface
src	The source IP and netmask for incoming traffic to be matched to the policy
tos	Type of service bit pattern in hexadecimal. This is matched and is good for a specific TOS.
tos_mask	Type of service bit mask in hexadecimal. Masks out unwanted bits. This is good for matching multiple TOS values.
dst	The destination IP and netmask for incoming traffic to be matched to the policy.
protocol	The protocol number to be matched.
port	The range of ports to match for incoming traffic.
oif	Outgoing interface where traffic is being directed to.
gwy	Outgoing gateway where traffic is being directed to

get firewall shaper

Displays traffic shaper bandwidths or lists configured traffic shapers.

Syntax

```
get firewall shaper [ per-ip| per-ip-shaper| traffic| traffic-
shaper ]
```

Parameters

Keyword/Variable	Description
per-ip	Displays all configured per-ip traffic shapers with their configurations.
per-ip-shaper	Lists all configured per-ip traffic shapers.
traffic	Displays all configured shared traffic shapers with their configurations including current bandwidth usage.
traffic-shaper	Lists all configured shared traffic shapers.

Usage/Remarks

Use this command to view traffic shaper bandwidths with traffic levels, and list configured traffic shapers for either shared (traffic) or per-ip traffic shapers.

For per-ip and traffic commands, if there is no shaper configured none will be displayed.

Scope: Vdom

Output Example

```
FGT # get firewall shaper per-ip

[ip_test]
maximum-bandwidth: 12 KB/sec
maximum-concurrent-session: 100
packets dropped: 0
```

Keyword/Variable	Description
ip_test	The name of the configured per-ip traffic shaper.
12 KB/sec	The maximum allowed bandwidth for this traffic shaper. The web-based manager units for this field are kbits/sec where this value is in kBytes/sec. Any traffic for this IP address that is over this limit will be dropped. For example entering 100 kbits/sec results in a value of 12 kBytes/sec being displayed here.
100	The maximum allowed number of concurrent sessions for this traffic shaper. If the maximum is reached, no new sessions will be started on this IP address until another session ends.
0	The number of packets that have been dropped from traffic using this shaper. Packets at rates greater than the maximum bandwidth limit are dropped.

```
FGT # get firewall shaper traffic

[guarantee-100kbps]
maximum-bandwidth: 131072 KB/sec
guaranteed-bandwidth:     12 KB/sec
current-bandwidth:      0 B/sec
priority: high
tos ff
packets dropped: 0
```

Keyword/Variable	Description
guarantee-100kbps	The name of the configured shared traffic shaper. There are a number of default configured traffic shapers that include — guarantee-100kbps, high-priority, low-priority, medium-priority, and shared-1M-pipe.
131072 KB/sec	The maximum allowed bandwidth for this traffic shaper. Any traffic for this shaper that is over this limit will be dropped. The web-based manager units for this field are kbits/sec where this value is in kBytes/sec. For example entering 1 048 576 kbits/sec results in a value of 131 072 kBytes/sec being displayed here.
12 KB/sec	The guaranteed minimum bandwidth ensures there will never be less than this amount of bandwidth available.
0 B/sec	The current amount of traffic using this traffic shaper. If this shaper is not assigned to any security policies this value will be zero. Note that the units here are B/sec and not the KB/sec of the other fields for this command.
high	The quality of service (QoS) level for traffic using this shaper. Values can be low, medium, or high. Higher priority traffic will be queued ahead of lower priority traffic to ensure its guaranteed minimum bandwidth is met when necessary.
tos ff	The type of service (TOS) used in the TCP packet headers. It is used to enact the selected priority.
0	The number of packets that have been dropped from traffic using this shaper. Packets at rates greater than the maximum bandwidth limit are dropped.

get hardware cpu

Displays the CPU information.

Syntax

```
get hardware cpu
```

Parameters

None.

Usage/Remarks

Use this command to view the specifications about CPUs on the FortiGate unit. Multiple CPUs will each have an entry. Apart from the CPU model information (vendor, cpu family, model name, MHz, and cache size) you can use the flags to determine what features are supported. For example mmx, and 3dnow indicate Single instruction, multiple data (SIMD) support.

Scope: Global

Output Example

```
FGT # get hardware cpu
processor: 0
vendor_id: GenuineIntel
cpu family: 6
model: 5
model name: Celeron (Covington)
stepping: 0
cpu MHz: 1200.078
cache size: 64 KB
fdiv_bug: no
hlt_bug: no
f00f_bug: no
coma_bug: no
fpu: yes
fpu_exception: yes
cpuid level: 2
wp: yes
flags: fpu vme de pse tsc msr pae mce cx8 sep mtrr pge mca cmov pat
clflush dts acpi mmx fxsr sse sse2 ss tm pbe
bogomips: 2392.06
```

get hardware nic

Displays information and statistics for the network interface card (NIC) specified.

Syntax

```
get hardware nic <interface>
```

Parameters

<interface>	Enter the interface name. For example, internal, wan1, wan2.

Usage/Remarks

Use this command to view the interface information and statistics. This is useful when debugging network problems on a particular interface, or providing Customer Support with hardware information about your FortiGate unit.

This command is the only way for you to see your MAC both its original value (`Permanent_HWaddr`) and if it has changed as its current value (`Current_HWaddr`) as well.

The output will be different for different NICs and may include more fields or different information fields.

Scope: Global

Output Example

```
FGT # get hardware nic wan1
Description        sundance Ethernet driver1.01+LK1.21
chip_id            6
IRQ                5
System_Device_Name wan1
Current_HWaddr     00:09:0f:78:71:32
Permanent_HWaddr   00:09:0f:78:71:32
State              up

Link               up
Speed              100
Duplex             full
FlowControl        Tx off, Rx off
MTU_Size           1500

Rx_Packets         52377
Tx_Packets         53098
Rx_Packets           47029877
Tx_Bytes           7199983
Collisions         0
Rx_Missed_Errors   0
Tx_Carrier_Errors  0
```

Keyword/Variable	Description
`Description`	Name of the network driver.
`chip_id`	Id of the chipset

Keyword/Variable	Description
IRQ	IRQ
System_Device_Name	Network device name (i.e. The physical interface name).
Current_HWaddr	Current MAC address.
Permanent_HWaddr	Permanent MAC address.
State	Administrative status (up/down).
Link	Link status (up/down).
Speed	Negotiated or configured network speed.
Duplex	Negotiated or configured duplex mode.
Rx_Packets	Packets' number received by the network device.
Tx_Packets	Packets number transmitted by the network device.
Rx_Packets	Amount of bytes received on the interface.
Tx_Bytes	Amount of bytes sent from this interface.
Collisions	Number of collisions usually due mostly to incorrect incorrect speed or duplex settings.
Rx_Missed_Errors	Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count). Only valid in 1000M mode, which is marked by PHY.
Tx_Carrier_Errors	The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed, or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register is not valid in internal SerDes1 mode (TBI mode for the 82544GC/EI), and is only valid when the Ethernet controller is operating at full duplex.

get hardware memory

Displays the status of the system memory resources.

Syntax

```
get hardware memory
```

Parameters

None.

Usage/Remarks

Use this command to view the status of the memory resources. This is useful to confirm and identify any potential memory leaks or even to simply confirm that reduced FortiOS performance is due to a shortage of free memory.

Scope: Global

Output Example

```
FGT # get hardware memory

      total:    used:    free:  shared:   buffers: cached:  shm:
Mem:  261955584 97312768 164642816 0   217088 55382016 51322880
Swap:        0        0        0
MemTotal:       255816 kB
MemFree:        160784 kB
MemShared:           0 kB
Buffers:           212 kB
Cached:          54084 kB
SwapCached:          0 kB
Active:          22832 kB
Inactive:        31524 kB
HighTotal:           0 kB
HighFree:            0 kB
LowTotal:       255816 kB
LowFree:        160784 kB
SwapTotal:           0 kB
SwapFree:            0 kB
```

Keyword/Variable	Description
Mem	Memory size.
Swap	Amount of memory in the swap.
MemTotal	HighTotal + LowTotal = amount of memory available on the unit.
MemFree	Free memory on the unit.
SwapCached	Amount of memory out of the Swap, but remaining in the cache.
Active	Amount of memory recently used.
Inactive	Amount of memory which has not been used for a while.

Keyword/Variable	Description
HighTotal	Amount of memory which belongs to the zone ZONE_HIGHMEM.
LowFree	Amount of Free memory available in the zone ZONE_NORMAL.

get hardware npu list

Displays the network processing unit (NPU) devices and paired interface names.

This is important to know because the paired interfaces can offload their traffic from the main CPU to the NPU. This can only be accomplished with paired interfaces.

Syntax

```
get hardware npu { legacy | np1 | np2 | np4 } list
```

Parameters

`{ legacy | np1 | np2 | np4 }`	Specify which level of NPU interfaces are to be displayed.

Usage/Remarks

Use this command to view the NPU devices and port numbers. This is useful because some FortiOS products contain network processors. Network processor features, and offloading requirements vary by network processor model.

The output is grouped by the ID number. Each ID number has four interfaces associated with it. These are the interfaces that are available to create paired interfaces. This is because each such group is assigned to one NPU. Mixing interfaces from different NPUs is not allowed. For example, from the output example, you would not be able to pair port1 with port14. Use this information when configuring your paired interfaces for accelerated offloading.

If the specified version of NPU is not present on this FortiGate unit, a message indicating that will be displayed.

Scope: Global

Output Example

```
FGT # get hardware npu np1 list
ID   Interface
0    port9 port10

FGT # get hardware npu np2 list
ID PORTS
-- -----
0 port1
0 port2
0 port3
0 port4

ID PORTS
-- -----
1 port5
1 port6
1 port7
1 port8

ID PORTS
-- -----
```

```
2 port9
2 port10
2 port11
2 port12

ID PORTS
-- -----
3 port13
3 port14
3 port15
3 port16
```

Keyword/Variable	Description
ID	The ID of the NPU assigned to these ports.
Interface	The names of the interfaces in the NPU's paired group. An NPU can handle either two or four ports. Any incoming traffic on this group of ports that leaves the FortiGate unit on the same group of ports can be handled by the NPU. Otherwise, the FortiGate unit's CPU will be involved.
PORTS	The names of the interfaces in the NPU's group.

get hardware npu performance

Displays the NPU performance for ISCP2, messages, and NAT.

Syntax

```
get hardware npu { legacy | np1 | np2 | np4 }performance <dev_id>
```

Parameters

{ legacy | np1 | np2 | np4 }	Specify which level of NPU interfaces are to be displayed.
<dev_id>	NPU ID number. If you are unsure you can enter a "?" to get a list of available valid NPU ID numbers.

Usage/Remarks

Use this command to view the performance numbers for NPU devices. This can be useful when you are checking NPU traffic—either for specific problems or for network optimization.

Network processor features, and therefore offloading requirements, vary by network processor model.

The values displayed are divided into two sections. The first is the ISCP2 performance numbers. In this section, the values are mostly counts for the stated values. For example BADCSUM is the number of bad checksums encountered.

The last section starts with IRQ. This is a list of 18 different registers.

Scope: Global

Output Example

```
FGT # get hardware npu np2 performance 1
ISCP2 Performance:
Nr_int    : 0x00000005   INTwoInd  : 0x00000000  RXwoDone  :

```

Keyword/Variable	Description
ISCP2 Performance	This section displays information about the ISCP2 performance that includes packet, TCP, and IPsec counts and errors.
MSG Performance	This section displays information about message traffic performance.
NAT Performance	This section displays information about NAT traffic performance. If BYPASS is enabled, many of the counters will be zero.

get hardware npu status

Displays the specific network processor unit (NPU) status. NPUs are used to accelerate network traffic passing through the FortiGate unit by offloading work from the CPU. More advanced NPUs have higher numbers.

Syntax

```
get hardware npu { legacy | np1 | np2 | np4 }status <dev_id>
```

Parameters

{ legacy | np1 | np2 | np4 }	Specify which level of NPU interfaces are to be displayed.
<dev_id>	NPU ID number. If you are unsure you can enter a "?" to get a list of available valid NPU ID numbers.

Usage/Remarks

Use this command to display the status of the interfaces attached to the NPU. This can be useful for advanced users to debug traffic on the NPU interfaces.

If you enter an NPU or device ID that doesn't exist, an error message stating that it was an invalid NPU ID will be displayed.

Scope: Global

Output Example

```
FGT # get hardware npu np2 status 1
NP2 Status

ISCP2 c2160000 (Neighbor f7940000) 1a29:0703 256MB Base f8a5a000

```

get hardware status

Displays basic hardware information about the FortiGate unit.

Syntax

```
get hardware status
```

Parameters

None.

Usage/Remarks

Use this command to get basic information about your FortiGate unit's hardware.

This is a short list that can be used to help guide troubleshooting efforts, especially by customer service. For example, if there is supposed to be compact flash memory available but this command shows 0MB available, then you know there is a hardware problem with the memory. Also, if there are known issues with particular chipsets, this command will display chipset information for hardware such as network cards.

The CPU information can vary from simply the number of cores, to the more in-depth information listed here.

Scope: Global

Output Example

```
FGT # get hardware status
Model name: Fortigate-3810A
ASIC version: CP6
ASIC SRAM: 64M
CPU: Intel(R) Core(TM)2 Duo CPU     E4300  @ 1.80GHz
RAM: 3532 MB
Compact Flash: 122 MB /dev/hda
USB Flash: not available
Network Card chipset: Broadcom 570x Tigon3 Ethernet Adapter
   (rev.0x8003)
Network Card chipset: Intel(R) PRO/1000 Network Connection
   (rev.0006)Related Commands
```

get ips session

Displays the IPS session status. An Intrusion prevention system (IPS) is a network security device that monitors network and/or system activities for malicious or unwanted behavior and can react, in real-time, to block or prevent those activities.

Syntax

```
get ips session
```

Parameters

None.

Usage/Remarks

Viewing the IPS session status allows you to see if traffic is checked by the IPS engine and if the IPS engine is working as expected. You can see the type of traffic and how many sessions are being processed by the IPS engine. You can also see how much memory the IPS engine is using. The displayed information is repeated with short delays to provide a time-lapse view of the IPS sessions status.

Scope: Vdom

Output Example

```
FGT # get ips session

SYSTEM:
memory capacity           73400320
memory used                3982780
recent pps\bps             0\0K
session in-use             0
TCP: in-use\active\total 0\0\0
UDP: in-use\active\total 0\0\0
ICMP: in-use\active\total 0\0\0
```

Keyword/Variable	Description
memory capacity	Total memory capacity in system available to IPS.
memory used	Memory used by IPS sessions. If this value is high, close to the memory capacity, it will likely result in dropped packets and other issues.
recent pps\bps	Recent IPS traffic in packets per second (pps) and bits per second (bps). Use these numbers to determine the level of IPS traffic. If they are very high, there will likely be problems with the FortiGate unit's performance.
session in-use	Current number of IPS sessions in use.
TCP: in-use\active\total	The number of in use, active, and total Transmission Control Protocol (TCP) packets sent over this session.
UDP: in-use\active\total	The number of in use, active, and total User Datagram Protocol (UDP) packets sent over this session.
ICMP: in-use\active\total	The number of in use, active and total Internet Control Message Protocol (ICMP) packets sent over this session.

get router info kernel

Displays the entries in the kernel routing table.

Syntax

```
get router info kernel
```

Parameters

None.

Usage/Remarks

Use this command to view the kernel routing table.

Computers and network devices connected to the Internet use routing tables to compute the next hop destination for a packet. The routing kernel table is an table of routes to particular network destinations that is stored in a router or a networked computer. This information contains the topology of the network immediately around it. Building the routing table is the primary goal of routing protocols and static routes.

In the routing table, the information that displays allows you to see the type of route, the protocol used, and the priority of each entry. You can use "get router info routing-table all" on page 828 for more information on each routing entry.

Scope: Vdom

Output Example

```
FGT # get router info kernel
tab=254 vf=2 scope=0 type=1 proto=11 prio=0 0.0.0.0/0.0.0.0/0-
>192.168.0.0/24 pref=0.0.0.0 gwy=9.1.1.1 dev=5(port1)
```

Keyword/Variable	Description
192.168.0.0/24	The destination network or destination host.
gwy=9.1.1.1	The gateway address for the next hop.
dev=5(port1)	Interface to which packets for this route is sent.

get router info routing-table all

Displays the routing table.

Syntax

```
get router info routing-table all
```

Parameters

None.

Usage/Remarks

Use this command to view the routing table. This routing table may be larger and have more entries than the kernel routing table when using the `get router info kernel` command.

Computers and network devices connected to Internet use routing tables to compute the next hop destination for a packet. It is an table of routes to particular network destinations that is stored in a router or a networked computer. This information contains the topology of the network immediately around it.

Scope: Vdom

Output Example

```
FGT# get router info routing-table all

Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type
2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-
IS inter area
       * - candidate default

S*      0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C       10.31.101.0/24 is directly connected, internal
C       172.20.120.0/24 is directly connected, wan1
```

The output of this command is fairly self-explanatory; however, if you select a specific routing protocol (static, rip, etc) when entering the command, only that part of this larger list of entries will be displayed.

The default route is indicated by the asterisk (*).

How a route is connected to the FortiGate unit is important in determining priority. The two C entries state "is directly connected", which indicates the lowest possible hop count to get there.

get system arp

Displays the IPv4 ARP table.

Syntax

```
get system arp
```

Parameters

None.

Usage/Remarks

This command is useful to view or alter the contents of the kernel's ARP tables. For example. when you suspect a duplicate Internet address is the cause for some intermittent network problem.

This command is not available in multiple VDOM mode.

Scope: Vdom

Output Example

```
FGT # get system arp
Address     Age(min) Hardware Addr      Interface
172.20.120.16    0     00:0d:87:5c:ab:65    internal
172.20.120.138   0     00:08:9b:09:bb:01    internal
```

Keyword/Variable	Description
Address	The IP address that is linked to the MAC address. The default is 0.0.0.0
Age	Current duration of the ARP entry in minutes. The default is 0.
Hardware Addr	The hardware, or MAC address, to link with this IP address. The default is 00:00:00:00:00:00:
Interface	The physical interface of the FortiGate unit where the address is connected.

get system auto-update status

Use this command to display information about the status FortiGuard updates on the FortiGate unit.

Syntax

```
get system auto-update status
```

Parameters

None.

Usage/Remarks

Use this command when you need to view the current antivirus and IPS status from the FortiGate unit.

The status command is used to test the current connectivity status, and can retrieve configuration information, such as push updates, update schedules, or other parameters related to the FortiGuard service operation.

The versions command provides extended information about each FortiGuard component and its version, build number, contract expiry date, last update attempts and results.

`Result: Connectivity failure` indicates the connections to the FortiGuard servers is not possible. This may be a serious problem that needs to be addressed. Until it is solved, you may not receive any FortiGuard updates leaving your network vulnerable.

These commands also allow the user to check whether the FortiGate unit is running the latest AV and IPS packages.

Scope: Global

Output Example

```
FGT # get system auto-update status
FDN availability:  available at Mon May 26 20:16:43 2008

Push update: disable
Scheduled update: enable
          Update every:   1 hours at 16 minutes after the hour
Virus definitions update: enable
IPS definitions updates: enable
Server override: disable
Push address override: disable
```

```
Web proxy tunneling: disable
```

Keyword/Variable	Description
FDN availability	Specify availability status and last access time (access time corresponds to the scheduled update settings). Possible values are: available/unavailable.
Push update	Specify wether push update method is enabled or disabled. Possible values are: enable/disable
Scheduled update	Specify wether scheduled update is enabled or disabled. Possible values are: enable/disable.
Update every	If scheduled update is enabled, specify the time defined to launch the update.
IPS definitions updates	Specify wether the IPS definitions update is enabled or disabled. Possible values are: enable/disable.

Server override	Specify wether the use of another FDS server is enabled or disabled.
	Possible values are: enable/disable.
	If enabled a new line is displayed showing the FDS IP address defined in the configuration.
	For example:
	`Server override: enable`
	`  Server: 10.0.0.1`

Push address override	If push update is enabled, specify wether the Fortigate override address feature is enabled or disabled.
	Possible values are: enable/disable.
	If enabled, a new line is displayed showing the FDS IP address and the TCP port (a.b.c.d:port) defined in the configuration.
	Example:
	`Push address override: enable`
	`  Address: 10.0.0.2:9443`

Web proxy tunneling	Specify wether FortiGate device is using a proxy to retrieve AV and IPS definitions updates.
	Possible values are: enable/disable.
	If enabled, additional lines are displayed showing the proxy settings.
	Example:
	`Web proxy tunneling: enable`
	`  Proxy address: 10.0.0.3`
	`  Proxy port:  8890`
	`  Username:  foo`
	`  Password:  foo`

get system auto-update versions

Displays antivirus and IPS engines and definitions, and license information.

Syntax

```
get system auto-update versions
```

Parameters

None.

Usage/Remarks

Use this command to view the antivirus and IPS engines and definitions and license information. This is useful in determining when the antivirus engine, virus definitions, attack definitions, IPS attack definitions, AS Rule set, AS engine, and FDS address were last updated, as well as when their contracts expire, which version they are using, and the result of the last update.

Scope: Global

Output Example

```
FGT # get system auto-update versions

AV Engine
---------
Version: 3.003
Contract Expiry Date: n/a
Last Updated using manual update on Wed Jan  9 18:26:00 2008
Last Update Attempt: n/a
Result: Updates Installed

Virus Definitions
---------
Version: 8.631
Contract Expiry Date: n/a
Last Updated using manual update on Tue Jan 15 14:27:00 2008
Last Update Attempt: n/a
Result: Updates Installed

Attack Definitions
---------
Version: 2.461
Contract Expiry Date: n/a
Last Updated using manual update on Fri Jan 18 11:23:00 2008
Last Update Attempt: n/a
Result: Updates Installed

IPS Attack Engine
---------
Version: 1.091
Contract Expiry Date: n/a
Last Updated using manual update on Wed Jan  9 18:22:00 2008
Last Update Attempt: n/a
```

```
Result: Updates Installed

FDS Address
---------
```

Keyword/Variable	Description
`Version`	Version number of the engine or the definitions.
`Contract Expiry Date`	The date the contract expires.
`Last Updated using manual update on`	Date of the last manual update.
`Last Update Attempt`	The date when the last update was attempted.
`Result`	The status of the last update.

get system ha status

Use this command to display information about an HA cluster. The command displays general HA configuration settings. The command also displays information about how the cluster unit that you have logged into is operating in the cluster.

Syntax

```
get system ha status
```

Parameters

Scope: Global.

Usage/Remarks

Usually you would log in to the primary unit CLI using SSH or telnet. In this case the `diagnose system ha status` command displays information about the primary unit first, and also displays the HA state of the primary unit (the primary unit operates in the work state).

For a virtual cluster configuration, the `diagnose system ha status` command displays information about how the cluster unit that you have logged into is operating in virtual cluster 1 and virtual cluster 2. For example, if you connect to the cluster unit that is the primary unit for virtual cluster 1 and the subordinate unit for virtual cluster 2, the output of the `diagnose system ha status` command shows virtual cluster 1 in the work state and virtual cluster 2 in the standby state. The `diagnose system ha status` command also displays additional information about virtual cluster 1 and virtual cluster 2.

See the *FortiGate CLI Reference Guide* or the *High Availability* handbook chapter more information.

Scope: Global

Output Example

```
FGT # get system ha status
Model: 5000
Mode: a-a
Group: 0
Debug: 0
ses_pickup: disable
load_balance: disable
schedule: round robin
Master:128 5001_Slot_4 FG50012204400045 1
Slave :100 5001_Slot_3 FG50012205400050 0
number of vcluster: 1
vcluster 1: work 10.0.0.2
Master:0 FG50012204400045
Slave :1 FG50012205400050
```

Keyword/Variable	Description
`Model`	The FortiGate model number.
`Mode`	The HA mode of the cluster: `a-a` or `a-p`. If the unit is not in HA mode, standalone will be displayed.

Keyword/Variable	Description
Group	The group ID of the cluster.
Debug	The debug status of the cluster.
ses_pickup	The status of the session pick-up feature, also known as session failover. Session failover means that a cluster maintains active network TCP and IPsec VPN sessions after a device or link failover. Session failover does not failover UDP, multicast, ICMP, or SSL VPN sessions. In some cases UDP sessions may be maintained after a failover.
load_balance	The status of the load-balance-all keyword: enable or disable. Relevant to active-active clusters only.
schedule	The active-active load balancing schedule. Relevant to active-active clusters only.
Master Slave	Master displays the device priority, host name, serial number, and cluster index of the primary (or master) unit. Slave displays the device priority, host name, serial number, and cluster index of the subordinate (or slave, or backup) unit or units. The list of cluster units changes depending on how you log into the CLI. Usually you would use ssh or telnet to log in to the primary unit CLI. In this case, the primary unit would be at the top the list followed by the other cluster units. If you use the execute ha manage command or a console connection to log in to a subordinate unit's CLI, and then enter diagnose system ha status, the subordinate unit that you have logged into appears at the top of the list of cluster units.
number of vcluster	The number of virtual clusters. If virtual domains are not enabled, the cluster has one virtual cluster. If virtual domains are enabled, the cluster has two virtual clusters.

get system performance firewall

Displays the status of important software and hardware systems on your FortiGate unit.

Syntax

```
get system performance firewall packet-distribution
get system performance firewall statistics
```

Parameters

None

Usage/Remarks

Use this command to quickly see information about traffic through the firewall.

The `packet-distribution` command divides network traffic into ten different packet sizes and lists the number of packets received in each category. This can help you spot hacking attempts, or optimize your network.

The `statistics` command provides packet and byte counts for different major protocols and packet types through the firewall. Packet types include TCP, UDP, ICMP, and IP.

Scope: All (Global and Vdom)

Output Example

```
FGT# get sys per firewall packet-distribution
getting packet distribution statistics...
0 bytes — 63 bytes: 3624747 packets
64 bytes — 127 bytes: 802612 packets
128 bytes — 255 bytes: 371774 packets
256 bytes — 383 bytes: 712180 packets
384 bytes — 511 bytes: 30691 packets
512 bytes — 767 bytes: 57220 packets
768 bytes — 1023 bytes: 23460 packets
1024 bytes — 1279 bytes: 3055 packets
1280 bytes — 1500 bytes: 64 packets
> 1500 bytes: 0 packets

FGT# get sys per firewall statistics
getting traffic statistics...
Browsing: 708624 packets, 408018318 bytes
DNS: 411789906583486464 packets, 0 bytes
E-Mail: 0 packets, 0 bytes
FTP: 0 packets, 0 bytes
Gaming: 0 packets, 0 bytes
IM: 0 packets, 0 bytes
Newsgroups: 0 packets, 0 bytes
P2P: 0 packets, 0 bytes
Streaming: 0 packets, 0 bytes
TFTP: 201239863725391872 packets, 56530359549952 bytes
VoIP: 3543070 packets, 25 bytes
Generic TCP: 55834574848 packets, 1786706395136 bytes
Generic UDP: 0 packets, 0 bytes
```

```
Generic ICMP: 0 packets, 0 bytes
Generic IP: 0 packets, 0 bytes
```

get system performance status

Displays the status of important software and hardware systems on your FortiGate unit.

Syntax

```
get system performance status
```

Parameters

None.

Usage/Remarks

Use this command to quickly see important information about your FortiGate unit's state. Information includes CPU usage, memory usage, network usage, number of sessions, viruses caught, IPS attacks blocked, and FortiGate unit uptime. These numbers provide a quick look at how the FortiGate unit is doing. If any one number needs attention, you can use other commands to get more information on that area.

For example, if the CPU states show 98 percent system, you know that your FortiGate unit is running at full capacity and you need to check the processes to see if any one process is using all the resources and if there are valid reasons for it.

Another example is that if memory usage is near 100 percent, AV failover may occur which, if enabled, may pass traffic without being scanned or refuse new connections.

Scope: All (Global and Vdom)

Output Example

```
FGT# get sys performance status
CPU states: 0% user 0% system 0% nice 100% idle
Memory states: 10% used
Average network usage: 0 kbps in 1 minute, 0 kbps in 10 minutes,
   13 kbps in 30 minutes
Average sessions: 31 sessions in 1 minute, 30 sessions in 10
   minutes, 31 sessions in 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 44 days,  18 hours,  42 minutes
```

get system performance top

Displays the processes running on your FortiGate unit.

Syntax

```
get system performance top <delay> <max_lines>
```

Parameters

delay	The amount of time, in seconds, in which the process information is polled. The default is 5 seconds.
max_lines	The maximum number of processes displayed in the output. The default is 20 lines.

Usage/Remarks

Use this command when you need to view the processes running and the information about each process. It displays as a static set of columns where the information changes in place. To exit this display, press <Ctrl-C>.

Scope: All (Global and Vdom)

Output Example

```
FGT # get system performance top 5 20
Run Time:  0 days, 1 hours and 53 minutes
1U, 1S, 97I; 248T, 99F, 73KF
            newcli      113       S       1.0     2.1

              authd       52       S       0.0     1.7
```

Keyword/Variable	Description
Run Time	Displays how long the FortiOS has been running as a string
U	User CPU usage (%)
S	System CPU usage (%)
I	Idle CPU usage (%)

Keyword/Variable	Description
T	Total memory
F	Free memory
KF	Kernel-free memory
Column 1	Process name
Column 2	Process identification (PID)
Column 3	One letter process status. S: sleeping process R: running process <: high priority
Column 4	CPU usage (%)
Column 5	Memory usage (%)

get system session-helper

Displays the session helper table IDs.

FortiGate units use session helpers to process sessions that have special requirements. Session helpers function like proxies by getting information from the session and performing support functions required by the session.

Syntax

```
get system session-helper
```

Parameters

None.

Usage/Remarks

Use this command to display if any of the pre-defined session-helpers are in use.

Scope: Global

Output Example

```
FGT # get system session-helper
== 1 ==
== 2 ==
== 3 ==
== 4 ==
== 5 ==
== 6 ==
== 7 ==
== 8 ==
== 9 ==
== 10 ==
== 11 ==
== 12 ==
== 13 ==
== 14 ==
== 15 ==
== 16 ==
== 17 ==
== 18 ==
== 19 ==
== 20 ==
```

Keyword/Variable	Description
1...20	If one of the pre-defined session helpers is in use, it will be listed here.

get system session-info full-stat

Displays the system's full session state.

Syntax

```
get system session-info full-stat
```

Parameters

None.

Usage/Remarks

Use this command to display in-depth information session info about the system's state. This includes session table size, expected session table size, session count, firewall error details, and more.

This data can provide an important picture of what is happening on your FortiGate unit, for example:

- if the ephemeral buffer is full, you have a very busy device which may indicate a DoS attack is under way. See `ephemeral=2/32752`.
- if there are many sessions in a SYN_SENT state to the point of causing other problems, you may be experiencing a SYN flood type DoS attack. See `10 in SYN_SENT state`.
- if the HTTP proxy is too busy to handle new connections, then the ACCEPT queue fills up, and resets if it completely fills up, resetting the user's connection. See `acceptqf=0`.

Scope: Global

Output Example

```
FGT # get system session-info full-stat
session table: table_size=131072 max_depth=1 used=50
expect session table: table_size=2048 max_depth=1 used=2
  misc info: session_count=167 setup_rate=0 exp_count=0 clash=0
  memory_tension_drop=0 ephemeral=2/32752 removeable=134
     ha_scan=0 delete=0 flush=0 dev_down=0/0
  TCP sessions
   6 in ESTABLISHED state
   10 in SYN_SENT state
   25 in TIME_WAIT state
   60 in CLOSE state
   6 in CLOSE_WAIT state
  firewall error stat:
  error1=00000000
  error2=00000000
  error3=00000000
  error4=00000000
  tt=00000000
  cont=0000630f
  ids_recv=0000dd8e
  url_recv=00000000
  av_recv=00000000
  fqdn_count=00000000
```

```
tcp reset stat:
syncqf=0 acceptqf=0 no-listener=0 data=0 ses=0 ips=0
global: ses_limit=0 ses6_limit=0 rt_limit=0 rt6_limit=0
```

The session setup rate is the second item on the first line of output. The information provided by this command includes:

Keyword/Variable	Description
session table	
table_size=131072	The maximum number of entries possible in the session table.
max_depth=1	
used=50	The number of session entries in the session table
expect session table	
table_size=2048	The maximum number of entries possible in the expect session table.
max_depth=1	
used=2	The number of expect session entries in the expect session table.

Keyword/Variable	Description
misc info:	
session_count=167	The number of sessions in the kernel.
setup_rate=0	How fast sessions have been created.
exp_count=0	The number of expect sessions in the kernel.
clash=0	Count of the collisions that occurred during the creation of a new session.
memory_tension_drop=0	Number of dropped sessions due to the system running out of memory.
ephemeral=2/32752	The ephemeral buffer is used to protect against DoS attacks. It is a type of input buffer so the real session table does not get overloaded if a DoS attack does happen. The first number is how many sessions are in use, and the second number is the maximum number allowed. If the two numbers are close, it is a good chance there is a DoS attack underway, such as a DDoS using UDP packets.

Keyword/Variable	Description
TCP sessions	During the lifetime of a TCP session, it changes state to reflect what stage it is at — starting a connection, established, or closing.
6 in ESTABLISHED state	The connection has been established and is ready for data transfer.

10 in SYN_SENT state	The FortiGate unit is waiting for the remote end of the session to acknowledge the SYN that was sent.
	If there are many sessions in this state, a SYN flood DoS attack may be in progress.
	To reduce the number of sessions in the SYN_SENT state, or half open state, you can reduce the wait period using the CLI command:
	`config system global`
	`  set tcp-halfopen-timer XX`
	`end`
	where XX is the number of seconds to wait for the peer to respond before closing the connection. The valid range is from 1 to 86 400, and the default is 60 seconds. Reducing this value will free up half-open sessions before the session table completely fills up.

25 in TIME_WAIT state	The state when a connection termination request is sent to wait for enough time to ensure the remote end received acknowledgement of the termination request.
	If there are too many sessions in TIME_WAIT state, you can reduce the wait period using the CLI command:
	`config system global`
	`  set tcp-timewait-timer XX`
	`end`
	where XX is the number of seconds to wait before closing the session. The valid range is 0 to 300 seconds, with the default being 120 seconds. A value of zero indicates no wait.

60 in CLOSE state	The session is closed.

6 in CLOSE_WAIT state	The session is being closed by the FortiGate unit— there will be no more data from the sender. This waits for the last ACK before going to the CLOSE state.
	If there are a lot of sessions in this state, also called half closed state, you can reduce the timer using the CLI command:
	`config system global`
	`  set tcp-halfclose timer XX`
	`end`
	where XX is the number of seconds to wait after one peer has sent a FIN packet for this session. The valid range is 0 to 86 400 seconds, with the default being 120 seconds.

Keyword/Variable	Description
firewall error stat:	
error1=00000000	This indicates there was a mismatch between the encryption state of the packet received and the session the packet belongs to. Either the packet was plain text when the session says it should have been decrypted (such as during a spoof), or the packet was decrypted properly but the session has no associated IPsec tunnel.

Keyword/Variable	Description
tcp reset stat:	
syncqf=0	**SYN queue full —** Reset happens when the syn queue is full. FortiGate sends a reset (RST) when any of the following occur: • syn queue full • accept queue full • FortiGate unit goes into conserve mode • CPU use is too high (queues aren't served correctly, and backlog increases) When this happens, the remote end will TCP timeout and close the TCP session, while on the FortiGate side the TCP session will go to a CLOSE_WAIT state.
acceptqf=0	**ACCEPT queue full —** When a new packets comes in for a new session before being transmitted to the application layer of the device they are stored in a kernel queue. When this queue gets full, it means that the application layer was not able to process the packet. This is a symptom of an overloaded FortiGate unit. This happens when the new session rate of traffic being handled by proxy is too high.
no-listener=0	Packet was received, but there is no service to handle it.

get system session-info list

Displays detailed session configuration information for sessions.

Syntax

```
get system session-info list
```

Parameters

None.

Usage/Remarks

Use this command to tell you the default time to live setting for sessions. All sessions created will have this length of time before they expire and need to create a new session table entry.

Scope: Global

Output Example

```
FGT # get system session-info list
   session info: proto=17 proto_state=00 duration=4685 expire=174
      timeout=0 flags=00000000 sockflag=00000000 sockport=0
      av_idx=0 use=4
   origin-shaper=
   reply-shaper=
   per_ip_shaper=
   ha_id=0 hakey=30944
   policy_dir=0 tunnel=/
   state=local may_dirty rem
   statistic(bytes/packets/allow_err): org=39032/119/1 reply=0/0/0
      tuples=2
   orgin->sink: org pre->in, reply out->post dev=2->9/9->2
      gwy=255.255.255.255/0.0.0.0
   hook=pre dir=org act=noop 172.20.120.225:68-
      >255.255.255.255:67(0.0.0.0:0)
   hook=post dir=reply act=noop 255.255.255.255:67-
      >172.20.120.225:68(0.0.0.0:0)
   misc=0 policy_id=0 id_policy_id=0 auth_info=0 chk_client_info=0
      vd=0
   serial=0002dcfe tos=ff/ff ips_view=0 app_list=0 app=0 dd_type=0
      dd_rule_id=0
   per_ip_bandwidth meter: addr=172.20.120.225, bps=112
```

Keyword/Variable	Description
session info:	
proto=17	The protocol this packet contains. Common protocol numbers include 17 (UDP), 6 (TCP), 47(GRE), 89(OSPF), and 1 (ICMP). See Assigned Internet Protocol Numbers.

Keyword/Variable	Description
proto_state=00	`proto_state` has two digits to keep track of the original direction and the reply direction. There are different states for each of TCP, SCTP, and UDP. ICMP traffic has no state and will always show as proto_state=00. For example if a TCP session has proto_state=67, the originator has closed the session, and the responder is waiting for the last ACK or halfclose timer to expire. TCP packet states 0 - none 1 - ESTABLISHED 2 - SYN_SENT 3 - SYN & SYN/ACK 4 - FIN_WAIT 5 - TIME_WAIT 6 - CLOSE 7 - CLOSE_WAIT 8 - LAST_ACK 9 - LISTEN SCTP packet states 0 - SCTP_S_NONE 1 - SCTP_S_ESTABLISHED 2 - SCTP_S_CLOSED 3 - SCTP_S_COOKIE_WAIT 4 - SCTP_S_COOKIE_ECHOED 5 - SCTP_S_SHUTDOWN_SENT 6 - SCTP_S_SHUTDOWN_RECD 7 - SCTP_S_ACK_SENT 8 - SCTP_S_MAX UDP packet states 0 - Reply Not Seen 1 - Reply Seen
`duration=4685`	The number of seconds since this session was created.
`expire=174`	The number of seconds until this session expires. GRE sessions have a very large expire value. This is to prevent them from timing out, and dropping the GRE session.
`timeout=0`	If there is a timer that will expire, this is the number of seconds until that timer expires. One example is the standard session ttl timer is 3600 seconds.

Keyword/Variable	Description

`origin-shaper=`
`reply-shaper=`
`per_ip_shaper=`
	The traffic shapers applied to traffic from the origin, from the responder (reply), or any per IP traffic shapers.
	The value is the name of the shaper that has been applied.

`ha_id=0`	The cluster ID. in an HA cluster.
`tunnel=/`	If this session is over a tunnel, this displays information about the tunnel.

Keyword/Variable	Description	
state=local may_dirty rem	The status of the session. Possible states include:	
	br	Session is being bridged, that is, in transparent mode.
	ext	Session is created by a firewall session helper.
	log	Session is being logged
	local	Session is originating from, or destined for, a local stack.
	may_dirty	Session is created by a policy. For example, the session for FTP channel control will have this state but the FTP data channel will not.
	ndr	Session will be checked by an IPS signature.
	nds	Session will be checked by an IPS anomaly.
	npu	Session will possibly be offloaded to NPU.
	wccp	Session is handled by WCCP.

Keyword/Variable	Description
misc=0 vd=0	misc displays the security policy's ID. Each security policy has an identifier, such as 20004. If this session has a UTM profile applied to it, misc indicates which one it is. vd is the VDOM this security policy applies to.
policy_id=0	The ID number of the security policy that matches this session.
auth_info=0	If an authentication policy is applied, this displays the ID of that policy. For example an IBP would be listed here.

statistic(bytes/packets/allow_err):	
org=39032/119/1	The bytes, packets, and errors sent from the original direction.
reply=0/0/0	The bytes, packets, and errors sent from the reply direction.

serial=0002dcfe	A counter that rolls over. This value is the same for parent and child sessions.
tos=ff/ff	Type of Service (TOS) from the TOS field in the packet header. The values apply to origin and reply directions accordingly.
dd_type=0 dd_rule_id=0	Data re-duplication (dd) values. These are associated with WAN Opt. Rule ID matches the WAN Opt rule number.

per_ip_bandwidth meter:	
addr=172.20.120.225,	The IP address this meter applies to.
bps=112	The bytes per second bandwidth for this IP address.

get system session-info ttl

Displays the system session time to live (ttl) configuration.

Syntax

```
get system session-info ttl
```

Parameters

None.

Usage/Remarks

Use this command to tell you the default time to live setting for sessions. All sessions created will have this length of time before they expire and need to create a new session table entry.

A similar command is `get system session-ttl` . It provides similar output.

Scope: Vdom

Output Example

```
FGT # get system session-info ttl
default             : 3600
port:
```

Keyword/Variable	Description
default	The default is one hour or 3600 seconds.
port	The session port.

get system startup-error-log

Displays any start-up configuration errors on the console.

Syntax

```
get system startup-error-log
```

Parameters

None.

Usage/Remarks

Use this command to view the start-up configuration errors on the console. If there are no errors, this command displays the http-err webproxy replacement message settings.

Scope: Global and Vdom

Output Example

```
FGT # get system startup-error-log
>>>  config system replacemsg webproxy "http-err"
>>>      set buffer "<html><head><title>%%HTTP_ERR_CODE%%
%%HTTP_ERR_DESC%%</title></head><body><font size=2><table
width=\"100%\"><tr><td bgcolor=#3300cc align=\"center\"
colspan=2><font color=#ffffff><b>%%HTTP_ERR_CODE%%
%%HTTP_ERR_DESC%%</b></font></td></tr></table><br><br>The
webserver for %%PROTOCOL%%%%URL%% reported that an error occurred
while trying to access the website.  Please click <u><a
href=\"javascript:history.back()\">here</a></u> to return to the
previous page.<br><br><hr></font></body></html>"
>>>      set header http
>>>      set format html
```

get system status

Displays basic information about a FortiGate unit.

Syntax

```
get system status
```

Parameters

None.

Usage/Remarks

Use this command to display basic information about your FortiGate unit such as firmware version, serial number, hostname, number of VDOMs, HA mode, and system time.

Scope: Global and Vdom

Output Example

```
FGT # get system status
Version: Fortigate-3810A v4.0,build0418,110209 (Interim)
Virus-DB: 11.00782(2010-05-07 00:42)
Extended DB: 1.00001(2010-05-21 13:37)
IPS-DB: 2.00910(2010-12-02 17:49)
FortiClient application signature package: 1.393(2011-06-06
   17:13)
Serial-Number: FG3K8A3407600241
BIOS version: 04000009
Log hard disk: Not available
Hostname: FG3K8A3407600241
Operation Mode: NAT
Current virtual domain: root
Max number of virtual domains: 10
Virtual domains status: 1 in NAT mode, 0 in TP mode
Virtual domain configuration: disable
FIPS-CC mode: disable
Current HA mode: standalone
Distribution: International
Branch point: 418
Release Version Information: Interim
System time: Tue Jun  7 14:40:16 2011
```

get test

Displays information statistics, control proxies, and status.

Syntax

```
get test <application> <level>
```

Parameters

application	acd — Aggregate Controller ddnscd — ddnscd daemon dhcprelay — dhcprelay dnsproxy — dns proxy ftpd — ftp proxy http — http proxy im — im proxy imap — imap proxy ipldbd — ipldbd daemon ipsengine — ips sensor ipsmonitor — ips monitor l2tpcd — l2tpcd nntp — nntp proxy pop3 — pop3 proxy proxyacceptor — proxy acceptor proxyworker — proxy worker scanunit — scanning unit sflowd — sflowd smtp — smtp proxy snmpd — snmpd daemon urlfilter — urlfilter daemon vs — virtual-server wad — wan optimization proxy wccpd -wccp daemon
<level>	1: Dump Memory Usage 2: Drop all connections 22: Drop max idle connections 222: Drop all idle connections 4: Display connection stat 44: Display info per connection

	444: Display connections per state 4444: Display per-VDOM statistics 44444: Display information about idle connections
	5: Toggle AV Bypass mode. Toggle AV bypass mode. You can use this level to diagnose AV scanning. When bypass mode is activated, no AV scanning is done on traffic handled by the proxy. **Note:** Antivirus scanning is disabled. 6: Toggle Print Stat mode every ~40 seconds 7: Toggle Backlog Drop 8: Clear stats 88: Toggle statistic recording — stats cleared 9: Toggle Accounting info for display 99: Restart proxy. When you suspect abnormal behavior of the proxy, you can use this level value to restore it to its normal state. **Note:** You will have a disruption in services. 11: Display the SSL session ID cache statistics 12: Clear the SSL session ID cache statistics 13: Display the SSL session ID cache 14: Clear the SSL session ID cache **Note:** Not all level numbers may be applicable to all applications. Use the command `diagnose test application <application> 0` to see a list of valid commands.

Usage/Remarks

Use this command to display information about advanced FortiOS applications such as SSL, and VoIP.

Scope: Global

Output Examples

```
FGT # get test ftpd 1

HTTP Proxy Test Usage

Fortigate-1000#
malloc memory usage
==================

```

get test urlfilter

Displays statistics, clears the cached, increases the timeout values, and many other functions for the URL filter engine.

Syntax

```
get test application urlfilter <number>
```

Parameters

<number>	1 — This menu 2 — Clear cache 3 — Display WF cache contents 4 — Display WF cache TTL list 5 — Display WF cache LRU list 6 — Display WF cache in tree format 7 — Toggle switch for dumping unrated packet 8 — Increase timeout for polling 9 — Decrease timeout for polling 10 — Print debug values 11 — Clear Spam Filter cache 12 — Clear AV Query cache 13 — Toggle switch for dumping expired license packets 14 — Show running timers (except request timers) 144 — Show running timers (including request timers) 15 — Send INIT requests 16 — Display WF cache contents of prefix type 99 — Restart the urlfilter daemon

Usage/Remarks

Use this command to troubleshoot and work with the URL filter engine. If you do not include one of the numbers listed above, the list of numbers will be displayed for you.

Scope: Global

Output Example

```
FGT # get test urlfilter 3
utree_stat: keylen=223 nodes=15 leaf=11
com.cisco.www cate = 52 len=13 ch=1
dhtml_pulldown/dropdownlib-100.js cate = 52 len=33 ch=0
niffer/snifflib-100.js cate = 52 len=22 ch=0
potlight/spotlightlib-120.js cate = 52 len=28 ch=0
offer/sp/cookie.js cate = 52 len=18 ch=0
cisco_detect.js cate = 52 len=15 ch=0
flyouts.js cate = 52 len=10 ch=0
global.js cate = 52 len=9 ch=0
hbx.js cate = 52 len=6 ch=0
```

```
sitewide_tools.js cate = 52 len=17 ch=0
windowutil.vb cate = 52 len=13 ch=0
```

get vpn ipsec stats crypto

Displays information about IPsec VPN cryptographic statistics.

Syntax

```
get vpn ipsec stats crypto
```

Parameters

None.

Usage/Remarks

Use this command to display which crypto devices are used with VPN connections such as 3DES, SHA1, and so on. A zero indicates that type of crypto is not used with any VPN connections. This command can be useful to help enforce the use of more secure crypto.

In the output, you should be aware that there is hardware (CP6) and software crypto categories. There are also separate columns for encrypted (outbound) and decrypted (inbound), or generated (outbound) and validated (inbound).

Scope: Vdom

Output Example

```
FG10CH3G09603750 # get vpn ipsec stats crypto
IPsec crypto devices in use:

CP6 (encrypted/decrypted):
        null:   0       0
        des:    0       0
        3des:   0       0
        aes:    0       0
CP6 (generated/validated):
        null:   0       0
        md5:    0       0
        sha1:   0       0
        sha256: 0       0

SOFTWARE (encrypted/decrypted):
        null:   0       0
        des:    0       0
        3des:   0       0
        aes:    0       0
SOFTWARE (generated/validated):
        null:   0       0
        md5:    0       0
        sha1:   0       0
        sha256: 0       0
```

get vpn ipsec stats tunnel

Displays information about IPsec VPN tunnels.

Syntax

```
get vpn ipsec stats tunnel
```

Parameters

None.

Usage/Remarks

Use this command to display information about IPsec VPN tunnels including how many of each type (static, dynamic, or manual addressing), how many errors there have been, and how many selectors there are.

Scope: Vdom

Output Example

```
FG10CH3G09603750 # get vpn ipsec stats tunnel
tunnels
  total: 1
    static/ddns: 1
    dynamic: 0
    manual: 0
  errors: 0
selectors
  total: 1
  up: 1
```

get vpn ipsec tunnel details

Displays detailed information about IPsec VPN tunnel.

Syntax

```
get vpn ipsec tunnel details
```

Parameters

None.

Usage/Remarks

Use this command to display in depth information about IPsec VPN tunnels. This command is useful when troubleshooting VPN tunnels due to the amount of information displayed.

Scope: Vdom

Output Example

```
FG10CH3G09603750 # get vpn ipsec tunnel details

gateway
  name: 'ph1'
  type: policy-based
  local-gateway: 172.16.68.34:0 (dynamic)

```

get vpn ipsec tunnel summary

Displays brief information about IPsec VPN tunnel.

Syntax

```
get vpn ipsec tunnel summary
```

Parameters

None.

Usage/Remarks

Use this command to display brief information about IPsec VPN tunnels including their name, IP address and port, how many selectors that tunnel has, and packets received, sent, and in error. This information is displayed for each tunnel defined.

Scope: Vdom

Output Example

```
FG10CH3G09603750 # get vpn ipsec tunnel summary
'ph1' 172.16.68.35:0  selectors(total,up): 1/1  rx(pkt,err): 0/0
   tx(pkt,err): 0/0
```

get vpn status ssl hw-acceleration-status

Displays the status of SSL hardware accelerated VPN connections.

Hardware acceleration can be accomplished in a number of ways. Some FortiGate models incorporate network processors (NPUs) in the main unit, others support the addition of AMC (Advanced Mezzanine Card) modules. The FortiGate-5000 series supports rear transition modules (RTMs) that incorporate network processors.

Syntax

```
get vpn status ssl hw-acceleration-status
```

Parameters

None.

Usage/Remarks

Use this command to display the status of SSL hardware accelerated VPN connections. This is useful if you need to troubleshoot a VPN connection that should be accelerated but is not.

Scope: Vdom

Output Example

```
FGT # get vpn status ssl hw-acceleration-status
Acceleration hardware detected: kxp=on cipher=on
```

get vpn status ssl list

Displays the status of list of SSL VPN connections.

Syntax

```
get vpn status ssl list
```

Parameters

None.

Usage/Remarks

Use this command to display the status of SSL list of VPN connections.

Scope: Vdom

Output Example

```
FGT # get vpn status ssl list
SSL VPN is disabled.
```

get webfilter ftgd-statistics

Displays the FortiGuard rating statistics.

Syntax

```
get webfilter ftgd-statistics
```

Parameters

None.

Usage/Remarks

Use this command to display many details about your FortiGuard statistics. These numbers can be useful in determining the source of a problem. For example DNS failures can reveal the source of problems that may be widespread and hard to track back to the source.

Scope: Global

Output Example

```
FGT # get webfilter ftgd-statistics
Rating Statistics:
==================
DNS failures                    :          3
DNS lookups                     :         16
Data send failures              :        876
Data read failures              :          0
Wrong package type              :          0
Hash table miss                 :          1
Unknown server                  :          0
Incorrect CRC                   :          0
Proxy request failures          :          0
Request timeout                 :        292
Total requests                  :          0
Requests to FortiGuard servers  :          0
Server errored responses        :         11
Relayed rating                  :          0
Invalid profile                 :          0

Allowed                         :          0
Blocked                         :          0
Logged                          :          0
Errors                          :          0

Cache Statistics:
==================
Maximum memory                  :          0
Memory usage                    :          0

Nodes                           :          0
   Leaves                       :          0
   Prefix nodes                 :          0
   Exact nodes                  :          0
```

```
Requests                        :          0
Misses                          :          0
Hits                            :          0
Prefix hits                   :          0
Exact hits                    :          0

No cache directives             :          0
Add after prefix                :          0
Invalid DB put                  :          0
DB updates                      :          0

Percent full                    :          0%
  Branches                      :          0%
  Leaves                        :          0%
    Prefix nodes                :          0%
    Exact nodes                 :          0%

Miss rate                       :          0%
Hit rate                        :          0%
  Prefix hits                   :          0%
  Exact hits                    :          0%
```

Keyword/Variable	Description
DNS lookups	Number of DNS look-ups for the domain name of the requested URL.
Data send failures	Number of non-responsive servers.
Request timeout	Number of seconds for the request time-out. A FortiGate unit sends the URL rating request every 2 seconds.
Total requests	Total number of URL rating requests to cache and FortiGuard servers.
Requests to FortiGuard servers	Total number of URL rating requests to FortiGuard servers.
Relayed rating	The number of times the master communicates with FortiGuard servers and relays all URL rating requests from the slaves in a HA cluster.
Maximum memory	Amount of memory assigned to FortiGuard cache. The default is 2 percent.
Memory usage	The amount of memory used to store the URL tree.
Prefix nodes	The number of prefixes used for a URL to increase the cache hit rate.
Exact nodes	The number of exact matches used for a URL.

get webfilter status

Displays webfilter rating and server information from FortiGuard.

Syntax

```
get webfilter status <refresh rate>
```

Parameters

<refresh rate>	How often to refresh the server list(s).

Usage/Remarks

Use this command to display webfilter statistics and server information if the service is enabled.

If the service is not enabled, this command displays the language of the locale and states the service is not enabled.

This command was previously called `diag debug rating`.

Scope: Global and Vdom

Output Example

```
FGT # get webfilter status 4
Locale : english
License : Contract
Expiration : Wed Feb 11 02:00:00 2009
Hostname : service.fortiguard.net

--=- Server List (Mon May 26 22:36:34 2008) -=-

IP           Weight  RTT Flags   TZ   Packets  Curr Lost  Total Lost
212.95.252.121   10    77         0         83          0          8

121.111.236.180   80    404         9         83          0          8
72.52.72.243      90    289        -8         83          0          8
218.106.244.81    90    455        -8         83          0          8
```

```
69.90.198.55      90    297 D      -8         85          0          9
```

Keyword/Variable	Description
Locale	Local environment language.
License	The license status: • Contract • Expired • Trial
Expiration	The date and time the license expires.
Hostname	The FortiGuard server the FortiGate unit connects to obtain the service. The FortiGuard server will return the information to the FortiGate unit. The default is service.fortiguard.net
IP	The IP address of other FortiGuard servers.
Weight	The priority value which the FortiGate unit uses to send the URL rating request. The lower weight value takes higher preference. The weight is calculated by time zone, packet round-trip time, and success rate.
RTT Flags	The round-trip time between the URL rating request and the response time from the FortiGuard server.
TZ	Time zone of the FortiGuard server (Greenwich Mean Time +/- the number).
Packets	Total packets sent to the FortiGuard server.
Curr Lost	The number of times the request is retried in a timeout period. The default is 15 seconds.
Total Lost	Total number of unresponsive requests.

Troubleshooting bootup and FSSO

When powering on your FortiGate unit, you may experience problems. This section addresses some problems you may experience in this area in rare cases. If you continue to have problems, please contact customer support for assistance.

After you have setup FSSO, you may experience problems. This section addresses many of the problems you may experience in this area.

This section contains the following topics:

FortiGate unit bootup issues

Bootup issues, while rare, can be very difficult to troubleshoot due to the lack of information about your issue. When the FortiGate unit is not running, you do not have access to your typical tools such as the CLI `diagnose` commands. This section walks you through some possible issues to give you direction in these situations.

To troubleshoot a bootup problem with your FortiGate unit, go to the section that lists your problem. If you have multiple problems, go the problem closest to the top of the list first, and work your way down the list.

It is rare that units experience any of the symptoms listed here. Fortinet hardware is reliable with a long expected operation life.

Basic bootup troubleshooting

If your FortiGate unit is hanging during the boot process, try the basic method here first before going through all the possible advanced troubleshooting.

If your FortiGate unit is hanging during boot, and after the “Press any key” prompt, try the following:

1. Reboot the FortiGate unit.
2. When you see the “`Press any key..`” prompt, press a key.

   You will see a menu of options.
3. If you suspect bad configuration is your problem, select `[I]` to view basic hardware and networking information, or to change basic networking settings.
4. It may be your firmware image is corrupted somehow. If you have an alternate firmware partition on the unit, select `[B]` to boot from the alternate partition.
5. If these do not solve your problem, continue on to advanced FortiGate bootup issues.

Advanced bootup troubleshooting

The issues covered in this section all refer to various potential bootup issues including:

- C. You have problems with the console text
- D. You have visible power problems
- E. You have a suspected defective FortiGate unit

A. You have text on the screen, but you have problems

Solution:

1. If the text on the screen is garbled, ensure your Console Communication parameters are correct. Check your Quick Start Guide for settings specific to your model.
2. If that fixes your problem, you are done.
3. If not, go to B. You do not see the boot options menu

B. You do not see the boot options menu

Solution:

1. Ensure your serial communication parameters are set to `no flow control`, and the proper baud rate and reboot the FortiGate unit by powering off and on.

FortiGate units ship with a baud rate of 9600 by default. If you have access, verify this with the CLI command config system console get , or parse an archived configuration file for the term baudrate.

2. If that fixes your problem, you are done.
3. If it does not fix your problem, go to E. You have a suspected defective FortiGate unit.

C. You have problems with the console text

1. Do you have any console message?
   - If Yes, go to D. You have visible power problems
   - If No, continue.
2. Is there garbage text onscreen?
   - If Yes, ensure Console Communication parameters are okay.
   - If that fixes the problem, you are done.
3. If no, does the FortiGate unit stop before the `Press Any Key to Download Boot Image` prompt ?
   - If Yes, go to E. You have a suspected defective FortiGate unit.
   - If No, go to Step 4.
4. Console Message - `Press any key to Download Boot Image`
5. When pressing a key, do you see the following messages?

```
[G] Get Firmware image from TFTP server
[F] Format boot device
[B] Boot with backup firmware and act as default
[I] Hardware and configuration information
[Q] Quit menu and continue to boot with default firmware
[H] Display this list of options
```

   - If Yes, go to E. You have a suspected defective FortiGate unit.

6 If No, ensure you serial communication parameters are set to `no flow control`, and the proper baud rate and reboot the FortiGate unit by powering off and on.

FortiGate units ship with a baud rate of 9600 by default. If you have access, parse an archived configuration file for the term baudrate or verify this setting with the CLI command:

```
config system console
  get
```

7 Did the reboot fix the problem?

- If that fixes your problem, you are done.
- If that does not fix your problem, go to E. You have a suspected defective FortiGate unit

D. You have visible power problems

1 Is there any LED on?

- If No, ensure power is on. If that fixes the problem you are done. If not, continue.
- If Yes, continue.

2 Do you have an external power adapter?

- If No, go to E. You have a suspected defective FortiGate unit.
- If Yes, try replacing the power adapter.

3 Is the power supply defective or you can't determine one way or the other?

- If No, go to E. You have a suspected defective FortiGate unit.
- If Yes, go to A. You have text on the screen, but you have problems

E. You have a suspected defective FortiGate unit

If you have followed these steps and determined there is a good chance your unit is defective, follow these steps.

1 Open a support ticket through FortiCare at https://support.fortinet.com.

2 In the ticket, document the problem or problems, and these steps that you have taken.

3 Provide all console messages and output.

4 Indicate if you have a suspected hard disk issue, and provide your evidence.

Fortinet Customer Support will contact you to help you with your ticket and issue.

FSSO issues

The following is a flow chart for troubleshooting FSSO issues.

- A. Initial information gathering
- B. The CA is not running and not connected
- C. The CA is running but not connected
- D. The CA is connected
- E. There are at least some users logged on
- F. Test user does not appear on the FSSO list

A. Initial information gathering

1. Is the Collector Agent (CA) connected? The best way to verify this is with the CLI commands

```
diagnose debug enable
diagnose debug authd fsso server-status
```

   - If it is connected, go to D. The CA is connected.
   - If not, continue on.

2. Is the CA running? Check by going to *Administrative Tools* > *Services* > *Check the 'Fortinet Server Authentication Extention' Service*.
   - If the CA is running but not connected, go to step 1.
   - If the CA is not running, go to B. The CA is not running and not connected.

B. The CA is not running and not connected

1. Is the CA running as admin? Go to *Administrative Tools* > *Services* > *Check the 'Fortinet Server Authentication Extention' Service* and see if it is using a domain administrator account. If not change the account.
2. Is the CA able to bind to socket? FSSO uses ports 8000 and 8002. If the ports are not available the service will not start. Check the CA logs to verify this, and stop the other application.
3. In general, checking the CA logs will show any other errors that are preventing the collector agent from starting.
4. Once CA is running if problems continue, go to A. Initial information gathering step 2.

C. The CA is running but not connected

1. Is the password correct? If not, reset the password
2. Is there a device filtering traffic? If so, change it to allow TCP port 8000.
3. If problems continue use the following CLI diag command to find more information.

```
diag debug enable
diag debug application authd 8256
```

4. Once CA is running and connected if problems continue, go to A. Initial information gathering step 2.

D. The CA is connected

1. Are you seeing groups on the FortiGate?

   If not, check the group filter on the CA.
2. Are the FortiGate and CA groups using the same mode? If not, change the modes to match.
3. Are you seeing logon events on the FortiGate unit? You can check this with the following CLI commands.

```
diagnose debug enable
diagnose debug authd fsso list
```

   - If there are any users logged in, go to step .
   - Otherwise, continue on.
4. Are DC agents installed on all Domain Controllers? If not install the DC Agents.

5 Are you using an LDAP server on the FSSO connector?
- To check go to *User* > *Directory Service* > *Edit FSSO connector* > *LDAP*.
- If an LDAP server is configured, disable it and go to step 3.
- If there is no LDAP server configured, contact support and open a support ticket.

E. There are at least some users logged on

1 Focus on a single 'test' user for farther troubleshooting. The information to collect about the 'test' user is:
- Account username of the user currently logged in
- IP address of the test host — you can run `ipconfig` to get the IP of the host
- Host DNS name — you can run `hostname` to get the host name.
- Logon server name, the domain controller the host used to authenticate — to get this, run `echo %logonserver%`.

2 Once you have the information about the test host, run the following CLI commands on the FortiGate unit.

```
diagnose debug enable
diagnose debug authd fsso list
```

- If the user is not in the list, got to F. Test user does not appear on the FSSO list.
- If the user appears in the list, continue on.

3 Does the user have the correct IP address? If not, check the DNS settings on the DNS server. If a computer has two network interfaces (multi-homed) traffic may get mixed up and go out the wrong interface.

4 Does the user have the correct groups? If not, disable group caching on the CA.

5 If all else appears okay, check the order of the security policies. Only the first authenticated group is allowed through, which may be the wrong policy.

6 If problems continue, contact support and open a support ticket.

F. Test user does not appear on the FSSO list

If the user did not appear in the FSSO list, run through the following checklist.

Is the user IP showing up with a service account?	If yes, add the user to the ignore list.
Has the user been moved to a new group recently?	If yes, disable group caching.
If the user is in the CA log:	
Were there any DNS errors in the CA for the host name?	These include the collector agent unable to resolve the host name at all or resolving to an incorrect IP. If yes, check the DNS server.
Did the user time out?	If the CA logs show the user timed out, the collector agent was not able to connect to the host on port 139 & 445 to verify the user.
If the user is not in the CA log:	

Check the logon server.	Check which domain controller authenticated the host (run `echo %logonserver%` on the host) and troubleshoot that domain controller.
Does the logon server have the DC agent installed?	If not, install the DC agent. If it is installed, enable logging on the DC agent on the logon server. Use the logs produced for farther troubleshooting.

Chapter 6 UTM Guide

This FortiOS Handbook chapter contains the following sections:

UTM overview describes UTM components and their relation to firewall policies, as well as SSL content scanning and inspection. We recommend starting with this section to become familiar with the different features in your FortiGate unit.

Network defense explains basic denial of service (DoS) and distributed denial of service (DDOS) concepts and provides an overview of the best practices to use with all the UTM features to defend your network against infection and attack.

AntiVirus explains how the FortiGate unit scans files for viruses and describes how to configure the antivirus options.

Email filter explains how the FortiGate unit filters email, describes how to configure the filtering options and the action to take with email detected as spam.

Intrusion protection explains basic Intrusion Protection System (IPS) concepts and how to configure IPS options; includes guidance and a detailed table for creating custom signatures as well as several examples.

Web filter and FortiGuard Web Filter The first of these sections describes basic web filtering concepts, the order in which the FortiGate unit performs web filtering, and configuration. The second section describes enhanced features of the subscription-based FortiGuard Web Filtering service and explains how to configure them. We recommend reading both sections if you are using FortiGuard Web Filtering because settings you configure in one feature may affect the other.

Data leak prevention describes the DLP features that allow you to prevent sensitive data from leaving your network and explains how to configure the DLP rules, compound rules, and sensors.

Application control describes how your FortiGate unit can detect and take action against network traffic based on the application generating the traffic.

DoS policy describes how to use DoS policies to protect your network from DoS attacks.

Sniffer policy describes how to use your FortiGate unit as a one-armed intrusion detection system (IDS) to report on attacks.

UTM overview

Ranging from the FortiGate®-30 series for small businesses to the FortiGate-5000 series for large enterprises, service providers and carriers, the FortiGate line combines a number of security features to protect your network from threats. As a whole, these features, when included in a single Fortinet security appliance, are referred to as Unified Threat Management (UTM). The UTM features your FortiGate model includes are:

- AntiVirus
- Intrusion Prevention System (IPS)
- Anomaly protection (DoS policies)
- One-armed IPS (Sniffer policies)
- Web filtering
- E-mail filtering, including protection against spam and grayware
- Data Leak Prevention (DLP)
- Application Control (for example, IM and P2P).

Firewall policies limit access, and while this and similar features are a vital part of securing your network, they are not covered in this document.

The following topics are included in this section:

UTM components

AntiVirus

Your FortiGate unit stores a virus signature database that can identify more than 15,000 individual viruses. FortiGate models that support additional virus databases are able to identify hundreds of thousands of viruses. With a FortiGuard AntiVirus subscription, the signature databases are updated whenever a new threat is discovered.

AntiVirus also includes file filtering. When you specify files by type or by file name, the FortiGate unit will stop the matching files from reaching your users.

FortiGate units with a hard drive or configured to use a FortiAnalyzer unit can store infected and blocked files for that you can examine later.

Intrusion Protection System (IPS)

The FortiGate Intrusion Protection System (IPS) protects your network against hacking and other attempts to exploit vulnerabilities of your systems. More than 3,000 signatures are able to detect exploits against various operating systems, host types, protocols, and applications. These exploits can be stopped before they reach your internal network.

You can also write custom signatures, tailored to your network.

Anomaly protection (DoS policies)

A complement to the signature-based IPS, anomaly protection detects unusual network traffic that can be used to attack your network. When you set thresholds for various types of network operations, the FortiGate unit will block any attempt to exceed the thresholds you have defined.

One-armed IDS (sniffer policies)

You can use sniffer policies on the FortiGate unit as a one-arm intrusion detection system (IDS). The unit examines traffic for matches to the configured IPS sensor and application control list. Matches are logged and then all received traffic is dropped. In this way, you can configure a unit to sniff network traffic for attacks without actually processing the packets.

The FortiGate unit can log all detected IPS signatures and anomalies in a traffic stream.

Web filtering

Web filtering includes a number of features you can use to protect or limit your users' activity on the web.

FortiGuard Web Filtering is a subscription service that allows you to limit access to web sites. More than 60 million web sites and two billion web pages are rated by category. You can choose to allow or block each of the 77 categories.

URL filtering can block your network users from access to URLs that you specify.

Web content filtering can restrict access to web pages based on words and phrases appearing on the web page itself. You can build lists of words and phrases, each with a score. When a web content list is selected in a web filter profile, you can specify a threshold. If a user attempts to load a web page and the score of the words on the page exceeds the threshold, the web page is blocked.

Email filtering

FortiGuard AntiSpam is a subscription service that includes an IP address black list, a URL black list, and an email checksum database. These resources are updated whenever new spam messages are received, so you do not need to maintain any lists or databases to ensure accurate spam detection.

You can use your own IP address lists and email address lists to allow or deny addresses, based on your own needs and circumstances.

Data Leak Prevention (DLP)

Data leak prevention allows you to define the format of sensitive data. The FortiGate unit can then monitor network traffic and stop sensitive information from leaving your network. Rules for U.S. social security numbers, Canadian social insurance numbers, as well as Visa, Mastercard, and American Express card numbers are included.

Application Control (for example, IM and P2P)

Although you can block the use of some applications by blocking the ports they use for communications, many applications do not use standard ports to communicate. Application control can detect the network traffic of more than 1000 applications, improving your control over application communication.

UTM profiles/lists/sensors

A profile is a group of settings that you can apply to one or more firewall policies. Each UTM feature is enabled and configured in a profile, list, or sensor. These are then selected in a security policy and the settings apply to all traffic matching the policy. For example, if you create an antivirus profile that enables antivirus scanning of HTTP traffic, and select the antivirus profile in the security policy that allows your users to access the World Wide Web, all of their web browsing traffic will be scanned for viruses.

Because you can use profiles in more than one security policy, you can configure one profile for the traffic types handled by a set of firewall policies requiring identical protection levels and types, rather than repeatedly configuring those same profile settings for each individual security policy.

For example, while traffic between trusted and untrusted networks might need strict protection, traffic between trusted internal addresses might need moderate protection. To provide the different levels of protection, you might configure two separate sets of profiles: one for traffic between trusted networks, and one for traffic between trusted and untrusted networks.

The UTM profiles include:

- antivirus profile
- IPS sensor
- Web filter profile
- Email filter profile
- Data Leak Prevention profile
- Application Control list
- VoIP profile

Although they’re called profiles, sensors, and lists, they’re functionally equivalent. Each is used to configure how the feature works.

Network defense

This section describes in general terms the means by which attackers can attempt to compromise your network and steps you can take to protect it. The goal of an attack can be as complex as gaining access to your network and the privileged information it contains, or as simple as preventing customers from accessing your web server. Even allowing a virus onto your network can cause damage, so you need to protect against viruses and malware even if they are not specifically targeted at your network.

The following topics are included in this section:

Monitoring

Monitoring, in the form of logging, alert email, and SNMP, does not directly protect your network. But monitoring allows you to review the progress of an attack, whether afterwards or while in progress. How the attack unfolds may reveal weaknesses in your preparations. The packet archive and sniffer policy logs can reveal more details about the attack. Depending on the detail in your logs, you may be able to determine the attackers location and identity.

While log information is valuable, you must balance the log information with the resources required to collect and store it.

Blocking external probes

Protection against attacks is important, but attackers often use vulnerabilities and network tools to gather information about your network to plan an attack. It is often easier to prevent an attacker from learning important details about your network than to defend against an attack designed to exploit your particular network.

Attacks are often tailored to the hardware or operating system of the target, so reconnaissance is often the first step. The IP addresses of the hosts, the open ports, and the operating systems the hosts are running is invaluable information to an attacker. Probing your network can be as simple as an attacker performing an address sweep or port scan to a more involved operation like sending TCP packets with invalid combinations of flags to see how your firewall reacts.

Address sweeps

An address sweep is a basic network scanning technique to determine which addresses in an address range have active hosts. A typical address sweep involves sending an ICMP ECHO request (a ping) to each address in an address range to attempt to get a response. A response signifies that there is a host at this address that responded to the ping. It then becomes a target for more detailed and potentially invasive attacks.

Address sweeps do not always reveal all the hosts in an address range because some systems may be configured to ignore ECHO requests and not respond, and some firewalls and gateways may be configured to prevent ECHO requests from being transmitted to the destination network. Despite this shortcoming, Address sweeps are still used because they are simple to perform with software tools that automate the process.

Use the `icmp_sweep` anomaly in a DoS sensor to protect against address sweeps.

There are a number of IPS signatures to detect the use of ICMP probes that can gather information about your network. These signatures include `AddressMask`, `Traceroute`, `ICMP.Invalid.Packet.Size`, and `ICMP.Oversized.Packet`. Include ICMP protocol signatures in your IPS sensors to protect against these probes/attacks.

Port scans

Potential attackers may run a port scan on one or more of your hosts. This involves trying to establish a communication session to each port on a host. If the connection is successful, a service may be available that the attacker can exploit.

Use the DoS sensor anomaly `tcp_port_scan` to limit the number of sessions (complete and incomplete) from a single source IP address to the configured threshold. If the number of sessions exceed the threshold, the configured action is taken.

Use the DoS sensor anomaly `udp_scan` to limit UDP sessions in the same way.

Probes using IP traffic options

Every TCP packet has space reserved for eight flags or control bits. They are used for communicating various control messages. Although space in the packet is reserved for all eight, there are various combinations of flags that should never happen in normal network operation. For example, the SYN flag, used to initiate a session, and the FIN flag, used to end a session, should never be set in the same packet.

Attackers may create packets with these invalid combinations to test how a host will react. Various operating systems and hardware react in different ways, giving a potential attackers clues about the components of your network.

The IPS signature `TCP.Bad.Flags` detects these invalid combinations. The default action is pass though you can override the default and set it to *Block* in your IPS sensor.

Configure packet reply and TCP sequence checking

The anti-reply CLI command allows you to set the level of checking for packet replay and TCP sequence checking (or TCP Sequence (SYN) number checking). All TCP packets contain a Sequence Number (SYN) and an Acknowledgement Number (ACK). The TCP protocol uses these numbers for error free end-to-end communications. TCP sequence checking can also be used to validate individual packets.

FortiGate units use TCP sequence checking to make sure that a packet is part of a TCP session. By default, if a packet is received with sequence numbers that fall out of the expected range, the FortiGate unit drops the packet. This is normally a desired behavior, since it means that the packet is invalid. But in some cases you may want to configure different levels of anti-replay checking if some of your network equipment uses non-RFC methods when sending packets.

Configure the anti-reply CLI command:

```
config system global
  anti-reply {disable | loose | strict}
end
```

You can set anti-replay protection to the following settings:

- `disable` — No anti-replay protection.
- `loose` — Perform packet sequence checking and ICMP anti-replay checking with the following criteria:
  - The SYN, FIN, and RST bit can not appear in the same packet.
  - The FortiGate unit does not allow more than one ICMP error packet through before it receives a normal TCP or UDP packet.
  - If the FortiGate unit receives an RST packet, and check-reset-range is set to strict, the FortiGate unit checks to determine if its sequence number in the RST is within the un-ACKed data and drops the packet if the sequence number is incorrect.
- `strict` — Performs all of the loose checking but for each new session also checks to determine of the TCP sequence number in a SYN packet has been calculated correctly and started from the correct value for each new session. Strict anti-replay checking can also help prevent SYN flooding.

If any packet fails a check it is dropped.

Configure ICMP error message verification

check-reset-range {disable | strict}

Enable ICMP error message verification to ensure an attacker can not send an invalid ICMP error message.

```
config system global
  check-reset-range {disable | strict}
end
```

- `disable` — the FortiGate unit does not validate ICMP error messages.
- `strict` — enable ICMP error message checking.

If the FortiGate unit receives an ICMP error packet that contains an embedded IP(A,B) | TCP(C,D) header, then if FortiOS can locate the A:C->B:D session it checks to make sure that the sequence number in the TCP header is within the range recorded in the session. If the sequence number is not in range then the ICMP packet is dropped. Strict checking also affects how the anti-replay option checks packets.

Protocol header checking

Select the level of checking performed on protocol headers.

```
config system global
  check-protocol-header {loose | strict}
end
```

- `loose` — the FortiGate unit performs basic header checking to verify that a packet is part of a session and should be processed. Basic header checking includes verifying that the layer-4 protocol header length, the IP header length, the IP version, the IP checksum, IP options are correct, etc.
- `strict` — the FortiGate unit does the same checking as above plus it verifies that ESP packets have the correct sequence number, SPI, and data length.

If the packet fails header checking it is dropped by the FortiGate unit.

Evasion techniques

Attackers employ a wide range of tactics to try to disguise their techniques. If an attacker disguises a known attack in such a way that it is not recognized, the attack will evade your security and possibly succeed. FortiGate security recognizes a wide variety of evasion techniques and normalizes data traffic before inspecting it.

Packet fragmentation

Information sent across local networks and the Internet is encapsulated in packets. There is a maximum allowable size for packets and this maximum size varies depending on network configuration and equipment limitations. If a packet arrives at a switch or gateway and it is too large, the data it carries is divided among two or more smaller packets before being forwarded. This is called fragmentation.

When fragmented packets arrive at their destination, they are reassembled and read. If the fragments do not arrive together, they must be held until all of the fragments arrive. Reassembly of a packet requires all of the fragments.

The FortiGate unit automatically reassembles fragmented packets before processing them because fragmented packets can evade security measures. Both IP packets and TCP packets are reassembled by the IPS engine before examination.

For example, you have configured the FortiGate unit to block access to the example.org web site. Any checks for example.com will fail if a fragmented packet arrives and one fragment contains `http://www.exa` while the other contains `mple.com/`. Viruses and malware can be fragmented and avoid detection in the same way. The FortiGate unit will reassemble fragmented packets before examining network data to ensure that inadvertent or deliberate packet fragmentation does not hide threats in network traffic.

Non-standard ports

Most traffic is sent on a standard port based on the traffic type. The FortiGate unit recognizes most traffic by packet content rather than the TCP/UDP port and uses the proper IPS signatures to examine it. Protocols recognized regardless of port include DHCP, DNP3, FTP, HTTP, IMAP, MS RPC, NNTP, POP3, RSTP, SIP, SMTP, and SSL, as well as the supported IM/P2P application protocols.

In this way, the FortiGate unit will recognize HTTP traffic being sent on port 25 as HTTP rather than SMTP, for example. Because the protocol is correctly identified, the FortiGate unit will examine the traffic for any enabled HTTP signatures.

Negotiation codes

Telnet and FTP servers and clients support the use of negotiation information to allow the server to report what features it supports. This information has been used to exploit vulnerable servers. To avoid this problem, the FortiGate unit removes negotiation codes before IPS inspection.

HTTP URL obfuscation

Attackers encode HTML links using various formats to evade detection and bypass security measures. For example, the URL www.example.com/cgi.bin could be encoded in a number of ways to avoid detection but still work properly, and be interpreted the same, in a web browser.

The FortiGate prevents the obfuscation by converting the URL to ASCII before inspection.

Table 57: HTTP URL obfuscation types

Encoding type	Example
No encoding	http://www.example.com/cgi.bin/
Decimal encoding	http://www.example.com/cgi.bin/
URL encoding	http://www.example.com/%43%47%49%2E%42%49%4E%2F
ANSI encoding	http://www.example.com/%u0063%u0067%u0069%u002E%u0062%u0069%u006E/
Directory traversal	http://www.example.com/cgi.bin/test/../

HTTP header obfuscation

The headers of HTTP requests or responses can be modified to make the discovery of patterns and attacks more difficult. To prevent this, the FortiGate unit will:

- remove junk header lines
- reassemble an HTTP header that's been folded onto multiple lines
- move request parameters to HTTP POST body from the URL

The message is scanned for any enabled HTTP IPS signatures once these problems are corrected.

HTTP body obfuscation

The body content of HTTP traffic can be hidden in an attempt to circumvent security scanning. HTTP content can be GZipped or deflated to prevent security inspection. The FortiGate unit will uncompress the traffic before inspecting it.

Another way to hide the contents of HTTP traffic is to send the HTTP body in small pieces, splitting signature matches across two separate pieces of the HTTP body. The FortiGate unit reassembles these 'chunked bodies' before inspection.

Microsoft RPC evasion

Because of its complexity, the Microsoft Remote Procedure Call protocol suite is subject to a number of known evasion techniques, including:

- SMB-level fragmentation
- DCERPC-level fragmentation
- DCERPC multi-part fragmentation
- DCERPC UDP fragmentation
- Multiple DCERPC fragments in one packet

The FortiGate unit reassembles the fragments into their original form before inspection.

Defending against DoS attacks

A denial of service is the result of an attacker sending an abnormally large amount of network traffic to a target system. Having to deal with the traffic flood slows down or disables the target system so that legitimate users can not use it for the duration of the attack.

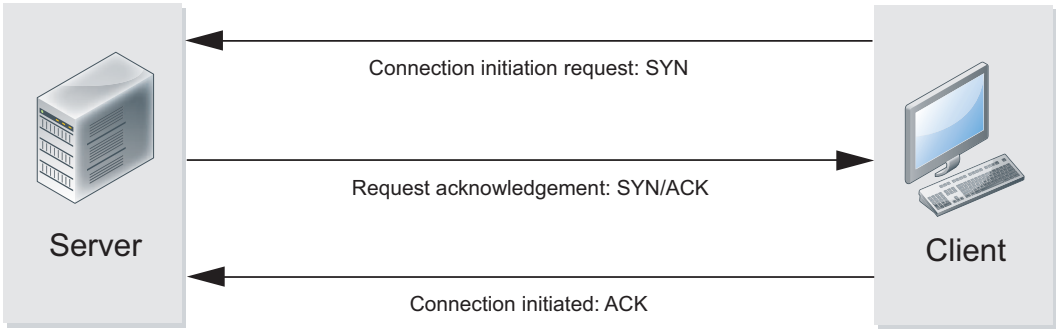
Any network traffic the target system receives has to be examined, and then accepted or rejected. TCP, UDP, and ICMP traffic is most commonly used, but a particular type of TCP traffic is the most effective. TCP packets with the SYN flag are the most efficient DoS attack tool because of how communication sessions are started between systems.

The “three-way handshake”

Communication sessions between systems start with establishing a TCP/IP connection. This is a simple three step process, sometimes called a “three-way handshake,” initiated by the client attempting to open the connection.

1. The client sends a TCP packet with the SYN flag set. With the SYN packet, the client informs the server of its intention to establish a connection.
2. If the server is able to accept the connection to the client, it sends a packet with the SYN and the ACK flags set. This simultaneously acknowledges the SYN packet the server has received, and informs the client that the server intends to establish a connection.
3. To acknowledge receipt of the packet and establish the connection, the client sends an ACK packet.

Figure 81: Establishing a TCP/IP connection



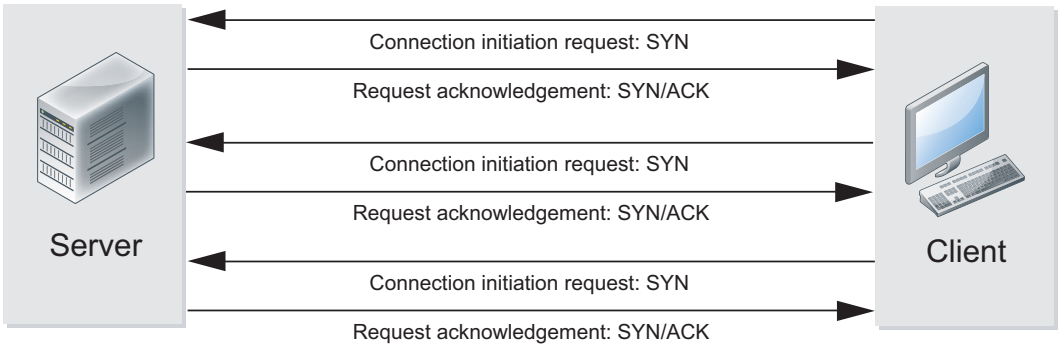
The three-way handshake is a simple way for the server and client to each agree to establish a connection and acknowledge the other party expressing its intent. Unfortunately, the three-way handshake can be used to interfere with communication rather than facilitate it.

SYN flood

When a client sends a SYN packet to a server, the server creates an entry in its session table to keep track of the connection. The server then sends a SYN+ACK packet expecting an ACK reply and the establishment of a connection.

An attacker intending to disrupt a server with a denial of service (DoS) attack can send a flood of SYN packets and not respond to the SYN+ACK packets the server sends in response. Networks can be slow and packets can get lost so the server will continue to send SYN+ACK packets until it gives up, and removes the failed session from the session table. If an attacker sends enough SYN packets to the server, the session table will fill completely, and further connection attempts will be denied until the incomplete sessions time out. Until this happens, the server is unavailable to service legitimate connection requests.

Figure 82: A single client launches a SYN flood attack

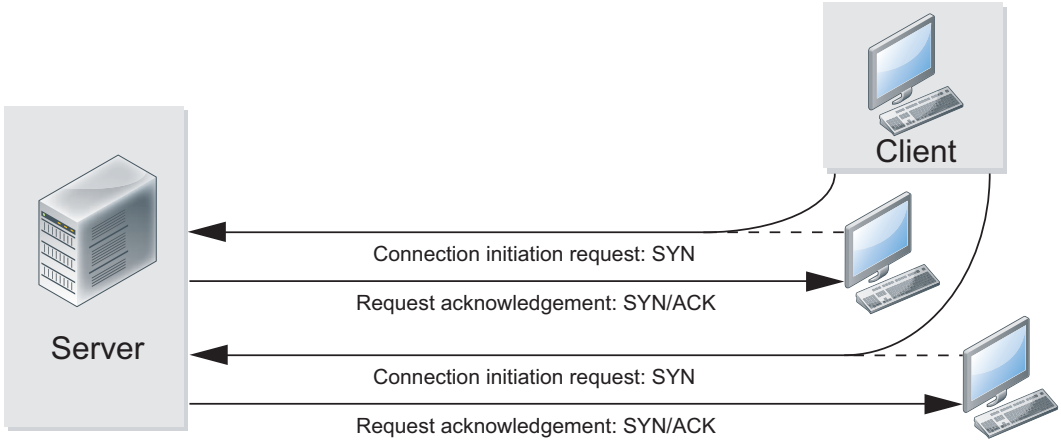


SYN floods are seldom launched from a single address so limiting the number of connection attempts from a single IP address is not usually effective.

SYN spoofing

With a flood of SYN packets coming from a single attacker, you can limit the number of connection attempts from the source IP address or block the attacker entirely. To prevent this simple defense from working, or to disguise the source of the attack, the attacker may spoof the source address and use a number of IP addresses to give the appearance of a distributed denial of service (DDoS) attack. When the server receives the spoofed SYN packets, the SYN+ACK replies will go to the spoofed source IP addresses which will either be invalid, or the system receiving the reply will not know what to do with it.

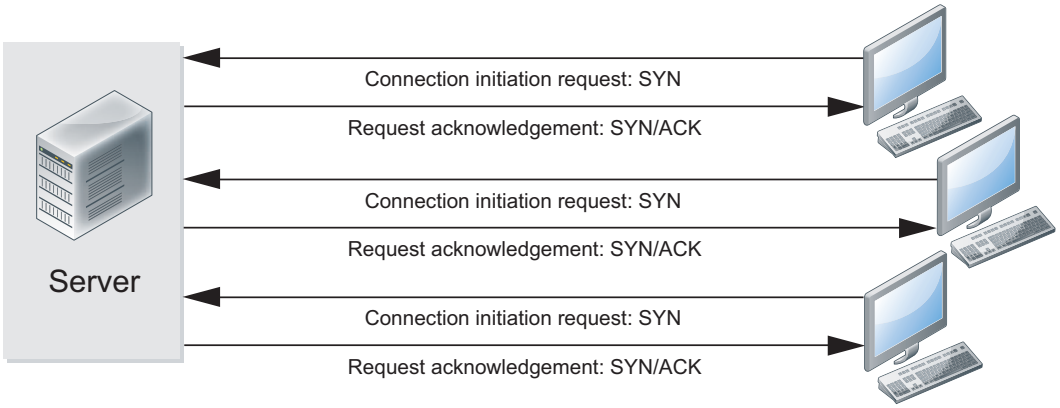
Figure 83: A client launches a SYN spoof attack



DDoS SYN flood

The most severe form of SYN attack is the distributed SYN flood, one variety of distributed denial of service attack (DDoS). Like the SYN flood, the target receives a flood of SYN packets and the ACK+SYN replies are never answered. The attack is distributed across multiple sources sending SYN packets in a coordinated attack.

Figure 84: Multiple attackers launch a distributed SYN flood



The distributed SYN flood is more difficult to defend against because multiple clients are capable of creating a larger volume of SYN packets than a single client. Even if the server can cope, the volume of traffic may overwhelm a point in the network upstream of the targeted server. The only defence against this is more bandwidth to prevent any choke-points.

Configuring the SYN threshold to prevent SYN floods

The preferred primary defence against any type of SYN flood is the DoS sensor `tcp_syn_flood` threshold. The threshold value sets an upper limit on the number of new incomplete TCP connections allowed per second. If the number of incomplete connections exceeds the threshold value, and the action is set to *Pass*, the FortiGate unit will allow the SYN packets that exceed the threshold. If the action is set to *Block*, the FortiGate unit will block the SYN packets that exceed the threshold, but it will allow SYN packets from clients that send another SYN packet.

The tools attackers use to generate network traffic will not send a second SYN packet when a SYN+ACK response is not received from the server. These tools will not “retry.” Legitimate clients will retry when no response is received, and these retries are allowed even if they exceed the threshold with the action set to *Block*.

For more information, see “Creating and configuring a DoS sensor” on page 1082. For recommendations on how to configure DoS policies, see “DoS policy recommendations” on page 892.

SYN proxy

FortiGate units with network acceleration hardware, whether built-in or installed in the form of an add-on module, offer a third action for the `tcp_syn_flood` threshold. Instead of *Block* and *Pass*, you can choose to *Proxy* the incomplete connections that exceed the threshold value.

When the `tcp_syn_flood` threshold action is set to *Proxy*, incomplete TCP connections are allowed as normal as long as the configured threshold is not exceeded. If the threshold is exceeded, the FortiGate unit will intercept incoming SYN packets from clients and respond with a SYN+ACK packet. If the FortiGate unit receives an ACK response as expected, it will "replay" this exchange to the server to establish a communication session between the client and the server, and allow the communication to proceed.

Other flood types

UDP and ICMP packets can also be used for DoS attacks, though they are less common. TCP SYN packets are so effective because the target receives them and maintains a session table entry for each until they time out. Attacks using UDP or ICMP packets do not require the same level of attention from a target, rendering them less effective. The target will usually drop the offending packets immediately, closing the session.

Use the `udp_flood` and `icmp_flood` thresholds to defend against these DoS attacks.

Traffic inspection

When the FortiGate unit examines network traffic one packet at a time for IPS signatures, it is performing traffic analysis. This is unlike content analysis where the traffic is buffered until files, email messages, web pages, and other files are assembled and examined as a whole.

DoS policies use traffic analysis by keeping track of the type and quantity of packets, as well as their source and destination addresses.

Application control uses traffic analysis to determine which application generated the packet.

Although traffic inspection doesn't involve taking packets and assembling files they are carrying, the packets themselves can be split into fragments as they pass from network to network. These fragments are reassembled by the FortiGate unit before examination.

No two networks are the same and few recommendations apply to all networks. This topic offers suggestions on how you can use the FortiGate unit to help secure your network against content threats.

IPS signatures

IPS signatures can detect malicious network traffic. For example, the Code Red worm attacked a vulnerability in the Microsoft IIS web server. Your FortiGate's IPS system can detect traffic attempting to exploit this vulnerability. IPS may also detect when infected systems communicate with servers to receive instructions.

IPS recommendations

- Enable IPS scanning at the network edge for all services.
- Use FortiClient endpoint IPS scanning for protection against threats that get into your network.
- Subscribe to FortiGuard IPS Updates and configure your FortiGate unit to receive push updates. This will ensure you receive new IPS signatures as soon as they are available.

- Your FortiGate unit includes IPS signatures written to protect specific software titles from DoS attacks. Enable the signatures for the software you have installed and set the signature action to *Block*.

  You can view these signatures by going to *UTM Profiles* > *Intrusion Protection* > *Predefined* and sorting by, or applying a filter to, the *Group* column.
- Because it is critical to guard against attacks on services that you make available to the public, configure IPS signatures to block matching signatures. For example, if you have a web server, configure the action of web server signatures to *Block*.

Suspicious traffic attributes

Network traffic itself can be used as an attack vector or a means to probe a network before an attack. For example, SYN and FIN flags should never appear together in the same TCP packet. The SYN flag is used to initiate a TCP session while the FIN flag indicates the end of data transmission at the end of a TCP session.

The FortiGate unit has IPS signatures that recognize abnormal and suspicious traffic attributes. The SYN/FIN combination is one of the suspicious flag combinations detected in TCP traffic by the `TCP.BAD.FLAGS` signature.

The signatures that are created specifically to examine traffic options and settings, begin with the name of the traffic type they are associated with. For example, signatures created to examine TCP traffic have signature names starting with TCP.

DoS policies

DDoS attacks vary in nature and intensity. Attacks aimed at saturating the available bandwidth upstream of your service can only be countered by adding more bandwidth. DoS policies can help protect against DDoS attacks that aim to overwhelm your server resources.

DoS policy recommendations

- Use and configure DoS policies to appropriate levels based on your network traffic and topology. This will help drop traffic if an abnormal amount is received.
- It is important to set a good threshold. The threshold defines the maximum number of sessions/packets per second of normal traffic. If the threshold is exceeded, the action is triggered. Threshold defaults are general recommendations, although your network may require very different values.

  One way to find the correct values for your environment is to set the action to *Pass* and enable logging. Observe the logs and adjust the threshold values until you can determine the value at which normal traffic begins to generate attack reports. Set the threshold above this value with the margin you want. Note that the smaller the margin, the more protected your system will be from DoS attacks, but your system will also be more likely to generate false alarms.

Application control

While applications can often be blocked by the ports they use, application control allows convenient management of all supported applications, including those that do not use set ports.

Application control recommendations

- Some applications behave in an unusual manner in regards to application control. For more information, see “Application considerations” on page 1070.

- By default, application control allows the applications not specified in the application control list. For high security networks, you may want to change this behavior so that only the explicitly allowed applications are permitted.

Content inspection and filtering

When the FortiGate unit buffers the packets containing files, email messages, web pages, and other similar files for reassembly before examining them, it is performing content inspection. Traffic inspection, on the other hand, is accomplished by the FortiGate unit examining individual packets of network traffic as they are received.

No two networks are the same and few recommendations apply to all networks. This topic offers suggestions on how you can use the FortiGate unit to help secure your network against content threats. Be sure to understand the effects of the changes before using the suggestions.

AntiVirus

The FortiGate antivirus scanner can detect viruses and other malicious payloads used to infect machines. The FortiGate unit performs deep content inspection. To prevent attempts to disguise viruses, the antivirus scanner will reassemble fragmented files and uncompress content that has been compressed. Patented Compact Pattern Recognition Language (CPRL) allows further inspection for common patterns, increasing detection rates of virus variations in the future.

AntiVirus recommendations

- Enable antivirus scanning at the network edge for all services.
- Use FortiClient endpoint antivirus scanning for protection against threats that get into your network.
- Subscribe to FortiGuard AntiVirus Updates and configure your FortiGate unit to receive push updates. This will ensure you receive new antivirus signatures as soon as they are available.
- Enable the Extended Virus Database if your FortiGate unit supports it.
- Examine antivirus logs periodically. Take particular notice of repeated detections. For example, repeated virus detection in SMTP traffic could indicate a system on your network is infected and is attempting to contact other systems to spread the infection using a mass mailer.
- The *builtin-patterns* file filter list contains nearly 20 file patterns. Many of the represented files can be executed or opened with a double-click. If any of these file patterns are not received as a part of your normal traffic, blocking them may help protect your network. This also saves resources since files blocked in this way do not need to be scanned for viruses.
- To conserve system resources, avoid scanning email messages twice. Scan messages as they enter and leave your network or when clients send and retrieve them, rather than both.

FortiGuard Web Filtering

The web is the most popular part of the Internet and, as a consequence, virtually every computer connected to the Internet is able to communicate using port 80, HTTP. Botnet communications take advantage of this open port and use it to communicate with infected computers. FortiGuard Web Filtering can help stop infections from malware sites and help prevent communication if an infection occurs.

FortiGuard Web Filtering recommendations

- Enable FortiGuard Web Filtering at the network edge.
- Install the FortiClient application and use FortiGuard Web Filtering on any systems that bypass your FortiGate unit.
- Block categories such as Pornography, Malware, Spyware, and Phishing. These categories are more likely to be dangerous.
- In the email filter profile, enable *IP Address Check* in *FortiGuard Email Filtering*. Many IP addresses used in spam messages lead to malicious sites; checking them will protect your users and your network.

Email filter

Spam is a common means by which attacks are delivered. Users often open email attachments they should not, and infect their own machine. The FortiGate email filter can detect harmful spam and mark it, alerting the user to the potential danger.

Email filter recommendations

- Enable email filtering at the network edge for all types of email traffic.
- Use FortiClient endpoint scanning for protection against threats that get into your network.
- Subscribe to the FortiGuard AntiSpam Service.

DLP

Most security features on the FortiGate unit are designed to keep unwanted traffic out of your network while DLP can help you keep sensitive information from leaving your network. For example, credit card numbers and social security numbers can be detected by DLP sensors.

DLP recommendations

- Rules related to HTTP posts can be created, but if the requirement is to block all HTTP posts, a better solution is to use application control or the *HTTP POST Action* option in the web filter profile.
- While DLP can detect sensitive data, it is more efficient to block unnecessary communication channels than to use DLP to examine it. If you don't use instant messaging or peer-to-peer communication in your organization, for example, use application control to block them entirely.

AntiVirus

This section describes how to configure the antivirus options. From an antivirus profile you can configure the FortiGate unit to apply antivirus protection to HTTP, FTP, IMAP, POP3, SMTP, IM, and NNTP sessions. If your FortiGate unit supports SSL content scanning and inspection, you can also configure antivirus protection for HTTPS, IMAPS, POP3S, SMTPS, and FTPS sessions.

The following topics are included in this section:

Antivirus concepts

The word “antivirus” refers to a group of features that are designed to prevent unwanted and potentially malicious files from entering your network. These features all work in different ways, which include checking for a file size, name, or type, or for the presence of a virus or grayware signature.

The antivirus scanning routines your FortiGate unit uses are designed to share access to the network traffic. This way, each individual feature does not have to examine the network traffic as a separate operation, and the overhead is reduced significantly. For example, if you enable file filtering and virus scanning, the resources used to complete these tasks are only slightly greater than enabling virus scanning alone. Two features do not require twice the resources.

How antivirus scanning works

Antivirus scanning examines files for viruses, worms, trojans, and malware. The antivirus scan engine has a database of virus signatures it uses to identify infections. If the scanner finds a signature in a file, it determines that the file is infected and takes the appropriate action.

The most thorough scan requires that the FortiGate unit have the whole file for the scanning procedure. To achieve this, the antivirus proxy buffers the file as it arrives. Once the transmission is complete, the virus scanner examines the file. If no infection is present, it is sent to the destination. If an infection is present, a replacement message is set to the destination.

During the buffering and scanning procedure, the client must wait. With a default configuration, the file is released to the client only after it is scanned. You can enable client comforting in the protocol options profile to feed the client a trickle of data to prevent them from thinking the transfer is stalled, and possibly cancelling the download.

Buffering the entire file allows the FortiGate unit to eliminate the danger of missing an infection due to fragmentation because the file is reassembled before examination. Archives can also be expanded and the contents scanned, even if archives are nested.

Since the FortiGate unit has a limited amount of memory, files larger than a certain size do not fit within the memory buffer. The default buffer size is 10 MB. You can use the `uncompsizelimit` CLI command to adjust the size of this memory buffer.

Files larger than the buffer are passed to the destination without scanning. You can use the *Oversize File/Email* setting to block files larger than the antivirus buffer if allowing files that are too large to be scanned is an unacceptable security risk.

Flow-based antivirus scanning

If your FortiGate unit supports flow-based antivirus scanning, you can choose to select it instead of proxy-based antivirus scanning. Flow-based antivirus scanning uses the FortiGate IPS engine to examine network traffic for viruses, worms, trojans, and malware, without the need to buffer the file being checked.

The advantages of flow-based scanning include faster scanning and no maximum file size. Flow-based scanning doesn't require the file be buffered so it is scanned as it passes through the FortiGate unit, packet-by-packet. This eliminates the maximum file size limit and the client begins receiving the file data immediately.

The trade-off for these advantages is that flow-based scans detect a smaller number of infections. Viruses in documents, packed files, and some archives are less likely to be detected because the scanner can only examine a small portion of the file at any moment. Also, the file archive formats flow-based scanning will examine are limited to ZIP and GZIP.

Antivirus scanning order

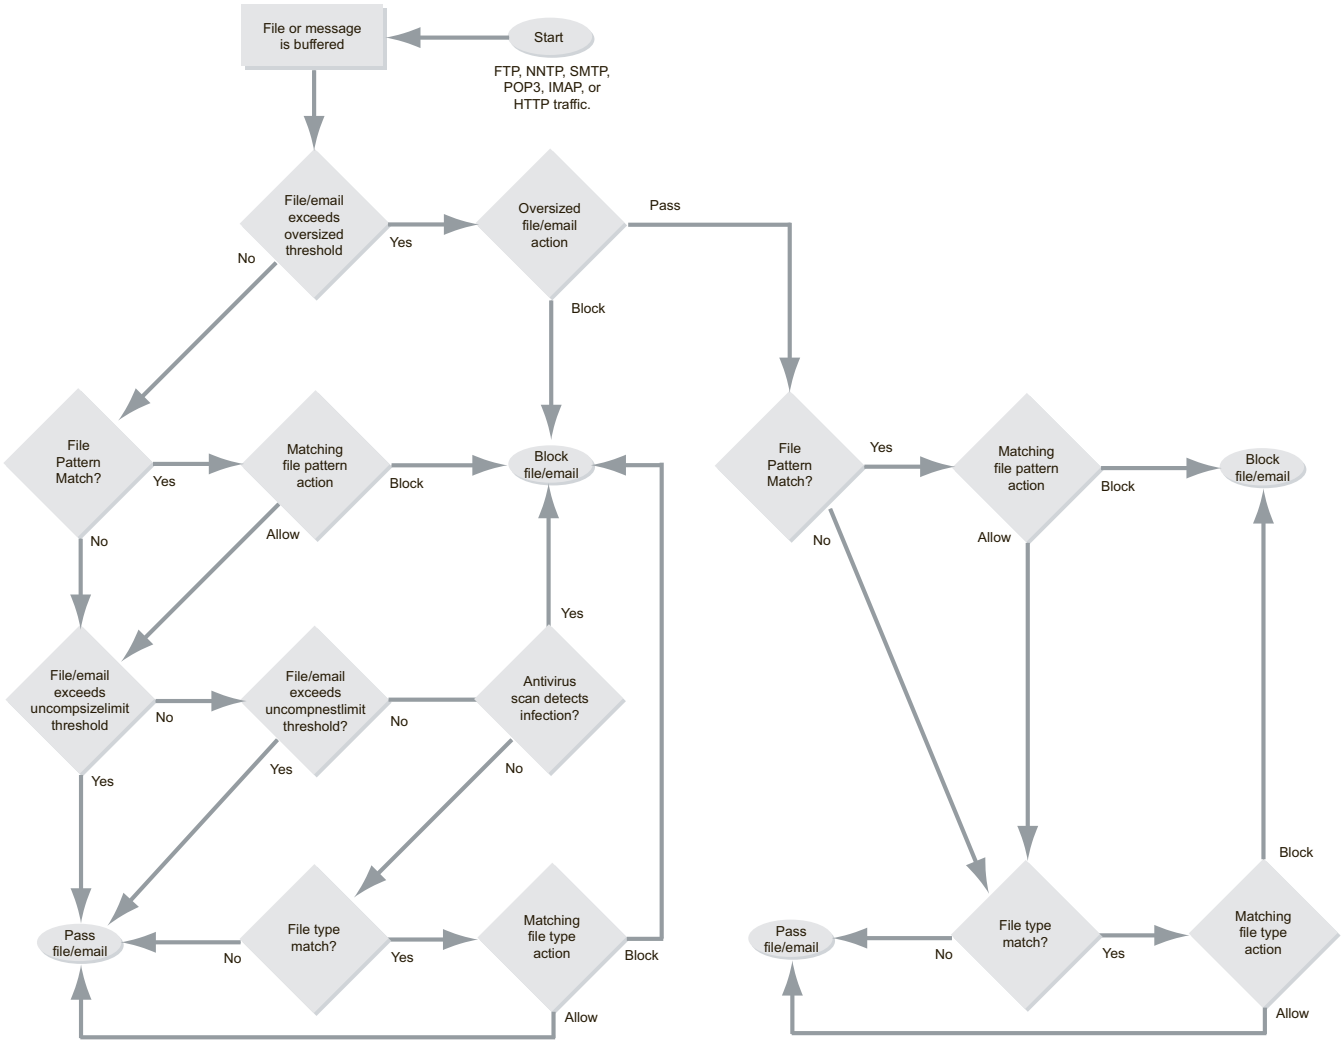
The antivirus scanning function includes various modules and engines that perform separate tasks.

Proxy-based antivirus scanning order

Figure 85 on page 897 illustrates the antivirus scanning order when using proxy-based scanning (i.e. the normal, extended, or extreme databases). The first check for oversized files/email is to determine whether the file exceeds the configured size threshold. The `uncompsizelimit` check is to determine if the file can be buffered for file type and antivirus scanning. If the file is too large for the buffer, it is allowed to pass without being scanned. For more information, see the `config antivirus service` command in the *FortiGate CLI Reference*. The antivirus scan includes scanning for viruses, as well as for grayware and heuristics if they are enabled.

File filtering includes file pattern and file type scans which are applied at different stages in the antivirus process.

Figure 85: Antivirus scanning order when using the normal, extended, or extreme database



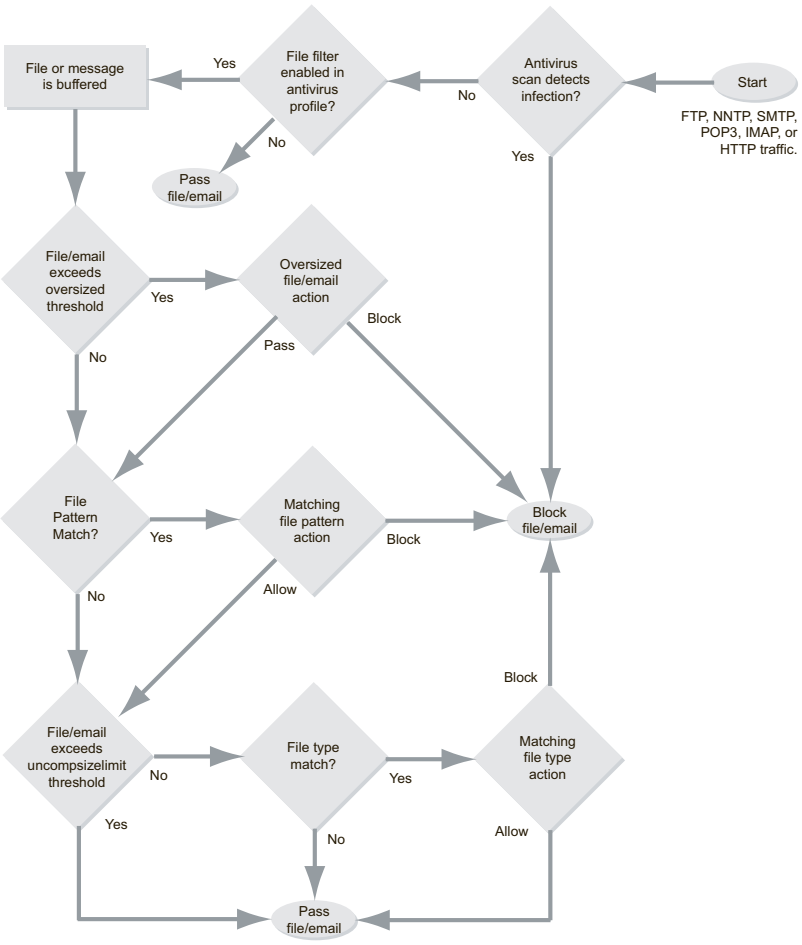
If a file fails any of the tasks of the antivirus scan, no further scans are performed. For example, if the file `fakefile.EXE` is recognized as a blocked file pattern, the FortiGate unit will send the end user a replacement message, and delete or quarantine the file. The unit will not perform virus scan, grayware, heuristics, and file type scans because the previous checks have already determined that the file is a threat and have dealt with it.

Flow-based antivirus scanning order

Figure 86 on page 898 illustrates the antivirus scanning order when using flow-based scanning (i.e. the flow-based database). The antivirus scan takes place before any other antivirus-related scan. If file filter is not enabled, the file is not buffered. The antivirus scan includes scanning for viruses, as well as for grayware and heuristics if they are enabled.

File filtering includes file pattern and file type scans which are applied at different stages in the antivirus process.

Figure 86: Antivirus scanning order when using the flow-based database



Antivirus databases

The antivirus scanning engine relies on a database to detail the unique attributes of each infection. The antivirus scan searches for these signatures, and when one is discovered, the FortiGate unit determines the file is infected and takes action.

All FortiGate units have the normal antivirus signature database but some models have additional databases you can select for use. Which you choose depends on your network and security needs.

Normal	Includes viruses currently spreading as determined by the FortiGuard Global Security Research Team. These viruses are the greatest threat. The Normal database is the default selection and it is available on every FortiGate unit.
Extended	Includes the normal database in addition to recent viruses that are no-longer active. These viruses may have been spreading within the last year but have since nearly or completely disappeared.

Extreme	Includes the extended database in addition to a large collection of 'zoo' viruses. These are viruses that have not spread in a long time and are largely dormant today. Some zoo viruses may rely on operating systems and hardware that are no longer widely used.
Flow	The flow-based database is a subset of the extreme database. Flow-based scans can not detect polymorphic and packed-file viruses so those signatures and not included in the flow-based database. Note that flow-based scanning is not just another database, but a different type of scanning. For more information, see "How antivirus scanning works" on page 895.

Antivirus techniques

The antivirus features work in sequence to efficiently scan incoming files and offer your network optimum antivirus protection. The first four features have specific functions, the fifth, heuristics, protects against any new, previously unknown virus threats. To ensure that your system is providing the most protection available, all virus definitions and signatures are updated regularly through the FortiGuard antivirus services. The features are discussed in the order that they are applied, followed by FortiGuard antivirus.

Virus scan

If the file passes the file pattern scan, the FortiGate unit applies a virus scan to it. The virus definitions are kept up-to-date through the FortiGuard Distribution Network (FDN). For more information, see "FortiGuard Antivirus" on page 899.

Grayware

If the file passes the virus scan, it will be checked for grayware. Grayware configurations can be turned on and off as required and are kept up to date in the same manner as the antivirus definitions. For more information, see "Enable grayware scanning" on page 906.

Heuristics

After an incoming file has passed the grayware scan, it is subjected to the heuristics scan. The FortiGate heuristic antivirus engine, if enabled, performs tests on the file to detect virus-like behavior or known virus indicators. In this way, heuristic scanning may detect new viruses, but may also produce some false positive results.

You can configure heuristics only through the CLI. See the *FortiGate CLI Reference*.

FortiGuard Antivirus

FortiGuard Antivirus services are an excellent resource which includes automatic updates of virus and IPS (attack) engines and definitions, as well as the local spam DNS black list (DNSBL), through the FDN. The FortiGuard Center web site also provides the FortiGuard Antivirus virus and attack encyclopedia.

The connection between the FortiGate unit and FortiGuard Center is configured in *System* > *Maintenance* > *FortiGuard*.

Enable antivirus scanning

Antivirus scanning is enabled in the antivirus profile. Once the antivirus profile is enabled and selected in one or more firewall policies, all the traffic controlled by those firewall policies will scanned according to your settings.

To enable antivirus scanning — web-based manager

1 Go to *UTM Profiles* > *AntiVirus* > *Profile*.

2 Select *Create New* to create a new antivirus profile, or select an existing antivirus profile and choose *Edit*.

3 In the row labeled *Virus Scan and Removal*, select the check boxes associated with the traffic you want scanned for viruses.

4 Select *OK*.

To enable antivirus scanning — CLI

You need to configure the scan option for each type of traffic you want scanned. In this example, antivirus scanning of HTTP traffic is enabled in the profile.

```
config antivirus profile
  edit my_av_profile
    config http
      set options scan
  end
end
```

Viewing antivirus database information

The FortiGate antivirus scanner relies on up-to-date virus signatures to detect the newest threats. To view the information about the FortiGate unit virus signatures, check the status page or the *Virus Database* information page:

- **Status page:** Go to *System* > *Dashboard* > *Dashboard*. In the *License Information* section under *FortiGuard Services*, the *AV Definitions* field shows the regular antivirus database version as well as when it was last updated.

  If your FortiGate unit supports extended and extreme virus database definitions, the database versions and date they were last updated is displayed in the *Extended set* and *Extreme DB* fields.

  The flow-based virus database is distributed as part of the IPS signature database. Its database version and date it was last updated is displayed in the *IPS Definitions* field.

- **Virus Database:** Go to *UTM Profiles* > *AntiVirus* > *Virus Database*. This page shows the version number, number of included signatures, and a description of the regular virus database.

  If your FortiGate unit supports extended, extreme, or flow-based virus database definitions, the version numbers, number of included signatures, and descriptions of those databases are also displayed.

Changing the default antivirus database

If your FortiGate unit supports extended, extreme, or flow-based virus database definitions, you can select the virus database most suited to your needs.

In most circumstances, the regular virus database provides sufficient protection. Viruses known to be active are included in the regular virus database. The extended database includes signatures of the viruses that have become rare within the last year in addition to those in the normal database. The extreme database includes legacy viruses that have not been seen in the wild in a long time in addition to those in the extended database.

The flow-based database contains a subset of the virus signatures in the extreme database. Unlike the other databases, selecting the flow-based database also changes the way the FortiGate unit scans your network traffic for viruses. Instead of the standard proxy-based scan, network traffic is scanned as it streams thought the FortiGate unit. For more information on the differences between flow-based and proxy-based antivirus scanning, see "How antivirus scanning works" on page 895.

If you require the most comprehensive antivirus protection, enable the extended virus database. The additional coverage comes at a cost, however, because the extra processing requires additional resources.

To change the antivirus database — web-based manager

1 Go to *UTM Profiles* > *AntiVirus* > *Virus Database*.

2 Select the antivirus database the FortiGate unit will use as the default database to perform antivirus scanning of your network traffic.

3 Select *Apply*.

To change the antivirus database — CLI

```
config antivirus settings
  set default-db extended
end
```

Overriding the default antivirus database

The default antivirus database is used for all antivirus scanning. If you have a particular policy or traffic type that requires scanning using a different antivirus database, you can override the default database. Antivirus database overrides are applied to individual traffic types in an antivirus profile. The override will affect only the traffic types to which the override is applied for the traffic handled by the security policy the antivirus profile is applied to. Antivirus database overrides can be set using only the CLI.

In this example, a database override is applied to HTTP traffic in a protocol options profile named `web_traffic`. The flow-based database is specified.

To override the default antivirus database — CLI

```
config antivirus profile
  edit web-traffic
    config http
      set avdb flow-based
  end
end
```

With this configuration, the flow-based database is used for antivirus scans on HTTP traffic controlled by firewall policies in which this antivirus profile is selected. Other traffic types will use the default database, as specified in *UTM Profiles* > *AntiVirus* > *Virus Database*.

Adding the antivirus profile to a security policy

This procedure is required only if your antivirus profile does not yet belong to a security policy. You need to add the antivirus profile to a policy before any antivirus profile settings can take effect.

To add the antivirus profile to a policy

1. Go to *Policy* > *Policy* > *Policy*.
2. Select *Create New* to add a new policy, or select the *Edit* icon of the security policy to which you want to add the profile.
3. Enable *UTM*.
4. Select *Enable AntiVirus* and select the antivirus profile that contains the quarantine configuration.
5. Select *OK* to save the security policy.

Configuring the scan buffer size

When checking files for viruses using the proxy-based scanning method, there is a maximum file size that can be buffered. Files larger than this size are passed without scanning. The default size for all FortiGate models is 10 megabytes.

Archived files are extracted and email attachments are decoded before the FortiGate unit determines if they can fit in the scan buffer. For example, a 7 megabyte ZIP file containing a 12 megabyte EXE file will be passed without scanning with the default buffer size. Although the archive would fit within the buffer, the uncompressed file size will not.

In this example, the `uncompsizelimit` CLI command is used to change the scan buffer size to 20 megabytes for files found in HTTP traffic:

```
config antivirus service http
  set uncompsizelimit 20
end
```

The maximum buffer size varies by model. Enter `set uncompsizelimit ?` to display the buffer size range for your FortiGate unit.

Flow-based scanning does not use a buffer and therefore has no file-size limit. File data is scanned as it passes through the FortiGate unit. The `uncompsizelimit` setting has no effect for flow-based scanning.

Configuring archive scan depth

The antivirus scanner will open archives and scan the files inside. Archives within other archives, or nested archives, are also scanned to a default depth of twelve nestings. You can adjust the number of nested archives to which the FortiGate unit will scan with the `uncompnestlimit` CLI command. Further, the limit is configured separately for each traffic type.

For example, this CLI command sets the archive scan depth for SMTP traffic to 5. That is, archives within archives will be scanned five levels deep.

```
config antivirus service smtp
  set uncompnestlimit 5
end
```

You can set the nesting limit from 2 to 100.

Configuring a maximum allowed file size

The protocol option profile allows you to enforce a maximum allowed file size for each of the network protocols in the profile. They are HTTP, FTP, IMAP, POP3, SMTP, IM, and NNTP. If your FortiGate unit supports SSL content scanning and inspection, you can also configure a maximum file size for HTTPS, IMAPS, POP3S, SMTPS, and FTPS.

The action you set determines what the FortiGate unit does with a file that exceeds the oversized file threshold. Two actions are available:

Block	Files that exceed the oversize threshold are dropped and a replacement message is sent to the user instead of the file.
Pass	Files exceed the oversized threshold are allowed through the FortiGate unit to their destination. Note that passed files are not scanned for viruses. File Filtering, both file pattern and file type, are applied, however.

You can also use the maximum file size to help secure your network. If you're using a proxy-based virus scan, the proxy scan buffer size limits the size of the files that can be scanned for infection. Files larger than this limit are passed without scanning. If you configure the maximum file size to block files larger than the scan buffer size, large infected files will not by-pass antivirus scanning.

In this example, the maximum file size will be configured to block files larger than 10 megabytes, the largest file that can be antivirus scanned with the default settings. You will need to configure a protocol options profile and add it to a security policy.

Create a protocol options profile to block files larger than 10 MB

1 Go to *Policy* > *Policy* > *Protocol Options*.
2 Select *Create New*.
3 Enter `10MB_Block` for the protocol options policy name.
4 For the comment, enter `Files larger than 10MB are blocked`.
5 Expand each protocol listed and select *Block* for the *Oversized File/Email* setting. Also confirm that the *Threshold* is set to `10`.
6 Select *OK*.

The protocol options profile is configured, but to block files, you must select it in the firewall profiles handling the traffic that contains the files you want blocked.

To select the protocol options profile in a security policy

1 Go to *Policy* > *Policy* > *Policy*.
2 Select a security policy.
3 Select the *Edit* icon.
4 Enable *UTM*.
5 Select `10MB_Block` from the *Protocol Options* list.
6 Select *OK* to save the security policy.

Once you complete these steps, any files in the traffic handled by this policy that are larger than 10MB will be blocked. If you have multiple firewall policies, examine each to determine if you want to apply similar file blocking the them as well.

Configuring client comforting

When proxy-based antivirus scanning is enabled, the FortiGate unit buffers files as they are downloaded. Once the entire file is captured, the FortiGate unit scans it. If no infection is found, the file is sent along to the client. The client initiates the file transfer and nothing happens until the FortiGate finds the file clean, and releases it. Users can be impatient, and if the file is large or the download slow, they may cancel the download, not realizing that the transfer is in progress.

The client comforting feature solves this problem by allowing a trickle of data to flow to the client so they can see the file is being transferred. The default client comforting transfer rate sends one byte of data to the client every ten seconds. This slow transfer continues while the FortiGate unit buffers the file and scans it. If the file is infection-free, it is released and the client will receive the remainder of the transfer at full speed. If the file is infected, the FortiGate unit caches the URL and drops the connection. The client does not receive any notification of what happened because the download to the client had already started. Instead, the download stops and the user is left with a partially downloaded file.

If the user tries to download the same file again within a short period of time, the cached URL is matched and the download is blocked. The client receives the Infection cache message replacement message as a notification that the download has been blocked. The number of URLs in the cache is limited by the size of the cache.

Client comforting can send unscanned and therefore potentially infected content to the client. You should only enable client comforting if you are prepared to accept this risk. Keeping the client comforting interval high and the amount low will reduce the amount of potentially infected data that is downloaded.

Client comforting is available for HTTP and FTP traffic. If your FortiGate unit supports SSL content scanning and inspection, you can also configure client comforting for HTTPS and FTPS traffic.

Enable and configure client comforting

1. Go to *Policy* > *Policy* > *Protocol Options*.
2. Select a protocol options profile and choose *Edit*, or select *Create New* to make a new one.
3. Expand HTTP, FTP, and if your FortiGate unit supports SSL content scanning and inspection, expand HTTPS and FTPS as well.
4. To enable client comforting, select *Comfort Clients* for each of the protocols in which you want it enabled.
5. Select *OK* to save the changes.
6. Select this protocol options profile in any security policy for it to take effect on all traffic handled by the policy.

The default values for Interval and Amount are 10 and 1, respectively. This means that when client comforting takes effect, 1 byte of the file is sent to the client every 10 seconds. You can change these values to vary the amount and frequency of the data transferred by client comforting.

Enable the file quarantine

You can quarantine blocked and infected files if you have a FortiGate unit with a local hard disk. You can view the file name and status information about the file in the *Quarantined Files* list and submit specific files and add file patterns to the *AutoSubmit* list so they will automatically be uploaded to the FortiGuard AntiVirus service for analysis.

FortiGate units can also quarantine blocked and infected files to a FortiAnalyzer unit. Files stored on the FortiAnalyzer unit can also be viewed from the *Quarantined Files* list in the FortiGate unit.

General configuration steps

The following steps provide an overview of the file quarantine configuration. For best results, follow the procedures in the order given. Note that if you perform any additional actions between procedures, your configuration may have different results.

1. Go to *UTM Profiles* > *AntiVirus* > *Quarantine* to configure the quarantine service and destination.
2. Go to *UTM Profiles* > *AntiVirus* > *Profile* and edit an existing antivirus profile or create a new one. In the *Quarantine* row, select the check boxes of the protocols for which you want the quarantine enabled. The *Quarantine* option only appears if your FortiGate unit has a local disk or if your FortiGate unit is configured to use a FortiAnalyzer unit to quarantine files.

Antivirus profiles also have a configurable feature called *Quarantine Virus Sender (to Banned User List)*. This is a different feature unrelated to the *Quarantine* option.

3. If you have not previously done so, go to *Policy* > *Policy* > *Policy* and add the antivirus profile to a security policy.

Configuring the file quarantine

You can configure quarantine options for HTTP, FTP, IMAP, POP3, SMTP, IM, and NNTP Traffic. If your FortiGate unit supports SSL content scanning and inspection you can also quarantine blocked and infected files from HTTPS, IMAPS, POP3S, SMTPS, and FTPS traffic.

The quarantine configuration is only available in the CLI. See the *CLI Reference* for a full description of the `config antivirus quarantine` command.

In this example, the quarantine is configured to use the FortiGate unit disk, save files for 24 hours, use a maximum of 500 MB, and overwrite the oldest file with a new one should the disk space limit be exceeded.

To configure the file quarantine

```
config antivirus quarantine
  set destination disk
  set agelimit 24
  set quarantine-quota 500
  set lowspace ovrw-old
end
```

Viewing quarantined files

The *Quarantined Files* list displays information about each quarantined file. You can sort the files by file name, date, service, status, duplicate count (DC), or time to live (TTL). You can also filter the list to view only quarantined files from a specific service.

To view quarantined files, go to *Log&Report* > *Quarantined Files*.

Downloading quarantined files

You can download any non-expired file from the quarantine. You may want to do so if it was quarantined as the result of a false positive or if you want to examine the contents.

To download a quarantined file

1 Go to *Log&Report* > *Quarantined Files*.

2 In the quarantine file list, find the file you want to download.

To find the file more quickly, use the *Sort by* function to change the sort order. Available sort criteria include status, services, file name, date, TTL, and duplicate count. You can also use the *Filter* function to display the files quarantined from an individual traffic type.

3 Select the *Download* icon to save a copy of the quarantined file on your computer.

Enable grayware scanning

Grayware programs are unsolicited software programs installed on computers, often without the user's consent or knowledge. Grayware programs are generally considered an annoyance, but they can also cause system performance problems or be used for malicious purposes.

To allow the FortiGate unit to scan for known grayware programs, you must enable both antivirus scanning and grayware detection. By default, grayware detection is disabled. To enable antivirus scanning, see "Enable antivirus scanning" on page 900.

To enable grayware detection — web-based manager

1 Go to *UTM Profiles* > *AntiVirus* > *Virus Database*.

2 Select *Enable Grayware Detection*.

To enable grayware detection — CLI

```
config antivirus settings
  set grayware enable
end
```

With grayware detection enabled, the FortiGate unit will scan for grayware any time it checks for viruses.

Testing your antivirus configuration

You have configured your FortiGate unit to stop viruses, but you'd like to confirm your settings are correct. Even if you have a real virus, it would be dangerous to use for this purpose. An incorrect configuration will allow the virus to infect your network.

To solve this problem, the European Institute of Computer Anti-virus Research has developed a test file that allows you to test your antivirus configuration. The EICAR test file is not a virus. It can not infect computers, nor can it spread or cause any damage. It's a very small file that contains a sequence of characters. Your FortiGate unit recognizes the EICAR test file as a virus so you can safely test your FortiGate unit antivirus configuration.

Go to http://www.fortiguard.com/antivirus/eicartest.html to download the test file (eicar.com) or the test file in a ZIP archive (eicar.zip).

If the antivirus profile applied to the security policy that allows you access to the Web is configured to scan HTTP traffic for viruses, any attempt to download the test file will be blocked. This indicates that you are protected.

Antivirus examples

The following examples provide a sample antivirus configuration scenario for a fictitious company.

Configuring simple antivirus protection

Small offices, whether they are small companies, home offices, or satellite offices, often have very simple needs. This example details how to enable antivirus protection on a FortiGate unit located in a satellite office. The satellite office does not have an internal email server. To send and retrieve email, the employees connect to an external mail server.

Creating an antivirus profile

Most antivirus settings are configured in an antivirus profile. Antivirus profiles are selected in firewall policies. This way, you can create multiple antivirus profiles, and tailor them to the traffic controlled by the security policy in which they are selected. In this example, you will create one antivirus profile.

To create an antivirus profile — web-based manager

1. Go to *UTM Profiles* > *AntiVirus* > *Profile*.
2. Select *Create New*.
3. In the *Name* field, enter `basic_antivirus`.
4. In the *Comments* field, enter `Antivirus protection for web and email traffic`.
5. Select the *Virus Scan* check boxes for the *HTTP*, *IMAP*, *POP3*, and *SMTP* traffic types.
6. Select *OK* to save the antivirus profile.

To create an antivirus profile — CLI

```
config antivirus profile
  edit basic_antivirus
    set comment "Antivirus protection for web and email traffic"
    config http
      set options scan
    end
    config imap
      set options scan
    end
```

```
    config pop3
      set options scan
    end
    config smtp
      set options scan
    end
  end
```

Selecting the antivirus profile in a security policy

An antivirus profile directs the FortiGate unit to scan network traffic only when it is selected in a security policy. When an antivirus profile is selected in a security policy, its settings are applied to all the traffic the security policy handles.

To select the antivirus profile in a security policy — web-based manager

1. Go to *Policy* > *Policy* > *Policy*.
2. Select a policy.
3. Select the *Edit* icon.
4. Enable *UTM*.
5. Select `default` from the *Protocol Options* list.

   UTM can not be enabled without selecting a protocol options profile. A default profile is provided.
6. Select the *Enable AntiVirus* option.
7. Select the `basic_antivirus` profile from the list.
8. Select *OK* to save the security policy.

To select the antivirus profile in a security policy — CLI

```
config firewall policy
  edit 1
    set utm-status enable
    set profile-protocol-options default
    set av-profile basic_antivirus
  end
```

HTTP, IMAP, POP3, and SMTP traffic handled by the security policy you modified will be scanned for viruses. A small office may have only one security policy configured. If you have multiple policies, consider enabling antivirus scanning for all of them.

Protecting your network against malicious email attachments

Grayware is commonly delivered by email or the web. The Example.com corporation has been the victim of multiple greyware infections in the past. Now that the company has a FortiGate unit protecting its network, you (Example.com's system administrator) can configure the unit to scan email and web traffic to filter out greyware attachments.

Enabling antivirus scanning in the antivirus profile

The primary means to avoid viruses is to configure the FortiGate unit to scan email and web traffic for virus signatures. You enable virus scanning in the antivirus profile and then select the antivirus profile in firewall policies that control email traffic.

To enable antivirus scanning in the antivirus profile

1. Go to *UTM Profiles* > *AntiVirus* > *Profile*.

2 Select *Create New* to add a new antivirus profile, or select the *Edit* icon of an existing antivirus profile.
3 Select the *Virus Scan* check box for *HTTP* to scan web traffic for viruses.
4 Select the *Virus Scan* check box for *IMAP*, *POP3*, and *SMTP* to scan all email protocols for viruses.
5 Select *OK* to save the antivirus profile.

Enabling grayware scanning

Grayware can also threaten Example.com's network. Viruses, email messages and the web are often the means by which grayware infections are delivered.

To enable grayware scanning

1 Go to *UTM Profiles* > *AntiVirus* > *Virus Database*.
2 Select *Enable Grayware Detection*.
3 Select *Apply*.

When *Enable Grayware Detection* is selected, virus scanning will also include grayware scanning. Any traffic scanned for viruses will also be scanned for grayware.

Selecting the antivirus profile in a security policy

An antivirus profile directs the FortiGate unit to scan network traffic only when it is selected in a security policy. When an antivirus profile is selected in a security policy, its settings are applied to all the traffic the security policy handles.

To select the antivirus profile in a security policy

1 Go to *Policy* > *Policy* > *Policy*.
2 Select the policy that controls the network traffic controlling email traffic.
3 Select the *Edit* icon.
4 Enable *UTM*.
5 Select the *Enable AntiVirus* option.
6 Select the antivirus profile from the list.
7 Select *OK* to save the security policy.

AntiVirus interface reference

The following explains the antivirus options that you can configure in the Antivirus menu. When configuring a profile, you can apply an antivirus profile to a firewall policy for HTTP, FTP, IMAP, POP3, SMTP, IM, and NNTP sessions. If your unit supports SSL content scanning and inspection you can also configure antivirus protection for HTTPS, IMAPS, POP3S, and SMTPS sessions.

This topic includes the following:

Profile

From the Profile submenu, you can configure antivirus profiles that are then applied to firewall policies. A profile is specific configuration information that defines how the traffic within a policy is examined and what action may be taken based on the examination.

You can create multiple antivirus profiles for different antivirus scanning requirements. For example, you create an antivirus profile that specifies only virus scanning for POP3 which you then apply to the out-going firewall policy. You can also choose specific protocols, such as POP3, that will be blocked and then archived by the unit. This option is available only in the CLI.

Within antivirus profiles, you can also choose specific protocols to be blocked and then archive them. This is available only in the CLI.

Antivirus profile configuration settings

The following are antivirus profile configuration settings in *UTM Profiles* > *Antivirus* > *Profile*.

Profile page Lists each individual antivirus profile that you created. On this page, you can edit, delete or create a new antivirus profile. You are redirected to this page when you select *View List* on the Edit Antivirus Profile page. **Note**: If you want to configure the profile to block and archive specific protocols, use the `options` value in the `config antivirus profile` command in the CLI.	
Create New	Creates a new antivirus profile. When you select *Create New*, you are automatically redirected to the New Antivirus Profile page.
Edit	Modifies settings within the antivirus profile. When you select *Edit*, you are automatically redirected to the Edit Antivirus Profile page.
Delete	Removes an antivirus profile from the list on the Profile page. To remove multiple antivirus profiles from within the list, on the Antivirus Profile page, in each of the rows of the profiles you want to remove, select the check box and then select *Delete*. To remove all antivirus profiles in the list, on the Antivirus Profile page, select the check box in the check box column, and then select *Delete*.
Name	The name of the antivirus profile.
Comments	A description for the antivirus profile.

Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is available within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
New Antivirus Profile page Provides settings for configuring a new antivirus profile. This page also allows you to configure quarantine settings for including a virus sender to the Banned User List. This page appears when you select *Create New* on the Edit Antivirus Profile page. If you are on the Profile page, and you select *Create New, you will be redirected to the New Antivirus Profile page.* **Note:** Logging is enabled in the CLI.	
Name	Enter a name for the profile. If you are editing an existing antivirus profile and want to change the name, enter a new name in this field. You must select *OK* to save these changes.
Comments	Enter a description for the profile; this is optional. If you are editing an existing antivirus profile and want to change the description, enter the changes in this field. You must select *OK* to save the changes.
Virus Scan and Removal	Select any of the following to have the unit scan for viruses when the available protocols are used for web (Internet activity, for example HTTP), email (for example, POP3 or POP3S), and transferring files (for example, FTP).
Quarantine	Select to enable the quarantine of detected viruses. Quarantined information is available in *Log&Report* > *Log & Archive Access*.

Virus Database

The unit contains multiple antivirus databases for you to choose from, so that you can get the maximum protection that you need for your network environment. The Virus Database, located in *UTM Profiles* > *Antivirus* > *Virus Database*, is used to detect viruses in network traffic. The databases are available on the Virus Database page:

- Regular Virus Database
- Extended Virus Database
- Extreme Virus Database
- Flow-based Virus Database

On the Virus Database page, you can also enable grayware detection. This grayware detection includes adware, dial, downloader, hacker tool, keylogger, RAT, and spyware.

The extended database provides “in the wild” viruses as well as a large collection of zoo viruses that have not yet been seen in current virus studies. An enhanced security environment is best suited for this type of database. The flow-based database provides “in the wild” viruses as well as some commonly seen viruses on the network. Flow-based virus scanning is an alternative to the file-based virus scanning, providing better performance but lower coverage rates than the file-based virus scan.

The extreme antivirus database allows scanning for both “in the wild” and “zoo” viruses that are no longer seen in recent studies as well as all available signatures that are currently supported. The extreme database provides flexibility, providing the maximum protection without sacrificing performance and is suited to an enhanced security environment. The extreme antivirus database is available only on models that have AMC-enabled platforms and large capacity hard drives.

The flow-based antivirus database helps to detect malware using IPS. This database includes “in the wild” viruses along with some commonly seen viruses on the network. The flow-based antivirus database provides an alternative to the file-based virus scan while also providing better performance.

The FortiGuard virus definitions are updated when the unit receives a new version of FortiGuard antivirus definitions from the FDN.

The FDN updates only the virus database selected in UTM Profiles > AntiVirus > Virus Database. If you’ve configured the use of other databases in antivirus profiles that are selected in security policies, those will also be updated by the FDN. To save bandwidth, antivirus databases that are in use are not updated.

The FortiGuard Center Virus Encyclopedia contains detailed descriptions of the viruses, worms, trojans, and other threats that can be detected and removed by your unit using the information in the FortiGuard virus definitions.

The FortiGuard AV definitions are updated automatically from the FortiGuard Distribution Network (FDN). Automatic antivirus definition updates are configured from the FDN by going to *System* > *Maintenance* > *FortiGuard*. You can also update the antivirus definitions manually from the system dashboard by going to *System* > *Dashboard* > *Status*.

If virtual domains are enabled, you must configure antivirus settings in antivirus profiles separately for each virtual domain.
Grayware settings can only be enabled or disabled when running FortiOS 4.0 MR2 or higher on the unit.

Email filter

This section describes how to configure FortiGate email filtering for IMAP, POP3, and SMTP email. Email filtering includes both spam filtering and filtering for any words or files you want to disallow in email messages. If your FortiGate unit supports SSL content scanning and inspection, you can also configure spam filtering for IMAPS, POP3S, and SMTPS email traffic.

The following topics are included in this section:

Email filter concepts

You can configure the FortiGate unit to manage unsolicited commercial email by detecting and identifying spam messages from known or suspected spam servers.

The FortiGuard Antispam Service uses both a sender IP reputation database and a spam signature database, along with sophisticated spam filtering tools, to detect and block a wide range of spam messages. Using FortiGuard Antispam email filter profile settings, you can enable IP address checking, URL checking, email checksum checking, and spam submission. Updates to the IP reputation and spam signature databases are provided continuously via the global FortiGuard Distribution Network.

From the FortiGuard Antispam Service page in the FortiGuard Center, you can find out whether an IP address is blacklisted in the FortiGuard antispam IP reputation database, or whether a URL or email address is in the signature database.

Email filter techniques

The FortiGate unit has a number of techniques available to help detect spam. Some use the FortiGuard Antispam Service and require a subscription. The remainder use your DNS servers or use lists that you must maintain.

FortiGuard IP address check

The FortiGate unit queries the FortiGuard Antispam Service to determine if the IP address of the client delivering the email is blacklisted. A match will cause the FortiGate unit to treat delivered messages as spam.

The default setting of the `smtp-spamhdrip` CLI command is `disable`. If enabled, the FortiGate unit will check all the IP addresses in the header of SMTP email against the FortiGuard Antispam Service. For more information, see the *FortiGate CLI Reference*.

FortiGuard URL check

The FortiGate unit queries the FortiGuard Antispam service to determine if any URL in the message body is associated with spam. If any URL is blacklisted, the FortiGate unit determines that the email message is spam.

Detect phishing URLs in email

The FortiGate unit sends the URL links in email messages to FortiGuard to determine if the links are associated with a known phishing site. If such a link is detected, the link is removed from the message. The URL remains, but it is no longer a selectable hyperlink.

FortiGuard email checksum check

The FortiGate unit sends a hash of an email to the FortiGuard Antispam server, which compares the hash to hashes of known spam messages stored in the FortiGuard Antispam database. If the hash results match, the email is flagged as spam.

FortiGuard spam submission

Spam submission is a way you can inform the FortiGuard AntiSpam service of non-spam messages incorrectly marked as spam. When you enable this setting, the FortiGate unit adds a link to the end of every message marked as spam. You then select this link to inform the FortiGuard AntiSpam service when a message is incorrectly marked.

IP address black/white list check

The FortiGate unit compares the IP address of the client delivering the email to the addresses in the IP address black/white list specified in the email filter profile. If a match is found, the FortiGate unit will take the action configured for the matching black/white list entry against all delivered email.

The default setting of the `smtp-spamhdrip` CLI command is `disable`. If enabled, the FortiGate unit will check all the IP addresses in the header of SMTP email against the specified IP address black/white list. For more information, see the *FortiGate CLI Reference*.

HELO DNS lookup

The FortiGate unit takes the domain name specified by the client in the HELO greeting sent when starting the SMTP session and does a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate unit determines that any messages delivered during the SMTP session are spam.

Email address black/white list check

The FortiGate unit compares the sender email address, as shown in the message envelope MAIL FROM, to the addresses in the email address black/white list specified in the email filter profile. If a match is found, the FortiGate unit will take the action configured for the matching black/white list entry.

Return email DNS check

The FortiGate unit performs a DNS lookup on the reply-to domain to see if there is an A or MX record. If no such record exists, the message is treated as spam.

Banned word check

The FortiGate unit blocks email messages based on matching the content of the message with the words or patterns in the selected spam filter banned word list.

Order of spam filtering

The FortiGate unit checks for spam using various filtering techniques. The order in which the FortiGate unit uses these filters depends on the mail protocol used.

Filters requiring a query to a server and a reply (FortiGuard Antispam Service and DNSBL/ORDBL) are run simultaneously. To avoid delays, queries are sent while other filters are running. The first reply to trigger a spam action takes effect as soon as the reply is received.

Each spam filter passes the email to the next if no matches or problems are found. If the action in the filter is *Mark as Spam*, the FortiGate unit tags the email as spam according to the settings in the email filter profile.

For SMTP and SMTPS, if the action is discard, the email message is discarded or dropped.

If the action in the filter is *Mark as Clear*, the email is exempt from any remaining filters. If the action in the filter is *Mark as Reject*, the email session is dropped. Rejected SMTP or SMTPS email messages are substituted with a configurable replacement message.

Order of SMTP and SMTPS spam filtering

The FortiGate unit scans SMTP and SMTPS email for spam in the order given below. SMTPS spam filtering is available on FortiGate units that support SSL content scanning and inspection.

1. IP address black/white list (BWL) check on last hop IP
2. DNSBL & ORDBL check on last hop IP, FortiGuard Antispam IP check on last hop IP, HELO DNS lookup
3. MIME headers check, E-mail address BWL check
4. Banned word check on email subject
5. IP address BWL check (for IPs extracted from “Received” headers)
6. Banned word check on email body
7. Return email DNS check, FortiGuard Antispam email checksum check, FortiGuard Antispam URL check, DNSBL & ORDBL check on public IP extracted from header.

Order of IMAP, POP3, IMAPS and POP3S spam filtering

The FortiGate unit scans IMAP, POP3, IMAPS and POP3S email for spam in the order given below. IMAPS and POP3S spam filtering is available on FortiGate units that support SSL content scanning and inspection.

1. MIME headers check, E-mail address BWL check
2. Banned word check on email subject
3. IP BWL check
4. Banned word check on email body
5. Return email DNS check, FortiGuard Antispam email checksum check, FortiGuard Antispam URL check, DNSBL & ORDBL check.

Enable email filter

Unlike antivirus protection, no single control enables all email filtering. Your FortiGate unit uses many techniques to detect spam; some may not be appropriate for every situation. For this reason, when you enable email filtering, you must then choose when techniques are applied to email traffic.

To enable email traffic inspection

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Select *Enable Spam Detection and Filtering*.

4 Select *Apply*.

Once you allow the FortiGate unit to examine one or more types of email traffic, you can enable any of the individual email filtering techniques.

Configure email traffic types to inspect

The FortiGate unit can examine IMAP, POP3, and SMTP email traffic. If your FortiGate unit supports content inspection, it can also examine IMAPS, POP3S, and SMTPS traffic. You can select which types of email traffic are examined by each email filter profile.

To select the email traffic types to inspect

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 If *Enable Spam Detection and Filtering* is enabled, the row immediately below shows a check box for each traffic type. Select the traffic types you want the FortiGate unit to examine when using this email filter profile.

4 Select *Apply*.

The traffic types you enable will be examined according to the settings in the email filter profile.

Configure the spam action

When spam is detected, the FortiGate unit will deal with it according to the *Spam Action* setting in the email filter profile. Note that POP3S, IMAPS and SMTPS spam filtering is available only on FortiGate units that support SSL content scanning and inspection. POP3, IMAP, POP3S and IMAPS mail can only be tagged. SMTP and SMTPS mail can be set to *Discard* or *Tagged*:

- **Discard**: When the spam action is set to *Discard*, messages detected as spam are deleted. No notification is sent to the sender or recipient.
- **Tagged**: When the spam action is set to *Tagged*, messages detected as spam are labelled and delivered normally. The text used for the label is set in the *Tag Format* field and the label is placed in the subject or the message header, as set with the *Tag Location* option.

To configure the spam action

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 The *Spam Action* row has a drop-down selection under the SMTP and SMTPS traffic type. Select *Discard* or *Tagged*.

No selection is available for POP3, IMAP, POP3S or IMAPS traffic. *Tagged* is the only applicable action for those traffic types.

By default, the tag location for any traffic set to *Tagged* is *Subject* and the tag format is `Spam`. If you want to change these settings, continue with "Configure the tag location" on page 917 and "Configure the tag format" on page 917.

4 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Configure the tag location

When the spam action is set to *Tagged*, the *Tag Location* setting determines where the tag is applied in the message.

To configure the tag location

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 The *Tag Location* row has two options for each traffic type. Note that if the spam action for SMTP traffic is set to discard, the tag location will not be available. Select the tag location:

- *Subject*: The FortiGate unit inserts the tag at the beginning of the message subject. For example, if the message subject is "Buy stuff!" and the tag is "[spam]", the new message subject is "[spam] Buy stuff!" if the message is detected as spam.
- *MIME*: The FortiGate unit inserts the tag into the message header. With most mail readers and web-based mail services, the tag will not be visible. Despite this, you can still set up a rule based on the presence or absence of the tag.

4 Select *Apply*.

Configure the tag format

When the spam action is set to *Tagged*, the *Tag Format* setting determines what text is used as the tag applied to the message.

To configure the tag format

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 The *Tag Format* row has a field for each traffic type. Note that if the spam action for SMTP traffic is set to discard, the tag format will not be available.Enter the text the FortiGate unit will use as the tag for each traffic type.

4 Select *Apply*.

Configure FortiGuard email filters

FortiGuard email filtering techniques us FortiGuard services to detect the presence of spam among your email. A FortiGuard subscription is required to use the FortiGuard email filters.

Enabling FortiGuard IP address checking

When you enable FortiGuard IP address checking, your FortiGate unit will submit the IP address of the client to the FortiGuard service for checking. If the IP address exists in the FortiGuard IP address black list, your FortiGate unit will treat the message as spam.

To enable FortiGuard IP address checking

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *FortiGuard Spam Filtering*, select *IP Address Check*.

4 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Enabling FortiGuard URL checking

When you enable FortiGuard IP address checking, your FortiGate unit will submit all URLs appearing in the email message body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL black list, your FortiGate unit will treat the message as spam.

To enable FortiGuard URL checking

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *FortiGuard Spam Filtering*, select *URL Check*.

4 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Enabling FortiGuard phishing URL detection

When you enable FortiGuard phishing URL detection, your FortiGate unit will submit all URL hyperlinks appearing in the email message body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL phishing list, your FortiGate unit will remove the hyperlink from the message. The URL will remain in place, but it will no longer be a selectable hyperlink.

To enable FortiGuard phishing URL detection

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *FortiGuard Spam Filtering*, select *Detect Phishing URLs in Email*.

4 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Enabling FortiGuard email checksum checking

When you enable FortiGuard email checksum checking, your FortiGate unit will submit a checksum of each email message to the FortiGuard service for checking. If a checksum exists in the FortiGuard checksum black list, your FortiGate unit will treat the message as spam.

To enable FortiGuard checksum checking

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *FortiGuard Email Filtering*, select *E-mail Checksum Check*.

4 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Enabling FortiGuard spam submission

When you enable FortiGuard email checksum checking, your FortiGate unit will append a link to the end of every message detected as spam. This link allows email users to “correct” the FortiGuard service by informing it that the message is not spam.

Carefully consider the use of the *Spam submission* option on email leaving your network. Users not familiar with the feature may click the link on spam messages because they are curious. This will reduce the accuracy of the feature.

To enable FortiGuard Spam submission

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *FortiGuard Email Filtering*, select *Spam Submission*.

4 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Configure local email filters

Local email filtering techniques us your own resources, whether DNS checks or IP address and email address lists that you maintain.

Enabling IP address black/white list checking

When you enable IP address black/white list checking, your FortiGate unit will compare the client IP address with the IP address black/white list specified in the email filter profile. If the client IP address exists, the FortiGate unit acts according to the action configured for the IP address in the list: allow the message, reject it, or mark it as spam.

The next two topics describe adding and configuring the IP address black/white list that you will need before you can enable the checking. If you already have this list, go to "Enabling the IP address black/white list checking" on page 921.

Creating an IP address black/white list

Before you can enable IP address black/white list spam filtering in the email filter profile, you must create an IP address black/white list.

To create an IP address black/white list

1. Go to *UTM Profiles* > *Email Filter* > *IP Address*.
2. Select *Create New*.
3. Enter a name for the IP address list.
4. Optionally, enter a description or comments about the list.
5. Select *OK* to save the IP address black/white list.

When a new IP address back/white list is created, it is empty. To perform any actions, you must add IP addresses to the list.

Adding addresses to an IP address black/white list

Each IP address black/white list contains a number of IP addresses, each having a specified action. When the FortiGate unit accepts mail from a client with an IP address on the IP address black/white list specified in the active email filter profile, it performs the action specified for the address.

To add an address to an IP address black/white list

1. Go to *UTM Profiles* > *Email Filter* > *IP Address*.
2. Select the list to which you want to add an address and choose *Edit*.
3. Select *Create New*.
4. Enter the address or netmask in the IP/netmask field.

5 Select the action:
- *Mark as Clear*: Messages from clients with matching IP addresses will be allowed, bypassing further email filtering.
- *Mark as Reject*: Messages from clients with matching IP addresses will be rejected. The FortiGate unit will return a reject message to the client. *Mark as Reject* only applies to mail delivered by SMTP. If an IP address black/white list is used with POP3 or IMAP mail, addresses configured with the *Mark as Reject* action will be marked as spam.
- *Mark as Spam*: Messages from clients with matching IP addresses will be treated as spam, subject to the action configured in the applicable email filter profile. For more information, see "Configure the spam action" on page 916.

6 By default, the address is enabled and the FortiGate unit will perform the action if the address is detected. To disable checking for the address, clear the *Enable* check box.

7 Select *OK*.

Enabling the IP address black/white list checking

Once you have created a black/white list and added the IP addresses, you can enable IP address the checking.

To enable IP address black/white list checking

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *Local Spam Filtering*, select *IP Address BWL Check*.

4 Select the IP address black/white list to use from the drop-down list.

5 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Enabling HELO DNS lookup

Whenever a client opens an SMTP session with a server, the client sends a HELO command with the client domain name. When you enable HELO DNS lookup, your FortiGate unit will take the domain the client submits as part of the HELO greeting and send it to the configured DNS. If the domain does not exist, your FortiGate unit will treat all messages the client delivers as spam.

The HELO DNS lookup is available only for SMTP traffic.

To enable HELO DNS lookup

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *Local Spam Filtering*, select *HELO DNS Lookup*.

4 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Enabling email address black/white list checking

When you enable email address black/white list checking, your FortiGate unit will compare the sender email address with the email address black/white list specified in the email filter profile. If the sender email address exists, the FortiGate unit acts according to the action configured for the email address in the list: allow the message or mark it as spam.

The next two topics describe adding and configuring the email address black/white list that you will need before you can enable the checking. If you already have this list, go to "Enabling email address black/white list checking" on page 923.

Creating an email address black/white list

Before you can enable email address black/white list spam filtering in the email filter profile, you must create an email address black/white list.

To create an email address black/white list

1 Go to *UTM Profiles* > *Email Filter* > *E-mail Address*.
2 Select *Create New*.
3 Enter a name for the email address list.
4 Optionally, enter a description or comments about the list.
5 Select *OK* to save the email address black/white list.

When a new IP address back/white list is created, it is empty. To perform any actions, you must add email addresses to the list.

Adding addresses to an email address black/white list

Each email address black/white list may contain a number of email addresses, each having a specified action. When the FortiGate unit accepts an email message from a client with a reply-to address that appears in the email address black/white list specified in the active email filter profile, it performs the action specified for the email message.

To add an address to an email address black/white list

1 Go to *UTM Profiles* > *Email Filter* > *E-mail Address*.
2 Select the *Edit* icon of the list to which you want to add an address.
3 Select *Create New*.
4 Enter the email address in the *Email Address* field.
5 If you need to enter a pattern in the *Email Address* field, select whether to use wildcards or regular expressions to specify the pattern.

   Wildcard uses an asterisk ("*") to match any number of any character. For example, *@example.com will match all addresses ending in @example.com.

   Regular expressions use Perl regular expression syntax. See http://perldoc.perl.org/perlretut.html for detailed information about using Perl regular expressions.
6 Select the action:
   - *Mark as Spam*: Messages with matching reply-to email addresses will be treated as spam, subject to the action configured in the applicable email filter profile. For more information, see "Configure the spam action" on page 916.
   - *Mark as Clear*: Messages with matching reply-to addresses will be allowed, bypassing further email filtering.

7 By default, the address is enabled and the FortiGate unit will perform the action if the address is detected. To disable checking for the address, clear the *Enable* check box.

8 Select *OK* to save the address.

Enabling email address black/white list checking

Once you have created a black/white list and added the email addresses, you can enable the checking.

To enable email address black/white list checking

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *Local Spam Filtering*, select *E-mail Address BWL Check*.

4 Select the email address black/white list to use from the drop-down list.

5 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Enabling return email DNS checking

When you enable return email DNS checking, your FortiGate unit will take the domain in the reply-to email address and send it to the configured DNS. If the domain does not exist, your FortiGate unit will treat the message as spam.

To enable return email DNS check

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *Local Spam Filtering*, select *Return E-mail DNS Check*.

4 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Enabling banned word checking

When you enable banned word checking, your FortiGate unit will examine the email message for words appearing in the banned word list specified in the email filter profile. If the total score of the banned word discovered in the email message exceeds the threshold value set in the email filter profile, your FortiGate unit will treat the message as spam.

When determining the banned word score total for an email message, each banned word score is added once no matter how many times the word appears in the message.

The next two topics describe adding and configuring the banned word list that you will need before you can enable the checking. If you already have this list, go to "Enabling banned word checking" on page 926.

How content is evaluated

Every time the banned word filter detects a pattern in an email message, it adds the pattern score to the sum of scores for the message. You set this score when you create a new pattern to block content. The score can be any number from zero to 99999. Higher scores indicate more offensive content. When the total score equals or exceeds the threshold, the email message is considered as spam and treated according to the spam action configured in the email filter profile. The score for each pattern is counted only once, even if that pattern appears many times in the email message. The default score for banned word patterns is 10 and the default threshold is 10. This means that by default, an email message is blocked by a single match.

A pattern can be part of a word, a whole word, or a phrase. Multiple words entered as a pattern are treated as a phrase. The phrase must appear as entered to match. You can also use wildcards or regular expressions to have a pattern match multiple words or phrases.

For example, the FortiGate unit scans an email message that contains only this sentence: “The score for each word or phrase is counted only once, even if that word or phrase appears many times in the email message.”

Banned word pattern	Pattern type	Assigned score	Score added to the sum for the entire page	Comment
word	Wildcard	20	20	The pattern appears twice but multiple occurrences are only counted once.
word phrase	Wildcard	20	0	Although each word in the phrase appears in the message, the words do not appear together as they do in the pattern. There are no matches.
word*phrase	Wildcard	20	20	The wildcard represents any number of any character. A match occurs as long as “word” appears before “phrase” regardless of what is in between them.
mail*age	Wildcard	20	20	Since the wildcard character can represent any characters, this pattern is a match because “email message” appears in the message.

In this example, the message is treated as spam if the banned word threshold is set to 60 or less.

Creating a banned word list

Before you can enable IP address black/white list spam filtering in the email filter profile, you must create an IP address black/white list.

To create an IP address black/white list

1 Go to *UTM Profiles* > *Email Filter* > *Banned Word*.
2 Select *Create New*.
3 Enter a name for the banned word list.
4 Optionally, enter a description or comments about the list.
5 Select *OK* to save the banned word list.

When a new banned word list is created, it is empty. To perform any actions, you must add words to the list.

Adding words to a banned word list

Each banned word list contains a number of words, each having a score, and specifying whether the email FortiGate unit will search for the word in the message subject, message body, or both.

When the FortiGate unit accepts an email message containing one or more words in the banned word list specified in the active email filter profile, it totals the scores of the banned words in the email message. If the total is higher than the threshold set in the email filter profile, the email message will be detected as spam. If the total score is lower than the threshold, the message will be allowed to pass as normal.

The score of a banned word present in the message will be counted toward the score total only once, regardless of how many times the word appears in the message.

To add words to a banned word list

1 Go to *UTM Profiles* > *Email Filter* > *Banned Word*.
2 Select the list to which you want to add a word.
3 Select *Edit*.
4 Select *Create New*.
5 Enter the word or the pattern in the *Pattern* field.
6 In the *Pattern Type* field, select whether you use wildcards or regular expressions.

   Wildcard uses an asterisk (“*”) to match any number of any character. For example, re* will match all words starting with “re”.

   Regular expression uses Perl regular expression syntax. See http://perldoc.perl.org/perlretut.html for detailed information about using Perl regular expressions.
7 In the *Language* field, select the language.
8 Select where the FortiGate unit will check for the banned word. The options are *Body*, *Subject*, or *All*, which combines the other two options.
9 Enter a score. If the word appears in the message as determined by the *Where* setting, the score is added to the scores of all the other banned words appearing in the email message. If the score total is higher than the threshold set in the email filter profile, the email message will be detected as spam. If the total score is lower than the threshold, the message will be allowed to pass as normal.

10 By default, the banned word is enabled and will appear in the list. To disable checking for the banned word, clear the *Enable* check box.

11 Select *OK* to save the banned word.

Enabling banned word checking

Once you have created a black/white list and added the email addresses, you can enable the checking.

To enable banned word checking

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 The default email filter profile is presented. To edit another profile, select it from the drop down in the *Edit Email Filter Profile* title bar.

3 Under the heading *Local Spam Filtering*, select *Banned Word Check*.

4 Select the banned word list to use from the drop-down list.

5 Enter a threshold value. If the total score of the banned words appearing in the message exceeds this threshold, the FortiGate unit treats the message as spam.

6 Select *Apply*.

Select the edited email filter profile in a security policy, and the traffic controlled by the security policy will be scanned according to the settings you configured. You may select the email filter profile in more than one security policy if required.

Email filter examples

Configuring simple antispam protection

Small offices, whether they are small companies, home offices, or satellite offices, often have very simple needs. This example details how to enable antispam protection on a FortiGate unit located in a satellite office.

Creating an email filter profile

Most email filter settings are configured in an email filter profile. Email filter profiles are selected in firewall policies. This way, you can create multiple email filter profiles, and tailor them to the traffic controlled by the security policy in which they are selected. In this example, you will create one email filter profile.

To create an email filter profile — web-based manager

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 Select the *Create New* icon in the Edit Email Filter Profile window title.

3 In the *Name* field, enter `basic_emailfilter`.

4 Select *Enable Spam Detection and Filtering*.

5 Ensure that *IMAP*, *POP3*, and *SMTP* are selected in the header row.

These header row selections enable or disable examination of each email traffic type. When disabled, the email traffic of that type is ignored by the FortiGate unit and no email filtering options are available.

6 Under *FortiGuard Spam Filtering*, enable *IP Address Check*.

7 Under *FortiGuard Spam Filtering*, enable *URL Check*.

8 Under *FortiGuard Spam Filtering*, enable *E-mail Checksum Check*.

9 Select *OK* to save the email filter profile.

To create an email filter profile — CLI

```
config spamfilter profile
  edit basic_emailfilter
    set options spamfsip spamfsurl spamfschksum
  end
```

Selecting the email filter profile in a security policy

An email filter profile directs the FortiGate unit to scan network traffic only when it is selected in a security policy. When an email filter profile is selected in a security policy, its settings are applied to all the traffic the security policy handles.

To select the email filter profile in a security policy — web-based manager

1 Go to *Policy* > *Policy* > *Policy*.

2 Select a policy.

3 Select the *Edit* icon.

4 Enable *UTM*.

5 Select the *Enable Email Filter* option.

6 Select the `basic_emailfilter` profile from the list.

7 Select *OK* to save the security policy.

To select the email filter profile in a security policy — CLI

```
config firewall policy
  edit 1
    set utm-status enable
    set profile-protocol-options default
    set spamfilter-profile basic_emailfilter
  end
```

IMAP, POP3, and SMTP email traffic handled by the security policy you modified will be scanned for spam. Spam messages have the text “Spam” added to their subject lines. A small office may have only one security policy configured. If you have multiple policies, consider enabling spam scanning for all of them.

Blocking email from a user

Employees of the Example.com corporation have been receiving unwanted email messages from a former client at a company called example.net. All ties between the company and the client have been severed, but the messages continue. The FortiGate unit can be configured to prevent these messages from being delivered.

To create the email address list

1 Go to *UTM Profiles* > *Email Filter* > *E-mail Address*.

2 Select *Create New*.

3 Enter a name for the new email address list.

4 Optionally, enter a descriptive comment for the email address list.

5 Select *OK* to create the list.

6 Select *Create New* to add a new entry to the email address list.

7 Enter `*@example.net` in the *E-mail Address* field.

8 Leave *Pattern Type* set to the default, *Wildcard*.

9 Leave *Action* as *Mark as Spam* to have the FortiGate unit mark all messages from example.net as spam.

Now that the email address list is created, you must enable the email filter in the email filter profile.

To enable Email Filter

1 Go to *UTM Profiles* > *Email Filter* > *Profile*.

2 Select the email filter profile that is used by the firewall policies handling email traffic from the email filter profile drop down list.

3 In the row *Tag Location*, select *Subject* for all three mail protocols.

4 In the row *Tag Format*, enter `SPAM:` in all three fields.

5 Select *Enable Spam Detection and Filtering*.

6 Ensure that the check boxes labeled *IMAP*, *POP3*, and *SMTP* in the header row are selected.

7 Under *Local Spam Filtering*, enable *E-mail Address BWL Check* and select the email address list you created in the previous procedure from the drop down list.

8 Select *OK*.

When this email filter profile is selected in a security policy, the FortiGate unit will add “SPAM:” to the subject of any email message from an address ending with @example.net for all email traffic handled by the security policy. Recipients can ignore the message or they can configure their email clients to automatically delete messages with “SPAM:” in the subject.

Email Filter interface reference

Reports page Provides settings for configuring a report that you generated. The information for these reports are taken from a web filter profile. You must first configure a web filter profile before you can generate a report.	
Web Filter Profile	Select the web filter profile that you want to see a report based on.
Clear report data	Removes all data within the report that you are currently viewing.
Report Type	Select the time period for the report. Choose from *Hour*, *Day*, or *All*.
Report Range	Select the time range (format is in the 24 hour clock) or day range (from six days ago to today) for the report. For example, for an “hour” report type with a range of 13 to 16, the result is a category block report for 1 pm and 4 pm today. For a “day” report type with a range of 0 to 3, the result is a category block report for three days ago from today.
Get Report	Select to generate a report.
The generated report includes the following columns that appear below the pie chart on the Reports page:	
Category	The category for which the statistic was generated.

Allowed	The number of allowed web addresses accessed in the selected time frame.
Blocked	The number of blocked web addresses accessed in the selected time frame.
Logged	The logged web filter information.
Overridden	The blocked instances where an override was allowed.

If your unit supports SSL content scanning and inspection you can also configure email filtering for IMAPS, POP3S, and SMTPS email traffic.

You can configure the unit to manage unsolicited commercial email by identifying spam messages from known or suspected spam servers.

The FortiGuard Antispam Service uses both a sender IP reputation database and a spam signature database, along with sophisticated spam filtering tools, to detect and block a wide range of spam messages. Using FortiGuard Email filtering profile settings you can enable IP address checking, URL checking, E-mail checksum checking, and Spam submission. Updates to the IP reputation and spam signature databases are provided continuously from the global FortiGuard distribution network.

From the FortiGuard Antispam Service page in the FortiGuard center you can use IP and signature lookup to check whether an IP address is blacklisted in the FortiGuard antispam IP reputation database, or whether a URL or email address is in the signature database.

This topic contains the following:

Order of email filtering

Email filtering uses various filtering techniques. The order the unit uses these filters depends on the mail protocol that is used.

Filters requiring a query to a server and a reply (FortiGuard Antispam Service and DNSBL/ORDBL) are run simultaneously. To avoid delays, queries are sent while other filters are running. The first reply to trigger a spam action takes effect as soon as the reply is received.

Each filter passes the email to the next if no matches or problems are found. If the action in the filter is Mark as Spam, the FortiGate unit tags as spam the email according to the settings in the email filter profile.

For SMTP and SMTPS if the action is discard the email message is discarded or dropped.

If the action in the filter is *Mark as Clear*, the email is exempt from any remaining filters. If the action in the filter is *Mark as Reject*, the email session is dropped. Rejected SMTP or SMTPS email messages are substituted with a configurable replacement message.

Order of SMTP and SMTPS email filtering

SMTPS email filtering is available on units that support SSL content scanning and inspection.

1 IP address BWL check on last hop IP.

2 DNSBL & ORDBL check on last hop IP, FortiGuard Email Filtering IP address check on last hop IP, HELO DNS lookup.
3 MIME headers check, E-mail address BWL check.
4 Banned word check on email subject.
5 IP address BWL check (for IPs extracted from “Received” headers).
6 Banned word check on email body.
7 Return email DNS check, FortiGuard Antispam email checksum check, FortiGuard Email Filtering URL check, DNSBL & ORDBL check on public IP extracted from header.

Order of IMAP, POP3, IMAPS and POP3S email filtering

IMAPS and POP3S email filtering is available on units the support SSL content scanning and inspection.

1 MIME headers check, Email address BWL check.
2 Banned word check on email subject.
3 IP BWL check.
4 Banned word check on email body.
5 Return email DNS check, FortiGuard Email Filtering email checksum check, FortiGuard Email Filtering URL check, DNSBL & ORDBL check.

Profile

The Profile menu allows you to configure email filter profiles for applying to firewall policies. A profile is specific information that defines how the traffic within a policy is examined and what action may be taken based on the examination.

Email filter profile configuration settings

The following are email filter profile configuration settings in *UTM Profiles* > *Email Filter* > *Profile*. Advanced settings are configured in the CLI.

Profile page	
Lists each individual email filter profile that you created. On this page, you can edit, delete or create a new email filter profile. You are redirected to this page when you select *View LIst* on the Edit Email Filter Profile page.	
Create New	Creates a new email filter profile. When you select *Create New*, you are automatically redirected to the New Email Filter Profile page.
Edit	Modifies settings within an email filtering profile. When you select *Edit*, you are automatically redirected to the Edit Email Filter Profile page.
Delete	Removes an email filter profile from the list. To remove multiple email filter profiles from within the list, on the Profile page, in each of the rows of the email filter profiles you want removed, select the check box and then select *Delete*. To remove all email filter profiles from the list, on the Profile page, select the check box in the check box column and then select *Delete*.

Name	The name of the email filter profile.
Comments	The description given to the email filter profile. This is an optional setting.
Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
New Email Filter Profile page Provides settings for configuring multiple email filter profiles. If you are editing an email filter profile, you are automatically redirected to the Edit Email Filter Profile page. This page appears when you select *Create New* on the Edit Email Filter Profile page. If you are on the Profile page, and you select *Create New*, you will be redirected to the New Email Filter Profile page. **Note:** Logging is enabled in the CLI.	
Name	Enter a name for the email filter profile. If you are editing an existing email profile and want to change the name, enter the new name in the *Name* field and then select *Apply* to save the changes.
Comments	Enter a description about the email filter profile. This is optional. If you are editing an existing email profile and want to change the description, enter the new description in the *Comments* field and then select *Apply* to save the changes.
Log Email Summary	Select to log specific information about the spam email activity on protocols such as IMAP or web mail such as Yahoo Mail. This feature does not record all email filtering activity, only IMAP, POP3, SMTP, Yahoo Mail, and MSN Hotmail spam detected email messages. If you want to log all email filtering activity, you must enabled it in the CLI.

Enable Spam Detection and Filtering	Select to enable specific settings for detecting and filtering spam email messages for IMAP, POP3 and SMTP as well as IMAPS, POP3S and SMTPS.
Spam Action	Select to either tag or discard email that the unit determines to be spam. Tagging adds the text in the *Tag Format* field to the subject line or header of an email message that is identified as spam. Discard is available only for SMTP. **Note:** When you enable virus scanning for SMTP and SMTPS in an antivirus profile, scanning in splice mode is also called streaming mode and is enabled automatically. When scanning in splice mode, the unit scans and streams the traffic to the destination at the same time, terminating the stream to the destination if a virus is selected. For more information about splicing behavior for SMTP, see the Knowledge Base article *FortiGate Proxy Splice and Client Comforting Technical Note*. When virus scanning is enabled for SMTP, the unit can only discard spam email if a virus is detected. Discarding immediately drops the connection. If virus scanning is not enabled, you can choose to either tag or discard SMTP spam.
Tag Location	Select to add the tag to the subject or MIME header of email identified as spam. If you select to add the tag to the subject line, the unit converts the entire subject line, including the tag, to UTF-8 format. this improves display for some email clients that cannot properly display subject lines that use more than one encoding. To add the tag to the MIME header, you must enable spamhdrcheck in the CLI for each protocol (IMAP, POP3 and SMTP).
Tag Format	Enter a word or phrase with which to tag email identified as spam. When typing a tag, use the same language as the unit's current administrator language setting. Tag text using other encodings may not be accepted. For example, when entering a spam tag that uses Japanese characters, first verify that the administrator language settings is Japanese; the unit will not accept a spam tag written in Japanese characters while the administrator language setting is English. Tags must not exceed 64 bytes. The number of characters constituting 64 bytes of data varies by text encoding, which may vary by the FortiGate administrator language setting.

FortiGuard Spam Filtering	Appears only when *Enable Spam Detection and Filtering* is enabled. Select to enable FortiGuard spam filtering.
Local Spam Filtering	Appears only when *Enable Spam Detection and Filtering* is enabled. Select to enable local spam filtering. Select the various check boxes beside the options you want included in the profile. When you enable local spam filtering, you can apply email address and IP address black and white lists, as well as a banned word list to the profile.

Banned Word

Control spam by blocking email messages containing specific words or patterns. You can add words, phrases, wild cards and Perl regular expressions to match content in email messages. For information, about wild cards and Perl regular expressions, see "Using wildcards and Perl regular expressions" on page 1145.

The unit checks each email message against the banned word list. The unit can sort email messages containing those banned words in the subject, body, or both. The score value of each banned word appearing in the message is added, and if the total is greater than the threshold value set in the email filter profile, the unit processes the message according to the setting in the profile. The score for a pattern is applied only once even if the word appears in the message multiple times.

Banned word configuration settings

The following are banned word configuration settings in *UTM Profiles* > *Email Filter* > *Banned Word*.

Banned Word page Lists each banned word list that you created. On this page you can edit, delete or create a new banned word.	
Create New	Creates a new banned word. When you select *Create New*, you are automatically redirected to the New List page. This page provides a name field and comment field. You must enter a name to go to the Banned Word Settings page.
Edit	Modifies the banned word list, list name, or list comment. When you select *Edit*, you are automatically redirected to the Banned Word Settings page.
Delete	Removes the banned word list from the catalog. The *Delete* icon is available only if the banned word list is not selected in any email filter profiles. To remove multiple banned word lists from within the list, on the Banned Word page, in each of the rows of the banned word lists you want removed, select the check box and then select *Delete*. To remove all banned word lists from the list, on the Banned Word page, select the check box in the check box column and then select *Delete*.
Name	The available Email Filter banned word lists.
# Entries	The number of entries in each banned word list.
Comments	Optional description of each banned word list.
Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.

Banned Word Settings page Provides settings for configuring a word pattern or word that will be considered banned by the unit. These words and word patterns make up a banned word list which appears on the Banned Word page. if you are editing a banned word, you are automatically redirected to the Banned Word Settings page.	
Name	If you are editing an existing banned word list and you want to change the name, enter a new name in this field. You must select *OK* to save these changes.
Comments	If you are editing an existing banned word list and want to change or add a description, enter the new text in this field. You must select *OK* to save these changes.
Create New	Adds a word or phrase to the banned word list. When you select *Create New*, you are automatically redirected to the Add Banned Word page.
Edit	Modifies banned word settings. When you select *Edit*, you are automatically redirected to the Edit Banned Word page.
Delete	Removes a banned word from the list. To remove multiple banned words from within the list, on the Banned Word Settings page, in each of the rows of the words you want removed, select the check box and then select *Delete*. To remove all banned words from the list, on the Banned Word Settings page, select the check box in the check box column and then select *Delete*.
Enable	Enables a banned word within the list.
Disable	Disables a banned word within the list.
Remove All Entries	Removes all banned word entries within the list on the Banned Word Settings page.
Page Controls	Use to navigate through the information in the Banned Word menu.
Enable	A green checkmark appears if the banned word is enabled.
Pattern	The list of banned words. Select the check box to enable all the banned words in the list.
Pattern Type	The pattern type used in the banned word list entry. Choose from wildcard or regular expression. For more information, see “Using wildcards and Perl regular expressions” on page 1145.
Language	The character set to which the banned word belongs.
Where	The location where the unit searches for the banned word: *Subject*, *Body*, or *All*.
Score	A numerical weighting applied to the banned word. The score values of all the matching words appearing in an email message are added, and if the total is greater than the Banned word check value set in the profile, the email is processed according to whether the spam action is set to *Discard* or *Tagged* in the email filter profile. The score for a banned word is counted once even if the word appears multiple times on the web page in the email. For more information, see “Email Filter interface reference” on page 928.

Add Banned Word page	
Provides settings for configuring a banned word entry.	
Pattern	Enter the banned word pattern. A pattern can be part of a word, a whole word, or a phrase. Multiple words entered as a pattern are treated as a phrase. The phrase must appear exactly as entered to match. You can also use wildcards or regular expressions to have a pattern match multiple words or phrases.
Pattern Type	Select the pattern type for the banned word. Choose from wildcard or regular expressions. For more information, see "Using wildcards and Perl regular expressions" on page 1145.
Language	Select the character sets for the banned word.
Where	Select where the FortiGate unit should search for the banned word, *Subject*, *Body*, or *All*.
Score	Enter a score for the pattern. Each entry in the banned word list added to the profile includes a score. When an email message is matched with an entry in the banned word list, the score is recorded. If an email message matches more than one entry, the score for the email message increases. When the total score for an email message equals or exceeds the threshold, the message is considered spam and handled according to the spam action configured in the profile.
Enable	Select to enable a disable banned word. By default, a banned word is enabled.

Perl regular expression patterns are case sensitive for banned words. To make a word or phrase case insensitive, use the regular expression `/i`. For example, `/bad language/i` will block all instances of `bad language` regardless of case. Wildcard patterns are not case sensitive.

IP Address

You can add IP address black/white lists and email address black/white lists to filter email. When performing an IP address list check, the unit compares the IP address of the message sender to the IP address list items in sequence. When performing an email list check, the unit compares the email address of the message sender to the email address list items in sequence. If a match is found, the action associated with the IP address or email address is taken. If no match is found, the message is passed to the next enabled email filter

You can add multiple IP address lists and then select the best one for each email filter profile.

After creating an IP address list, you can add IP addresses to the list.

Enter an IP address or a pair of IP address and mask in the following formats:

- x.x.x.x, for example, 192.168.69.100.
- x.x.x.x/x.x.x.x, for example, 192.168.69.100/255.255.255.0
- x.x.x.x/x, for example, 192.168.69.100/24

IP address configuration settings

The following are IP address configuration settings in *UTM Profiles* > *Email Filter* > *IP Address*.

IP Address page	
Lists each individual IP address list that you created. On this page, you can edit, delete or create a new IP address list. An IP address list contains multiple IP addresses and this list is configured in the IP Address Settings page.	
Create New	Creates a new IP address list. When you select *Create New*, you are automatically redirected to the New List page. This page provides a name field and comment field. You must enter a name to go to the IPS Address Settings page.
Edit	Modifies settings within an IP address list. When you select *Edit*, you are automatically redirected to the IP Address Settings page.
Delete	Removes the IP address black/white list from the list. The *Delete* icon is available only if the IP address list is not selected in any profiles. To remove multiple IP address black/white lists from within the list, on the IP Address page, in each of the rows of the black/white lists you want removed, select the check box and then select *Delete*. To remove all IP address lists from the list, on the IP Address page, select the check box in the check box column and then select *Delete*.
Name	The available name of the IP address lists.
# Entries	The number of entries in each IP address list.
Comments	Optional description of each IP address list.

Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
IP Address Settings page Provides settings for configuring multiple IP addresses that are then grouped together to form a list of IP addresses. This list is then applied within the email filter profile. You are automatically redirected to this page from the New List page. If you are editing an IP Address, you are automatically redirected to the IP Address Settings page.	
Name	If you are editing an existing IP address list and want to change the name, enter a new name in this field. You must select *OK* to save the change.
Comments	If you are editing an existing IP address list and want to change or add a description, enter the new text in this field. You must select *OK* to save the changes.
Create New	Creates a new IP address with settings. When you select *Create New*, you are automatically redirected to the Add IP Address page.
Edit	Modifies the settings within an IP address. When you select *Edit*, you are automatically redirected to the Edit IP Address page.

Delete	Removes an IP address from the list. To remove multiple IP addresses from within the list, on the IP Address Settings page, in each of the rows of the IP addresses you want removed, select the check box and then select *Delete*. To remove all IP addresses from the list, on the IP Address Settings page, select the check box in the check box column and then select *Delete*.
Enable	Enables an IP address within that IP address list.
Disable	Disables an IP address within that IP address list.
Move To	Moves the entry to a different position in the list. When you select *Move To*, the Move IP Address window appears. To move an IP address, select the new position *Before* or *After*, which will place the current IP address before or after the IP address you enter in the field *(IP/Netmask)*. Enter the IP address and netmask in the *(IP/Netmask)* field. The firewall policy executes the list from top to bottom. For example, if you have IP address 192.168.100.1 listed as spam and 192.168.100.2 listed as clear, you must put 192.168.100.1 above 192.168.100.2 for 192.168.100.1 to take effect.
Remove All Entries	Removes all IP addresses from within the list on the IP Address Settings page.
Enable	Indicates that the IP address is either enabled or disabled. A green check mark indicates that it is enabled; a gray x indicates that it is disabled.
IP/Netmask	The IP address and/or netmask.
Action	The type of action the unit will take when a match is detected. For example, the *Action* is *Spam*; when a match is found, the detected IP address is considered spam.
Add IP Address page	
Provides settings for configuring an IP address to add to the list.	
IP/Netmask	Enter the IP address or the IP address/mask pair.
Action	Select: *Mark as Spam* to apply the spam action configured in the profile, *Mark as Clear* to bypass this and remaining email filters, or *Mark as Reject* (SMTP or SMTPS) to drop the session.
Enable	Select to enable the address.

E-mail Address

The unit can filter email from specific senders or all email from a domain (such as example.net). You can add email address lists and then select the best one for each profile.

Email address configuration settings

The following are email address configuration settings in *UTM Profiles* > *Email Filter* > *E-mail Address*.

E-mail Address page	
Lists each individual email address list that you created. On this page, you can edit, delete or create a new email address list.	
Create New	Creates a new email address list. When you select *Create New*, you are automatically redirected to the New List page. This page provides a name field and comment field; you must enter a name to go to the E-mail Address Settings page.
Edit	Modifies settings within an email address list. When you select *Edit*, you are automatically redirected to the E-mail Address Settings page.
Delete	Removes the email address list from the list on the E-mail Address page. The *Delete* icon is only available if the email address list is not selected in any profiles. To remove multiple email address lists from within the list, on the E-mail Address page, in each of the rows of the lists you want removed, select the check box and then select *Delete*. To remove all email filter lists from the list, on the E-mail Address page, select the check box in the check box column and then select *Delete*.
Name	The name of the email address list.
# Entries	The number of entries in each email address list.
Comments	Optional description of each email address list.

Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
E-mail Address Settings page Provides settings for configuring multiple email addresses that are then grouped together to form a list of email addresses. This list is then applied within the email filter profile. You are automatically redirected to this page from the New List page. If you are editing an email address list, you are automatically redirected to the E-mail Address Settings page.	
Name	If you are editing an existing email address list and want to change the name, enter a new name in this field. You must select *OK* to save the change.
Comments	If you are editing an existing email address list and want to change or add a description, enter the new text in this field. You must select *OK* to save the changes.
Create New	Creates a new email address to the email address list. When you select *Create New*, you are automatically redirected to the Add E-mail Address page.
Edit	Modifies settings within that email address in the list on the E-mail Address Settings page. When you select *Edit*, you are automatically redirected to the Edit E-mail Address page.
Delete	Removes an email address from within the list on the E-mail Address Settings page.
Enable	Enables an email address within the list.
Disable	Disables an email address within the list.

Move To	Moves the entry to a different position in the list. When you select *Move To*, the Move E-mail Address window appears. To move an email address, select the new position *Before* or *After*, which will place the current email address before or after the email address you enter in the *(E-mail Address)* filed. Enter the email address in the field and then select *OK*.
Remove All Entries	Removes all email addresses within the list on the E-mail Address Settings page.
Page Controls	Use to navigate through the lists on the E-mail Address Settings page.
Enable	A green checkmark appears if an email address is enabled. A gray x appears if an email address is disabled.
E-mail Address	The email address entered.
Pattern Type	The pattern type chosen for that email address.
Action	The action that will be take when that email address is detected.
Add E-Mail Address page	
E-mail Address	Enter the email address.
Pattern Type	Select a pattern type: *Wildcard* or *Regular Expression*. For more information, see “Using wildcards and Perl regular expressions” on page 1145.
Action	Select: *Mark as Spam* to apply the spam action configured in the profile, or *Mark as Clear* to bypass this and remaining email filters.
Enable	Select to enable the email address.

Intrusion protection

The FortiGate Intrusion Protection system combines signature detection and prevention with low latency and excellent reliability. With intrusion protection, you can create multiple IPS sensors, each containing a complete configuration based on signatures. Then, you can apply any IPS sensor to any security policy.

This section describes how to configure the FortiGate Intrusion Protection settings.

If you enable virtual domains (VDOMs) on the FortiGate unit, intrusion protection is configured separately for each virtual domain.

The following topics are included:

IPS concepts

The FortiGate intrusion protection system protects your network from outside attacks. Your FortiGate unit has two techniques to deal with these attacks: anomaly- and signature-based defense.

Anomaly-based defense

Anomaly-based defense is used when network traffic itself is used as a weapon. A host can be flooded with far more traffic than it can handle, making the host inaccessible. The most common example is the denial of service (DoS) attack, in which an attacker directs a large number of computers to attempt normal access of the target system. If enough access attempts are made, the target is overwhelmed and unable to service genuine users. The attacker does not gain access to the target system, but it is not accessible to anyone else.

The FortiGate DoS feature will block traffic above a certain threshold from the attacker and allow connections from other legitimate users.

Signature-based defense

Signature-based defense is used against known attacks or vulnerability exploits. These often involve an attacker attempting to gain access to your network. The attacker must communicate with the host in an attempt to gain access and this communication will include particular commands or sequences of commands and variables. The IPS signatures include these command sequences, allowing the FortiGate unit to detect and stop the attack.

Signatures

IPS signatures are the basis of signature-based intrusion protection. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. Signatures include this information so your FortiGate unit knows what to look for in network traffic.

Signatures also include characteristics about the attack they describe. These characteristics include the network protocol in which the attack will appear, the vulnerable operating system, and the vulnerable application.

To view the complete list of predefined signatures, go to *UTM Profiles* > *Intrusion Protection* > *Predefined*.

Protocol decoders

Before examining network traffic for attacks, the IPS engine uses protocol decoders to identify each protocol appearing in the traffic. Attacks are protocol-specific, so your FortiGate unit conserves resources by looking for attacks only in the protocols used to transmit them. For example, the FortiGate unit will only examine HTTP traffic for the presence of a signature describing an HTTP attack.

To view the protocol decoders, go to *UTM Profiles* > *Intrusion Protection* > *Protocol Decoder*.

IPS engine

Once the protocol decoders separate the network traffic by protocol, the IPS engine examines the network traffic for the attack signatures.

IPS sensors

The IPS engine does not examine network traffic for all signatures, however. You must first create an IPS sensor and specify which signatures are included. Add signatures to sensors individually using signature entries, or in groups using IPS filters.

To view the IPS sensors, go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor*.

IPS filters

IPS sensors contain one or more IPS filters. A filter is a collection of signature attributes that you specify. The signatures that have all of the attributes specified in a filter are included in the IPS filter.

For example, if your FortiGate unit protects a Linux server running the Apache web server software, you could create a new filter to protect it. By setting *OS* to *Linux*, and *Application* to *Apache,* the filter will include only the signatures that apply to both Linux and Apache. If you wanted to scan for all the Linux signatures and all the Apache signatures, you would create two filters, one for each.

To view the filters in an IPS sensor, go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor*, select the IPS sensor containing the filters you want to view, and choose *Edit*.

Custom/predefined signature entries

Signature entries allow you to add an individual custom or predefined IPS signature. If you need only one signature, adding a signature entry to an IPS sensor is the easiest way. Signature entries are also the only way to include custom signatures in an IPS sensor.

Another use for signature entries are to change the settings of individual signatures that are already included in a filter within the same IPS sensor. Add a signature entry with the required settings above the filter, and the signature entry will take priority.

Policies

To use an IPS sensor, you must select it in a security policy or an interface policy. An IPS sensor that it not selected in a policy will have no effect on network traffic.

IPS is most often configured as part of a security policy. Unless stated otherwise, discussion of IPS sensor use will be in regards to firewall policies in this document.

Enable IPS scanning

Enabling IPS scanning involves two separate parts of the FortiGate unit:

- The security policy allows certain network traffic based on the sender, receiver, interface, traffic type, and time of day. Firewall policies can also be used to deny traffic, but those policies do not apply to IPS scanning.
- The IPS sensor contains filters, signature entries, or both. These specify which signatures are included in the IPS sensor.

When IPS is enabled, an IPS sensor is selected in a security policy, and all network traffic matching the policy will be checked for the signatures in the IPS sensor.

General configuration steps

For best results in configuring IPS scanning, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Create an IPS sensor.
2. Add filters and/or predefined signatures and custom signatures to the sensor. The filters and signatures specify which signatures the IPS engine will look for in the network traffic.
3. Select a security policy or create a new one.
4. In the security policy, enable UTM protection, select *Enable IPS*, and choose the IPS sensor from the list.

All the network traffic controlled by this security policy will be processed according to the settings in the policy. These settings include the IPS sensor you specify in the policy.

Creating an IPS sensor

You need to create an IPS sensor and save it before configuring it with filters and entries.

To create a new IPS sensor

1. Go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor*.
2. Select the *Create New* icon in the top of the Edit IPS Sensor window.
3. Enter the name of the new IPS sensor.
4. Optionally, you may also enter a comment. The comment will appear in the IPS sensor list and serves to remind you of the details of the sensor.
5. Select *OK*.

The IPS sensor is created and the sensor configuration window appears. A newly created sensor is empty and contains no filters or signatures. You need to add one or more filters or signatures before the sensor can take effect.

Creating an IPS filter

While individual signatures can be added to a sensor, a filter allows you to add multiple signatures to a sensor by specifying the characteristics of the signatures to be added.

To create a new IPS filter

1 Go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor*.

2 Select the IPS sensor to which you want to add the filter using the drop-down list in the top row of the Edit IPS Sensor window.

3 Select the *Create New* drop-down and choose *Filter*.

4 Configure the filter that you require. Signatures matching all of the characteristics you specify in the filter will be included in the filter.

Severity	Select *Specify* and choose the severity levels to include in the filter. If you select *All*, the severity attribute will not be used to determine which signatures are included in the filter.
Target	Select *Specify* and choose the type of system the signature protects. If you select *All*, the target attribute will not be used to determine which signatures are included in the filter.
OS	Select *Specify* and choose the operating system the signature protects. If you select *All*, the OS attribute will not be used to determine which signatures are included in the filter. Predefined signatures listed with an OS attribute of *All* affect all operating system and are automatically included in any filter regardless of whether a single, multiple, or all operating systems are specified.
Protocol	Select *Specify* and choose the network protocols the signature protects by selecting an item in the Available column and using the right-arrow icon to move the item to the Selected column. Similarly, remove protocols by selecting an item in the Selected column and use the left-arrow icon to move the item to the Available column. If you select *All*, the Protocol attribute will not be used to determine which signatures are included in the filter.
Application	Select *Specify* and choose the applications the signature protects by selecting an item in the Available column and using the right-arrow icon to move the item to the Selected column. Similarly, remove applications by selecting an item in the Selected column and using the left-arrow icon to move the item to the Available column. If you select *All*, the Application attribute will not be used to determine which signatures are included in the filter.

Tags	Tags are a means by which you can apply customized labels to your IPS filters. Specified tags are displayed only within the filter itself on the Edit IPS Filter page. By default, the tag feature is disabled on all but the largest FortiGate models. If the Tags option is not visible, you must go to *System* > *Admin* > *Settings* and enable *Display Object Tagging and Coloring* to enable it. For more information about tags, see "Tag management" on page 582.
Applied Tags	Displays the tags that you have applied to the filter.
Add tags	Enter a tag and then select the plus (+) icon to add the tag to the filter. This also adds the tag to the *Applied tags* list.
View Matched rules	Select view a list of all the signatures included in the filter with the current settings.
Enable All Matching Signatures	All predefined signatures have an *Enable* attribute that is set to on or off. Select *Accept signature defaults* use the *Enable* default setting for each included signature. This means that if a signature included in the filter has an *Enable* setting of off, traffic matching the signature will not be detected even though the signature is included in the filter. Select *Enable all* to enable all the signatures included in the filter, regardless of their *Enable* setting. Similarly, you may select *Disable all* to disable all the signatures included in the filter.
Action When Signature Is Triggered	All predefined signatures have an *Action* attribute that is set to Pass or Drop. Select *Accept signature defaults* use the default action for each included signature. This means that if a signature included in the filter has an *Action* setting of Pass, traffic matching the signature will be detected and then allowed to continue to its destination. Select *Monitor all* to pass all traffic matching the signatures included in the filter, regardless of their default *Action* setting. Similarly, you may select *Block all* to drop traffic matching any the signatures included in the filter.
Quarantine Attackers (to Banned Users List)	Enable this option to add the source of the offending traffic to the Banned User list.
Packet Logging	Select to enable packet logging for the filter. When you enable packet logging on a filter, the unit saves a copy of the packets that match any signatures included in the filter. The packets can be analyzed later. For more information about packet filtering, see "Viewing and saving logged packets" on page 1144

5 Select *OK*.

The filter is created and added to the filter list.

Updating predefined IPS signatures

The FortiGuard Service periodically updates the pre-defined signatures and adds new signatures to counter emerging threats as they appear.

Because the signatures included in filters are defined by specifying signature attributes, new signatures matching existing filter specifications will automatically be included in those filters. For example, if you have a filter that includes all signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures as they are added.

Viewing and searching predefined IPS signatures

Go to *UTM Profiles* > *Intrusion Protection* > *Predefined* to view the list of predefined IPS signatures. You may find signatures by paging manually through the list, apply filters, or by using the search field.

Searching manually

Signatures are displayed in a paged list, with 50 signatures per page. The bottom of the screen shows the current page and the total number of pages. You can enter a page number and press enter, to skip directly to that page. Previous Page and Next Page buttons move you through the list, one page at a time. The First Page and Last Page button take you to the beginning or end of the list.

Applying filters

You can enter criteria for one of more columns, and only the signatures matching all the conditions you specify will be listed.

To apply filters

1. Go to *UTM Profiles* > *Intrusion Protection* > *Predefined*.
2. Select Filter Settings.
3. Select Add New Filter.
4. Select column by which to filter.
5. Select the item or items by which to filter.
6. Continue to add more filters to narrow your search, if required.
7. Select *OK*.

The available options vary by column. For example, Enable allows you to choose between two options, while OS has multiple options, and you may select multiple items together. Filtering by name allows you to enter a text string and all signature names containing the string will be displayed.

Using the search field

To use the search field, located above the signature list, start typing any portion of the signature name. Signatures names matching the text you enter are displayed in a drop-down list. A maximum of ten matches are displayed at a time.

Select a signature from the drop-down list to display its signature list entry.

Creating a signature entry

Pre-defined and custom signature entries are configured and work largely the same as filters, except they define the behavior of only one signature.

You can use entries in two ways:

- To change the behavior of a signature already included in a filter.

  For example, to protect a web server, you can create a filter that includes and enables all signatures related to servers. If you want to disable one of those signatures, the simplest way is to create an entry and mark the signature as disabled.
- To add an individual signature, not included in any filters, to an IPS sensor. This is the only way to add custom signatures to IPS sensors.

When a pre-defined signature is specified in an entry, the default status and action attributes of the signature are ignored. These settings must be explicitly set when creating the entry.

To create an IPS signature entry

1. Go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor*.
2. Select the IPS sensor to which you want to add the entry from the sensor drop down list in the *Edit IPS Sensor* window title bar.
3. Select the Create New drop down and choose either *Pre-defined Entry* or *Custom Entry*, depending on the type of IPS signature entry you require.
4. For the *Action*, select *Pass*, *Block*, or *Reset*. When the entry is enabled, the action determines what the FortiGate will do with traffic containing the specified signature.
5. Select *Packet Log* to save the packets containing the specified signature. For more information, see "Enable IPS packet logging" on page 967.
6. Select the *Browse* icon and choose the signature to include in the entry.
7. Select *Enable*.
8. Select *OK*.

Creating a custom IPS signature

The FortiGate predefined signatures cover common attacks. If you use an unusual or specialized application or an uncommon platform, add custom signatures based on the security alerts released by the application and platform vendors.

You can add or edit custom signatures using the web-based manager or the CLI.

To create a custom signature

1. Go to *UTM Profiles* > *Intrusion Protection* > *Custom*.
2. Select *Create New* to add a new custom signature.
3. Enter a *Name* for the custom signature.
4. Enter the *Signature*. For information about completing this field, see "Custom signature syntax and keywords".
5. Select *OK*.

Custom signature syntax and keywords

All custom signatures follow a particular syntax. Each begins with a header and is followed by one or more keywords. The syntax and keywords are detailed in the next two topics.

Custom signature syntax

A custom signature definition is limited to a maximum length of 512 characters. A definition can be a single line or span multiple lines connected by a backslash (\) at the end of each line.

A custom signature definition begins with a header, followed by a set of keyword/value pairs enclosed by parenthesis [( )]. The keyword and value pairs are separated by a semi colon (;) and consist of a keyword and a value separated by a space. The basic format of a definition is HEADER (KEYWORD VALUE;)

You can use as many keyword/value pairs as required within the 512 character limit. To configure a custom signature, go to *UTM Profiles* > *Intrusion Protection* > *Custom* and enter the data directly into the *Signature* field, following the guidance in the next topics.

Table 58 shows the valid characters and basic structure. For details about each keyword and its associated values, see "Custom signature keywords" on page 951.

Table 58: Valid syntax for custom signature fields

Field	Valid Characters	Usage
HEADER	F-SBID	The header for an attack definition signature. Each custom signature must begin with this header.
KEYWORD	Each keyword must start with a pair of dashes (--), and consist of a string of 1 to 19 characters. Normally, keywords are an English word or English words connected by an underscore (_). Keywords are case insensitive.	The keyword is used to identify a parameter. See "Custom signature keywords" on page 951 for tables of supported keywords.
VALUE	Double quotes (") must be used around the value if it contains a space and/or a semicolon (;). If the value is NULL, the space between the KEYWORD and VALUE can be omitted. Values are case sensitive. Note: If double quotes are used for quoting the value, the double quotes are not considered as part of the value string.	The value is set specifically for a parameter identified by a keyword.

Custom signature keywords

Table 59: Information keywords

Keyword and value	Description
`--attack_id <id_int>;`	Use this optional value to identify the signature. It cannot be the same value as any other custom rules. If an attack ID is not specified, the FortiGate automatically assigns an attack ID to the signature. If you are using VDOMs, custom signatures appear only in the VDOM in which you create them. You can use the same attack ID for signatures in different VDOMs. An attack ID you assign must be between 1000 and 9999. Example: `--attack_id 1234;`
`--name <name_str>;`	Enter the name of the rule. A rule name must be unique. If you are using VDOMs, custom signatures appear only in the VDOM in which you create them. You can use the same rule name for signatures in different VDOMs. The name you assign must be a string greater than 0 and less than 64 characters in length. Example: `--name "Buffer_Overflow";`

Table 60: Session keywords

Keyword and value	Description
`--flow {from_client[,reversed] | from_server[,reversed] | bi_direction };`	Specify the traffic direction and state to be inspected. They can be used for all IP traffic. Example: --src_port 41523; --flow bi_direction; The signature checks traffic to and from port 41523. If you enable “quarantine attacker”, the optional `reversed` keyword allows you to change the side of the connection to be quarantined when the signature is detected. For example, a custom signature written to detect a brute-force log in attack is triggered when “Login Failed” is detected `from_server` more than 10 times in 5 seconds. If the attacker is quarantined, it is the server that is quarantined in this instance. Adding `reversed` corrects this problem and quarantines the actual attacker. Previous FortiOS versions used `to_client` and `to_server` values. These are now deprecated, but still function for backwards compatibility.

Table 60: Session keywords

`--service {HTTP | TELNET | FTP | DNS | SMTP | POP3 | IMAP | SNMP | RADIUS | LDAP | MSSQL | RPC | SIP | H323 | NBSS | DCERPC | SSH | SSL};`	Specify the protocol type to be inspected. This keyword allows you to specify the traffic type by protocol rather than by port. If the decoder has the capability to identify the protocol on any port, the signature can be used to detect the attack no matter what port the service is running on. Currently, HTTP, SIP, SSL, and SSH protocols can be identified on any port based on the content.

Table 61: Content keywords

Keyword and value	Description
`--byte_jump <bytes_to_convert>, <offset>[, relative] [, big] [, little] [, string] [, hex] [, dec] [, oct] [, align];`	Use the `byte_jump` option to extract a number of bytes from a packet, convert them to their numeric representation, and jump the match reference up that many bytes (for further pattern matching or byte testing). This keyword allows relative pattern matches to take into account numerical values found in network data. The available keyword options include: • `<bytes_to_convert>`: The number of bytes to examine from the packet. • `<offset>`: The number of bytes into the payload to start processing. • `relative`: Use an offset relative to last pattern match. • `big`: Process the data as big endian (default). • `little`: Process the data as little endian. • `string`: The data is a string in the packet. • `hex`: The converted string data is represented in hexadecimal notation. • `dec`: The converted string data is represented in decimal notation. • `oct`: The converted string data is represented in octal notation. • `align`: Round up the number of converted bytes to the next 32-bit boundary.

Table 61: Content keywords (Continued)

Keyword and value	Description
`--byte_test <bytes_to_convert>, <operator>, <value>, <offset>[, relative] [, big] [, little] [, string] [, hex] [, dec] [, oct];`	Use the `byte_test` keyword to compare a byte field against a specific value (with operator). This keyword is capable of testing binary values or converting representative byte strings to their binary equivalent and testing them. The available keyword options include: • `<bytes_to_convert>`: The number of bytes to compare. • `<operator>`: The operation to perform when comparing the value (<,>,=,!,&). • `<value>`: The value to compare the converted value against. • `<offset>`: The number of bytes into the payload to start processing. • `relative`: Use an offset relative to last pattern match. • `big`: Process the data as big endian (default). • `little`: Process the data as little endian. • `string`: The data is a string in the packet. • `hex`: The converted string data is represented in hexadecimal notation. • `dec`: The converted string data is represented in decimal notation. • `oct`: The converted string data is represented in octal notation.
`--depth <depth_int>;`	Use the `depth` keyword to search for the contents within the specified number of bytes after the starting point defined by the `offset` keyword. If no `offset` is specified, the `offset` is assumed to be equal to 0. If the value of the `depth` keyword is smaller than the length of the value of the `content` keyword, this signature will never be matched. The `depth` must be between 0 and 65535.
`--distance <dist_int>;`	Use the `distance` keyword to search for the contents within the specified number of bytes relative to the end of the previously matched contents. If the `within` keyword is not specified, continue looking for a match until the end of the payload. The `distance` must be between 0 and 65535.

Table 61: Content keywords (Continued)

Keyword and value	Description
`--content [!]"<content_str>";`	***Deprecated, see*** `pattern` ***and*** `context` ***keywords.*** Use the `content` keyword to search for the content string in the packet payload. The content string must be enclosed in double quotes. To have the FortiGate search for a packet that does not contain the specified context string, add an exclamation mark (!) before the content string. Multiple content items can be specified in one rule. The value can contain mixed text and binary data. The binary data is generally enclosed within the pipe (|) character. The double quote ("), pipe sign(|) and colon(:) characters must be escaped using a back slash if specified in a content string. If the value of the `content` keyword is greater than the length of the value of the `depth` keyword, this signature will never be matched.

`--context {uri | header | body | host};`	Specify the protocol field to look for the pattern. If context is not specified for a pattern, the FortiGate unit searches for the pattern anywhere in the packet buffer. The available context variables are:
	• `uri`: Search for the pattern in the HTTP URI line.
	• `header`: Search for the pattern in HTTP header lines or SMTP/POP3/SMTP control messages.
	• `body`: Search for the pattern in HTTP body or SMTP/POP3/SMTP email body.
	• `host`: Search for the pattern in HTTP HOST line.
	Example:
	`--pattern "GET "`
	`--context uri`
	`--pattern "yahoo.com"`
	`--context host`
	`--no_case`
	`--pcre "/DESCRIBE\s+\/\s+RTSP\//i"`
	`--context header`

`--no_case;`	Use the `no-case` keyword to force the FortiGate unit to perform a case-insensitive pattern match.

Table 61: Content keywords (Continued)

Keyword and value	Description
`--offset <offset_int>;`	Use the `offset` keyword to look for the contents after the specified number of bytes into the payload. The specified number of bytes is an absolute value in the payload. Follow the `offset` keyword with the `depth` keyword to stop looking for a match after a specified number of bytes. If no `depth` is specified, the FortiGate unit continues looking for a match until the end of the payload. The `offset` must be between 0 and 65535.

`--pattern [!]"<pattern_str>";`	The FortiGate unit will search for the specified pattern.
	A `pattern` keyword normally is followed by a `context` keyword to define where to look for the pattern in the packet. If a `context` keyword is not present, the FortiGate unit looks for the pattern anywhere in the packet buffer.
	To have the FortiGate search for a packet that does not contain the specified URI, add an exclamation mark (!) before the URI.
	Example:
	`--pattern "/level/"`
	`--pattern "|E8 D9FF FFFF|/bin/sh"`
	`--pattern !"|20|RTSP/"`

Table 61: Content keywords (Continued)

Keyword and value	Description
`--pcre [!]"(/<regex>/|m<delim><regex><delim>)[ismxAEGRUB]";`	Similarly to the `pattern` keyword, use the `pcre` keyword to specify a pattern using Perl-compatible regular expressions (PCRE). A `pcre` keyword can be followed by a `context` keyword to define where to look for the pattern in the packet. If no `context` keyword is present, the FortiGate unit looks for the pattern anywhere in the packet buffer. For more information about PCRE syntax, go to http://www.pcre.org. The switches include: • `i`: Case insensitive. • `s`: Include newlines in the dot metacharacter. • `m`: By default, the string is treated as one big line of characters. `^` and `$` match at the beginning and ending of the string. When `m` is set, `^` and `$` match immediately following or immediately before any newline in the buffer, as well as the very start and very end of the buffer. • `x`: White space data characters in the pattern are ignored except when escaped or inside a character class. • `A`: The pattern must match only at the start of the buffer (same as `^`). • `E`: Set `$` to match only at the end of the subject string. Without `E`, `$` also matches immediately before the final character if it is a newline (but not before any other newlines). • `G`: Invert the “greediness” of the quantifiers so that they are not greedy by default, but become greedy if followed by `?`. • `R`: Match relative to the end of the last pattern match. (Similar to distance:0;). • `U`: Deprecated, see the `context` keyword. Match the decoded URI buffers.

Table 61: Content keywords (Continued)

Keyword and value	Description
`--uri [!]"<uri_str>";`	***Deprecated, see*** `pattern` ***and*** `context` ***keywords.*** Use the `uri` keyword to search for the URI in the packet payload. The URI must be enclosed in double quotes ("). To have the FortiGate unit search for a packet that does not contain the specified URI, add an exclamation mark (!) before the URI. Multiple content items can be specified in one rule. The value can contain mixed text and binary data. The binary data is generally enclosed within the pipe (|) character. The double quote ("), pipe sign (|) and colon (:) characters must be escaped using a back slash (\) if specified in a URI string.
`--within <within_int>;`	Use this together with the `distance` keyword to search for the contents within the specified number of bytes of the payload. The `within` value must be between 0 and 65535.

Table 62: IP header keywords

Keyword and Value	Description
`--dst_addr [!]<ipv4>;`	Use the `dst_addr` keyword to search for the destination IP address. To have the FortiGate search for a packet that does not contain the specified address, add an exclamation mark (!) before the IP address. You can define up to 28 IP addresses or CIDR blocks. Enclose the comma separated list in square brackets. Example: `dst_addr [172.20.0.0/16, 10.1.0.0/16,192.168.0.0/16]`
`--ip_id <field_int>;`	Check the IP ID field for the specified value.
`--ip_option {rr | eol | nop | ts | sec | lsrr | ssrr | satid | any};`	Use the `ip_option` keyword to check various IP option settings. The available options include: • `rr`: Check if IP RR (record route) option is present. • `eol`: Check if IP EOL (end of list) option is present. • `nop`: Check if IP NOP (no op) option is present. • `ts`: Check if IP TS (time stamp) option is present. • `sec`: Check if IP SEC (IP security) option is present. • `lsrr`: Check if IP LSRR (loose source routing) option is present. • `ssrr`: Check if IP SSRR (strict source routing) option is present. • `satid`: Check if IP SATID (stream identifier) option is present. • `any`: Check if IP any option is present.
`--ip_tos <field_int>;`	Check the IP TOS field for the specified value.
`--ip_ttl [< | >] <ttl_int>;`	Check the IP time-to-live value against the specified value. Optionally, you can check for an IP time-to-live greater-than (>) or less-than (<) the specified value with the appropriate symbol.
`--protocol {<protocol_int> | tcp | udp | icmp};`	Check the IP protocol header. Example: `--protocol tcp;`
`--src_addr [!]<ipv4>;`	Use the `src_addr` keyword to search for the source IP address. To have the FortiGate unit search for a packet that does not contain the specified address, add an exclamation mark (!) before the IP address. You can define up to 28 IP addresses or CIDR blocks. Enclose the comma separated list in square brackets. Example: `src_addr 192.168.13.0/24`

Table 63: TCP header keywords

Keyword and Value	Description
`--ack <ack_int>;`	Check for the specified TCP acknowledge number.
`--dst_port [!]{<port_int> | :<port_int> | <port_int>: | <port_int>:<port_int>};`	Use the `dst_port` keyword to specify the destination port number. You can specify a single port or port range: • `<port_int>` is a single port. • `:<port_int>` includes the specified port and all lower numbered ports. • `<port_int>:` includes the specified port and all higher numbered ports. • `<port_int>:<port_int>` includes the two specified ports and all ports in between.
`--seq <seq_int>;`	Check for the specified TCP sequence number.
`--src_port [!]{<port_int> | :<port_int> | <port_int>: | <port_int>:<port_int>};`	Use the `src_port` keyword to specify the source port number. You can specify a single port or port range: • `<port_int>` is a single port. • `:<port_int>` includes the specified port and all lower numbered ports. • `<port_int>:` includes the specified port and all higher numbered ports. • `<port_int>:<port_int>` includes the two specified ports and all ports in between.

Table 63: TCP header keywords (Continued)

Keyword and Value	Description

`--tcp_flags <SAFRUP120>[!|*|+] [,<SAFRUP120>];`	Specify the TCP flags to match in a packet.
	• `S`: Match the SYN flag.
	• `A`: Match the ACK flag.
	• `F`: Match the FIN flag.
	• `R`: Match the RST flag.
	• `U`: Match the URG flag.
	• `P`: Match the PSH flag.
	• `1`: Match Reserved bit 1.
	• `2`: Match Reserved bit 2.
	• `0`: Match No TCP flags set.
	• `!`: Match if the specified bits are not set.
	• `*`: Match if any of the specified bits are set.
	• `+`: Match on the specified bits, plus any others.
	The first part if the value (`<SAFRUP120>`) defines the bits that must be present for a successful match. For example:
	`--tcp_flags AP`
	only matches the case where both `A` and `P` bits are set.
	The second part ([`,<SAFRUP120>`]) is optional, and defines the additional bits that can be present for a match. For example:
	`tcp_flags S,12`
	matches the following combinations of flags: `S`, `S` and `1`, `S` and `2`, `S` and `1` and `2`.
	The modifiers `!`, `*` and `+` cannot be used in the second part.

`--window_size [!]<window_int>;`	Check for the specified TCP window size. You can specify the window size as a hexadecimal or decimal integer. A hexadecimal value must be preceded by `0x`. To have the FortiGate search for the absence of the specified window size, add an exclamation mark (`!`) before the window size.

Table 64: UDP header keywords

Keyword and Value	Description
`--dst_port [!]{<port_int> | :<port_int> | <port_int>: | <port_int>:<port_int>};`	Specify the destination port number. You can specify a single port or port range: • `<port_int>` is a single port. • `:<port_int>` includes the specified port and all lower numbered ports. • `<port_int>:` includes the specified port and all higher numbered ports. • `<port_int>:<port_int>` includes the two specified ports and all ports in between.
`--src_port [!]{<port_int> | :<port_int> | <port_int>: | <port_int>:<port_int>};`	Specify the source port number. You can specify a single port or port range: • `<port_int>` is a single port. • `:<port_int>` includes the specified port and all lower numbered ports. • `<port_int>:` includes the specified port and all higher numbered ports. • `<port_int>:<port_int>` includes the two specified ports and all ports in between.

Table 65: ICMP keywords

Keyword and Value	Usage
`--icmp_code <code_int>;`	Specify the ICMP code to match.
`--icmp_id <id_int>;`	Check for the specified ICMP ID value.
`--icmp_seq <seq_int>;`	Check for the specified ICMP sequence value.
`--icmp_type <type_int>;`	Specify the ICMP type to match.

Table 66: Other keywords

Keyword and Value	Description
`--data_size {<size_int> | <<size_int> | ><size_int> | <port_int><><port_int>};`	Test the packet payload size. With `data_size` specified, packet reassembly is turned off automatically. So a signature with `data_size` and `only_stream` values set is wrong. • `<size_int>` is a particular packet size. • `<<size_int>` is a packet smaller than the specified size. • `><size_int>` is a packet larger than the specified size. • `<size_int><><size_int>` is a packet within the range between the specified sizes.

Table 66: Other keywords (Continued)

Keyword and Value	Description
`--data_at <offset_int>[, relative];`	Verify that the payload has data at a specified offset, optionally looking for data relative to the end of the previous content match.
`--rate <matches_int>,<time_int>;`	Instead of generating log entries every time the signature is detected, use this keyword to generate a log entry only if the signature is detected a specified number of times within a specified time period. • `<matches_int>` is the number of times a signature must be detected. • `<time_int>` is the length of time in which the signature must be detected, in seconds. For example, if a custom signature detects a pattern, a log entry will be created every time the signature is detected. If `--rate 100,10;` is added to the signature, a log entry will be created if the signature is detected 100 times in the previous 10 seconds. Use this command with `--track` to further limit log entries to when the specified number of detections occur within a certain time period involving the same source or destination address rather than all addresses.
`--rpc_num <app_int>[, <ver_int> | *][, <proc_int> | *>];`	Check for RPC application, version, and procedure numbers in SUNRPC CALL requests. The `*` wildcard can be used for version and procedure numbers.
`--same_ip;`	Check that the source and the destination have the same IP addresses.

Table 66: Other keywords (Continued)

Keyword and Value	Description
`--track {client | server}[,block_int];`	When used with `--rate`, this keyword narrows the custom signature rate totals to individual addresses. • `client` has the FortiGate unit maintain a separate count of signature matches for each source address. • `server` has the FortiGate unit maintain a separate count of signature matches for each destination address. • `block_int` has the FortiGate unit block connections for the specified number of seconds, from the client or to the server, depending on which is specified. For example, if `--rate 100,10` is added to the signature, a log entry will be created if the signature is detected 100 times in the previous 10 seconds. The FortiGate unit maintains a single total, regardless of source and destination address. If the same custom signature also includes `--track client;` matches are totalled separately for each source address. A log entry is added when the signature is detected 100 times in 10 seconds within traffic from the same source address. The `--track` keyword can also be used without `--rate`. If an integer is specified, the client or server will be blocked for the specified number of seconds every time the signature is detected.

IPS processing in an HA cluster

IPS processing in an HA cluster is no different than with a single FortiGate unit, from the point of view of the network user. The difference appears when a secondary unit takes over from the primary, and what happens depends on the HA mode.

Active-passive

In an active-passive HA cluster, the primary unit processes all traffic just as it would in a stand-alone configuration. Should the primary unit fail, a secondary unit will assume the role of the primary unit and begin to process network traffic. By default, the state of active communication sessions are not shared with secondary units and will not survive the fail-over condition. Once the sessions are reestablished however, traffic processing will continue as normal.

If your network requires that active sessions are taken over by the new primary unit, select *Enable Session Pick-up* in your HA configuration. Because session information must be sent to all subordinate units on a regular basis, session pick-up is a resource-intensive feature and is not enabled by default.

Active-active

The fail-over process in an active-active cluster is similar to an active-passive cluster. When the primary unit fails, a secondary unit takes over and traffic processing continues. The load-balancing schedule used to distribute sessions to the cluster members is used by the new primary unit to redistribute sessions among the remaining subordinate units. If session pick-up is not enabled, the sessions active on the failed primary are lost, and the sessions redistributed among the secondary units may also be lost. If session pick-up is enabled, all sessions are handled according to their last-known state.

For more information about HA options and settings, see "High Availability" on page 1983.

Configure IPS options

There are a number of CLI commands that influence how IPS functions.

Configuring the IPS engine algorithm

The IPS engine is able to search for signature matches in two ways. One method is faster but uses more memory, the other uses less memory but is slower. Use the `algorithm` CLI command to select one method:

```
config ips global
  set algorithm {high | low | engine-pick}
end
```

Specify `high` to use the faster more memory intensive method or `low` for the slower memory efficient method. The default setting is `engine-pick`, which allows the IPS engine to choose the best method on the fly.

Configuring the IPS engine-count

FortiGate units with multiple processors can run more than one IPS engine concurrently. The `engine-count` CLI command allows you to specify how many IPS engines are used at the same time:

```
config ips global
  set engine-count <int>
end
```

The recommended and default setting is `0`, which allows the FortiGate unit to determine the optimum number of IPS engines.

Configuring fail-open

If the IPS engine fails for any reason, it will fail open by default. This means that traffic continues to flow without IPS scanning. If IPS protection is more important to your network than the uninterrupted flow if network traffic, you can disable this behavior using the `fail-open` CLI command:

```
config ips global
  set fail-open {enable | disable}
end
```

The default setting is enable.

Configuring the session count accuracy

The IPS engine can keep track of the number of open session in two ways. An accurate count uses more resources than a less accurate heuristic count.

```
config ips global
  set session-limit-mode {accurate | heuristic}
end
```

The default is heuristic.

Configuring the IPS buffer size

Set the size of the IPS buffer.

```
config ips global
  set socket-size <int>
end
```

The acceptable range is from 1 to 64 megabytes. The default size varies by model.

Configuring protocol decoders

The FortiGate Intrusion Protection system uses protocol decoders to identify the abnormal traffic patterns that do not meet the protocol requirements and standards. For example, the HTTP decoder monitors traffic to identify any HTTP packets that do not meet the HTTP protocol standards.

To view the decoders and the port numbers that each protocol decoder monitors, go to *UTM* > *Intrusion Protection* > *Protocol Decoder*. The port or ports monitored by each decoder are listed. Many decoders are able to recognize traffic by type rather than by port. These decoders have their port listed as *auto* because the traffic will be recognized automatically, regardless of the port.

To change the ports a decoder examines, you must use the CLI. In this example, the ports examined by the DNS decoder are changed from the default 53 to 100, 200, and 300.

```
config ips decoder dns_decoder
  set port_list "100,200,300"
end
```

You cannot assign specific ports to decoders that are set to *auto* by default. These decoders can detect their traffic on any port. Specifying individual ports is not necessary.

Configuring security processing modules

FortiGate Security Processing Modules, such as the CE4, XE2, and FE8, can increase overall system performance by accelerating some security and networking processing on the interfaces they provide. They also allow the FortiGate unit to offload the processing to the security module, thereby freeing up its own processor for other tasks. The security module performs its own IPS and firewall processing, but you can configure it to favor IPS in hostile high-traffic environments.

If you have a security processing module, use the following CLI commands to configure it to devote more resources to IPS than firewall. This example shows the CLI commands required to configure a security module in slot 1 for increased IPS performance.

```
config system amc-slot
  edit sw1
    set optimization-mode fw-ips
    set ips-weight balanced
    set ips-p2p disable
```

```
    set ips-fail-open enable
    set fp-disable none
    set ipsec-inb-optimization enable
    set syn-proxy-client-timer 3
    set syn-proxy-server-timer 3
  end
```

In addition to offloading IPS processing, security processing modules provide a hardware accelerated SYN proxy to defend against SYN flood denial of service attacks. When using a security module, configure your DoS sensor `tcp_syn_flood` anomaly with the *Proxy* action. The *Proxy* action activates the hardware accelerated SYN proxy.

Because DoS sensors are configured before being applied to an interface, you can assign a DoS sensor with the *Proxy* action to an interface that does not have hardware SYN proxy support. In this circumstance, the *Proxy* action is invalid and a *Pass* action will be applied.

Enable IPS packet logging

Packet logging saves the network packets containing the traffic matching an IPS signature to the attack log. The FortiGate unit will save the logged packets to wherever the logs are configured to be stored, whether memory, internal hard drive, a FortiAnalyzer unit, or the FortiGuard Analysis and Management Service.

You can enable packet logging in signature entries or in filters. Use caution in enabling packet logging in a filter. Filters configured with few restrictions can contain thousands of signatures, potentially resulting in a flood of saved packets. This would take up a great deal of space, require time to sort through, and consume considerable system resources to process. Packet logging is designed as a focused diagnostic tool and is best used with a narrow scope.

Although logging to multiple FortiAnalyzer units is supported, packet logs are not sent to the secondary and tertiary FortiAnalyzer units. Only the primary unit receives packet logs.

To enable packet logging for a signature

1. Create either a pre-defined or custom entry in an IPS sensor. For more information, see “Creating a signature entry” on page 948.
2. Before saving the entry, select *Packet Log*.
3. Select the IPS sensor in the security policy that allows the network traffic the FortiGate unit will examine traffic for the signature.

To enable packet logging for a filter

1. Create a filter in an IPS sensor. For more information, see “Creating an IPS filter” on page 946.
2. Before saving the filter, select *Enable All* for *Packet Logging*.
3. Select the IPS sensor in the security policy that allows the network traffic the FortiGate unit will examine for the signature.

For information on viewing and saving logged packets, see “Viewing and saving logged packets” on page 1144.

IPS examples

Configuring basic IPS protection

Small offices, whether they are small companies, home offices, or satellite offices, often have very simple needs. This example details how to enable IPS protection on a FortiGate unit located in a satellite office. The satellite office contains only Windows clients.

Creating an IPS sensor

Most IPS settings are configured in an IPS sensor. IPS sensors are selected in firewall policies. This way, you can create multiple IPS sensors, and tailor them to the traffic controlled by the security policy in which they are selected. In this example, you will create one IPS sensor.

To create an IPS sensor— web-based manager

1. Go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor*.
2. Select the *Create New* icon in the top of the Edit IPS Sensor window.
3. In the *Name* field, enter `basic_ips`.
4. In the *Comments* field, enter `IPS protection for Windows clients`.
5. Select *OK*.
6. Select the *Create New* drop-down and choose *Filter*.
7. For *Target*, select *Specify* and *Client*.
8. For *OS*, select *Specify* and *Windows*.
9. Select *OK* to save the filter.
10. Select *OK* to save the IPS sensor.

To create an IPS sensor — CLI

```
config ips sensor
  edit basic_ips
    set comment "IPS protection for Windows clients"
    config filter
      edit 1
        set location client
        set os windows
    end
  end
```

Selecting the IPS sensor in a security policy

An IPS sensor directs the FortiGate unit to scan network traffic only when it is selected in a security policy. When an IPS sensor is selected in a security policy, its settings are applied to all the traffic the security policy handles.

To select the IPS sensor in a security policy — web-based manager

1. Go to *Policy* > *Policy* > *Policy*.
2. Select a policy.
3. Select the *Edit* icon.
4. Enable *UTM*.

5 Select the *Enable IPS* option.

6 Select the `basic_ips` profile from the list.

7 Select *OK* to save the security policy.

To select the IPS sensor in a security policy — CLI

```
config firewall policy
  edit 1
    set utm-status enable
    set ips-sensor basic_ips
  end
```

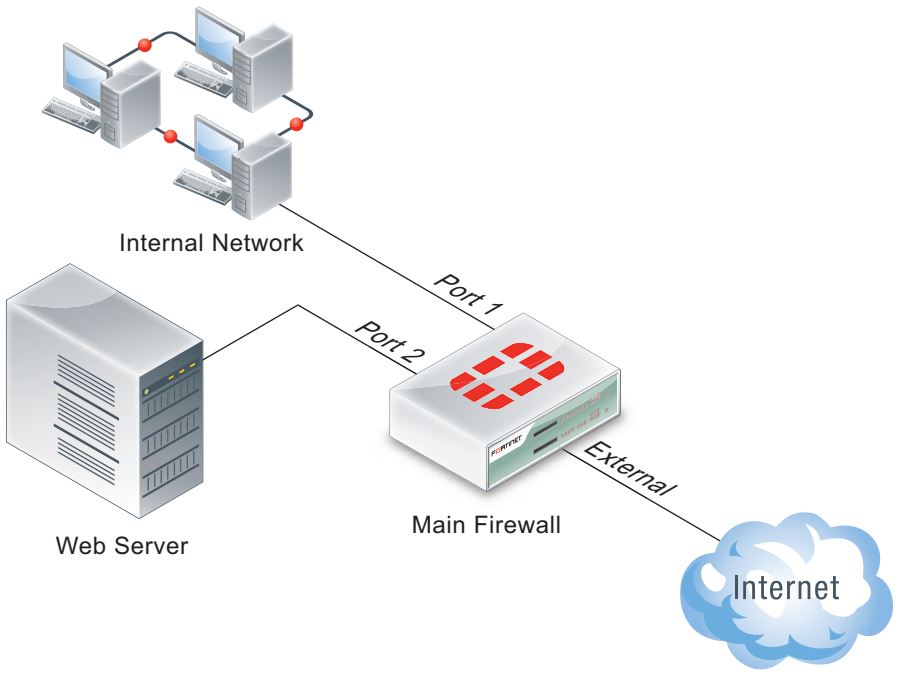
All traffic handled by the security policy you modified will be scanned for attacks against Windows clients. A small office may have only one security policy configured. If you have multiple policies, consider enabling IPS scanning for all of them.

Using IPS to protect your web server

Many companies have web servers and they must be protected from attack. Since web servers must be accessible, protection is not as simple as blocking access. IPS is one tool your FortiGate unit has to allow you to protect your network.

In this example, we will configure IPS to protect a web server. As shown in Figure 87 on page 969, a FortiGate unit protects a web server and an internal network. The internal network will have its own policies and configuration but we will concentrate on the web server in this example.

Figure 87: A simple network configuration



The FortiGate unit is configured with:

- a virtual IP to give the web server a unique address accessible from the Internet.
- a security policy to allow access to the web server from the Internet using the virtual IP.

To protect the web server using intrusion protection, you need to create an IPS sensor, populate it with filters, then enable IPS scanning in the security policy.

To create an IPS sensor

1 Go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor* and select *Create New*.
2 Enter `web_server` as the name of the new IPS sensor.
3 Select *OK*.

The new IPS sensor is created but it has no filters, and therefore no signatures are included.

The web server operating system is Linux, so you need to create a filter for all Linux server signatures.

To create the Linux server filter

1 Go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor* and select the `web_server` IPS sensor and select the *Edit* icon.
2 Select *Add Filter*.
3 Enter `Linux Server` as the name of the new filter.
4 For *Target*, select *Specify* and choose *server*.
5 For *OS*, select *Specify* and choose *Linux*.
6 Select *OK*.

The filter is saved and the IPS sensor page reappears. In the filter list, find the *Linux Server* filter and look at the value in the *Count* column. This shows how many signatures match the current filter settings. You can select the *View Rules* icon to see a listing of the included signatures.

The web server software is Apache, so you need to create a second filter for all Apache signatures.

To create the Apache filter

1 Go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor* and select the `web_server` IPS sensor and select the *Edit* icon.
2 Select *Add Filter*.
3 Enter `Apache` as the name of the new filter.
4 For *Application*, select *Specify* and choose *Apache* from the *Available* list.
5 Select the right-arrow to move *Apache* to the *Selected* list.
6 Select *OK*.

The filter is saved and the IPS sensor page reappears.

It might seem that you can skip a step and create one filter that specifies both Linux server and Apache signatures. However, this would include a smaller number of filters. It would not include signatures to detect attacks against the operating system directly, for example.

You have created the IPS sensor and the two filters that include the signatures you need. To have it start scanning traffic, you must edit the security policy.

To edit the security policy

1 Go to *Policy* > *Policy* > *Policy*, select security policy that allows access to the web server, and select the *Edit* icon.

2 Enable *UTM*.
3 Select the Enable IPS option and choose the `web_server` IPS sensor from the list.
4 Select *OK*.

Since IPS is enabled and the `web_server` IPS sensor is specified in the security policy controlling the web server traffic, the IPS sensor examines the web server traffic for matches to the signatures it contains.

Create and test a packet logging IPS sensor

In this example, you create a new IPS sensor and include a filter that detects the EICAR test file and saves a packet log when it is found. This is an ideal first experience with packet logging because the EICAR test file can cause no harm, and it is freely available for testing purposes.

Create an IPS senor

1 Go to *UTM Profiles* > *Intrusion Protection* > *IPS Sensor*.
2 Select *Create New*.
3 Name the new IPS sensor `EICAR test`.
4 Select *OK*.

Create an entry

1 Select the Create New drop down menu and choose *Pre-defined Entry*.
2 Select the signature browse icon.
3 Rather than search through the signature list, use the name filter by selecting the filter icon in the header of the *Name* column.
4 In the *Filters* list, select *Name*.
5 Select *Enable*.
6 In the Field selection, choose *Contains*.
7 Enter `EICAR` in the Text field.
8 Select *OK*.
9 Select the *EICAR.AV.Test.File.Download* signature.
10 Select *OK*.
11 Select *Enable*, *Logging*, and *Packet Log*.
12 Select *OK*.
13 Select *Block* as the *Action*.
14 Select OK to save the IPS sensor.

You are returned to the IPS sensor list. The `EICAR test` sensor appears in the list.

Add the IPS sensor to the security policy allowing Internet access

1 Go to *Policy* > *Policy* > *Policy*.
2 Select the security policy that allows you to access the Internet.
3 Select the *Edit* icon.
4 Enable *Log Allowed Traffic*.
5 Enable *UTM*.
6 Select *Enable IPS*.

7 Choose `EICAR test` from the available IPS sensors.

8 Select *OK*.

With the IPS sensor configured and selected in the security policy, the FortiGate unit blocks any attempt to download the EICAR test file.

Test the IPS sensor

1 Using your web browser, go to http://www.eicar.org/anti_virus_test_file.htm.

2 Scroll to the bottom of the page and select *eicar.com* from the row labeled as using the standard HTTP protocol.

3 The browser attempts to download the requested file and,

- If the file is successfully downloaded, the custom signature configuration failed at some point. Check the custom signature, the IPS sensor, and the firewall profile.
- If the download is blocked with a high security alert message explaining that you're not permitted to download the file, the EICAR test file was blocked by the FortiGate unit antivirus scanner before the IPS sensor could examine it. Disable antivirus scanning and try to download the EICAR test file again.
- If no file is downloaded and the browser eventually times out, the custom signature successfully detected the EICAR test file and blocked the download.

Viewing the packet log

1 Go to *Log&Report* > *Log & Archive Access* > *UTM Log*.

2 Locate the log entry that recorded the blocking of the EICAR test file block. The Message field data will be `tools: EICAR.AV.Test.File.Download`.

3 Select the *View Packet Log* icon in the *Packet Log* column.

4 The packet log viewer is displayed.

Creating a custom signature to block access to example.com

In this first example, you will create a custom signature to block access to the example.com URL.

This example describes the use of the custom signature syntax to block access to a URL. To create the custom signature entry in the FortiGate unit web-based manager, see "Creating a custom IPS signature" on page 949.

1 Enter the custom signature basic format

All custom signatures have a header and at least one keyword/value pair. The header is always the same:

```
F-SBID( )
```

The keyword/value pairs appear within the parentheses and each pair is followed by a semicolon.

2 Choose a name for the custom signature

Every custom signature requires a name, so it is a good practice to assign a name before adding any other keywords.

Use the `--name` keyword to assign the custom signature a name. The name value follows the keyword after a space. Enclose the name value in double-quotes:

```
F-SBID( --name "Block.example.com"; )
```

The signature, as it appears here, will not do anything if you try to use it. It has a name, but does not look for any patterns in network traffic. You must specify a pattern that the FortiGate unit will search for.

3 Add a signature pattern

Use the `--pattern` keyword to specify what the FortiGate unit will search for:

```
F-SBID( --name "Block.example.com"; --pattern "example.com"; )
```

The signature will now detect the example.com URL appearing in network traffic. The custom signature should only detect the URL in HTTP traffic, however. Any other traffic with the URL should be allowed to pass. For example, an email message to or from example.com should not be stopped.

4 Specify the service

Use the `--service` keyword to limit the effect of the custom signature to only the HTTP protocol.

```
F-SBID( --name "Block.example.com"; --pattern "example.com";
    --service HTTP; )
```

The FortiGate unit will limit its search for the pattern to the HTTP protocol. Even though the HTTP protocol uses only TCP traffic, the FortiGate will search for HTTP protocol communication in TCP, UDP, and ICMP traffic. This is a waste of system resources that you can avoid by limiting the search further, as shown below.

5 Specify the traffic type.

Use the `--protocol tcp` keyword to limit the effect of the custom signature to only TCP traffic. This will save system resources by not unnecessarily scanning UDP and ICMP traffic.

```
F-SBID( --name "Block.example.com"; --pattern "example.com";
    --service HTTP; --protocol tcp; )
```

The FortiGate unit will limit its search for the pattern to TCP traffic and ignore UDP and ICMP network traffic.

6 Ignore case sensitivity

By default, patterns are case sensitive. If a user directed his or her browser to Example.com, the custom signature would not recognize the URL as a match.

Use the `--no_case` keyword to make the pattern matching case insensitive.

```
F-SBID( --name "Block.example.com"; --pattern "example.com";
    --service HTTP; --no_case; )
```

Unlike all of the other keywords in this example, the `--no_case` keyword has no value. Only the keyword is required.

7 Limit pattern scans to only traffic sent from the client

The `--flow` command can be used to further limit the network traffic being scanned to only that send by the client or by the server.

```
F-SBID( --name "Block.example.com"; --pattern "example.com";
    --service HTTP; --no_case; --flow from_client; )
```

Web servers do not contact clients until clients first open a communication session. Therefore, using the `--flow from_client` command will force the FortiGate to ignore all traffic from the server. Since the majority of HTTP traffic flows from the server to the client, this will save considerable system resources and still maintain protection.

8 Specify the context

When the client browser tries to contact example.com, a DNS is first consulted to get the example.com server IP address. The IP address is then specified in the URL field of the HTTP communication. The domain name will still appear in the host field, so this custom signature will not function without the `--context host` keyword/value pair.

```
F-SBID( --name "Block.example.com"; --pattern "example.com";
    --service HTTP; --no_case; --flow from_client;
    --context host; )
```

Creating a custom signature to block the SMTP “vrfy” command

The SMTP “vrfy” command can be used to verify the existence of a single email address or to list all of the valid email accounts on an email server. A spammer could potentially use this command to obtain a list of all valid email users and direct spam to their inboxes.

In this example, you will create a custom signature to block the use of the vrfy command. Since the custom signature blocks the vrfy command from coming through the FortiGate unit, the administrator can still use the command on the internal network.

This example describes the use of the custom signature syntax to block the vrfy command. To create the custom signature entry in the FortiGate unit web-based manager, see “Creating a custom IPS signature” on page 949.

1 Enter the custom signature basic format

All custom signatures have a header and at least one keyword/value pair. The header is always the same:

```
F-SBID( )
```

The keyword/value pairs appear within the parentheses and each pair is followed by a semicolon.

2 Choose a name for the custom signature

Every custom signature requires a name, so it is a good practice to assign a name before you add any other keywords.

Use the `--name` keyword to assign the custom signature a name. The name value follows the keyword after a space. Enclose the name value in double-quotes:

```
F-SBID( --name "Block.SMTP.VRFY.CMD"; )
```

The signature, as it appears here, will not do anything if you try to use it. It has a name, but does not look for any patterns in network traffic. You must specify a pattern that the FortiGate unit will search for.

3 Add a signature pattern

Use the `--pattern` keyword to specify what the FortiGate unit will search for:

```
F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy"; )
```

The signature will now detect the vrfy command appearing in network traffic. The custom signature should only detect the command in SMTP traffic, however. Any other traffic with the pattern should be allowed to pass. For example, an email message discussing the vrfy command should not be stopped.

4 Specify the service

Use the `--service` keyword to limit the effect of the custom signature to only the HTTP protocol.

```
F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy";
   --service SMTP; )
```

The FortiGate unit will limit its search for the pattern to the SMTP protocol.

Even though the SMTP protocol uses only TCP traffic, the FortiGate will search for SMTP protocol communication in TCP, UDP, and ICMP traffic. This is a waste of system resources that you can avoid by limiting the search further, as shown below.

5 Specify the traffic type.

Use the `--protocol tcp` keyword to limit the effect of the custom signature to only TCP traffic. This will save system resources by not unnecessarily scanning UDP and ICMP traffic.

```
F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy";
   --service SMTP; --protocol tcp; )
```

The FortiGate unit will limit its search for the pattern to TCP traffic and ignore the pattern in UDP and ICMP network traffic.

6 Ignore case sensitivity

By default, patterns are case sensitive. If a user directed his or her browser to Example.com, the custom signature would not recognize the URL as a match.

Use the `--no_case` keyword to make the pattern matching case insensitive.

```
F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy";
   --service SMTP; --no_case; )
```

Unlike all of the other keywords in this example, the `--no_case` keyword has no value. Only the keyword is required.

7 Specify the context

The SMTP vrfy command will appear in the SMTP header. The `--context host` keyword/value pair allows you to limit the pattern search to only the header.

```
F-SBID( --name "Block.SMTP.VRFY.CMD"; --pattern "vrfy";
   --service SMTP; --no_case; --context header; )
```

Configuring a Fortinet Security Processing module

The Example Corporation has a web site that is the target of SYN floods. While they investigate the source of the attacks, it's very important that the web site remain accessible. To enhance the ability of the company's FortiGate-620B to deal with SYN floods, the administrator will install an ASM-CE4 Fortinet Security Processing module and have all external access to the web server come though it.

The security processing modules not only accelerate and offload network traffic from the FortiGate unit's processor, but they also accelerate and offload security and content scanning. The ability of the security module to accelerate IPS scanning and DoS protection greatly enhances the defense capabilities of the FortiGate-620B.

Assumptions

As shown in other examples and network diagrams throughout this document, the Example Corporation has a pair of FortiGate-620B units in an HA cluster. To simplify this example, the cluster is replaced with a single FortiGate-620B.

An ASM-CE4 is installed in the FortiGate-620B.

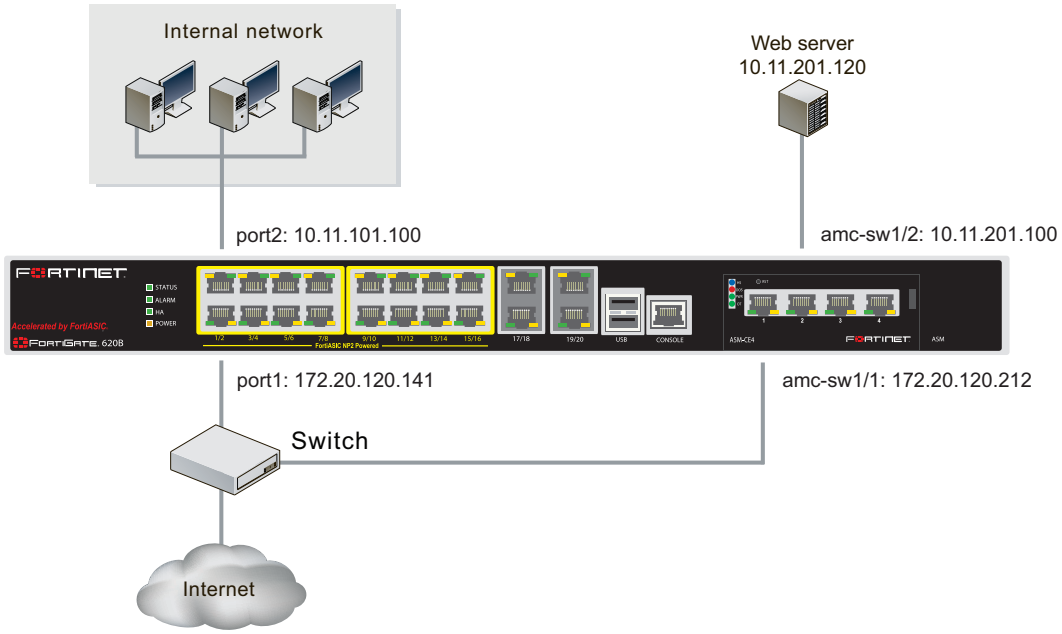
The network is configured as shown in Figure 88.

Network configuration

The Example Corporation network needs minimal changes to incorporate the ASM-CE4. Interface amc-sw1/1 of the ASM-CE4 is connected to the Internet and interface amc-sw1/1 is connected to the web server.

Since the main office network is connected to port2 and the Internet is connected to port1, a switch is installed to allow both port1 and amc-sw1/1 to be connected to the Internet.

Figure 88: The FortiGate-620B network configuration



The switch used to connect port1 and amc-sw1/1 to the Internet must be able to handle any SYN flood, all of the legitimate traffic to the web site, and all of the traffic to and from the Example Corporation internal network. If the switch can not handle the bandwidth, or if the connection to the service provider can not provide the required bandwidth, traffic will be lost.

Security module configuration

The Fortinet security modules come configured to give equal priority to content inspection and firewall processing. The Example Corporation is using a ASM-CE4 module to defend its web server against SYN flood attacks so firewall processing is a secondary consideration.

Use these CLI commands to configure the security module in ASM slot 1 to devote more resources to content processing, including DoS and IPS, than to firewall processing.

```
config system amc-slot
  edit sw1
    set optimization-mode fw-ips
    set ips-weight balanced
    set ips-p2p disable
    set ips-fail-open enable
    set fp-disable none
    set ipsec-inb-optimization enable
    set syn-proxy-client-timer 3
```

```
    set syn-proxy-server-timer 3
  end
```

These settings do not disable firewall processing. Rather, when the security module nears its processing capacity, it will chose to service content inspection over firewall processing.

DoS sensor configuration

Defend against anomaly-based attacks using a DoS sensor. For the SYN floods launched against the Example Corporation web site, the *tcp_syn_flood* anomaly is the best defense.

Create a DoS sensor for SYN flood protection

1. Go to *UTM Profiles* > *Intrusion Protection* > *DoS Sensor*.
2. Select *Create New*.
3. Enter `Web site SYN protection` for the DoS sensor name.
4. Select *OK* to create the sensor.

The default tcp_syn_flood threshold is 2000. This means that the configured action will be triggered when the number of TCP packets with the SYN flag set exceeds 2000 per second.

For some applications, this value will be too high, while for others it will be too low. One way to find the correct values for your environment is to set the action to *Pass* and enable logging. Observe the logs and adjust the threshold values until you can determine the value at which normal traffic begins to generate attack reports. Set the threshold above this value with the margin you want. Note that the smaller the margin, the more protected your network will be from DoS attacks, but your network traffic will also be more likely to generate false alarms.

Configure a DoS sensor for SYN flood protection

1. Go to *UTM Profiles* > *Intrusion Protection* > *DoS Sensor*.
2. Select the `Web site SYN protection` sensor and select the *Edit* icon.
3. Select *Enable* and *Logging* for the *tcp_syn_flood* anomaly.
4. Select the Proxy action for the *tcp_syn_flood* anomaly.
5. Enter the threshold value for the *tcp_syn_flood* anomaly.
6. Select OK.

With the action configured as Proxy, TCP packets with the SYN flag set will be passed until the threshold value is exceeded. At that point, TCP packets with the SYN flag set until their numbers fall below the threshold value.

The ASM-CE4 security module will intercept the packet, and reply to the client with a TCP packet that has the SYN and ACK flags set. If the connection request is legitimate, the client will reply with a packet that has the ACK flag set. The ASM-CE4 will then ‘replay’ this exchange to the server and allow the client and server to communicate directly.

If the client does not reply with the expected packet, the ASM-CE4 will close the connection. Therefore, if the security module receives a flood of SYN packets, they will be blocked. Only the legitimate connections will be allowed through to the server.

DoS policy configuration

Before the DoS sensor can begin examining network traffic, you must create and configure a DoS policy and specify the DoS sensor.

Create a DoS policy

1. Go to *Policy* > *Policy* > *DoS Policy*.
2. Select *Create New*.
3. Select *amc-sw1/1* for *Source Interface/Zone*.
4. Select *all* for *Source Address*.
5. Select *all* for *Destination Address*.
6. Select *ANY* for *Service*.
7. Enable *DoS Sensor* and select the `Web site SYN protection` sensor from the list.
8. Select *OK*.

Virtual IP configuration

Traffic destined for the web server will arrive at the amc-sw1/1 interface. You must create a virtual IP mapping to have the ASM-CE4 direct the traffic to the web server.

Create a virtual IP mapping

1. Go to *Firewall Objects* > *Virtual IP* > *Virtual IP*.
2. Select *Create New*.
3. In the *Name* field, enter `web_server`.
4. Select *amc-sw1/1* as the *External Interface*.
5. Enter `172.20.120.212` as the *External IP Address/Range*.
6. Enter `10.11.201.120` as the *Mapped IP Address/Range*.
7. Select *OK*.

Security policy configuration

A security policy is required to allow traffic through to the web server. Further, the security policy must include the virtual IP so the traffic is directed to the web server.

Create a security policy

1. Go to *Policy* > *Policy* > *Policy*.
2. Select *Create New*.
3. Select *amc-sw1/1* for the *Source Interface/Zone*.
4. Select *all* for the *Source Address*.
5. Select *amc-sw1/2* for the *Destination Interface/Zone*.
6. Select *web_server* for the *Destination Address*.
7. Select *Enable NAT*.
8. Select *OK*.

Attempts to connect to 172.20.120.212 will be forwarded to the web server with this security policy in place.

View proxy statistics

With a FortiGate security module installed, a CLI command displays the current proxy statistics.

At the CLI prompt, type `execute npu-cli /dev/ce4_0 showsynproxy`. The last nine lines will list the proxy statistics:

```
Total Proxied TCP Connections:            434055223
Working Proxied TCP Connections:          515699
Retired TCP Connections:                  433539524
Valid TCP Connections:                    0
Attacks, No Ack From Client:              433539524
No SynAck From Server:                    0
Rst By Server (service not supported):    0
Client timeout setting:                   3 Seconds
Server timeout setting:                   3 Seconds
```

Total Proxied TCP Connections	The number of proxied TCP connection attempts since the FortiGate unit was restarted. This value is the sum of the working and retired connection totals.
Working Proxied TCP Connections	The number of TCP connection attempts currently being proxied.
Retired TCP Connections	The number of proxied TCP connection attempts dropped or allowed. These connection attempts are no-longer being serviced. This value is the sum of the valid and attacks totals.
Valid TCP Connections	The number of valid proxied TCP connection attempts.
Attacks, No Ack From Client	The number of proxied TCP connection attempts in which the client did not reply. These are typically attacks.
No SynAck From Server	The number of valid client connection attempts in which the server does not reply.
Rst By Server (service not supported)	The number of valid client connection attempts in which the server resets the connection.
Client timeout setting	The client time-out duration.
Server timeout setting	The server time-out duration.

Intrusion Protection interface reference

The Intrusion Protection system combines signature and anomaly detection and prevention with low latency and excellent reliability. With Intrusion Protection, you can create multiple IPS sensors, each containing a complete configuration based on signatures. Then, you can apply any IPS sensor to a firewall policy. You can also create DoS sensors to examine traffic for anomaly-based attacks.

This topic contains the following:

IPS Sensor

You can group signatures into IPS sensors for easy selection when applying to firewall policies. You can define signatures for specific types of traffic in separate IPS sensors, and then select those sensors in profiles designed to handle that type of traffic. For example, you can specify all of the web-server related signatures in an IPS sensor, and that sensor can then be applied to a firewall policy that controls all of the traffic to and from a web server protected by the unit.

The FortiGuard Service periodically updates the pre-defined signatures, with signatures added to counter new threats. Since the signatures included in filters are defined by specifying signature attributes, new signatures matching existing filter specifications will automatically be included in those filters. For example, if you have a filter that includes all signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures as they are added.

Each IPS sensor consists of two parts: filters and overrides. Overrides are always checked before filters.

Each filter consists of a number of signatures attributes. All of the signatures with those attributes, and only those attributes, are checked against traffic when the filter is run. If multiple filters are defined in an IPS Sensor, they are checked against the traffic one at a time, from top to bottom. If a match is found, the unit takes the appropriate action and stops further checking.

A signature override can modify the behavior of a signature specified in a filter. A signature override can also add a signature not specified in the sensor's filters. Custom signatures are included in an IPS sensor using overrides.

The signatures in the overrides are first compared to network traffic. If the IPS sensor does not find any matches, it then compares the signatures in each filter to network traffic, one filter at a time, from top to bottom. If no signature matches are found, the IPS sensor allows the network traffic.

The signatures included in the filter are only those matching every attribute specified. When created, a new filter has every attribute set to *all* which causes every signature to be included in the filter. If the severity is changed to high, and the target is changed to server, the filter includes only signatures checking for high priority attacks targeted at servers.

IPS sensor configuration settings

The following are IPS sensor configuration settings in *UTM Profiles* > *Intrusion Protection* > *IPS Sensor*.

IPS Sensor page	
Lists each individual IPS sensor, either default or ones that you created. On this page you can edit, delete or create a new IPS sensor. If you want to configure tags, and the tag options are not available on the web-based manager, you must enable tag options by going to *System* > *Admin* > *Settings*. **Note:** You can configure IPS signatures to not be triggered until the threshold is met; however, this is configured only in the CLI. You must use `config override` in `config ips sensor` command to configure this option.	
Create New	Creates a new IPS sensor. When you select *Create New*, you are automatically redirected to the New IPS Sensor page. This page provides a name field and comment field. You must enter a name to go the IPS Sensor Settings page.
Delete	Removes the IPS sensor from the list. To remove multiple IPS sensors from within the list, on the IPS Sensor page, in each of the rows of the sensors you want removed, select the check box and then select *Delete*. To remove all IPS sensors from the list, on the IPS Sensor page, select the check box in the check box column and then select *Delete*.
Edit	Modifies settings within an IPS sensor. When you select *Edit*, you are automatically redirected to the Edit IPS Sensor page.
Name	The name of each IPS sensor.
Comments	An optional description of the IPS sensor.

Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
all_default (default)	Includes all signatures. The sensor is set to use the default enable status and action of each signature.
all_default_pass (default)	Includes all signatures. The sensor is set to use the default enable status of each signature, but the action is set to pass.
protect_client (default)	Includes only the signatures designed to detect attacks against clients and uses the default enable status and action of each signature.
protect_email_server (default)	Includes only the signatures designed to detect attacks against servers and the SMTP, POP3, or IMAP protocols and uses the default enable status and action of each signature.
protect_http_server (default)	Includes only the signatures designed to detect attacks against servers and the HTTP protocol and uses the default enable status and action of each signature.
Edit IPS Sensor page	
Provides settings for configuring multiple filters and overrides that make up an IPS sensor. The Edit IPS Sensor Settings page contains two sections, one called Filters where you can configure filters and the other called Overrides where you can configure either predefined or custom overrides. **Note:** Logging is enabled in the CLI.	
Name	If you are editing an existing IPS sensor and you want to change the name, enter a new name in the field. You must select *Apply* to save the change.

Comments	If you are editing an existing IPS sensor and you want to change the description, enter the changes in the field. You must select *Apply* to save the change.
Create New	Creates a new filter. You can also use the Insert icon to create a new filter for an IPS sensor. When you select *Create New*, you are automatically redirected to the Edit IPS Filter page. If you want to create a predefined override or a custom override, select the down arrow beside *Create New*. From the list, you can select *Pre-defined Entry*, which creates a predefined override, or you can select *Custom Entry*, which creates a custom override. For more information about overrides, see "Pre-defined overrides and custom overrides configuration settings" on page 985.
Edit	Modifies settings within a filter. When you select *Edit*, you are automatically redirected to the Edit IPS Filter page.
Delete	Removes a filter from the list within the Filters section of the IPS Sensor Settings page. To remove multiple filter lists from within the list, in the Filters section, in each of the rows of the filters you want removed, select the check box and then select *Delete*. To remove all filters from the list, in the Filters section, select the check box in the check box column and then select *Delete*.
Insert	Inserts a new filter in filter list in the list in the Filters section. When you select *Insert*, you are automatically redirected to the Edit IPS Filter page.
Move To	Moves a filter to any position within the list in the Filters section. You must select the check box in the row of the filter you want moved so that filter will be moved within the list. When you select *Move To*, the following appears: `Please enter the destination filter position.` Enter the number for the filter's new position within the list, for example, 5, to place the first entry in the fifth position Select *OK*.
View Rules	View the rules of a filter. When you select *View Rules*, the Matched Rules window appears. Scroll through the list to see all the rules within that filter.
ID	The identification number of the entry you created.
Severity	The severity level of the filter.
Target	The target specified for that filter.
Protocol	The type of protocol for that filter.
OS	The type of operating system.
Application	The software application, such as Adobe.

Enable	A green check mark appears if you select *Enable all* within the filter's settings. If you select *Disable all*, a gray x appears. **Note:** For the default IPS sensor (called "default") the word *Default* displays instead of the check mark. It cannot be disabled.
Action	The type of action the unit will take. This action can be *Block*, *Pass*, or *Reset*.
Packet Logging	A green checkmark appears if you select *Enable all* within the filter's settings. A gray x appears if you select *Disable all*.
Matched Signatures	The number of signatures included in the filter. Overrides are not included in the total.

Filters configuration settings

A filter is a collection of signature attributes that you specify. The signatures that have all of the attributes specified in a filter are included in the IPS signature. An IPS sensor can contain multiple IPS filters. The following are the available options when configuring filters.

The following are filter configuration settings for an IPS sensor in *UTM Profiles* > *Intrusion Protection* > *IPS Sensors*.

New IPS Filter page	
Provides settings for configuring a filter. You are automatically redirected to this page when you select *Create New* in the *Filters* section of the IPS Sensor Settings page.	
Name	Enter a name for the filter.
Severity	Select a severity level. You must specify a severity level if you do not want to all severity levels.
Target	Select the type of system targeted by the attack.
OS	Select to specify the type of operating system, or select All to include all operating systems. The operating system available include BSD and Solaris. Signatures with an OS attack attribute of All affect all operating system and these signatures are automatically included in any filter regardless of whether a single, multiple, or all operating systems are specified.
Protocol	Select to choose multiple protocols or all available protocols. To select specific protocols, select Specify, and then move each protocol that you want from the Available column to the Selected column using the -> arrow. To remove a protocol from the Selected column, select the protocol and then use the <- arrow to move the protocol back to the Available column.
Application	Select to choose multiple applications or all available applications. To select specific applications, select *Specify*, and then move each application that you want from the *Available* list to the *Selected* list using the -> arrow. To remove an application from the *Selected* list, select the protocol and then use the <- arrow to move the application back to the *Available* list.

Tags	Applies tags to the file filter only. These tags do not display within the Filters section, only within the filter itself on the Edit IPS Filter page. If you do not see *Tags* and its available settings, go to *System* > *Admin* > *Settings* to enable them on the web-based manager.
Applied tags	Displays the tags that you have added to the filter.
Add tags	Enter the tag in the field and then select the plus (+) sign to add the tag to the filter. This also adds the tag to the *Applied tags* list.
Enable All Matching Signatures	Select to accept the defaults, or enable all signatures, or disable all.
Action When Signature Is Triggered	Select to indicate to the unit what action to take when a signature is triggered. When you select *Accept signature defaults*, and then select to enable *Quarantine Attackers (to Banned Users List)*, the *Method* and *Expires* options display. The Quarantine *Attackers (to Banned Users List)* appears only when *Accept signature defaults* is selected.
Quarantine Attackers (to Banned Users List)	Select if you want to add an attacker to the *Banned Users List*.
Method	Select *Attacker's IP Address* to block all traffic sent from the attacker's IP address. Traffic from the attacker's IP address is blocked because the attacker's IP address is in the Banned Users List. Select *Attacker and Victim IP Addresses* to block all traffic sent from the attacker IP address to the target (victim) IP address. Traffic from the attacker IP address to addresses other than the victim IP address is allowed. The attacker and target IP addresses are added to the banned user list as one entry. Select *Attack's Incoming Interface* to block all traffic from connecting to the FortiGate interface that received the attack. The interface is added to the banned user list.
Expires	You can select whether the attacker is banned indefinitely or for a specified number of days, hours, or minutes. Select *Indefinitely* if you do not want the information to expire. Select *After* and enter the number of hours, minutes or days.
Packet Logging	Select to enable packet logging on the filter. When you select to enable packet logging on a filter, the unit saves a copy of the packets that triggered an attack detection for future analysis or for audit purposes. **Note:** You must enable logging for both filter and sensor so that logging occurs. The logging option is available only in the CLI.

Pre-defined overrides and custom overrides configuration settings

Pre-defined and custom overrides are configured and work mainly in the same way as filters. Unlike filters, each override defines the behavior of one signature.

Overrides can be used in two ways:

- Change the behavior of a signature already included in a filter. For example, to protect a web server, you could create a filter that includes and enables all signatures related to servers. If you wanted to disable one of those signatures, the simplest way would be to create an override and mark the signature as disabled.
- Add an individual signature that is not included in any filters to an IPS sensor. This is the only way to add custom signatures to IPS sensors.

When a pre-defined signature is specified in an override, the default status and action attributes have no effect. These settings must be explicitly set when creating the override.

When configuring either a pre-defined override or a custom override, the following options are available regardless which override you are configuring.

Predefined and custom overrides are configured in the IPS Sensor itself, located in *UTM Profiles* > *Intrusion Protection* > *IPS Sensors*. The following are configuration settings for both predefined and custom overrides.

Before an override can affect network traffic, you must add it to a filter, and you must select the IPS sensor and then apply it to a policy. An override does not have the ability to affect network traffic until these steps are taken.

Configure IPS Entry page	
Provides settings for configuring both predefined overrides and custom overrides. You are automatically redirected to this page after selecting either *Pre-defined Entry* or *Custom Entry,* which is accessed when you select the down arrow beside *Create New*. **Note:** Logging is enabled in the CLI.	
Signature	Select the browse icon to view the list of available signatures. From this list, select a signature the override will apply to and then select *OK*.
Enable	Select to enable the signature override.
Action	Select *Pass*, *Block* or *Reset*. When the override is enabled, the action determines what the unit will do with traffic containing the specified signature.
Packet Log	Select to save packets that trigger the override to the unit's hard drive for later examination.
Quarantine Attackers (to Banned Users List)	Select to enable NAC quarantine for this override. The unit deals with the attack according to the IPS sensor or DoS sensor configuration regardless of this setting.

Method	Select *Attacker's IP address* to block all traffic sent from the attackers IP address. The attackers IP address is also added to the banned user list. The target address is not affected. Select *Attacker and Victim IP Addresses* to block all traffic sent from the attacker IP address to the target (victim) IP address. Traffic from the attacker IP address to addresses other than the victim IP address is allowed. The attacker and target IP addresses are added to the banned user list as one entry. Select *Attack's Incoming Interface* to block all traffic from connecting to the FortiGate interface that received the attack. The interface is added to the banned user list.
Expires	You can select whether the attacker is banned indefinitely or for a specified number of days, hours, or minutes.
Exempt IP	Enter IP addresses to exclude from the override. The override will then apply to all IP addresses except those defined as exempt. The exempt IP addresses are defined in pairs, with a source and destination, and traffic moving from the source to the destination is exempt from the override.
Source	The exempt source IP address. Enter `0.0.0.0/0` to include all source IP addresses.
Destination:	The exempt destination IP address. Enter `0.0.0.0/0` to include all destination IP addresses.
Add	Select to add other exempt IP addresses to the list in the table below Add.
#	The number identifying the order of the item in the list.
Source	The source IP address and netmask entered.
Destination	The destination IP address and netmask entered.
Delete	Select to remove an item in the list.

DoS sensor

IPS uses a traffic anomaly detection feature to identify network traffic that does not fit known or common traffic patterns and behavior. For example, one type of flooding is the denial of service (DoS) attack that occurs when an attacking system starts an abnormally large number of sessions with a target system. The large number of sessions slows down or disables the target system so legitimate users can no longer use it. This type of attack gives the DoS sensor its name, although it is capable of detecting and protecting against a number of anomaly attacks.

You can enable or disable logging for each traffic anomaly, and configure the detection threshold and action to take when the detection threshold is exceeded.

You can create multiple DoS sensors. Each sensor consists of 12 anomaly types that you can configure. When a sensor detects an anomaly, it applies the configured action. One sensor can be selected for use in each DoS policy, allowing you to configure the anomaly thresholds separately for each interface. Multiple sensors allow great granularity in detecting anomalies because each sensor can be configured for the specific needs of the interface it is attached to by the DoS policy.

The traffic anomaly detection list can be updated only when the firmware image is upgraded on the unit.

Since an improperly configured DoS sensor can interfere with network traffic, no DoS sensors are present on a factory default unit. You must create your own and then select them in a DoS policy before they will take effect. Thresholds for newly created sensors are preset with recommended values that you can adjust to meet the needs of your network.

It is important to know normal and expected network traffic before changing the default anomaly thresholds. Setting the thresholds too low could cause false positives, and setting the thresholds too high could allow otherwise avoidable attacks.

If virtual domains are enabled on the unit, the Intrusion Protection settings must be configured separately in each VDOM. All sensors and custom signatures will appear only in the VDOM in which they were created.

DoS sensor configuration settings

The following are DoS sensor configuration settings in *UTM Profiles* > *Intrusion Protection* > *DoS Sensor*.

DoS Sensor page	
Lists each default DoS sensor and each DoS sensor that you created. On this page, you can create, edit or delete a DoS sensor.	
Create New	Creates a new DoS sensor. When you select *Create New*, you are automatically redirected to the New DoS Sensor page. The New DoS Sensor page provides a name field and a comment file. You must enter a name to go to the Edit DoS Sensor page.
Edit	Modifies the settings within a DoS sensor. You can modify the following information: Action, Severity, and Threshold. When you select *Edit*, you are automatically redirected to the Edit DoS Sensor page.
Delete	Removes a DoS sensor from the list on the DoS Sensor page. To remove multiple DoS sensors from within the list, on the DoS Sensor page, in each of the rows of the sensors you want removed, select the check box and then select *Delete*. To remove all DoS sensors from the list, on the DoS Sensor page, select the check box in the check box column and then select *Delete*.
Name	The DoS sensor name.
Comments	An optional description of the DoS sensor.

Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
Edit DoS Sensor page Provides settings for configuring the action type, threshold amount, and if logging should be enabled for the anomaly. There are twelve default anomalies to configure settings for. If you are editing a DoS Sensor, you are redirected to this page.	
Name	If you are editing an existing DoS sensor setting and want to change the name, enter a new name in this field. You must select *OK* to save the change.
Comments	If you are editing an existing DoS sensor setting and want to change or add a description, enter the new text in this field. You must select *OK* to save these changes.
Anomalies Configuration	
Name	The name of the anomaly.
Enable	Select the check box to enable the DoS sensor to detect when the specified anomaly occurs. Selecting the check box in the header row will enable all anomalies.
Logging	Select the check box to enable the DoS sensor to log when the anomaly occurs. Selecting the check box in the header row will enable logging for all anomalies. Anomalies that are not enabled are not logged.

Action	Select *Pass* to allow anomalous traffic to pass when the unit detects it, or set *Block* to prevent the traffic from passing.
Threshold	Displays the number of sessions/packets that must show the anomalous behavior before the FortiGate unit triggers the anomaly action (pass or block). If required, change the number. Range 1 to 2 147 483 647.For more information about how these settings affect specific anomalies, see Table 68 on page 990 and "SYN threshold (preventing SYN floods using a DoS sensor)" on page 990.

SYN proxy

FortiGate units with Fortinet security processing modules installed offer a third action for the tcp_syn_flood threshold when a module is installed. Instead of Block and Pass, you can choose to Proxy the incomplete connections that exceed the threshold value.

When the tcp_syn_flood threshold action is set to proxy, incomplete TCP connections are allowed as normal as long as the configured threshold is not exceeded. If the threshold is exceeded, the unit will intercept incoming SYN packets from clients and respond with a SYN+ACK packet. If the unit receives an ACK response as expected, it will "replay" this exchange to the server to establish a communication session between the client and the server, and allow the communication to proceed.

SYN threshold (preventing SYN floods using a DoS sensor)

The preferred primary define against any type of SYN flood is the DoS sensor tcp_syn_flood threshold. The threshold value sets an upper limit on the number of new incomplete TCP connections allowed per second. If the number of incomplete connections exceeds the threshold value, and the action is set to Pass, the unit will allow the SYN packets that exceed the threshold. If the action is set to Block, the unit will block the SYN packets that exceed the threshold, but it will allow SYN packets from clients that send another SYN packet.

The tools attackers use to generate network traffic will not send a second SYN packet with a SYN+ACK response is not received from the server. These tools will not "retry". Legitimate clients will retry when no response is received, and these retries are allowed even if they exceed the threshold with the action set to Block.

Understanding the anomalies

Each DoS sensor offers four configurable statistical anomaly types for each of the TCP, UDP, and ICMP protocols.

Table 67: The four statistical anomaly types.

For each of the TCP, UDP, and ICMP protocols, DoS sensors offer four statistical anomaly types. The result is twelve configurable anomalies, which are shown in Table 68.

Table 68: The twelve individually configurable anomalies

Anomaly	Description
`tcp_syn_flood`	If the SYN packet rate, including retransmission, to one destination IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.

Table 68: The twelve individually configurable anomalies (Continued)

Anomaly	Description
tcp_port_scan	If the SYN packets rate, including retransmission, from one source IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
tcp_src_session	If the number of concurrent TCP connections from one source IP address exceeds the configured threshold value, the action is executed.
tcp_dst_session	If the number of concurrent TCP connections to one destination IP address exceeds the configured threshold value, the action is executed.
udp_flood	If the UDP traffic to one destination IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
udp_scan	If the number of UDP sessions originating from one source IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
udp_src_session	If the number of concurrent UDP connections from one source IP address exceeds the configured threshold value, the action is executed.
udp_dst_session	If the number of concurrent UDP connections to one destination IP address exceeds the configured threshold value, the action is executed.
icmp_flood	If the number of ICMP packets sent to one destination IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
icmp_sweep	If the number of ICMP packets originating from one source IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
icmp_src_session	If the number of concurrent ICMP connections from one source IP address exceeds the configured threshold value, the action is executed.
icmp_dst_session	If the number of concurrent ICMP connections to one destination IP address exceeds the configured threshold value, the action is executed.

Predefined

The Intrusion Protection system can use signatures once you have grouped the required signatures in an IPS sensor. If required, you can override the default settings of the signatures specified in an IPS sensor. The unit provides a number of pre-built IPS sensors, but you should check their settings before using them, to ensure they meet your network requirements.

By using only the signatures you require, you can improve system performance and reduce the number of log messages and alert email messages that the IPS sensor generates. For example, if the unit is not protecting a web server, web server signatures are not included.

The predefined signature list, located in *UTM Profiles* > *Intrusion Protection* > *Predefined*, includes signatures that are currently in the FortiGuard Center Vulnerability Encyclopedia. This encyclopedia also includes additional signatures not found in the Predefined menu. Each signature name is a link to the vulnerability encyclopedia entry for the signature. The vulnerability encyclopedia describes the attack detected by the signature and provides recommended actions and links for more information.

The predefined signature list also includes characteristics such as the severity level of the attack, protocol, and applications affected for each signature. These characteristics give you a quick reference to what the signature is for. You can also use these characteristics to sort the signature list, grouping signatures by common characteristics. The signature list also displays the default action, the default logging status, and whether the signature is enabled by default. The signatures are sorted by name, which is default. The predefined signature list table allows you to view these characteristics in detail. The table is located at the bottom of the page; however, you can customize the table so that it appears on the right side of the page or hidden.

Viewing predefined signatures

You can view predefined signatures in *UTM Profiles* > *Intrusion Protection* > *Predefined*.

When you are viewing signatures, you can view each one in detail, from the IPS signatures viewer table. The IPS Signatures Viewer table appears, by default, at the bottom of the page; however, you can choose to hide the table or position the table at the right side of the page.

If virtual domains are enabled on the unit, the Intrusion Protection settings are configured separately in each VDOM. All sensors and custom signatures will appear only in the VDOM in which they were created.

Predefined page	
Lists each predefined signature that is currently on your unit. When you select the name of the signature, you are automatically redirected to that signature's detailed definition in the FortiGuard Center Vulnerability Encyclopedia. This page also indicates which signatures are enabled and which are disabled. **Tip:** To determine what effect IPS protection will have on your network traffic, enable the required signatures, set the *Action* to *Pass*, and enable logging. Traffic will not be interrupted, and you will be able to examine, in detail, which signatures were detected.	
Tags	Select to add or remove tags to the predefined signature. **Note:** If tag settings are not available on the web-based manager, they must be enabled in *System* > *Admin* > *Settings* to then appear on the Predefined page. When you select the down arrow beside *Tags*, you can add tags or remove tags. To add tags to a predefined signature, select the signature first, select the down arrow beside *Tags*, and then select *Add Tags*. The Add Tags window appears. Enter the tag in the *Add Tag* field and then select the plus (+) sign; repeat until all tags are in the *Tags to apply* list. To remove tags, select the signature first, select the down arrow beside Tags, and then select *Remove Tags*. The Remove Tags window appears. Select the tags that you want removed in the *Applied Tags* row; repeat until all the tags are in the *Tags to remove* row. The tags will automatically be put in the *Tags to remove* row after being selected in the *Applied Tags* row. **Note:** When you select a signature, the Signature Viewer Table appears. The Signature Viewer Table is the same as the Log Viewer Table, providing detailed information about a signature. If there are tags that you want to add that have been configured for another object, you can add those tags as well to signatures. To apply these other object tags, select the signature first, select the down arrow beside Tags, and then select *Add Tags*. The Add Tags window appears. Select the tags you want to add in the *Click tag to* add row. The tags automatically appear in the *Tags to apply* row. Select *OK* to add those tags to the application.
Column Settings	Select to customize the signature information displayed in the table. You can also readjust the column order.

Filter Settings	Select to filter the information on the page. *Filters* appears automatically after selecting *Filter Settings*, below the column headings. Use to configure filter settings. **Note:** *Filter Settings* configures all filter settings. Filter icons are used to configure filter settings within that column. To apply a filter setting, select the plus sign beside *Add new filter* and then select and enter the information required. Repeat to add other filter settings.To modify settings, select *Change* beside the setting and edit the settings. To clear all filter settings, select the icon beside *Clear all filters*. To use a filter icon to filter settings within a column, select the filter icon in the column; Filters appears. Within Filters, configure the settings for that column. The *Filters Settings* on the Predefined page contains *Copy to Sensor*, which allows you to copy filter settings and apply them to a IPS sensor. To apply existing filter settings to a sensor, select the down arrow beside *Filter Settings*, and then select *Copy to Sensor*. The Select Object window appears. Select the sensor that you want to apply the settings to from the drop-down list. Select *OK*.
View Details	Select the down arrow to choose to either hide the predefined signature viewer table or position the table on the right side of the page.
Search	Enter search criteria in the field provided. Select the *Clear All* icon beside the field to clear the criteria for a new search.
Name	The name of the signature. Each name is also a link to the description of the signature in the FortiGuard Center Vulnerability Encyclopedia.
Severity	The severity rating of the signature. The severity levels, from lowest to highest, are *Information*, *Low*, *Medium*, *High*, and *Critical*. These levels appear as bars in this column; each bar is explained in the predefined signature viewer table.
Target	The target of the signature: servers, clients, or both.
Protocols	The protocol the signature applies to.
OS	The operating system the signature applies to.
Applications	The applications the signature applies to.
Tags	The tags that are applied to the predefined signature.
Enable	The default status of the signature. A green check mark indicates the signature is enabled. A gray x indicates the signature is not enabled.
Action	The default action for the signature: • *Pass* – allows the traffic to continue without any modification. • *Drop* – prevents the traffic with detected signatures from reaching its destination. If logging is enabled, the action appears in the status field of the log message generated by the signature.
Page Controls	Use to navigate through the list on the page.

Custom

Custom signatures provide the power and flexibility to customize the Intrusion Protection system for diverse network environments. The predefined signatures represent common attacks. If you use an unusual or specialized application or an uncommon platform, you can add custom signatures based on the security alerts released by the application and platform vendors.

You can also create custom signatures to help you block P2P protocols.

After creating custom signatures, you need to specify them in IPS sensors that were created to scan traffic.

Use custom signatures to block or allow specific traffic. For example, to block traffic containing profanity, add custom signatures similar to the following:

```
set signature 'F-SBID (--protocol tcp; --flow bi_direction; --
pattern "bad words"; --no_case)'
```

Custom signatures must be added to a signature override in an IPS filter to have any effect. Creating a custom signature is a necessary step, but a custom signature does not affect traffic simply by being created.

Custom signatures are an advanced feature. This document assumes the user has previous experience creating intrusion detection signatures.

Custom signature configuration settings

The following are custom signature configuration settings in *UTM Profiles* > *Intrusion Protection* > *Custom*.

If virtual domains are enabled on the unit, the Intrusion Protection settings are configured separately in each VDOM. All sensors and custom signatures will appear only in the VDOM in which they were created.

Custom page	
Lists each custom signature that you created. On this page you can edit, delete or create a new custom signature.	
Create New	Creates a new custom signature. When you select *Create New*, you are automatically redirected to the New Custom Signature page.
Edit	Modifies the name or signature of a custom signature. When you select *Edit*, you are automatically redirected to the Edit Custom Signature page.
Delete	Removes a custom signature from the list on the Custom page. To remove multiple custom signatures from within the list, on the Custom page, in each of the rows of the custom signatures you want removed, select the check box and then select *Delete*. To remove all custom signatures from the list, on the Custom page, select the check box in the check box column and then select *Delete*.
Name	The name of the custom signature.
Signature	The signature itself.

New Custom Signature page	
Provides settings for configuring a new custom signature.	
Name	Enter a name for the custom signature.
SIgnature	Enter the signature.

Protocol Decoder

The Intrusion Protection system uses protocol decoders to identify the abnormal traffic patterns that do not meet the protocol requirements and standards. For example, the HTTP decoder monitors traffic to identify any HTTP packets that do not meet the HTTP protocol standards.

The decoder list is provided for your reference and can be configured using the CLI.

You can view protocol decoders in *UTM Profiles* > *Intrusion Protection* > *Protocol Decoder*.

Protocol Decoder page	
Displays a list of the current protocol decoders that are on your unit. The unit automatically updates this list by contacting the FDN. This lists includes the port number that the protocol decoder monitors.	
Protocols	The protocol decoder name.
Ports	The port number or numbers that the decoder monitors.

Upgrading the IPS protocol decoder list

The Intrusion Protection system protocol decoders are upgraded automatically through the FortiGuard Distribution Network (FDN) if existing decoders are modified or new decoders added. The FDN keeps the protocol decoder list up-to-date with protection against new threats such as the latest versions of existing IM/P2P as well as against new applications.

Web filter

This section describes FortiGate web filtering for HTTP traffic. The three main parts of the web filtering function, the Web Content Filter, the URL Filter, and the FortiGuard Web Filtering Service interact with each other to provide maximum control over what the Internet user can view as well as protection to your network from many Internet content threats. Web Content Filter blocks web pages containing words or patterns that you specify. URL filtering uses URLs and URL patterns to block or exempt web pages from specific sources. FortiGuard Web Filtering provides many additional categories you can use to filter web traffic.

This section describes the Web Content Filter and URL Filter functions. For information on FortiGuard Web Filtering, see "FortiGuard Web Filter" on page 1023.

The following topics are included in this section:

Web filter concepts

Web filtering is a means of controlling the content that an Internet user is able to view. With the popularity of web applications, the need to monitor and control web access is becoming a key component of secure content management systems that employ antivirus, web filtering, and messaging security. Important reasons for controlling web content include:

- lost productivity because employees are accessing the web for non-business reasons
- network congestion — when valuable bandwidth is used for non-business purposes, legitimate business applications suffer
- loss or exposure of confidential information through chat sites, non-approved email systems, instant messaging, and peer-to-peer file sharing
- increased exposure to web-based threats as employees surf non-business-related web sites
- legal liability when employees access/download inappropriate and offensive material
- copyright infringement caused by employees downloading and/or distributing copyrighted material.

As the number and severity of threats increase on the World Wide Web, the risk potential increases within a company's network as well. Casual non-business related web surfing has caused many businesses countless hours of legal litigation as hostile environments have been created by employees who download and view offensive content. Web-based attacks and threats are also becoming increasingly sophisticated. Threats and web-based applications that cause additional problems for corporations include:

- spyware/grayware
- phishing
- pharming
- instant messaging
- peer-to-peer file sharing
- streaming media
- blended network attacks.

Spyware, also known as grayware, is a type of computer program that attaches itself to a user's operating system. It does this without the user's consent or knowledge. It usually ends up on a computer because of something the user does such as clicking on a button in a pop-up window. Spyware can track the user's Internet usage, cause unwanted pop-up windows, and even direct the user to a host web site. For further information, visit the FortiGuard Center.

Some of the most common ways of grayware infection include:

- downloading shareware, freeware, or other forms of file-sharing services
- clicking on pop-up advertising
- visiting legitimate web sites infected with grayware.

Phishing is the term used to describe attacks that use web technology to trick users into revealing personal or financial information. Phishing attacks use web sites and email that claim to be from legitimate financial institutions to trick the viewer into believing that they are legitimate. Although phishing is initiated by spam email, getting the user to access the attacker's web site is always the next step.

Pharming is a next generation threat that is designed to identify and extract financial, and other key pieces of information for identity theft. Pharming is much more dangerous than phishing because it is designed to be completely hidden from the end user. Unlike phishing attacks that send out spam email requiring the user to click to a fraudulent URL, pharming attacks require no action from the user outside of their regular web surfing activities. Pharming attacks succeed by redirecting users from legitimate web sites to similar fraudulent web sites that have been created to look and feel like the authentic web site.

Instant messaging presents a number of problems. Instant messaging can be used to infect computers with spyware and viruses. Phishing attacks can be made using instant messaging. There is also a danger that employees may use instant messaging to release sensitive information to an outsider.

Peer-to-peer (P2P) networks are used for file sharing. Such files may contain viruses. Peer-to-peer applications take up valuable network resources and may lower employee productivity but also have legal implications with the downloading of copyrighted or sensitive company material.

Streaming media is a method of delivering multimedia, usually in the form of audio or video to Internet users. Viewing streaming media impacts legitimate business by using valuable bandwidth.

Blended network threats are rising and the sophistication of network threats is increasing with each new attack. Attackers learn from each previous successful attack and enhance and update attack code to become more dangerous and fast spreading. Blended attacks use a combination of methods to spread and cause damage. Using virus or network worm techniques combined with known system vulnerabilities, blended

threats can quickly spread through email, web sites, and Trojan applications. Examples of blended threats include Nimda, Code Red, Slammer, and Blaster. Blended attacks can be designed to perform different types of attacks, which include disrupting network services, destroying or stealing information, and installing stealthy backdoor applications to grant remote access.

Different ways of controlling access

The methods available for monitoring and controlling Internet access range from manual and educational methods to fully automated systems designed to scan, inspect, rate and control web activity.

Common web access control mechanisms include:

- establishing and implementing a well-written usage policy in the organization on proper Internet, email, and computer conduct
- installing monitoring tools that record and report on Internet usage
- implementing policy-based tools that capture, rate, and block URLs.

The final method is the focus of this topic. The following information shows how the filters interact and how to use them to your advantage.

Order of web filtering

The FortiGate unit applies web filters in a specific order:

1. URL filter
2. FortiGuard Web Filter
3. web content filter
4. web script filter
5. antivirus scanning.

If you have blocked a FortiGuard Web Filter category but want certain users to have access to URLs within that pattern, you can use the *Override* within the FortiGuard Web Filter. This will allow you to specify which users have access to which blocked URLs and how long they have that access. For example, if you want a user to be able to access www.example.com for one hour, you can use the override to set up the exemption. Any user listed in an override must fill out an online authentication form that is presented when they try to access a blocked URL before the FortiGate unit will grant access to it. For more information, see “FortiGuard Web Filter” on page 1023.

Web content filter

You can control web content by blocking access to web pages containing specific words or patterns. This helps to prevent access to pages with questionable material. You can also add words, phrases, patterns, wild cards and Perl regular expressions to match content on web pages. You can add multiple web content filter lists and then select the best web content filter list for each web filter profile.

Enabling web content filtering involves three separate parts of the FortiGate configuration.

- The security policy allows certain network traffic based on the sender, receiver, interface, traffic type, and time of day.
- The web filter profile specifies what sort of web filtering is applied.
- The web content filter list contains blocked and exempt patterns.

The web content filter feature scans the content of every web page that is accepted by a security policy. The system administrator can specify banned words and phrases and attach a numerical value, or score, to the importance of those words and phrases. When the web content filter scan detects banned content, it adds the scores of banned words and phrases in the page. If the sum is higher than a threshold set in the web filter profile, the FortiGate unit blocks the page.

General configuration steps

Follow the configuration procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Create a web content filter list.
2. Add patterns of words, phrases, wildcards, and regular expressions that match the content to be blocked or exempted.

   You can add the patterns in any order to the list. You need to add at least one pattern that blocks content.
3. In a web filter profile, enable the web content filter and select a web content filter list from the options list.

To complete the configuration, you need to select a security policy or create a new one. Then, in the security policy, enable *UTM* and select the appropriate web filter profile from the list.

Creating a web filter content list

You can create multiple content lists and then select the best one for each web filter profile. Creating your own web content lists can be accomplished only using the CLI.

This example shows how to create a web content list called inappropriate language, with two entries, offensive and rude.

To create a web filter content list

```
config webfilter content
  edit 3
    set name "inappropriate language"
    config entries
      edit offensive
        set action block
        set lang western
        set pattern-type wildcard
        set score 15
        set status enable
      next
      edit rude
        set action block
        set lang western
        set pattern-type wildcard
        set score 5
        set status enable
      end
    end
  end
```

See the *CLI Reference* for a complete description of all the web filter content list commands and options.

How content is evaluated

Every time the web content filter detects banned content on a web page, it adds the score for that content to the sum of scores for that web page. You set this score when you create a new pattern to block the content. The score can be any number from zero to 99999. Higher scores indicate more offensive content. When the sum of scores equals or exceeds the threshold score, the web page is blocked. The default score for web content filter is 10 and the default threshold is 10. This means that by default a web page is blocked by a single match. Blocked pages are replaced with a message indicating that the page is not accessible according to the Internet usage policy.

Banned words or phrases are evaluated according to the following rules:

- The score for each word or phrase is counted only once, even if that word or phrase appears many times in the web page.
- The score for any word in a phrase without quotation marks is counted.
- The score for a phrase in quotation marks is counted only if it appears exactly as written.

The following table describes how these rules are applied to the contents of a web page. Consider the following, a web page that contains only this sentence: “The score for each word or phrase is counted only once, even if that word or phrase appears many times in the web page.”

Table 69: Banned Pattern Rules

Banned pattern	Assigned score	Score added to the sum for the entire page	Threshold score	Comment
word	20	20	20	Appears twice but only counted once. Web page is blocked.
word phrase	20	40	20	Each word appears twice but only counted once giving a total score of 40. Web page is blocked
word sentence	20	20	20	“word” appears twice, “sentence” does not appear, but since any word in a phrase without quotation marks is counted, the score for this pattern is 20. Web page is blocked.

Table 69: Banned Pattern Rules (Continued)

Banned pattern	Assigned score	Score added to the sum for the entire page	Threshold score	Comment
“word sentence”	20	0	20	“This phrase does not appear exactly as written. Web page is allowed.
“word or phrase”	20	20	20	This phrase appears twice but is counted only once. Web page is blocked.

Enabling the web content filter and setting the content threshold

When you enable the web content filter, the web filter will block any web pages when the sum of scores for banned content on that page exceeds the content block threshold. The threshold will be disregarded for any exemptions within the web filter list.

To enable the web content filter and set the content block threshold

1. Go to *UTM Profiles* > *Web Filter* > *Profile.*
2. Select the *Create New* icon on the Edit Web Filter Profile window title bar.
3. In the *Name* field, enter the name of the new web filter profile.
4. Optionally, you may also enter a comment. The comment can remind you of the details of the sensor.
5. Select the *Inspection Method*.

   Proxy-based detection involves buffering the file and examining it as a whole. Advantages of proxy-based detection include a more thorough examination of attachments, especially archive formats and nesting.

   Flow-based detection examines the file as it passes through the FortiGate unit without any buffering. Advantages of flow-based detection include speed and no interruption of detection during conserve mode.
6. Expand the *Advanced Filter* heading.
7. Enable *Web Content Filter*.
8. Select the required web filter content list from the *Web Content Filter* drop-down list.
9. Select *Apply*.

The web filter profile configured with web content filtering is ready to be added to a firewall profile.

URL filter

You can allow or block access to specific URLs by adding them to the URL filter list. You add the URLs by using patterns containing text and regular expressions. The FortiGate unit allows or blocks web pages matching any specified URLs or patterns and displays a replacement message instead.

URL blocking does not block access to other services that users can access with a web browser. For example, URL blocking does not block access to ftp:// ftp.example.com. Instead, use firewall policies to deny ftp connections.

When adding a URL to the URL filter list, follow these rules:

- Type a top-level URL or IP address to control access to all pages on a web site. For example, `www.example.com` or `192.168.144.155` controls access to all pages at this web site.
- Enter a top-level URL followed by the path and file name to control access to a single page on a web site. For example, `www.example.com/news.html` or `192.168.144.155/news.html` controls access to the news page on this web site.
- To control access to all pages with a URL that ends with example.com, add `example.com` to the filter list. For example, adding example.com controls access to www.example.com, mail.example.com, www.finance.example.com, and so on.
- Control access to all URLs that match patterns using text and regular expressions (or wildcard characters). For example, `example.*` matches example.com, example.org, example.net and so on.

URLs with an action set to exempt or pass are not scanned for viruses. If users on the network download files through the FortiGate unit from a trusted web site, add the URL of this web site to the URL filter list with an action to pass it so the FortiGate unit does not virus scan files downloaded from this URL.

URL filter actions

You can select one of four actions for URL patterns you include in URL filter lists.

Block

Attempts to access any URLs matching the URL pattern are denied. The user will be presented with a replacement message.

Allow

Any attempt to access a URL that matches a URL pattern with an allow action is permitted. The traffic is passed to the remaining antivirus proxy operations, including FortiGuard Web Filter, web content filter, web script filters, and antivirus scanning.

Allow is the default action. If a URL does not appear in the URL list, it is permitted.

Pass

Traffic to, and reply traffic from, sites matching a URL pattern with a pass action will bypass all antivirus proxy operations, including FortiGuard Web Filter, web content filter, web script filters, and antivirus scanning.

Make sure you trust the content of any site you pass.

Exempt

Exempt is similar to Pass in that it allows trusted traffic to bypass the antivirus proxy operations, but it functions slightly differently. In general, if you're not certain that you need to use the Exempt action, use Pass.

HTTP 1.1 connections are persistent unless declared otherwise. This means the connections will remain in place until closed or the connection times out. When a client loads a web page, the client opens a connection to the web server. If the client follows a link to another page on the same site before the connection times out, the same connection is used to request and receive the page data.

When you add a URL pattern to a URL filter list and apply the Exempt action, traffic sent to and replies traffic from sites matching the URL pattern will bypass all antivirus proxy operations, as with the Pass action. The difference is that the connection itself inherits the exemption. This means that all subsequent reuse of the existing connection will also bypass all antivirus proxy operations. When the connection times out, the exemption is cancelled.

For example, consider a URL filter list that includes `example.com/files` configured with the Exempt action. A user opens a web browser and downloads a file from the URL `example.com/sample.zip`. This URL does not match the URL pattern so it is scanned for viruses. The user then downloads `example.com/files/beautiful.exe` and since this URL does match the pattern, the connection itself inherits the exempt action. The user then downloads `example.com/virus.zip`. Although this URL does not match the exempt URL pattern, a previously visited URL did, and since the connection inherited the exempt action and was re-used to download a file, the file is not scanned.

If the user next goes to an entirely different server, like `example.org/photos`, the connection to the current server cannot be reused. A new connection to example.org is established. This connection is not exempt. Unless the user goes back to example.com before the connection to that server times out, the server will close the connection. If the user returns after the connection is closed, a new connection to example.com is created and it is not exempt until the user visits a URL that matches the URL pattern.

Web servers typically have short time-out periods. A browser will download multiple components of a web page as quickly as possible by opening multiple connections. A web page that includes three photos will load more quickly if the browser opens four connections to the server and downloads the page and the three photos at the same time. A short time-out period on the connections will close the connections faster, allowing the server to avoid unnecessarily allocating resources for a long period. The HTTP session time-out is set by the server and will vary with the server software, version, and configuration.

Using the exempt action can have unintended consequences in certain circumstances. You have a web site at example.com and since you control the site, you trust the contents and configure `example.com` as exempt. But example.com is hosted on a shared server with a dozen other different sites, each with a unique domain name. Because of the shared hosting, they also share the same IP address. If you visit example.com, your connection your site becomes exempt from any antivirus proxy operations. Visits to any of the 12 other sites on the same server will reuse the same connection and the data you receive is exempt from scanned.

Use of the exempt action is not suitable for configuration in which connections through the FortiGate unit use an external proxy. For example, you use proxy.example.net for all outgoing web access. Also, as in the first example, URL filter list that includes a URL pattern of `example.com/files` configured with the Exempt action. Users are protected by the antivirus protection of the FortiGate unit until a user visits a URL that matches the of `example.com/files` URL pattern. The pattern is configured with the Exempt action so the connection to the server inherits the exemption. With a proxy however, the connection is from the user to the proxy. Therefore, the user is entirely unprotected until the connection times out, no matter what site he visits.

Ensure you are aware of the network topology involving any URLs to which you apply the Exempt action.

Examples using exempt and pass actions

These examples illustrate the differences between the exempt and pass actions.

The URL filter list in use has a single entry: `www.example.com/files/content/`

- With an exempt action, the user downloads the file `www.example.com/files/content/eicar.com`. This URL matches the URL filter list entry so the file is not scanned. Further, the connection itself inherits the exemption. The user next downloads `www.example.com/virus/eicar.com`. Although this does not match the URL filter list entry, the existing connection to example.com will be used so the file is not scanned.
- With a pass action, the user downloads the file `www.example.com/files/content/eicar.com`. This URL matches the URL filter list entry so the file is not scanned. The user next downloads `www.example.com/virus/eicar.com`. This does not match the URL filter entry so it will be scanned. The pass action does not affect the connection and every URL the user accesses is checked against the URL filter list.

The URL filter list in use has a single entry: `www.domain.com/files/content/`. The user's browser is configured to use an external web proxy. All user browsing takes advantage of this proxy.

- With an exempt action, the user downloads `www.example.com/files/content/eicar.com` through the proxy. This matches the URL filter list entry so the file is not scanned. Further, the connection to the proxy inherits the exemption. The user next downloads `www.eicar.org/virus/eicar.com` through the proxy. Although this does not match the URL filter list entry, the existing connection to the proxy will be used so the file is not scanned. In fact, until the user stops browsing long enough for the connection to time out, all the user web traffic is exempt and will not be scanned.
- With a pass action, the user downloads `www.example.com/files/content/eicar.com` through the proxy. This matches the URL filter list entry so the file is not scanned. The user next downloads `www.eicar.org/virus/eicar.com` through the proxy. This does not match the URL filter entry so it will be scanned. The pass action does not affect the connection and every URL the user accesses is checked against the URL filter list.

General configuration steps

Follow the configuration procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Create a URL filter list.
2. Add URLs to the URL filter list.

3 Select a web filter profile or create a new one.

4 In the web filter profile, create a URL List filter.

To complete the configuration, you need to select a security policy or create a new one. Then, in the security policy, enable *UTM* and select the appropriate web filter profile from the list.

Creating a URL filter list

To create a URL Filter list

1 Go to *UTM Profiles* > *Web Filter* > *URL Filter.*

2 Select *Create New.*

3 Enter a *Name* for the new URL filter list.

4 Enter optional comments to describe it.

5 Select *OK.*

Configuring a URL filter list

Each URL filter list can have up to 5000 entries. For this example, the URL www.example*.com will be used. You configure the list by adding one or more URLs to it.

To add a URL to a URL filter list

1 Go to *UTM Profiles* > *Web Filter* > *URL Filter.*

2 Select an existing list and choose *Edit*.

3 Select *Create New*.

4 Enter the URL, without the “http”, for example: `www.example*.com`.

5 Select a *Type*: *Simple*, *Wildcard* or *Regular Expression*.

In this example, select Wildcard.

6 Select the *Action* to take against matching URLs: Exempt, Block, Allow, or Pass.

7 Select *Enable*.

8 Select *OK.*

SafeSearch

SafeSearch is a feature of popular search sites that prevents explicit web sites and images from appearing in search results. Although SafeSearch is a useful tool, especially in educational environments, the resourceful user may be able to simply turn it off. Enabling SafeSearch for the supported search sites enforces its use by rewriting the search URL to include the code to indicate the use of the SafeSearch feature.

Three search sites are supported:

Google	Enforce the strict filtering level of safe search protection for Google search results by adding `&safe=on` to search URL requests. Strict filtering removes both explicit text and explicit images from the search results.
Yahoo!	Enforce the strict filtering level of safe search protection for Yahoo! search results by adding `&vm=r` to search URL requests. Strict filtering removed adult web, video, and images from search results.
Bing	Enforce the strict filtering level of safe search protection for Bing search results by adding `adlt=strict` to search URL requests. Strict filtering removes explicit text, images, and video from the search results.

Enabling SafeSearch — CLI

```
config webfilter profile
  edit default
    config web
      set safe-search bing google yahoo
    end
  end
```

This enforces the use of SafeSearch in traffic controlled by the firewall policies using the web filter you configure.

Advanced web filter configuration

The *Advanced Filter* section of the web filter profile provides a number of advanced filtering options. The FortiGuard Web Filter options in the advance filter section are detailed in the FortiGuard Web Filter section, in "Advanced FortiGuard Web Filter configuration" on page 1029.

ActiveX filter

Enable to filter ActiveX scripts from web traffic. Web sites using ActiveX may not function properly with this filter enabled.

Cookie filter

Enable to filter cookies from web traffic. Web sites using cookies may not function properly with this enabled.

Java applet filter

Enable to filter java applets from web traffic. Web sites using java applets may not function properly with this filter enabled.

Web resume download block

Enable to prevent the resumption of a file download where it was previously interrupted. With this filter enabled, any attempt to restart an aborted download will download the file from the beginning rather than resuming from where it left off.

This prevents the unintentional download of viruses hidden in fragmented files.

Note that some types of files, such as PDF, fragment files to increase download speed and enabling this option can cause download interruptions. Enabling this option may also break certain applications that use the Range Header in the HTTP protocol, such as YUM, a Linux update manager.

Block Invalid URLs

Select to block web sites when their SSL certificate CN field does not contain a valid domain name.

FortiGate units always validate the CN field, regardless of whether this option is enabled. However, if this option is not selected, the following behavior occurs:

- If the request is made directly to the web server, rather than a web server proxy, the FortiGate unit queries for FortiGuard Web Filtering category or class ratings using the IP address only, not the domain name.
- If the request is to a web server proxy, the real IP address of the web server is not known. Therefore, rating queries by either or both the IP address and the domain name is not reliable. In this case, the FortiGate unit does not perform FortiGuard Web Filtering.

HTTP POST action

Select the action to take with HTTP POST traffic. HTTP POST is the command used by your browser when you send information, such as a form you have filled-out or a file you are uploading, to a web server.

The available actions include:

Normal	Allow use of the HTTP POST command as normal.
Comfort	Use client comforting to slowly send data to the web server as the FortiGate unit scans the file. Use this option to prevent a server time-out when scanning or other filtering is enabled for outgoing traffic. The client comforting settings used are those defined in the protocol options profile selected in the security policy. For more information, see "Configuring client comforting" on page 904.
Block	Block the HTTP POST command. This will limit users from sending information and files to web sites. When the post request is blocked, the FortiGate unit sends the http-post-block replacement message to the web browser attempting to use the command.

Web filtering example

Web filtering is particularly important for protecting school-aged children. There are legal issues associated with improper web filtering as well as a moral responsibility not to allow children to view inappropriate material. The key is to design a web filtering system in such a way that students and staff do not fall under the same web filter profile in the FortiGate configuration. This is important because the staff may need to access websites that are off-limits to the students.

School district

The background for this scenario is a school district with more than 2300 students and 500 faculty and staff in a preschool, three elementary schools, a middle school, a high school, and a continuing education center. Each elementary school has a computer lab and the high school has three computer labs with connections to the Internet. Such easy access to the Internet ensures that every student touches a computer every day.

With such a diverse group of Internet users, it was not possible for the school district to set different Internet access levels. This meant that faculty and staff were unable to view websites that the school district had blocked. Another issue was the students' use of proxy sites to circumvent the previous web filtering system. A proxy server acts as a go-between for users seeking to view web pages from another server. If the proxy server has not been blocked by the school district, the students can access the blocked website.

When determining what websites are appropriate for each school, the district examined a number of factors, such as community standards and different needs of each school based on the age of the students.

The district decided to configure the FortiGate web filtering options to block content of an inappropriate nature and to allow each individual school to modify the options to suit the age of the students. This way, each individual school was able to add or remove blocked sites almost immediately and have greater control over their students' Internet usage.

In this simplified example of the scenario, the district wants to block any websites with the word ***example*** on them, as well as the website www.example.com. The first task is to create web content filter lists for the students and the teachers.

To create a web content filter list for the students

```
config webfilter content
  edit 5
    set name "Student Web Content List"
    config entries
      edit example
        set action block
        set status enable
    end
  end
```

It might be more efficient if the Teacher Web Content List included the same blocked content as the student list. From time to time a teacher might have to view a blocked page. It would then be a matter of changing the *Action* from *Block* to *Allow* as the situation required.

To create a web content filter list for the teachers

```
config webfilter content
  edit 5
    set name "Teacher Web Content List"
    config entries
      edit example
        set action exempt
        set status enable
    end
  end
```

URL filter lists with filters to block unwanted web sites must be created for the students and teachers. For this example the URL *www.example.com* will be used.

To create a URL filter for the students

1 Go to *UTM Profiles* > *Web Filter* > *URL Filter*.
2 Select *Create New*.
3 Enter `Student URL List` as the URL filter *Name*.
4 Enter optional comments to describe the contents of the list.
5 Select *OK*.

The URL filter for the students has been created. Now it must be configured.

6 Select *Create New*.
7 Enter `example.com` in the URL field.
8 Select *Simple* from the *Type* list.
9 Select *Block* from the *Action* list.
10 Select *Enable.*
11 Select *OK*.
12 Select *OK*.

The teachers should be able to view the students' blocked content, however, so an addition URL filter is needed.

To create a URL filter for the teachers

1 Go to *UTM Profiles* > *Web Filter* > *URL Filter*.
2 Select *Create New*.
3 Enter `Teacher URL List` as the URL filter *Name*.
4 Enter optional comments to describe the list.
5 Select *OK*.

The URL filter for the students has been created. Now it must be configured.

6 Select *Create New*.
7 Enter `www.example.com` in the *URL* field.
8 Select *Simple* from the *Type* list.
9 Select *Exempt* from the *Action* list.
10 Select *Enable*.
11 Select *OK*.
12 Select *OK*.

A web filter profile must be created for the students and the teachers.

To create a web filter profile for the students

1 Go to *UTM Profiles* > *Web Filter* > *Profile*.
2 Select the *Create New* icon in the Edit Web Filter window title bar.
3 Enter `Students` as the *Profile Name*.
4 Enter optional comments to identify the profile.
5 Expand the *Advanced Filter* heading.
6 Enable *Web Content Filter*.
7 Select *Student Web Content List* from the *Web Content Filter* drop-down list.
8 Enable *Web URL Filter*.

9 Select *Student URL List* from the *Web URL Filter* drop-down list.

10 Enable *Web Resume Download Block*.

Selecting this setting will block downloading parts of a file that have already been downloaded and prevent the unintentional download of virus files hidden in fragmented files. Note that some types of files, such as PDFs, are fragmented to increase download speed, and that selecting this option can cause download interruptions with these types.

11 Select *OK*.

To create a security policy for the students

1 Go to *Policy* > *Policy* > *Policy.*

2 Select *Create New*.

3 Enable *UTM*.

4 Select *Enable Web Filter*.

5 Select *Students* from the web filter drop-down list.

6 Enter optional comments.

7 Select *OK*.

To create a web filter profile for the teachers

1 Go to *UTM Profiles* > *Web Filter* > *Profile*.

2 Select the *Create New* icon in the Edit Web Filter window title bar.

3 Enter `Teachers` as the *Profile Name*.

4 Enter optional comments to identify the profile.

5 Expand the *Advanced Filter* heading.

6 Enable *Web Content Filter*.

7 Select *Teacher Web Content List* from the *Web Content Filter* drop-down list.

8 Enable *Web URL Filter*.

9 Select *Teacher URL List* from the *Web URL Filter* drop-down list.

10 Enable *Web Resume Download Block*.

11 Select *OK*.

To create a security policy for Teachers

1 Go to *Policy* > *Policy* > *Policy.*

2 Select *Create New*.

3 Enable *UTM*.

4 Select *Enable Web Filter*.

5 Select *Teachers* from the web filter drop-down list.

6 Enter optional comments.

7 Select *OK*.

Web Filter interface reference

The following explains the web filtering options in the Web Filtering menu. If your unit supports SSL content scanning and inspection you can also configure web filtering for HTTPS traffic.

If you want to configure advanced settings, such as web content filter, you must configure them within the CLI. Advanced settings also includes overrides.

This topic includes the following:

Profile

The Profile menu allows you to configure a web filter profile to apply to a firewall policy. A profile is specific information that defines how the traffic within a policy is examined and what action may be taken based on the examination.

Web profile configuration settings

The following are web filter profile configuration settings in *UTM Profiles* > *Web Filter* > *Profile*. If you want to configure advanced settings, such as FortiGuard web filtering overrides, you must configure these settings within the CLI.

Profile page Lists each web filter profile that you created. On this page, you can edit, delete or create a new web filter profile. You are redirected to this page when you select *View List* on the Edit Web Filter Profile page. **Note:** Web filtering overrides are profile-based, allowing a rule to be created that changes the web filter profile that applies to a user. An override link appears in all related blocked pages. This is available only in the CLI.	
Create New	Creates a new web filter profile. When you select *Create New*, you are automatically redirected to the New Web Filter Profile page.
Edit	Modifies settings within a web filter profile. When you select *Edit*, you are automatically redirected to the Edit Web Filter Profile page.
Delete	Removes a web filter profile from within the list on the Profile page. To remove multiple web filter profiles from within the list, on the Profile page, in each of the rows of the file filter lists you want removed, select the check box and then select *Delete*. To remove all web filter profiles from the list, on the Profile page, select the check box in the check box column and then select *Delete*.
Name	The name of the web filter profile.
Comments	A description given to the web filter profile. This is an optional setting.

Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
New Web Filter Profile page Provides settings for configuring a web filter profile. Advanced features, such as web content filtering and FortiGuard web filtering, is configured in the CLI. This page appears when you select *Create New* on the Edit Web Filter Profile page. If you are on the Profiile page, and you select *Create New*, you will be redirected to the New Web Filter Profile page. **Note**: Logging is enabled in the CLI.	
Name	Enter a name for the web filter profile. If you want to edit the name at any time, select the profile and enter a new name in the *Name* field. Select *Apply* to save the change.
Comments	Enter a description for the web filter profile. This is optional. If you want to edit the description at any time, select the profile and enter the new description in the *Comments* field. Select *Apply* to save the change.
Inspection mode	Select to enable either flow-based web filtering or proxy-based. Flow-based web filtering is a non-proxy solution, which provides high concurrent session, high session rate, and low-latency web filtering service.

FortiGuard Categories	A list of FortiGuard category groups and categories that are used to rate web sites. Selecting a category group will automatically select all of the categories within the group. For example, if you select Security Risk, you can see that all of the categories within are selected if you expand the group. You can however, select or deselect categories within groups as required.
Show	Select an action to view all of the categories that are currently configured with the selected action.
Change Action for Selected Categories to	Select an action, and all of the selected categories will have the selected action applied. Selected category groups will have the action applied to all categories within the group.
Quota on Categories	Users can have their web browsing time limited by category through the use of quotas. Quotas can be applied only to categories that are configured with the Monitor action. If you create a quota for a single category, every authenticated user subject to the security policy in which the web filter profile is applied is limited in browsing web sites in the category to the duration you specify. If you create a single quota that includes multiple categories, the quota will apply to the categories as a whole. Quotas are ignored for unauthenticated users. To enforce quotas, configure the security policy to require authentication.
Enable Safe Search (Support Search Engines: Google, Yahoo and Bing)	When enabled, the supported search engines exclude offensive material from search results.
HTTPS Scanning	Available only on models that support HTTPS. Select to have all of the web filtering specified in the web filter profile to HTTPS traffic as well as HTTP traffic.
Advanced Filter	Expand this heading for advanced web filtering options.
Web URL Filter	Enable to block access to URLs listed in the selected URL list.
Web Resume Download Block	Enable to prevent the resumption of a file download where it was previously interrupted. With this filter enabled, any attempt to restart an aborted download will download the file from the beginning rather than resuming from where it left off. This prevents the unintentional download of viruses hidden in fragmented files. Note that some types of files, such as PDF, fragment files to increase download speed and enabling this option can cause download interruptions. Enabling this option may also break certain applications that use the Range Header in the HTTP protocol, such as YUM, a Linux update manager.

Block Invalid URLs	Select to block web sites when their SSL certificate CN field does not contain a valid domain name. FortiGate units always validate the CN field, regardless of whether this option is enabled. However, if this option is not selected, the following behavior occurs: • If the request is made directly to the web server, rather than a web server proxy, the FortiGate unit queries for FortiGuard Web Filtering category or class ratings using the IP address only, not the domain name. • If the request is to a web server proxy, the real IP address of the web server is not known. Therefore, rating queries by either or both the IP address and the domain name is not reliable. In this case, the FortiGate unit does not perform FortiGuard Web Filtering.
HTTP POST Action	Select the action to take with HTTP POST traffic. HTTP POST is the command used by your browser when you send information, such as a form you have filled-out or a file you are uploading, to a web server. The available actions include: • Normal: Allow use of the HTTP POST command as normal. • Comfort: Use client comforting to slowly send data to the web server as the FortiGate unit scans the file. Use this option to prevent a server time-out when scanning or other filtering is enabled for outgoing traffic. The client comforting settings used are those defined in the protocol options profile selected in the security policy. • Block: Block the HTTP POST command. This will limit users from sending information and files to web sites. When the post request is blocked, the FortiGate unit sends the http-post-block replacement message to the web browser attempting to use the command.
Remove Java Applet Filter	Enable to filter java applets from web traffic. Web sites using java applets may not function properly with this filter enabled.
Remove ActiveX Filter	Enable to filter ActiveX scripts from web traffic. Web sites using ActiveX may not function properly with this filter enabled.
Remove Cookie Filter	Enable to filter cookies from web traffic. Web sites using cookies may not function properly with this enabled.
Search Engine Keyword Filter	Enter the keywords that you want to monitor when users enter those same or similar keywords during a search within the supported search engines.
Web Content Filter	Enable to block access to web pages that include the words included in the selected web content filter list.
Provide Details for Blocked HTTP 4xx and 5xx Errors	Enable to have the FortiGate unit display its own replacement message for 400 and 500-series HTTP errors. If the server error is allowed through, malicious or objectionable sites can use these common error pages to circumvent web filtering.

Rate Images by URL (Blocked images will be replaced with blanks)	Enable to have the FortiGate retrieve ratings for individual images in addition to web sites. Images in a blocked category are not displayed even if they are part of a site in an allowed category. Blocked images are replaced on the originating web pages with blank place-holders. Rated image file types include GIF, JPEG, PNG, BMP, and TIFF.
Allow Websites When a Rating Error Occurs	Enable to allow access to web pages that return a rating error from the FortiGuard Web Filter service. If your FortiGate unit cannot contact the FortiGuard service temporarily, this setting determines what access the FortiGate unit allows until contact is re-established. If enabled, users will have full unfiltered access to all web sites. If disabled, users will not be allowed access to any web sites.
Strict Blocking	This setting determines when the FortiGate unit blocks a site. Enable strict blocking to deny access to a site if any category or classification assigned to the site is set to Block. Disable strict blocking to deny access to a site only if all categories and classifications assigned to the site are set to Block. All rated URLs are assigned one or more categories. URLs may also be assigned a classification. If Rate URLs by domain and IP address is enabled, the site URL and IP address each carry separately assigned categories and classifications. Depending on the FortiGuard rating and the FortiGate configuration, a site could be assigned to at least two categories and up to two classifications.
Rate URLs by Domain and IP Address	Enable to have the FortiGate unit request the rating of the site by URL and IP address separately, providing additional security against attempts to bypass the FortiGuard Web Filter. FortiGuard Web Filter ratings for IP addresses are not updated as quickly as ratings for URLs. This can sometimes cause the FortiGate unit to allow access to sites that should be blocked, or to block sites that should be allowed.
Block HTTP Redirects by Rating	Enable to block HTTP redirects. Many web sites use HTTP redirects legitimately but in some cases, redirects may be designed specifically to circumvent web filtering, as the initial web page could have a different rating than the destination web page of the redirect. This option is not supported for HTTPS.

Browser cookie-based FortiGuard Web Filtering overrides

By using browser cookie-based FortiGuard Web Filtering overrides, you can identify users according to their web browser cookie instead of their IP address and then to use this identification to apply FortiGuard Web Filtering overrides to individual users.

This feature uses the dynamic profile feature to assign a web filter profile that includes FortiGuard Web Filtering to a communication session. Just like normal FortiGuard Web Filtering overrides, when FortiGuard Web Filtering blocks access to a web page, the user can authenticate to override FortiGuard Web Filtering. However, with Browser cookie-based overrides enabled, the browser cookie is used to identify the user instead of the user's IP address.

To allow browser based FortiGuard Web Filtering overrides in a user group, go to *User* > *User Group*, edit a firewall or directory service user group. Select *Allow to create FortiGuard Web Filtering overrides* and make sure *Browser (Cookie) Override* is set to *Allow.*

You can also go to *UTM Profiles* > *Web Filter* > *Configuration* and configure the following browser cookie-based override settings.

Additional browser cookie-based configuration settings are available from the CLI using the `config webfilter cookie-ovrd` command.

Cookie (Browser Based) Override Configuration page	
Provides settings for configuring the browser cookie-based override.	
Override Validation Hostname	Enter the override validation hostname in the field.
Override Validation Port	Enter the port number in the field.

How browser cookie-based FortiGuard Web Filtering overrides work

The following steps occur when a user's session that can use browser cookie-based FortiGuard Web Filtering overrides is received:

1. The Dynamic Profile applies a profile to the user session in the normal way.
2. The user issues a request to a remote site blocked by FortiGuard Web Filtering.

   For example, http://www.example.com.
3. FortiGuard Web Filtering blocks the page and provides an override link.
4. The user selects the override option and successfully authenticates.
5. The unit sends a cookie to the remote site that seems to come from the *Override Validation Hostname*.
6. The unit creates a second cookie to the user's browser for the domain of the remote site.

   For example, the domain could be example.com.

The rest of the communication between the user and the remote site is authorized with the unit by these cookies

URL Filter

Allow or block access to specific URLs by adding them to the URL filter list. Add patterns using text and regular expressions (or wildcard characters) to allow or block URLs. The unit allows or blocks web pages matching any specified URLs or patterns and displays a replacement message.

You can add multiple URL filter lists and then select the best URL filter list for each profile.

You can add the following to block or exempt URLs:

- complete URLs
- IP addresses
- partial URLs to allow or block all sub-domains

Each URL filter list can have up to 5000 entries.

URL filter configuration settings

The following are URL filter configuration settings in *UTM Profiles* > *Web Filter* > *URL Filter*.

URL blocking does not block access to other services that users can access with a web browser. For example, URL blocking does not block access to `ftp://ftp.example.com`. Instead, use firewall policies to deny FTP connections.

URL Filter page Lists each URL filter that you created. On this page, you can edit, delete or create a new URL filter.	
Create New	Creates a new URL filter list. When you select *Create New*, you are automatically redirected to the New List page. This page provides a name field and comment field. You must enter a name to go to the URL Filter Settings page.
Edit	Modifies settings within a URL filter list. When you select *Edit*, you are automatically redirected to the URL Filter Settings page.
Delete	Removes the URL filter list from the list on the URL Filter page. The *Delete* icon is only available if the URL filter list is not selected in any profiles. To remove multiple URL filter list from within the list, on the URL Filter page, in each of the rows of the file filter lists you want removed, select the check box and then select *Delete*. To remove all URL filter list from the list, on the URL Filter page, select the check box in the check box column and then select *Delete*.
Name	The available URL filter lists.
# Entries	The number of URL patterns in each URL filter list.
MMS Profiles (FortiOS Carrier only)	The name of the MMS profile
Comments	Optional description of each URL filter list.

Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
URL Filter Settings page Provides settings for configuring URLs that make up the URL filter, and also lists the URLs that you created. You are automatically redirected to this page from the New List Page. If you are editing a URL filter, you are automatically redirected to this page.	
Name	If you are editing an existing URL filter setting and want to change the name, enter a new name in this field. You must select *OK* to save the change.
Comments	If you are editing an existing URL filter setting and want to change or add a description, enter the new text in this field. You must select *OK* to save these changes.
Create New	Adds a URL address and filter settings to the list. When you select *Create New*, you are automatically redirected to the New URL Filter list.
Edit	Modifies the settings within a URL filter.
Delete	Removes an entry from the list. To remove multiple URL filters from within the list, on the URL Filter Settings page, in each of the rows of the filters you want removed, select the check box and then select *Delete*. To remove all URL filters from the list, on the URL Filter Settings page, select the check box in the check box column and then select *Delete*.
Enable	Enables a filter in the list.
Disable	Disables a filter in the list.
Move To	Moves the URL to any position in the list. When you select *Move To*, the Move URL Filter window appears. To move a URL, select the new position *Before* or *After*, which will place the current URL entry before or after the entry you enter in the *(URL)* field. For example, 1example.com is being moved after 3example.com, so 3example.com is entered in the *(URL)* field.

Remove All Entries	Removes all filter entries within the list on the URL Filter Settings page.
Enable	Indicates whether the URL is enable or disabled. A green check mark indicates that the URL is enabled; a gray check mark indicates that the URL is disabled.
URL	The URL address.
Action	The type of action the unit will take when there is a match.
Type	The type of URL. For example, the type of URL is *Regex*.
New URL Filter page Provides settings for configuring a URL to add to the filter list.	
URL	Enter the URL. Do not include http://. For details about URL formats, see "URL formats" on page 1020.
Type	Select a type from the drop-down list: *Simple*, *Regex* (regular expression), or *Wildcard*.
Action	Select an action the unit will take. • *Allow* – any attempt to access a URL that matches a URL pattern with an allow action is permitted. • *Exempt* – similar to *Pass* in that it allows trusted traffic to bypass the antivirus proxy operations, but it functions slightly differently; ensure you are aware of the network topology involving URLs that you applied the Exemption action. Additional information about the Exempt action is found in the UTM chapter of the FortiOS Handbook. • *Block* – attempts to access any URLs matching the URL pattern are denied; user is presented with a replacement message. • *Pass* – traffic to, and replay traffic from sites that match a URL pattern with a pass action will bypass all antivirus proxy operations, including FortiGuard Web Filter, web content filter, web script filters, and antivirus scanning. Make sure you trust the content of any site you pass, otherwise there may be a security risk.
Enable	Select to enable the URL. By default, the URL is enabled.

Type a top-level domain suffix (for example, "com" without the leading period) to block access to all URLs with this suffix.

URL formats

When adding a URL to the URL filter list, follow these rules:

How URL formats are detected when using HTTPS

If your unit does not support SSL content scanning and inspection or if you have selected the *URL filtering* option in web content profile for *HTTPS content filtering mode* under *Protocol Recognition*, filter HTTPS traffic by entering a top level domain name, for example, `www.example.com`. HTTPS URL filtering of encrypted sessions works by extracting the CN from the server certificate during the SSL negotiation. Since the CN only contains the domain name of the site being accessed, web filtering of encrypted HTTPS sessions can only filter by domain names.

If your unit supports SSL content scanning and inspection and if you have selected Deep Scan, you can filter HTTPS traffic in the same way as HTTP traffic.

How URL formats are detected when using HTTP

URLs with an action set to exempt are not scanned for viruses. If users on the network download files through the unit from trusted web site, add the URL of this web site to the URL filter list with an action set to exempt so the unit does not virus scan files downloaded from this URL.

- Type a top-level URL or IP address to control access to all pages on a web site. For example, `www.example.com` or `192.168.144.155` controls access to all pages at this web site.
- Enter a top-level URL followed by the path and filename to control access to a single page on a web site. For example, `www.example.com/news.html` or `192.168.144.155/news.html` controls the news page on this web site.
- To control access to all pages with a URL that ends with `example.com`, add `example.com` to the filter list. For example, adding `example.com` controls access to `www.example.com`, `mail.example.com`, `www.finance.example.com`, and so on.
- Control access to all URLs that match patterns created using text and regular expressions (or wildcard characters). For example, `example.*` matches `example.com`, `example.org`, `example.net` and so on.

  FortiGate URL filtering supports standard regular expressions.

If virtual domains are enabled on the unit, web filtering features are configured globally. To access these features, select *Global Configuration* on the main menu.

Local Ratings

You can configure user-defined categories and then specify the URLs that belong to the category. This allows users to block groups of web sites on a per profile basis. The ratings are included in the global URL list with associated categories and compared in the same way the URL block list is processed.

Local ratings configuration settings

The following are local ratings configuration settings in *UTM Profiles* > *Web Filter* > *Local Ratings*.

Local Ratings page Lists each individual local rating that you created. On this page, you can edit, delete or create a new local rating. You can also disable or enable a local rating, as well as remove all local ratings from the page.	
Create New	Creates a new local rating. When you select *Create New*, you are automatically redirected to the New Local Rating page.
Edit	Modifies settings within a local rating. When you select *Edit*, you are automatically redirected to the Edit Local Rating page.
Delete	Select to remove a local rating from the list.
Enable	Enables a local rating within the list on the Local Ratings page.

Disable	Disables a local rating within the list on the Local Ratings page.
Remove All Entries	Removes all local ratings within the list on the Local Ratings page.
Search	Enter a word or name to search for the local rating within the list. Select *Go* to start the search.
#	The number identifying the order of the item in the list.
Enable	A green checkmark appears if the local rating is enabled. A gray x appears if the local rating is disabled.
URL	The URL address of the local rating.
Category	The category that was selected for the local rating.
Page controls	Use to navigate through the list of local ratings.
New Local Rating page	
Provides settings for configuring the URL address that belongs to a category and classification rating. When editing a local rating, you are automatically redirected to the Edit Local Rating page which contains the same settings.	
URL	Enter the URL address.
Category Rating	Select the ratings for the URL.

FortiGuard Web Filter

This section describes FortiGuard Web Filter for HTTP and HTTPS traffic.

FortiGuard Web Filter is a managed web filtering solution available by subscription from Fortinet. FortiGuard Web Filter enhances the web filtering features supplied with your FortiGate unit by sorting billions of web pages into a wide range of categories users can allow or block. The FortiGate unit accesses the nearest FortiGuard Web Filter Service Point to determine the category of a requested web page, and then applies the security policy configured for that user or interface.

FortiGuard Web Filter includes over 45 million individual ratings of web sites that apply to more than two billion pages. Pages are sorted and rated into several dozen categories administrators can allow or block. Categories may be added or updated as the Internet evolves. To make configuration simpler, you can also choose to allow or block entire groups of categories. Blocked pages are replaced with a message indicating that the page is not accessible according to the Internet usage policy.

FortiGuard Web Filter ratings are performed by a combination of proprietary methods including text analysis, exploitation of the web structure, and human raters. Users can notify the FortiGuard Web Filter Service Points if they feel a web page is not categorized correctly, so that the service can update the categories in a timely fashion.

The following topics are discussed in this section:

Before you begin

Before you follow the instructions in this section, you should have a FortiGuard Web Filter subscription and your FortiGate unit should be properly configured to communicate with the FortiGuard servers. For more information about FortiGuard services, see the FortiGuard Center web page. You should also have a look at “Web filter concepts” on page 997.

FortiGuard Web Filter and your FortiGate unit

When FortiGuard Web Filter is enabled in a web filter profile, the setting is applied to all firewall policies that use this profile. When a request for a web page appears in traffic controlled by one of these firewall policies, the URL is sent to the nearest FortiGuard server. The URL category is returned. If the category is blocked, the FortiGate unit provides a replacement message in place of the requested page. If the category is not blocked, the page request is sent to the requested URL as normal.

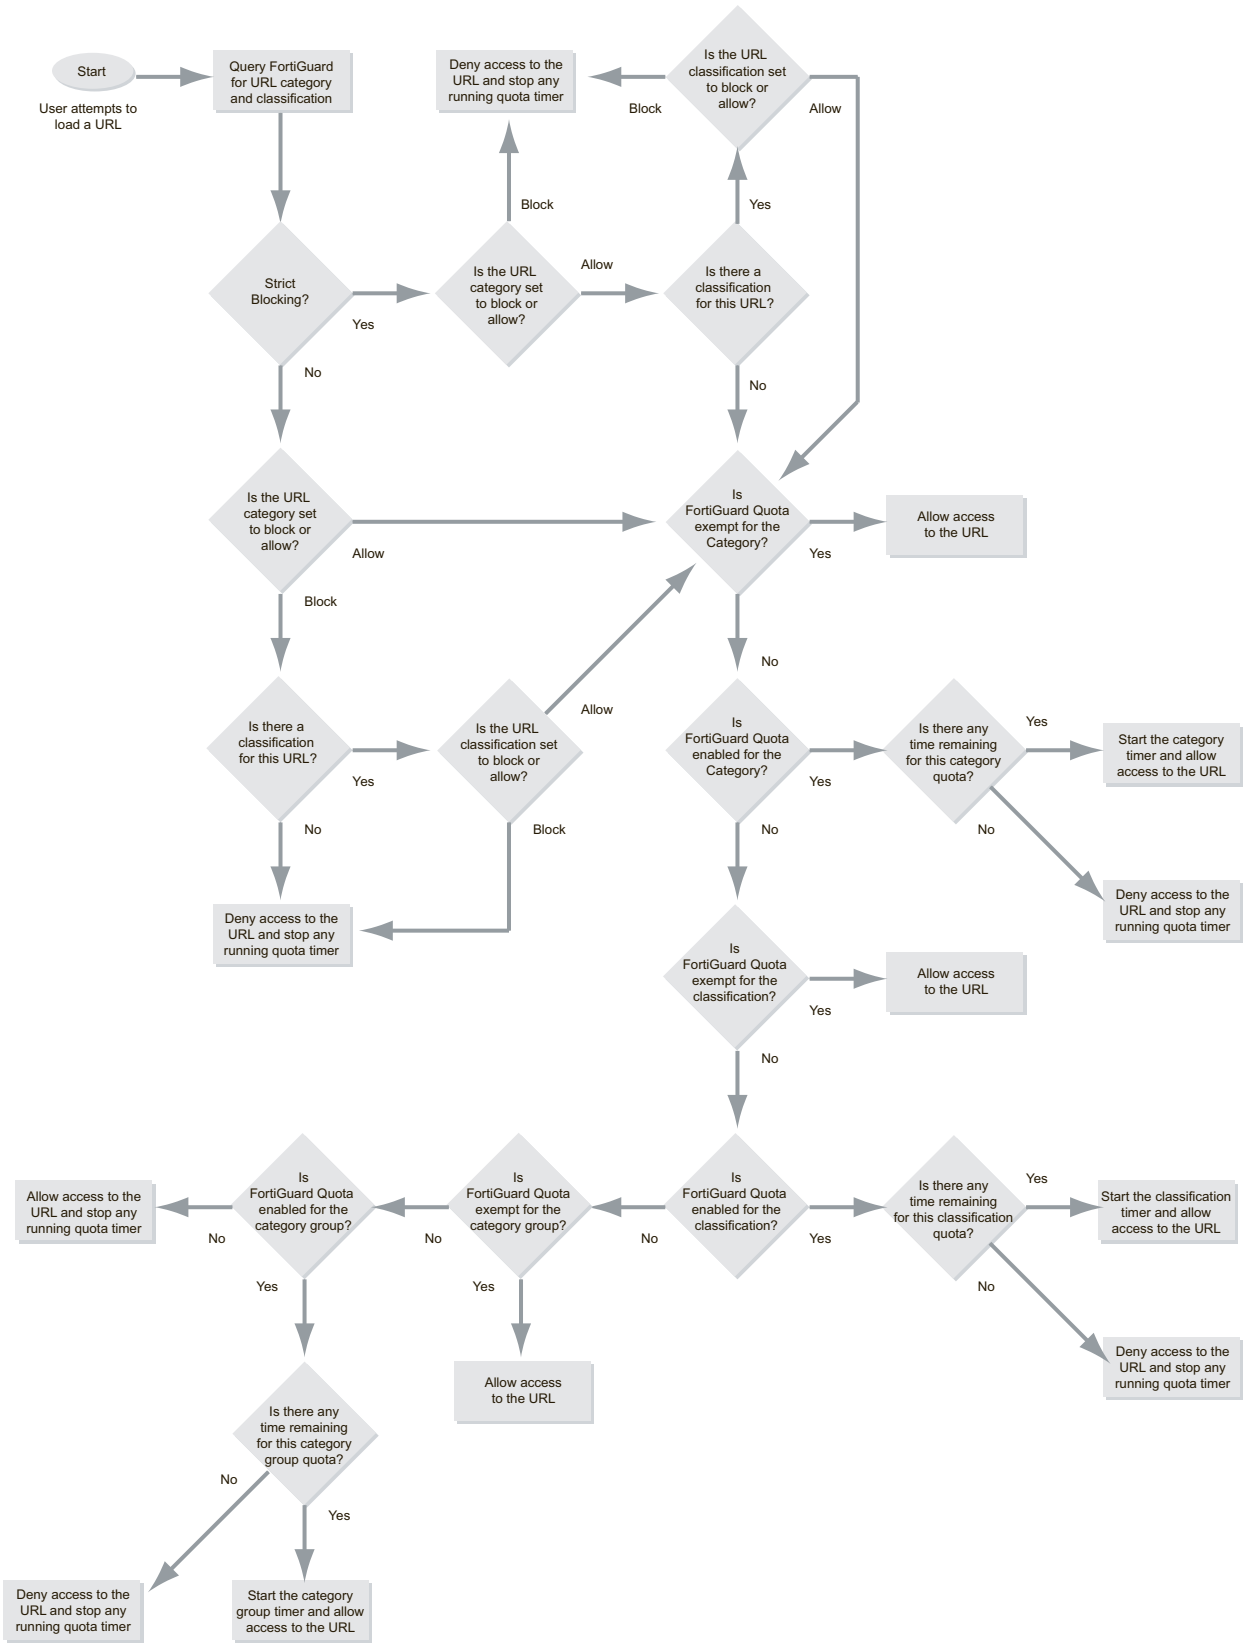
Order of web filtering

The FortiGate unit applies web filters in a specific order:

1. URL filter
2. FortiGuard Web Filter
3. web content filter
4. web script filter
5. antivirus scanning.

The flowchart in Figure 89 on page 1025 shows the steps involved in FortiGuard Web Filtering. Most features are included but some of the advanced options, including overrides, are not. The features appearing in the flowchart are described in this section.

Figure 89: FortiGuard Web Filter sequence of events



Enable FortiGuard Web Filter

FortiGuard Web Filter is enabled and configured within web filter profiles. Overrides, local categories, and local ratings are configured in *UTM Profiles* > *Web Filter*.

General configuration steps

1. Go to *UTM Profiles* > *Web Filter* > *Profile*.
2. Select the *Edit* icon of the web filter profile in which you want to enable FortiGuard Web Filter, or select *Create New* to add a new web filter profile.
3. Create a category filter in the profile.
4. The categories allow you to block or allow access to general or more specific web site categories. Configure access as required.
5. Save the filter and web filter profile.
6. To complete the configuration, you need to select the security policy controlling the network traffic you want to restrict. Then, in the security policy, enable *UTM* and select *Enable Web Filter* and select the appropriate web filter profile from the list.

Configuring FortiGuard Web Filter settings

FortiGuard Web Filter includes a number of settings that allow you to determine various aspects of the filtering behavior.

To configure FortiGuard Web Filter settings

1. Go to *UTM Profiles* > *Web Filter* > *Profile*.
2. Select the web filter profile in which you want to enable FortiGuard Web Filter from the drop down list in the Edit Web Filter Profile window title bar, or select *Create New* to add a new web filter profile.
3. The category groups are listed in a table. You can expand each category group to view and configure every category within the groups. If you change the setting of a category group, all categories within the group inherit the change.
4. Select the category groups and categories to which you want to apply an action.
5. Select an action from the *Change Action for Selected Categories* drop-down list immediately below the category table. Five actions are available:
   - *Allow* permits access to the sites within the category.
   - *Monitor* permits and logs access to sites in the category. You may also enable user quotas when enabling the monitor action.
   - *Warning* presents the user with a message, allowing them to continue if they choose.
   - *Authenticate* requires a user authenticate with the FortiGate unit before being allowed access to the category or category group.
   - *Block* prevents access to sites within the category. Users attempting to access a blocked site will receive a replacement message explaining that access to the site is blocked.
6. Select *OK*.

Configuring FortiGuard Web Filter usage quotas

In addition to using category and classification blocks and overrides to limit user access to URLs, you can set a daily timed access quota by category, category group, or classification. Quotas allow access for a specified length of time, calculated separately for each user. Quotas are reset every day at midnight.

Users must authenticate with the FortiGate unit. The quota is applied to each user individually so the FortiGate must be able to identify each user. One way to do this is to configure a security policy using the identity based policy feature. Apply the web filter profile in which you have configured FortiGuard Web Filter and FortiGuard Web Filter quotas to such a security policy.

The use of FortiGuard Web Filter quotas requires that users authenticate to gain web access. The quotas are ignored if applied to a security policy in which user authentication is not required.

When a user first attempts to access a URL, they're prompted to authenticate with the FortiGate unit. When they provide their username and password, the FortiGate unit recognizes them, determines their quota allowances, and monitors their web use. The category and classification of each page they visit is checked and FortiGate unit adjusts the user's remaining available quota for the category or classification.

Editing the web filter profile resets the quota timers for all users.

To configure the FortiGuard Web Filter categories

1. Go to *UTM Profiles* > *Web Filter* > *Profile*.
2. Select the web filter profile in which you want to enable FortiGuard Web Filter from the drop down list in the Edit Web Filter Profile window title bar, or select *Create New* to add a new web filter profile.
3. Select *Create New*.
4. Select a *Filter Type* of *Category*.
5. Select the required category groups. You may also expand the category groups to select individual categories.
6. Select the *Monitor* action.
7. Enable *Enforce Quota* to activate the quota for the selected categories and category groups.
8. Select *Hours*, *Minutes*, or *Seconds* and enter the number of hours, minutes, or seconds. This is the daily quota allowance for each user.
9. Select *OK*.
10. Select *Apply*.

Apply the web filter profile to an identity-based security policy. All the users subject to that policy are restricted by the quotas.

Quota hierarchy

You can apply quotas to categories and category groups. Only one quota per user can be active at any one time. The one used depends on how you configure the FortiGuard Web Filter.

When a user visits a URL, the FortiGate unit queries the FortiGuard servers for the category of the URL. From highest to lowest, the relative priority of the quotas are:

1 Category

2 Category group

So for example, the *General Interest - Business* category group contains the *Information and Computer Security* category. When a user visits a page in the *Information and Computer Security* category, the FortiGate unit will check for quotas in sequence:

- Is there is a quota set for the *Information and Computer Security* category? If there is, the category quota timer is started and the user is allowed access to the URL. If no time remains in the category quota, the URL is blocked and the user cannot access it for the remainder of the day.
- If no quota is set for the category, is there a quota set for the *General Interest - Business* category group? If there is, the category group quota timer is started and the user is allowed access to the URL. If no time remains in the category group quota, the URL is blocked and the user cannot access it for the remainder of the day.
- If there is no category group quota, the user is allowed to access the URL. Getting to this point means there are no quotas set for the page. The FortiGate unit will stop any running quota timer because the current URL has no quota.

Only one quota timer can be running at any one time for a single user. Whenever a quota timer is started or a page is blocked, the timer running because of the previous URL access, is stopped. Similarly, a URL with no quotas will stop a quota timer still running because of the URL the user previously accessed.

Quota exempt

The quota checking sequence occurs for every URL the user accesses. This is true for every web page, and every element of the web page that is loaded. For example, if a user loads a web page, the quota is checked for the web page as soon as it is loaded. If there is a photo on the page, it is also checked and the quota is adjusted accordingly.

This can cause unexpected behavior. For example, if the web page a user loads is in the *Information and Computer Security* category and it has a quota, the quota timer is started. The web page includes a number of graphics, so as these are loaded, each is checked and the appropriate quota is started. If they all share the same category rating, which they often will, there is no problem. However, if the last graphic or page element loaded comes from another site, the quota may not work as you expect. If the last graphic is an ad, loaded from a site categorized as *Advertising*, the *Information and Computer Security* category quota timer will stop almost as soon as it is started because the FortiGate unit sees the ad URL and finds that it belongs to the *Advertising* category. If *Advertising* has a quota, its timer will start. If it is blocked or allowed, the *Information and Computer Security* category quota timer is stopped and the user can view the page without using the quota set to limit the *Information and Computer Security* category.

To solve this problem, you can configure a categories and category groups as exempt. This effectively allows the quota system to ignore it entirely. Any quota timer running when an exempt URL is encountered continues to run. An exempt category or category group, or classification can not have a quota. This may sound the same as simply disabling the quota and setting the FortiGuard Web Filter action to allow, but there is a difference. This difference is that the allow and block actions stop an already running quota timer, while the exempt action does not.

The exempt action is generally used for commonly accessed web pages that load elements from other sites that have different category ratings. Pages that load ads from advertising sites are the most common example.

To set a category or category group, see the *CLI Reference* for the `exempt-quota` webfilter command.

Checking quota usage

With quotas enabled, the FortiGate unit keeps track of quota usage for each user in each web filter profile. You can check the amount of quota usage for each user and their remaining time for each individual quota on the FortiGuard Quota page.

To view FortiGuard Web Filter quota usage

1. Go to *UTM Profiles* > *Monitor* > *FortiGuard Quota*.
2. The table shows the users who have used some or all of their quota allowance. The total time used is listed by web filter profile for each user.
3. Select the *View* icon in any row to view the remaining quota for each category, category group, and classification. A category, category group, or classification displayed in bold type indicates the quota currently in use.

Quotas are reset every day at midnight.

Advanced FortiGuard Web Filter configuration

The *Advanced Filter* section of the web filter profile provides a number of advanced filter options. The web filter options in the advance filter section unrelated to FortiGuard Web Filter are detailed in the web filter section, in "Advanced web filter configuration" on page 1007.

Provide Details for Blocked HTTP 4xx and 5xx Errors

Enable to have the FortiGate unit display its own replacement message for 400 and 500-series HTTP errors. If the server error is allowed through, malicious or objectionable sites can use these common error pages to circumvent web filtering.

Rate Images by URL (blocked images will be replaced with blanks)

Enable to have the FortiGate retrieve ratings for individual images in addition to web sites. Images in a blocked category are not displayed even if they are part of a site in an allowed category.

Blocked images are replaced on the originating web pages with blank place-holders. Rated image file types include GIF, JPEG, PNG, BMP, and TIFF.

Allow Websites When a Rating Error Occurs

Enable to allow access to web pages that return a rating error from the FortiGuard Web Filter service.

If your FortiGate unit cannot contact the FortiGuard service temporarily, this setting determines what access the FortiGate unit allows until contact is re-established. If enabled, users will have full unfiltered access to all web sites. If disabled, users will not be allowed access to any web sites.

Strict Blocking

This setting determines when the FortiGate unit blocks a site. Enable strict blocking to deny access to a site if any category or classification assigned to the site is set to *Block*. Disable strict blocking to deny access to a site only if all categories and classifications assigned to the site are set to *Block*.

All rated URLs are assigned one or more categories. URLs may also be assigned a classification. If *Rate URLs by domain and IP address* is enabled, the site URL and IP address each carry separately assigned categories and classifications. Depending on the FortiGuard rating and the FortiGate configuration, a site could be assigned to at least two categories and up to two classifications.

Rate URLs by Domain and IP Address

Enable to have the FortiGate unit request the rating of the site by URL and IP address separately, providing additional security against attempts to bypass the FortiGuard Web Filter.

FortiGuard Web Filter ratings for IP addresses are not updated as quickly as ratings for URLs. This can sometimes cause the FortiGate unit to allow access to sites that should be blocked, or to block sites that should be allowed.

Block HTTP Redirects by Rating

Enable to block HTTP redirects.

Many web sites use HTTP redirects legitimately but in some cases, redirects may be designed specifically to circumvent web filtering, as the initial web page could have a different rating than the destination web page of the redirect.

This option is not supported for HTTPS.

Daily log of remaining quota

Enable to log daily quota use.

As part of the quota reset at midnight, the FortiGate unit will record a log entry for every quota each user consumed during the day. These log entries are labeled with the sub-type `ftgd_quota`. Each entry includes the VDOM, user name, web filter profile name, category description, quota used (in seconds), and quota (in seconds). You can use log filtering to quickly limit the displayed entries to those you want, and generate reports from the logs.

Add or change FortiGuard Web Filter ratings

The FortiGuard Center web site allows you to check the current category assigned to any URL.

To check the category assigned to a URL

1. Using your web browser, go to the FortiGuard Center Web Filter URL Lookup & Submission page at http://www.fortiguard.com/webfiltering/webfiltering.html.
2. Enter the URL as directed.
3. Select *Search*.
4. If the URL has been rated by the FortiGuard web filter team, the category is displayed.

If a URL has not been rated, or you believe it is incorrectly rated, you can suggest the appropriate category and classification.

To add or change the category for a URL

1. Check the category assigned to the URL as described in the previous procedure.
2. Below the rating, select *Check to submit the URL*.

3 Enter your name, company, and email address.
4 Optionally, you may enter a comment.
5 Select the most appropriate category and classification for the URL.
6 Select *Submit* to send your submission to the FortiGuard web filter team.

Create FortiGuard Web Filter overrides

You can configure FortiGuard Web Filter to allow or deny access to web sites by category and classification. You may want to block a category but allow your users temporary access to one site within the blocked category. You may need to allow only some users to temporarily access one site within a blocked category. Do these things by using administrative and user overrides.

Understanding administrative and user overrides

The administrative overrides are backed up with the main configuration. The administrative overrides are not deleted when they expire and you can reuse them by extending their expiry dates. You can create administrative overrides either through the CLI or the web-based manager.

The user overrides are not backed up as part of the main configuration. These overrides are automatically deleted when they expire. You can only view and delete the user override entries. Users create user overrides using the authentication form opened from the block page when they attempt to access a blocked site, if override is enabled.

Customize categories and ratings

The FortiGuard Web Filter rating categories are general enough that virtually any web site can be accurately categorized in one of them. However, the rigid structure of the categories can create complications. For example, your company uses a web-based email provider. If you select the Web-based Email category, all sites categorized as web-based email providers, including the one your company uses, are blocked.

Local categories and local ratings allow you to assign sites to any category you choose. You can even create new categories. These settings apply only to your FortiGate unit. The changes you make are not sent to the FortiGuard Web Filter Service.

Creating local categories

Categories are labels that describe web site content. Creating your own category allows you to customize how the FortiGuard Web Filter service works.

Local categories appear in the web filter profile, under the FortiGuard Web Filter category list, in the *Local Categories* group. Local categories are empty when created. To populate local categories with web sites, see “Customizing site ratings” on page 1032.

To create a local category

```
config webfilter ftgd-local-cat
  edit "My local category"
end
```

The new local category is added to the list, but will remain empty until you add a web site to it.

Customizing site ratings

You may find it convenient to change the rating of a site. For example, if you want to block all the sites in a category except one, you can move the one site to a different category.

To customize a site rating

1 Go to *UTM Profiles* > *Web Filter* > *Local Ratings*.
2 Select *Create New*.
3 In the *URL* field, enter the URL of the site you want to change.
4 In the *Category Rating* table, select the category or categories to apply to the site.
If you created any local categories, a *Local Categories* group will appear.
5 Select *OK*.

FortiGuard Web Filter examples

FortiGuard Web Filter can provide more powerful filtering to your network because you can use it to restrict access to millions of sites by blocking the categories they belong to.

Configuring simple FortiGuard Web Filter protection

Small offices, whether they are small companies, home offices, or satellite offices, often have very simple needs. This example details how to enable FortiGuard Web Filter protection on a FortiGate unit located in a satellite office.

Creating a web filter profile

Most FortiGuard Web Filter settings are configured in a web filter profile. Web filter profiles are selected in firewall policies. This way, you can create multiple web filter profiles, and tailor them to the traffic controlled by the security policy in which they are selected. In this example, you will create one web filter profile.

To create a web filter profile — web-based manager

1 Go to *UTM Profiles* > *Web Filter* > *Profile*.
2 Select *Create New* in the Edit Web Filter Profile window title bar
3 In the *Name* field, enter `basic_FGWF`.
4 Select *OK*.
5 Select *Add Filter*.
6 Select a *Filter type* of *Category*.
7 the *FortiGuard Web Filtering* check boxes for the *HTTP* and *HTTPS* traffic types.
8 Select the *FortiGuard Web Filtering* expand arrow.
9 Select the *Potentially Liable*, *Controversial*, and *Security Risk* categories.
10 Select an *Action* of *Block*.
11 Select *OK*.
12 Enable *HTTPS Scanning*.
13 Select *Apply*.

Applying the web filter profile to a security policy

A web filter profile directs the FortiGate unit to scan network traffic only when it is selected in a security policy. When a web filter profile is selected in a security policy, its settings are applied to all the traffic the security policy handles.

To select the web filter profile in a security policy — web-based manager

1 Go to *Policy* > *Policy* > *Policy*.
2 Select a policy and choose the *Edit* icon.
3 Enable *UTM*.
4 Select the *Enable Web Filter* option.
5 Select the `basic_FGWF` profile from the list.
6 Select *OK* to save the security policy.

To select the web filter profile in a security policy — CLI

```
config firewall policy
  edit 1
    set utm-status enable
    set profile-protocol-options default
    set webfilter-profile basic_FGWF
  end
```

HTTP and HTTPS traffic handled by the security policy you modified will be monitored for attempts to access to the blocked sites. A small office may have only one security policy configured. If you have multiple policies, consider enabling web filter scanning for all outgoing policies.

If you have multiple policies, consider enabling web filter scanning for all outgoing policies.

School district

Continuing with the example in the Web filter section, you can use FortiGuard Web Filter to protect students from inappropriate material. For the first part of this example, see "Web filtering example" on page 1008.

To enable FortiGuard Web Filter

1 Go to *UTM Profiles* > *Web Filter* > *Profile*.
2 Select the web filter profile named *Students*.
3 Enable *HTTPS Scanning*.
4 Select *OK*.

The *Students* web filter profile has no FortiGuard Web Filtering filter. You must create and configure a filter to use FortiGuard Web Filter.

To configure the sites to block

1 Go to *UTM Profiles* > *Web Filter* > *Profile*.
2 Select the web filter profile named *Students*.
3 In the FortiGuard Categories table, select these categories: *Potentially Liable*, *Controversial*, and *Bandwidth Consuming*.

4 Select *Block* from the *Change Action for Selected Categories to* drop-down list.

5 Select *Apply* to save the web filter profile.

The students will not be able to access any of the web sites in those three general categories or the categories within them.

Data leak prevention

The FortiGate data leak prevention (DLP) system allows you to prevent sensitive data from leaving your network. When you define sensitive data patterns, data matching these patterns will be blocked, or logged and allowed, when passing through the FortiGate unit. You configure the DLP system by creating individual filters based on file type, file size, a regular expression, an advanced rule, or a compound rule, in a DLP sensor and assign the sensor to a security policy.

Although the primary use of the DLP feature is to stop sensitive data from leaving your network, it can also be used to prevent unwanted data from entering your network and to archive some or all of the content passing through the FortiGate unit.

This section describes how to configure the DLP settings.

The following topics are included:

Data leak prevention concepts

Data leak prevention examines network traffic for data patterns you specify. You define whatever patterns you want the FortiGate unit to look for in network traffic. The DLP feature is broken down into a number of parts.

DLP sensor

A DLP sensor is a package of filters. To use DLP, you must enable it in a security policy and select the DLP sensor to use. The traffic controlled by the security policy will be searched for the patterns defined in the filters contained in the DLP sensor. Matching traffic will be passed or blocked according to how you configured the filters.

DLP filter

Each DLP sensor has one or more filters configured within it. Filters can examine traffic for known files using DLP fingerprints, for files of a particular type or name, for files larger than a specified size, for data matching a specified regular expression, or for traffic matching an advanced rule or compound rule.

You can configure the action taken when a match is detected. The actions include Log Only, Block, Exempt, and Quarantine User, IP address, or Interface.

Logging is enabled by default, but you can also choose to archive matching traffic or generate an archive summary.

Fingerprint

Fingerprint scanning allows you to create a library of files for the FortiGate unit to examine. It will create checksum fingerprints so each file can be easily identified. Then, when files appear in network traffic, the FortiGate will generate a checksum fingerprint and compare it to those in the fingerprint database. A match triggers the configured action.

File filter

File filters use file filter lists to examine network traffic for files that match either file names or file types. For example, you can create a file filter list that will find files called secret.* and also all JPEG graphic files. You can create multiple file filter lists and use them in filters in multiple DLP sensors as required.

File size

This filter-type checks for files exceeding a configured size. All files larger than the specified size are subject to the configured action.

Regular expression

The FortiGate unit checks network traffic for the regular expression specified in a regular expression filter. Matching traffic is subject to the configured action.

Advanced rule

Each advanced rule includes a single condition and the type of traffic in which the condition is expected to appear. For more information about the supplied advanced rules, see “Understanding the default advanced rules” on page 1044.

Compound rule

Compound rules combine multiple advanced rules and require that all the conditions in the included advanced rules are true before the compound rule is triggered. For more information about the supplied compound rules, see “Understanding the default compound rules” on page 1045

Enable data leak prevention

DLP examines your network traffic for data patterns you specify. You must configure DLP in sequence.

General configuration steps

Follow the configuration procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Create a DLP sensor.

   New DLP sensors are empty. You must create one or more filters in a sensor before it can examine network traffic.

2. Add one or more filters to the DLP sensor.

   Each filter searches for a specific data pattern. When a pattern in the active DLP sensor appears in the traffic, the FortiGate unit takes the action configured in the matching filter.

3 Add the DLP sensor to one or more firewall policies that control the traffic to be examined.

Creating a DLP sensor

DLP sensors are collections of filters. You must also specify an action for the filter when you create it in a sensor. Once a DLP sensor is configured, you can select it a security policy profile. Any traffic handled by the security policy will be examined according to the DLP sensor configuration.

To create a DLP sensor

1 Go to *UTM Profiles* > *Data Leak Prevention* > *Sensor*.

2 Select the *Create New* icon on the Edit DLP Sensor window title bar.

3 In the *Name* field, enter the name of the new DLP sensor.

4 Optionally, you may also enter a comment. The comment appears in the DLP sensor list and can remind you of the details of the sensor.

5 Select the *Inspection Method*.

Proxy-based detection involves buffering the file or message and examining it as a whole. Advantages of proxy-based detection include a more thorough examination of attachments, especially archive formats and nesting.

Flow-based detection examines the file as it passes through the FortiGate unit without any buffering. Advantages of flow-based detection include speed and no interruption of detection during conserve mode.

6 Select *OK*.

The DLP sensor is created and the sensor configuration window appears.

7 Select OK.

A newly created sensor is empty, containing no filters. Without filters, the DLP sensor will do nothing.

Adding filters to a DLP sensor

Once you have created a DLP sensor, you need to add filters.

To add filters to a DLP sensor

1 Go to *UTM Profiles* > *Data Leak Prevention*> *Sensor*.

2 Select the Sensor in the Edit DLP Sensor window title bar drop-down list.

3 Select *Create New*.

4 Enter a filter name.

5 Select the type of filter from the *Filter By* drop-down list. The filter you choose determines the options available to you.

Fingerprint	A fingerprint filter checks files in traffic against those in the FortiGate unit document fingerprint database. A match triggers the configured action. You must configure a document source or uploaded documents to the FortiGate unit for fingerprint scanning to work. For more information about document fingerprinting, see "DLP document fingerprinting" on page 1040.
File Type	Files in the network traffic are filtered by filename and file type.
File Pattern	Select a file filter list that includes the file patterns and file types the network traffic will be examined for. Files matching the types or patterns in the selected list are treated according to the selected action. To create a file filter list, see "Creating a file filter list" on page 1043.
File Size	Files in the network traffic are filtered by size.
Maximum Size	Enter a file size in kilobytes. Files larger than the specified size are treated according to the selected action.
Regular Expression	Network traffic is examined for the pattern described by the regular expression.
Regular Expression	Enter a regular expression. Traffic matching the regular expression is treated according to the selected action. For details about regular expression syntax, see "Using wildcards and Perl regular expressions" on page 1145.
Advanced Rule	Advanced rules detect a variety of data patterns in network traffic.
Advanced Rule	Select an advanced rule. Traffic matching the selected advanced rule is treated according to the selected action.
Compound Rule	Compound rules detect a variety of data patterns in network traffic. Compound rules are made of multiple advanced rules and all of the conditions must match for the compound rule to take effect.
Advanced Rule	Select a compound rule. Traffic matching the selected compound rule is treated according to the selected action.

6 Select the *Action* the FortiGate unit will take against network traffic matching the rule. A number of actions are available:

Log Only	The FortiGate unit will take no action on network traffic matching a rule with this action. The filter match is logged, however. Other matching filters in the same sensor may still operate on matching traffic.
Block	Traffic matching a filter with the block action will not be delivered. The matching message or download is replaced with the data leak prevention replacement message.
Quarantine User	If the user is authenticated, this action blocks all traffic to or from the user using the protocol that triggered the rule and adds the user to the Banned User list. If the user is not authenticated, this action blocks all traffic of the protocol that triggered the rule from the user's IP address. If the banned user is using HTTP, FTP, or NNTP (or HTTPS if the FortiGate unit supports SSL content scanning and inspection) the FortiGate unit displays the "Banned by data leak prevention" replacement message for the protocol. If the user is using IM, the IM and P2P "Banned by data leak prevention" message replaces the banned IM message and this message is forwarded to the recipient. If the user is using IMAP, POP3, or SMTP (or IMAPS, POP3S, SMTPS if your FortiGate unit supports SSL content scanning and inspection) the Mail "Banned by data leak prevention" message replaces the banned email message and this message is forwarded to the recipient. These replacement messages also replace all subsequent communication attempts until the user is removed from the banned user list.
Quarantine IP Address	This action blocks access for any IP address that sends traffic matching a filter with this action. The IP address is added to the Banned User list. The FortiGate unit displays the "NAC Quarantine DLP Message" replacement message for all connection attempts from this IP address until the IP address is removed from the banned user list.
Quarantine Interface	This action blocks access to the network for all users connecting to the interface that received traffic matching a filter with this action. The FortiGate unit displays the "NAC Quarantine DLP Message" replacement message for all connection attempts to the interface until the interface is removed from the banned user list.
Exempt	The exempt action prevents any filters from taking action on matching traffic. This action overrides the action assigned to any other matching filters.

Quarantine User, *Quarantine IP*, and *Quarantine Interface* provide functionality similar to NAC quarantine. However, these DLP actions block users and IP addresses at the application layer while NAC quarantine blocks IP addresses and interfaces at the network layer.

If you have configured DLP to block IP addresses and if the FortiGate unit receives sessions that have passed through a NAT device, all traffic from that NAT device — not just traffic from individual users — could be blocked. You can avoid this problem by implementing authentication.

To view or modify the replacement message text, go to *System* > *Config* > *Replacement Message*.

7 Select how traffic matching the rule will be archived.

Disable	Do not archive network traffic matching the rule.
Summary Only	Archive a summary of matching network traffic. For example, if applied to a rule governing email, the information archived includes the sender, recipient, message subject, message size, and other details.
Full	Archive the matching network traffic in addition to the summary information. For example, full archiving of email traffic includes the email messages and any attached files.

Archiving requires a FortiAnalyzer device or a subscription to the FortiGuard Analysis and Management Service.

8 Select *OK*.

The filter is added to the sensor. You may select *Create New* to add more filters, if required.

DLP document fingerprinting

One of the DLP techniques to detect sensitive data is fingerprinting (also called document fingerprinting). Most DLP techniques rely on you providing a characteristic of the file you want to detect, whether it's the file type, the file name, or part of the file contents. Fingerprinting is different in that you provide the file itself. The FortiGate unit then generates a checksum fingerprint and stores it. The FortiGate unit generates a fingerprint for all files detected in network traffic, and it is compared to all of the fingerprints stored in its fingerprint database. If a match is found, the configured action is taken.

The document fingerprint feature requires a FortiGate unit with internal storage. The document fingerprinting menu item does not appear on models without internal storage.

Any type of file can be detected by DLP fingerprinting and fingerprints can be saved for each revision of your files as they are updated.

To use fingerprinting you select the documents to be fingerprinted and then add fingerprinting filters to DLP sensors and add the sensors to firewall policies that accept the traffic to which to apply fingerprinting.

Fingerprinted Documents

The FortiGate unit must have access to the documents for which it generates fingerprints. One method is to manually upload documents to be fingerprinted directly to the FortiGate unit. The other is to allow the FortiGate unit to access a network share that contains the documents to be fingerprinted.

If only a few documents are to be fingerprinted, a manual upload may be the easiest solution. If many documents require fingerprinting, or if the fingerprinted documents are frequently revised, using a network share makes user access easier to manage.

To configure manual document fingerprints

1 Go to *UTM Profiles* > *Data Leak Prevention* > *Document Fingerprinting*.

2 In the Manual Document Fingerprints section, select *Create New*.

3 Select the file to be fingerprinted.

4 Choose a security level.

5 If the file is an archive containing other files, select *Process files inside archive* if you also want the individual files inside the archive to have fingerprints generated in addition to the archive itself.

6 Select *OK*.

The file is uploaded and a fingerprint generated.

To configure a fingerprint document source

1 Go to *UTM Profiles* > *Data Leak Prevention* > *Document Fingerprinting*.

2 In the Document Sources section, select *Create New*.

3 Configure the settings:

Name	Enter a descriptive name for the document source.
Server Address	Enter the IP address of the server.
User Name **Password**	Enter the user name and password of the account the FortiGate unit uses to access the server network share.
Path	Enter the path to the document folder.
Filename Pattern	You may enter a filename pattern to restrict fingerprinting to only those files that match the pattern. To fingerprint all files, enter an asterisk (“*”).
Severity Level	Select a severity level. The severity is a tag for your reference that is included in the log files. It does not change how fingerprinting works.
Scan Periodically	To have the files on the document source scanned on a regular basis, select this option. This is useful if files are added or changed regularly. Once selected, you can choose Daily, Weekly, or Monthly update options, and enter the time of day the files are fingerprinted.
Advanced	Expand the Advanced heading for additional options.
Fingerprint files in subdirectories	By default, only the files in the specified path are fingerprinted. Files in subdirectories are ignored. Select this option to fingerprint files in subdirectories of the specified path.

Remove fingerprints for deleted files	Select this option to retain the fingerprints of files deleted from the document source. If this option is disabled, fingerprints for deleted files will be removed when the document source is rescanned.
Keep previous fingerprints for modified files	Select this option to retain the fingerprints of previous revisions of updated files. If this option is disabled, fingerprints for previous version of files will be deleted when a new fingerprint is generated.

4 Select *OK*.

File filter

File filter is a DLP option that allows you to block files based on their file name or their type.

- **File patterns** are a means of filtering based purely on the names of files. They may include wildcards (*). For example, blocking *.scr will stop all files with an scr file extension, which is commonly used for Windows screen saver files. Files trying to pass themselves off as Windows screen saver files by adopting the file-naming convention will also be stopped.

  Files can specify the full or partial file name, the full or partial file extension, or any combination. File pattern entries are not case sensitive. For example, adding `*.exe` to the file pattern list also blocks any files ending with `.EXE`.

  Files are compared to the enabled file patterns from top to bottom, in list order.

  In addition to the built-in patterns, you can specify more file patterns to block. For details, see "Creating a file filter list" on page 1043.
- **File types** are a means of filtering based on an examination of the file contents, regardless of the file name. If you block the file type *Archive (zip)*, all zip archives are blocked even if they are renamed with a different file extension. The FortiGate examines the file contents to determine what type of file it is and then acts accordingly.

The FortiGate unit can take either of the following actions toward the files that match a configured file pattern or type:

- **Block**: the file is blocked and a replacement message is sent to the user. If both file pattern filtering and virus scan are enabled, the FortiGate unit blocks files that match the enabled file filter and does not scan these files for viruses.
- **Allow**: the file is allowed to pass.

The FortiGate unit also writes a message to the UTM log and sends an alert email message if configured to do so.

File filter does not detect files within archives. You can use file filter to block or allow the archives themselves, but not the contents of the archives.

General configuration steps

The following steps provide an overview of file filter configuration. For best results, follow the procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1 Create a file filter list.

2 Create one or more file patterns or file types to populate the file filter list.
3 Enable the file filter list by adding it to a filter in a DLP sensor.
4 Select the DLP sensor in a security policy.

Creating a file filter list

Before your FortiGate unit can filter files by pattern or type, you must create a file filter list.

To create a file filter list

1 Go to *UTM Profiles* > *Data Leak Prevention* > *File Filter*.
2 Select *Create New*.
3 Enter a *Name* for the new file filter list.
4 Select *OK*.

The new list is created and the edit file filter list window appears. The new list is empty. You need to populate it with one or more file patterns or file types.

Creating a file pattern

A file pattern allows you to block or allow files based on the file name. File patterns are created within file filter lists.

To create a file pattern

1 Go to *UTM Profiles* > *Data Leak Prevention* > *File Filter*.
2 Select a file filter list.
3 Select the *Edit* icon.
4 Select *Create New*.
5 Select *File Name Pattern* as the *Filter Type*.
6 Enter the pattern in the *Pattern* field. The file pattern can be an exact file name or can include wildcards (*). The file pattern is limited to a maximum of 80 characters.
7 Select the action the FortiGate unit will take when it discovers a matching file: *Allow* or *Block*.
8 The filter is enabled by default. Clear the *Enable* check box if you want to disable the filter.
9 Select *OK*.

Creating a file type

A file type allows you to block or allow files based on the kind of file. File types are created within file filter lists.

To create a file type

1 Go to *UTM Profiles* > *Data Leak Prevention* > *File Filter*.
2 Select the *Edit* icon of the file filter list to which you will add the file type.
3 Select *Create New*.
4 Select *File Type* as the *Filter Type*.
5 Select the kind of file from the *File Type* list.

6 Select the action the FortiGate unit will take when it discovers a matching file: *Allow* or *Block*.

7 The filter is enabled by default. Clear the *Enable* check box if you want to disable the filter.

8 Select *OK*.

Advanced rules

A number of advanced rules are provided with your FortiGate unit. If you require additional rules, you can create your own.

Understanding the default advanced rules

You can use the default advanced rules as provided, or modify them to fit your needs.

These rules affect only unencrypted traffic types. If you are using a FortiGate unit that can decrypt and examine encrypted traffic, you can enable those traffic types in these rules to extend their functionality if required.

Before using the rules, examine them closely to ensure you understand how they will affect the traffic on your network.

All-Email, All-FTP, All-HTTP, All-IM, All-NNTP	These rules will detect all email, FTP, HTTP, instant messaging, and NNTP traffic.
Email-AmEx, Email-Canada-SIN, Email-US-SSN, Email-Visa-Mastercard	These four rules detect American Express numbers, Canadian Social Insurance Numbers, U.S. Social Security Numbers, or Visa and Mastercard numbers within the message bodies of SMTP, POP3, and IMAP email traffic.
HTTP-AmEx, HTTP-Canada-SIN, HTTP-US-SSN, HTTP-Visa-Mastercard	These four rules detect American Express numbers, Canadian Social Insurance Numbers, U.S. Social Security Numbers, or Visa and Mastercard numbers sent using the HTTP POST command. The HTTP POST command is used to send information to a web server. As written, these rules are designed to detect data the user is sending to web servers. This rule does not detect the data retrieved with the HTTP GET command, which is used to retrieve web pages.
Large-Attachment	This rule detects files larger than 5MB attached to SMTP, POP3, and IMAP email messages.
Large-FTP-Put	This rule detects files larger than 5MB sent using the FTP PUT command. Files received using FTP GET are not examined.

Large-HTTP-Post	This rule detects files larger than 5MB sent using the HTTP POST command. Files received using HTTP GET are not examined.
Email-Not-Webex, HTTP-Post-Not-Webex	These rules detect all traffic that is not generated by the WebEx web conference service. While not very useful on their own, these rules are used in the default compound rules.

Creating advanced rules

Most DLP functions can be accomplished using file filtering, file size, or regular expression features, but advanced rules do offer filtering features unavailable elsewhere in DLP. Creating your own advanced rules can be accomplished only using the CLI.

The general procedure when creating a DLP advanced rule is to specify the protocol, sub-protocol (if any), the field, and then the remaining options as required.

This example shows one way to create an advanced rule called email-confidential to detect the word “confidential” in the body of any email message. The rule can detect the word regardless of whether it is uppercase, lowercase, or a mixture of both.

To create a DLP advanced rule

```
config dlp rule
  edit email-confidential
    set protocol email
    set sub-protocol imap pop3 smtp
    set field body
    set regexp /confidential/i
    set description "Detect the word Confidential in email"
  end
```

See the *CLI Reference* for a complete list of the DLP advanced rule commands and options.

Compound rules

A number of compound rules are provided with your FortiGate unit. If you require additional compound rules, you can create your own.

Understanding the default compound rules

You can use the default compound rules as provided, or modify them to fit your needs.

These rules affect only unencrypted traffic types. If you are using a FortiGate unit that can decrypt and examine encrypted traffic, you can enable those traffic types in these rules to extend their functionality if required.

Before using the rules, examine them closely to ensure you understand how they will affect the traffic on your network.

Email-SIN	This rule combines the Email-Canada-SIN and Email-Not-Webex advanced rules. If you use the Webex web conferencing service, the Email-Canada-SIN advanced rule can be mistakenly triggered by Webex traffic. Combining the advanced rules in a compound rules ensures that the Email-Canada-SIN rule will be triggered only by non-Webex network traffic.
HTTP-Post-SIN	This rule combines the HTTP-Canada-SIN and HTTP-Post-Not-Webex advanced rules. If you use the Webex web conferencing service, the HTTP-Canada-SIN advanced rule can be mistakenly triggered by Webex traffic. Combining the advanced rules in a compound rules ensures that the HTTP-Canada-SIN rule will be triggered only by non-Webex network traffic.

Creating compound rules

Compound rules are a very powerful feature to detect a specific set of circumstances. Because of this, you may need to create your own compound rules. Creating your own compound rules can be accomplished only using the CLI.

This example shows one way to create a compound rule called email-confidential-attachment to detect email messages that have the word “confidential” in the body of any email message and a file attachment of at least 5 MB in size.

To create a DLP compound rule

```
config dlp compound
  edit email-confidential-attachment
    set protocol email
    set sub-protocol imap pop3 smtp
    set member email-confidential
    set member Large-Attachment
  end
```

See the *CLI Reference* for a complete list of the DLP compound rule commands and options.

DLP archiving

DLP is typically used to prevent sensitive information from getting out of your company network, but it can also be used to record network use. This is called DLP archiving. The DLP engine examines email, FTP, IM, NNTP, and web traffic. Enabling archiving for rules when you add them to sensors directs the FortiGate unit to record all occurrences of these traffic types when they are detected by the sensor.

Since the archive setting is configured for each rule in a sensor, you can have a single sensor that archives only the things you want.

DLP archiving comes in two forms: *Summary Only*, and *Full*.

Summary archiving records information about the supported traffic types. For example, when an email message is detected, the sender, recipient, message subject, and total size are recorded. When a user accesses the Web, every URL the user visits recorded. The result is a summary of all activity the sensor detected.

For more detailed records, full archiving is necessary. When an email message is detected, the message itself, including any attachments, is archived. When a user accesses the Web, every page the user visits is archived. Far more detailed than a summary, full DLP archives require more storage space and processing.

Because both types of DLP archiving require additional resources, DLP archives are saved to a FortiAnalyzer unit or the FortiGuard Analysis and Management Service (subscription required).

Two sample DLP sensors are provided with DLP archiving capabilities enabled. If you select the `Content_Summary` sensor in a security policy, it will save a summary DLP archive of all traffic the security policy handles. Similarly, the `Content_Archive` sensor will save a full DLP archive of all traffic handled the security policy you apply it to. These two sensors are configured to detect all traffic of the supported types and archive them.

DLP examples

Blocking sensitive email messages

Someone in the Example.com corporation has been sending copies of the company president's monthly update email messages to the press. These messages have included the full header. Rather than try to block them, the IT department at Example.com will find out who is sending the messages using DLP.

All messages include the text `From: president@example.com` and `Subject: XYZ Monthly Update` where XYZ is the month the update applies to.

You will create a rule for the email address and a rule for the subject, combine them in a compound rule, and add the compound rule to a DLP sensor. You will then add the DLP sensor to the security policy that controls outgoing email traffic.

To create the "address" rule

```
config dlp rule
  edit "President address"
    set description "Finds president@example.com in email"
    set protocol email
    set sub-protocol imap pop3 smtp
    set field body
    set regexp-wildcard enable
    set regexp president@example.com
  end
```

To create the "subject" rule

```
config dlp rule
  edit "President subject"
    set description "Finds XYZ Monthly Update in email subject"
    set protocol email
    set sub-protocol imap pop3 smtp
    set field subject
    set regexp-wildcard enable
    set regexp "* Monthly Update"
  end
```

The asterisk ('*') can represent any characters so the rule will match any monthly update.

Adding these two rules to a DLP sensor may generate a large number of false positives because any rule in a sensor will trigger the action. If the action were to log messages matching the address and subject rules in this example, then left as individual rules, the DLP sensor would log Monthly Updates from any employee and log all the president's email messages. In this case, you only want to know when both rules are true for a single message. To do this, you must first add the rules to a compound rule.

To create the "president + subject" compound rule.

```
config dlp compound
  edit "President + Subject"
    set protocol email
    set sub-protocol imap pop3 smtp
    set member "President address"
    set member "President subject"
  end
```

To create the "president" DLP sensor

1. Go to *UTM Profiles* > *Data Leak Prevention* > *Sensor*.
2. Select the *Create New* icon on the Edit DLP Sensor window title bar.
3. In the *Name* field, enter `president`.
4. In the *Comments* field, enter `Finds "president@example.com" and "XYZ Monthly Update" in email`.
5. Select *OK* to save the new sensor.
6. Select *Create New* to add a rule to the sensor.
7. Enter `President + Subject` for the *Filter Name*.
8. Set *Filter By* to *Compound Rule*.
9. Set *Advanced Rule* to *President + Subject*.
10. Set *Archive* to *Full*.
11. Select *OK*.

With the DLP sensor ready for use, you need to select it in the security policy.

To select the DLP sensor in the security policy

1. Go to *Policy* > *Policy* > *Policy*.
2. Select the security policy that controls outgoing email traffic.
3. Select the *Edit* icon.
4. Enable *UTM*.
5. Select the *Enable DLP Sensor* option.
6. Select the `president` sensor from the list.
7. Select *OK* to save the security policy.

With the DLP sensor specified in the correct security policy, any email message with both president@example.com and Monthly Update in the subject will trigger the sensor and the email message will be archived.

Data Leak Prevention interface reference

You can use the Data Leak Prevention (DLP) system to prevent sensitive data from leaving or entering your network. You can define sensitive data patterns, and data matching these patterns will be blocked and/or logged or archived when passing through the unit. The DLP system is configured by creating individual rules, combining the rules into DLP sensors, and then assigning a sensor to a firewall policy.

Although the primary use of the DLP feature is to stop sensitive data from leaving your network, it can also be used to prevent unwanted data from entering your network and to archive some or all of the content passing through the unit.

This topic includes the following:

Sensor

DLP sensors are simply collections of DLP rules and DLP compound rules. The DLP sensor also includes settings such as action, archive, and severity for each rule or compound rule. Once a DLP sensor is configured, it can be specified in a firewall policy. Any traffic handled by the policy in which the DLP sensor is specified will enforce the DLP sensor configuration.

You can create a new DLP sensor and configure it to include the DLP rules and DLP compound rules required to protect the traffic leaving your network.

A DLP sensor must be created before it can be configured by adding rules and compound rules.

Before use, examine the sensors and rules in the sensors closely to ensure you understand how they will affect the traffic on your network.

DLP sensor configuration settings

The following are DLP sensor configuration settings in *UTM Profiles* > *Data Leak Prevention* > *Sensor*.

Sensor page	
Lists each individual DLP sensor that you created, as well as the default DLP sensors. On this page, you can edit DLP sensors (default or ones that you created), delete or create new DLP sensors. You are redirected to this page when you select *View List* on the Edit DLP Sensor page.	
Create New	Creates a new DLP sensor. When you select *Create New*, you are automatically redirected to the New DLP List page. This page provides a name field and comment field. You must enter a name to go to the Sensor Settings page.
Edit	Modifies settings within a DLP sensor. When you select *Edit*, you are automatically redirected to the Edit DLP Sensor page.
Delete	Removes a DLP sensor from the list. To remove multiple DLP sensors from within the list, on the Sensor page, in each of the rows of the sensors you want removed, select the check box and then select *Delete*. To remove all DLP sensors from the list, on the Sensor page, select the check box in the check box column and then select *Delete*.
Clone	Select to use an existing DLP sensor's settings as the basis for a new DLP sensor's settings.
Name	The DLP sensor name. There are six default sensors. The following default DLP sensors are provided with your unit. You can use these as provided, or modify them as required.
Comments	The optional description of the DLP sensor.

Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.* To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is available within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
Content_Archive (default)	DLP archive all email (POP3, IMAP, and SMTP), FTP, HTTP, and IM traffic. For each rule in the sensor, *Archive* is set to *Full*. No blocking or quarantine is performed. See "DLP archiving" on page 1060. You can add the *All-Session-Control* rule to also archive session control content. If you have a unit that supports SSL content scanning and inspection, you can edit the *All-Email* rule to archive POP3S, IMAPS, and SMTPS traffic. You can also edit the *All-HTTP* rule to archive HTTPS traffic.
Content_Summary (default)	DLP summary archive all email (POP3, IMAP, and SMTP), FTP, HTTP, and IM traffic. For each rule in the sensor, *Archive* is set to *Summary Only*. No blocking or quarantine is performed. See "DLP archiving" on page 1060. You can add the *All-Session-Control* rule to also archive session control content. If you have a unit that supports SSL content scanning and inspection, you can edit the *All-Email* rule to archive POP3S, IMAPS, and SMTPS traffic. You can also edit the *All-HTTP* rule to archive HTTPS traffic.

Credit-Card (default)	The number formats used by American Express, Visa, and Mastercard credit cards are detected in HTTP and email traffic. As provided, the sensor is configured not to archive matching traffic and an action of *None* is set. Configure the action and archive options as required.
Large-File (default)	Files larger than 5MB will be detected if attached to email messages or if send using HTTP or FTP. As provided, the sensor is configured not to archive matching traffic and an action of *None* is set. Configure the action and archive options as required.
SSN-Sensor (default)	The number formats used by U.S. Social Security and Canadian Social Insurance numbers are detected in email and HTTP traffic. As provided, the sensor is configured not to archive matching traffic and an action of *None* is set. Configure the action and archive options as required.
Edit DLP Sensor page Provides settings for configuring rules that are added to DLP sensors. When you select *Create New* to create a new sensor, you are automatically redirected to the New DLP Sensor page. You must enter a name for the sensor in the *Name* field to continue configuring the sensor, at which time you are redirected to the Sensor Settings page. When you select *Create New* on this page, you are redirected to the New DLP Sensor Rule page. **Note:** Enabling logging or NAC quarantine is available in the CLI.	
Name	If you are editing an existing sensor and want to change the name, enter a name in this field. You must select *OK* to save the change.
Comment	If you are editing an existing sensor and want to change or add a description, enter the new text in this field. You must select *OK* to save these changes.
Inspection Method	Select the type of DLP inspection method.
Flow-based Detection	Select to enable flow-based DLP scanning. Flow-based is a non-proxy solution which provides high concurrent session, high session rate, and low-latency DLP service.
Proxy-based Detection (Extended)	Select to enable a proxy-based detection scanning method.
Create New	Adds a new rule or compound rule to the sensor. When you select a specific type of member, either *Compound rule* or *Rule*, different options become available. When you select *Create New*, you are automatically redirected to the New DLP Sensor Rule page.
Edit	Modifies a rule or compound rule. When you select *Edit*, you are automatically redirected to Edit DLP Sensor Rule page.

Delete	Removes a compound rule or a rule from the list. To remove multiple compound rules or rules from the list, on the DLP Sensor Settings page, in each of the rows of the compound rules or rules you want removed, select the check box and then select *Delete*. To remove all compound rules and/or rules from the list, select the check box in the check box column and then select *Delete*.
Filter Name	The name of the rule that you have created. This is often referred to as a filter because it can filter the information using the rule applied.
Type	The type of rule that was applied, such as compound rule or fingerprint.
Action	The action configured for each rule. If the selected action is *None*, no action will be listed. Although archiving is enabled independent of the action, the *Archive* designation appears with the selected action. For example, if you select the *Block* action and set *Archive* to *Full* for a rule, the action displayed in the sensor rule list is *Block, Archive*.
Archive	The type of archiving that is selected for that rule. For example, summary only.
New DLP Sensor Filter page Provides settings for configuring filter, such as compound rule or document finger print.	
Filter Name	Enter a name for the rule.
Filter By	Select what the DLP sensor will filter by, for example compound rule. You can choose to filter by the following rules: • Finger Print • File Type • File Size • Regular Expression • Advanced Rule • Compound Rule
Sensitivity	The sensitivity level for document fingerprinting. Appears only when *Filter By* is *Finger Print*.
Advanced Rule	Select the advance rule that you want applied to the filter. Appears when *Filter By* is either *Compound Rule* or *Advanced Rule*.
Regular Expression	Enter the regular expression in the filed provided. Appears only when *Filter By* is *Regular Expression*.
Maximum Size	Enter the maximum file size in kB. Appears only when *Filter By* is *File Size*.

File Pattern	Select the type of file pattern. Appears only when *Filter By* is *File Type*.
Action	Select an action that the unit will take for that particular rule or compound rule.

DLP prevents duplicate action. Even if more than one rule in a sensor matches some content, DLP will not create more than one DLP archive entry, quarantine item, or ban entry from the same content.

Document Fingerprinting

DLP document fingerprinting allows you to better protect specific documents from leakage. Document fingerprinting, in this sense, is a method of uniquely identifying a document. This method breaks up files into chunks, taking a checksum of those chunks and using that checksum as the fingerprint. The fingerprint is then applied to a DLP filter rule within a DLP sensor which is then used during the scanning process of DLP activity.

Document Fingerprint page	
Lists the document sources as well as the document files that were manually inputted.	
Document Sources section	
Lists the configured document sources for document fingerprinting.	
Create New	Creates a new document source. When you select *Create New*, you are automatically redirected to the Document Source page.
Delete	Removes a document source from within the list. To remove multiple document sources from the list, in the Document Sources section of the page, in each of the rows of sources you want removed, select the check box and then select *Delete*. To remove all document sources from the list, select the check box in the check box column and then select *Delete*.
View	Select to view the document sources' information.
Name	The name of the document source.
Server	The source's IP address or server IP address of where the documents/files are located.
Path	The location of where the files are located on the server.
Sensitivity Level	The level of sensitivity for the documents on the server.
# Documents	The total number of documents for fingerprinting.
Manual Document Fingerprints section	
Lists each individual document or file that you uploaded to the FortiGate unit for fingerprinting.	
Create New	Uploads a file or document that you want for fingerprinting. When you select *Create New*, you are automatically redirected to the Upload File for Fingerprinting page. For more information about uploading individual documents for fingerprinting, see "Manual Document Fingerprints" on page 1056.

Delete	Removes a document from within the list. To remove multiple documents from the list, in the Manual Document Fingerprints section of the page, in each of the rows of documents you want removed, select the check box and then select *Delete*. To remove all documents from the list, select the check box in the check box column and then select *Delete*.
Name	The name of the document.
Sensitivity Level	The level of sensitivity given to that uploaded document.

Document Sources configuration settings

The following are configuration settings for document sources in *UTM Profiles* > *Data Leak Prevention* > *Document Fingerprinting*.

Document Source page Provides settings for configuring the document sources, or servers, that contain the files or documents that you want to prevent being leaked from your intranet.	
Name	Enter the name of the document source.
Server Type	Select the type of server, such as a windows share server. The Windows Share server is the default server type available.
Server Address	Enter the server's IP address.
User Name	Enter the name of the user that logs in to the server.
Password	Enter the user's password that is required to log in to the server.
Path	Enter the location of where the files are located on the server.
Filename Pattern	Enter the pattern of the name of the files, such as *.pdf.
Sensitivity Level	Select the type of sensitivity level you created in the CLI, using the `config dlp fp-sensitivity` command. There are three default sensitivity levels: Private, Critical and Warning.
Scan Periodically	Select to schedule when the FortiGate unit scans the server. When you select the check box to enable this, the following options appear.
Daily	Select to schedule a daily scan. Enter the hour and minutes in the fields provided.
Weekly	Select to schedule a scan during a day of the week and at a specific time. When you select *Weekly*, *Weekday* appears. Select a day from the drop-down list in *Weekday* and then enter the hour and minutes in the fields provided. For example, a scan will occur every Monday at 5:30.

Monthly	Select the day of the month to scan. Enter the date of the month, such as 5, in the *Date* field. Enter the hour and minutes in the fields provided.
Advanced	Expand to enable or disable any of the following: • *Fingerprint files in subdirectories* – fingerprints files that are in subdirectories as well as in directories • *Remove fingerprints for deleted files* – removes fingerprints from files that are deleted from the source or server. • *Keep previous fingerprints for modified files* – keeps the fingerprints for files that were recently modified.

Manual Document Fingerprints

The Manual Document Fingerprints section of the DLP Fingerprint page allows you to upload a document that will be fingerprinted by the FortiGate unit.

The following are settings for uploading documents for fingerprinting in *UTM Profiles* > *Data Leak Prevention* > *Document Fingerprinting*.

Upload File for Fingerprinting page Uploads the individual files that you want to provide for fingerprinting.	
File	Enter the file name.
Sensitivity Level	Select the sensitivity level from the drop-down list.
Process files inside archives	Select to enable the FortiGate unit to process files that are inside archive files.

File Filter

The Filter menu allows you to configure filtering options that block specific file patterns and file types. Files are compared to the enabled file patterns and then the file types from top to bottom. If a file does not match any specified patterns or types, it is passed along to antivirus scanning (if enabled). In effect, files are passed if not explicitly blocked. The unit also writes a message to the virus log and sends an alert email message if configured to do so.

The unit can take either of these actions toward files that match a configured file pattern or type:

- Allow: the file is allowed to pass.
- Block: the file is blocked and a replacement messages will be sent to the user. If both file filter and virus scan are enabled, the unit blocks files that match the enabled file filter and does not scan these files for viruses.
- Intercept: the file will be archived to the local hard disk or the FortiAnalyzer unit. (FortiOS Carrier only)

By using the *Allow* action, this behavior can be reversed with all files being blocked unless explicitly passed. Simply enter all the file patterns or types to be passed with the allow attribute. At the end of the list, add an all-inclusive wildcard (*.*) with a block action. Allowed files continue to antivirus scanning (if enabled) while files not matching any allowed patterns are blocked by the wildcard at the end. For standard operation, you can choose to disable file filter in the profile, and enable it temporarily to block specific threats as they occur.

The unit is preconfigured with a default list of file patterns:

- executable files (*.bat, *.com, and *.exe)
- compressed or archive files (*.gz, *.rar, *.tar, *.tgz, and *.zip)
- dynamic link libraries (*.dll)
- HTML application (*.hta)
- Microsoft Office files (*.doc, *.ppt, *.xl?)
- Microsoft Works files (*.wps)
- Visual Basic files (*.vb?)
- screen saver files (*.scr)
- program information files (*.pif)
- control panel files (*.cpl)

The unit can detect the following file types:

Table 70: Supported file types

arj	activemime	aspack	base64	bat	binhex	bzip	bzip2
cab	class	cod	elf	exe	fsg	gzip	hlp
hta	html	jad	javascript	lzh	mime	msc	msoffice
petite	prc	rar	sis	tar	upx	uue	zip
unknown	ignored						

The “unknown” type is any file type that is not listed in the table. The “ignored” type is the traffic the unit typically does not scan. This includes primarily streaming audio and video.

File filter configuration

You can add multiple file filter lists to the antivirus profile. For file patterns, you can add a maximum of 5000 patterns to a list. For file types, you can select only from the supported types.

The following are file filter configuration settings in *UTM Profiles* > *Data Leak Prevention* > *File Filter*.

File Filter page Lists each individual file filter that you created. On this page, you can edit, delete or create a new file filter.	
Create New	Creates a new file filter. When you select *Create New*, you are automatically redirected first to the New List page. You must enter a name for the file filter list in the *Name* field on the New List page and then select *OK* then be redirected to the File Filter Settings page.
Delete	Removes the file filter list from the list on the File Filter page. To remove multiple file filter lists from within the list, on the File Filter page, in each of the rows of the file filter lists you want removed, select the check box and then select *Delete*. To remove all file filter lists from the list, on the File Filter page, select the check box in the check box column and then select *Delete*.
Edit	Modifies the settings within a file filter list. When you select *Edit*, you are redirected to the File Filter Settings page.
Name	The name of the file filter list.
# Entries	The number of file patterns or file types in each file filter list.
DLP Rule	The DLP rules in which each filter is used.
Comments	An optional description of each file filter list.
Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
File Filter Settings page Provides settings for configuring multiple file patterns and file types that make up a file filter. This page also lists the file patterns and file types that were created for the file filter. If you are editing a file filter, you are redirected to this page.	

Name	The name that was entered in the *Name* field on the New List page. To change the name, edit the text in this field and select *OK*.
Comment	The comment that was entered in the *Comment* field on the New List page. If you want to edit or add the description, enter the text in this field and select *OK*.
Create New	Creates a new file filter pattern or type within the list on the File Filter Settings page. When you select *Create New*, you are automatically redirected to the New File Filter page.
Edit	Modifies settings within the file pattern/type and action. When you select *Edit*, you are automatically redirected to the Edit File Filter page.
Delete	Removes the file pattern or type from the list on the File Filter Settings page. To remove multiple file filter lists from within the list, on the File Filter page, in each of the rows of the file filter lists you want removed, select the check box and then select *Delete*. To remove all file filter lists from the list, on the File Filter page, select the check box in the check box column and then select *Delete*.
Enable	Enables a disabled file pattern or type.
Disable	Disables a file pattern or type.
Move To	Moves the file pattern or type to any position in the list. When you select *Move To*, the Move AV File Filter Entry window appears. To move a file pattern or type, select the new position *Before* or *After*, which will place the current entry before or after the entry you enter in *(Entry)*. Enter the entry's name in the *(Entry)* field.
Filter	The current list of file patterns and types.
Action	Files matching the file patterns and types can be set to *Block* or *Allow*.
Enable	Indicates that the file pattern or file type is either enabled or disabled. A green check mark indicates that the patter or type is enabled; a gray x indicates that it is disabled.
New File Filter page Provides settings for configuring the file pattern or file type for the list. When you select *Create New* on the File Filter Settings page, you are automatically redirected to this page.	
Filter Type	Select *File Name Pattern* or *File Type*.
File Type	Select a file type from the list. Appears only when *File Type* is selected in *Filter Type*.
Pattern	Enter the file pattern. The file pattern can be an exact file name or can include wildcards. The file pattern can be 80 characters long.
Action	Select an action from the drop down list: *Block* or *Allow*.
Enable	Select to enable or disable the filter.

The default file pattern list catalog is called *builtin-patterns*.

DLP archiving

You can use DLP archiving to collect and view historical logs that have been archived to a FortiAnalyzer unit or the FortiGuard Analysis and Management Service. DLP archiving is available for FortiAnalyzer when you add a FortiAnalyzer unit to the FortiGate configuration. The FortiGuard Analysis server becomes available when you subscribe to the FortiGuard Analysis and Management Service.

You can configure full DLP archiving and summary DLP archiving. Full DLP archiving includes all content, for example, full email DLP archiving includes complete email messages and attachments. Summary DLP archiving includes just the meta data about the content, for example, email message summary records include only the email header.

You can archive Email, FTP, HTTP, IM, and session control content:

- Email content includes IMAP, POP3, and SMTP sessions. Email content can also include email messages tagged as spam by Email filtering. If your unit supports SSL content scanning and inspection, Email content can also include IMAPS, POP3S, and SMTPS sessions.
- HTTP content includes HTTP sessions. If your unit supports SSL content scanning and inspection HTTP content can also include HTTPS sessions.
- IM content includes AIM, ICQ, MSN, and Yahoo! sessions.
- MMS content includes MM1, MM3, MM4, and MM7 sessions. (FortiOS Carrier only)
- Session control content includes SIP, SIMPLE and SCCP sessions. Only summary DLP archiving is available for SIP and SCCP. Full and summary DLP archiving is available for SIMPLE.

You add DLP sensors to archive Email, Web, FTP, IM, and session control content. Archiving of spam email messages is configured in the DLP sensor.

In FortiOS Carrier, MMS archiving is configured in MMS profiles.

DLP archiving is enabled in the DLP sensor itself. DLP sensors are located in *UTM Profiles* > *Data Leak Prevention* > *Sensor*. You can also use either Content_Archive or Content_Summary sensors to archive DLP logs instead of creating a new DLP sensor for archiving purposes.

You can now create a session control DLP rule that includes SIP, SIMPLE or SCCP for DLP archiving within the CLI.

Application control

Using the application control UTM feature, your FortiGate unit can detect and take action against network traffic depending on the application generating the traffic. Based on FortiGate Intrusion Protection protocol decoders, application control is a user-friendly and powerful way to use Intrusion Protection features to log and manage the behavior of application traffic passing through the FortiGate unit. Application control uses IPS protocol decoders that can analyze network traffic to detect application traffic even if the traffic uses non-standard ports or protocols.

The FortiGate unit can recognize the network traffic generated by a large number of applications. You can create application control sensors that specify the action to take with the traffic of the applications you need to manage and the network on which they are active, and then add application control sensors to the firewall policies that control the network traffic you need to monitor.

This section describes how to configure the application control settings.

If you enable virtual domains (VDOMs) on the Fortinet unit, you need to configure application control separately for each virtual domain.

The following topics are included in this section:

Application control concepts

You can control network traffic generally by the source or destination address, or by the port, the quantity or similar attributes of the traffic itself in the security policy. If you want to control the flow of traffic from a specific application, these methods may not be sufficient to precisely define the traffic. To address this problem, the application control feature examines the traffic itself for signatures unique to the application generating it. Application control does not require knowledge of any server addresses or ports. The FortiGate unit includes signatures for over 1000 applications, services, and protocols.

Updated and new application signatures are delivered to your FortiGate unit as part of your FortiGuard Application Control Service subscription. Fortinet is constantly increasing the number of applications that application control can detect by adding applications to the FortiGuard Application Control Database. Because intrusion protection protocol decoders are used for application control, the application control database is part of the FortiGuard Intrusion Protection System Database and both of these databases have the same version number.

To view the version of the application control database installed on your FortiGate unit, go to the *License Information* dashboard widget and find the *IPS Definitions* version.

To see the complete list of applications supported by FortiGuard Application Control go to the FortiGuard Application Control List. This web page lists all of the supported applications. You can select any application name to see details about the application.

Enable application control

Application control examines your network traffic for traffic generated by the applications you want it to control.

General configuration steps

Follow the configuration procedures in the order given. Also, note that if you perform any additional actions between procedures, your configuration may have different results.

1. Create an application sensor.
2. Configure the sensor to include the signatures for the application traffic you want the FortiGate unit to detect. Configure each entry to allow or pass the traffic.
3. Enable UTM and application control in a security policy and select the application sensor.

Creating an application sensor

You need to create an application sensor before you can enable application control.

To create an application sensor

1. Go to *UTM Profiles* > *Application Control* > *Application Sensor*.
2. Select the *Create New* icon in the title bar of the *Edit Application Sensor* window.
3. In the *Name* field, enter the name of the new application sensor.
4. Optionally, you may also enter a comment.
5. Select *OK*.

The application sensor is created and the sensor configuration window appears. A newly created application sensor is empty. Without applications, the application sensor will have no effect.

Adding applications to an application sensor

Once you have created an application sensor, you need to need to define the applications that you want to control.

You can add applications vising application entries and application filters. Entries allow you to choose individual applications. Filters allow you to choose application attributes and all the applications with matching attributes are included in the filter.

The sequence of the entries in the table is significant. The entries are checked in sequence, from top to bottom, and when a match is found and the action executed, further checking is stopped.

To add an application entry to an application sensor

1. Go to *UTM Profiles* > *Application Control* > *Application Sensor*.
2. Select an application sensor from the drop-down list in the Edit Application Sensor window title bar.
3. Select the *Create New* drop-down icon in the sensor and choose *Entry*.

4 Using the *Category* selection, choose the type of application you want to add. For example, if you want to add Facebook chat, choose *im*.

The *Category* selection displays only the options available in the *Application* you select. If you want to see all the applications listed, leave *Category* set to *All Categories*.

5 Using the *Application* selection, choose the application you want to add.

The applications available to you will be limited to those in the category you select.

6 Select the *Action* the FortiGate unit will take when it detects network traffic from the application:

- *Block* will stop all traffic from the application and log all occurrences.
- *Monitor* allows the application traffic to flow normally and log all occurrences.

If you set the action to *Monitor*, you have the option of enabling traffic shaping for the application or applications specified in this application list entry. For more information about application control traffic shaping, see "Application traffic shaping" on page 1067

7 Enable *Session TTL* to specify a time-to-live value for the session, in seconds. If this option is not enabled, the TTL defaults to the setting of the CLI command `config system session-ttl`.

8 Select *Enable Packet Log* to have the FortiGate unit save the packets that application control used to determine the traffic came from the application.

9 Some applications have additional options:

IM Options (for some IM applications)	
Block Login	Select to prevent users from logging in to the selected IM system.
Block File Transfers	Select to prevent the sending and receiving of files using the selected IM system.
Block Audio	Select to prevent audio communication using the selected IM system.
Inspect Non-standard Port	Select to allow the FortiGate unit to examine nonstandard ports for the IM client traffic.
Display DLP meta-information on the system dashboard	Select to include meta-information detected for the IM system on the FortiGate unit dashboard.
Other Options	
Command	Some traffic types include a command option. These include FTP.Command, NNTP.Command, POP3.Command, and SMTP.Command. Specify a command that appears in the traffic that you want to block or pass. For example, enter `GET` as a command in the *FTP.Command* application to have the FortiGate unit examine FTP traffic for the GET command. Multiple commands can be entered.

Method	A method option is available for HTTP, RTSP, and SIP protocols. Specify a method that appears in the traffic that you want to block or pass. For example, enter `POST` as a method in the *HTTP.Method* application to have the FortiGate unit examine HTTP traffic for the POST method. Multiple methods can be entered.
Program Number	Enter the program number appearing in Sun Remote Procedure Calls (RPC) that you want to block or pass. Multiple program numbers can be entered.
UUID	Enter the UUID appearing in Microsoft Remote Procedure Calls (MSRPC) that you want to block or pass. Multiple UUIDs can be entered.

To add an application filter to an application sensor

1 Go to *UTM Profiles* > *Application Control* > *Application Sensor*.

2 Select an application sensor from the drop-down list in the Edit Application Sensor window title bar.

3 Select the *Create New* drop-down icon in the sensor and choose *Filter*.

4 Configure the filter that you require. Applications matching all of the characteristics you specify in the filter will be included in the filter.

Category	Select *Specify* and choose an application category to include in the filter. All applications within the category will be included. Some categories have one or more subcategories to allow you to narrow the included applications. For example, selecting IM will include all of the instant messaging applications, but the VoIP subcategory will restrict the applications to only those related to VoIP. If you select *All*, the category attribute will not be used to determine which signatures are included in the filter.
Vendor	Select *Specify* and choose a vendor to include all of that vendor's applications in the filter. If you select *All*, the vendor attribute will not be used to determine which signatures are included in the filter.
Behavior	Select *Specify* and choose the type of application behavior to include. For example, selecting *Encrypted-Tunneling* will include all applications providing or related to encrypted tunneling. If you select *All*, the behavior attribute will not be used to determine which signatures are included in the filter.
Technology	Select *Specify* and choose the technology of the applications to include. Options include web-browser, peer-to-peer, client, and server. If you select *All*, the technology attribute will not be used to determine which signatures are included in the filter.

Protocol	Select *Specify* and choose the network protocols the applications use. If you select *All*, the Protocol attribute will not be used to determine which signatures are included in the filter.
Tags	Tags are a means by which you can apply customized labels to your application filters. Specified tags are displayed only within the filter itself on the Edit Application Filter page. By default, the tag feature is disabled on all but the largest FortiGate models. If the Tags option is not visible, you must go to *System* > *Admin* > *Settings* and enable *Display Object Tagging and Coloring* to enable it. For more information about tags, see "Tag management" on page 582.
Applied Tags	Displays the tags that you have applied to the filter.
Add tags	Enter a tag and then select the plus (+) icon to add the tag to the filter. This also adds the tag to the *Applied tags* list.
View Matched rules	Select view a list of all the applications included in the filter with the current settings.
Action	Select the *Action* the FortiGate unit takes when it detects network traffic from the application: • *Block* will stop all traffic from the application and log all occurrences. • *Monitor* allows the application traffic to flow normally and log all occurrences. • *Reset* will reset the network session the application is using. If you set the action to *Monitor*, you have the option of enabling traffic shaping for the application or applications specified in this application list entry. For more information about application control traffic shaping, see "Application traffic shaping" on page 1067.
Session TTL	Enable *Session TTL* to specify a time-to-live value for the session, in seconds. If this option is not enabled, the TTL defaults to the setting of the CLI command `config system session-ttl`.
Packet Logging	Select to enable packet logging for the filter. When you enable packet logging on a filter, the unit saves a copy of the packets that match any signatures included in the filter. The packets can be analyzed later. For more information about packet filtering, see "Viewing and saving logged packets" on page 1144

5 Select *OK*.

The filter is created and added to the filter list.

Understanding the default application sensor

A default application sensor is provided with your FortiGate unit. You can use it as provided, or modify it as required.

Before using the default application sensor, examine it closely to ensure you understand how it works.

monitor-all	This sensor allows all application traffic and enables the application control monitoring for all traffic.

Viewing and searching the application list

Go to *UTM Profiles* > *Application Control* > *Application List* to view the list of applications the FortiGate unit recognizes. You may find applications by paging manually through the list, apply filters, or by using the search field.

Searching manually

Applications are displayed in a paged list, with 50 applications per page. The bottom of the screen shows the current page and the total number of pages. You can enter a page number and press enter, to skip directly to that page. Previous Page and Next Page buttons move you through the list, one page at a time. The First Page and Last Page button take you to the beginning or end of the list.

Applying application list filters

You can enter criteria for one or more columns, and only the applications matching all the conditions you specify will be listed.

To apply filters

1. Go to *UTM Profiles* > *Application Control* > *Application List*.
2. Select *Filter Settings*.
3. Select *Add New Filter*.
4. Select column by which to filter.
5. Select the item or items by which to filter.
6. Continue to add more filters to narrow your search, if required.
7. Select *OK*.

The options available to you will vary by column. For example, Category allows you to choose one option from a list, while Behavior allows you to select multiple items. Filtering by name allows you to enter a text string and all application names containing the string will be displayed.

Using the search field

To use the search field, located above the application list, start typing any portion of the application name. Application names matching the text you enter are displayed in a drop-down list. A maximum of ten matches are displayed at a time.

Select an application from the drop-down list to display its application list entry.

Application traffic shaping

You can apply traffic shaping for application list entries you configure to pass. Traffic shaping enables you to limit or guarantee the bandwidth available to the application or applications specified in an application list entry. You can also prioritize traffic by using traffic shaping.

When the action is set to *Monitor*, two options appear: *Traffic Shaping* and *Reverse Direction Traffic Shaping*. When enabled, you can select traffic shapers configured in *Firewall Objects* > *Traffic Shaper*.

You can create or edit traffic shapers by going to *Firewall Objects* > *Traffic Shaper* > *Shared*. Per-IP traffic shapers are not available for use in application traffic shaping.

For more information about traffic shaping, see "Traffic shaping methods" on page 2261.

Enabling application traffic shaping

Enabling traffic shaping in an application sensor involves selecting the required shaper. You can create or edit shapers in *Firewall Objects* > *Traffic Shaper* > *Shared*.

To enable traffic shaping

1. Go to *UTM Profiles* > *Application Control* > *Application Sensor*.
2. Select an application sensor from the drop-down list in the Edit Application Sensor window title bar.
3. Select the application control list entry and choose *Edit*.
4. Select *Traffic Shaping* and choose the required traffic shaper from the list.

   If the action is set to *Block*, the traffic shaping option is not available. Only allowed traffic can be shaped.
5. Select *Reverse Direction Traffic Shaping* and choose the required traffic shaper from the list if traffic flowing in the opposite direction also requires shaping.
6. Select *OK*.

Any security policy with this application sensor selected will shape application traffic according to the applications specified in the list entry and the shaper configuration.

Reverse direction traffic shaping

To enable traffic shaping, you must set the action to *Monitor*, enable *Traffic Shaping* and then choose the shaper. This will apply the shaper configuration to the application traffic specified in the entry, but only in the direction as specified in the security policy in which the application sensor is selected. To shape traffic travelling in the opposite direction, enable *Reverse Direction Traffic Shaper*.

For example, if you find that your network bandwidth is being overwhelmed by streaming HTTP video, one solution is to limit the bandwidth by applying a traffic shaper to an application control entry that allows the HTTP.Video application. Your users access the Web using a security policy that allows HTTP traffic from the internal interface to the external interface. Firewall policies are required to initiate communication so even though web sites respond to requests, a policy to allow traffic from the external interface to the internal interface is not required for your users to access the Web. The internal to external policy allows them to open communication sessions to web servers, and the external servers can reply using the existing session.

If you enable *Traffic Shaping* and select the shaper in an application sensor specified in the security policy, the problem will continue. The reason is the shaper you select for *Traffic Shaping* is applied only to the application traffic moving in the direction stated in the security policy. In this case, that is from the internal interface to the external interface. The security policy allows the user to visit the web site and start the video, but the video itself is streamed from the server to the user, or from the external interface to the internal interface. This is the reverse of the direction specified in the security policy. To solve the problem, you must enable *Reverse Direction Traffic Shaping* and select the shaper.

Shaper re-use

Shapers are created independently of firewall policies and application sensors so you are free to reuse the same shapers in multiple list entries and policies. Shared shapers can be configured to apply separately to each security policy or across all policies. This means that if a shaper is configured to guaranteed 1000 KB/s bandwidth, each security policy using the shaper will have its own 1000 KB/s reserved, or all of the policies using the shaper will share a pool if 1000 KB/s, depending on how it is configured.

The same thing happens when a shaper is used in application sensors. If an application sensor using a shaper is applied to two separate policies, how the bandwidth is limited or guaranteed depends on whether the shaper is set to apply separately to each policy or across all policies. In fact, if a shaper is applied directly to one security policy, and it is also included in an application sensor that is applied to another security policy, the same issue occurs. How the bandwidth is limited or guaranteed depends on the shaper configuration.

If a shaper is used more than once within a single application sensor, all of the applications using the shaper are restricted to the maximum bandwidth or share the same guaranteed bandwidth.

For example, you want to limit the bandwidth used by Skype and Facebook chat to no more than 100 KB/s. Create a shaper, enable *Maximum Bandwidth*, and enter 100. Then create an application sensor with an entry for Skype and another entry for Facebook chat. Apply the shaper to each entry and select the application sensor in the security policy that allows your users to access both services.

This configuration uses the same shaper for each entry, so Skype ***and*** Facebook chat traffic are limited to no more than 100 KB/s in total. That is, traffic from both applications is added and the total is limited to 100 KB/s. If you want to limit Skype traffic to 100 KB/s and Facebook chat traffic to 100 KB/s, you must use separate shapers for each application control entry.

Application control monitor

The application monitor enables you to gain an insight into the applications generating traffic on your network. When monitor is enabled in an application sensor entry and the list is selected in a security policy, all the detected traffic required to populate the selected charts is logged to the SQL database on the FortiGate unit hard drive. The charts are available for display in the executive summary section of the log and report menu.

Because the application monitor relies on a SQL database, the feature is available only on FortiGate units with an internal hard drive.

While the monitor charts are similar to the top application usage dashboard widget, it offers several advantages. The widget data is stored in memory so when you restart the FortiGate unit, the data is cleared. Application monitor data is stored on the hard drive and restarting the system does not affect old monitor data.

Application monitor allows you to choose to compile data for any or all of three charts: top ten applications by bandwidth use, top ten media users by bandwidth, and top ten P2P users by bandwidth. Further, there is a chart of each type for the traffic handled by each security policy with application monitor enabled. The top application usage dashboard widget shows only the bandwidth used by the top applications since the last system restart.

Enabling application control monitor

Once you have configured and enabled application control, you can enable application monitor. There are three steps, as detailed below: enabling application monitor in an application sensor, selecting the charts in the security policy, and displaying the charts in the Executive Summary.

To enable application control monitor in an application sensor

1. Go to *UTM Profiles* > *Application Control* > *Application Sensor*.
2. Select an application sensor from the drop-down list in the Edit Application Sensor window title bar.
3. Select *Enable Monitoring*.
4. Select *OK*.

With application control monitoring enabled, the FortiGate unit begins collecting data for the applications specified in the application sensor from the traffic handled by all policies using the list. If you require monitoring in other application sensors, follow the same procedure to enable it in each sensor.

To configure the charts for which data is collected

1. Go to *Policy* > *Policy* > *Policy*.
2. Select the security policy in which the application sensor is selected and choose *Edit*. Note the security policy ID number.
3. Under *UTM*, the *Enable Application Control* selection has three new options, one for each chart type. Select one or more chart types.
4. Select *OK*.
5. If you have the application sensor specified in multiple firewall policies, repeat this procedure for each policy.

To display the application monitor charts

1. Go to *Log&Report* > *Report Access* > *Executive Summary*.
2. Select *Add Widget*.

3 Select the chart you want from the *Widgets* list.

The three application monitor charts correspond to the three chart selections in the security policy. They are listed in the list as:

- `top10-application-bw-X-0`
- `top10-media-user-X-0`
- `top10-p2p-user-bw-X-0`

If you have application monitor enabled in multiple firewall policies, one chart of each type per policy will be available for you to choose. The '`X`' in the chart name is the security policy number.

4 Select a *Daily* or *Weekly* schedule. The chart will display the data collected from only the current day or current week, depending on the setting. The chart will be reset daily on the hour specified, or weekly on the hour and day specified.

5 Select *OK*.

Application control packet logging

Packet logging saves the network packets that application control identifies application traffic with. These packets can be used to trouble-shoot false positives or for forensic investigation.The FortiGate unit saves the logged packets to the attack log, wherever the logs are configured to be stored, whether memory, internal hard drive, a FortiAnalyzer unit, or the FortiGuard Analysis and Management Service.

You can enable packet logging in individual application list entries. Use caution in enabling packet logging. Application sensor entries configured with few restrictions can contain hundreds of applications, potentially resulting in a flood of saved packets. This would take up a great deal of space, require time to sort through, and consume considerable system resources to process. Packet logging is designed as a focused diagnostic tool and is best used with a narrow scope.

Although logging to multiple FortiAnalyzer units is supported, packet logs are not sent to the secondary and tertiary FortiAnalyzer units. Only the primary unit receives packet logs.

To enable application control packet logging

1 Create an entry in an application sensor. For more information, see "Adding applications to an application sensor" on page 1062.

2 Before saving the entry, select *Packet Log*.

3 Select the application sensor in the security policy that allows the network traffic the FortiGate unit will examine for the application or applications.

For information on viewing and saving logged packets, see "Viewing and saving logged packets" on page 1144.

Application considerations

Some applications behave differently from most others. You should be aware of these differences before using application control to regulate their use.

IM applications

Application control regulates most instant messaging applications by preventing or allowing user access to the service. Selecting *Block Login* will not disconnect users who are logged in when the change is made. Once users log out, however, they will not be able to log in again.

Skype

Based on the NAT firewall type, Skype takes advantage of several NAT firewall traversal methods, such as STUN (Simple Traversal of UDP through NAT), ICE (Interactive Connectivity Establishment) and TURN (Traversal Using Relay NAT), to make the connection.

The Skype client may try to log in with either UDP or TCP, on different ports, especially well-known service ports, such as HTTP (80) and HTTPS (443), because these ports are normally allowed in firewall settings. A client who has previously logged in successfully could start with the known good approach, then fall back on another approach if the known one fails.

The Skype client could also employ Connection Relay. This means if a reachable host is already connected to the Skype network, other clients can connect through this host. This makes any connected host not only a client but also a relay server.

Application control examples

Blocking all instant messaging

Instant messaging use is not permitted at the Example Corporation. Application control helps enforce this policy.

First you will create an application sensor with a single entry that includes all instant messaging applications. You will set the list action to block.

To create the application sensor

1. Go to *UTM Profiles* > *Application Control* > *Application Sensor*.
2. Select the *Create New* icon in the title bar of the *Edit Application Sensor* window.
3. In the *Name* field, enter `no IM` for the application sensor name.
4. Select *OK*.
5. Select the *Create New* drop-down icon in the sensor and choose *Entry*.
6. For *Category*, select *im*.
7. For *Action*, select *Block*.
8. Select *OK* to save the new list entry.
9. Select *OK* to save the list.

Next you will enable application control and select the list.

To enable application control and select the application sensor

1. Go to *Policy* > *Policy* > *Policy*.
2. Select the security policy that allows the network users to access the Internet and choose *Edit*.
3. Enable *UTM*.
4. Select *Enable Application Control*.

5 Select the *no IM* application sensor.

6 Select *OK*.

No IM use will be allowed by the security policy. If other firewall policies handle traffic that users could use for IM, enable application control with the *no IM* application sensor for those as well.

Allowing only software updates

Some departments at Example Corporation do not require access to the Internet to perform their duties. Management therefore decided to block their Internet access. Software updates quickly became an issue because automatic updates will not function without Internet access and manual application of updates is time-consuming.

The solution is configuring application control to allow only automatic software updates to access the Internet.

To create an application sensor — web-based manager

1 Go to *UTM Profiles* > *Application Control* > *Application Sensor*.

2 Select the *Create New* icon in the title bar of the *Edit Application Sensor* window.

3 In the *Name* field, enter `Updates_Only` as the application sensor name.

4 Select *OK*.

5 Select the *Create New* drop-down icon in the sensor and choose *Entry*.

6 Select *update* from the *Category* list.

7 Select *Pass* from the *Action* list.

8 Select *OK* to save the entry.

This application list entry will allow all software update application traffic.

9 Select the *All Other Known Applications* entry.

10 Select *Edit*.

11 Select *Block* from the *Action* list.

12 Select *OK*.

This application list entry will block all traffic from recognized applications that are not specified in this application sensor.

13 Select the *All Other Unknown Applications* entry.

14 Select *Edit*.

15 Select *Block* from the *Action* list.

16 Select *OK*.

This application list entry will block all traffic from applications that are not recognized by the application control feature.

17 Select *OK*.

18 Select *OK* to save the application sensor.

To create an application sensor — CLI

```
config application list
  edit Updates_Only
    config entries
      edit 1
        set category 17
```

```
      set action pass
    end
  set other-application-action block
  set unknown-application-action block
end
```

Selecting the application sensor in a security policy

An application sensor directs the FortiGate unit to scan network traffic only when it is selected in a security policy. When an application sensor is selected in a security policy, its settings are applied to all the traffic the security policy handles.

To select the application sensor in a security policy — web-based manager

1. Go to *Policy* > *Policy* > *Policy*.
2. Select a policy.
3. Select the *Edit* icon.
4. Enable *UTM*.
5. Select the *Enable Application Control* option.
6. Select the `Updates_only` list.
7. Select `default` from the *Protocol Options* list.

   Application control can not be enabled without selecting a protocol options profile. A default profile is provided.
8. Select *OK*.

To select the application sensor in a security policy — CLI

```
config firewall policy
  edit 1
    set utm-status enable
    set profile-protocol-options default
    set application-list Updates_Only
  end
```

Traffic handled by the security policy you modified will be scanned for application traffic. Software updates are permitted and all other application traffic is blocked.

Application Control interface reference

This section describes how to configure the application control options associated with firewall policies.

By using the UTM feature's application control, the unit can detect and take action against network traffic depending on the application generating the traffic. Based on Intrusion Protection protocol decoders, application control is a more user-friendly and powerful way to use Intrusion Protection features to log and manage the behavior of application traffic passing through the unit. Application control uses IPS protocol decoders that can analyze network traffic to detect application traffic even if the traffic uses non-standard ports or protocols.

The unit can recognize the network traffic generated by a large number of applications. You can create application control black/white lists that specify the action to take with the traffic of the applications you need to manage and the network on which they are active. Add application control lists to firewall policies applied to the network traffic you need to monitor.

Fortinet is constantly increasing the list of applications that application control can detect by adding applications to the FortiGuard Application Control Database. Because intrusion protection protocol decoders are used for application control, the application control database is part of the FortiGuard Intrusion Protection System Database and both of these databases have the same version number.

You can find the version of the application control database that is installed on your unit, by going to the *License Information* dashboard widget and find IPS Definitions version.

You can go to the FortiGuard Application Control List to see the complete list of applications supported by FortiGuard. This web page lists all of the supported applications. You can select any application name to see details about the application.

This topic includes the following:

- Application Sensor
- Application List

DiffServ is supported per-application and is available only in the CLI.

Application Sensor

Each application control list contains details about the application traffic to be monitored and the actions to be taken when it is detected. An application control list must be selected in a firewall policy to take effect.

There are no default application control lists provided.

The unit examines network traffic for the application entries in the listed order, one at a time, from top to bottom. Whenever a match is detected, the action specified in the matching rule is applied to the traffic and further checks for application entry matches are stopped. Because of this, you can use both actions to create a complex rule with fewer entries.

Application sensor configuration settings

The following are application sensor configuration settings in *UTM Profiles* > *Application Control* > *Application Sensor*.

Application Sensor page	
Lists each individual black/white list that you created. On this page, you can edit, delete and create a new application sensors. You are redirected to this page when you select *View List* on the Edit Application Sensor page.	
Create New	Creates a new application control sensor. When you select *Create New*, you are automatically redirected to the New Application Control List page. This page provides a name field and a comment field. You must enter a name to go to the Edit Application Sensor page where you can then configure settings for the new application sensor.
Edit	Modifies settings within an application black/white list. When you select *Edit*, you are automatically redirected to the Edit Application Control List page.

Delete	Removes the application control black/white list from within the list on the page.
Name	The available application control lists.
# of Entries	The number of application rules in each application control list.
Comments	An optional description of each application control list.
Ref.	Displays the number of times the object is referenced to other objects. For example, av_1 profile is applied to a firewall policy; on the Profile page (*UTM Profiles* > *Antivirus* > *Profile*), 1 appears in *Ref.*. To view the location of the referenced object, select the number in *Ref.*, and the Object Usage window appears displaying the various locations of the referenced object. To view more information about how the object is being used, use one of the following icons that is avialable within the Object Usage window: • **View the list page for these objects** – automatically redirects you to the list page where the object is referenced at. • **Edit this object** – modifies settings within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy and so, when this icon is selected, the user is redirected to the Edit Policy page. • **View the details for this object** – table, similar to the log viewer table, contains information about what settings are configured within that particular setting that the object is referenced with. For example, av_1 profile is referenced with a firewall policy, and that firewall policy's settings appear within the table.
Edit Application Sensor page Provides settings for configuring the applications for the list. When you are editing a list, you are redirected to this page. **Note:** Logging is enabled in the CLI.	
Name	If you are editing an existing application control list and want to change the name, enter a new name in the field. You must select *OK* to save the change.
Comments	If you are editing an existing list and want to change or add a description, enter the new text in the field. You must select *OK* to save the change.

Create New	Creates a new application entry. When you select *Create New*, you are automatically redirected to the New Application Filter page. When you select the down arrow beside *Create New*, you can choose to create either a new application filter or entry. When you select *Filter*, you are automatically redirected to the New Application Filter page where you can configure a filter. When you select *Entry*, you are automatically redirected to the New Application Entry page where you can configure an entry.
Edit	Modifies settings within the application control entry. When you select *Edit* you are automatically redirected to the Edit Application Entry page.
Delete	Removes the application control entry in the list. To remove multiple application control entries from within the list, on the Edit Application Sensor page, in each of the rows of the entries you want removed, select the check box and then select *Delete*. To remove all application control entries from the list, on the Edit Application Sensor page, select the check box in the check box column and then select *Delete*.
Insert	Creates a new application control entry above the entry you highlighted. When you select *Insert*, you are automatically redirected to the New Application Entry page.
Move To	Moves the application control entry to any position in the list. When you select *Move To*, the Move Application Control Entry window appears. To move an application control entry, select the new position *Before* or *After*, which will place the current entry before or after the entry you enter in the *Application ID* field. Use the number found in the *ID* column when entering the new position in the *Application ID* field.
View Rules	Select to view the rules of an entry. When you select *View Rules*, the Matched Rules window appears. You can view all the rules associated within that entry in this window.
Page Controls	Use to navigate through the application control entries within an application control list.
ID	The identification number of the entry.
Category	The category indicates the scope of the applications included in the application entry if *Application* is set to *all*. For example, if *Application* is *all* and *Category* is *toolbar*, then all the toolbar applications are included in the application entry even though they are not specified individually. If *Application* is a single application, the value in *Category* has no effect on the operation of the application entry.
Vendor	The application's vendor name.
Behavior	The type of behavior chosen.
Technology	The type of technology associated with the application.

Application	The type of application that was chosen. **Note:** *Full List* appears in this column only when you choose all applications for a filter. When you select *Full List*, the Match Rules window appears where you can view all the applications.
Action	If the unit detects traffic from the specified application, the selected action will be taken.
New Application Filter page Provides settings for configuring an application filter to add to the application control sensor. This page appears when you select *Create New* on the Edit Application Sensor page. If you are on the Application Sensor page, and you select *Create New*, you will be redirected to the New Application Filter page.	
Category	The applications are categorized by type. If you want to choose an IM application, for example, select the *im* category, and the application control list will show only the *im* applications. The *Category* selection can also be used to specify an entire category of applications. To select all IM applications for example, select the *im* category, and select *all* as the application. This specifies all the IM applications with a single application control black/white list entry.
Vendor	Select to either specify a vendor or enable all vendors.
Behavior	When you select *Specify*, the lists *Available* and *Selected* appear. Select the available behavior of the application (for example, encrypted-tunneling) in the *Available* list and then move it to the *Selected* list using the -> arrow. Use the same method to remove a behavior from the *Selected* list except use the <- arrow.
Technology	Select to include all technology or specify the technology. For example, web browsers.
Protocol	Select to include all protocols or specify a particular protocol.
Tags	Adds and displays the tags you create. If tag settings are not available on the web-based manager, you must enable them in *System* > *Admin* > *Settings*.
Applied tags	Displays the current tags configured for the filter.
Add tags	Enter the tag in the field and then select the plus sign (+) beside the field to add the tag to the list in *Applied tags*.
View Matched rules	Select to view the matched rules.
Action	If the unit detects traffic from the specified application, the selected action will be taken.
Monitor	Select to monitor the filter using traffic shaping or reverse direction traffic shaping or both.
Block	Select to block.

Session TTL	The application's session TTL. If this option is not enabled, the TTL defaults to the setting of the `config system session-ttl` CLI command.
Packet Logging	Select to log the occurrence of packet logs which concern application control.
New Application Entry page Provides settings for configuring an application entry, to add to the application sensor.	
Category	Select a category from the drop-down list.
Application	Select an application from the drop-down list.
Action	Select either *Monitor* or *Block* for the type of action the unit will take. When you select *Monitor*, the options for applying traffic shaping and reverse direction traffic shaping. Select the check box beside either one or both to enable these options and then select
Session TTL	Enter a number for the session's time to live.
Packet Logging	Select to enable packet logging.

Application List

The application list displays applications, which also shows their popularity and risk. You can view the details of each application by selecting the application's name; this link redirects you to the FortiGuard Application Control List where the details are given for the application. You can also filter the information that appears in *UTM Profiles* > *Application Control* > *Application List*.

You can go to the FortiGuard Application Control List to see the complete list of applications supported by FortiGuard. This web page lists all of the supported applications. You can select any application name to see details about the application.

Application lists are viewed from *UTM Profiles* > *Application Control* > *Application List*.

Application List page Lists the applications that are available on the unit, which includes their category, popularity rating and risk.	
Tags	Select to add or remove tags to the applications in the list. **Note:** If *Tags* is not available on the web-based manager, you must enable it in *System* > *Admin* > *Settings*. When you select the down arrow beside *Tags*, you can add tags or remove tags. To add tags to an application, select the application first then select the down arrow to then select *Add Tags*. The Add Tags window appears. Enter the tag in the *Add tag* field and select the plus (+) sign; repeat until all tags are in the Tags to apply list. To remove tags, select the application first, select the down arrow beside Tags, and then select *Remove Tags*. The Remove Tags window appears. Select the tags that you want removed in the *Applied Tags* row; repeat until all the tags are in the *Tags to remove* row. The tags will automatically be put in the *Tags to remove* row after being selected in the *Applied Tags* row. If there are tags that you want to add that have been configured for another object, you can add those tags as well to signatures. To apply these other object tags, select the signature first, select the down arrow beside Tags, and then select *Add Tags*. The Add Tags window appears. Select the tags you want to add in the *Click tag to* add row. The tags automatically appear in the *Tags to apply* row. Select *OK* to add those tags to the application.
Column Settings	Customize the column view. You can select the columns to hid or display them and specify the column display order.

Filter Settings	Select to filter the information on the page. *Filters* appears automatically after selecting *Filter Settings*, below the column headings. Use to configure filter settings. **Note:** *Filter Settings* configures all filter settings. Filter icons are used to configure filter settings within that column. To apply a filter setting, select the plus sign beside *Add new filter* and then select and enter the information required. Repeat to add other filter settings. To modify settings, select *Change* beside the setting and edit the settings. To clear all filter settings, select the icon beside *Clear all filters*. To use a filter icon to filter settings within a column, select the filter icon in the column; Filters appears. Within Filters, configure the settings for that column. The *Filters Settings* on the Application List page contains *Copy to Sensor*, which allows you to copy filter settings and apply them to an application sensor. To apply existing filter settings to a sensor, select the down arrow beside *Filter Settings*, and then select *Copy to Sensor*. The Select Object window appears. Select the sensor that you want to apply the settings to from the drop-down list. Select *OK*.
Search	Enter search criteria into the field and then press Enter on your keyboard. Use the *Clear All* icon beside the field to clear the search results.
Page Controls	Use to navigate through the list to view the applications.
[Total: <maximum number>]	The maximum number of applications that are currently in the FortiGuard Application Control List.
Application Name	The name of the application.
Category	The category that the application is associated with.
Vendor	The type of vendor.
Technology	The type of technology that the application uses. For example, 56.COM using Peer-to-Peer technology.
Protocol	The type of protocol the application uses.
Behavior	The type of behavior that is associated with the application.
Tags	The tags that are associated with that application. If no tag configuration settings display, this indicates that this feature is disabled. You can enable tag configuration settings from *System* > *Admin Settings*.

DoS policy

Denial of Service (DoS) policies are primarily used to apply DoS sensors to network traffic based on the FortiGate interface it is entering as well as the source and destination addresses. DoS sensors are a traffic anomaly detection feature to identify network traffic that does not fit known or common traffic patterns and behavior. A common example of anomalous traffic is the denial of service attack. A denial of service occurs when an attacking system starts an abnormally large number of sessions with a target system. The large number of sessions slows down or disables the target system, so that legitimate users can no longer use it.

This section describes how to create and configure DoS sensors and policies to protect the publicly accessible servers on your network.

The following topics are included in this section:

DoS policy concepts

DoS policies are similar to firewall policies except that instead of defining the way traffic is allowed to flow, they keep track of certain traffic patterns and attributes and will stop traffic displaying those attributes. Further, DoS policies affect only incoming traffic on a single interface. You can further limit a DoS policy by source address, destination address, and service.

DoS policies examine network traffic very early in the sequence of protective measures the FortiGate unit deploys to protect your network. Because of this early detection, DoS policies are a very efficient defence that uses few resources. Denial of service attacks, for example, are detected and its packets dropped before requiring security policy look-ups, antivirus scans, and other protective but resource-intensive operations. For more information about DoS attacks, see “Defending against DoS attacks” on page 888.

Enable DoS

A DoS policy examines network traffic arriving at an interface for anomalous patterns usually indicating an attack. Enable DoS sensors to protect your FortiGate unit from attack. To apply a DoS policy, you must follow the steps below in sequence:

1. Create a DoS sensor.
2. Create a DoS policy
3. Apply the DoS sensor to the DoS policy.

Creating and configuring a DoS sensor

Because an improperly configured DoS sensor can interfere with network traffic, no DoS sensors are present on a factory default FortiGate unit. You must create your own and then enable them before they will take effect. Thresholds for newly created sensors are preset with recommended values that you can adjust to meet the needs of your network.

It is important to know normal and expected network traffic before changing the default anomaly thresholds. Setting the thresholds too low could cause false positives, and setting the thresholds too high could allow otherwise avoidable attacks.

To create a DoS sensor

1 Go to *UTM Profiles* > *Intrusion Protection* > *DoS Sensor*.
2 Select *Create New*.
3 In the *Name* field, enter the name of the DoS sensor.
4 Optionally, enter a description of the DoS sensor in the *Comment* field.
5 Select *OK*.

The DoS sensor is created and the sensor configuration window appears. However, a newly created DoS sensor contains default values which may not be appropriate for your network. You can adjust these values by configuring the DoS sensor thresholds.

To configure a DoS sensor

1 Go to *UTM Profiles* > *Intrusion Protection* > *DoS Sensor*.
2 Select the DoS sensor you want to configure and choose *Edit*.
3 The DoS sensor configuration window appears.

The *Anomalies Configuration* table lists 12 types of network anomalies.

Anomaly	Description
tcp_syn_flood	If the SYN packet rate of new TCP connections, including retransmission, to one destination IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
tcp_port_scan	If the SYN packet rate of new TCP connections, including retransmission, from one source IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
tcp_src_session	If the number of concurrent TCP connections from one source IP address exceeds the configured threshold value, the action is executed.
tcp_dst_session	If the number of concurrent TCP connections to one destination IP address exceeds the configured threshold value, the action is executed.
udp_flood	If the UDP traffic to one destination IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
udp_scan	If the number of UDP sessions originating from one source IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.

udp_src_session	If the number of concurrent UDP connections from one source IP address exceeds the configured threshold value, the action is executed.
udp_dst_session	If the number of concurrent UDP connections to one destination IP address exceeds the configured threshold value, the action is executed.
icmp_flood	If the number of ICMP packets sent to one destination IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
icmp_sweep	If the number of ICMP packets originating from one source IP address exceeds the configured threshold value, the action is executed. The threshold is expressed in packets per second.
icmp_src_session	If the number of concurrent ICMP connections from one source IP address exceeds the configured threshold value, the action is executed.
icmp_dst_session	If the number of concurrent ICMP connections to one destination IP address exceeds the configured threshold value, the action is executed.

4 Select *Enable* to have the FortiGate unit examine traffic for the anomaly.

5 Select *Logging* to create an entry in the attack log if the anomaly is detected.

6 Select an *Action* for the anomaly. By default, the action is *Pass*, which allows the traffic containing the anomaly to pass uninterrupted. If set to *Block*, the anomalous traffic is blocked and will not flow through the FortiGate unit.

With a Fortinet security processing module installed, FortiGate units that support these modules offer a third action for the `tcp_syn_flood` threshold. In addition to *Block* and *Pass*, you can choose to *Proxy* connect attempts when their volume exceeds the threshold value. When the `tcp_syn_flood` threshold action is set to *Proxy*, incomplete TCP connections are allowed as normal as long as the configured threshold is not exceeded. If the threshold is exceeded, the FortiGate unit will intercept incoming SYN packets with a hardware accelerated SYN proxy to determine whether the connection attempts are legitimate or a SYN flood attack. Legitimate connections are allowed while an attack is blocked.

Because DoS sensors are configured before being applied to an interface, you can assign a DoS sensor with the *Proxy* action to an interface that does not have hardware SYN proxy support. In this circumstance, the *Proxy* action is invalid and a *Pass* action will be applied.

7 Set the *Threshold* value for the anomaly. See the table in step 3 for details about the threshold values for each anomaly.

8 Select *OK*.

Creating a DoS policy

DoS policies examine network traffic entering an interface. The DoS sensor specified in the DoS policy allows you to limit certain anomalous traffic to protect against attacks.

To create a DoS policy

1 Go to *Policy* > *Policy* > *DoS Policy* and select *Create New*.

2 For *Source Interface/Zone*, select the interface on which the DoS policy will examine incoming traffic.
3 For *Source Address*, select the address or address group that defines the source addresses of the traffic the DoS policy will examine. Network traffic from addresses not included in the selected address group is ignored by this DoS policy.
4 For *Destination Address*, select the address or address group that defines the destination addresses of the traffic the DoS policy will examine. Network traffic to addresses not included in the selected address group is ignored by this DoS policy.
5 For *Service*, select the type of network traffic the DoS policy will examine. Protocols not included in the selected service or service group are ignored by this DoS policy.
6 Select the *DoS Sensor* check box and choose the required sensor from the list.
7 Select *OK*.

Apply an IPS sensor to a DoS policy

Although IPS sensors are usually applied to firewall policies, you can also apply them to DoS policies by using CLI commands. There are two reasons you might want to apply an IPS sensor to a DoS policy:

- If you want to have all traffic coming into one FortiGate unit interface checked for the signatures in an IPS sensor, it is simpler to apply the IPS sensor once to a DoS policy. In a complex configuration, there could be many policies controlling the traffic coming in on a single interface.
- The operations in a DoS policy occur much earlier in the sequence of operations performed on incoming traffic. This means that IPS examination of traffic occurs much sooner if the IPS sensor is applied to a DoS policy. Fewer system resources are used because signatures set to block traffic will take effect before security policy checking and all of the scans specified in the security policy.

The CLI command for configuring DoS policies is `config firewall interface-policy`. The following command syntax shows how to add an example IPS sensor called `all_default_pass` to a DoS policy with policy ID 5 that was previously added from the web-based manager.

```
config firewall interface-policy
  edit 5
    set ips-sensor-status enable
    set ips-sensor all_default_pass
  end
```

DoS example

The Example.com corporation installed a web server and connected it to Port5 on its FortiGate unit. To protect against denial of service attacks, you will configure and apply a DoS sensor to protect the web server.

To create the DoS sensor

1 Go to *UTM Profiles* > *Intrusion Protection* > *DoS Sensor*.
2 Select *Create New*.
3 Enter `Web Server` in the *Name* field.
4 In the *Anomalies Configuration* table, select the *Enable* check box in the table heading. This enables all the anomalies with a single selection.

5 Select *OK* to save the new DoS policy.

As suggested in "Defending against DoS attacks" on page 888, the IT administrators will run the DoS policy with logging enabled and the anomaly actions set to *Pass* until they determine the correct threshold values for each anomaly.

To create a DoS policy

1 Go to *Policy* > *Policy* > *DoS Policy*.

2 Select *Create New*.

3 In the *Source Interface/Zone* field, select *Port1* which is the interface connected to the Internet.

4 In the *Source Address* field, select *all*.

5 In the *Destination Address* field, select *all*.

If there were more than one publicly accessible server connected to the FortiGate unit, you would specify the address of the web server in this field.

6 In the *Service* field, select *ANY*.

7 Select the *DoS Sensor* check box and choose *Web Server* from the list.

8 Select *OK* to save the DoS policy.

The DoS policy will monitor all network traffic entering Port1 and log the violations if the thresholds in the *Web Server* DoS sensor are exceeded.

DoS Policy interface reference

The DoS security policy list displays the DoS security policies in their order of matching precedence for each interface, source/destination address pair, and service.

If virtual domains are enabled on the unit, DoS security policies are configured separately for each virtual domain; you must access the VDOM before you can configure its security policies.

You can add, delete, edit, and re-order security policies in the DoS policy list. DoS policy order affects security policy matching. As with security policies, DoS security policies are checked against traffic in the order in which they appear in the DoS policy list, one at a time, from top to bottom. When a matching security policy is discovered, it is used and further checking for DoS policy matches are stopped.

The DoS policy configuration allows you to specify the interface, a source address, a destination address, and a service. All of the specified attributes must match network traffic to trigger the security policy.

DoS policies configuration settings

The following are DoS policy configuration settings in *Policy* > *Policy* > *DoS Policy*.

DoS Policy page	
Lists each individual DoS policy that you created. On this page, you can edit, delete or create a new DoS policy.	
Create New	Adds a new DoS policy. Select the down arrow beside *Create New* to add a new section to the list to visually group the security policies. When you select *Create New*, (or the *Policy* option from the down arrow's drop-down list), you are automatically redirected to the New Policy page. When you select *Section Title*, the Section Title window appears. Enter the section title name in the *Name* field and then enter the DoS policy ID number of the security policy that you want the section title to come before in the *Starting Policy ID* field. For example, branch_office_dos comes before the DoS policy ID 2, so 2 is entered in the *Starting Policy ID* field.
Edit	Modifies settings within the security policy. When you select *Edit*, you are automatically redirected to the Edit Policy page. When you select the down arrow beside *Edit*, you can select to modify the security policy (*Edit Policy*), disable a security policy (*Disable*), or enable a security policy (*Enable*).
Delete	Removes a security policy from the list on the DoS Policy page. To remove multiple DoS security policies from within the list, on the DoS Policy page, in each of the rows of the security policies you want removed, select the check box and then select *Delete*. To remove all DoS security policies from the list, on the DoS Policy page, select the check box in the check box column, and then select *Delete*.
Move To	Moves the corresponding security policy before or after another security policy in the list. When you select *Move To*, the Move Policy window appears. To move a security policy, select the new position either *Before* or *After*, which will place the current entry before or after the security policy number that you enter in the *(Policy ID)* field. Enter the security policy ID number and then select OK. For example, policy ID 2 is moved after policy ID 5.
Insert	Inserts a new security policy above the corresponding security policy. When you select Insert, the New Policy window appears.

Filter Settings	Select to filter the information on the page. *Filters* appears automatically after selecting *Filter Settings*, below the column headings. Use to configure filter settings. **Note:** *Filter Settings* configures all filter settings. Filter icons are used to configure filter settings within that column. To apply a filter setting, select the plus sign beside *Add new filter* and then select and enter the information required. Repeat to add other filter settings. To modify settings, select *Change* beside the setting and edit the settings. To clear all filter settings, select the icon beside *Clear all filters*. To use a filter icon to filter settings within a column, select the filter icon in the column; *Filters* appears. Within *Filters*, configure the settings for that column.
Column Settings	Customize the table view. You can select the columns to hide or display and specify the column displaying order in the table.
Section View	Select to display security policies organized by interface.
Global View	Select to list all security policies in order according to a sequence number.
ID	A unique identifier for each security policy. Policies are numbered in the order they are created.
Source	The source address or address group to which the security policy applies.
Destination	The destination address or address group to which the security policy applies.
Service	The service to which the security policy applies.
DoS Sensor	The DoS sensor selected in this security policy.
Interface	The interface to which this security policy applies.
Status	When selected, the DoS security policy is enabled. Clear the check box to disable the security policy.
New Policy page	
Provides settings for configuring a DoS security policy. When you select *Create New* on the DoS Policy page, you are automatically redirected to this page.	
Source Interface/Zone	The interface or zone to be monitored.
Source Address	Select an address, address range, or address group to limit traffic monitoring to network traffic sent from the specified address or range. Select *Multiple* to include multiple addresses or ranges. You can also select *Create New* to add a new address or address group.
Destination Address	Select an address, address range, or address group to limit traffic monitoring to network traffic sent to the specified address or range. Select *Multiple* to include multiple addresses or ranges. You can also select *Create New* to add a new address or address group.

Service	Select a firewall pre-defined service or a custom service to limit traffic monitoring to only the selected service or services. You can also select *Create New* to add a custom service.
DoS Sensor	Select and specify a DoS sensor to have the FortiGate unit apply the sensor to matching network traffic. You can also select *Create New* to add a new DoS Sensor. See "Creating and configuring a DoS sensor" on page 1082.

Endpoint Control and monitoring

This section describes the Endpoint Control feature and how to configure it.

The following topics are included in this section:

Endpoint Control overview

Endpoint Control ensures that workstation computers (endpoints) meet security requirements, otherwise they are not permitted access. Endpoint Control can enforce

- use of FortiClient Endpoint Security
- use of a licensed version of FortiClient Endpoint Security
- use of FortiClient firewall
- use of FortiClient antivirus protection
- use of FortiClient web content filtering
- use of up-to-date FortiClient antivirus signatures
- installation or running of specific applications
- absence or non-use of specific applications

Non-compliant endpoints can be either warned or blocked.

Of the features listed above, enforcement of FortiClient licensing and FortiClient web content filtering can be configured only through the CLI using the `config endpoint-control profile` command.

Endpoint Control settings are grouped into one or more Endpoint Control profiles. You enable Endpoint Security in firewall policies and select an Endpoint Control profile.

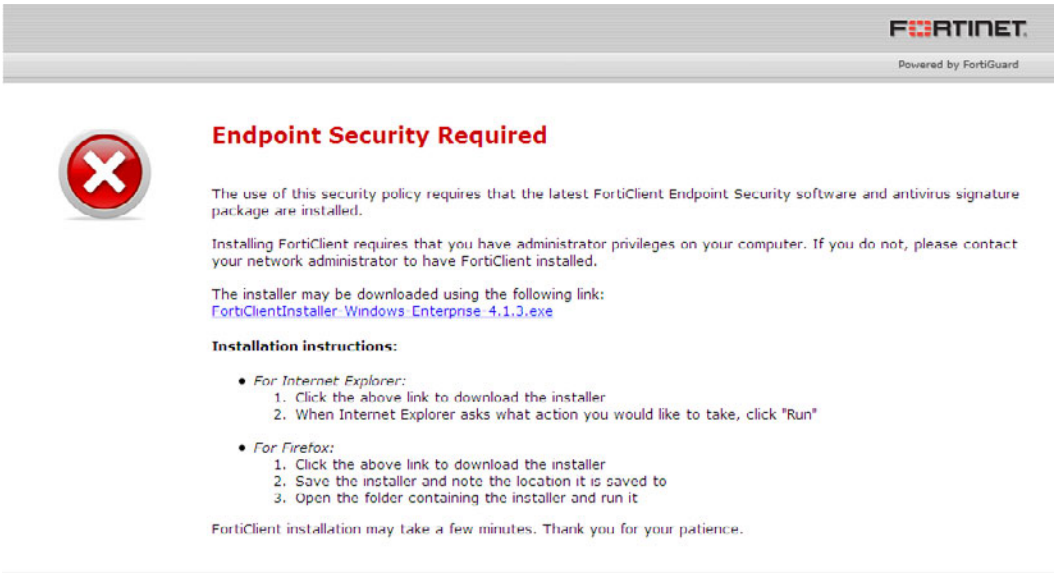
User experience

Endpoint Control applies to users attempting to make a connection that is controlled by a firewall policy with Endpoint Security enabled. The user of a non-compliant endpoint using a web browser receives a replacement message HTML page from the FortiGate unit. The message explains the non-compliance. Depending on the endpoint profile, the user may be allowed to continue or id blocked from further access. For information about modifying these replacement pages, see “Modifying Endpoint Security replacement pages” on page 1100.

FortiClient version non-compliance

If the *FortiClient* application detection entry in the Endpoint Control profile has either the Warn or Block action selected, the user sees a message like this:

Figure 90: Default FortiClient non-compliance message



If there is a FortiClient installer available for the user's endpoint computer, a link is provided to download the installer from the location defined in *UTM Profiles* > *Endpoint Control* > *Client Installers*. If there is no installer available, the user is asked to contact the network administrator.

If the action on the *FortiClient* application detection entry is Warn, there is a link at the bottom of the page to enable the user to continue to the requested web site without installing FortiClient Endpoint Security. Otherwise, the same message will be displayed for every connection attempt where Endpoint Security is in effect until the user installs FortiClient Endpoint Security.

Blocked user - FortiClient features not compliant

If the Endpoint Control profile has the *Block* action selected for FortiClient features such as antivirus or firewall, the FortiGate unit sends a message like this to the user's browser.:

Figure 91: Endpoint blocked message
