

Changing Key Assignments with Partial Save

8-20-04 partial saves.doc

This is to allow a quick method of reconfiguring a system setup involving just a few keypanels and saving a file for future modifications off line for other updates.

1. Select a keypanel from the KP view and make the desired changes to key assignments.
2. Select Partial Save from the File pull down menu. The panel you have been working on should be highlighted in the "selected" window.
3. In the Resource Type window, select "alphas" and in Alpha Type, select "ports".
4. In the Subset window, select "all alphas", click "add", then o.k.
5. Repeat sequence in **steps 3 and 4** for Party Lines, IFB's, Special Lists, GPI Outputs, ISO's, & UPL Resources.
6. Now name the file and click "save".
7. Select enter "file mode", then click "continue".
8. In the Edit pull down, click "copy", then "paste special".
9. De-select all boxes that appear in this next screen except "talk & listen assignments, select "all keys", then the ports you want to change, then select "paste".
10. Click on "partial save" again but don't change anything and click o.k. If prompted to overwrite file, click o.k.
11. Go "on line" to "send file" and select the file you just created and send it.

This file may be edited off line and re-sent for other changes.
