Manual Issue and Date: Issue A - March 2011 - For Version 1.0.415+ Software

Licence Agreement

"Product": SD10 software product produced by Digico UK Ltd intended for use on Target Platform identified below.

"Target Platform": Digico SD10 Digital Console system.

In return for the payment of the one-time fee, the Customer (identified at the end of this Agreement) receives from Digico UK Ltd a licence to use the Product subject to the following terms and conditions.

1. The Product may be used without time limit by the Customer on the Target Platform.
2. The Customer must register the Product with Digico UK Ltd. Registering the Product is deemed an acceptance of the terms and conditions in this agreement.
3. The Product and its licence are not transferable, and the Customer is not permitted to onward-license to any third party. The Customer indemnifies Digico UK Ltd against any and all claims and actions arising from third party use of copies of the Product made by the Customer.
4. The Customer agrees not to attempt to decompile the object code of the Product otherwise than in circumstances specifically provided for by law, and then only after consultation with Digico UK Ltd.
5. The Customer agrees not to use, or licence the Product for use, with equipment other than the Target Platform.
6. The Customer agrees not to modify the Product without the prior written consent of Digico UK Ltd.
7. This Agreement applies to any enhancement or upgrades that may become available for the Product.
8. This Agreement does not transfer any right, title, or interest in the Product to Customer except as specifically set forth herein.
9. Digico UK Ltd reserves the right to terminate this Agreement upon breach, in which event Customer shall thereafter only be authorised to use the Product to the extent that its contractual commitments to third parties require and then only where such commitments relate to use of the Product as authorised in the foregoing provisions of the Agreement.

LIMITED WARRANTY - Digico UK Ltd warrants for a period of 1 year from the date of purchase of the Product, the Product will reasonably execute its programming instructions when properly installed on the Target Platform. In the event that this Product fails to execute its programming instructions during the warranty period, the Customer's remedy shall be to return the Product to Digico UK Ltd for replacement or repair at Digico UK Ltd option. Digico UK Ltd makes no other express warranty, whether written or oral with respect of this Product.

LIMITATION OF LIABILITY - Except as otherwise expressly provided by law, (a) the remedies provided above are the Customer's sole and exclusive remedies and (b) Digico UK Ltd shall not be liable for any direct, indirect, special, incidental, or consequential damages (including lost profit whether based on warranty, contract, tort, or any other legal theory.)

This agreement is made under the Laws of England.

SD10 Operation Manual

Chapter 1:

Getting Started

1.1 Introduction

The Digico SD10 consists of a worksurface with an onboard audio engine and a range of onboard inputs and outputs. This can be connected to multiple Input/Output Rack Units by MADI links or optical fibre (optionally) which carry all the audio input and output signals.

The console worksurface consists of 3 sections that can control 96 input channels (12 of which can be stereo with no loss of channel count), 12 VCAs, up to 48 aux/group busses (plus Master buss configurable as LCR, and solo buss), a matrix of 16 inputs and 12 outputs, 24 onboard graphic EQs and 10 onboard stereo effects.

The left section has 12 assignable faders and 12 sets of assignable encoders and switches.

The centre section has, a touchscreen, 12 assigned encoders, 12 assignable faders, 12 sets of assignable encoders and switches, a full set of channel processing controls and a master fader.

The right section has 12 assignable faders, 12 sets of assignable encoders and switches and controls for monitoring, headphones, talkback, macros and snapshots.

Any of these worksurface sections can be assigned to the centre touchscreen.

Multiple console setups can provide:

Front of House and Monitoring with shared stage racks and gain tracking.

Remote control of a console from a laptop computer.

Optional extras include Waves plug-ins and Broadcast mode (Broadcast mode includes features such as surround busses, mix minus busses, multi-input channels, backstop PFL, auto PFL, fader start GPOs and expanded monitoring options). See the Appendices for details of these options.

1.2 Manual Overview

- Chapter 1 provides an overview of the desk, and describes some of the basic operating principles which the user will need to understand in order to run the desk.
- Chapter 2 describes the functions of the different channel types.
- Chapter 3 describes the master section of the desk, focusing on the various menus in the Master screen.
- Chapter 4 describes network, mirroring and multi-console setups
- Chapter 5 is a guide to troubleshooting
- Appendices are provided for the Waves plug-ins, Broadcast mode options, and Optocore operation.

The following typographical conventions are used in this manual:

Bold type is used to indicate that the text is an exact copy of the labelling either on a screen or on the worksurface.

An arrow bracket (>) is used to indicate a sequence of button pressing. For example, **Layout > Fader Banks** indicates that the **Fader Banks** button is accessed by first pressing the **Layout** button.

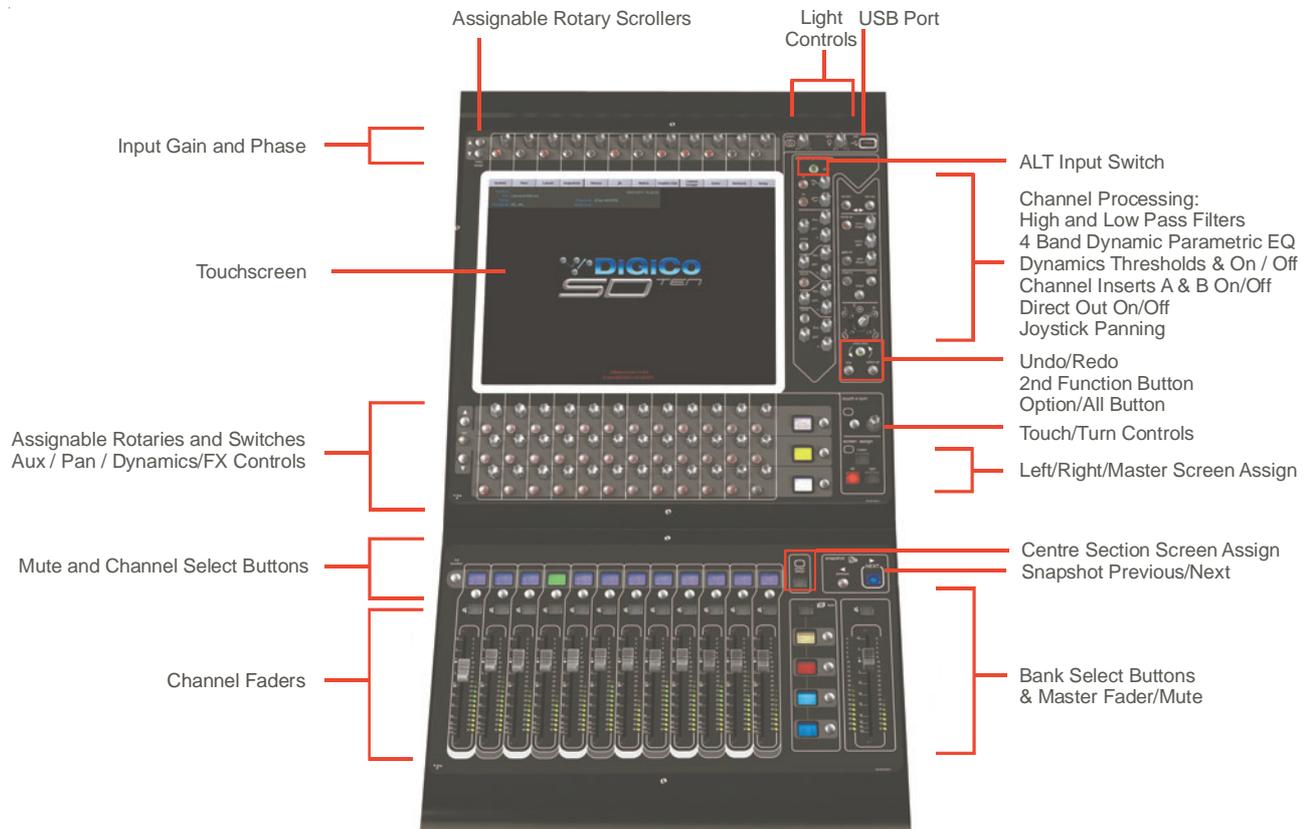

Chapter 1 - Getting Started

1.3 Before You Start

There are certain general operating principles and terms that should be understood before continuing to use this manual. Please read this chapter carefully before proceeding.

1.3.1 Worksurface Layout

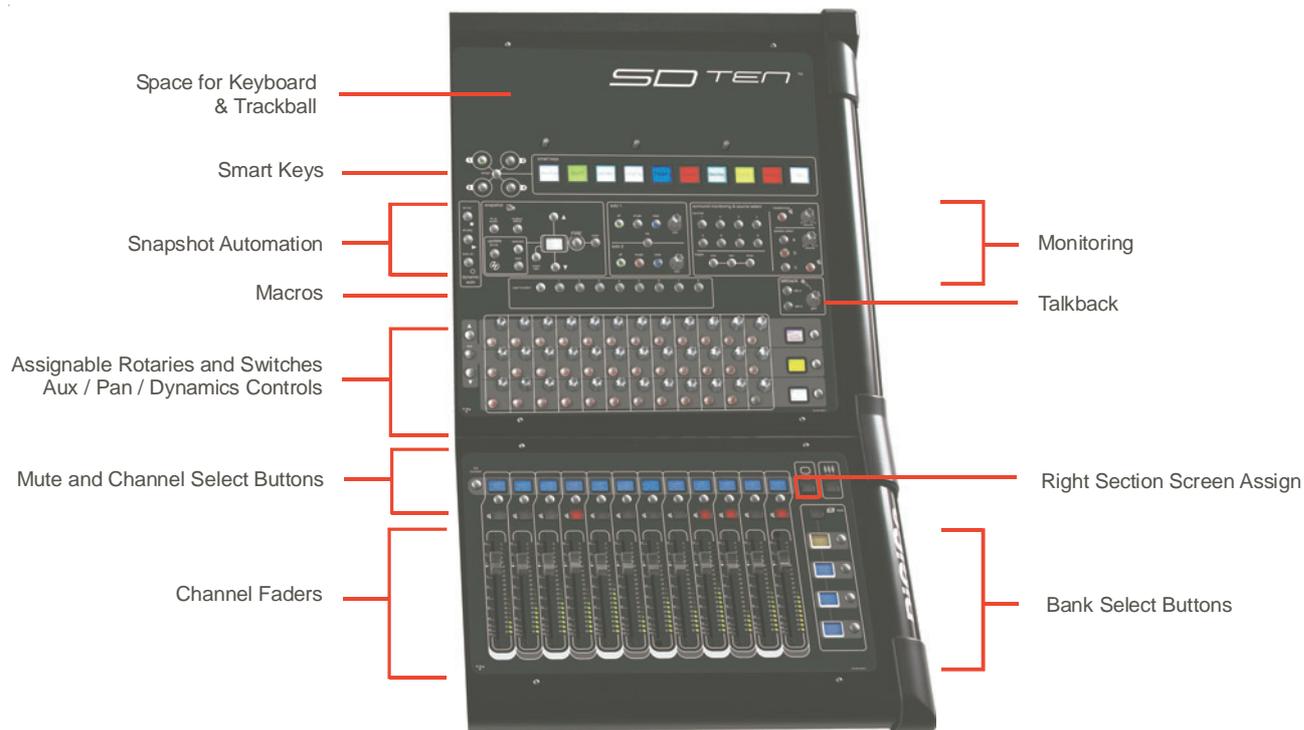

Centre Section

Left Section

Right Section

1.3.2 Screen Assignment

The SD10 touchscreen is used to access many of the console's functions. There are 4 possible views that can be seen on this screen - Left section - Centre section - Right section - Master screen. Each console worksurface section has its own **Screen Assign** button which, when pressed, will allow the channels in that section to be viewed on the screen and controlled by the Centre section's Channel Processing controls such as EQ and Dynamics. When the button is lit, that section is assigned to the screen. When a section has been assigned to the screen all of the controls in the upper centre section are also assigned.

The Left and Right worksurface sections also each have a button labelled **Assign To Centre** which will allow all of the Centre sections controls including faders, mutes and solos to control the bank which has been selected in the Left or Right sections..

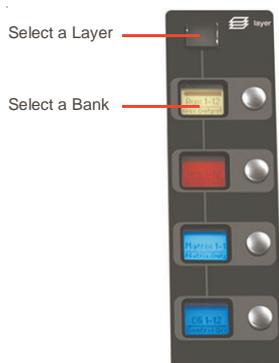

There are also additional buttons in the centre section which can assign the Left and Right sections to the screen and a **Master** button which allows you to view the Master screen. The Master screen gives access to many setup and other functions which are not directly related to the console's channels.

Chapter 1 - Getting Started

1.3.3 Layers and Banks

The SD10's worksurface is divided into Layers and Banks. Each Bank contains twelve channels, and the channels which are currently active on the control surface are defined using the **fader bank** and **bank layer** buttons to the right of the Channel Strip section's faders:

A 'bank' is a set of twelve faders, and a 'layer' contains up to four 'banks'. There are two 'layers' in each section of the desk, allowing up to 144 channels to be accessible on the worksurface.

Pressing the **bank layer** button, located above the **fader bank** buttons, toggles between layers.

To access a bank of faders within that layer, press the appropriate **fader bank** button. To switch all three sections of the console to the same bank level, press and hold one of the **fader bank** buttons.

The position of the banks on the worksurface is defined in the **Layout > Fader Banks** panel. By default, the Input channels will be assigned to Layer 1 on the left and right sections of the console. The different output channels will be assigned to Layer 1 on centre section. Control Groups will also be assigned to the centre section. These bank assignments can be customised by the user and saved in a session at any time.

1.3.4 Using the Control Surface

There are two main ways in which all of the functions of the SD10 are accessed:

1. The touchscreen display, which can be controlled directly using a finger, or by using the keyboard and mouse
2. The physical encoders, switches and faders.

Note that when touching the screen directly, you may find it easier to use a finer point than your finger. However, in order to prevent damage to the screen, it is important that you only use devices specifically designed for touching screens (such as a pda stylus), and that you never press down hard on the screen.

A number of functions can be accessed in different ways, allowing users to operate the console using whichever interface they prefer. This manual will describe accessing on-screen functions by touching the screen directly and not by using the mouse.

All of the physical controls found in the centre section are described in full within the relevant section of the manual and many require no further introduction. The Master screen has a row of grey buttons which are used to access a range of configuration displays. Pressing these buttons opens either a further drop-down sub-menu or a pop-up display. If a drop-down menu is opened, pressing on one of its entries will open a pop-up display. The buttons lighten to indicate that their sub-menu or pop-up display is open. A number of the buttons within each pop-up display generate further pop-ups.

The buttons within the pop-ups are coloured grey when their function is inactive, generally switching to a lighter shade of the pop-up background when their function is active. Pressing on a text box opens a numeric or QWERTY keypad which can be operated directly by pressing the screen or via the console's external keyboard.

Pop-ups are closed by pressing the box in the top right-hand corner of the pop-up, marked **CLOSE** or **CANCEL** (or by pressing **CAN** on keypad pop-ups).

To the right and below the Master screen is a single encoder marked **touch-n-turn** (shown below). This is used to access some of the rotary and switch controls within the Master screen. To assign the **touch-n-turn** encoder to a particular on-screen pot, touch the pot to be assigned. You will notice that a coloured ring appears around the on-screen pot, indicating that it is assigned to the **touch-n-turn** encoder/switch.

1.3.5 The Assigned Channel

One of the channels in the Channel Strip panel is displayed in gold, indicating that it is currently the Assigned Channel. This means that it has been assigned to the worksurface controls and can be configured in detail, as described below. To Assign a channel, touch anywhere in the channel on the screen (except the Aux Send area).

Once a channel is Assigned, all of the controls for that channel which are not displayed within the channel strip itself can be accessed via secondary pop-ups, displayed by touching inside the relevant area of the channel. These pop-ups include controls such as input and output routing and signal processing parameters.

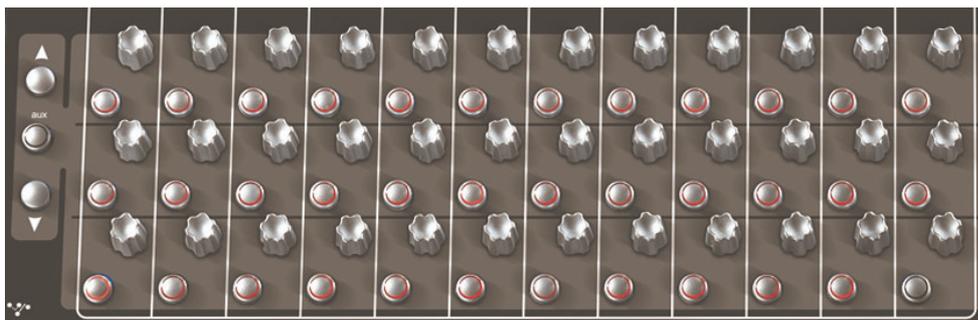

A number of the physical rotary encoders on the control surface can be assigned to different on-screen pots. In order to ensure that it is clear which function is assigned to which encoder, the assigned on-screen pot will have a coloured ring around it.

The twelve encoders and buttons immediately above the touchscreen refer to the channels with which they are aligned. These controls are concerned with the channel input, located at the top of the Channel Strip panel.

The three rows of encoders and buttons immediately below the touchscreen also refer to the channels with which they are aligned. Normally, the upper two rows control the level and on/off status of the two highlighted aux sends, but can have a number of functions assigned to them. Touching on an aux send on the screen will assign that aux and the ones immediately below it to the aux encoders. Six of the aux sends can be displayed in the Channel Strip panel at any one time. If more than six aux sends have been created in the session, the scroll buttons outside the bottom left-hand corner of the screen can be used to scroll the display through the remaining auxiliaries. The third row is assigned to channel pan by default.

The controls to the right of the Channel Strip panel allow the Assigned channel to be adjusted:

1.3.6 The Master Fader

By default, the master fader is assigned to the master group output, which is the lowest stereo group output by default. In addition, the master fader can be assigned to the solo buss output.

Chapter 1 - Getting Started

1.3.7 Other Centre Section Controls

To the left of the Channel Strip panel are more channel controls: When pressed, the **2nd function** button allows access to different parameters:

- 1) Stereo Aux Pan and Pre/Post switching
- 2) Hard Mute of a channel
- 3) Fine adjustment of Delay settings on output channels

The **Option/All** button has 2 main functions:

- 1) When pressed and released, any channel that is a member of a gang will be temporarily isolated from that gang.
- 2) When pressed and held, any parameter that is adjusted on a single channel will also be adjusted in the same way on all of the channels in that bank

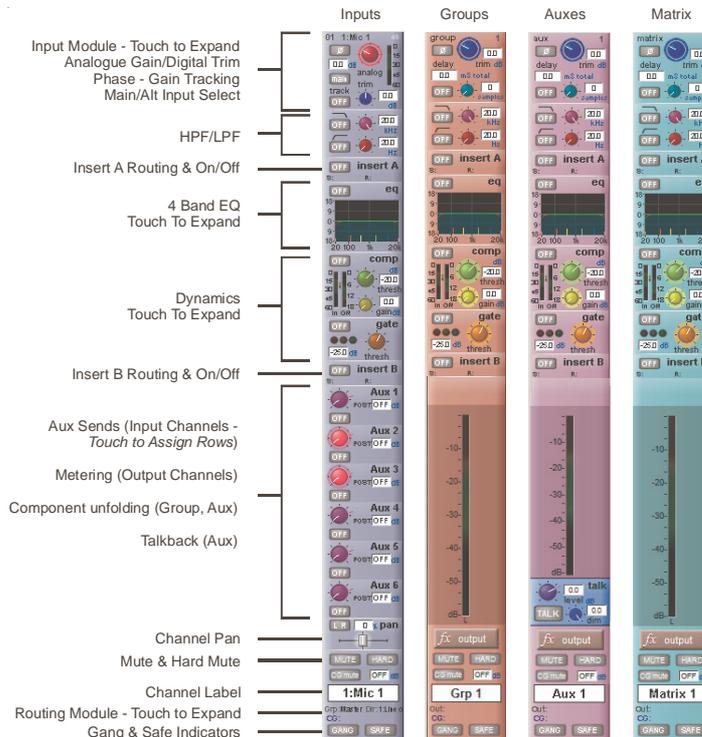

1.3.8 Channel Types

The signal flow of the SD10 is best understood in terms of the four channel types contained within it, shown below. Each channel type offers full signal processing capabilities. As a summary, the four channel types are as follows:

- Input channels bring signals into the console to be mixed and sent to aux and group busses.
- Aux channels send a variety of mixes of the Input channels to the Aux outputs, mainly for use as monitor mixes and FX sends.
- Group channels mix groups of input channels together, to feed the buss outputs or the output matrix.
- Matrix channels send the outputs of the matrix to the console's main outputs (Optionally).

Note there is also a TB In channel which is its own channel type. This is described in the Talkback section of the Master Screen chapter.

The Group channels, Aux channels and Matrix channels are all referred to as output channels. While the Aux and Matrix channels are the channel types most commonly routed to outputs, all four channel types can be routed directly to outputs.

Channels are laid out in banks of 12 on the console worksurface and can be identified by their colour: Light-blue for Input channels, red for Group channels, purple for Aux channels and blue-green for Matrix channels.

By default, the Input Channels will be assigned to Layer 1 on the left and right sections of the console. Output channels (Groups, Auxes and Matrices) and Control Groups will be assigned to the centre section. These bank assignments can be customised by the user and saved in a session at any time.

Holding any bank or layer button down for a couple of seconds will switch all 3 worksurface sections to the same bank level or layer.

The controls on each different type of output channel are similar but an input channel has a number of additional features.

1.4 Hardware Configuration

1.4.1 Connections

Detailed information on the various systems of connection is provided in the relevant Appendix but the following diagram provides an overview of a single console/single rack setup.

All connections should be made before switching on the console and racks.

The console and rack each have dual redundant power supplies and both should be switched on at all times. After switching on the console the software will be launched automatically and the state of the worksurface and settings should be the same as when it was last Shut Down.

To Shut Down the console press the **System>Shut Down** button and wait until you receive a message saying that it is safe to switch the power off.

The SD10 worksurface has 8 analogue I/O and 8 AES I/O on its rear panel and remote I/O racks are available in several formats. These racks can be connected to the console with 2x 100M high specification 75Ohm coaxial cables fitted with BNC connectors, or optical fibre.

In normal operation the MADI connections should be as follows (see diagram below):

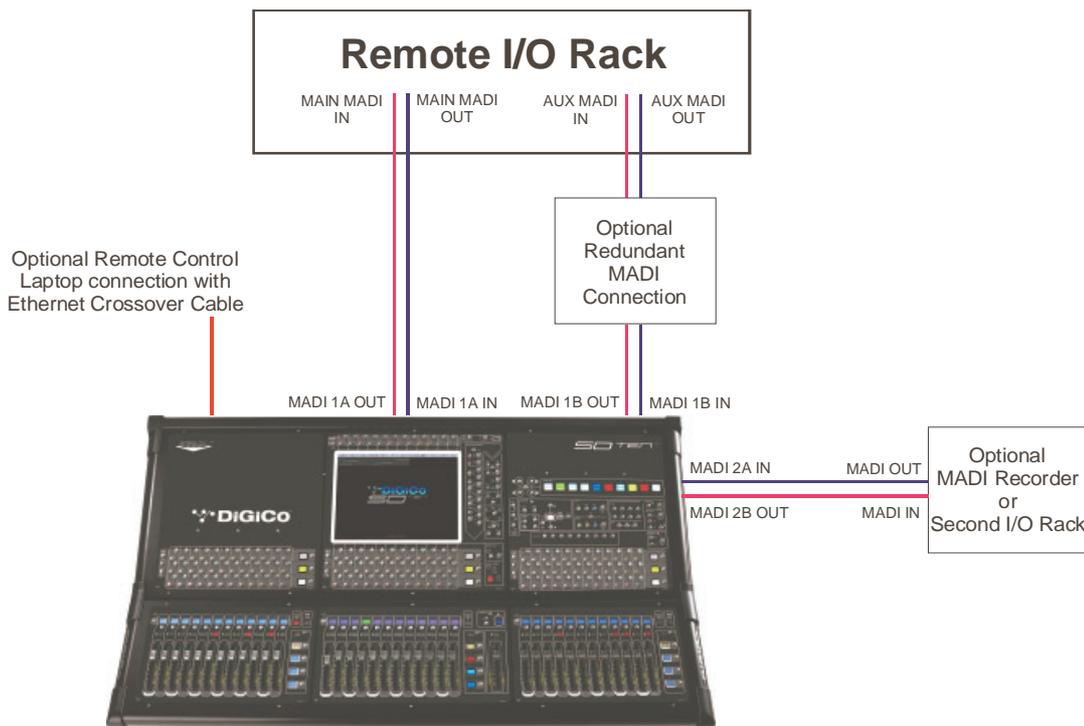

Rack MAIN MADI IN connected to the console MADI 1A OUT

Rack MAIN MADI OUT connected to the console MADI 1A IN

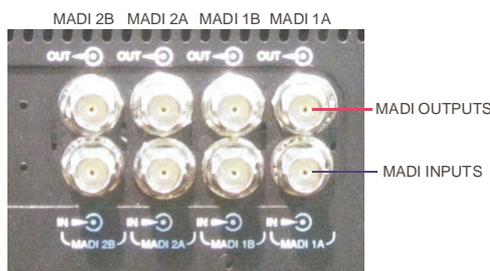

Note - Optionally, a second set of MADI cables can be connected to provide MADI redundancy from the rack's AUX MADI ports to the console's MADI 1B ports

The console's MADI Port 2 can be connected to a MADI recorder or a second DiGiCo Rack or console.

STANDARD CONNECTION WITH MADI

SD10 Rear Panel MADI Connections

Chapter 1 - Getting Started

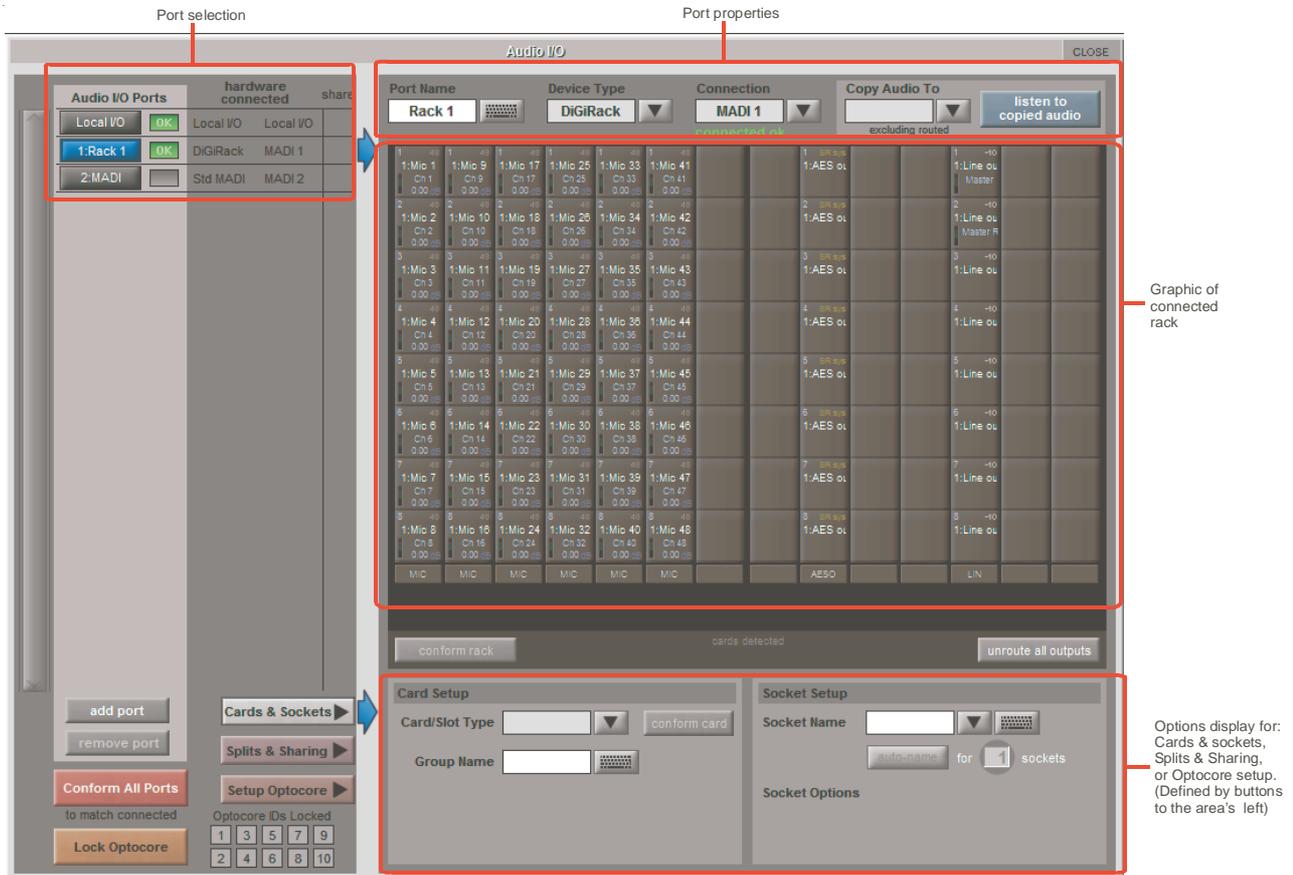

1.4.2 Audio I/O Panel.....

The Audio I/O window is used to configure the physical I/O connected to the SD10, including configuring and naming the sockets of the cards installed in racks, and the setting of Pads and phantom power.

Local I/O : The SD10 provides local audio I/O in the rear of the console. These operate independently of connected racks.

To access the SD10 Audio I/O Setup touch **Setup>Audio I/O** on the Master Screen

The Audio I/O window that opens is divided up into the following sections:

The top-left corner of the window shows the ports. Each port relates to an available physical audio connection (Local IO, MADI Ports or optional Optocore connections).

The top section to the right of this contains the controls relating to the ports. When a port is selected, this section changes to reflect the status of the selected port, and allows its configuration to be changed as required.

Below the port controls is a graphical representation of the rack configuration connected to the selected port. Depending on the port selected, the graphic will change, showing the available physical I/O. Each small “square” on the image represents a single physical audio connection or socket, with these arranged in columns or rows, representing I/O cards in racks, or the local I/O on the back of the console.

The section below the graphical rack picture displays one of three things, as selected by the coloured buttons to its left:

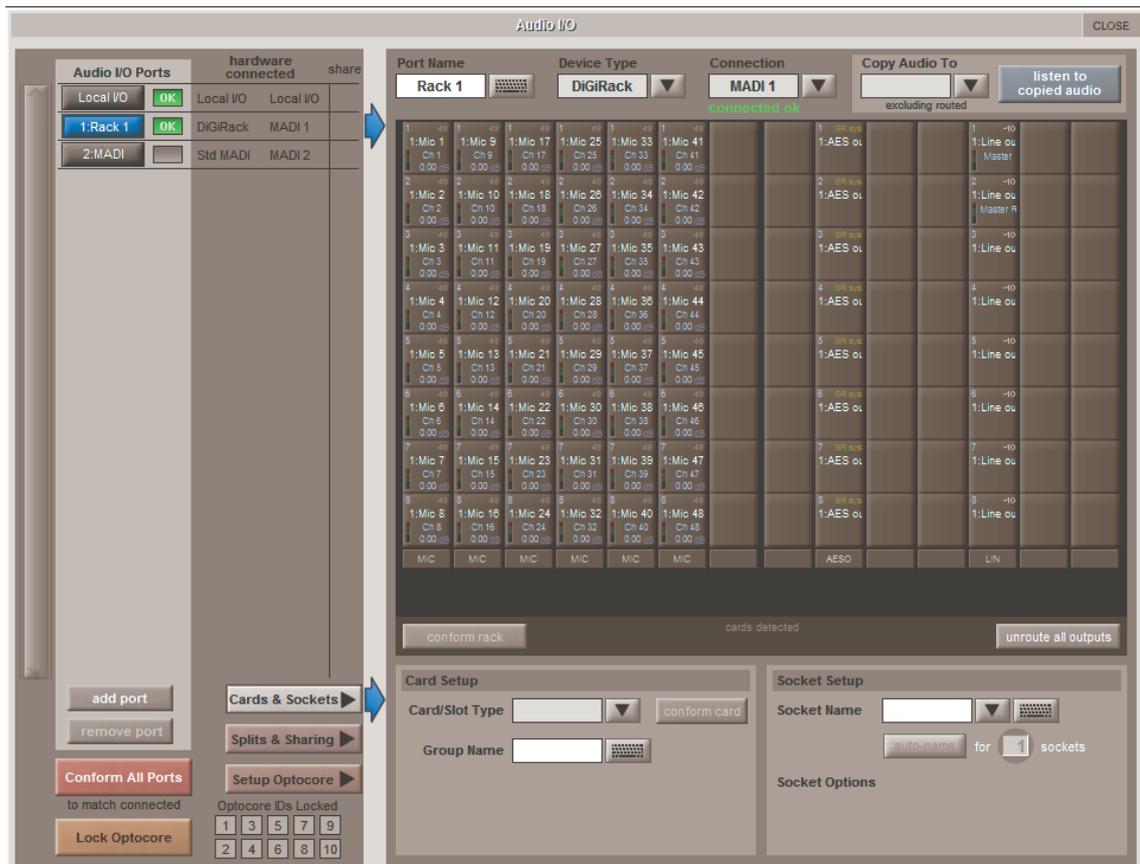

- Select **Cards &Sockets** to configure the cards or slots and sockets, including custom naming, phantom power and pad selection.
- Select **Splits &Sharing** to configure the sharing of card control between consoles and split outputs on an SD Rack
- Select **Setup Optocore** to configure optocore connections (See the separate Optocore v221 manual)

The local I/O configuration is fixed, so no hardware changes are possible. You can, however, change the Port Name, the Group Names and the Socket Names (the name of each physical connector on a card).

Note that **Setup Optocore** only applies (and only appears) if the session is setup to use Optocore version 221.

Rack Connections

With a Rack selected in the left hand port selection list, the window will change to look something like the image below, depending on the cards installed in the connected rack. The graphic shows the 14 available cards/slots, 7 input & 7 output.

In order to use the rack, the on-screen contents of the rack must match the cards physically installed in the rack connected. There are two ways of achieving this :

Manual Conforming of Rack:

Select each card (column) and manually select the appropriate card in the Card/Slot Type drop down menu in the lower section of the window (displayed when the **Cards & Sockets** button towards the bottom-left is selected). Once the correct card type is selected, the Label at the bottom the selected card will turn green, indicating the card type matches the card installed in the rack. If the Card Type name is Red, then there is a mismatch, and the error should be corrected by selecting the correct card type.

Automatic Conforming:

There are three levels of automatic conforming:

- globally, using the red Conform All Ports button in the bottom left of the window;
- on a rack-by-rack basis, using the **conform rack** button just below the rack view section of the window;
- on a card-by-card basis, by selecting a socket from the card in the graphical display and using the **conform card** button next to the Card/Slot type button selector in the lower section of the window. (Note that the **Cards & Sockets** button towards the bottom-left should be selected)

Pressing any of these buttons will correctly select the card types for the range in question. Once complete, all of the Card Labels beneath each slot should turn green.

Copying Audio and Listening to Copied Audio (External Recorder Setup)

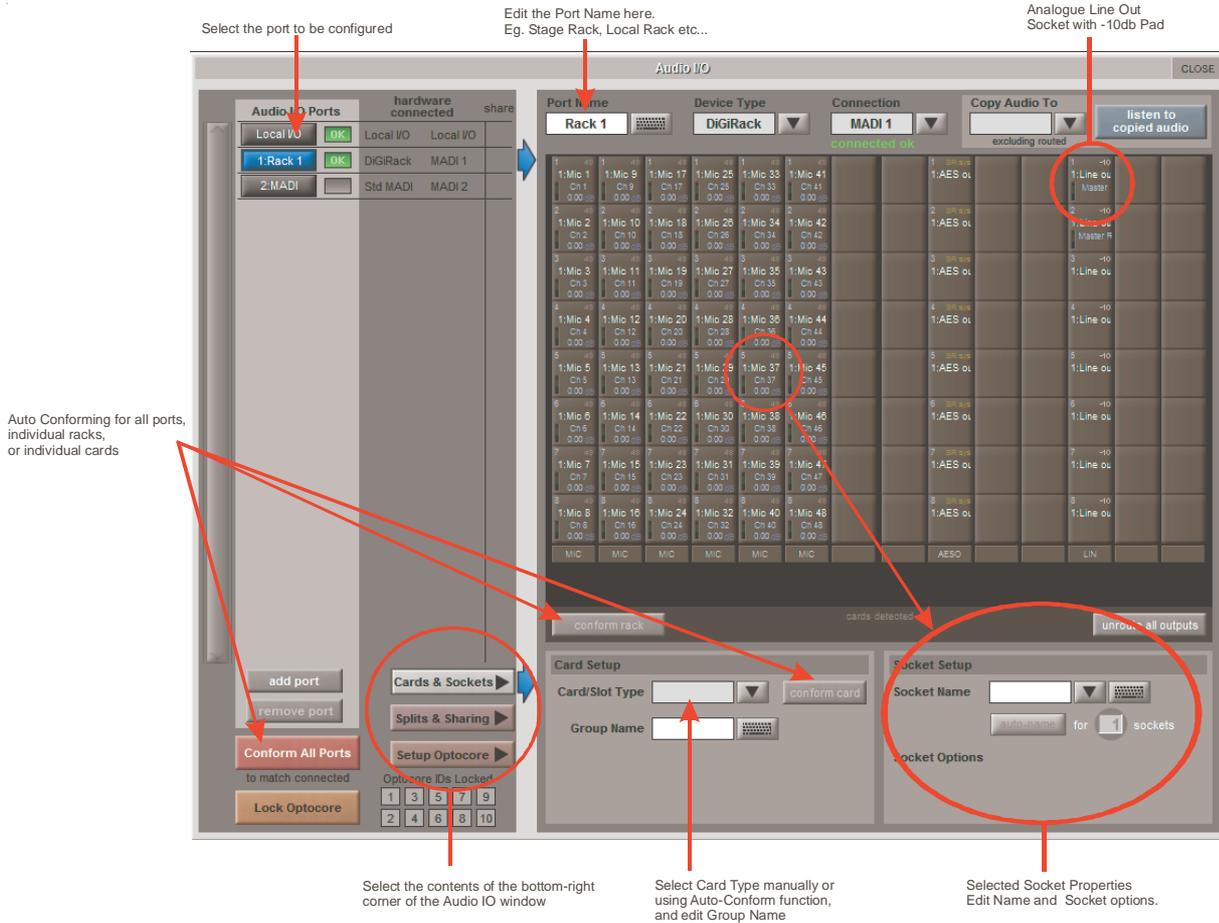

Any incoming MADI or Optocore stream can be copied to any MADI Output by selecting the incoming Port in the Ports list (in the top left of the panel) and selecting the MADI output in its **Copy Audio To** drop-down menu (in the top right of the panel). The console will send the 56 channel MADI stream to the selected output.

In addition, by connecting a MADI return from the external device (the playback from a recorder, for example) to its corresponding MADI input on the console, it can be monitored in the same channels as the original source material: press the **Listen to Copied Audio** button. Press the button again to return to normal monitoring.

Chapter 1 - Getting Started

Standard MADI Connections

If you have a standard MADI connection (not a DiGiCo Rack) to your SD10, you can set the SD10 to display the MADI with generic signal names, i.e. MADI 1, MADI 2.. etc. through to MADI 56 instead of the usual rack style names. The naming does not affect the signal, but makes routing signals easier.

Console to Console routing

If two DiGiCo consoles are connected together, it is possible to route audio between them.

Splits & Sharing

In a multi-console system where Racks are connected with MADI and shared between two DiGiCo Consoles, only one of the consoles can take control of the rack, with respect to Gain, Phantom Power and Pads. To overcome this, it is possible to place the SD10 into one of 3 states of operation; Isolate, Receive Only or Full Control.

Sharing is configured in the bottom right-hand corner of the window when the **Splits & Sharing** button is selected:

These three states can be set individually in the right column), on a per-rack basis (middle column), or globally for all shared racks (left column).

Isolate : The SD10 will not communicate with the rack and therefore any adjustment of input gain or +48V switch will have no effect on the rack settings

Receive Only : The SD10 will receive the rack's existing settings but will not be able to control the gain etc on the racks.

Full Control : The SD10 will send its settings to the racks and change them accordingly.

1.5 Configuring a Session

The SD10 has a default setup which means that the new user need not get involved in configuring the desk at this stage. However, here is a brief overview of how the different displays are used in putting together a session. Each of the master displays introduced below are described fully within the rest of the manual.

The **Setup > Audio IO** display is used to configure the physical I/O connected to the SD10, including configuring and naming the sockets of the option cards installed in racks, and the setting of pads and phantom power. (See previous section)

The **File > Session Structure** display is used for configuring how the console's the DSP channels are divided between channel types, and is also where the format of the channels is defined.

The **Session Structure** display can be used to automatically assign the channels to the worksurface. However, channels can also be manually added to the worksurface using the **Layout > Channel Faders** display.

1.5.1 Session Structure

When starting a new session, it is important to decide how many of each type of buss is required. While changes to session structure can be made once a session has been started, it is best to try and set these parameters before configuring the session. The structure will set the number and type of aux and group channels and allow you to choose which parts of the new session will be cleared and reset. There is also an option to automatically route the inputs and outputs from channel types that you have opted to clear.

To adjust any of the channel allocations, touch on the associated channel count box, and either enter a number using the pop-up number keypad, or adjust using the assigned touchturn controller.

The maximum total amount of Aux and Group channels available is 48. As you increase the number that you require you will see the resources available decreasing accordingly in the number boxes at the bottom of the panel.

Note - Pressing the Default All button followed by the Restructure button will automatically configure a new session with the following setup where the first 96 rack inputs are routed to input channels 1-96 and the Master Buss is routed to Local outputs 1 & 2 and also to rack outputs 1 & 2. All input channels will be routed to the Master Buss and the console headphones will be fed by the Master Buss when nothing else is soloed.

The default configuration is :

- 96 Input channels (Adjustable)
- 6 Mono Aux busses & 6 Stereo Aux busses (Adjustable)
- 6 Mono Group busses & 6 Stereo Group busses (Adjustable)
- 16 Matrix Inputs and 12 Matrix Outputs (Fixed)
- 12 Control Groups (Fixed)
- 1 Stereo or LCR Master Buss (Fixed)
- 2 Mono or Stereo Solo Busses (Fixed)

The screenshot shows the 'Session Structure' configuration interface. Annotations include:

- Touch numbers to edit with pop-up keypad or touchturn**: Points to the 'channel count' box showing '96'.
- Select session sample rate**: Points to the '48KHz' and '96KHz' buttons.
- Enter Session title**: Points to the 'session title' input field.
- Set number of input channels and define sends**: Points to the 'input channels' section with 'clear all' and 'auto-route' buttons.
- Set number and type of Aux**: Points to the 'aux busses' section with 'clear all' and 'auto-route' buttons.
- Set number and type of Group**: Points to the 'group busses' section with 'clear all' and 'auto-route' buttons.
- Option to Clear parts of the session when restructuring**: Points to the 'clear all' buttons for various components.
- Option to automatically route inputs/outputs when using the Clear function**: Points to the 'auto-route' buttons.
- Total number of unallocated processing**: Points to the 'spare: channel processing' box showing '12'.
- Total number of spare busses**: Points to the 'busses' box showing '14'.
- Create a default session with flat parameters and basic routing**: Points to the 'DEFAULT ALL' button.

Chapter 1 - Getting Started

Clear All Buttons: When changing routing, you have the option of clearing any non-default routing or processing (EQ, dynamics etc) from the channels in the session. This is especially useful when restructuring an existing session to make a new session. The clear snapshots, clear automation and clear macro's perform similar operations.

Rebuild Banks: When changing the session structure, there are two possible scenarios. If you restructure the session without rebuilding banks, any additional channels you have allocated are not "placed" on the worksurface, and need to be manually assigned to faders. If however, you restructure a session with Rebuild Banks enabled, the worksurface will be built with all channels available on the worksurface.

Aux Sends and Direct Sends: By toggling the state of the Aux Sends and Direct Sends Buttons in the Input Channels section, it is possible to change the default operation of the Aux Sends and Direct Sends. These functions toggle between "Post Fader", "Pre-Fader" and "Pre-Mute". These buttons can only be used in conjunction with the **clear all** function.

Auto-Route: The Auto-route functions automatically routes consecutive inputs for input channels, and consecutive outputs for busses. For example, auto-routing 60 inputs will route the first physical input (eg 1: Mic 1) to input channel 1, the second physical input (1: Mic 2) to input channel 2... until you either run out of inputs or channels. Auto-routes are as follows :

Input Channels auto-route with physical inputs

Aux, Group and Matrix Channels auto route to physical outputs

Matrix Inputs auto-route with group outputs

NOTE: Auto-Routing can only be used in conjunction with the "Clear All" button.

Session Sample Rate: The Session Structure window is also used to set the session's sample rate. Use the buttons to the right of the **session title** box to switch the sample rate between **48kHz** and **96kHz**.

1.5.2 Assigning Faders to the Worksurface

If, after a Session Restructure where the Rebuild Banks button was not pressed, you find that newly created channels do not appear on the worksurface, open the **Layout>Channel List** panel on the Master screen and you will see a full list of all input and output channels that are present in the session.

Channels can be assigned to the worksurface individually (in order to create custom banks of mixed channel formats) or as complete banks.

First, select a bank and press the **LCD Function** button.

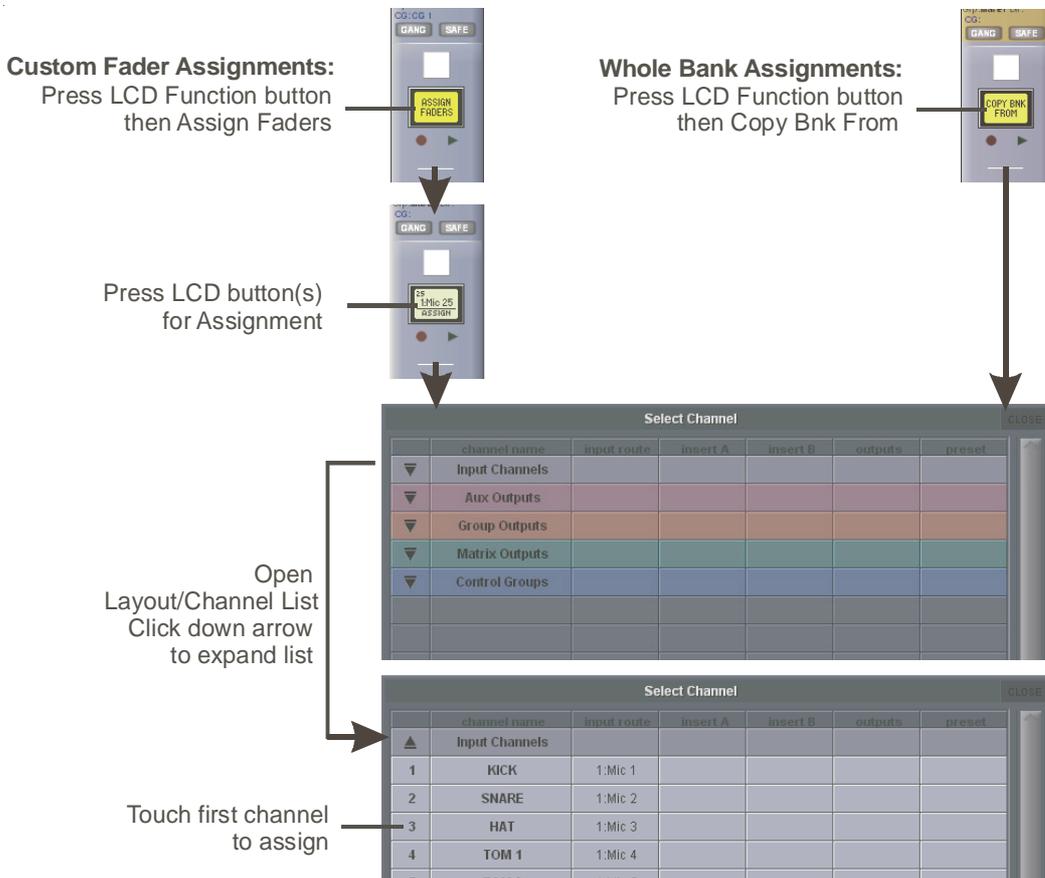

To create a custom bank, press the Channel Select button below the display labelled **Assign Faders** followed by the LCD button on the fader to be assigned (or select multiple faders to assign consecutive channels).

To create complete a complete bank, press the Channel Select button labelled **Copy Bank From**.

Having selected the faders or bank, press the first channel that you wish to assign on the **Layout/Channel List** on the Master screen.

Consecutive channels will be assigned to the selected worksurface faders.

Now press the LCD Function button again and return to the standard mode by pressing the LCD button labelled **Solo**

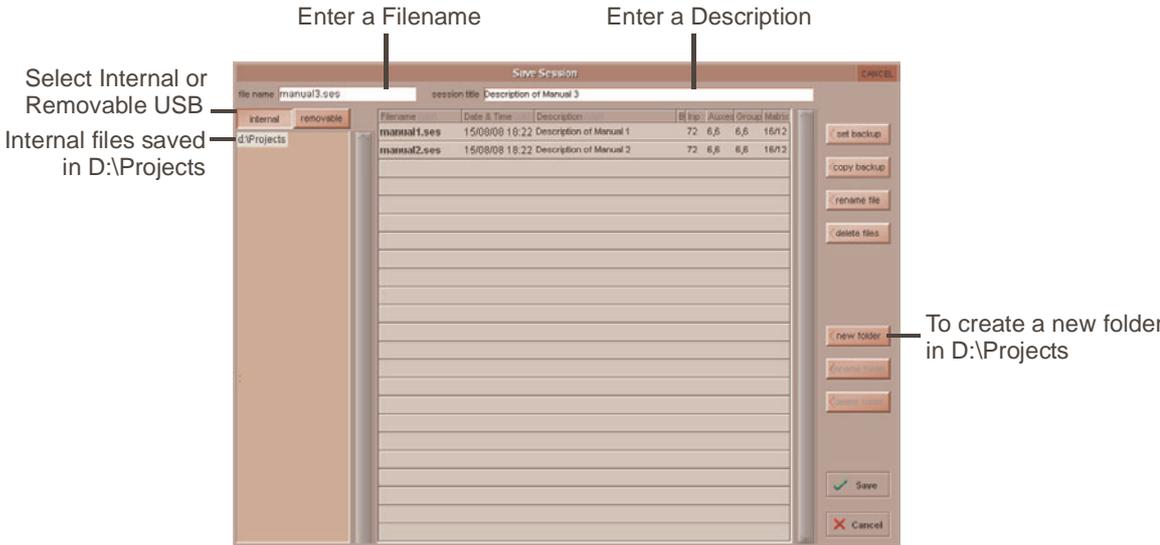

1.6 Saving and Loading Sessions

1.6.1 Save As New File

When you change the configuration of the a session you should save under a new filename.
 If the Save Session panel has not appeared automatically after a session restructure then touch the **Files** button on the Master screen and then press **Save As New File**.
 Select the destination drive (Internal or Removable) and file path and then enter a new file name and description for the file - then press the **Save** button.
 The USB connection for the removable drive is located in the top right hand corner of the centre section.

Note: If you touch a session name on the existing list, this name will automatically be selected as the new file name and touching Save will overwrite the old file.

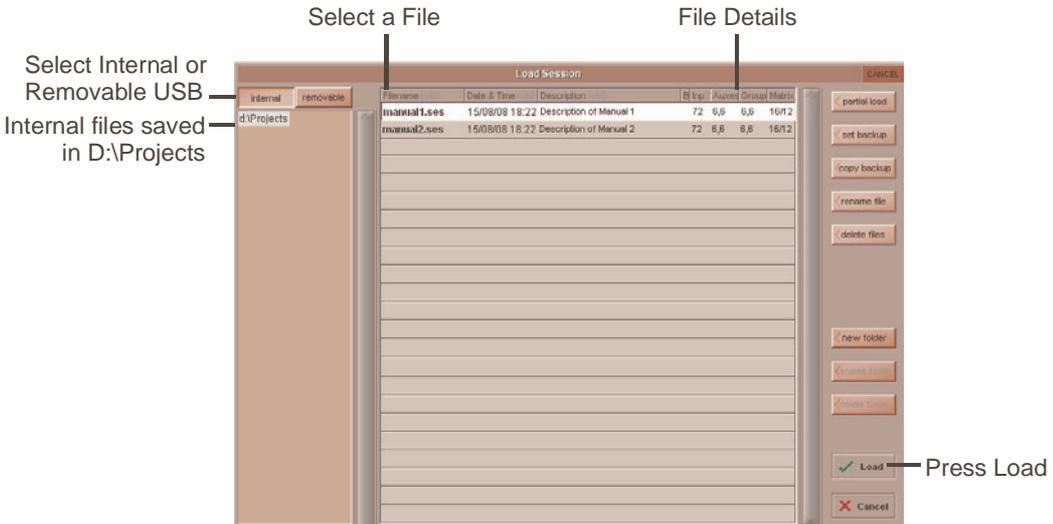

1.6.2 Save Session

This button which is found above the **Save As New File** button will save the existing session in the same location and under the same file name as it was previously saved or loaded from. It therefore serves as a "**Quick Save**" option to update an existing session.

Remember that this function will overwrite your last saved version.
 If you wish to save the session under a new name use the **Files** menu button and select **Save As New File** (See above).

Load Session

To load a previously saved session:
 Touch the **Files** button on the Master screen and then press **Load Session**.
 Select the source drive (Internal or Removable) and the required file from the list - then press the **Load** button.

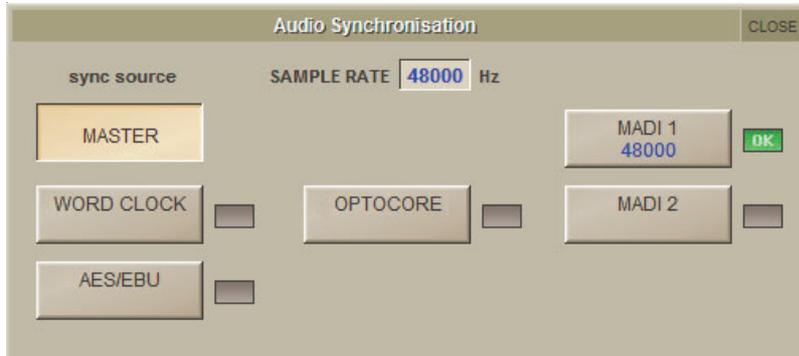

Chapter 1 - Getting Started

1.7 Audio Sync

The SD10 will operate at Sample Rates of either 48000Hz (48kHz) or 96000Hz (96kHz). By default, it is set to clock internally (as a Master) at 48kHz. To switch the clock to 96kHz, open the **Session Structure** dialogue in the **File** menu and click on the appropriate sample rate button at the top of the window.

Within a normal setup, the SD10 will usually remain as clock master. However, there are times when the SD10 needs to be clocked externally. The Audio Sync panel allows you to control external synchronisation.

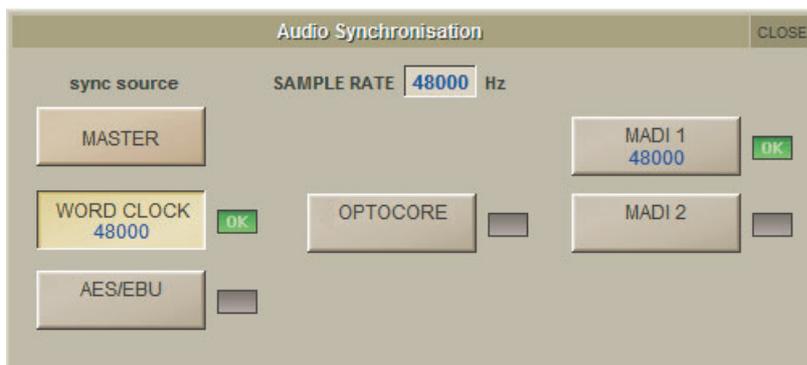

To access the Audio Sync Panel, touch the Setup Menu button, followed by Audio Sync. A panel similar to the below will open.

The SD10 will clock from the following sources : Word Clock, AES/EBU, MADI & Optocore (if fitted)

Note : When a valid clock is detected on an external sync input, the corresponding Green OK box will light, even if that input is not selected as the clock source for the SD10.

Example External Clocking : Word Clock @ 48kHz

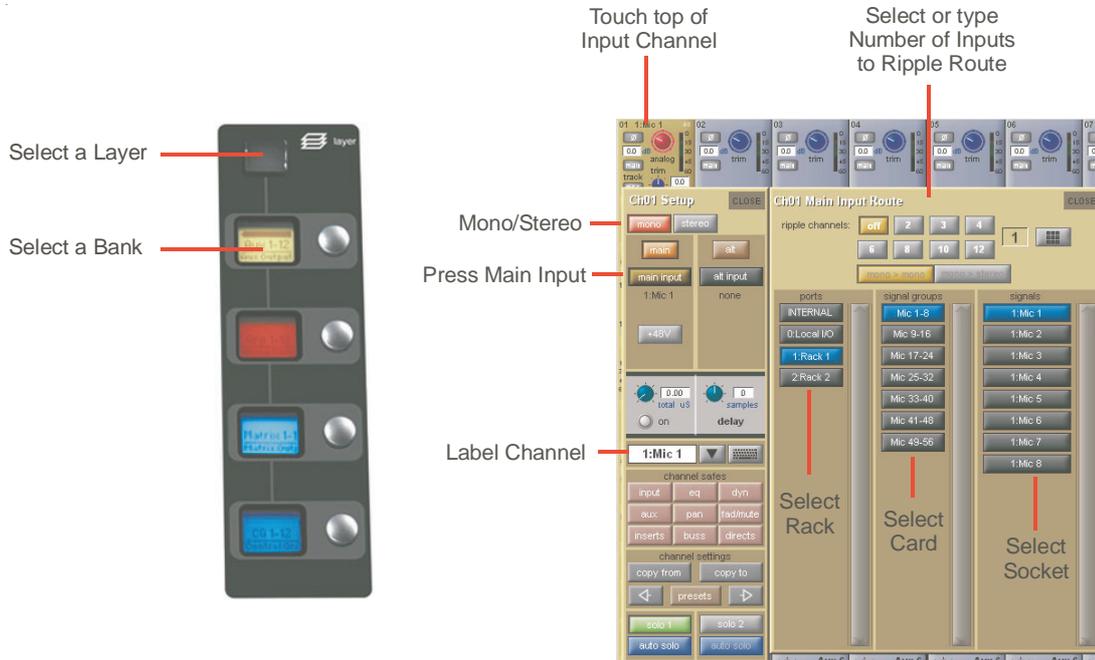

1.8 Routing Basics

1.8.1 Selecting Inputs & Outputs

All channel input, output, insert send and insert return routing is done via routing displays, accessed via the dark grey routing buttons in the channel **Setup** and **Output** displays (shown below for an Input channel's input).

To access Channel Input Setup, touch the top of an input channel display on the touchscreen.

To access Channel Output Setup, touch the bottom of any channel type's display on the touchscreen.

Within each display, there are three columns containing three levels of routing selection:

- The left-hand column contains the available **ports** within which the desired input or output might be located;
- The middle column, **signal groups**, then shows the available groups of inputs or outputs within that port;
- The right-hand column, **signals**, then displays the individual inputs or outputs available within that signal group.

The boxes in each column are lit blue to indicate that they are currently selected. If there is already a routing assigned within the display, the **port** and **signal group** columns containing the current assignment will be half-lit.

Each output can only have one channel routed to it. The outputs that are currently in use by another channel display in blue text. If you attempt to route a different channel to an output which is already in use, a confirmation box appears, indicating which channel is already using it, and warning that continuing with the action will cause the old channel to be derouted from this output. Press **Yes** to proceed, **No** to cancel.

Note that when routing direct outs from Input channels or outputs from output channels, any number of available signals can be selected. A new route selection will therefore be added to previous selections in these cases. However, inputs, insert sends and insert returns can only route to/from one signal (in the case of mono channels) or two signals (in the case of stereo channels). A new route selection will therefore result in the previous selection being lost for inputs and insert sends and returns.

For stereo channels, left and right routes are presumed to be consecutive: When routing stereo signals, select the left route, and the next signal in the list will be automatically selected as the right route. If the last signal in a signal group or port is selected as the left route, the first signal in the following signal group or port will be selected as the right route.

Note: If Waves is enabled, a Waves port will be displayed. See the relevant appendix for more details.

For input and insert return routing, the **INTERNAL** port provides the following signal groups:

- Misc:** The oscillator, white and pink noise generators.
- Graphic EQs:** The outputs of the SD10's internal graphic EQ's.
- Effects:** The outputs of any effects sends that have been created
- Channels:** The direct outputs from the other input channels
- Groups:** The outputs of the group busses
- Auxes:** The outputs of the auxiliary busses.

Chapter 1 - Getting Started

Note: The outputs for the channel being routed are locked out of the signal list.

Note also that the console views all routes as a single list. Therefore, if the left signal is connected to the last signal in a port, the right signal, will be automatically connected to the first signal of the next port, regardless of port type.

For output and insert send routing, the **INTERNAL** port provides access to the inputs of the SD10's Graphic EQ's, and the inputs to any effects that have been created.

The **0:Local I/O** port contains a list of the inputs or outputs found directly on the SD10's back panel.

The **Rack** ports contain all of the inputs or outputs available within the remote I/O racks, as defined in the **Audio I/O** display.

The **mono > mono** and **mono > stereo** buttons define whether sends from mono channels to the console's Internal effects and Waves effects (see the relevant appendix) are mono or stereo.

Once a route has been selected, its name will appear below the routing button in the **Setup** or **Outputs** display.

Whenever a route is created, metering and additional controls are made available below the routing button. These controls are dependent on the type of route created, and are described in detail within Chapter 2 where necessary:

Local input routed to an input or insert return: a **Line** or **Mic** selector.

Line input routed to an input or insert return: no additional control.

Mic pre-amp routed to a mono input: a **48V** button for remote control of phantom power, and delay controls.

Mic pre-amp routed to a stereo input: a **48V** button, delay controls and pan controls.

Mic pre-amp routed to an insert return: a **48V** button, phase reverse (**AE**) button and gain trim.

Output routed to a console output: a **-10db** pad (rack out only), **on** button for switching the send on and off, gain trim and send point selector which toggles the place within the channel from which the direct output is fed:

pre-F Pre-fader,

post Post-fader

pre-M Pre-mute (and pre-fader)

Insert send routed to a console output: a **-10db** pad (rack out only), **on** button for switching the send on and off, and gain trim.

Insert send routed to a graphic EQ: an **on** button for switching the send on and off

Output routed to a graphic EQ: no additional control.

Buttons become ringed in either red or green to indicate that they are on.

1.8.2 Ripple Channels

The **ripple channels** function, located at the top of the route display, allows consecutive channel routes to follow the routing of the current display incrementally. For example, Channels 1 to 8 direct outputs can be routed to Rack 1 > Line outs 1 to 8 respectively by routing Channel 1's direct out to Rack 1 > Line out 1 and allowing the **ripple channels** function to route Channels 2-8 automatically.

The number of channels to be rippled is defined either by selecting the appropriate grey numbered button, or by selecting the keyboard button to the right of the numbered buttons, typing the required number of channels (8 in the example above) into the numeric keypad which appears, and pressing **OK**. Once you have configured the **ripple channels** function, any routing action will also effect the appropriate number of channels above the channel being routed.

The **ripple channels** function treats stereo channels as two channels. In other words, if Channel 2 in the above example is stereo, the **ripple channels** function will route Channel 1 to Line out 1, Channel 2 Left and Right to Line outs 2 and 3, Channel 3 to Line out 4 etc.

1.9 Presets

Presets are used for storing and recalling settings for channels, fx units, graphic EQs and the matrix. While each preset functions slightly differently, this section provides a basic understanding of how to use the various preset displays:

The left-hand column of a preset display contains the available **groups** of presets, and touching one of these groups brings up the list of presets within that group in the column to its right (**name**). The columns to the right of the preset name displays the number of channels whose settings are included in the preset (**chs**) (Channel and Matrix presets only), the date and time it was created or updated (**notes**), and whether or not it is locked (**lock**).

Note that a presets display will only list presets of the relevant type.

To recall a preset, touch the name of the **group** containing the preset you wish to recall, and then touch the preset's name. The **recall scope** buttons at the bottom of the some preset displays allow you to select which elements are recalled and which elements remain unchanged. The buttons are included in the recall when they are lit.

To save the current settings as a new preset, touch the group in which you want the preset to be stored and press the **new** button. The new preset is automatically named according to the preset type. To alter the preset's name, type the new name using the keyboard display that appears (or the external keyboard) then, if relevant, touch and edit the number of channels' settings that you want to store in the preset (the default is one channel). Now touch **OK**.

Note that pressing CAN in the keyboard display will cancel the display but create the new preset with its default name.

To save the settings as an update of a previous preset, press **update**, touch the preset you wish to overwrite, and press **Yes** in the confirmation display which appears.

Note that when updating a previous preset, failing to press update will result in the preset you wish to overwrite being recalled, and the settings to be saved being lost.

To create a new group of presets, press **new group**. A new group will be created, called **group n**, where **n** is the next available preset group number. To alter the group's name, type the new name using the keyboard display that appears (or the external keyboard) and touch **OK**.

Note that pressing CAN in the keyboard display will cancel the display but create the new group with its default name.

The **edit name** button allows preset names and group names to be edited, and the preset to be locked, preventing them from being edited, overwritten, or deleted. The button lightens to indicate that it is active. To edit a preset's name, make sure the preset is unlocked (see below), activate the **edit name** button and touch the preset's name. Type the new name in the keyboard display and press **OK**. To edit a preset group name, activate the **edit name** button and touch the group name. Type the new name in the keyboard display and press **OK**.

To lock the preset, activate the **edit name** button and touch the preset's **lock** column. A grey padlock appears, indicating that the preset is now locked. Touching the lock again with **edit name** active unlocks the preset.

To delete a preset, press **delete**, touch the preset to be deleted, and press **confirm**. To delete a consecutive range of presets, press **delete** followed by **select range**, touch the first and last preset to be deleted and press **confirm**. To delete one preset, or a nonconsecutive range, touch each preset to be deleted and press **confirm**. To delete an entire group of presets, press **delete** followed by **select all**, then press **confirm**.

Chapter 1 - Getting Started

1.10 Naming Channels and Busses

A large number of elements within the SD10 can be custom named. Access to the naming facility is via black and white text boxes with down arrow and keyboard buttons to their right, such as shown here:

To create a name manually, touch the text box or the keyboard symbol to its right to bring up a QWERTY keyboard display. This keyboard includes standard **Caps**, **Shift** and **Delete** functions, as well as **Cut**, **Copy** and **Paste** functions which can be used to move name text between channels. The arrow buttons in the bottom left-hand corner of the keyboard display move the cursor within the text box. Create the new name, either using the on-screen keyboard display or the external keyboard, and press **OK**. To close the keyboard display without changing the name, press **CAN**. To move the keyboard display to the following channel, press **Next** (or **TAB** on the external keyboard).

The **Channel Name** display enables commonly used words to be inserted quickly without the use of the keyboard. This facility is available not only when naming channels but also when naming other elements. To open the **Channel Name** display, touch the down arrow immediately to the right of the **Setup** display's channel name text box.

CAPS	Initial Cap	custom	edit	Channel Name										CLEAR	CLOSE
				12 string	bot	crash	girls	keys	mic	piano	snare	tom		0	
				ac	boys	dl	glock	kick	mid	princ	soprano	top		1	
				acoustic	brass	direct	gong	kit	midi	prog	spare	track		2	
				alto	bv	double	gtr	l&r	mono	rack	stage	trombone		3	
				audience	cd	drums	guitar	lead	mp3	rear	stalls	trumpet		4	
				backing	cello	far	hand	left	near	reverb	strings	vola		5	
				backup	choir	feed	harmony	lo	noise	rhythm	sub	violin		6	
				band	chorus	fill	hat	loops	o/h	ride	surr	vocal		7	
				baritone	circle	floor	head	madi	oboe	right	sync	vxx		8	
				bass	clarinet	flute	hi	main	opto	sax	synth	wind		9	
				bongo	click	front	hi-hat	master	organ	seq	tenor	woodwind		L	
				buuth	conga	fx	hurr	mid	perc	slide	timpani	xylophure		R	

Touching any word from the display inserts that word into the channel name text box. Further words can then be added to the channel name in the same way, divided by a single space. Numeric and L/R identifiers can be added from the column down the right-hand edge of the display. Text can be entered in CAPS or Initial Caps by pressing the **CAPS** and **Initial Cap** buttons in the top of the display. If neither of these are selected, all text is inserted in lower case.

Note that the first text to be inserted from the Channel Name display when it is opened overwrites all previous text.

Note also that text that extends beyond the end of the text box will not be visible!

In addition to the standard word set, a list of user-defined words can be created and inserted by pressing the **custom** button, located next to the **Initial Cap** button. The button lightens to indicate that the custom set is displayed.

CAPS	Initial Cap	custom	edit	Channel Name										CLEAR	CLOSE
				Sopranino	Euphonium									0	
				Upper										1	
				Lower										2	
				Back										3	
				Contact										4	
				electric										5	
														6	
														7	
														8	
														9	
														L	
														R	

To add a new word to the custom set, touch the box which you want to use and press **edit**, located next to the **custom** button, to bring up a QWERTY keyboard display. Type the required word and press **OK**. In this keyboard display, the **Next** button saves any text inserted in the current box and moves the keyboard to the next box in the custom list. To cancel the keyboard display, press **CAN** within the display, or press **edit** again. The words in the custom list are inserted into the channel name text box in exactly the same way as words in the standard list. Pressing **custom** again returns the display to the standard word set.

Tip: As custom names appear in the box in which they are typed, they are not automatically alphabetised. The user may find it helpful to define a system for ordering the custom page.

Note also that the standard word set cannot be edited.

The current name can be cleared by touching the **CLEAR** button towards the top right-hand corner of the **Channel Name** display. The **Channel Name** display can be closed by touching the **CLOSE** box, in the top right-hand corner.

1.11 Channel Processing

1.11.1 EQ

On input channels, the EQ section comprises four user-configurable parametric filters and a pair of swept High-pass and Low-pass filters. On output channels, there are eight bands of EQ and no filters.

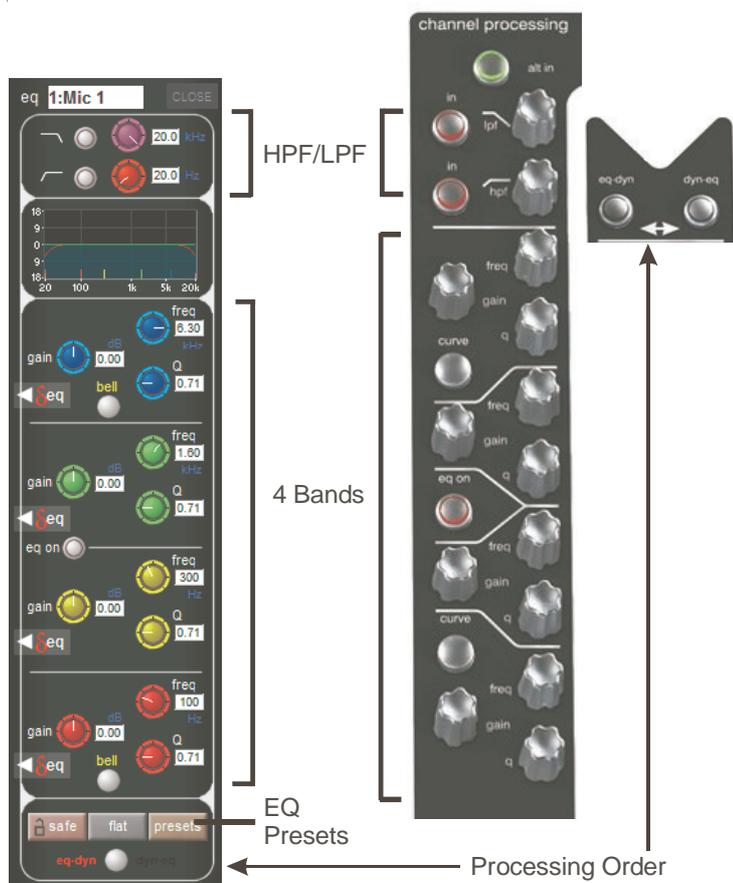

The EQ is accessed by touching the on screen display to **Assign** the channel (the colour changes to yellow) and then using the controls on the right hand side of the screen.

When a control is adjusted the expanded view seen below appears in the input screen but this view can be seen at any time by touching the EQ response graph on the screen.

Note - If the expanded view does not appear when a control is adjusted open the Options panel and set the Auto Expand EQ option to Yes

Touching the normal EQ response graph will show an expanded view in a separate panel.

The order of EQ and Dynamics in the channel signal path can be changed using the worksurface button to the right of the worksurface HPF and LPF controls.

The type of filter used by the top and bottom bands can be changed by successive presses of the **Curve** button for that band.

Dynamics are available to each EQ band – dynamic EQ modules can be assigned to a maximum of 10 channels. Clicking on the 'delta' EQ button below the band's gain control will open up its Dynamic EQ display:

Chapter 1 - Getting Started

1.11.2 Dynamics

The dynamics are accessed by touching the words **Comp** or **Gate** just below the EQ graph on screen to open the dynamics panel.

The worksurface controls beneath the screen control the various parameters. Touching the **Close** button in the top right corner of the panel will close it.

Dedicated **Threshold**, **Gain** controls and **In/Out** switches can be found on the right hand side of the centre section's worksurface. These can control the Assigned channel's dynamics whether the on screen dynamics panel is open or not.

The **Assignable encoders and switches** beneath the screen can be assigned to any of the main dynamics controls. Hold the **Assign Switch** button on the left of the input section and touch the dynamics control required on the screen. The selected control is shown by the **Status Display**.

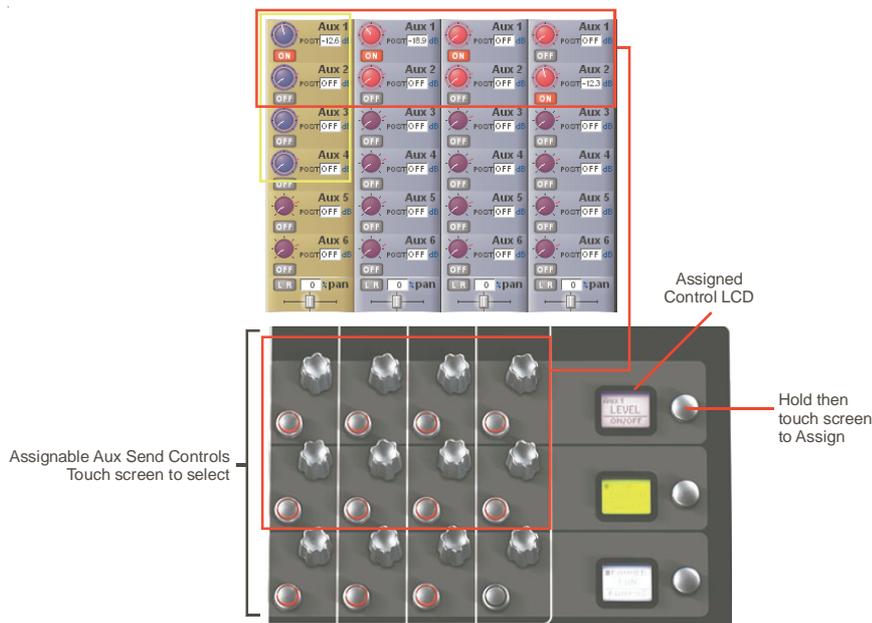

Multiband Compression is available for up to 10 channel dynamics modules. Click on the **multi-band** button at the top of the display to access the 3 dynamics bands:

1.11.3 Auxiliaries

The auxiliaries can be accessed by touching the auxiliary row on screen or using the **Screen Scroll** buttons on the left of the worksurface

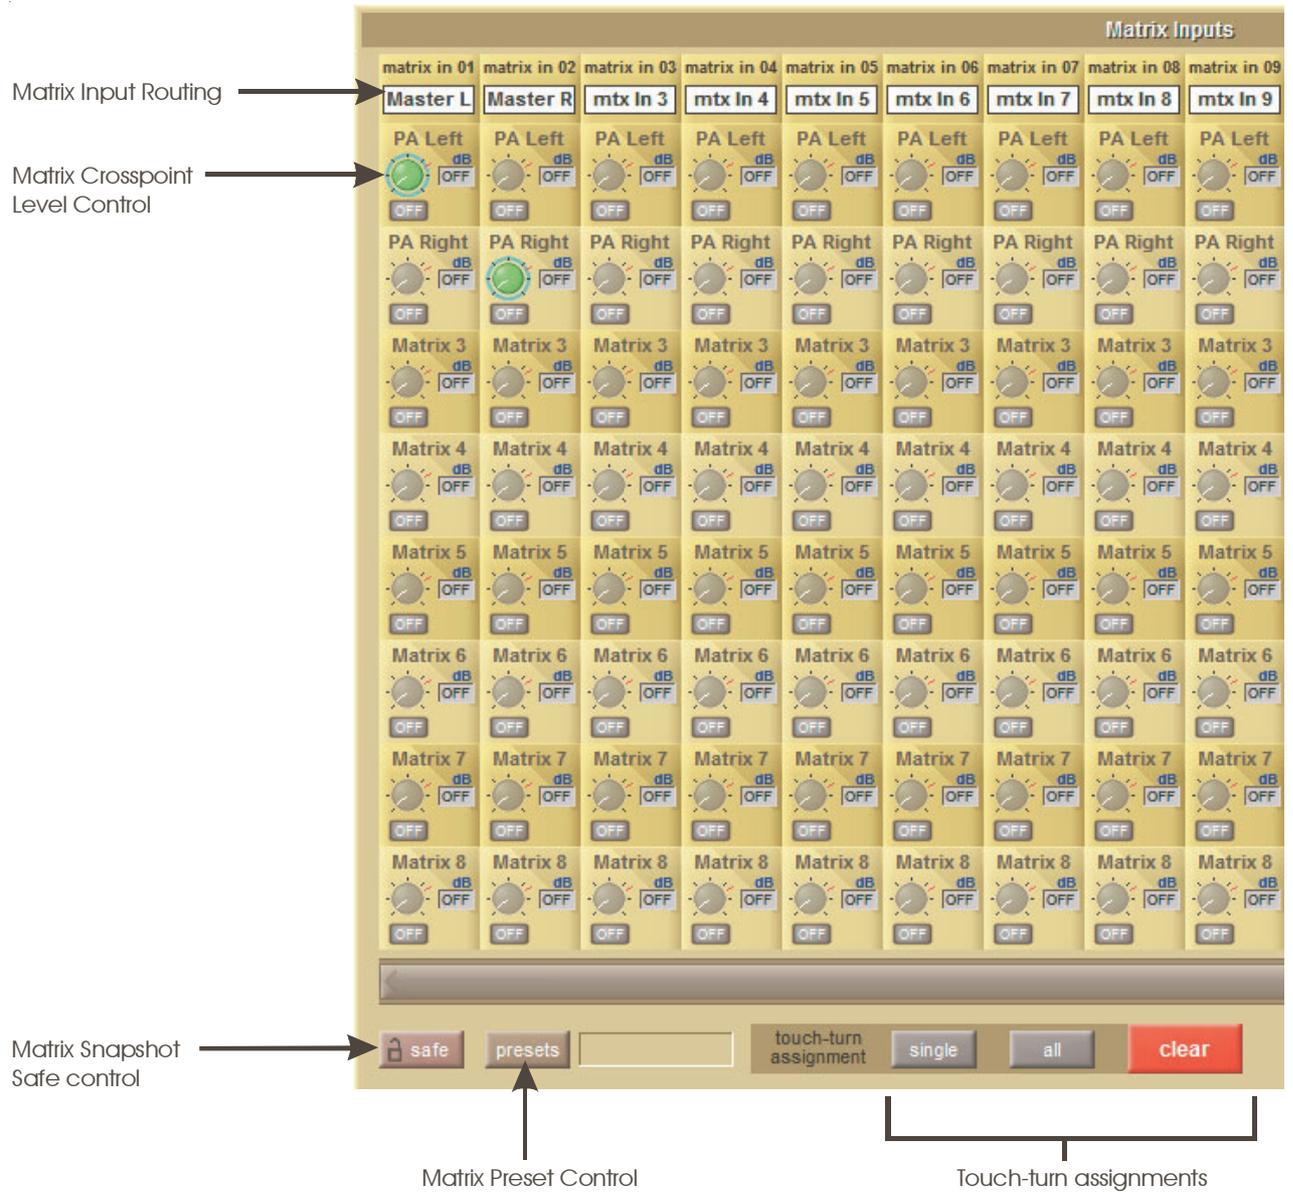

Using either of these methods, the highlighted auxiliaries on the input screen will change. The 3 rows of rotary controls and switches in each worksurface section are used as auxiliary sends, pans (with 2nd Function ON), On/Off and pre/post switches (with 2nd Function ON).

1.12 The Matrix

To open the Matrix Inputs panel, touch the Matrix button on the Master Screen Menu. The window that opens allows you to route inputs to the Matrix Output Channels, and set the Matrix crosspoint levels.

To route an input, touch the top of the appropriate Matrix column. This opens a standard SD10 input routing page.

The example above has the Master Stereo Buss routed to the inputs of Matrix 1 and Matrix 2 (Labelled as PA LEFT & PA RIGHT). By adjusting the crosspoint levels, you can change how much of each side of the Master buss is fed to these Matrix Channels.

There are three modes of level adjustment : **multi, single & all.**

Multi : Touch one or more level “knob” on screen, then adjust using the Touchturn control.

Single : Touch any level “knob” and adjust. Touching another “knob” will deselect the first.

All : All “knobs” are adjusted at the same time.

When adjusting more than one crosspoint, their relative levels are maintained.

Note that Matrix outputs are named in the Matrix Channel displays.

Chapter 1 - Getting Started

1.13 Control Groups

Any number of input channels and output channels can be connected to one or more of the 12 Control Groups. They can then all be operated from a single worksurface channel. Changes to the Control Group fader, mute or solo or controls will affect all channels connected to the group.

There are 2 methods to set up Control Groups:

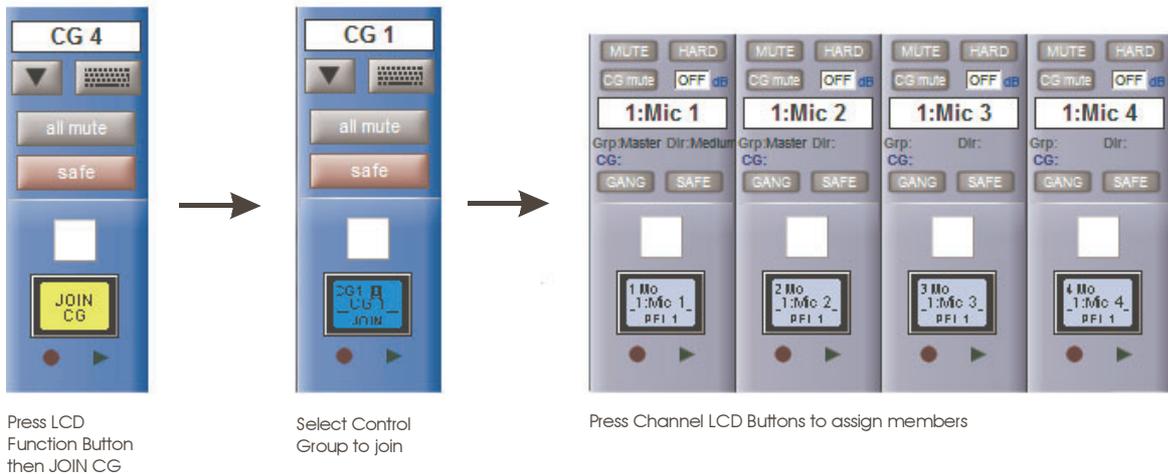

1) Press the LCD Function button on a CG fader bank (normally found in the centre section)

Press the **JOIN CG** button

Press the channel select button for the CG that you want to use

Press the channel select buttons for each of the channels that you want to make members of the CG

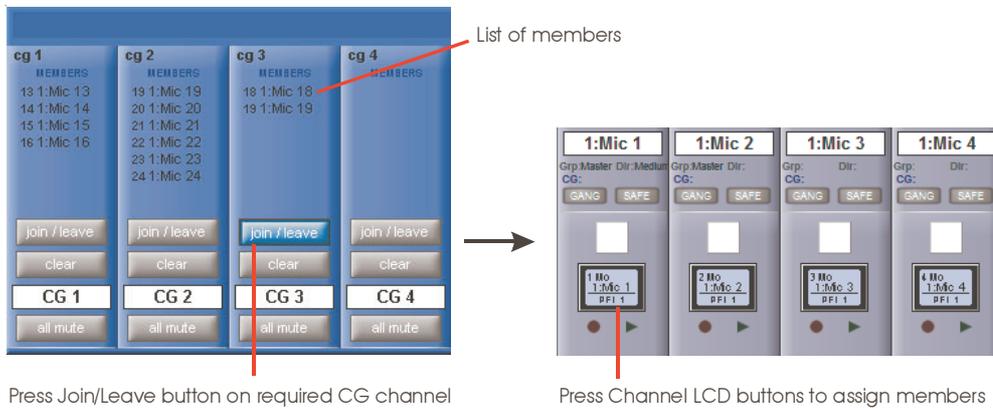

Release the **JOIN CG** button and return to standard Solo mode by pressing the channel select button beneath the LCD display labelled **SOLO**

2) Press the on screen JOIN/LEAVE button for the required CG channel

Press the channel select buttons for each of the channels that you want to make members of the CG

Release the JOIN/LEAVE button

A list of all the connected channels and their names is displayed above each Control Group display.

You can also clear all the channels from a Control Group by pressing **Clear**.

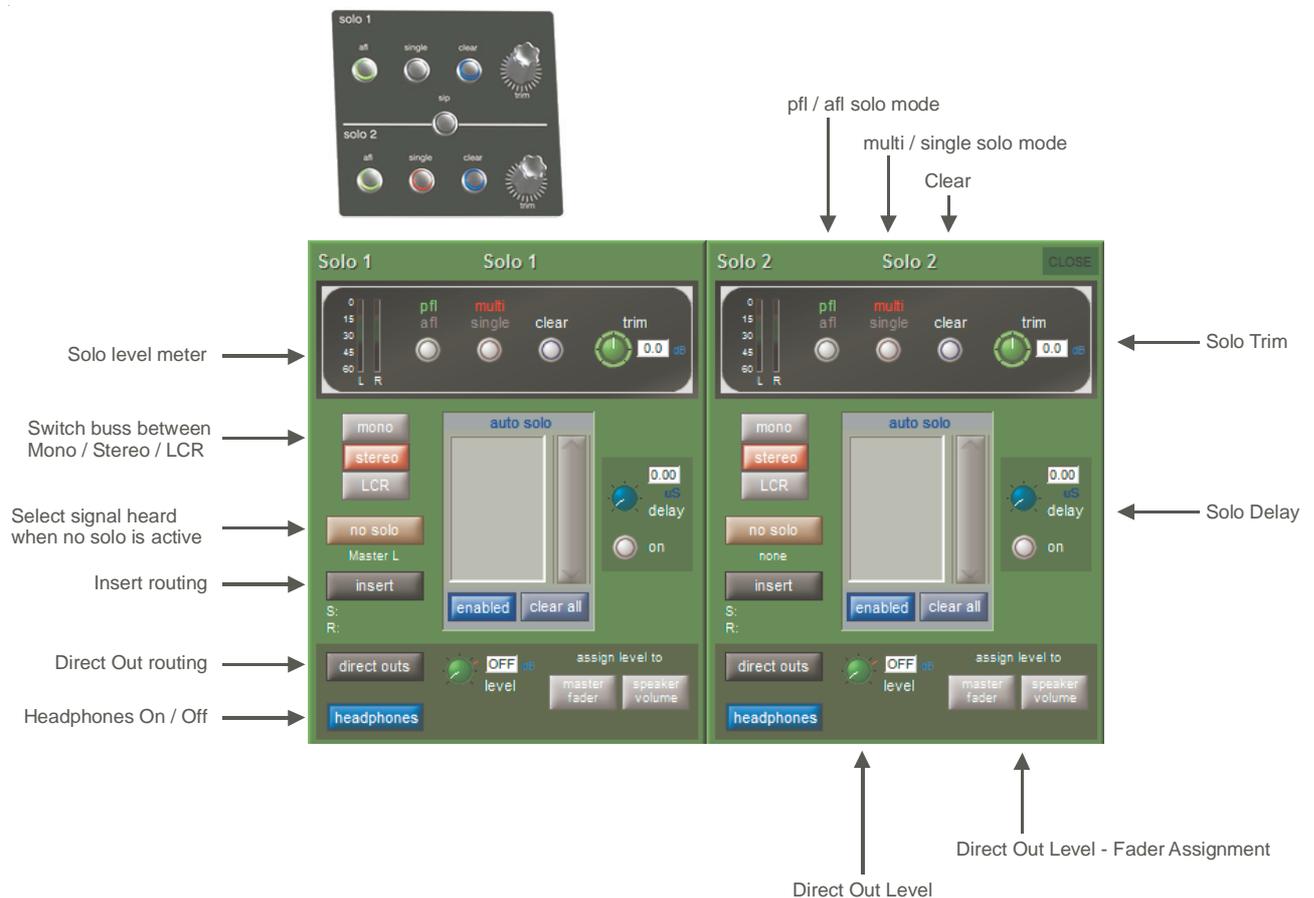

When a channel is a member of a Control Group, its own controls can still be adjusted independently of the other Group members. Adjustments to fader levels are transmitted to the Group members as dB changes, so that a level increase of 2dB on the Control Group fader will increase all the member levels by 2dB, irrespective of the relative levels of the individual channel faders.

Control Group Mutes are treated as “in series” where a channel is a member of more than one group – all CG mutes must be off for channel to be unmuted and muting any CG always mutes all of its members. If a channel is CG muted by single or multiple CGs, the worksurface channel mute button will override all CG mutes for that channel. The channel will not however be removed from CG membership, so if the relevant CG is muted again, the channel will also be muted.

1.14 Solo Setup

The SD10 Solo panel is accessed from a button at the top of the Master Screen. Some of the controls on this panel are duplicated on the right worksurface section.

There are two solo busses and each channel on the console can be independently assigned to use Solo1, Solo2 or Solo 1+2. Therefore, if the console was being used for Stage monitors, the first solo buss could feed "In-Ear" monitors, and the second solo buss could feed a wedge.

The following functions are available independently for each solo buss :

- Mono / Stereo Switch
- No Solo source routing
- Insert Point with both internal and external routing capability
- Direct Out routing (eg. for feeding a wedge)
- Assignment of Direct Out level control to master fader or speaker volume pot
- afl or pfl mode
- single or multi solo mode
- Delay
- Level Trim
- Auto solo mode

No Solo : Source for solo buss when no channel is in solo mode. No Solo source does not show on Solo meters.

Auto Solo : If a channel is set to Auto Solo, it will automatically solo when another channel is soloed. The Auto Solo function of each solo buss can be enabled and disabled as required. The solo buss must be in multi mode for the auto solo function to operate.

SD10 Operation Manual

Chapter 2:

Channel Types and Functions

Chapter 2 - Channel Types

2.1 Introduction to Channel Types

This chapter describes all of the functions available within the SD10's channel strips. The first two parts of the chapter will examine the Input/Setup and Output sections of each of the types of channel strip, and the third part will cover the in-channel signal processing, which functions in precisely the same way on each channel type. Those elements which are common to each channel type are dealt with first, and then those elements which are specific to a channel type are dealt with separately. In order to understand this chapter, you will find it helpful to have read Chapter 1 (Getting Started).

2.2 Channel Input Setup - Common Elements

2.2.1 Channel Strip Input Area

The channel strip input section is located at the top of the channel strip in the Channel Strip panel (shown below for an Input channel). This is where the channel inputs, snapshot safes, and solo bus feeds are configured. Some basic controls are displayed in the channel strip. However, most of the input parameters are contained in the channel **Setup** display, accessed by touching the channel's input or filters areas at the top of the screen. The **Setup** display also contains a number of channel configuration elements.

Note that channels without an external input selected display a simpler input section than that shown here.

The large pot at the top of the input area of the main channel strip controls the input level, and can be accessed using the encoder immediately above the channel strip. For Input channels which have ADC's assigned to their inputs, this remotely controls the analogue gain of the mic pre-amp in the I/O rack. For all other input types, this is a digital level trim. The gain value is displayed to the right of the level pot.

To the left of the pot there is a phase reverse button which is grey when inactive and red when switched in.

In output channels, the lower half of the channel strip input area contains the input delay controls: The delay is switched on using the on/off button on below the on screen total delay readout. The button turns red to indicate that the delay is active. The small pot to its right determines the course delay amount, and the current course delay value is displayed above the on/off switch. The channel's topmost encoder can be assigned to the delay pot using the **rotary assign** scrollers to the left of the encoders. On Output channels, the delay can then be adjusted more finely by pressing the **2nd function** button and turning the gain encoder. This value is displayed in microseconds or milliseconds to the right of the delay pot.

Note that, in Input channels, the lower half of the channel strip input area is used for trim and track controls. The delay function is found within the **Setup** display, not in the channel strip.

2.2.2 Channel Names

The black and white text box in the **Setup** display is used for naming the channel. Channel names are displayed in the scribble strip at the bottom of the screen. By default, the channel is given the same name as the selected input signal.

Note that if no input signal is selected, the scribble strip simply displays the channel number, prefixed by **ch** for Input channels, and prefixed by **Aux**, **Grp** or **Matrix** in the case of output channels.

The following notes are specific to naming channels:

The **Next** button moves the entire **Setup** display to the new channel.

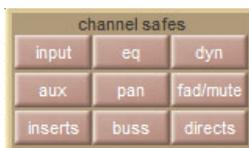

At the very top of the channel, the channel number and input signal name are displayed for Input channels, and the channel type and number are displayed for output channels. These labels remain unchanged, regardless of any channel naming.

For Input channels, note that if the channel input signal is changed once a channel has been manually named, the channel name will no longer follow the input signal name. To reactivate the automatic channel naming function, clear the name and re-select the channel input.

Note also that the channel **Output** display also provides access to this channel naming facility.

2.2.3 Channel Safes

The **Channel Safes** area of the **Setup** display defines which parts of the channel will not be affected when snapshots are recalled to this channel.

Note that the above diagram displays the Input channel safes. Output channels display a smaller list of available channel safes.

Select whichever parts of the channel you want to protect in this way by touching the appropriate button. To cancel a safe, press the relevant button again. The buttons turn red to indicate that they are safed. The presence of safes within the channel is also indicated by the label of the appropriate channel part turning red and the background colour of that channel's name also turning red.

The EQ and dynamics settings can also be safed and unsafed from within the **eq** and **dynamics** displays. The whole channel can also be safed and unsafed by pressing the **SAFE** button at the bottom of on-screen channel (Offline software). It is grey to indicate that some elements of the channel are not safed, and red to indicate that the entire channel is safed.

Tip: When some elements of the channel are safed, a double-press on the SAFE button can be used to quickly clear all channel safes.

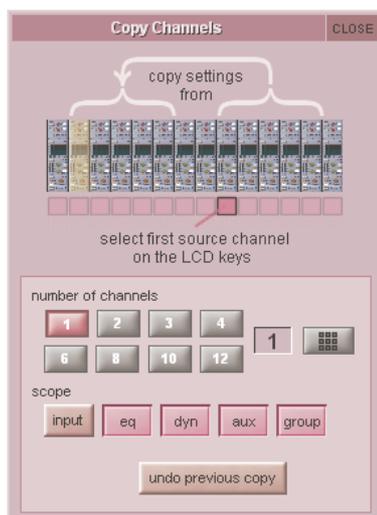

Note: Channel safes refer specifically to snapshot recalls and do not protect channel settings when using the copy from, copy to and presets functions described below.

2.2.4 Channel Settings

The **Channel Settings** area of the **Setup** display allow channel settings to be copied between channels. The left and right arrow buttons are used to move the **Setup** display to adjacent channels.

The **copy from** button allows settings to be copied from other channels to this channel and those to its right: Pressing **copy from** opens up a **Copy Channels** display:

The extent of the channel settings to be copied is selected using the **scope** buttons towards the bottom of the display. Each button lightens to indicate that it is included in the copy function. The number of source channels to be copied is defined either by selecting the appropriate grey numbered button, or by selecting the keypad button to the right of the numbered buttons, typing the required number of source channels into the numeric keypad which appears, and pressing **OK**. Press the Channel Select button (shown below) on the left-most source channel in order to action the channel copy. If more than one source channel has been selected, the settings of appropriate number of channels to the right of the source channel will copy to the channels to the right of the destination channel (The current Assigned channel).

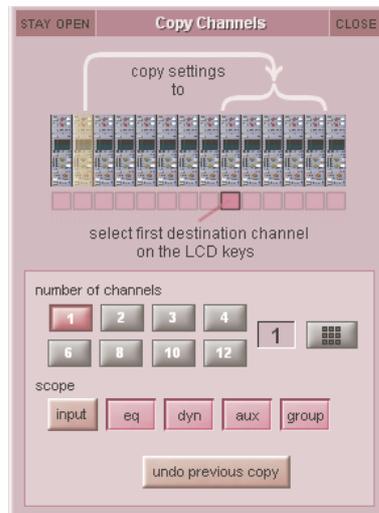

Chapter 2 - Channel Types

For example, to copy the EQ settings on channels 1-8 to channels 9-16 respectively:

- Make channel 9 the Assigned channel and touch **copy from**
- In the scope area of the **Copy Channels** display, select only the **eq** button
- Set the **number of channels** to be **8**.
- Press the Channel Select button on channel 1.

The **copy to** button allows settings to be copied from this channel to other channels: Pressing **copy to** opens up a **Copy Channels** display:

Note that this is a different Copy Channels display from that opened by the copy from button.

The extent of the channel settings to be copied is selected using the **scope** buttons towards the bottom of the display. Each button lightens to indicate that it is included in the copy function. The number of destination channels to which this channel's settings will be copied is defined either by selecting the appropriate grey numbered button, or by selecting the button to the right of the numbered buttons, typing the required number of source channels into the numeric keypad which appears, and pressing **OK**. Press the Channel Select button (shown above) on the left-most destination channel in order to action the channel copy. If more than one destination channel has been selected, the settings of the source channel will copy to the appropriate number of channels to the right of the selected destination channel.

For example, to copy the EQ settings on channel 1 to channels 9-16:

- Make channel 1 the Assigned channel and touch **copy to**
- In the scope area of the **Copy Channels** display, select only the **eq** button
- Set the **number of channels** to be **8**.
- Press the Channel Select button on channel 9.

If a **copy from** or **copy to** function is actioned by mistake, it can be undone by pressing the **undo previous copy** button in the current **Copy Channels** display.

Tip: Use copy to for copying one channel's settings to a number of other channels; Use copy from to copy the settings of a group of channels to another group of channels.

Tip: If you wish to make several different copies press the STAY OPEN button on the Copy To panel and it will remain open until it is manually closed with the CLOSE button

Pressing the **presets** button opens the **Presets** display. The basic functions of a Preset display are described in the Getting Started section. Functions specific to Channel presets are described below.

Note that presets are specific to a channel type: The Presets display will only list those presets which apply to the current channel type.

To reset the channel to the default settings, press **default**.

2.2.5 Channel Solos

The SD10 has two solo busses, and each channel can be assigned to **solo 1**, **solo 2** or both **solo 1** and **2**. If the console was being used for Stage monitors, this would allow, for example, the first solo buss to feed In-Ear monitors and the second solo buss to feed a wedge.

Note: The solo busses are configured in the master solo displays, accessed by pressing the Solos button at the top of the Master Screen.

The channel's solo routing is assigned in the section at the bottom section of the channel Setup display. Pressing the green **solo 1** and **solo 2** buttons enables the channel to be routed to solo busses 1 and 2 respectively. The buttons are green to indicate that the solo bus is available, and grey to indicate that it isn't.

Solo buss assignments can also be configured by pressing an **lcd function** button, followed by the **SOLO CHOICE** function button which appears. Pressing a channel's LCD button will then cycle the channel's solo buss routing between **SOLO 1**, **SOLO 2** and **SOLO 1+2**.

Note that each channel must be enabled for at least one solo buss.

When the blue **auto solo** buttons are active (indicated by white, rather than grey, text), that channel is automatically routed to that solo bus whenever another channel is soloed to that buss.

Note that a list of channels with auto solo enabled is displayed in the auto solo section of the master solo display. The auto solo function has to be activated by pressing the blue enabled button below the auto solo list in the master solo display.

Chapter 2 - Channel Types

Tip: If you are using effects returns, selecting auto solo can allow soloed tracks to be auditioned with their effects returns.

2.3 Channel Output and Inserts - Common Elements

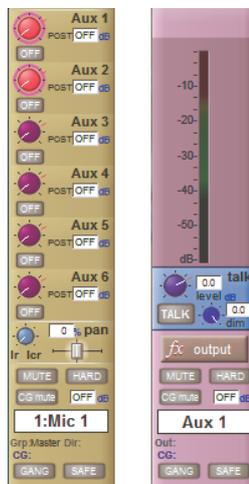

2.3.1 Channel Strip Output Area

The channel strip output area makes up the lower half of the Channel Strip panel (shown below for an input channel). This is where the channel output routes are configured (including Aux sends in the case of Input channels).

Each channel also has two inserts: insert A and insert B. Both inserts follow the format (mono or stereo) of their channel. The channel strip insert areas are located above the **eq** section (**insert A**) and below the **gate** section (**insert B**), and their signals are sent and returned to that position within the signal path: **insert A** is pre-signal processing (but post filters), and **insert B** is post signal-processing.

Some basic output and insert functions are found in the channel strip. However, most of the output and insert parameters are contained in the channel **Output** display, accessed by touching the channel's output or insert areas.

For all output channel types, there is a channel meter displayed in the channel strip (see below right). For Input channels, this part of the channel strip contains the aux outputs (see below left):

Below the meters section of the output channels, there is an **fx output** button. This button brings up either the controller display for the effects preset that has been assigned, or the **fx Presets** display if no preset has been assigned.

Note that below the aux section of an Input channel, there is a pan control in place of the fx output button. When an effects preset has been assigned to that channel's Direct Out, touching this pan control brings up the FX preset controller display.

Towards the bottom of the channel strip there is a scribble strip of black and white text boxes displaying the channel names.

Note that the channel naming facility is found in both the channel Setup and Outputs displays.

Below the channel name, there is indication of the lowest group (**Grp:**) output (along with indication of the lowest direct output (**Dir:**) in the case of Input channels), and indication of any control group (**CG:**) to which the channel belongs.

The on-screen channel has **MUTE** and **HARD** indicators located above the scribble strip. Pressing the worksurface **MUTE** button silences all outputs from the channel apart from any which have been assigned pre-mute (this option is available for auxes and direct outs) Pressing the worksurface **2nd Function** button to activate the **HARD** mute silences all outputs from the channel, including those which are assigned pre-mute.

Immediately below the **HARD** button, there is a numeric display of the channel's main fader value in dB.

In the bottom left-hand corner of the channel strip, there is a **GANG** display. To the right of the **GANG** button there is a **SAFE** button. This indicates the Safe status of the channel.

2.3.2 Channel Strip Insert Areas

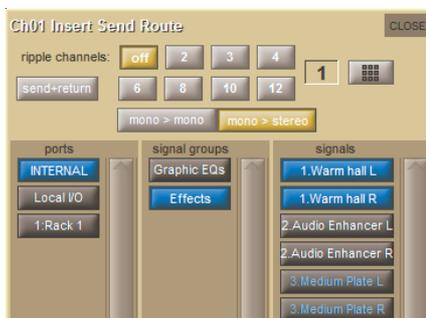

Each channel has two inserts which are displayed in the channel strip in the location which reflects their position within the channel's processing order. The channel strip insert areas include a button for switching that insert send on and off, which is grey when the send is off, and red when it is on.

Below the on/off button, there is a display of the current insert routing. The send route is displayed on the left, prefixed by **S:**, and the return route is displayed on the right, prefixed by **R:**. If no routing has been selected, these areas are blank apart from these prefixes. If the channel is stereo, only the left side of the insert routing is displayed.

2.3.3 Console Output and Insert Routing

The **Output** displays for all four channel types allow direct routing either to the external IO racks, or to one of a variety of internal locations, for both the channel's main output (or direct output in the case of Input channels), and its insert send and return. Towards the bottom of the **Outputs** display, there are three buttons marked **output** (**direct** in Input channels), **insert A** and **insert B**. Selecting one of these buttons assigns that send (or send and return) to the signal routing area above it: When either insert is assigned, the **ins A send** or **ins B send** routing button appears in the left-hand column, and the **ins A return** or **ins B return** routing button in the right-hand column; When the output (direct output in Input channels) is assigned, the **outputs** (**direct outs** in Input channels) routing button appears in the left-hand column and the right-hand column is left blank. Pressing any of these routing buttons opens a routing display.

There are two additional options for insert routing:

The **send+return** button links the send and return routing for all signals within the **INTERNAL** port: If the **Graphic 1** input is assigned to the insert send, the **Graphic 1** output is automatically assigned to that insert return. Similarly, if it is the return which is manually assigned, the send automatically copies that send assignment. The **send+return** button is grey when inactive and brown when active.

The **mono > mono** and **mono > stereo** buttons define how inserts are routed to the internal fx units: If **mono > mono** is selected, mono channels are routed to a single side of the selected fx unit. If **mono > stereo** is selected, mono channels are routed to both sides of the unit, via the channel's pan control.

2.3.4 Creating and Configuring FX Modules

Each channel output or insert send can be sent to an internal FX Unit. FX modules can be accessed either from a channel which is to feed them, or using the **fx** menu button in the Master Screen.

Channel FX access

Press the **fx presets** button at the bottom of a channel's **Outputs** display to bring up the **fx presets** display. The effects preset is applied to whichever channel output is active in the **Outputs** display when the **fx presets** button is pressed: the main channel output (or direct output), insert send A or insert send B:

Chapter 2 - Channel Types

Note that the basic functions of Preset displays are described in the Getting Started Chapter.

A number of factory presets are provided, and these provide the basis for any user-adjusted presets. Factory presets are indicated by the presence of a red padlock in the **lock** column on the right. The FX modules available are listed below, along with notes regarding anything which users may not be familiar with.

- Delay** Simple delay, and Studio delay (which includes a **cross fb** button which reverses the pan on stereo feedback signals, along with a feedback **hi pass** filter and **modulator**)
The **tempo** button below the delay pot can be used to set the delay length: When the button is pressed twice within five seconds, the delay time is set to the time interval between button presses.
- Reverb** A range of reverbs are provided, including a number of non-linear options. Note that the **lo filter** is 'high-pass' and the **hi filter** is 'low-pass'.
- Pitch Shifter** A number of pitch-shift/thickener presets are included. The **left** and **right** numeric values are displayed as a ratio of the original pitch.
- Chorus** A number of chorus presets are included.
- Enhancer** There is also an audio enhancer module.

Select an fx preset group (left column) followed by the specific preset (right column). The fx preset is then adjusted using the fx module which appears:

It can then be saved, either as a new preset or as an updated version of the preset that has already been created, to prevent the changes from being lost.

To lock the preset, activate the **edit name** button and touch the preset's **lock** column. A grey padlock appears, indicating that the preset is now locked. Touching the lock again with **edit name** active unlocks the preset. All master presets are locked and cannot be unlocked. Master presets can be distinguished from user presets by the red colour of their padlocks.

Note - that factory preset group names can be edited, even though the presets themselves cannot.

Once an effects preset has been assigned, the **fx output** button in the channel strip recalls the preset's controller display. In the case of Input channels, once an effects preset has been assigned, the preset's display can be recalled by touching the pan area of the channel strip. The **fx Presets** display can then be recalled by pressing the **fx presets** button within the controller display.

Each FX unit can be saved by pressing the **safe** button at the top of its display. The channel's name and output are also shown at the top of the display, and each effect displays its input and output levels in meters in the left-hand side of the controller.

Note that a total of ten fx units of any type can be assigned. If Presets are greyed out in the presets list this means that the maximum number of modules has already been used.

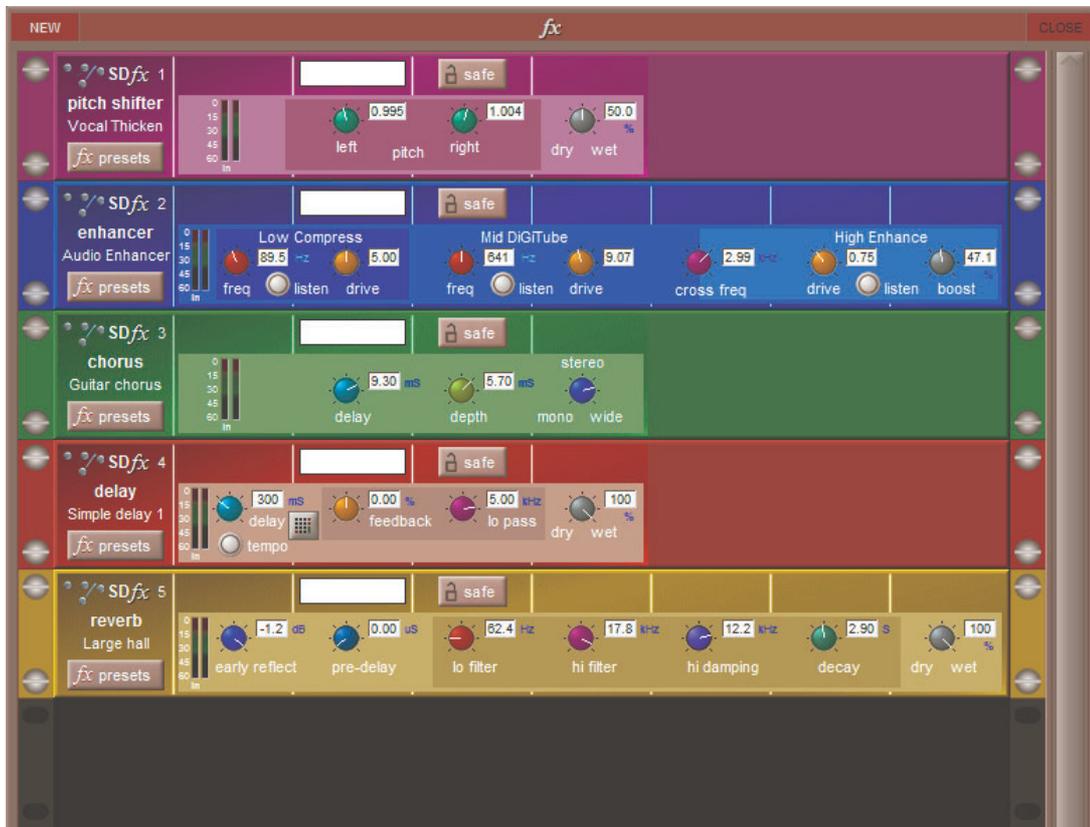

When an fx unit is open in a channel screen, its pots are assigned to the assignable encoders below the screen. Each value is displayed to the right of its pot.

To cancel a route to an fx module, open the **fx Presets** window for that channel, and deselect the preset.

Note that all fx modules are stereo, though mono signals can be routed to them as described in the previous section.

The Master FX Display

Selecting the **fx** menu button in the master screen opens the master **fx** display, which shows all of the currently assigned fx units in a single rack.

To create a new module, click on the **New** button in the top left-hand corner of the fx window to bring up the **fx Presets** display, then select the appropriate preset in the usual way. Routing to fx modules is then performed in the channel **Outputs** display. Note that up to 10 fx modules can be created. A scroll bar provides access to hidden modules when the rack overshoots the screen.

To delete a module, click on the **fx presets** button on the module, and deselect the preset in the **fx Presets** display which appears.

2.4 Input Channel Specific Functions

2.4.1 Trim and Track.....

On Input channels with an external input, there is a trim section at the bottom of the channel strip's input area, consisting of a smaller pot marked **trim** and a **track** on/off button. The **trim** pot trims the level of the digital input signal, and the level adjustment is displayed to the right of the pot in dB. If **track** is switched on, the trim level automatically compensates for any adjustments made to the analogue input level: If the analogue input level is increased, the trim level will decrease in order to keep the signal level coming through the channel at the same level. This function is particularly useful when the analogue level is being controlled from another console, such as when this console is running monitor mixes and another console is running Front of House. Control of the **trim** pot and **track** on/off button can be assigned to the encoder and button above the channel using the **assign** scrollers to the right of the encoders.

2.4.2 Input Routing.....

The two buttons at the top of the channel **Setup** display to define the format of the channel: **mono** or **stereo**.

As the channel format affects a number of functions within the **Setup** display, it is advisable to select the format before any further configuration takes place. The current format of the channel is indicated in the channel strip by the number of meters displayed: One meter for mono channels and two for stereo.

For mono channels, each input channel has two inputs: a **main** input and an **alt(ernative)** input. These are selected using the **main** button in the channel strip. The button is green when the **main** input is selected and red when the **alt** input is selected. The input can also be selected using the **main** and **alt** buttons towards the top of the **Setup** display – these buttons go green and red respectively when selected. For stereo channels, the alternative input is becomes the right side of the stereo input, and therefore no **main** and **alt** input selection buttons are shown.

The inputs available on an Input channel include feeds from the external IO racks, the local inputs on the back of the console and a variety of internal signals. Pressing either the **main input** or **alt input** routing button in the **Setup** display opens the **Input Route** display. The signal feeding each input can then be selected as described in the Getting Started section of this manual.

2.4.3 Input Configuration.....

If a channel is stereo, **balance** and **width** controls appear below the **mono** and **stereo** buttons: The left-hand blue pot controls the balance and can be reset to centre by pressing the **centre** button below it. The right-hand blue pot effects the width of the stereo signal, with a range from mono to wide. The width can be reset to stereo by pressing the **stereo** button beneath the **width** pot. The value of the balance and width is displayed to the right of each pot as a percentage divergence.

In addition to the standard routing button, stereo channels also have an **m-s** button which switches in a decode function for replaying M-S signals as a normal stereo pair. There are three further buttons in this panel: **L<>R** swaps the channel's left and right outputs, **L>L+R** sends the left signal to both left and right busses, and **R>L+R** sends the right signal to both left and right busses.

Input channel delay controls are found below the input routing area of the **Setup** display. The delay is switched on using the **on** button, which is ringed in red to indicate that it is on. The left-hand blue pot controls the course delay amount in milliseconds. The right-hand blue pot enables fine adjustments to be made, measured in samples. Both pots can be assigned to gain encoders using the **assign** scrollers to the right of the encoders, in which case each pot is assigned to the encoder above it.

Note: This will normally mean that the course pot is assigned to the Assigned channel's gain encoder and the fine pot is assigned to the next channel's encoder. If, however, the Assigned channel is channel 12, the course pot is assigned to the previous channel's encoder and the fine pot is assigned to the Assigned channel's encoder.

2.4.4 Output Routing

Input channels have four different output types: aux sends, group sends, insert sends and direct outputs. The top half of the output section of the Input channel strip contains the aux buss controls. Aux sends, Insert routing and basic direct output routing are described in the Getting Started chapter.

2.4.5 Aux Busses and Assignable Controls

Within an Input channel strip, all aux sends have a level trim and on/off switch. The switch is grey to indicate that the send is off, and red to indicate that it is on. The trim level is displayed in dB on the right of the channel strip, underneath the aux number.

There are three places within the channel from which the aux sends can be fed, as indicated by the source display immediately to the right of the level trim:

PRE	Pre-fader
POST	Post-fader
Pre-M	Pre-mute (and pre-fader)

The source position can be changed by pressing the worksurface **2nd function** button and using the switches below the aux send encoders. The source for each aux can also be adjusted globally via the aux channel's **Setup** display.

On stereo aux sends, there is a pan control to the right of the on/off switch. This can be adjusted by pressing the worksurface **2nd function** button and using the rows of encoders below the worksurface screen. The pan controls for each aux can be globally linked to the channel fader via the aux channel's **Setup** display.

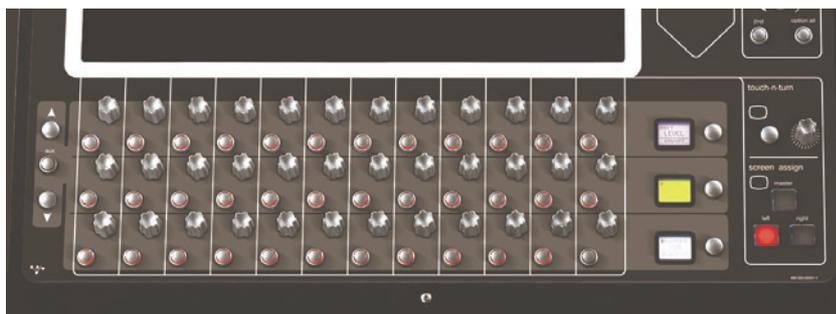

The three rows of encoders and buttons on each worksurface section can be used to control either the aux sends, or a separate function. This function is referred to as the 'locked' function, as it does not change when the auxes are moved. The button at the right-hand end of each row, next to the LCD, flips the assignment of that row between the aux sends and the locked function. Touching any on-screen aux send assigns the highest available encoder row to that send, and assigns any other available encoder rows to the aux sends below it. The scroll buttons to the right of the rows of encoders allow scrolling of the assigned auxes.

Pressing the button labelled **Aux** situated between the two scroll buttons will automatically assign the three rows of encoders to the aux sends.

Pressing and holding this button will assign the three rows of encoders to the aux sends in all 3 worksurface sections which have selected banks that contain input channels. In this state the button will flash green - press it again to release the function.

Note that only six auxes can be displayed in the Channel Strip panel at once. The panel will always display the auxes assigned to the encoder rows below it. This means that the auxes controlled by the dedicated aux encoders in the channel worksurface controls may not be visible.

By default, the encoders control the aux level and the button controls the aux on/off status. However, by pressing the **2nd function** button (located to the left of the Channel Strip panel), the button becomes the aux's source selector (toggling between **PRE**, **POST** or **Pre-M**), and the encoder becomes the pan control of a stereo channel. On mono auxes, the encoder has no second function.

Note that further worksurface assignments of auxes is available via the Surface and Solo tabs of the Options menu. See the Master Screen Chapter

2.4.6 Group Outputs

Group outputs are routed from within the **groups** section of the channel **Outputs** display. Touching the **mono**, **stereo** or **LCR** buttons in the left of the display produces a list of groups of the selected format in the right of the display. These buttons light to indicate that it is their group outputs list which is currently displayed. Touching any of the groups within each list routes the channel to that group. Each channel can be routed to as many mono and stereo groups as have been created.

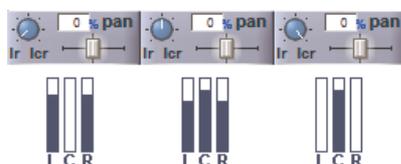

Any mono groups being fed by a stereo channel will receive a L+R summed signal of the channel output.

The lowest selected group output is displayed in the channel strip, below the left side of the channel name, and the currently selected direct output is displayed below the right side of the channel name.

When a new session is created, one buss is designated the **Master**. The Master will always be the lowest numbered group with the highest number of channels – the LCR buss if there is one, or the first stereo buss if there is no LCR buss. All input channels are routed to the **Master** by default, and the master faders are assigned to it.

Pan and Blend

Below the auxes, there is a pan control for panning to stereo and LCR busses, and a blend control for adjusting the centre component of sends to LCR busses. Approximate blend ratios are as follows:

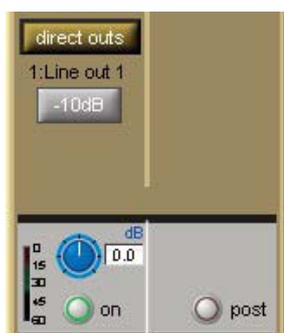

The pan of the Assigned channel can be controlled using the joystick in the centre section. The pan control is assigned to the lower row of assignable encoders by default, with LCR blend as the control's 2nd function. The numeric box above the pan control displays the pan value as a percentage of divergence from centre, with left panning being indicated by a negative value.

On stereo channels, the pan controls the balance of sends to stereo and LCR busses.

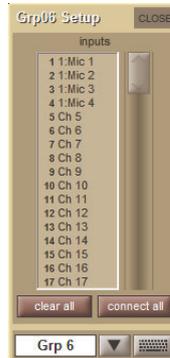

2.4.7 Direct Outputs

Basic routing is described in the Getting Started section. Once the direct output has been routed, any relevant additional controls are displayed below the **direct outs** routing button. The output is switched on by pressing the grey **on** button next to the output level meter in the grey area below the routing button. The direct out is taken post-fader by default, but can be switched to pre-fader or pre mute by pressing the button to the right of the **on** button. The current selection is displayed to the right of the button.

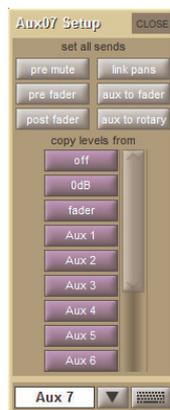

2.5 Group Channels Specific Functions

The Group channel input signals are defined within the Input channels **Output** display. The top section of the Group channel **Setup** display lists all of the currently selected **inputs** to that group. The inputs list can be scrolled using the scroll bar to the right if necessary. Below the list there are two buttons: **clear all** removes all of the input routes to that group. Pressing this button produces a confirmation box in which the clear all can be confirmed or cancelled. **connect all** routes all Input channels to the group.

2.6 Aux Channels Specific Functions

As the Aux channel input signals are defined within the Input channels, there is no input selection available within the Aux channel **Setup** display. There are, however, a number of configuration options in the top half of the **Setup** display:

The grey **set all sends** buttons at the top of the **Setup** display affect the sends to that aux bus from all of the Input channels. The three buttons on the left, **pre mute**, **pre fader** and **post fader**, set the point in the channel from which the aux send is taken. The current send point is displayed next to the aux send level in the Input channels.

Note that send points can also be individually selected within the Input channel using the 2nd function button.

Pressing the **link pans** button, located to the right of the **pre mute** button on stereo busses, links that aux send pan to the main channel pan in the Input channels. Further indication is provided by the aux pan slider in the Input channel strip being lit pink.

Pressing **aux to fader** assigns control of all input channel's auxiliary sends to the channel faders. Pressing **aux to rotary** assigns control of all input channel's auxiliary sends to the top available encoder row beneath the Channel Strip panel.

The purple **copy levels from** buttons also affect the sends to that aux bus from all of the Input channels. The buttons list can be scrolled using the scroll bar on the right. These buttons are used for universally setting the aux send levels: **Off** sets the level to off and **0dB** to 0db. **fader** sets each Input channel's aux send level to match the level of its channel fader. The remaining **copy levels from** buttons copy a different set of Input channel aux send levels to that aux send.

Note that when a copy levels from button has been pressed, send levels can still be individually readjusted within the Input channel.

In the main Aux channel strip, there is also a **talk** area for assigning talkback to auxes. This is described in the Talkback section of the Master Screen chapter.

Chapter 2 - Channel Types

2.7 Matrix Channels Specific Functions

As the Matrix channel input signals are defined within the **Matrix** inputs display, there is no input selection available within the Matrix channel.

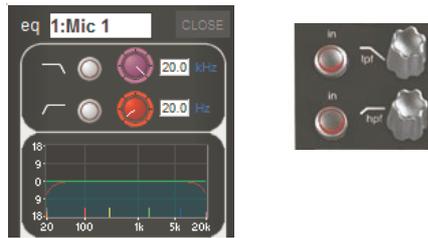

2.8 Channel Signal Processing

Each channel type contains signal processing capability, including multi-band EQ and a compressor/gate. Pressing on each of these areas of the channel strip will open the relevant signal-processing display.

2.8.1 Channel Filters (Input Channels Only)

The filters section of an input channel's fader strip is located below the input section. It consists of two frequency pots, each with its own on/off button and a display of the filter's cutoff frequency in Hertz. The grey on/off buttons become ringed red to indicate that they are on. The low-pass filter is at the top and the high-pass filter is at the bottom, and both have a roll-off of 24dB per octave. The filters directly follow the input section in the signal chain.

The filters area is replicated at the top of the EQ/filters display, accessed by touching the EQ area of the channel strip. The filter can be configured using the dedicated filter encoders and buttons at the top of the channel worksurface controls:

A graphic representation of the filters is included in the EQ graph located below **Insert A** in the channel strip, described below. The red line in the graph represents the current filter settings.

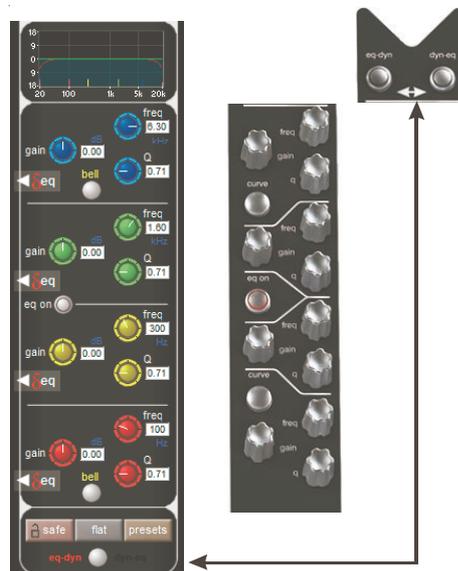

2.8.2 Channel EQ

SD10 input channels have four bands of EQ which can be configured using the dedicated encoders and buttons on the worksurface. Output channels have eight bands – four before Insert A and four after. The **pre-insert eq** and **post-insert eq** buttons above the Insert A area of an output channel strip select which set of bands is assigned to the control surface encoders.

The four EQ bands are colour coded: Blue for HF, green for HMF, yellow for LMF and red for LF. The in-channel display is located below **Insert A** and consists of a graphic representation of the current EQ and an on/off button. The button is grey to indicate that the EQ is off, and red to indicate that it is on. The green line in the graph represents the frequency response of the EQ, and the red line represents the response of the filters. The central frequency of each band is displayed by small lines in the band colours, along the bottom of the graph, with pre-insert output bands indicated by lighter shades of the relevant colour.

Touching the EQ area of the channel strip brings up the EQ display. On input channels, the EQ section of the display is below the filters section. On output channels, the **pre-insert eq** and **post-insert eq** buttons at the top of the display define which set of four EQ bands is shown in the rest of the display (and is assigned to the worksurface encoders). The display follows the same layout as the worksurface encoders.

There is also a larger graphic representation of the current EQ at the top. Touching this EQ graph will open an expanded view of the graph.

In both the EQ/filters display and on the worksurface, each band has a ± 18 dB **gain** controller on the left, a **frequency** controller (ranging from 20Hz to 20kHz) top right and a **Q** control bottom right. Each pot has its value displayed to its right. The top and bottom EQ bands have **Curve** buttons that allow the filter type to be switched.

Towards the bottom of the EQ/filters display are three grey buttons marked **safe**, **flat** and **preset**. Touching **safe** adds the EQ to that channel's list of channel safes. Touching **flat** resets the EQ gain controls to 0dB. Touching **preset** brings up the **Presets** display which can be used to save and recall presets.

Below these buttons is a smaller round button which is also found on the channel worksurface controls, for switching the signal-processing order. The default setting is EQ followed by dynamics, as indicated by the **eq-dyn** label being to the left of the button. Pressing this button reverses the order, as indicated by the labelling switching to an **dyn-eq** display to the right of the button.

Note that on output channels, these processing order buttons refer to the position of the post-insert EQ.

Dynamic EQ

Dynamics are available to each EQ band – dynamic EQ modules can be assigned to a maximum of 10 channels. Clicking on the 'delta' EQ button below the band's gain control will open up its Dynamic EQ display:

Switch the EQ band on and off using the **band on** button, and activate the band's dynamics using the **dynamic on** button.

The **over under** button switches between the following modes, with the active mode shown in red:

In **over** mode (default), adjustment (amplification or attenuation) to the frequency band's level begins at the threshold (**thresh**), and increases to the maximum defined by the **gain** control. The **ratio** affects how fast this maximum is reached.

In **under** mode (**over under** button ring lights red), adjustment to the frequency band's level is at a maximum when the signal is well below the threshold, reducing to 0 at the threshold. The signal level at which level adjustment starts to reduce is defined by the **gain** and **ratio** controls.

The amount of gain adjustment is indicated by the gain meter which appears above the **gain** pot once dynamics have been activated.

Note that dynamics are not available for the pre-insert EQ on output channels.

Note also that a warning message will appear if you attempt to create more than 10 dynamic EQ modules.

EQ Graph

The amount of gain reduction being introduced is indicated in the graph located in the channel strip **eq** area and in the expanded **eq** display. The green line indicates the effect of the EQ (with the maximum gain change indicated in the case of dynamic EQ), and the red line indicates the effect of the filters. Note that these lines assume that each filter and eq band is switched on – the light shaded area in the display indicates the actual effect of the filters, with the light area being restricted to underneath the red line when the filters are on.

The centre frequency of each band is indicated by a small line at the base of the display, matching the colour of the band's controls.

Chapter 2 - Channel Types

2.8.3 Channel Dynamics

The SD10's channel dynamics includes a fully configurable compressor and a gate with high- and low-pass filtering. The in-channel display is located below the **eq** display. The compressor can be switched on by pressing the on/off switch to the left of the **comp** label, and the gate can be switched on by pressing the on/off switch to the left of the **gate** label. These buttons are grey when off and red when on. The channel strip compressor display then includes a **threshold** and gain pot, each with their current value displayed to their right in dB, an input (**In**) meter and a gain reduction (**GR**) meter. The gate display includes a **threshold** pot with its current value displayed to its left in dB, and three status indication lights. The input meter in the **comp** area has two small arrows to its right: The green arrow displays the current compressor threshold, and the orange arrow the gate threshold.

Pressing anywhere in the **comp** or **gate** areas brings up the **dynamics** display. When the expanded display is open the compressor and gate controls are assigned to the encoders below the touch screen.

Both compressor and gate can be switched on using the **on** button below their **threshold** buttons. The compressor also has an auto gain function which is switched on by pressing the **auto gain** button below the **ratio** pot. This function automatically adjusts the **gain** makeup to when changes are made to the **threshold**, thus keeping the compressor output steady.

On mono channels, there is also a **link** button to the right of the compressor controls, allowing two channels to be linked together as if stereo. In other words, the link button enables another channel signal's to be added to this compressor's control circuit input, and for this channel's signal to be added to the other channel's control circuit input. Pressing this button brings up a dynamics link display listing **Channels**, **Groups** and **Auxes signal groups** in the left-hand side. When one of these **signal groups** is selected, their available **signals** are listed in the right-hand side of the display. Select a signal to link to and close the display. The **link** button is ringed red and the linked channel's number and name is displayed in the box above it to indicate that there is a link present. To cancel the link, press the button again and deselect the link signal.

Gates can be keyed by a different signal by pressing the **key** button below the **attack** pot. This brings up a **Gate Key Route** display from which a key input can be selected. Consecutive channel gates can be keyed by consecutive input signals using the **ripple channels** function. The key button is ringed red and displays the key input in the text box to its right to indicate that another signal is keying the gate. The key input signal can be auditioned by pressing the **key listen** button.

Each pot has its value displayed to its right. These pots are automatically assigned to the worksurface encoders below the screen when the dynamics panel is expanded, as indicated by the matching coloured rings around the pots and encoders. When the display is expanded to three bands, each band is assigned to a row of encoders. When the gate is also on, it appears in the bottom row of encoders.

At the top of the **dynamics** display are two buttons marked **safe**, and **presets**. Touching **safe** adds the dynamics to that channel's list of channel safes. Touching **preset** brings up the **Presets** display which can be used to save and recall presets. The meters in the left of the window display the incoming signal level and compression amount, with small colour-coded arrows on the input meter to indicate the compressor and gate thresholds.

Multiband Compression

Multiband Compression is available for up to 10 channel dynamics modules. Clicking on the **multi-band** button at the top of the display produces an expanded dynamics display, showing three bands of compression.

Each band provides the same controls as the single-band module, with global controls for on/off and link functions. Each band can also be switched on and off individually.

Important note: if a band is switched off, that EQ band will not pass audio.

The purple and red pots on the left of the display control the frequency at which the bands crossover. Each band's listen button solos that band to the mix (not the solo) buss. The threshold and gain controls located in the main channel strip adjust all three bands, maintaining relative levels.

Note that all settings will be lost when switching between single-band and multi-band modes. Note also that a warning message will appear if you attempt to create more than 10 multiband compression modules.

2.9 LCD Functions

2.9.1 Introduction to LCD Functions

The LCD functions are accessed by pressing the **lcd function** button located to the left of the channel LCD displays in each of the three console sections. The LCD displays themselves provide information about the relevant channel and the current function mode is displayed in the bottom half of the display.

When the **lcd function** button is pressed, the Channel Select buttons beneath the LCD displays are used to activate the various functions and to select channels as required:

Selecting one of these options assigns that function mode to the Channel Select buttons for all the channels within the **banks** associated with that **lcd function** button.

There are nine different function mode options.

2.9.2 Solo

When an **lcd function** button is pressed, the left-hand LCD display is labelled **SOLO**. When **SOLO** mode is selected, the Channel Select buttons become solo buttons. The bottom half of the LCD display indicates which solo busses are available to the channel, as defined in the channel **Setup** display and the SOLO CHOICE function mode (described below). The button also displays whether each buss is AFL or PFL, as defined in the top-left corner of the master solo display.

In **SOLO** mode, the LCD displays are coloured according to their channel type when not soloed, and coloured green when soloed.

Note that this is the default mode of the LCD displays, current when no other function modes have been selected.

2.9.3 Solo Choice

When an **lcd function** button is pressed, the second LCD display from the left is labelled **SOLO CHOICE**. When this mode is selected, the Channel Select buttons are used to select the solo bus assignment for that channel, toggling between **1**, **2** and **1+2**.

In **SOLO CHOICE** mode, the LCD displays are coloured cyan.

2.9.4 GANG

When an **lcd function** button is pressed, the third LCD display from the left is labelled **GANG**. When this mode is selected, the Channel Select buttons are used for linking together all channel controls. All Channel Select buttons which are then pressed will have their controls linked. In the case of currently ganged channels, the Channel Select button can be used to remove them from their ganging group. The colour of the **GANG** symbols in the bottom left-hand corner of the on-screen channel display indicate what ganging groups exist: All faders which are ganged together will share one colour. Each time the **GANG lcd function** is selected, a new ganging group is started, as indicated by the **GANG** symbols turning a different colour.

When channels are ganged together, operating any of their channel controls will cause all other channels within the ganging group to replicate that movement. Pan and phase controls are not included in gangs.

Note that it is the level change associated with the fader movement which is replicated, not the physical distance the fader is moved.

Note also that gangs cannot be edited once they have been created - they must be cleared and created again.

Note also that when channel is muted, those channels within the ganging group which were already muted will stay muted. When the channel is then unmuted, all channels unmute, irrespective of whether they had been initially muted.

Channels can be temporarily isolated from Gangs by pressing the Option button.

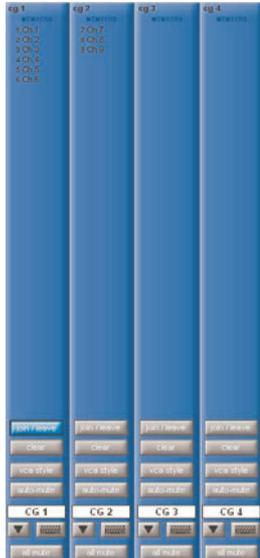

Chapter 2 - Channel Types

2.9.5 JOIN CG

When an **lcd function** button is pressed, the fourth LCD display from the left is labelled **JOIN CG**. When this mode is selected for a bank that contains the blue Control Group channel strips, the Channel Select buttons are used for assigning channels to Control Groups.

Control Groups enable a number of channel output levels and mute functions to be controlled from one master fader. Control Groups can include any combination of channels from all four channel types.

First select a Control Group to Join by pressing the appropriate Channel Select button (the LCD display will show a tick symbol) and then press all of the Channel Select buttons that you wish to make members of that Control Group.

Note that Control Group channels function completely differently from Group (GRP) channels: Group channels mix together the audio from any channels routed to them, whereas Control Groups simply allow adjustment of the levels of the channels to which are assigned to them, irrespective of any audio routing.

A session can have up to 12 Control Groups. Control Groups can be named using the standard naming tools described in the Getting Started Section. The **safe** button, located at the bottom of the on-screen channel strip, can be used to protect the assignments and settings of the Control Group from being changed if a new Snapshot is fired.

Control Groups Channel Assignments

To add or remove channels from a Control Group, enter **JOIN CG** function mode and press the Channel Select button on the Control Group channel to be edited. Alternatively, touch the **join/leave** button at the top of the button set in the Control Group channel's panel. All Channel Select buttons will now turn blue to indicate that they are in Control Group Join mode, and will display the number of the Control Group being edited in the bottom half of the button.

Note that touching join/leave on one channel puts all channels into JOINCG mode.

The LCD displays on any channel currently included in the group will display light blue. Press the Channel Select button to remove that channel from the group.

All other channel LCD displays will be dark blue, indicating that they are not currently included in the Control Group being edited. Pressing any of the Channel Select buttons will add them to the group.

All of the Control Groups to which a channel belongs are displayed immediately above the **GANG** and **SAFE** buttons in the Channel strip panel.

Note that only the first two to three Control Group assignments within a channel can be displayed in the channel strip.

All of the channels included in a Control Group are listed in the top half of its channel strip display.

To clear all of the channels currently assigned to a Control Group, touch the Control Group's **clear** button, located below the **join/leave** button, and press **Yes** in the warning display that appears.

Control Group Fader Modes

There are three modes in which the Control Group fader can interact with the faders of the channels assigned to it, and the button below the **clear** button in the channel strip display toggles between them:

In **moving fader** mode, all assigned faders will move to replicate any Control Group fader movements.

Note that it is the level change associated with the fader movement which is replicated, not the physical distance the fader is moved.

In **vca style** mode, moving the Control Group fader affects the output level of all assigned channels without moving their faders.

In **mute only** mode, the Control Group only controls the mute buttons of assigned channels, not the output level.

Note that in all three modes, moving the fader of a channel assigned to a group does not impact the output levels of other channels within the group.

Control Group Mute Functions

The mute buttons within a Control Group interact in the same way, regardless of the current fader mode:

The mute button above the LCD display on a Control Group fader can be used to mute all of its assigned channels. Its function is duplicated by the **all mute** button below the channel's scribble strip. When deactivated, the Control Group mute button unmutes all assigned channels, regardless of their mute state before the Control Group mute button was activated. If a channel is unmuted while a Control Group to which it is assigned is muted, the remaining channels in the group remain individually muted but the Control mute button will no longer be lit.

The auto-mute function, activated by touching the **auto-mute** button located above the Control Group name in the Channel Strip panel, automatically mutes any channel which is removed from that Control Group and unmutes any channel that joins the Control Group.

The Master Control Groups Display

In addition to the Control Group channel strips, an overview of all the Control Groups within a session can be access via the **Control Groups** menu button in the master screen.

This display consists of basic versions of each Control Group channel strip, including the channel assignments lists and a number of basic settings which can also be adjusted in the display: **join/leave**, **clear** and **all mute**. The Control Group naming controls are also available within the display's channel strips.

2.9.6 Assign Faders

To create custom banks of channels from different channel types, press **ASSIGN FADERS**, followed by the LCD buttons on the faders to which you wish to assign channels, and then select the channels in the **Layout** menu's **Channel List**. See the Getting Started section for more information.

2.9.6 Unassign Faders

To de-assign individual channels from their faders, press **UNASSIGN FADERS**, followed by the LCD buttons on the faders you wish to de-assign. the faders will go blank. Press the **lcd functions** button to cancel **UNASSIGN FADERS** mode.

Chapter 2 - Channel Types

2.9.8 Copy Bank From

To copy a different bank of channels to the current bank location, press **COPY BNK FROM**. The message 'PRESS | A BANK | BUTTON | FOR | COPYIN | FROM' will be shown across the LCD displays. Simply press the **bank** button for the bank which you want to copy to the current location.

Note that **COPY BNK FROM** can also be used to assign new banks of contiguous channels from the **Layout** menu's **Channel List**. See the Getting Started section for more information.

2.9.9 Copy Bank To

To copy the current bank to different bank location, press **COPY BNK TO**. The message 'PRESS | A BANK | BUTTON | FOR | COPYIN | TO' will be shown across the LCD displays. Simply press the **bank** button for the bank to which you want to copy.

2.9.10 Clear Bank

To clear all channels from a bank, press **CLEARBANK**. The message 'CONFIR| CLEAR| BANK:| YES| NO' will be shown across the LCD displays. Press **NO** to cancel the action or **YES** to continue.

Note - Banks can be moved between layers, and also between sections of the console.

Note also that the Fader Banks display on the master screen can also be used for altering the bank layout.

Note also that there is no undo function for these actions. Proceed with care!

SD10 Operation Manual

Chapter 3:

The Master Screen

Chapter 3 - The Master Screen

This chapter describes all of the functions accessed from the Master Screen. The chapter focuses on the functions of the menu buttons across the top of the Master Panel, working through the buttons from left to right. Centre Section worksurface elements are described within the context of the Master Panel display.

To open the Master screen press the worksurface **Master** button in the centre section.

3.1 System Menu

System	Files	Layout
Diagnostics		
Oscillator		
Security		
Clear Over Indicators		
Overview Clear Screen		
Keyboard Help		
F10: Reset FX		
F11: Reset Engine		
F12: Reset Surfaces		
Set Date & Time		
Update Software		
Shut Down		

3.1.1 Diagnostics

The SD10's **Diagnostics** display is explained in the Troubleshooting chapter.

3.1.2 Oscillator

The SD10's oscillator is configured in the **Oscillator** display.

The frequency of the oscillator is controlled by the left-hand **frequency** pot, and its audio level is controlled by the right-hand **level** pot. The buttons below each pot, can be used to set the oscillator to standard frequencies (**100Hz, 440Hz, 1kHz, 10kHz**) and levels (**-3dB, -6dB, -12dB, -18dB**). The current value of each parameter is displayed below its pot.

For Stereo channels, the 1 KHz oscillator can be set to produce a pulsing ID signal on the left signal or a GLITS signal as indicated by the on-screen graphic.

3.1.3 Security

Security allows access to the console's functions to be restricted to the following levels:

Setup : Users have full access to every function on the console.

Live : Access to elements of the console can be limited, and password protected.

Unattended : The console is locked, and cannot be operated.

Chapter 3 - The Master Screen

3.1.4 Clear Over Indicators

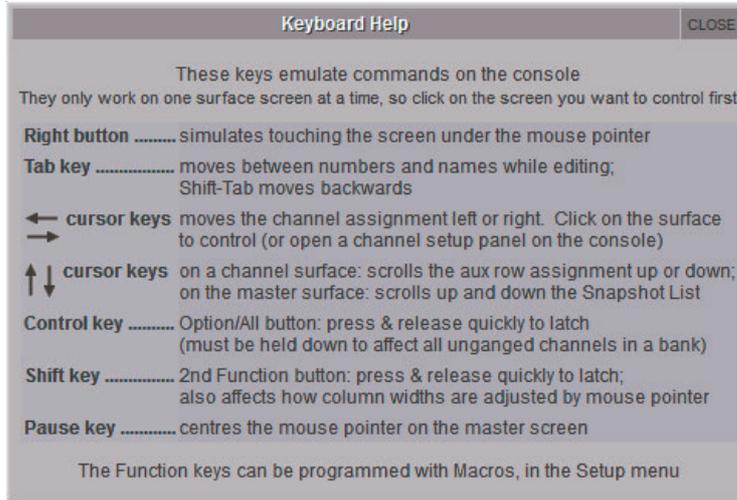

Pressing this entry in the **System** sub-menu clears all peak LED's from the on screen meters.

3.1.5 Overview Clear Screen

Some panels such as the information bar and the status indicators can be dragged with the trackball to external overview screen. To quickly reset the position of these panels back to the Master screen, press the **Overview Clear Screen** button.

3.1.6 Keyboard Help

The Keyboard Help button opens up a display detailing the console control elements which are available via an external keyboard:

3.1.7 F10: Reset FX

Pressing this entry in the **System** sub-menu will reset the FX module audio. This allows, for example, lengthy delay and reverb tails to be killed. To complete the reset, select **Yes** in the warning pop-up which appears.

Note that this will briefly bypass all of the FX units.

3.1.8 F11: Reset Engine

Pressing this entry in the **System** sub-menu will restart the audio engine. To complete the reset, select **Yes** in the warning pop-up which appears.

Note that this will briefly interrupt the audio - do not use this function unless absolutely necessary.

3.1.9 F12: Reset Surfaces

Pressing this entry in the **System** sub-menu will reset all of the worksurface controls. To complete the reset, select **Yes** in the warning pop-up which appears.

3.1.10 Set Date & Time

Pressing this entry in the **System** sub-menu will open the Date and Time window for the console's operating system.

3.1.11 Shutdown

Pressing this entry in the **System** sub-menu shuts the console's control computer down. If the session is not saved, pressing **Shutdown** will bring up a warning display. Press **Yes** to shut down without saving, or **No** to cancel the shut down.

3.2 Files Menu

3.2.1 Session Structure

Touching on **Session Structure** in the **Files** menu brings up the **Session Structure** display. This is where a session is named and where the buss allocation for the session is configured. While changes to session structure can be made once a session has been started, it is best to try and set these parameters before configuring the session. Session Structure changes are not implemented until the **Restructure** button in the bottom right-hand corner of the display is pressed.

To name the session, touch the **session title** box, type the session name using the either the on-screen or external keyboard, and press **OK**.

To define the session's sample rate, use the **48kHz** and **96kHz** buttons to the right of the **session title**.

Below the session title, each channel type has its own setup row, which includes **clear all** and **auto-route** buttons, and a display of the current number of channels in the session. To adjust the quantity of aux or group busses, touch on the associated channel count box, and either enter a number using the pop-up number keypad, or adjust using the assigned Touch-Turn controller. Sessions can have up to 96 Input Channels (up to 12 of which can be set to stereo in the input channel screens without loss of channel count) and up to 48 busses (aux or group) in addition to the stereo or LCR master buss. The **spare: channel processing** and **busses** boxes at the bottom of the display show the number of processing channels and output channels still available.

Note that two or three processing channels (one stereo or LCR group) are reserved for the master buss.

The screenshot shows the 'Session Structure' interface with the following annotations:

- Enter Session title**: Points to the 'session title' text box.
- Set number of input channels and define sends**: Points to the 'input channels' row, specifically the 'channel count' box showing '96'.
- Set number and type of Aux**: Points to the 'aux busses' row, specifically the 'channel count' boxes for Mono and Stereo.
- Set number and type of Group**: Points to the 'group busses' row, specifically the 'channel count' boxes for Mono, Stereo, and LCR.
- Touch numbers to edit with pop-up keypad or touchturn**: Points to the 'channel count' box for 'input channels'.
- Select session sample rate**: Points to the '48kHz' and '96kHz' buttons.
- Option to Clear parts of the session when restructuring**: Points to the 'clear all' button for 'matrix inputs'.
- Option to automatically route inputs/outputs when using the Clear function**: Points to the 'auto-route' button for 'matrix inputs'.
- Total number of unallocated processing**: Points to the 'spare: channel processing' box showing '12'.
- Total number of spare busses**: Points to the 'busses' box showing '14'.
- Create a default session with flat parameters and basic routing**: Points to the 'DEFAULT ALL' button.

Note - Pressing the Default All button followed by the Restructure button will automatically configure a new session with the following setup where the first 96 rack inputs are routed to input channels 1-96 and the Master Buss is routed to Local outputs 1 & 2 and also to outputs 1 & 2 on the first rack. All input channels will be routed to the Master Buss and the console headphones will be fed by the Master Buss when nothing else is soloed.

Chapter 3 - The Master Screen

The default configuration is :

96 input channels (Adjustable), twelve of which can be stereo without loss of channel count;
6 Mono Aux busses & 6 Stereo Aux busses (Adjustable);
6 Mono Group busses & 6 Stereo Group busses (Adjustable);
16 Matrix Inputs and 12 Matrix Outputs (Fixed);
12 Control Groups (Fixed);
1 Master Buss (Stereo, or LCR if an LCR buss is present);
2 Mono or Stereo Solo Busses (Fixed).

If the **clear all** button is pressed, any non-default routing or processing (EQ, dynamics etc) will be cleared from the channels in the session when the **Restructure** button is pressed. This is especially useful when restructuring an existing session to make a new session.

The **auto-route** button automatically routes the physical inputs and outputs in the rack to the inputs and output channels in the session when the **Restructure** button is pressed, thus saving the operator from manually routing them in the channel **Setup** and **Output** displays. For example, auto-routing 48 inputs will route the first physical input (eg 1: Mic 1) to input channel 1, the second physical input (1: Mic 2) to input channel 2 until you either run out of inputs or channels. Auto-routes are as follows:

- Input Channels auto-route with physical inputs
- Aux, Group and Matrix Channels auto-route to physical outputs
- Matrix Inputs auto-route with group outputs

Note that auto-routing can only be used in conjunction with the Clear All button, and is not available for input channel direct outs.

Important Note: auto-routing overwrites any previous input and output routing.

Note also that the outputs of Aux, Group and Matrix channels are auto-routed in sequence: Aux outputs followed by Group outputs, followed by Matrix outputs.

As Control Groups include no signal routing, there is no control groups auto-route button.

The send point for input channel direct outs can be set globally using the **direct sends** button toward the top right-hand corner of the display. The button is made active by touching the input channels **Clear All** button. The **direct sends** button then toggles between **Post-Fader**, **Pre-Fader** and **Pre-Mute**.

Similarly, the send point for aux channel outputs can be set globally using the **aux sends** button to the left of the **direct sends** button. The button is made active by touching the aux busses **Clear All** button. The **aux sends** button then toggles between **Post-Fader**, **Pre-Fader** and **Pre-Mute**.

The **audio i/o** and **comms** rows beneath the standard channel-type rows allow the settings of the audio i/o cards and talkback function to be reset. When configuring sessions off-line, use the **DiGiRack default** and **SD Rack default** buttons to define which rack type will be used on the session. (Note that these buttons are not used when configuring sessions on-line)

The **clear snapshots** and **clear macros** buttons towards the bottom-right of the window can be used to clear any existing snapshots and macros when making a new session.

Note that the clear automation function has not yet been implemented.

The **Rebuild Banks** button to the right of the **clear snapshots** button enables changes in the Session Structure display to be reflected in the layout of the console's layers and banks. If you restructure the session without rebuilding banks, any additional channels you have allocated are not placed on the worksurface, and need to be manually assigned to faders. If however, you press **Restructure** with **Rebuild Banks** enabled, the worksurface will be rebuilt with all channels being made available on the worksurface.

Note that when Rebuild Banks is used, any non-default configuration of the channel layout is lost.

To implement changes in the **Session Structure** display touch the **Restructure** button in the bottom right-hand corner. To exit the display without implementing the changes, touch **Cancel**, located below the **Restructure** button.

To clear unimplemented changes from the display, touch **REVERT**, located in the top left-hand corner of the display.

3.2.2 Load Session

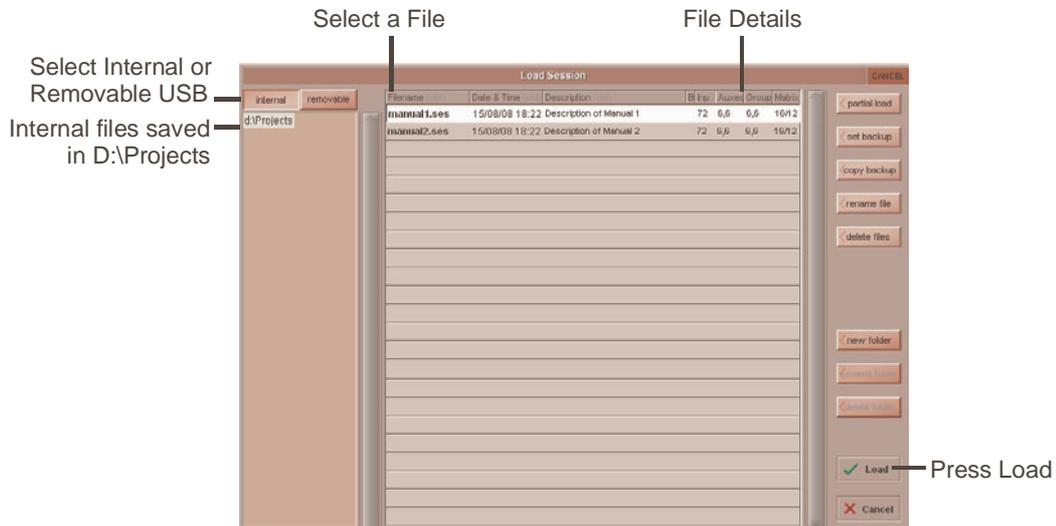

Touching this entry in the **File** menu opens the **Load Session** display. The left-hand column of the display shows the file directory. At the top of the directory are two buttons which switch the list of folders below them between the contents of the console computer's **internal** d:/Projects folder and the contents of a **removable** USB drive. Each folder can be expanded by touching the + symbol to its right. The list can be scrolled using the scroll bar to its right.

When a folder or sub-folder in the left-hand directory is touched, a list of the session files contained within it appears in the list in the centre of the screen. The list displays the **Filename**, **Date & Time** of last save, and **Description** of the session. In addition, the list also displays the number of **Inputs**, **Auxes** (mono, stereo), **Groups** (mono, stereo) and **Matrix** channels (ins/outs).

To load a session, touch the session in the list and press **Load**, located in the bottom right-hand corner of the display. To close the display without loading a session, press **Cancel**, located below the **Load** button (and also found in the top right-hand corner of the display).

Once a session is loaded, a summary of the currently loaded session is displayed in the **Session:** display in the background of the master panel. Once any changes have been made to the session, the **File:** indication in this display will only show the folder of the most recently saved session, not the file name.

Note also that if any of the buttons in the right-hand column of the window are active, sessions cannot be selected from the list.

3.2.3 Save Session

Touching this entry in the **File** menu saves the current session. Once the session has been saved, a confirmation pop-up appears displaying the location of the saved session file.

Note that this function overwrites the most recently saved session. If you want to retain the most recently saved session, save the current session as a new session.

3.2.4 Save As New File

Touching this entry in the **File** menu opens the **Save Session** display. At the top of the display are two text boxes showing a **file name** and **session title**. The **file name** will normally be 'sessionxxx.ses' where xxx is an auto-incrementing number and the **session title** is the same as the current session. If the session has not been changed since it was last saved, the file name will be the same as the current session. To edit the **file name** and **session title**, touch the relevant text box, enter the new name or title in the on-screen or external keyboard, and press **OK**. To overwrite another session, or to save the session in a new folder but with a previously used name, touch the session of that name and its name will appear in the **file name** box.

The location of the session file to be saved is defined in the directory in the left-hand side of the display. At the top of the directory are two buttons which switch the list of folders below them between the contents of the console computer's **internal** d:/Projects folder and the contents of a **removable** USB drive. Each folder can be expanded by touching the + symbol to its right. The list can be scrolled using the scroll bar to its right. Touch the button and folder within which you want to save the session.

To create a new folder, select the location for the folder in the way described above, touch the **new folder** button in the right-hand side of the display, type the folder's name using the external keyboard and press the external keyboard's return button. To rename a folder, touch the folder within the directory, touch the **rename folder** button in the right-hand side of the display, type the folder's new name using the external keyboard and press the external keyboard's return button.

Chapter 3 - The Master Screen

To delete a folder, touch the **delete folder** button in the right-hand side of the display, touch the folder to be deleted and touch **Yes** in the confirmation pop-up which appears.

Note that this action cannot be undone.

Once the session has been named and its save location has been selected, save the session by pressing **Save**, located in the bottom right-hand corner of the display. To close the display without saving, press **Cancel**, located below the **Save** button (and also found in the top right-hand corner of the display). If you attempt to save the session under a file name which already exists within that folder, a pop-up appears, warning that continuing will cause the file with that name to be overwritten. Touch **Yes** to continue, **No** to cancel.

Note that overwriting the most recently saved session can be performed more quickly using the Save Session function described above.

Once the session has been saved, a confirmation pop-up appears displaying the location of the saved session file.

To rename a file, touch the file to be renamed followed by **rename file**, located in the right-hand side of the display, enter the new name into the on-screen or external keyboard and press **OK**. If **rename file** is pressed without a file being selected, the first file in the list will be automatically selected for renaming.

Note that the file name is the only file element that can be edited once the file has been saved.

To delete files, select the folder containing the files to be deleted and touch **delete files**. To delete all files in the folder, touch **select all**, followed by **confirm delete**. To delete one file or a selection of files, touch the files you wish to delete followed by **confirm delete**. To delete a consecutive range of files, touch **select range**, touch the first and last files included in the range to be deleted, and touch **confirm delete**. To complete the deletion process, touch **Yes** in the confirmation pop-up which appears.

Note that the set backup and copy backup functions have not yet been implemented.

3.2.5 Load Presets

Touching this entry in the **File** menu opens the **Load Presets** display. This allows Channel, FX, Graphic EQ and Matrix presets created in other sessions to be imported into the current session. The left-hand column of the display shows the file directory. At the top of the directory are two buttons which switch the list of folders below them between the contents of the console computer's **internal** d:/Projects folder and the contents of a **removable** USB drive. Each folder can be expanded by touching the + symbol to its right. The list can be scrolled using the scroll bar to its right.

When a folder or sub-folder in the left-hand directory is touched, a list of the Preset files contained within it appears in the list in the centre of the screen. The list displays the **Filename**, creation **Date & Time**, and **Description** of the preset file. In addition, the list also displays the number of **Input**, **Out** (fx), **GEQ** (Graphic EQ) and **Matrix** presets contained within the preset file.

To load a set of presets, touch the preset file in the list and press **Load**, located in the bottom right-hand corner of the display. To close the display without loading a session, press **Cancel**, located below the **Load** button (and also found in the top right-hand corner of the display).

Note that a session's presets are also saved as part of the session file.

Note also that the set backup and copy backup functions have not yet been implemented.

Note also that if any of the buttons in the right-hand column of the window are active, sessions cannot be selected from the list.

3.2.6 Save Presets

Touching this entry in the **File** menu opens the **Save Presets** display. At the top of the display is a text box showing the **file name** of the most recently created presets file. It will normally be 'presetsxxx.pre' where xxx is an auto-incrementing number. To edit the **file name** touch the text box, enter the new name or title in the on-screen or external keyboard, and press **OK**. To overwrite another file, or to save the file in a new folder but with a previously used name, touch the file of that name and its name will appear in the **file name** box.

The location of the presets file to be saved is defined in the directory in the left-hand side of the display. At the top of the directory are two buttons which switch the list of folders below them between the contents of the console computer's **internal** d:/Projects folder and the contents of a **removable** USB drive. Each folder can be expanded by touching the + symbol to its right. The list can be scrolled using the scroll bar to its right. Touch the button and folder within which you want to save the session.

Once the presets file has been named and its save location has been selected, save it by pressing **Save**, located in the bottom right-hand corner of the display. To close the display without saving, press **Cancel**, located below the **Save** button (and also found in the top right-hand corner of the display). If you attempt to save the set of presets under a file name which already exists within that folder, a pop-up appears, warning that continuing will cause the file with that name to be overwritten. Touch **Yes** to continue, **No** to cancel.

Note that a session's presets are also saved as part of the session file.

Note also that the set backup and copy backup functions have not yet been implemented.

3.2.7 Global Set To Defaults

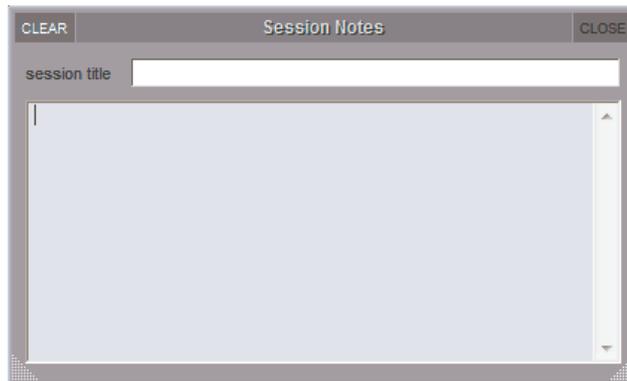

The **Global Set to Defaults** Panel allows global default settings to be applied to the console. Select the Channel type from the list on the left side of the panel, and then select the operation to perform from the available functions. The **UNDO** button in the top left-hand corner undoes all changes since the panel was opened.

Note that once the panel is closed, changes cannot be undone.

Chapter 3 - The Master Screen

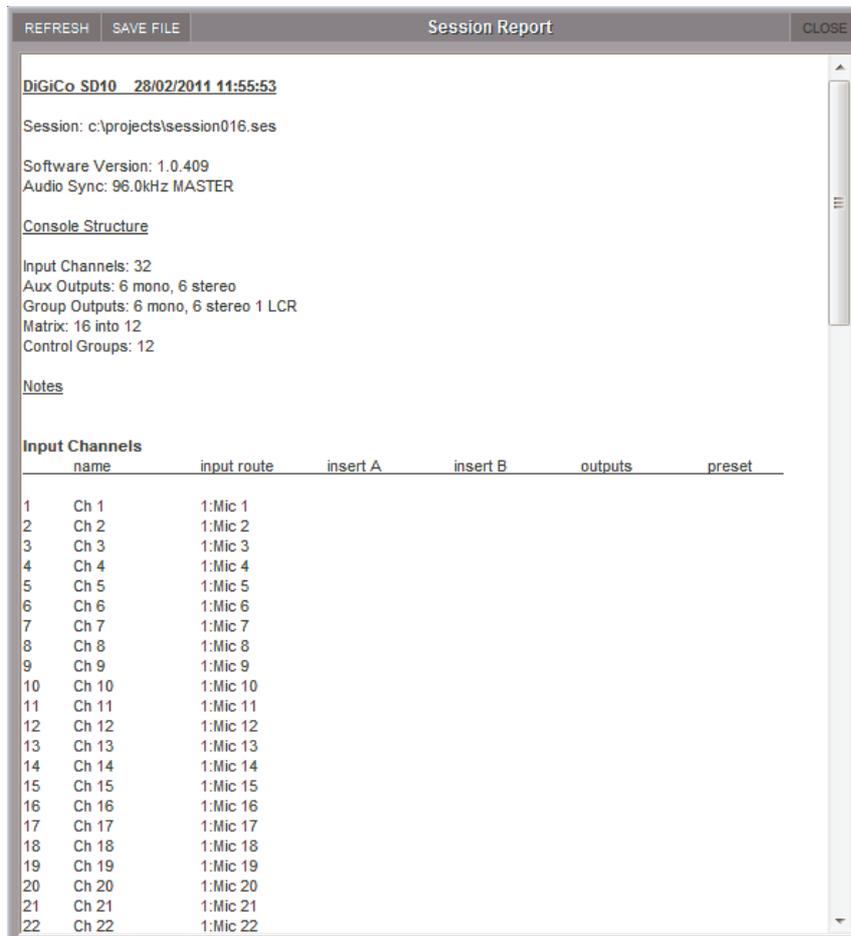

3.2.8 Session Notes

The **Session Notes** button opens a simple note-taking panel. Note that no manual saving is required.

3.2.9 Session Report

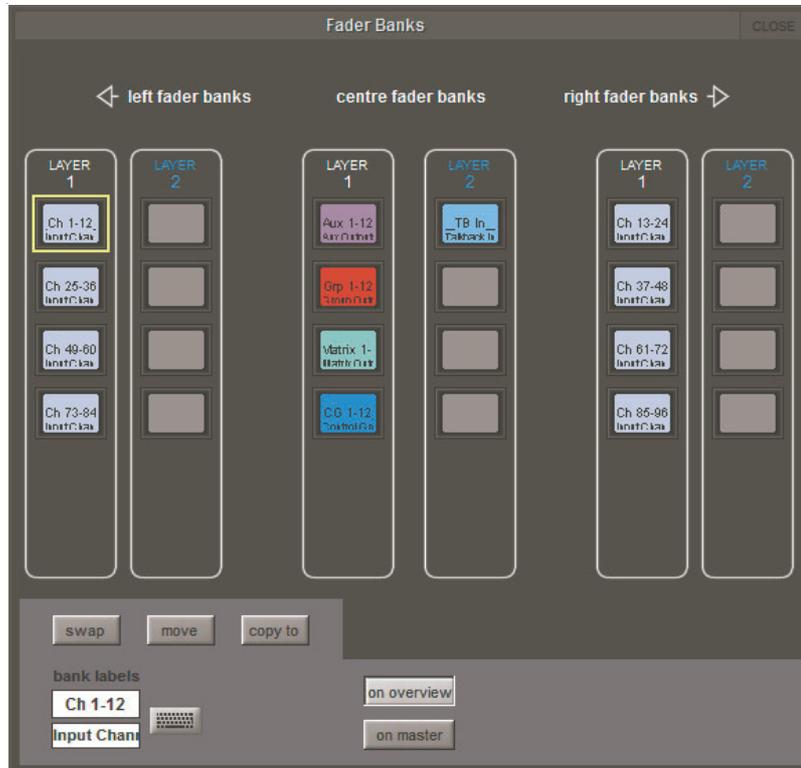

The **Session Reports** button opens a display of session details. The report can be saved as an .rtf file by pressing the **SAVE FILE** button – the file will be saved in the Projects folder with the same name as the session. The **REFRESH** button updates any of the window's contents which have changed since it was last opened.

3.3 Layout Menu

3.3.1 Fader Banks

Touching on **Fader Banks** in the **Layout** menu brings up the **Fader Banks** display. This display allows the location of each fader bank to be altered. The bank buttons available within each layer of each section of the desk are displayed with their current fader set, with the left and right section banks on the left and right respectively, and the centre section banks down the middle. Towards the bottom of the display there are a number of grey function buttons which turn light-grey to indicate that they have been selected.

To swap the locations of two fader banks, touch one bank button so that it is highlighted in yellow, touch **swap** (located below the left fader bank's layer 1) and touch the other bank button.

To copy a fader bank to a new location, highlight the bank you wish to copy, touch **copy to** and touch the bank to which you wish to copy it. If there is currently a fader bank in the destination bank, it will be overwritten.

Clearing a bank is associated with the LCD Functions described in the Channel Types Chapter of this manual.

The labelling within the bank LCD displays can be edited using the text boxes in the bottom left-hand corner of the display. By default, the top row of the button displays a short version of the channel type (**Ch** for input channels, **Aux** for aux channels, **Grp** for group channels, **Matrix** for matrix channels and **CG** for control group channels) followed by the channel number range, and the bottom row displays the channel type in full.

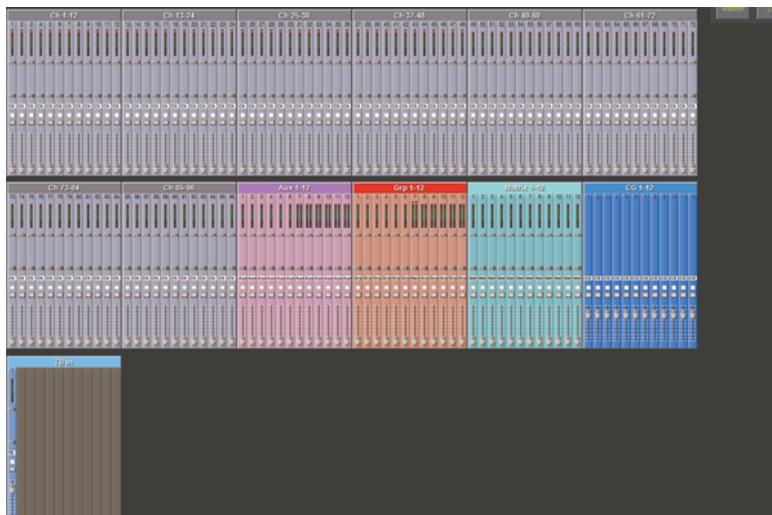

To edit the either row, touch its text box, type in the new name using the on-screen or external keyboard and press OK. The keyboard symbol to the right also activates the naming function for the top row.

Note that this label affects the bank button displays, not the channel faders within the bank.

Chapter 3 - The Master Screen

The Overview Display

A miniature graphic of each fader set can be displayed on the master screen, or on a separate screen connected to the **Overview** VGA output on the back of the console. These graphics display the fader position, mute, solo status and insert status, and the meter for the channels within all displayed banks. The parameters displayed in this overview can also be adjusted on the overview screen using the external mouse. The **on overview** and **on master** buttons, located below the **Fader Bank** display's master banks, are used to include and exclude fader banks from the external overview display and the master panel respectively.

3.3.2 Channel List

Touching on **Channel List** in the **Layout** menu brings up the **Channel List** display, containing a complete list of all the input, aux, group, matrix and control group channels which exist within the session. The channel list for each channel type can be accessed by touching the appropriate down arrow in the left-hand column.

Primarily, the **Channel List** display is used for adjusting the fader assignments of the session's channels. This function employs the **ASSIGN FADERS** and **COPY BANK FROM** LCD function modes, and is described in full in the Getting Started chapter of this manual.

Note that when new channels are added to a session, or when a session is created, all of the existing channels can be assigned to the worksurface using the rebuild banks function within the Session Structure display.

3.3.3 Transport Control

Touching on **Transport Control** in the **Layout** menu brings up a display of the transport control of an external playback device. Playback devices are controlled via the MIDI or MTC/SONY 9Pin connector on the console's back panel. The incoming MTC is also displayed.

Note that control of external playback devices can be programmed within the **Snapshots** screen, as described in the following section.

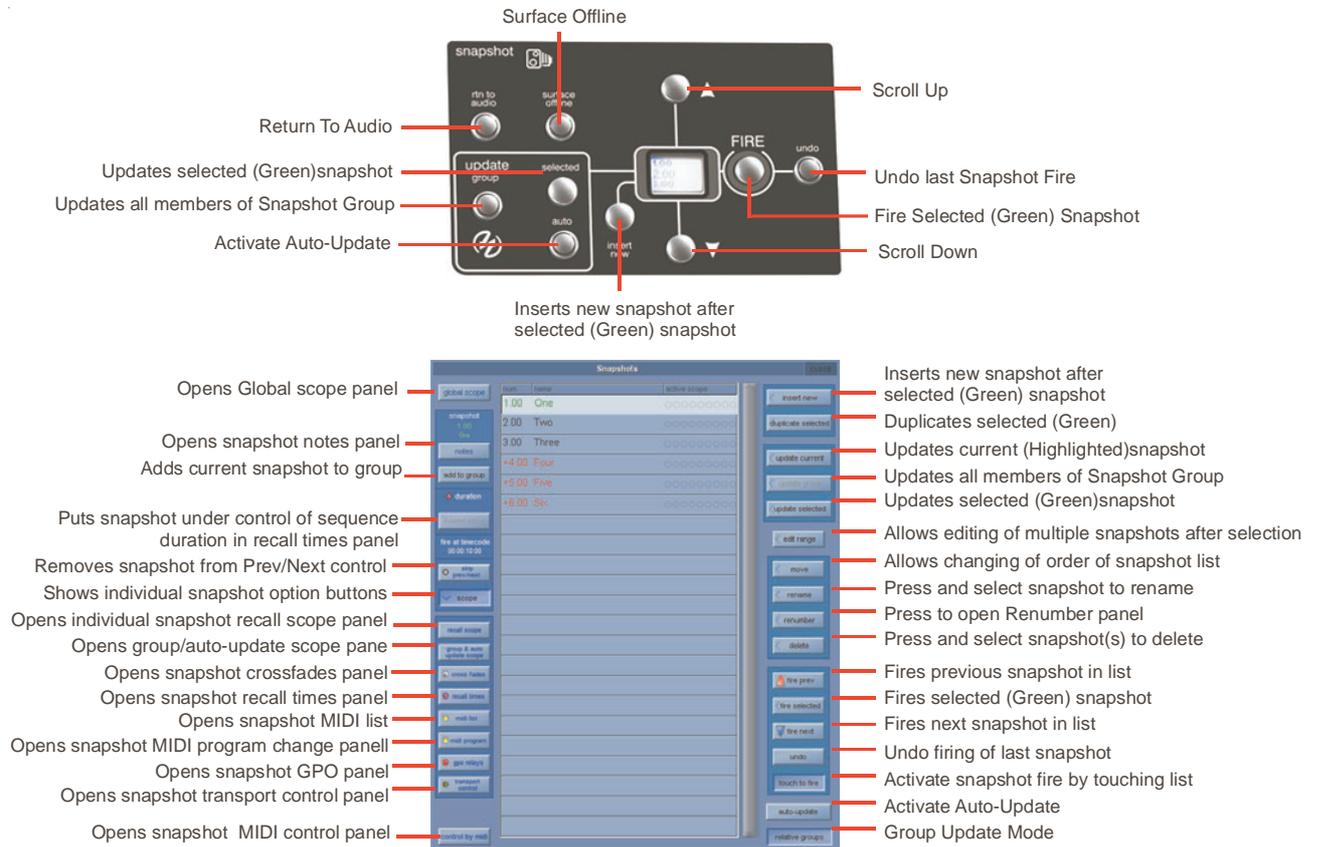

3.4 Snapshots Menu

Any number of Snapshots of the entire current console settings can be stored and recalled using the Snapshots panel. (This is only limited by system memory). These Snapshots can be absolute or grouped with other snapshots.

The recall scope of the snapshot (how many controls it will affect when fired) can be set by controller or by input channel.

To display the Snapshots panel, touch the Snapshots button at the top of the Master Screen.

Worksurface controls can be found on the right section of the console worksurface.

Note - The current snapshot appears in the panel as the highlighted (pressed) button. The snapshot name displayed in green indicates that it is the selected snapshot on the worksurface and its name is indicated in the display. The Fire button recalls this selected snapshot and highlights it in the screen list as the current snapshot.

If the current snapshot button shows an asterisk next to the number (eg. 001*) this indicates that a controller has changed since the snapshot was fired.

If a Snapshot name appears in **black** in the list it is a standard Snapshot and if it appears in **red** or **blue** then it is a member of a group of snapshots.

3.4.1 Storing a Snapshot

When a snapshot is stored all the console settings are saved but when the snapshot is recalled its effect can be limited to certain channels and controllers using the **Global** and **Recall Scopes**.

To store a snapshot of the current state of all the console controls, touch the Snapshot panel or worksurface **Insert New** button and a new snapshot will be inserted below the currently selected (green) snapshot. Alternatively, if the **Touch To Fire** function is active, touch an unused button in the list and a new snapshot will be added to the end of the list, then type a name for the snapshot.

Another method of creating a Snapshot is to press the **Duplicate Selected** button and this will create a copy of the selected (green) Snapshot below it.

Note - If Duplicate Selected is used, the Snapshot that is stored may not reflect the current state of the console's controls - it will simply create a copy of the Snapshot that was selected when the button was pressed.

Chapter 3 - The Master Screen

3.4.2 Recalling a Snapshot

There are several ways to recall a snapshot:

- 1) Activate the **Touch To Fire** function using the button on the Snapshot panel and then touch the snapshot button you require.
- 2) The buttons on the Worksurface on the right of the screen provide **Scroll Up/Down** buttons to change the selected snapshot named in the worksurface display and listed on screen in green.

The **Fire** button then recalls the assigned snapshot.

- 3) The worksurface **Previous** and **Next** buttons just above the master fader can be used to step up and down the list firing snapshots in consecutive order.

- 4) Snapshot firing can also be controlled by specific events on MIDI channel 16 (See Snapshots and MIDI).

- 5) Assign a **Macro** button to fire the Snapshot.

3.4.3 Replacing a Snapshot

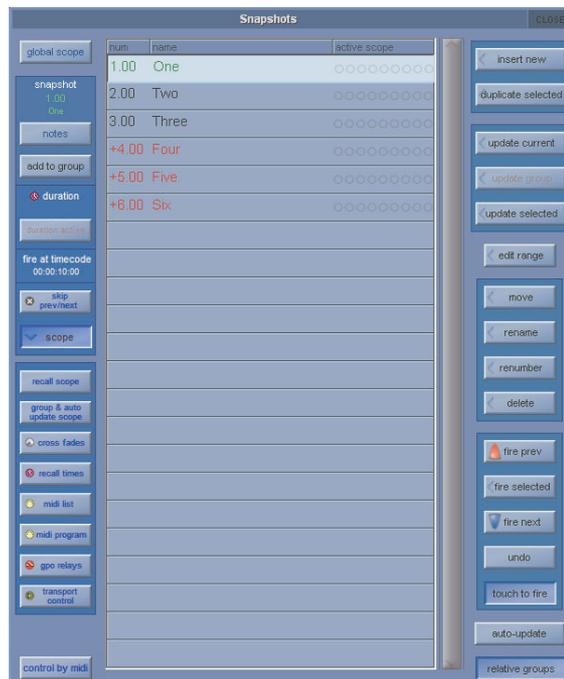

To update or change a snapshot, set the console controls as required and then touch the one of the **Update** buttons (**Current**, **Selected** or **Group**)

Note - The Current snapshot is not necessarily the one whose name appears in the display on the worksurface, this is the Selected snapshot. For a snapshot to be Current it must have been the last one that was fired and be highlighted in the on screen panel's list.

3.4.4 Editing Multiple Snapshots

Individual controller changes can be written to several snapshots simultaneously using the **edit range** button. This does not replace the complete snapshot associated with the button.

When the **edit range** button is pressed, a panel pops up allowing a group of Snapshots to be selected by pressing their buttons. If you press the **select range** button, touching the first and last snapshots in a range will automatically select all the snapshots in that range. Pressing **select all** selects all the snapshots in the list. To cancel an Edit operation before it has been confirmed, press **cancel**.

With the **edit range** button active, pressing the Snapshot buttons does not fire the snapshots, it only selects them for editing. The selection may be changed by pressing and releasing snapshot buttons at any time during the operation of the Edit command, so a variety of controllers or routes may be changed in a variety of snapshots before completing the operation.

Once finished, press the **Confirm** button.

The Snapshots window may even be closed to gain access to other editable functions - In this case, a warning message will appear to advise the user that they are still in snapshot edit mode.

While any Snapshot button is selected, changes to any snapshottable controller, routing changes, and any changes to the Snapshot Scope controls can be written to every selected Snapshot, overwriting the previous settings.

Pressing the **Confirm** button keeps the changes.

For example, if Snapshots 1 and 2 are selected and the input gain for channel 1 is changed, subsequent recall of Snapshots 1 or 2 will set channel 1's input gain to the new value.

Only channels which are altered while the Edit command is active will be affected and only in snapshots that are selected at the time.

Note - Snapshot Scopes and Crossfade Times can also be edited for multiple Snapshots using the Edit Range function.

3.4.5 Moving a Snapshot

If you wish the Snapshot list to appear in a specific order, you may change the order of the list by moving the entries. Touch the **move** button and then touch the Snapshot that you wish to move. You then touch the point in the list where the snapshot should be moved to.

3.4.6 Renaming a Snapshot

To rename a snapshot, touch the **rename** button, then the name that you wish to change and enter a new name using the keyboard.

3.4.7 Renumbering Snapshots

As snapshots can be inserted at any point in the list you may find that you wish to renumber part or all of the list.

Press the **renumber** button at the bottom of the snapshots panel and a new panel will open. Enter the range that you wish to renumber using the touch turn control or by touching the entry and typing and then enter the steps to renumber to (1.00 is the default value). Then press the **Renumber** button and the list will be adjusted accordingly.

3.4.8 Deleting a Snapshot

To delete snapshots, touch the **delete** button and then **select range** or **select all**. If you have pressed **select range**, touch the Snapshots in the list that you wish to delete and then press **confirm**. If you have pressed **select all**, the complete list of Snapshots will be highlighted and pressing **confirm** will delete all Snapshots. Pressing **cancel** will cancel the deletion.

3.4.9 Snapshot Undo

When a snapshot is fired, a separate hidden snapshot of the complete console is stored before the fired snapshot has its effect. If the **undo** button is pressed, the hidden snapshot is fired using the same scope as the previously fired snapshot to undo its effect.

3.4.10 Snapshot Groups

A standard Snapshot (black entry in the list) is an absolute snapshot of the current state of all the console controls. A Snapshot can also be a member of a Group, allowing all members of that Group to be updated together according to the Group Update mode that is selected.

To make a Snapshot a member of a Group, select the Snapshot in the list and press the **add to group** button on the left of the Snapshot panel. Grouped snapshots are red or blue in the list.

Note - Snapshots can only be members of the same Group if they are next to each other in the list. There can be several different groups of Snapshots in one list.

If a Snapshot is a member of a Group, the colour of its entry in the list is determined by the current setting of the **relative groups** button in the bottom right of the Snapshots panel. This determines how the Group of Snapshots will be updated when **update group** is pressed.

Red entry in the list = Relative Update mode selected

Blue entry in the list = Non Relative Update mode selected

Relative Group Update Mode (Red entries in the list)

If **update group** is pressed when the **relative groups** button is active, all dB controls such as faders and aux sends will be updated relatively. This means that if a fader is moved by +10dB in one snapshot, the same fader will be moved by +10dB in all Snapshots that are members of the same group, irrespective of the original level of that fader. So +10dB will be applied to the stored level of that fader in all of the Snapshots in the group.

Non dB controls such as Dynamics times, EQ Frequency & Q and Pans will only be changed in members of the group that had the same value for that control before it was moved. So, if one channel pan is in the same position in all the members of a group of Snapshots and you change one of them and press Update Group in Relative mode then the same channel pan will change in the same way in all the other snapshots that are members of that group. If however, any one of the Snapshots in the group has that channel pan in a different position to the current Snapshot then this one will not be changed when you press Update Group.

Non Relative Group Update Mode (Blue entries in the list)

If **update group** is pressed when the **relative groups** button is not active then all controls behave in exactly the same way. Changes are only applied to the other Snapshots in the group if the controls that are being changed had the same value as the current Snapshot before the change was made. This is exactly the same behaviour as non dB controllers in Relative mode but in this case all controls are included.

Chapter 3 - The Master Screen

Group & Auto Update Scope

The behaviour of the **group update** function explained above is also dependant on the Global Auto Scope and the Group and Auto Update Scope settings that can be set per Snapshot for different types of controls.

Pressing the **global scope** button at the top left of the Snapshot panel opens the following display:

Global Snapshot Scope														CLOSE
channel types	input/trim	delay	filters	eq	dynamics	inserts	sends	fader	mute	panner	to groups	outputs		
	recall	update	recall	update	recall	update	recall	update	recall	update	recall	update	recall	update
Input devices	X	X												
Input Channels	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Aux Outputs	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓			✓	✓
Group Outputs	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓			✓	✓
Control Groups														
FX	✓	✓												
Matrix Inputs	✓	✓					✓	✓						
Matrix Outputs	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓			✓	✓
Graphic EQ				✓	✓									
Output devices													✓	✓

midi gpo relays

Horizontal rows show the different sections of the console and the vertical rows show the **recall** and **update** status for each of the different types of control. A red X indicates not included, a green tick indicates included, and a blank box indicates that the parameter isn't applicable. These settings can be changed individually by touching the X or tick symbols or by touching the name of a row or column to change all of its contents.

The **update** columns determine which controls will be included in the automatic group update. Any elements that have a red X will not be updated in any snapshots when **update group** is pressed: In the picture above the **Input devices** (rack and local input sockets) are not included in the **update** scope, so none of their gains or phantom power can be updated using the **update group** function. All other elements are ticked and therefore can be included. (**Recall** is dealt with in the next section)

Note - If elements are included in the Global Auto Scope they can still be prevented from Group Updating by the individual Snapshot's Group and Auto Update Scope.

Selecting a Snapshot in the list and pressing the **group & auto update scope** button (visible when the **scope** button is active) opens the following panel:

Group & Auto-Update Scope: Snapshot 2.00 Two														CLOSE
	channel name	input/trim	delay	filters	eq	dynamics	inserts	sends	fader	mute	panner	to groups	outputs	
▼	Local I/O	X												
▼	Rack 1	X												
▼	Input Channels	X	X	X	✓	X	X	X	✓	✓	X	X	X	
▼	Aux Outputs	X	X	X	✓	X	X		✓	✓			X	
▼	Group Outputs	X	X	X	✓	X	X		✓	✓		X	X	
▼	Control Groups								✓					
▼	Matrix Inputs	X						X						
▼	Matrix Outputs	X	X	X	✓	X	X		✓	✓			X	
▼	Graphic EQ				✓									
▼	Local I/O												X	
▼	Rack 1												X	

Press channel names to change whole row, column headings to change whole columns

This is very similar to the **global scope** panel but represents the Group and Auto Update Scope for one individual snapshot which is indicated by its name and number at the top of the panel.

Pressing on any of the arrows down the left-hand side of the panel expands the element, allowing each of its contents (individual connections, channels or devices) to be configured separately.

In the picture above the only green ticks are in the EQ, faders and mutes columns and therefore all other elements are prevented from being affected by a Group Update in this particular Snapshot.

Note - When using Snapshot Groups it is advisable to set the Global Auto Update scope before attempting to change the update settings for each individual Snapshot. Use of the Global Scope alone probably offers quite sufficient control for most common applications.

3.5.11 Global Recall Scope

When a snapshot is stored, all the console settings are saved, but when the snapshot is recalled its effect can be limited to certain channels and controllers.

Note - All elements of console channels and several other features such as Graphic EQ and Effects have their own SAFE settings. If any of these SAFE settings are active then the relevant controls cannot be affected by any Snapshots. This is in addition to the Global Scope settings described here.

Pressing the **global scope** button expands the panel to display and edit the scope for all snapshots.

channel types	input/trim		delay		filters		eq		dynamics		inserts		sends		fader		mute		panner		to groups		outputs	
	recall	auto	recall	auto	recall	auto	recall	auto	recall	auto	recall	auto	recall	auto	recall	auto	recall	auto	recall	auto	recall	auto	recall	auto
Input devices	X	X																						
Input Channels	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Aux Outputs	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Group Outputs	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Control Groups															✓	✓								
FX	✓	✓																						
Matrix Inputs	✓	✓											✓	✓										
Matrix Outputs	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Graphic EQ							✓	✓																
Output devices																							✓	✓

Horizontal rows show the different sections of the console and the vertical rows show the **recall** and **update** status for each of the different types of control. A red X indicates not included, a green tick indicates included, and a blank box indicates that the parameter isn't applicable. These settings can be changed individually by touching the X or tick symbols or by touching the name of a row or column to change all of its contents.

The **recall** columns determine which controls will be included in the Snapshot recall. Any elements that have a red X will not be recalled in any snapshots.

In the picture above the **Input devices** (rack and local input sockets) are not included in the snapshot scope, so none of their gains or phantom power can be changed by firing Snapshots. All other elements are ticked and therefore can potentially be changed when a Snapshot is fired.

Note - If elements are included in the Global Recall Scope they can still be prevented from recall by the individual Snapshot's Recall Scope.

3.5.12 Individual Snapshot Recall Scope

Selecting a Snapshot in the list and pressing the **recall scope** button opens the following panel:

	channel name	input/trim	delay	filters	eq	dynamics	inserts	sends	fader	mute	panner	to groups	outputs
▼	Local I/O	X											
▼	Rack 1	X											
▼	Input Channels	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
▼	Aux Outputs	✓	✓	✓	✓	✓	✓	✓	✓	✓			✓
▼	Group Outputs	✓	✓	✓	✓	✓	✓	✓	✓	✓		✓	✓
▼	Control Groups								✓				
▼	Matrix Inputs	✓						✓					
▼	Matrix Outputs	✓	✓	✓	✓	✓	✓	✓	✓	✓			✓
▼	Graphic EQ				✓								
▼	Local I/O												✓
▼	Rack 1												✓

This is very similar to the **group & auto update scope** panel but represents the Recall Scope for one individual snapshot which is indicated by its name and number at the top of the panel.

In the picture above the only red crosses are in the input trim column for Local I/O and Rack 1 and therefore all other elements can potentially be recalled with Snapshots.

Chapter 3 - The Master Screen

The controls that are included in each of the Recall Scope columns can be seen at the bottom of the panel when any of the entries are changed and are as follows:

Controllers

Input/Trim (Local I/O and Racks) - analogue gains, switches and phantom power

Input/Trim (Input Channels) - input routes, digital trim, phase and channel name

Input/Trim (Aux Outputs/Group Outputs/Matrix Outputs) - digital trim, phase, delays and buss name

Input/Trim (Matrix Inputs) - input routes and matrix input name

Delay (All channel types) - Channel delay

Filters (All channel types) - HPF and LPF

EQ (All channel types) - all controllers except channel HPF and LPF.

Dynamics (All channel types) - all controllers except stereo link.

Inserts (All channel types) - Insert Send & Return routes and ON/OFF switch

Sends (Input Channels) - Aux send levels, ON/OFF & PRE/POST switches and Aux pans

Sends (Matrix Inputs) - Matrix send levels and switches

Fader (All channel types) - channel fader.

Mute (All channel types) - channel mute

Panner (Input Channels) - channel pan

To Groups (Input Channels) - Input Channel to Buss routing switches

To Groups (Group Channels) - Group to Group routing switches

Outputs (Input Channels) - Direct output routes, direct gains and ON/OFF switches

Outputs (Aux Outputs/Group Outputs/Matrix Outputs) - Output routes and gains

Outputs (Local I/O and Racks) - analogue output 10dB pads and digital output SRC

Misc

CG Members - Control Group label and a complete list of each group's members.

Gangs - Channel gang members.

Banks - Current assignment for all controllers on the worksurface.

3.5.13 Snapshot Crossfades

A crossfade time which is measured in seconds and frames can be applied to different controls in a Snapshot by adjusting the Crossfade Time in the Cross Fades panel. This crossfade occurs as you go into the Snapshot.

Select an individual time by touching it or select a column or row by touching its heading. Then enter a time in the Secs/Frames boxes at the bottom of the panel. Either touch and type or use the Touch Turn rotary to enter a figure.

Different Crossfade times can be applied to input trims, filters, EQs, dynamics, sends, faders and pans and these will apply to all of the channels in a given category eg All input channels. A value of zero switches it off.

Cross-Fade Times: Snapshot 2.00 Two								CLOSE
	channel name	trim/delay	filters	eq	dynamics	sends	fader	panner
▼	Input Channels	00:00	00:00	00:00	00:00	00:00	01:00	00:00
▼	Aux Outputs	00:00	00:00	00:00	00:00		01:00	
▼	Group Outputs	00:00	00:00	00:00	00:00		01:00	
▼	Control Groups						01:00	
▼	Matrix Inputs					00:00		
▼	Matrix Outputs	00:00	00:00	00:00	00:00		01:00	
▼	Graphic EQ			00:00				

secs frames

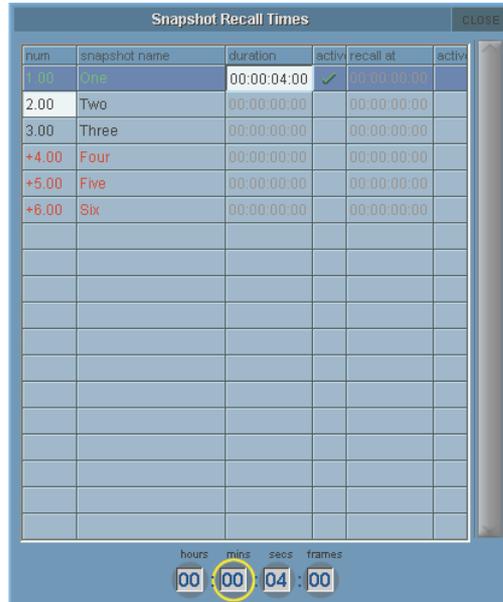

3.5.14 Snapshot Recall Times

In addition to being fired manually, snapshots can be timed to fire automatically in sequence. This is done in the **Snapshot Recall Times** panel, opened by pressing the **scope>recall times** button on the left hand side of the **Snapshots** panel. Each snapshot can be given a **recall at** time (the timecode at which the snapshot will fire) and a **duration** (the time lapse before moving onto the following snapshot).

Both the **duration** and **recall times** must be activated by ensuring that their **Active** column is ticked.

The first snapshot can be fired manually in the main **Snapshot** window, if no specific **recall at** time is required.

When this snapshot is fired, the next snapshot in the list will automatically be fired after the set time has elapsed and a progress bar in the snapshot's entry in the **Snapshots** panel will show the time remaining until the snapshot is fired. Pressing the **duration active** button while the progress bar is moving will halt the process. The **recall at** time overrides any active **duration** time.

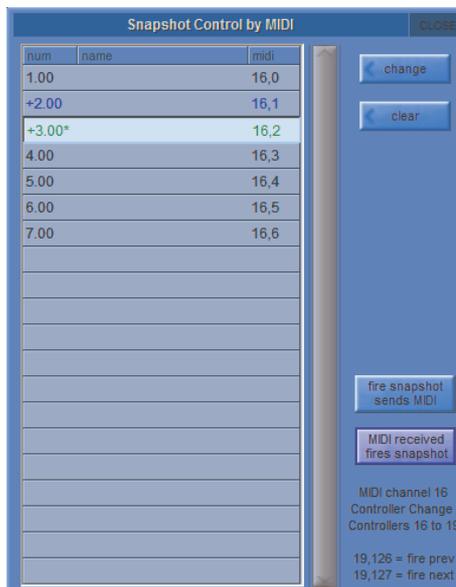

3.5.15 Introducing Snapshots and MIDI

MIDI can be used within snapshots to control external devices, and can also be used to fire snapshots from external devices:

- 1) A snapshot can have a MIDI Message attached to it, and will output that MIDI when fired. The MIDI message can be created via the **scope>midi program**, **scope>midi list**, or **control by midi** buttons.
- 2) The firing of snapshots can be controlled by incoming MIDI messages on channel 16, and can cause these same messages to be output in addition to any MIDI snapshots included in (1) above.

3.5.16 Snapshot Control by MIDI

The use of incoming MIDI to trigger snapshots is configured in the **Snapshot Control by MIDI** panel, opened by pressing the **control by midi** button. Basic outgoing program change MIDI commands can also be configured here.

Chapter 3 - The Master Screen

The **MIDI received fires snapshot** button allows the Snapshot system to respond to the following incoming MIDI messages:

- General Purpose Controller A (Controller 16); Values 0 to 127 will fire snapshots 1 to 128
- General Purpose Controller B (Controller 17); Values 0 to 127 will fire snapshots 129 to 256
- General Purpose Controller C (Controller 18); Values 0 to 127 will fire snapshots 257 to 384.
- General Purpose Controller D (Controller 19); Values 0 to 125 will fire snapshots 385 to 510.
- General Purpose Controller D (Controller 19); Value 126 will fire the previous snapshot in list.
- General Purpose Controller D (Controller 19); Value 127 will fire the next snapshot in list.

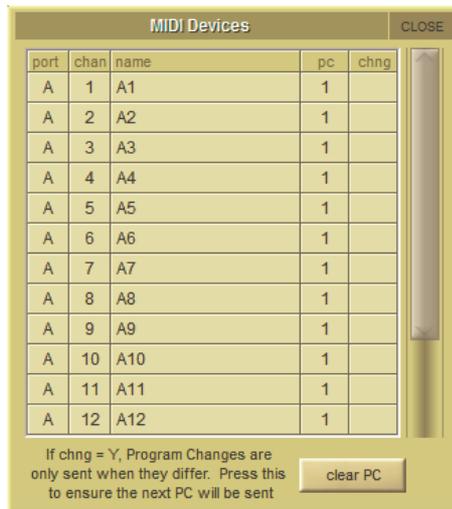

When active, the **fire snapshot sends MIDI** button causes the above messages 1 to 510 to be sent whenever a snapshot button is pressed. Previous and Next buttons do not output MIDI messages of their own.

To change any MIDI controller number, select its snapshot, press **change** and select a new number from the list which appears. To clear a MIDI controller number, select the snapshot and press **clear**.

3.4.17 MIDI Devices

If you intend to send MIDI to external devices it is advisable to first define your receiving devices - this will make the programming of MIDI messages in Snapshots easier to achieve.

Press either the **scope>midi program** or the **scope>midi list** button and then press the **devices** button - the following panel will open:

The SD10's built in MIDI port is referred to as Port A in the **port** column.

Set the receiving MIDI **channel** and **name** for each of your receiving devices and set 1 or 0 in the **PC** column according to whether the device uses 0-127 (0) or 1-128 (1) for its data values. If you don't know this piece of information then leave the setting as 1.

Placing a **Y** in the **chng** column will result in program changes only being sent when they differ from the last one. Pressing the **clear PC** button ensures that the next program change is sent, even if it is the same.

This has defined your devices for later use and the panel can now be closed.

3.4.18 MIDI Program and MIDI List

The MIDI Program changes panel has a column for each of the 16 MIDI channels on Port A and a row for each existing Snapshot. Touch and type, use the value up/down buttons or enter a value using the Touch Turn rotary control for each program change that you wish to send with each snapshot and ensure that the **Active** box is ticked for each relevant Snapshot. Once entered, this MIDI information will be sent when the Snapshot is fired.

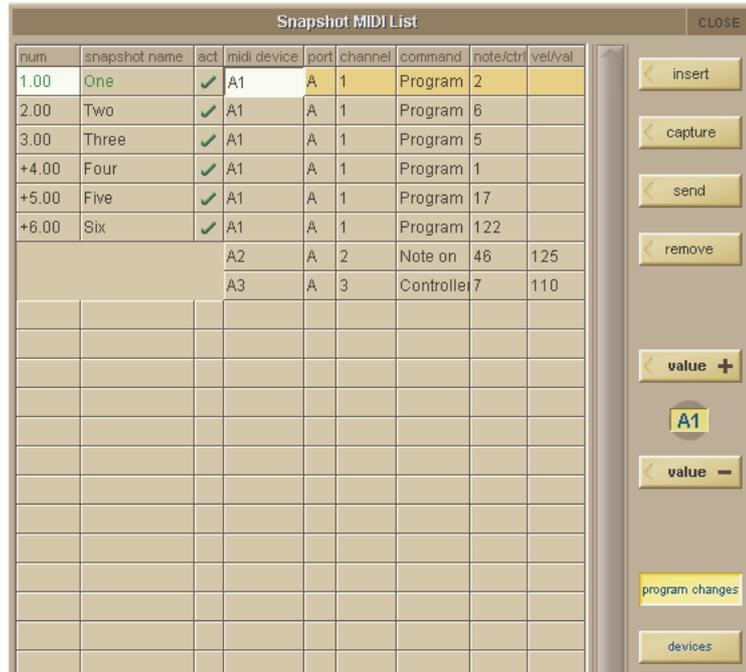

Selecting the **ripple down** button will cause new program changes to be replicated in all snapshots following the one being edited.

If MIDI program change messages have been entered in this way they will also appear in the **Scope>MIDI List** panel which allows entry and editing of other types of MIDI message.

There are columns for the **device name** (mentioned in the last section), the **MIDI port**, **MIDI channel**, type of **command** and two **data values**.

Note - If you have already defined MIDI Devices, selecting one of these in the MIDI Device column will automatically enter the Port and MIDI channel that you have previously entered for that device.

If you want to send multiple MIDI messages with a single Snapshot, use the **Insert** button to add extra lines for message entry. To test the MIDI message without firing the Snapshot, press the **Send** button - the display at the bottom right of the panel shows the presence of incoming and outgoing MIDI messages.

MIDI messages can also be automatically entered into the list by generating the required message from the external MIDI device, sending this to the console's MIDI In and pressing the **Capture** button.

3.4.19 GPOs and Snapshots

GPOs can be included as part of Snapshots, using the **GPO Relays** panel, opened using the **scope>gpo relays** button in the Snapshot window:

The GPOs are displayed in columns and the Snapshots in rows. Selecting a box will cause it to go red, indicating that the relay will open with that Snapshot and close with the following Snapshot.

Clicking the box again will cancel the relay closure on the following Snapshot, as indicated by the thinner red segment.

Ensure that GPOs are active for the Snapshots in question, as indicated by a tick in the **act** column.

Chapter 3 - The Master Screen

3.4.20 Surface Offline & Snapshot Editing

In the Snapshot section of the console worksurface there are 2 buttons labelled **Surface Offline** and **RTN To Audio**. When pressed, the Surface Offline button stops the communication between the worksurface controls and the audio engine - this means that anything that is done on the surface of the console will have no effect on the audio passing through the console. Pressing the RTN To Audio button will reconnect the surface controls to the audio engine ignoring any worksurface changes that have been made since the surface was put Offline and returning the console to its state before the Surface was put Offline.

Important Note - if the Surface Offline button is pressed, worksurface changes are made and the Surface Offline button is pressed a second time, the changes that have been made on the worksurface will immediately applied to the current audio - be careful with this function...!

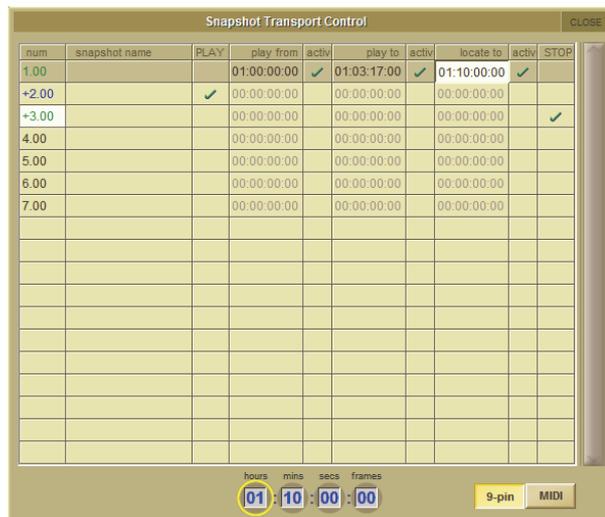

The main purpose of the Surface Offline and RTN To Audio buttons is to enable Snapshots to be edited with the worksurface offline so that any Snapshot can be previewed, adjusted and updated without affecting the current audio. While Surface Offline is active any of the Snapshot functions already described can be used.

As an example, if you are currently in Snapshot number one and wish to check or edit Snapshot number two you should:

- 1) Press the Surface Offline button and the audio will continue normally.
- 2) Scroll down and fire Snapshot two to see its settings on the worksurface.
- 3) Edit the settings for Snapshot two and Update either Current or Selected according to requirements.
- 4) Press the RTN to Audio button to automatically put the surface back online and back in Snapshot one.

3.4.21 Snapshots and Transport Automation

Control of an external playback machine can be automated alongside any snapshot sequencing, using MMC messages. This is done in the **Snapshot Transport Control** panel, opened by pressing the **transport control** button in the bottom left of the main **Snapshot** panel.

The panel lists all current session snapshots and allows entry, per snapshot, of the following MMC commands:

- PLAY:** Basic Play command. External device will play from current location
- play from:** External device will play from specified time value
- play to:** External device will stop when the specified time is reached.
- locate to:** External device will Locate to specified time, once playback has stopped.
- STOP:** Basic Stop command. External device will stop.

Place a tick in the appropriate box to make the command active.

Commands can be sent via MIDI or 9Pin, selected at the bottom of the panel.

NOTE: Correct MMC operation relies on a correctly configured MIDI system, with MTC from the external device connected to the console MIDI Input. If this MTC connection is not present, the MMC snapshot system will not work.

3.4.22 Auto Update

The Auto Update button in the Snapshots panel activates automatic updating of the current Snapshot whenever a control is adjusted. The current Snapshot will be updated without using the Update Current, Selected or Group functions. The elements of the Snapshot that are automatically updated is dictated by the Group and Auto Update Scope settings that are described in the Group Snapshots section of this chapter.

Note - In view of the potential for changing Snapshots without active manual intervention, it is probably advisable to leave this function OFF unless you are absolutely certain that you require it.

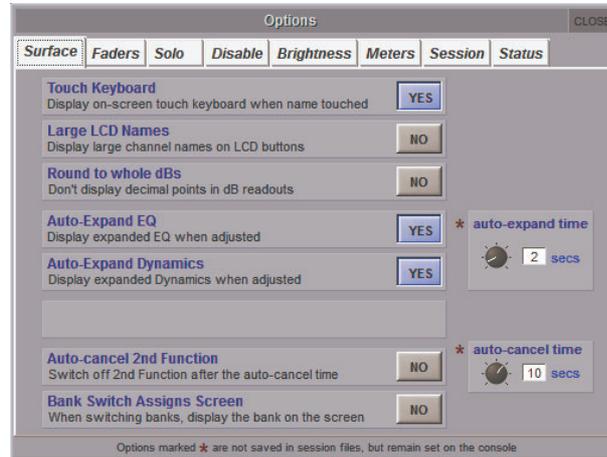

3.5 Options Menu

The **Options** menu includes a variety of SD10 system preferences, grouped into eight tabs. Most functions are described fully within the display. Each function's button displays **Yes** in purple to indicate that it is active, and **No** in grey to indicate that it is inactive.

Note that if Waves is enabled, the **Options** menu is located in the **Setup** drop-down menu. See the appendices for more details.

3.5.1 Surface

The **Surface** tab includes settings related to the console screen, buttons and encoders:

Touch Keyboard

This option defines whether or not the on-screen keyboard appears when a name box is touched. It is active by default.

Large LCD Names

This option allows the names in the LCD displays to be displayed in a larger font. It is inactive by default.

Round to whole dBs

Fractional dB values are rounded to the nearest integer value.

Auto Expand EQ

This option defines whether or not the EQ display opens when an EQ is adjusted. It is active by default.

Auto Expand Dynamics

This option defines whether or not the dynamics display opens when an dynamics is adjusted. It is active by default.

Auto Expand Time

This pot, located to the right of the **Auto Expand EQ** and **Dynamics** options, defines how long the EQ and dynamics displays remain open after the parameters within them are adjusted. The current setting is displayed in seconds, below the pot. Touching the pot assigns it to the Touch-Turn encoder.

Auto-cancel 2nd Function

This option defines whether or not active **2nd Function** buttons are cancelled after the time defined in the **auto-cancel time** pot to its right. It is inactive by default. Touching the pot assigns it to the Touch-Turn encoder.

Note that both the auto-expand time and auto-cancel time values are set on the console and are not saved as part of the session file.

Bank Switch Assigns Screen

This option defines whether or not pressing a bank button will automatically assign that bank to the screen. It is inactive by default.

Chapter 3 - The Master Screen

3.5.2 Faders

Fader Assigns Channel

This option allows a channel to be assigned to the worksurface channel controls whenever it is touched. It is inactive by default.

Note that when this option is active, accidentally touching a fader will assign it to the worksurface controls.

Fader 0dB Detent

This option defines which controls have a detent at 0dB. Options are **None**, **Graphic EQ only** (default) and **ALL**.

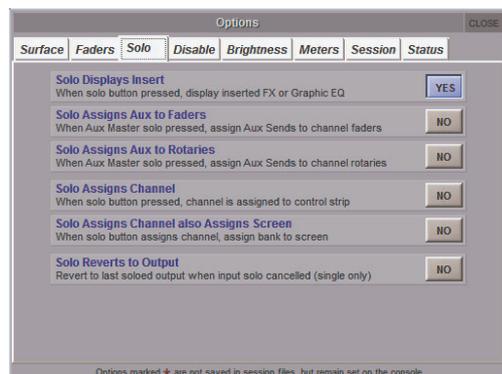

Fader Touch Control

This option defines whether or not a fader moves when it doesn't detect a touch. Options are Free (fader moves freely) and Protected (fader is protected from moving without touch).

Note that this setting is set on the console and is not saved as part of the session file.

3.5.3 Solo

The **Solo** tab includes settings related to the console's solo functions:

Solo Displays Insert

This option defines whether or not the display of any FX or Graphic EQ inserted on a channel is opened when that channel's solo button is pressed. The Graphic EQ panel can only be displayed on the Master screen. It is active by default.

Solo Assigns Aux to Faders

This option defines whether or not the send levels to an aux channel are assigned to the channel faders when that aux channel's solo button is pressed. It is inactive by default.

Solo Assigns Aux to Rotaries

This option defines whether or not the send levels to an aux channel are assigned to the top row of aux encoders when that aux channel's solo button is pressed. It is inactive by default.

Solo Assigns Channel

This option defines whether or not a channel is automatically assigned to the channel worksurface controls when that channel's solo button is pressed. It is inactive by default.

Solo Assigns Channel Also Assigns Screen

If the Solo Assigns Channel option above is active this option defines whether soloing a channel will assign that channel's bank to the screen.

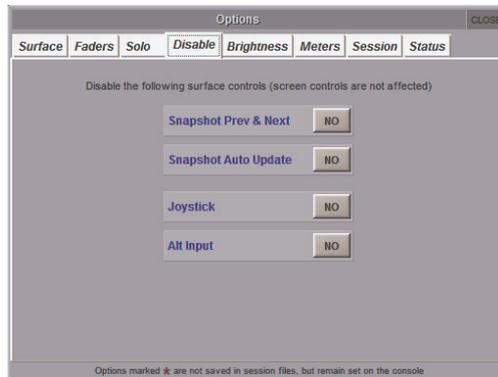

Solo Reverts to Output

This option defines what happens if an output channel solo is active when an input channel solo is then activated and deactivated. When this option is active, deactivating the input channel solo will return the solo buss to the output previously in solo mode. When this function is inactive, deactivating the input channel solo will leave all solos inactive.

The option is only available if the solo buss is in **single** mode. The option is inactive by default.

3.5.4 Disable

This tab is used for disabling **Snapshot Prev & Next**, **Snapshot Auto Update**, **Joystick** and **Alt Input** worksurface buttons. These disables do not affect on-screen operation of the functions:

3.5.5 Brightness

The **Brightness** tab is used for setting the brightness of the console's **meter leds**, **lcd displays** and **surface leds**. Touching each pot assigns it to the Touch-Turn encoder.

3.5.6 Meters

The **Meters** tab includes settings related to the console meters:

The four pots across the top half of the display affect the attack and release reaction time (**attack rate** and **release rate**), the **peak hold** time and the **overs hold** time. The current setting for each is displayed in either milliseconds or seconds, below each pot. Touching each pot assigns it to the Touch-Turn encoder.

Note that when the overs hold time is set to 0, the hold time is set to infinite, not 0. The overs lights will therefore remain lit until they are manually cleared.

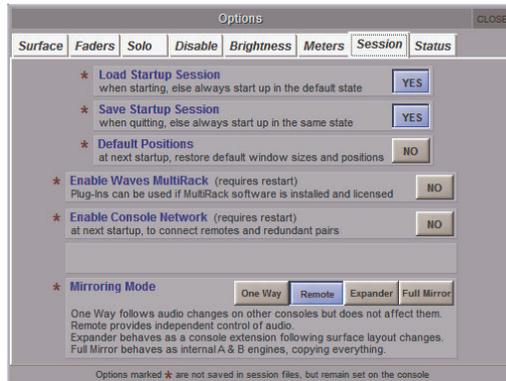

Chapter 3 - The Master Screen

The point being metered within the channel is set using the eight buttons in bottom left of the display. The input channel meters are adjusted using the buttons on the left, and the output channels are adjusted on the right. The options for each are **pre-trim**, **post-trim (pre-processing)**, **pre-fader (post-processing)** and **post fader**. The default setting is **post-trim** for input channels, and **post-fader** for output channels. The currently selected button is displayed in purple. The **Overview** area in the bottom right of the display allows the size of Input and Output Meters to be set: **small** or **large**.

Note that the settings in the bottom half of the display affect the meters on the worksurface, not the on-screen meters.

3.5.7 Session

The **Session** tab includes settings related to the console's startup procedure:

Load Startup Session

This option allows the startup session to be automatically loaded on system start up. When not selected, the desk will always start up in the default state.

Save Startup Session

This option allows the startup session to be automatically saved when quitting. When not selected, the desk will always start up in the same state.

Default Positions

This option allows all windows to be set to their default positions on next launch.

Enable Waves MultiRack

This option enables Waves features. Waves is an optional extra which provides a set of Waves plug-ins in addition to the console's own fx units. See the relevant appendix for more details, or contact DiGiCo if you are interested in purchasing waves.

Enable Console Network

This option activates networking for remote control PCs and consoles and is explained in the **Network and Mirroring** chapter.

Mirroring Mode

This option defines the way control is assigned between networked consoles and is explained in the **Network and Mirroring** chapter.

Note that Enable Waves MultiRack and Enable Console Network both require a restart for changes to take effect.

3.5.8 Status

The **Status** tab defines whether console status notifications are displayed. Both functions are active by default.

Display System Status Indicators

This option defines whether or not the Status display is open. This display provides constant monitoring of various elements of the console's systems. The indication box to the right of each element displays a green **OK** when that element is running correctly, a red **ERR** when that element is in need of attention, and a blank grey box when that element is not relevant. Clicking on any indication box will bring up the appropriate Diagnostics page, if there is one.

Display System Alerts

This option defines whether or not system warnings are displayed. The time for which alerts are displayed is adjusted via the message display time pot, located towards the bottom of the window. The current setting is displayed in seconds, below the pot. Touching the pot assigns it to the Touch-Turn encoder.

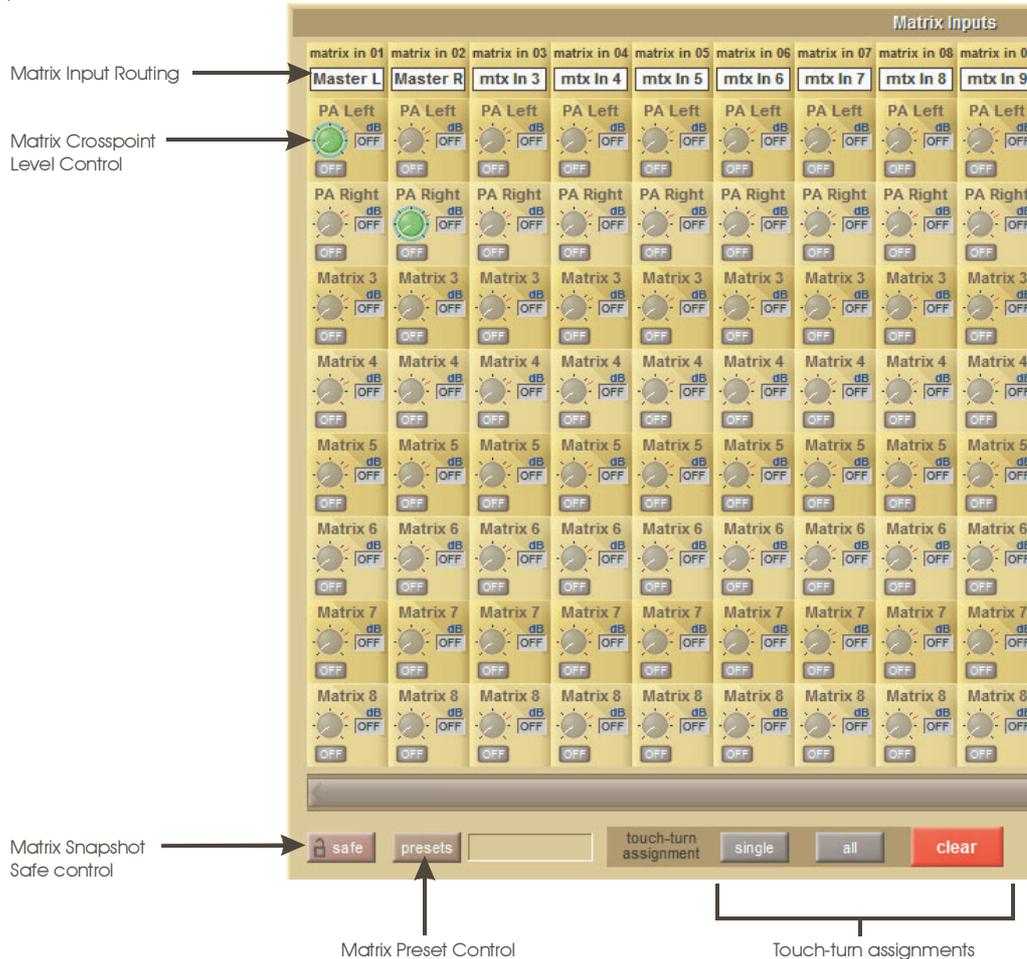

Chapter 3 - The Master Screen

3.6 Matrix Menu

Note that the fx menu is covered in the Channel Functions chapter.

3.6.1 The Matrix Panel

Touching the **Matrix** menu opens the **Matrix Inputs** panel. This panel allows the matrix inputs to be selected and the level of that input feeding each of the matrix outputs to be set. Each column of the display represents an input to the matrix, and each row represents an output.

Each pot within the display trims the signal coming from the input for that column, going to the output for that row. The top of each input column displays the input's name, and the label above each trim pot displays the pot's matrix output. Touching any trim pot assigns it to the Touch-Turn encoder, and the pots lighten and are ringed green to indicate that they have been assigned.

There are three **touch-turn assignment** buttons at the bottom of the display. The **all** button assigns all the trim pots to the Touch-Turn encoder. Individual pots can then be deselected by touching them. The **clear** button clears all the pots from the touch-turn encoder. Activating the **single** button prevents more than one trim pot from being assigned to the Touch-Turn encoder simultaneously. The button goes brown to indicate that it is active.

Note that the all function can still be triggered when the single function is active.

Multiple pots can be assigned at the same time, in which case the encoder alters all assigned pots by the same amount, regardless of each pot's position. The value of each trim pot is displayed in dB to its right. Each trim pot is switched on by touching the box below it. This box displays **OFF** in grey when it is off, and **ON** in red when switched on. Turning a pot also automatically switches it on.

Each matrix input signal is selected in the **Setup** display for that matrix input, accessed by touching the text box at the top of each input column:

At the top of the display, there is a text box which can be used for renaming the matrix input..

Below the text box, there is a matrix input routing button which opens up a routing display. Routing displays are described in The Getting Started Section of this manual.

3.6.2 Matrix Presets

The **Matrix Input Presets** display is opened by touching either the **presets** button at the bottom of a matrix input **Setup** display (this creates a one channel preset by default) or the **presets** button towards the bottom left-hand corner of the **Matrix** panel (this creates a 16 channel preset by default). Matrix presets include all of the matrix input routes, trim pot levels and on/off buttons. The **chs** column of the **Matrix Input Presets** display indicates the number of channels included in the preset.

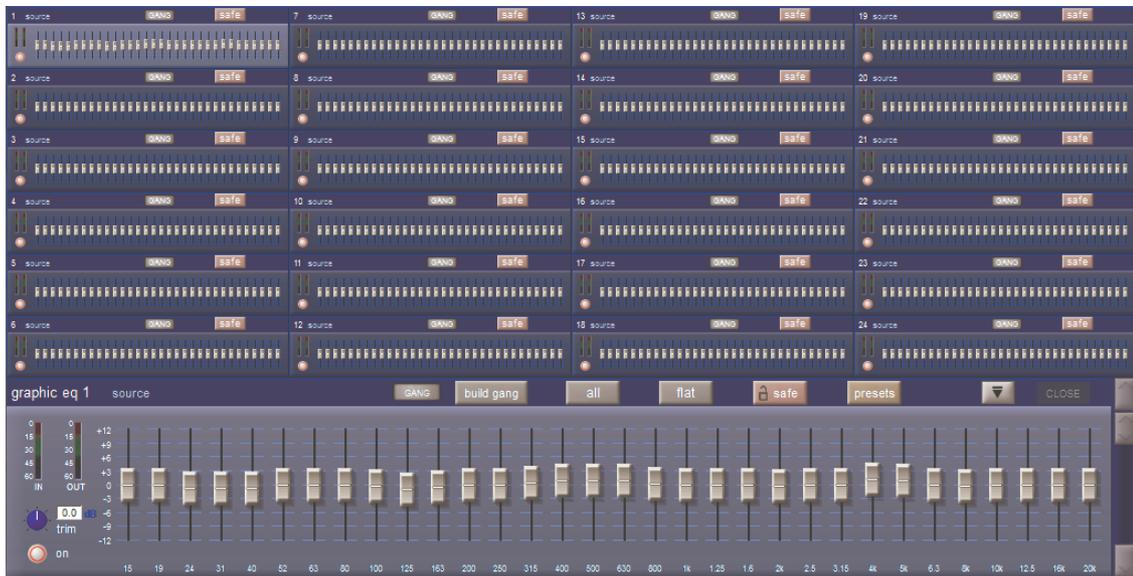

Activating the **safe** button, located in the bottom left-hand corner of the **Matrix** panel, protects the matrix settings from being overwritten by a snapshot recall.

3.7 Graphic EQs Menu

3.7.1 Graphic EQ Panel

Touching the **Graphic EQs** menu opens a display of the SD10's Graphic EQs. This display allows all 24 of the 32-band Graphic EQ's to be configured. Graphic EQ's can be assigned to the inserts and outputs of all four channel types, and can also feed the input of an input channel. Graphic EQ routing is done via the channel routing pages, and is not accessible from the master **Graphic EQs** display.

The display consists of miniature representations of all 24 Graphic EQ's, one of which is also shown expanded in the bottom of the display:

The settings on each graphic EQ are accessed via the expanded display, though some settings can also be adjusted in the miniature display. Touch any of the graphic EQs to assign it to the expanded display. The EQ assigned to the expanded display can also be scrolled using the scroll bar to the right of the expanded display. The EQ currently assigned to the expanded display is indicated in the top left-hand corner of the expanded display, along with indication of the EQ's **source**. The miniature display can be opened and closed by pressing the expand button (a down-arrow when opened, and an up-arrow when closed) to the left of the expanded EQ **close** button.

The left-hand side of the expanded display includes metering of the EQ's **IN** and **OUT** signals, a ± 18 dB gain **trim** pot with value indication to its right, and an **on** button which is ringed red to indicate that the EQ is on. Touch the **trim** pot to assign it to the Touch-Turn encoder. To the right of these controls, the 32 EQ band faders are displayed. The label located beneath each fader indicates the frequency of each band in Hertz, and the gain associated with each line on the display is indicated to the left of the lowest band. Each band can also be altered within the miniature display.

Chapter 3 - The Master Screen

3.7.2 Ganging Graphic EQs

The grey **GANG** and **build gang** buttons above the band faders are used for ganging together different graphic EQ's. When EQs are ganged, their band faders, **on** buttons and trim pots are locked together.

Note that ganging of faders is relative: EQs can have different shapes when they are ganged, and each EQ will move by the same amount when a band is adjusted.

Note that if faders are moved within the miniature display, any other EQs ganged to them will also move.

To start building a gang, touch one of the graphic EQs to be included in the gang to assign it to the expanded display, and touch **build gang**. The button turns red to indicate that it is active. The **GANG** button to its left will also become coloured, indicating that it is included in the gang being built. To add further EQs to the gang, touch anywhere within the displays of the graphic EQs to be included, and their **GANG** button will change colour to match the expanded EQ's **GANG** button. To deselect an EQ from the gang, touch its display again and its **GANG** button will return to grey. Touch the **build gang** button to complete the ganging process. EQ gang assignments can be adjusted by reselecting the **build gang** button.

Note - To temporarily isolate a Graphic EQ band from a gang, press and hold the mute button above the band's fader and then make the adjustment to that fader - this move will only be made to that band on the Graphic EQ that you are currently adjusting.

3.7.3 Graphic EQ ALL Button

To adjust all 32 graphic EQs at once, select the **all** button to the right of the **build gang** button. It turns red to indicate that it is active. Adjusting any band in the expanded EQ will cause that band in all 32 EQs to jump to that position.

Note that the all function is absolute: Once a band is altered, any variations on that band between the EQs is eliminated.

Note also that the all function does not affect the normal operation of faders in the miniature display.

To return all 32 bands within one EQ to 0dB, touch the **flat** button to the right of the **all** button, and touch **Yes** in the confirmation pop-up which appears.

Note that the flat function affects any EQs which are ganged to the expanded EQ.

Note also that pressing flat when the all button is selected does not result in the flattening of any ungang EQs.

Activating the **safe** button, to the right of the **flat** button, protects the graphic EQ settings from being overwritten by a snapshot recall.

3.7.4 Graphic EQ Presets

Touching the **preset** button, to the right of the **safe** button, opens the **Graphic EQ Presets** display in which current settings can be saved and pre-created settings imported.

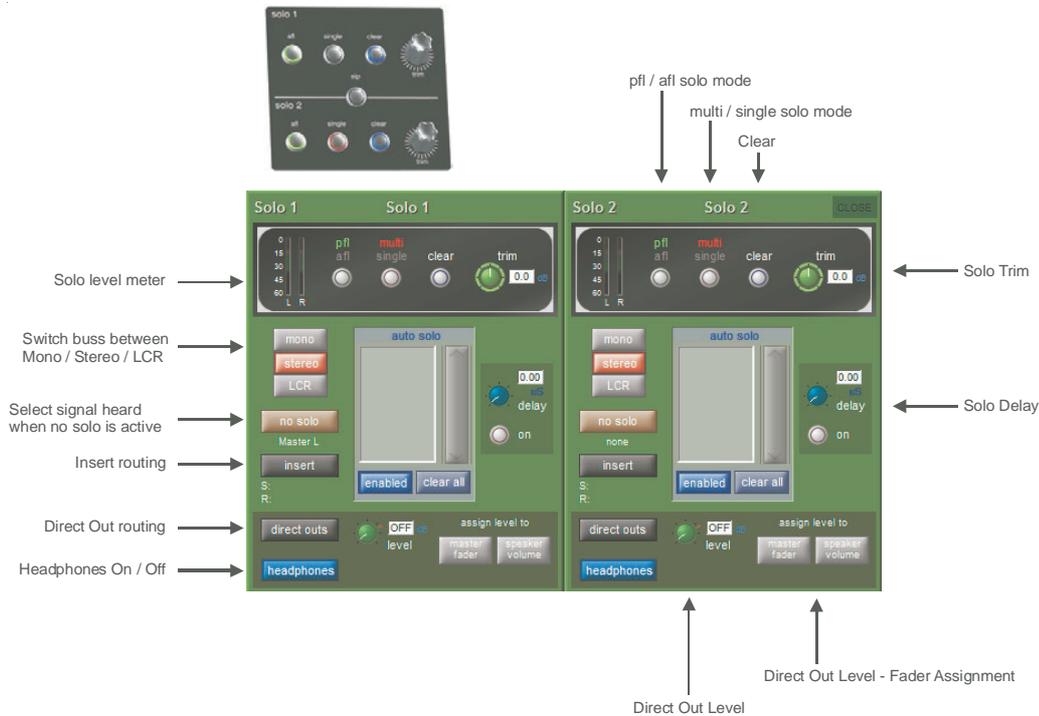

The positions of the **trim** pot, **on** button and all 32 faders are included in an EQ preset. To reset the channel to the default settings, press **default**.

3.8 Solos Menu

Note that Control Groups are covered in the Channel Functions chapter.

3.8.1 The Solo Panel

Touching the **Solos** menu opens the **Solo 1** and **Solo 2** displays. These displays are used for configuring the console's solo busses. Solo buss 1 is configured in the left-hand display, and solo buss 2 in the right. Both displays function in exactly the same way:

Note that the in-channel solo functions are described in the Channel Types Chapter

At the top of each display is a black box containing the solo meter(s), three buttons, and an input trim pot. These controls are duplicated on the console worksurface in the right hand section:

The first button selects which point in the channel feeds the buss, and toggles between PFL and AFL, as indicated by the **pfl** or **afl** labelling above the button turning green. The button is also ringed green on the worksurface when **afl** is selected.

The second button toggles the two solo button modes: **multi** in which multiple channels can feed the solo buss at once, or **single** in which only one channel can feed the buss. In **single** mode, when a channel is feeding the solo buss, pressing the solo button on a different channel will cause the originally selected channel to be deselected from the solo buss. The solo button mode is indicated by the **multi** or **single** labelling above the button turning red. The button is also ringed red on the worksurface when **single** is selected.

All feeds to the solo buss can also be cleared by pressing the **clear** button. When there is a feed to that solo buss somewhere on the console, the button is ringed blue on the worksurface.

The level of the solo buss can be adjusted using the on-screen **trim** pot or the trim encoder on the worksurface. The on-screen **trim** pot is always assigned to this worksurface encoder, as indicated by the presence of green ring around it. The signal can be trimmed by $\pm 18\text{dB}$, and the trim value is indicated to the right of the on-screen **trim** pot.

In the centre of the **Solo 1** or **Solo 2** display, there is an **auto solo** area which lists all the channels which are selected for the **auto solo** function. This function automatically routes selected channels to that solo bus whenever another channel is assigned to it, and the selected channels can be scrolled if necessary using the scroll bar on the right of the list. The **auto solo** channels are selected in the Channel Setup display. This **auto solo** function is enabled and disabled by touching the left-hand blue button below the **auto solo** list. The button label displays whether the **auto solo** function is **enabled** or **disabled**. The channels in the **auto solo** list can all be removed by touching the clear all button below the **auto solo** list.

Tip: If you are using effects returns, selecting auto solo will allow soloed tracks to be auditioned with their effects returns.

The solo buss signal can be delayed using the **delay** pot to the right of the **auto solo** area. Switch the delay on using the **on** button below the pot. Touch the pot to assign it to the Touch-Turn encoder. The delay value has a range of 0 to 3 seconds and is displayed above and to the right of the **delay** pot.

The **mono**, **stereo** and **LCR** buttons define the buss format. The selected button is red and the format is also indicated by the number of meters displayed in the top-left corner of each display.

Chapter 3 - The Master Screen

3.8.2 The No Solo Setup Display

Below the **mono**, **stereo** and **LCR** buttons is a button marked **no solo**. This button defines what signal (if any) is present on the buss when no channel solo is active. By default, when no channel solo is active, the master buss feeds solo buss 1 and there is no signal feeding solo buss 2. Pressing this button opens the **No Solo Setup** display:

At the top of the display, there is a text box which can be used for renaming the solo buss. Touch the box or the keyboard symbol to its right, type the new name on the on-screen or external keyboard and press **OK**. The **Channel Name** display containing commonly used words for quick insertion can be accessed for buss naming by touching the down arrow immediately to the right of the text box. The solo buss name will then appear at the top of its master solo display, and in any solo-assigned master faders (See below for details).

Below the naming area, there are two columns of buttons used for selecting the audio source for the **no solo** function from among the group and aux channels. The left-hand column contains a number of buttons: the **groups** buttons (**mono**, **LCR** or **stereo**) and the **auxes** buttons (**mono** or **stereo**). Touching one of these buttons causes it to lighten to indicate that it is selected, and results in a list of those channels appearing in the right-hand column. A scroll bar appears in the right of the display if the channel list is too long for the window.

Touching one of these signal buttons assigns it to the **no solo** function, as indicated by the lightening of the signal's button and by the labelling immediately beneath the **no solo** button displaying the signal name. If a stereo signal is selected here, only the left-hand signal is displayed beneath the button. Signals can be deselected by touching them again. When no signal is selected for the **no solo** function, the labelling beneath the button displays **none**.

To close the **No Solo Setup** display, press the **CLOSE** button in the top right-hand corner.

The area below the **auto solo** area concerns the solo buss outputs. In the centre of the output area, there is an output level pot. Touch the pot to assign it to the Touch-Turn encoder. The buss output level trim ranges from **OFF** to +10dB, as indicated to the right of the pot.

3.8.3 Assigning Solo Busses to Worksurface Controls

The solo buss output level can also be assigned to either the master fader or the speaker volume rotary by pressing one of the **assign level to** buttons to the right of the **level** pot. The buttons turn brown when selected.

3.8.4 Solo Outputs Routing

Each solo buss includes an insert send and return, and a direct output, both of which are routed in the **Solo Outputs** display. This display is accessed by touching the **insert** button below the **no solo** button, or the **direct outs** button in the top left of the solo buss output area.

This insert point only applies to the Solo buss Direct Output, not to the headphone signal.

At the top of the **Solo Outputs** display, the buss naming function described above is duplicated. Towards the bottom of the display, there are two buttons marked **output** and **insert A**. Selecting one of these buttons assigns that send (or send and return) to the signal routing area above it: When the insert is assigned, the **ins A send** routing button appears in the left-hand column, and the **ins A return** routing button in the right-hand column; When the output is assigned, the **outputs** routing button appears in the left-hand column and the right-hand column is left blank. Pressing any of these routing buttons opens a routing display. Insert and output routing can then be routed as described in the Getting Started section of this manual.

An extra button labelled **send+return** is included above the **ports** list in the **Insert Send Route** display button. When this button is activated, the send and return routing is linked for all signals within the **INTERNAL** port: If the **Graphic 1** input is assigned to the insert send, the **Graphic 1** output is automatically assigned to that insert return. Similarly, if it is the return which is manually assigned, the send automatically copies that send assignment. The **send+return** button is grey when inactive and brown when active.

Once insert send and return signals have been selected, any relevant controls appear in the bottom half of the **Solo Outputs** display, along with a meter (or pair of meters, in the case of stereo channels) displaying the send or return level. In the send area there is an **on** button which switches the send on and off, and in the return area there is a reverse phase button which inverts the phase of the returning signal. Both of these buttons become ringed in red to indicate that they are on.

Once any insert or direct out has been routed, the route is displayed below the button in the **Solo 1** or **Solo 2** display.

3.8.5 Headphone Outputs

Touching the **headphone** button in the bottom left-hand corner of the display sends the solo buss signal to the headphone socket, located on the right side of the console, under the arm rest. The button turns blue to indicate that it is active.

The headphone output receives both solo buss signals, and the headphones will be silent when neither buss is routed to them, unless a **no solo** signal has been assigned.

The headphone level is controlled by the output **level** pot in the output area, and also by the headphone level encoder located in the right hand section of the worksurface. The headphone signal can be muted by pressing the **mute** button next to the worksurface headphone level encoder, and the button is ringed red to indicate that the headphone send is muted.

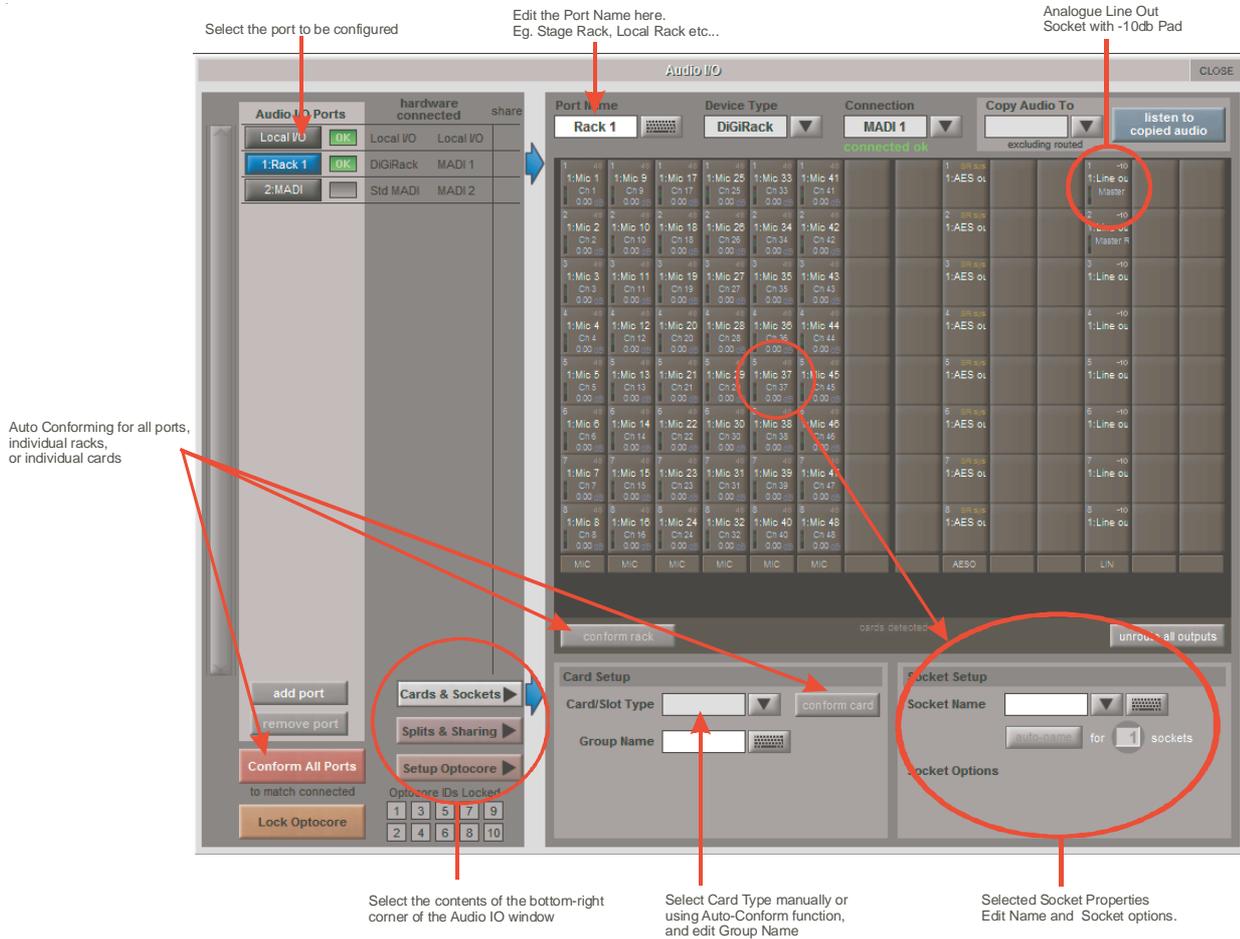

Chapter 3 - The Master Screen

3.9 Setup Menu

Note that the Network menu is covered in the Networking and Mirroring chapter.

3.9.1 Audio I/O

The **Audio I/O** display is used to configure the physical I/O connected to the SD10, including identifying and naming the sockets of the option cards installed in racks, and the setting of pads and phantom power.

3.9.2 Port Selection

The **ports** buttons in the top left-hand corner of the display select which port is being configured in the rest of the display. Each port relates to a set of physical audio connections:

- Local I/O** The Input/Output sockets on the rear of the console
- Rack** A remote I/O rack connected via MADI or Optocore

Once a port has been selected, the connections contained within it are displayed in the Sockets graphic which makes up the most of the rest of the **Audio I/O** display.

Note that on sessions running at 96kHz, both MADI ports are required for 56 channels of audio, and they are therefore displayed as a single port.

The box to the right of each port selection button displays the current state of the connection:

3.9.3 Port Hardware Configuration

The port is named automatically according to its connection type, as displayed to the right of the **ports** selection area. However, the name can be edited by touching the **Port Name** box or the keyboard symbol to its right, typing the new name into the QWERTY keyboard which appears, and pressing **OK**. The type of device connected to the port can be altered by touching the down arrow next to the **Device Type** box, located next to the **Port Name** box, and selecting the appropriate device (normally **DiGiRack**) from the drop-down list that appears.

Note that the configuration of the Local I/O port is fixed, so no hardware changes are possible. You can, however, change the Port Name, the Group Names (relating to name of each physical card) and the Socket Names (the name of each physical connector on a card).

3.9.4 Port Control

The Splits & Sharing button, towards the base of the panel, will cause the port control configuration to be displayed in the bottom right of the window. These buttons define the level of control between the console and the I/O racks:

Normally, the input gain, phantom power and pad of each DiGiRack input is controlled remotely from the SD10. However, in multi-console systems where DiGiRacks are connected with MAD1 and shared between two DiGiCo consoles, only one of the consoles can remotely control these rack settings. Therefore, the level of control given to each console must be defined. There are three levels of control: **isolate**, **receive only** or **full control**.

isolate: The SD10 will not exchange any control data with the rack. This means that the console will neither be able to adjust rack settings, nor adjust its own settings according to returning control data.

receive only: The SD10 will receive the rack's existing settings but not send control data back. This means that the console will not be able to adjust rack settings, but will be able to adjust its own settings according to returning control data.

full control: The SD10 will receive the rack's existing settings and will send control data back. This means that the console will be able to adjust both its own settings and the rack's settings.

If racks are defined as **Shared** by selecting the relevant port and pressing the **Shared** button, the global control buttons in the bottom left of the panel can be used to set the level of control for all shared racks.

Individual racks can also be controlled using the Isolate, Receive Only and Full Connect buttons beneath the Shared button - these buttons will only affect the selected port.

Note that card splits are only available on SD Racks and are described in the separate SD Rack manual.

3.9.5 The Socket Display

When a port has been selected from the **ports** list on the left, the individual connections within that port are displayed in the Sockets graphic, which makes up most of the rest of the **Audio IO** display. For Rack or Console ports, each column in the graphic represents an I/O card, and the type of I/O card is displayed at the bottom of each column. For the **Local I/O** port, each row represents a type of I/O socket.

Each individual socket displays the following information: the current socket name is across the middle, and the socket number within the card is in the top left-hand corner.

For analogue input sockets, the current gain is at the bottom, and the top right-hand corner displays a red **48** symbol if the socket's phantom power is switched on.

For analogue rack output sockets, there is a **-10** symbol in the top right-hand corner which is yellow to indicate that the 10dB pad is switched in, and white to indicate that no pad is present.

For digital inputs the status of Sample Rate Conversion On/Off is displayed.

Touching a socket within the graphic assigns that socket and its card to the area below the graphic for configuration, as described below.

3.9.6 Socket Conforming

In order to use the rack, the on-screen contents of the rack must match the cards physically installed in the rack connected. There are two ways of achieving this:

Manual Conforming

Select each card (column) and manually select the appropriate card in the **Card/Slot Type** drop down menu in the lower section of the window. Once the correct card type is selected, the card type name at the bottom the selected card will turn green, indicating the card type matches the card installed in the rack. If there is a mismatch, the card type name will be red, and the error should be corrected by selecting the correct card type.

Automatic Conforming

The audio I/O can be automatically conformed for the whole console (using the **Conform All Ports** button in the bottom left of the panel) or the currently selected rack (using the **conform rack** button below the socket display). Pressing these buttons will correctly select the correct card for each slot. Once complete, all of the card labels beneath each slot should turn green.

It is also possible to auto-conform on a card-by-card basis: With a single card selected (by touching any of the sockets on that card), press the **Cards & Sockets** button towards the base of the screen, followed by the **conform card** button which appears in the area to its right.

Chapter 3 - The Master Screen

3.9.7 Group and Socket Names

Cards and sockets are named automatically, according to the **Device Type**, **Card/Slot Type** and their position within the port. However, these names can be edited by touching either the **Group Name** and **Socket Name** boxes (or the keyboard symbol to their right) which are visible below the Sockets graphic when the **Cards & Sockets** button is active. Type the new name into the QWERTY keyboard which appears and press **OK**.

Touching the down arrow in between the **Socket Name** box and keyboard symbol opens up the **Channel Name** display which enables commonly used words to be inserted quickly without the use of the keyboard.

A range of sockets can be named with the same label and an incrementing number by using the **auto-name** function below the **Socket Name** box:

To define how many sockets will be auto-named, touch the numeric display, turn the Touch-Turn encoder to the right of the screen until the numeric display below the keyboard symbol displays the correct number.

Alternatively, touch the numeric display, type in the number of sockets to auto-name into the keypad that appears, and press **OK**. Once the number of sockets has been defined, the auto-name button becomes active. Pressing it will cause the name of the assigned socket to be replicated for all the sockets selected for auto-naming.

If the assigned socket's name does not end in a number, a '1' will be added to it and incremented for the remaining sockets. If the assigned socket's name already ends in a number, that number will be incremented for the remaining sockets.

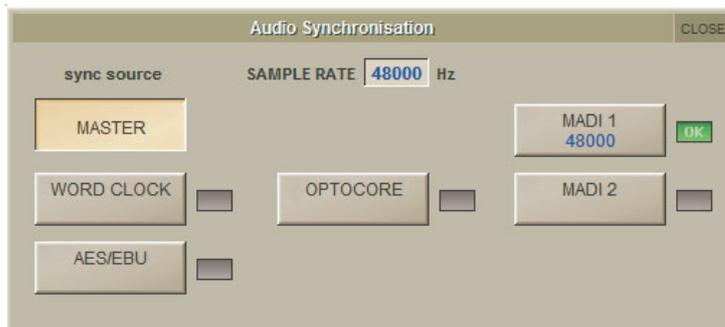

For assistance with the **Setup Optocore** display, please refer to the separate Optocore v221 manual.

3.9.8 Socket Options

Depending on the socket type, further **Socket Options** are displayed below the **Socket Name** area.

3.9.9 Audio Sync

Selecting **Audio Sync** from the **Setup** menu opens the **Audio Sync** display. This is where the clock master is selected:

The currently selected rate is indicated in the **SAMPLERATE** box at the top of the display. This can be switched between **48kHz** and **96kHz** in the **Files > Session Structure** window..

Within a normal setup, the SD10 will usually be the clock master, indicated by the **MASTER** button on the left of the display being selected. However, there are times when the SD10 needs to be clocked externally. The sources from which an external clock can be taken are shown in the rest of display: **Word Clock**, **AES/EBU**, **Optocore** (if implemented) and the two **MADI** inputs.

When a valid clock is detected on an external sync input, it will have a green **OK** symbol to its right, even if that input is not selected as the clock source for the SD10. To select an external source, simply touch the appropriate labelled box from among those which have a green **OK** symbol.

3.9.10 Timecode & Transport

This section of the SD10 has not been implemented

3.9.11 Macros

Selecting **Macros** from the **Setup** menu opens the **Macros** display. This display is also opened by pressing the **assign** button to the left of the main row of **smart keys** on the worksurface.

This is where macro commands can be assigned to the **smart keys** in the right-hand section of the console (shown below), as well as to the function (F) buttons on the external keyboard and to the console's GPIs (if implemented). There are four banks of ten smart keys – use the four numbered buttons to their left to switch between banks. Macros can also be fired directly from this list by touching the macro when none of the right-hand buttons is active.

The **Macros** display includes a list of all the macro commands which have been created, along with the button to which they have been assigned, if this has been selected. The list is scrollable using the scroll bar to the right of the list.

Note that this list therefore includes macros which have been created but have no trigger.

To create a blank macro, touch the **new** button, in the top right-hand corner of the display. To create a macro based one that already exists, touch the **duplicate** button below the **new** button, followed by the macro you wish to duplicate. When either button is touched, a macro is created with the default name **macro n** where **n** is an auto-incrementing number, and the **Macro Editor** display (described below) is opened. A duplicate macro will contain all of the settings of its parent, apart from the name.

To edit a macro, touch the **editor** button below the **duplicate** button, followed by the macro you wish to edit. The **Macro Editor** display (described below) will then open.

Macros can be assigned from the main **Macros** display without opening the **Macro Editor** by touching the **assign** button below the **editor** button, touching the macro you wish to assign, and then pressing the button to which you wish to assign the macro.

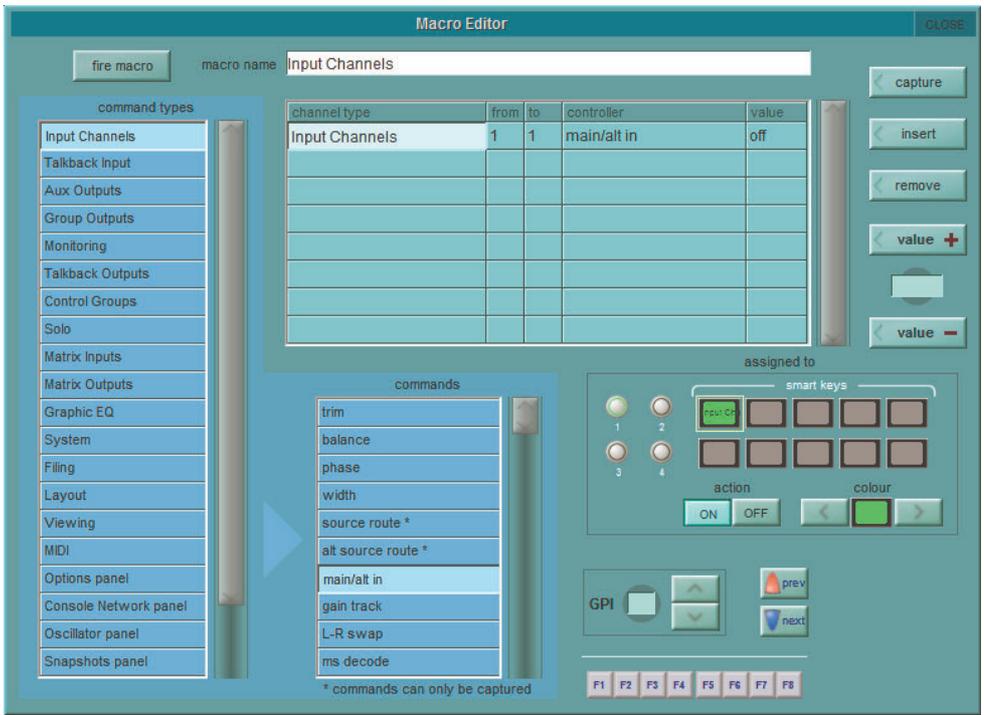

Macros can be deleted by touching **delete**. To delete all the macros in the list, touch **select all**, followed by **confirm**. To delete one macro or a selection of macros, touch the macros you wish to delete followed by **confirm**. To delete a consecutive range of macros, touch **select range**, touch the first and last macros included in the range to be deleted, and touch **confirm**.

Chapter 3 - The Master Screen

3.9.12 The Macro Editor

The **Macro Editor** is where macros are defined, including the commands included in the them and the button used to trigger them. Virtually any command within the console can be assigned to a macro.

Note that fx parameters are only included available once fx units are in use in the session.

The name of the macro being edited is shown at the top of the display. To switch to a different macro in the list, touch the new macro in the Macro display list (You may need to move the displays around the panel to access the list).

To rename the macro, touch the **macro name** text box, type the new name in the on-screen or external keyboard, and touch **OK**. This name will be used in the Macros display and also in the LCD display within a smart key assigned to that macro.

The list beneath the **macro name** text box, lists the commands currently included in the macro. When there are multiple commands in the included commands list, they are triggered in the order in which they are listed.

New commands are added to the selected row in the list, overwriting any command previously in that row. To insert a row for a new command in between two adjacent commands, touch the row above which you want to insert the command, then touch the **insert** button to the right of the included commands list.

There are two ways of adding a command to the included commands list:

1. Touch the row in the list in which you want the command to appear, then touch the **capture** button, located in the top right-hand corner of the display. The button turns pink to indicate that it is active. Any commands now actioned on the console will then be added to the included commands list. Once all the desired commands have been actioned, deselect the **capture** button.
2. Touch the row in the list in which you want the command to appear, then touch one of the command types in the scrollable **command types** list to the left of the display. This brings up a list of the commands within that command type in the scrollable **commands** list in the centre of the lower half of the display. Touch the desired command to bring it into the included commands list.

For commands associated with worksurface controls (all command types above **System** in the **command types** list), the included commands list displays the command type (in the **channel type** column), the scope of channels included in the command where appropriate (in the **from** and **to** columns), the command's name (**controller**) and any value associated with the command. For command types associated with the master panel (from **System** down), the included commands list displays the **command**, along with any **filename** or **value** associated with it. The list can be scrolled if necessary using the scroll bar to its right.

The values in the **from**, **to** and **value** columns can be adjusted by using the Touch-Turn encoder and **value +** and **value -** buttons to the right of the included commands list. Touch the box to be adjusted to assign it to the encoder and value buttons. The

present value is shown in the display in between the value buttons. If the **value** column displays something other than numeric values, the options are cycled using the Touch-Turn encoder and **value +** and **value -** buttons (cycling for example, between **on**, **off** and **toggle**).

Values can also be typed in by touching the value box, typing the new value using the external or on-screen keyboard, and touching **OK**.

To remove a command from the list, touch the command to be removed and touch the **remove** button to the right of the included commands list.

The bottom-right of the **Macro Editor** is used to define which of the **smart keys** triggers the macro. The **action** buttons define whether the Macro is to be triggered by a macro button **ON** command or a macro button **OFF** command. This means that one macro button can trigger 2 different macros depending on whether it is switched **ON** or **OFF**. If you do not require the macro button to trigger 2 different macros then set the action to **ON**. Selecting a new trigger for a macro automatically deselects any old trigger than might have been assigned.

Smart keys are selected below the **assigned to** legend. Select the bank using the numbered buttons (the selected button's ring will light green), followed by the smart key within that bank. You can now select a button colour by using the left and right **colour** scrollers. (The lower row in the display refer to the right-hand five worksurface buttons)

If GPIs are implemented, they are selected by touching the **GPI** number box and using the Touch-Turn encoder, or by using the arrow buttons to the right of the **GPI** number.

Macros can also be fired with snapshots by assigning them to the **previous** and **next** buttons in the **snapshot** area just above the main fader. They are shown in the **Macro Editor** display to the right of the **GPI** box.

Function keys on the external keyboard are assigned by touching the **F1** to **F8** buttons at the bottom of the display.

Macros can be tested by touching the **fire macro** button, located in the top left-hand corner of the display. Once the macro has been fully configured, close the **Macro Editor** display.

3.9.13 Talkback

The talkback area of the console is located in the top right-hand corner of the right hand section. The talkback area includes a **gain** control encoder and two **talk** buttons, labelled **a** and **b**. Pressing these buttons routes the talkback mic to that **talk** buss output, as assigned in the **Talkback** display. These buttons are momentary if held, and latching if pressed quickly. The Talk buttons only function if there is a valid output route for the Talkback.

Note that the input signal for the talkback mic should be defined as one of the Local I/O or rack inputs in the Talkback panel.

The **Talkback** display is opened by selecting **Talkback** from the **Setup** menu. This is where the two talkback busses are configured.

The white boxes across the bottom of the display open routing panels, allowing for selection of the main output for each talk buss, and the **input** used for the talkback mic, using the standard routing procedure. Routes can also be named in the normal way. The current routes are displayed in the boxes. Note that multiple outputs can be selected (though only the first is displayed) and there is an alt input available.

Chapter 3 - The Master Screen

The grey boxes above the **a** and **b** buttons allow aux outputs to be included in the talkback. Press a box to open the **Talk to Aux Setup** panel. The **mono** and **stereo** buttons define whether the mono or stereo auxes are listed in the right of the panel. Select all of the auxes to be included in that talkback, then close the panel.

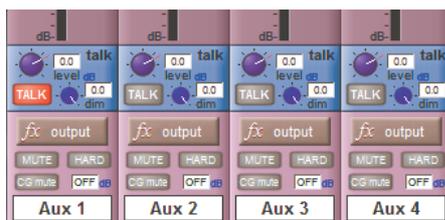

In the right-hand side of the **Talkback** display, there is a mic **input** gain pot which is always assigned to the **gain** encoder in the worksurface talkback area. The pot's gain value is indicated in dB in the box above the pot and its signal level is shown in the meter to its right.

The two **talk** buttons (labelled **a** and **b**), activate and deactivate the corresponding talkback button on the worksurface. Each button rings red to indicate that the buss is active.

The **TB In** channel strip (which is located in Layer 2 of the centre section faders by default) can also be used to route talkback mics to the Talkback buss. Standard input channel control is provided, including full signal processing. Note, however, that there is no channel fader.

Talkback to Auxes can also be controlled from the **talk** area of the Aux output channel strips:

Touching the Talk button will route the talkback mic to that aux output. The level pot controls the talkback level on the aux buss, and the dim pot controls the amount of level reduction introduced to the aux buss's normal signal when talkback is active. You will notice the talk button go red on any aux buss assigned to a talkback via the master screen, whenever that talkback is active.

To assign control of the talk area to one of the encoder rows beneath the screen, hold that row's Assign button and then touch inside the talk area on the screen. This will assign the selected rotary encoder and switch to be talkback level and on/off control, and the 2nd function rotary encoder to be the dim level.

3.10 Screen and Light Brightness

In the top right hand corner of the centre section there are two pots for controlling the brightness of the screen and the brightness of any little desk-light:

SD10 Operation Manual

Chapter 4:

Network & Mirroring

Chapter 4 - Network & Mirroring

4.1 Network and Mirroring

4.1.1 Network Configuration

The SD10 console is fitted with a network card and offers the possibility of remote controlling the console from a standard PC. In order to take advantage of this, you need to verify the console networking is functioning and synchronise your session between the two devices.

The SD10 software on the PC is exactly the same as the console software and the USB key that is provided with the console will contain a file called SD10_xxx.exe that should be used to install the software on the PC.

Alternatively download the Offline Software from the Support downloads section at www.digico.biz.

Run this self extracting ZIP file and change the install path from D:\SD10 to C:\SD10 - this will copy the SD10 folder and its contents to C:\SD10. Now create a new folder called C:\Projects which is where you will save and load your sessions from.

Finally, open the C:\SD10 folder on your PC and double click on the SD10.exe program file to run the application.

IMPORTANT NOTE - When mirroring a console to a PC you are required to set a static IP address on your PC which is in the same subnet as the console itself. The console's subnet mask is 255.255.0.0 and its IP address can be seen next to its entry in the Network panel - in the picture below it is 192.168.2.77.

The IP address of the PC must start with 192.168.xxx.xxx. and must be different to that of the console.

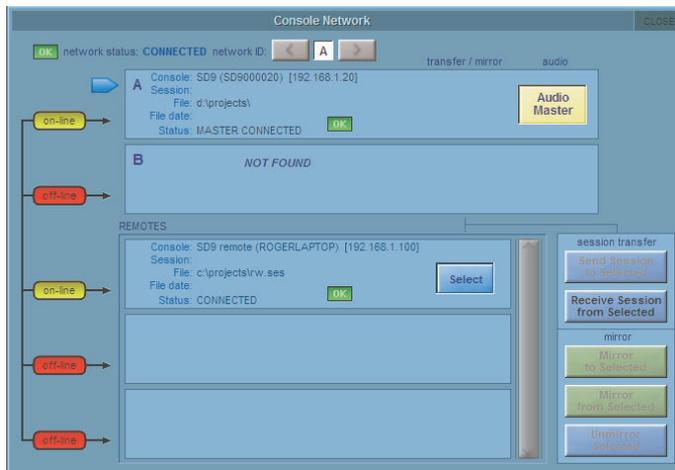

The setup of network addresses on a PC may differ from one operating system to another so if you are in doubt, please consult the documentation for your PC's operating system before proceeding.

As an example, on Windows XP, the IP address and subnet mask can be changed by:

- 1) Opening the **Control Panel>Network Connections**.
- 2) Right clicking on the **Local Area Connection** and selecting **Properties**.
- 3) Double Click on **Internet Protocol (TCP/IP)** from the list to show its **Properties**.
- 4) Set the radio button to **Use the following IP address**
- 5) Type the **IP Address** and **Subnet Mask** as detailed above
- 6) Confirm the changes and restart the computer

Before the console and PC can be mirrored, you should ensure that a standard crossover network (Ethernet) cable is connected between the two devices. Without this connection, the two devices will not "talk" to each other.

To open the Network window, touch the **Network** button at the top of the Master Screen. The following window will open...

Note - The picture above shows a console identified as an SD9 - this entry will reflect the console model used

When running SD10 software on a PC the software will appear in a number of "floating" windows, each of which represent a console section. A screen touch on the console is simulated by a right click with the PC mouse. To switch between console sections use the small toolbar buttons that also appear on the screen marked Master\Left\Right\Overview.

4.1.2 Mirroring for the first time

If the console and the PC are connected together, but do not see each other you will see red offline indicators next to the device entries in the network list. In this case you may need to enable Networking.

There is an option in the **OPTIONS/SESSION** tab to **ENABLE CONSOLE NETWORK (YES/NO)**. This must be set to YES on both devices. After doing this, shutdown and restart both devices and when the sessions are loaded go to the NETWORK window and you should see yellow Online lights against Engine A and one of the Remote Control slots as in the picture above. This indicates that the network has connected the two devices but they are not yet mirrored.

In order to mirror the two devices, they need to be running the same session. The way to achieve this is to load the session into the console, then transfer it to the remote PC using this Network window.

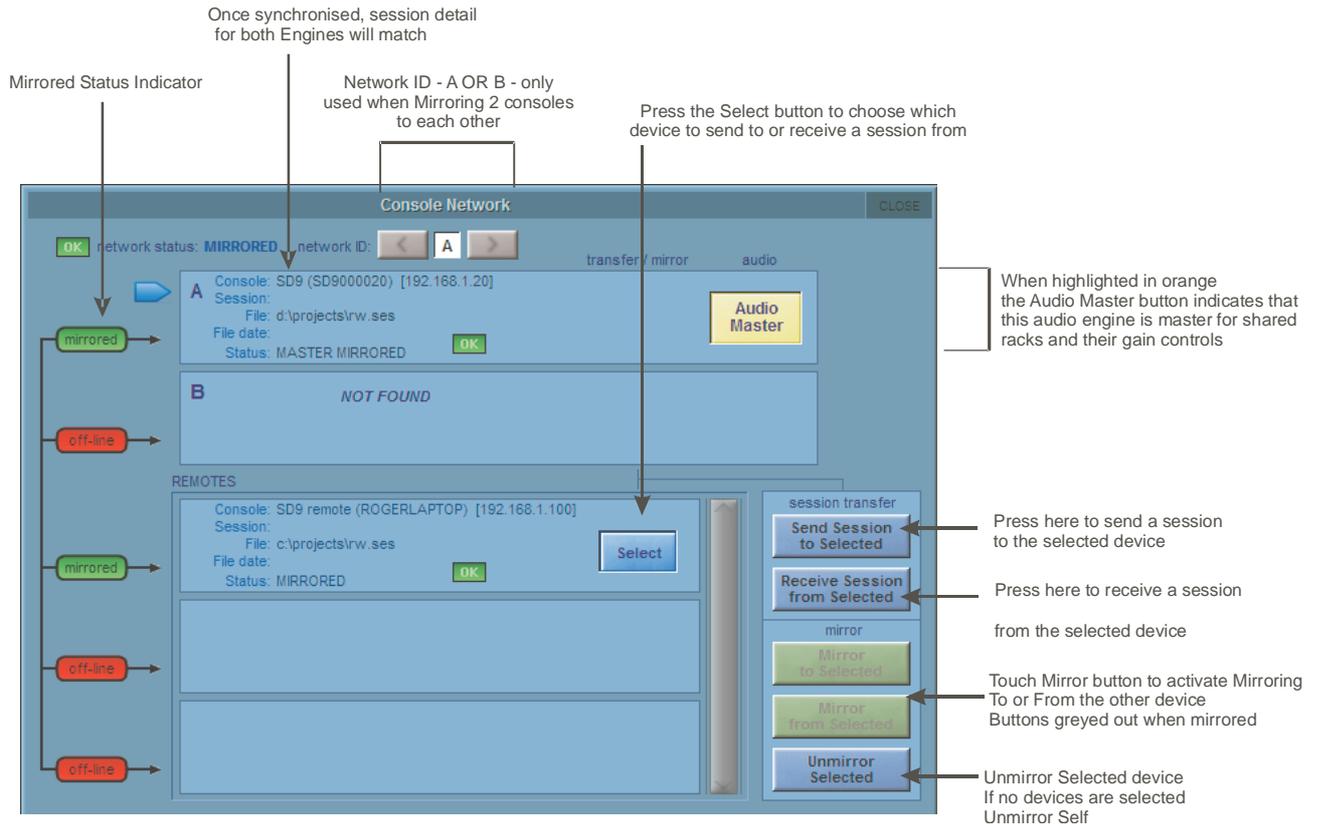

1. Load your session into the console.
2. Open the Network Window
3. Press the **Select** button for the Remote PC and then press the **Send Session To Selected** button.

This will copy your current console session and load it into the remote PC. Once this is done, the remote detail section will change to reflect the new loaded session. You can also check that this process is complete by looking at the remote PC and waiting for the progress bar to indicate that the session has finished building.

You can now press the **Mirror To Selected** button or the **Mirror From Selected** button.

Note: We recommend mirroring the console TO the remote PC to ensure that the current state of the console is transferred to the remote PC.

The Mirror buttons will turn green, and the console is now mirrored.

Note - The picture above shows a console identified as an SD9 - this entry will reflect the console model used

Note - The exact method of Mirroring is determined by a setting in the Options panel / Sessions tab - see below

Mirroring Mode

This option determines how the console will behave when Mirrored via a network to another console or Offline PC.

This option is saved for console not in the individual session.

There are 4 modes of operation.

Full Mirror - all functions mirrored from one device to the other.

Expander - intended for use with an SD7 console and an EX007 Expander unit. The second device mirrors most functions from the first device but significantly, allows different banks to be selected on the different devices.

Remote - intended for use with a PC being used as a Remote Control for a console. Allows different banks to be selected and different setup options on each device.

One Way - only to be used in exceptional circumstances when specifically directed to do so by a qualified DiGiCo support representative.

Functions are mirrored from one device to the second device but not from the second device back to the first.

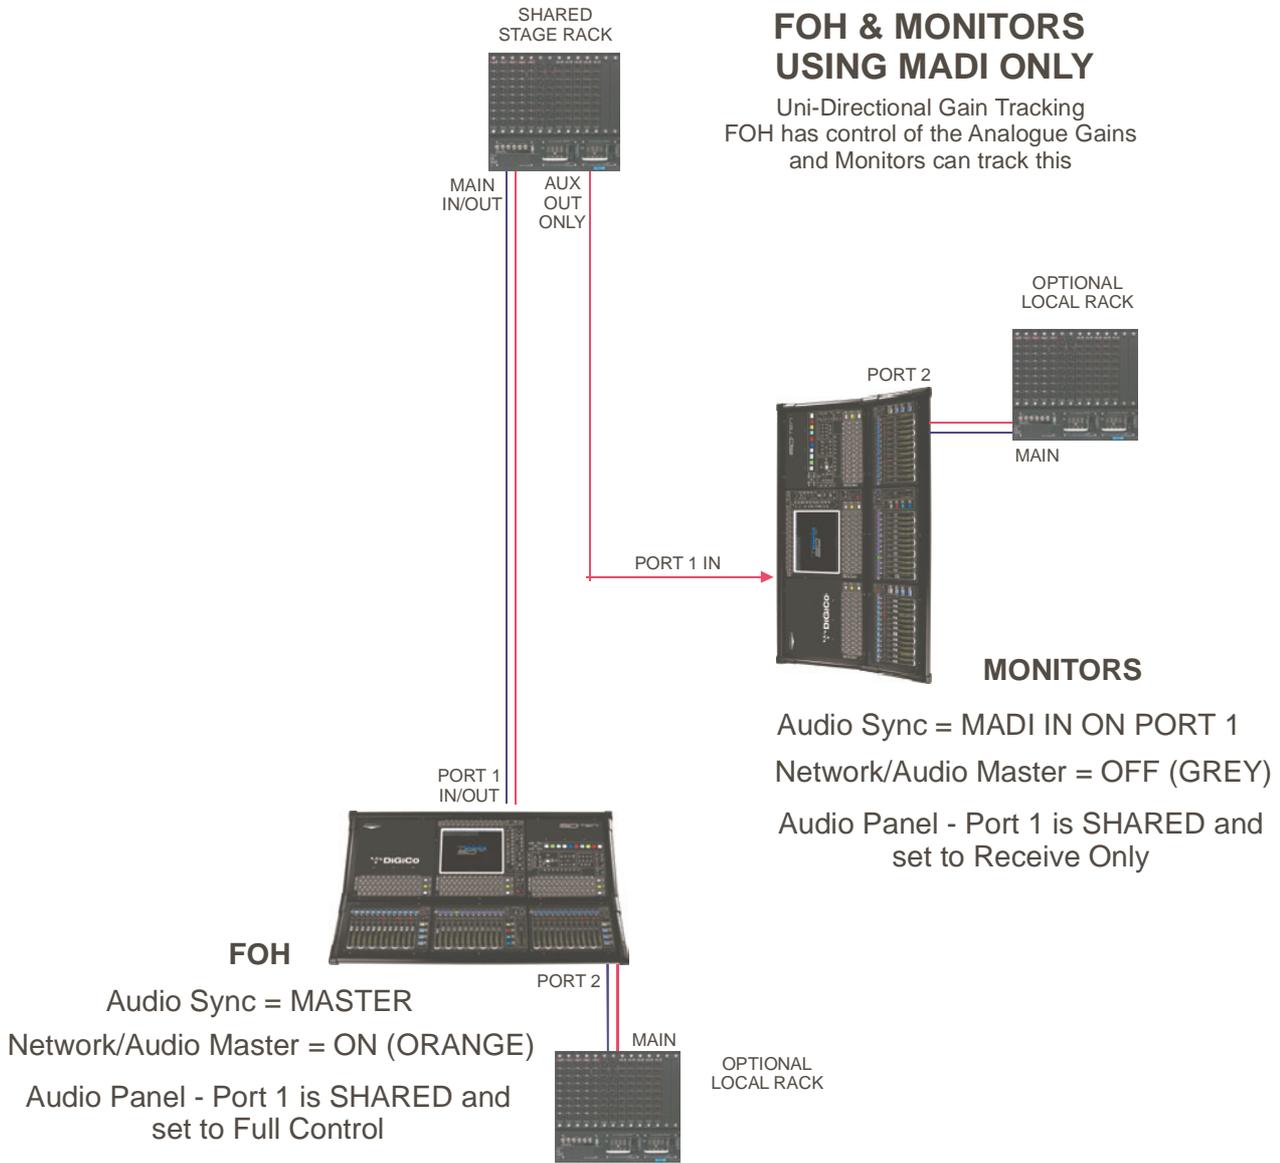

4.2 Multi-console Setups

4.2.1 FOH and Monitors sharing a stage rack

It is possible for 2 DiGiCo consoles to share the inputs from a remote DiGiCo Rack by using the 2 sets of MADI ports on the rack. In the case of the SD10 the shared rack can be connected by BNC MADI cables to console Ports 1 or 2 (or with optical fibre where fitted).

In the situation where connections are made with BNC MADI cables, only one of the consoles can control the rack functions such as the analogue gain of the mic pre amp and the phantom power switching.

The suggested setup for two SD10's which are sharing the same rack is as follows:

The recommended connection between the Monitor console and Stage Rack is a single MADI OUT from the Stage Rack's AUX MADI connected to one of the console's MADI IN ports.

The FOH (Master console) is connected via MADI IN and OUT to the stage rack.

A similar method can be used if the Monitor console requires gain control and the FOH console will track the gain changes.

MADI OUT from the Stage Rack's AUX MADI connected to the FOH console's MADI IN..

The Monitor (Master console) is connected via MADI IN and OUT to the stage rack.

Each console may also optionally be connected to one or two Racks for its own local signals.

Note - The console that is controlling the gains should be set to Setup / Audio Sync = Master and the console that is tracking should be set to Setup / Audio Sync = MADI X (where X is the incoming MADI signal's port)

- 1) Open the **Setup>Audio I/O** panel, select the shared rack port from the port's list (eg Port 1) and then press the **Shared** button for that rack. Do this on both consoles and the rack control functions **Isolate/Receive Only/Full Control** will become available.
- 2) One console should be fully connected to the racks using the **Setup>Audio I/O** panel's **Full Control** button for the **Shared** racks.
This console's **Network / Audio Master** button should be pressed (Orange) to allow Full Control to be set.
- 3) The operators should agree on and set a level of analogue gain that provides enough headroom for the required application.
- 4) The second console should connect to the Shared racks in **Receive Only** mode
This console's **Network / Audio Master** button should be off (Grey) to allow Receive Only to be set.
- 5) Gain Tracking (the **Track** buttons at the top of the Input channel screen) should be switched on for the console that is in **Receive Only** mode for all the channels that are being shared.
- 6) When an analogue gain control is changed on the "Master" console, the "Slave" console's analogue gain should reflect the changes and the digital trim control should compensate for this change by moving by the same amount in the opposite direction.

SD10 Operation Manual

Chapter 5:

Troubleshooting

Chapter 5 - Troubleshooting

5.1 Troubleshooting

5.1.1 Starting the console

If, for any reason, you have a problem starting the console, turn both power supplies off and on again and as the console starts up, hold the keyboard **SHIFT** key. This will enable you to select the **Revert To Defaults** option that will appear on the screen and the console will start up with an empty session, ignoring any previous startup or automatic recovery sessions.

5.1.2 Audio not passing on certain channels

There are many things in the audio processing path that could prevent a signal from passing from its input to an output or the monitoring system - here are some things to check if this situation occurs:

The input channel is set to use its ALT Input - look for a small red button at the top of the on screen channel marked ALT IN - in this case, assign the channel by touching the screen and press the ALT input button at the top of the centre worksurface section.

Inserts In on Input channel - either channel insert A or B is active but has no Send & Return route.

Channel or Group fader down - check that all faders in the path of the signal are up

No Output Routing - touch the bottom of the input channel screen to open the output view and ensure that the channel is routed to the correct buss or Direct output

Inserts in on Group channel - the buss that the channel is routed to has insert A or B active but has no Send & Return route

Something is soloed - a solo is active on one of the console channels - press Solo Clear on the right hand worksurface

Hard or Soft Mute on Input Channel or Group - a mute is active on either the input or output channel in question - hard mute is accessed by pressing the 2nd Function button and using the normal channel mute button.

Control Group fader down - the channel in question is the member of a Control Group that is muted or turned down.

Gate In Input Channel or Group - the input or output channel has an active gate that is not opening.

5.1.3 Snapshots not recalling as expected

When a Snapshot is stored, all of the console settings are included but when it is fired only the settings that are included in the Global and individual Recall scopes (ticked in green) will be recalled.

Most channel settings can be made SAFE from all Snapshot recall using the buttons in the channel setup panels that are accessed by touching the top of an on screen channel.

If the Auto Update button is active in the Snapshot panel, the current Snapshot is updated whenever you change a console setting according to the Auto Update Scope. This may lead to some confusion about the contents of the saved Snapshot.

5.1.4 Snapshots not inserting as expected

When a Snapshot is inserted in the list using the Insert New or Duplicate Selected buttons, the new Snapshot will be placed below the SELECTED Snapshot (the one marked in green) not below the CURRENT Snapshot (the highlighted one in the list)

5.1.5 Assigning console controls

If you have assigned a bank to the screen and are trying to adjust a specific parameter but something else is being changed it is possible that the worksurface 2nd Function button is active.

If this button is pressed the following alternative controls become available:

- Channel Mute button becomes the Hard Mute button
- Aux ON/OFF switch becomes Aux Pre/Post switch
- Stereo Aux sends become stereo Aux pans
- Output channel coarse delay becomes output channel fine delay

It is also possible that the channel which is being adjusted is not the intended channel - make sure that the correct channels are assigned to the screen by checking the small channel numbers at the top of the on screen channel.

5.1.6 Console controls not affecting the audio

If none of the console worksurface controls are affecting the audio, it is possible that the right hand worksurface **Surface Online** button is active in the Snapshots section. If it is flashing then the surface is **OFFLINE** - press the button again to apply the current worksurface settings to the audio or press the **RTN To Audio** button to take the worksurface back to the state that it was in when the Surface Online button was first pressed - this is likely to change worksurface settings but not the audio.

If the problem is not related to the Surface Online button then press the **System>Reset Surfaces** button on the Master screen - this will cause all the faders to briefly jump to a different position, then return to their previous position.

Important Note - A Reset Surfaces command result in a brief pause in any audio passing through the console's Local I/O.

5.1.7 Channels not appearing on the worksurface

If any channels are no longer accessible from the worksurface, it is likely that a bank of channels has been cleared using the **Clear Bank** LCD Function. To get these channels back onto the surface use the **COPY FROM** LCD function in conjunction with the **Layout>Channel List** panel on the Master screen - See the Getting Started Chapter for more details.

5.1.8 No signal from the Solo buss

If either of the Solo busses don't appear to be passing audio, open the Solos panel on the Master screen and check that the Solo level control at the bottom of the panel is turned up. This is not the same control as the Solo trim on the worksurface and can be set by touching it and using the **Touch Turn** control or assigning it to either worksurface **Master fader** or **Speaker volume** controls using the buttons in the on screen Solo panel.

5.1.9 Signal from the Solo buss when nothing is soloed

When nothing on the console appears to be soloed, it is possible to derive a signal from the Solo buss. This is the result of the **No Solo** function in the Master screen Solos panel being set to monitor either a group or aux buss. By default, the setting allows monitoring of the Master Buss but this can be prevented by touching the No Solo button and removing the Master Buss selection from the Stereo Groups section.

5.1.10 External keyboard

In order to function correctly the external keyboard must be connected to the console before it is powered on. The console will function without an external keyboard connected but it is very useful for such functions as labelling. Connecting the keyboard after the console has started up will not work - you should **Shut Down**, connect the keyboard and power on again.

5.1.11 Resetting the console

There are two different types of console reset. There should be no need to use these functions in normal operation but if there is either a computer or audio problem that cannot be resolved in any other way you should be quite clear on the 2 different types of Reset.

System>Reset Engine on the Master Screen (F11 is the keyboard equivalent) - this button will reset the audio engine but not the control PC. Be very careful with the use of this function as it will interrupt the audio for a few seconds and can possibly cause unwelcome audio side effects (potential ticks, pops etc)

The **Restart** button on the console rear panel (small square red button next to the MADi connections) - this button will restart the control PC but will not interrupt the audio as the audio engine is not affected. You will have no control of the audio settings until the console has rebooted so it is not advisable to try this in normal circumstances.

5.1.12 Talkback

The Talkback system in the SD10 requires that a talkback microphone is routed from the console Local I/O or a MADiRack. Route this socket to the Talkback input in the **Setup>Talkback** panel on the Master screen.

Then route the talkback (TB Outputs) to the required sockets on the Local I/O or a DiGiCo Rack. There are 2 worksurface buttons that activate the talkback channels and route them to chosen outputs. The talkback level control is on the right hand section of the worksurface.

5.1.13 Meters

If the console's meters are not working in the required or expected way please check the Options Menu Meter tab on the Master screen - there are several meter configuration to choose from.

5.1.14 Console lighting

Various elements of the consoles lighting are controlled in 2 different places. On the worksurface at the top of the centre section there are rotary controls for the **touchscreen** brightness and the back panel light sockets. On the Master screen Options panel there is a **Brightness** tab where you will find controls for the **Meter LEDs**, the **LCD Displays** and the **Surface LEDs**.

5.1.15 Joystick not responding as expected

The centre section worksurface joystick can be used to control stereo panning if required. If a channel is assigned by touching it on the screen, the on screen pan position indicator will contain a vertical green line - this is the current position of the joystick. To adjust the pan, move the joystick until it meets the actual pan position and then the pan control will be "picked up" and be movable with the joystick.

5.1.16 Features not yet implemented

There are a number of controls on the SD10 which have not yet been implemented (at March 2011) - these are:

Dynamic Automation

Monitor Matrix section (only available with Broadcast software)

Speaker Select section (only available with Broadcast software)

Chapter 5 - Troubleshooting

5.1.17 Diagnostics

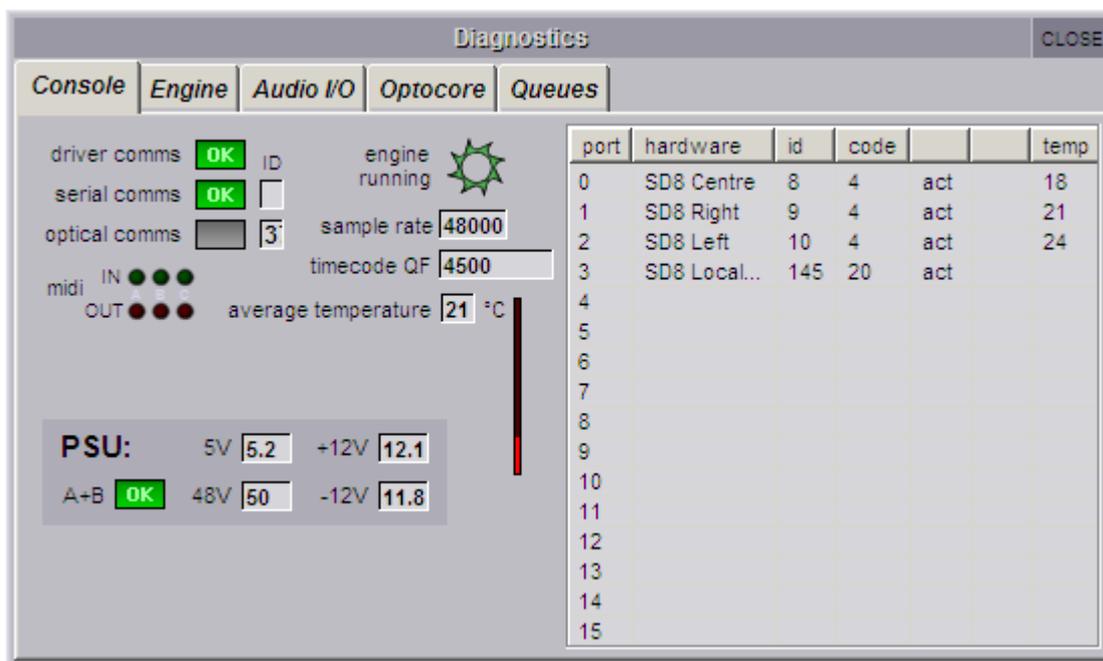

If you are experiencing any hardware problems with the SD10 you may be required to check the **System>Diagnostics** panels. Basic details of these are as follows:

To Open the Diagnostics Panel, touch System>Diagnostics.

The Panel that opens has 5 Tabs; Console, Engine, Audio I/O, Optocore & Queues

Console

The Console diagnostics provides information about the condition of the console hardware, including power supplies, the work-surfaces and local I/O connection, and other physical interfaces.

Significant Parameters in the Console Tab are :

Engine Running Pin Wheel : When the Engine is running, the Green Pin Wheel will turn continuously. If the Engine stops, the Pin Wheel will turn Red and will stop turning.

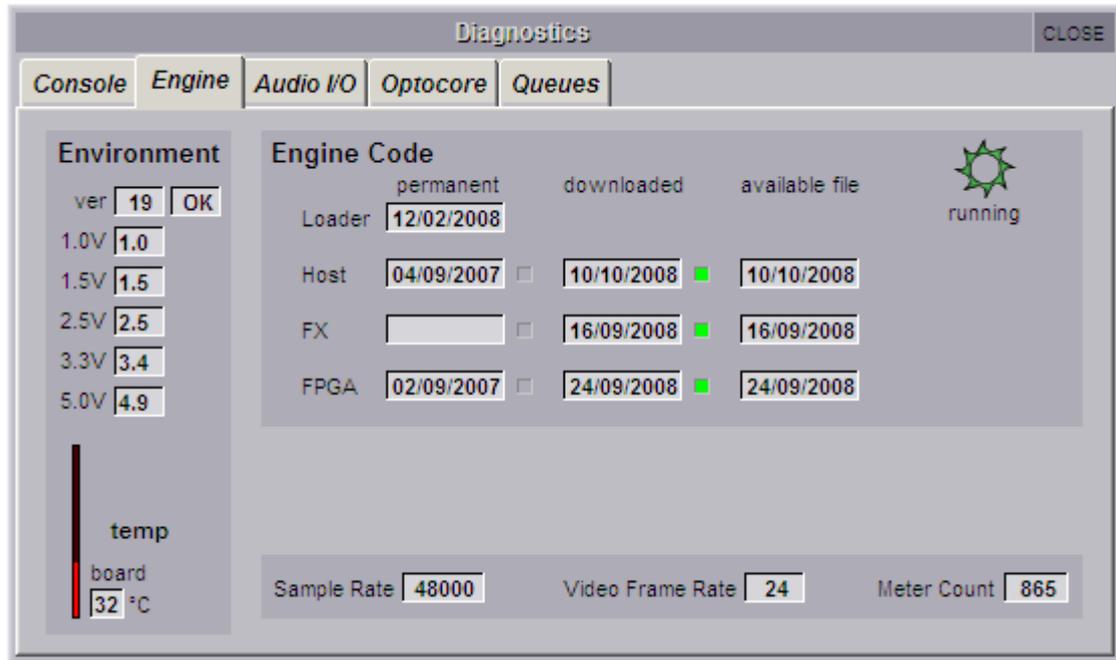

MIDI In / Out : These activity LEDS show MIDI activity on the physical Ports. If MIDI functions within the Console do not appear to be working correctly, it could be useful to monitor MIDI activity here.

PSU : The Power Supply Voltages displayed in the Console Diagnostics are measured on the Local I/O Board, and can help when diagnosing Power Supply problems. The A+B OK indicator shows that both power supplies are switched on. If one supply is switched off, the Green "OK" will be replaced by a Red "Err" indicator.

The right hand side of the Console Tab shows the Serial devices of the Console : The 3 worksurfaces and the Local I/O. For each port or device, the table shows hardware ID, Firmware Code Version and Temperature.

If one of the four serial devices is missing from the list, or not functioning correctly, then a hardware failure has occurred. *Contact your local DiGiCo dealer....*

Engine

The Engine diagnostics are split into two sections.

The Environment section displays the version of Engine Supervisor Code on the Engine Board. This can only be upgraded with a computer and a Microchip programmer. This is not user-upgradable.

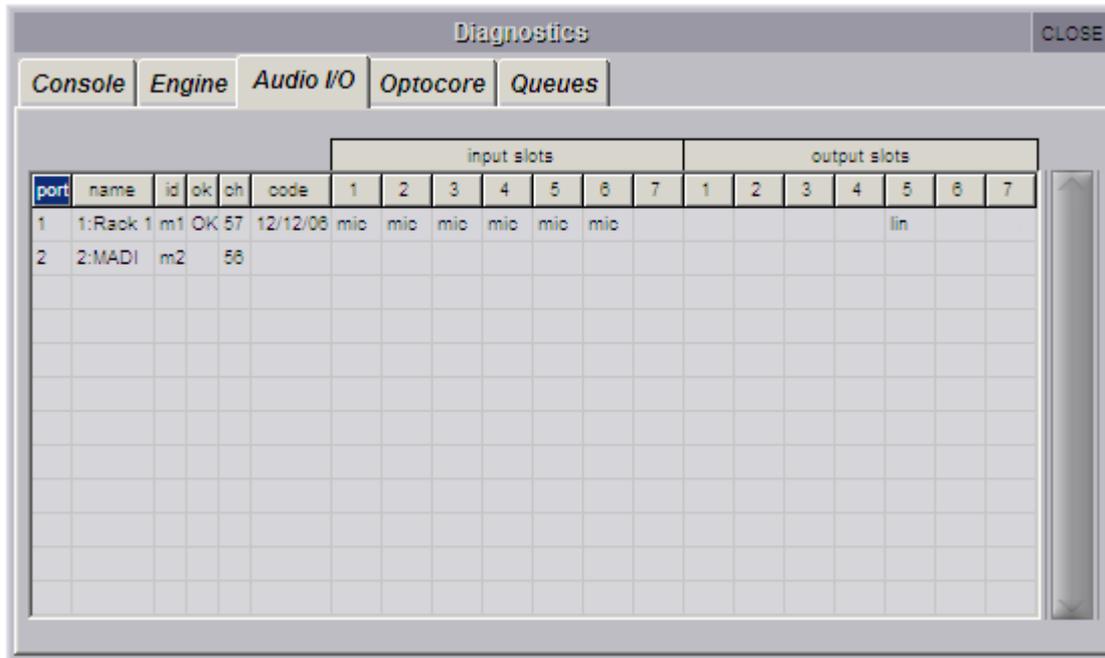

It also shows Power Supply measurements on the Engine Board. These will be displayed as numerical values. If you have a faulty power supply, or a fault on the Engine Board, these values may show as LO. If this is the case, contact your DigiCo dealer for assistance.

The Engine Code section of the Engine tab displays the release dates of Host Code, FX Code and FPGA Code in the Engine. These codes are written into hardware.

The "downloaded" column will show the dates of the code that the console is actually running. Following a software upgrade, the "available file" dates may be newer than the "downloaded" dates, and if this is the case, you should update your console.

At the bottom of the Engine diagnostics tab, the Sample Rate, Video Frame Rate and Meter Count are displayed. The values here are to assist authorised DiGiCo service partners in locating the cause of specific faults, and have no other practical use.

Audio I/O

The screenshot shows a software window titled "Diagnostics" with a "CLOSE" button in the top right corner. Below the title bar are five tabs: "Console", "Engine", "Audio I/O", "Optocore", and "Queues". The "Audio I/O" tab is selected. The main content area contains a table with columns for "port", "name", "id", "ok", "ch", "code", and two groups of "input slots" (1-7) and "output slots" (1-7). The table contains two rows of data.

port	name	id	ok	ch	code	input slots							output slots											
						1	2	3	4	5	6	7	1	2	3	4	5	6	7					
1	1:Rack 1	m1	OK	57	12/12/06	mic	mic	mic	mic	mic	mic							lin						
2	2:MADI	m2		58																				

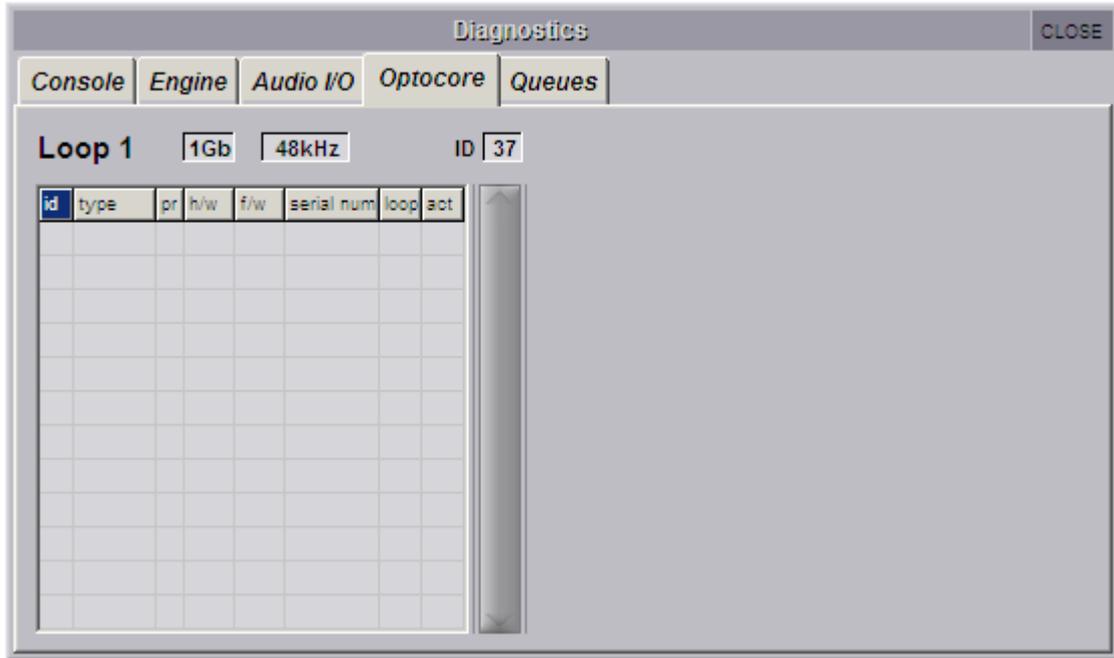

The Audio I/O tab provides detailed information about the DiGiCo Racks connected to the console.

The SD10 has two MADI ports. For each port, detailed information regarding the configuration of the attached rack is provided. This can be used to track hardware issues, and configuration problems.

In the above example, we can see that Port 1, defined as a Rack, is connected to a rack that is configured with 48 Mic Inputs (6 “cards” of 8 inputs) and a single output card in the first of the Rack’s output slots. The last 2 slots are empty. It also shows us that the Firmware Code on the rack is dated 12/12/06. The above picture also shows that the second MADI port is configured as a Standard MADI connection, and therefore no rack configuration data is displayed.

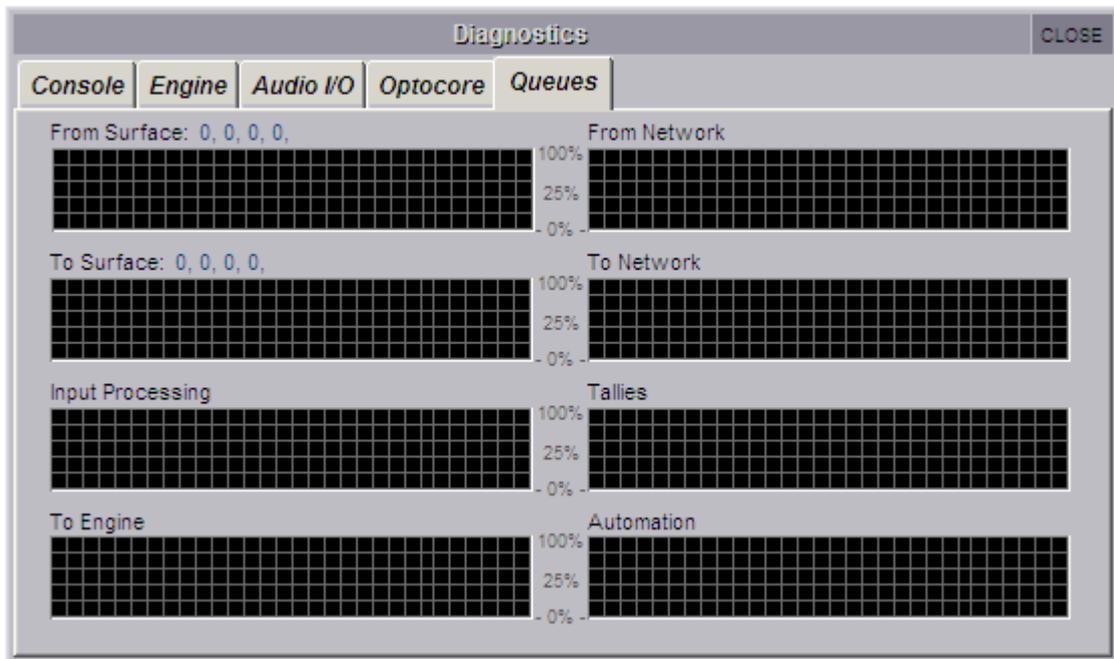

If you are having trouble with specific cards or sockets on the connected rack, or the Audio I/O Panel does not seem to reflect the correct contents of the rack, then the Audio I/O diagnostics can be used to monitor the status of the rack, which cards are installed, and firmware code versions for the connected racks.

Optocore

When Optocore is implemented on the SD10, the Optocore diagnostics will provide details of all the optocore devices connected, including type and loop status. More information on SD10 Optocore is provided in the Optocore V221 User Guide.

Queues

In normal operation the Queues tab will not show any major activity.
