Introduction

SpotOn is a utility that can playout WAV, MP2, MP3, AIF and WMA format audio files from either touchscreen, keyboard, mouse or external trigger.

The main screen is shown below with the default setting of 64 buttons and 5 pages giving a total 320 buttons, initially all the buttons will be coloured dark green indicating an unassigned button.

Once loaded the button will change colour from green to blue and display the track name and duration, the colour and text can be changed later to something more appropriate.

Some of the main features of SpotOn: -

- Simple playout from mouse click or keyboard hot keys
- Audio output can be directed to any of the installed sound cards
- Customisable screen layout ranging from 1 to 160 buttons per page
- Button text and colour fully editable
- Audio gain, pan and speed adjustable
- Midi note input and output triggers available
- GPI input triggering
- Audio start and end points can be edited
- Buttons can be set to loop audio track
- Juke box style of playout with spacebar playing next track
- Fade In and Out options available
- Any number of tracks can be played simultaneously

- Uses WAV file Playlist data
- Comprehensive master/slave linking of buttons
- 5.1 surround sound capable
- ...

Installation

Installation 1

The SpotOn package is supplied in a single file: -

SetUp.exe (Windows installer)

To install - insert the SpotOn CD into drive and the install process should begin automatically, if not navigate to the root directory of the CD drive and run the file SetUp.exe

When installation is complete SpotOn will appear as a shortcut Icon on the Windows Desktop.

Use the Control Panel 'Add/Remove Programs' utility to remove or update the SpotOn package.

SpotOn requires an external security key (dongle) before it will run, see activationsection for details.

The minimum requirements for running the application are: -

Operating System	Windows XP Professional recommended, Vista and Windows 7 compatible
Installed RAM	1024MB
Software	Microsoft DirectX version 9
Sound Card/s	Fully Microsoft DirectSound compatible with WDM drivers

File types used by SpotOn

*.dta	Session data - binary
*.pkg	Package - binary
*.txt	Track List and logs - tab delimited text
*.csv	Track List - comma delimited text
*.blk	Button Block - binary
*.tcl	Timecode Trigger List- binary
*.ctp	Button colour template - binary
*.stf	Play Stack file - binary

SpotOn data folders under ..\Documents and Settings\All Users\Application Data\Serialtech\SpotOn\

BackUp	BackUp session files
Debug	Debug files
Event Logs	Daily logs of significant events for fault diagnosis (EventLog_ddmmyy.txt)
Local	Copies of audio files loaded from remote or removable drives
Playout Logs (text)	Daily logs of tracks played in plain text (PlayLog_ddmmyy.txt)
Playout Logs (XML)	Daily logs of tracks played in XML format (PlayLog_ddmmyy.xml)
Recent	Links to recently used audio files
Temp	Temporary files

SpotOn system files under ..\Documents and Settings\All Users\Application Data\Serialtech\SpotOn\

~temp.dta	Session saved/loaded when SpotOn exits/runs
BackUp\~backup_X.dta	BackUp sessions
BackUp\~statuslog_X.txt	Status log files
Recent*.lnk	Recent file list

The above are default folder locations for the files, some folders can be changed via Admin|File Folders menu option.

SpotOn system folders under ..\Program Files\Serialtech\SpotOn\

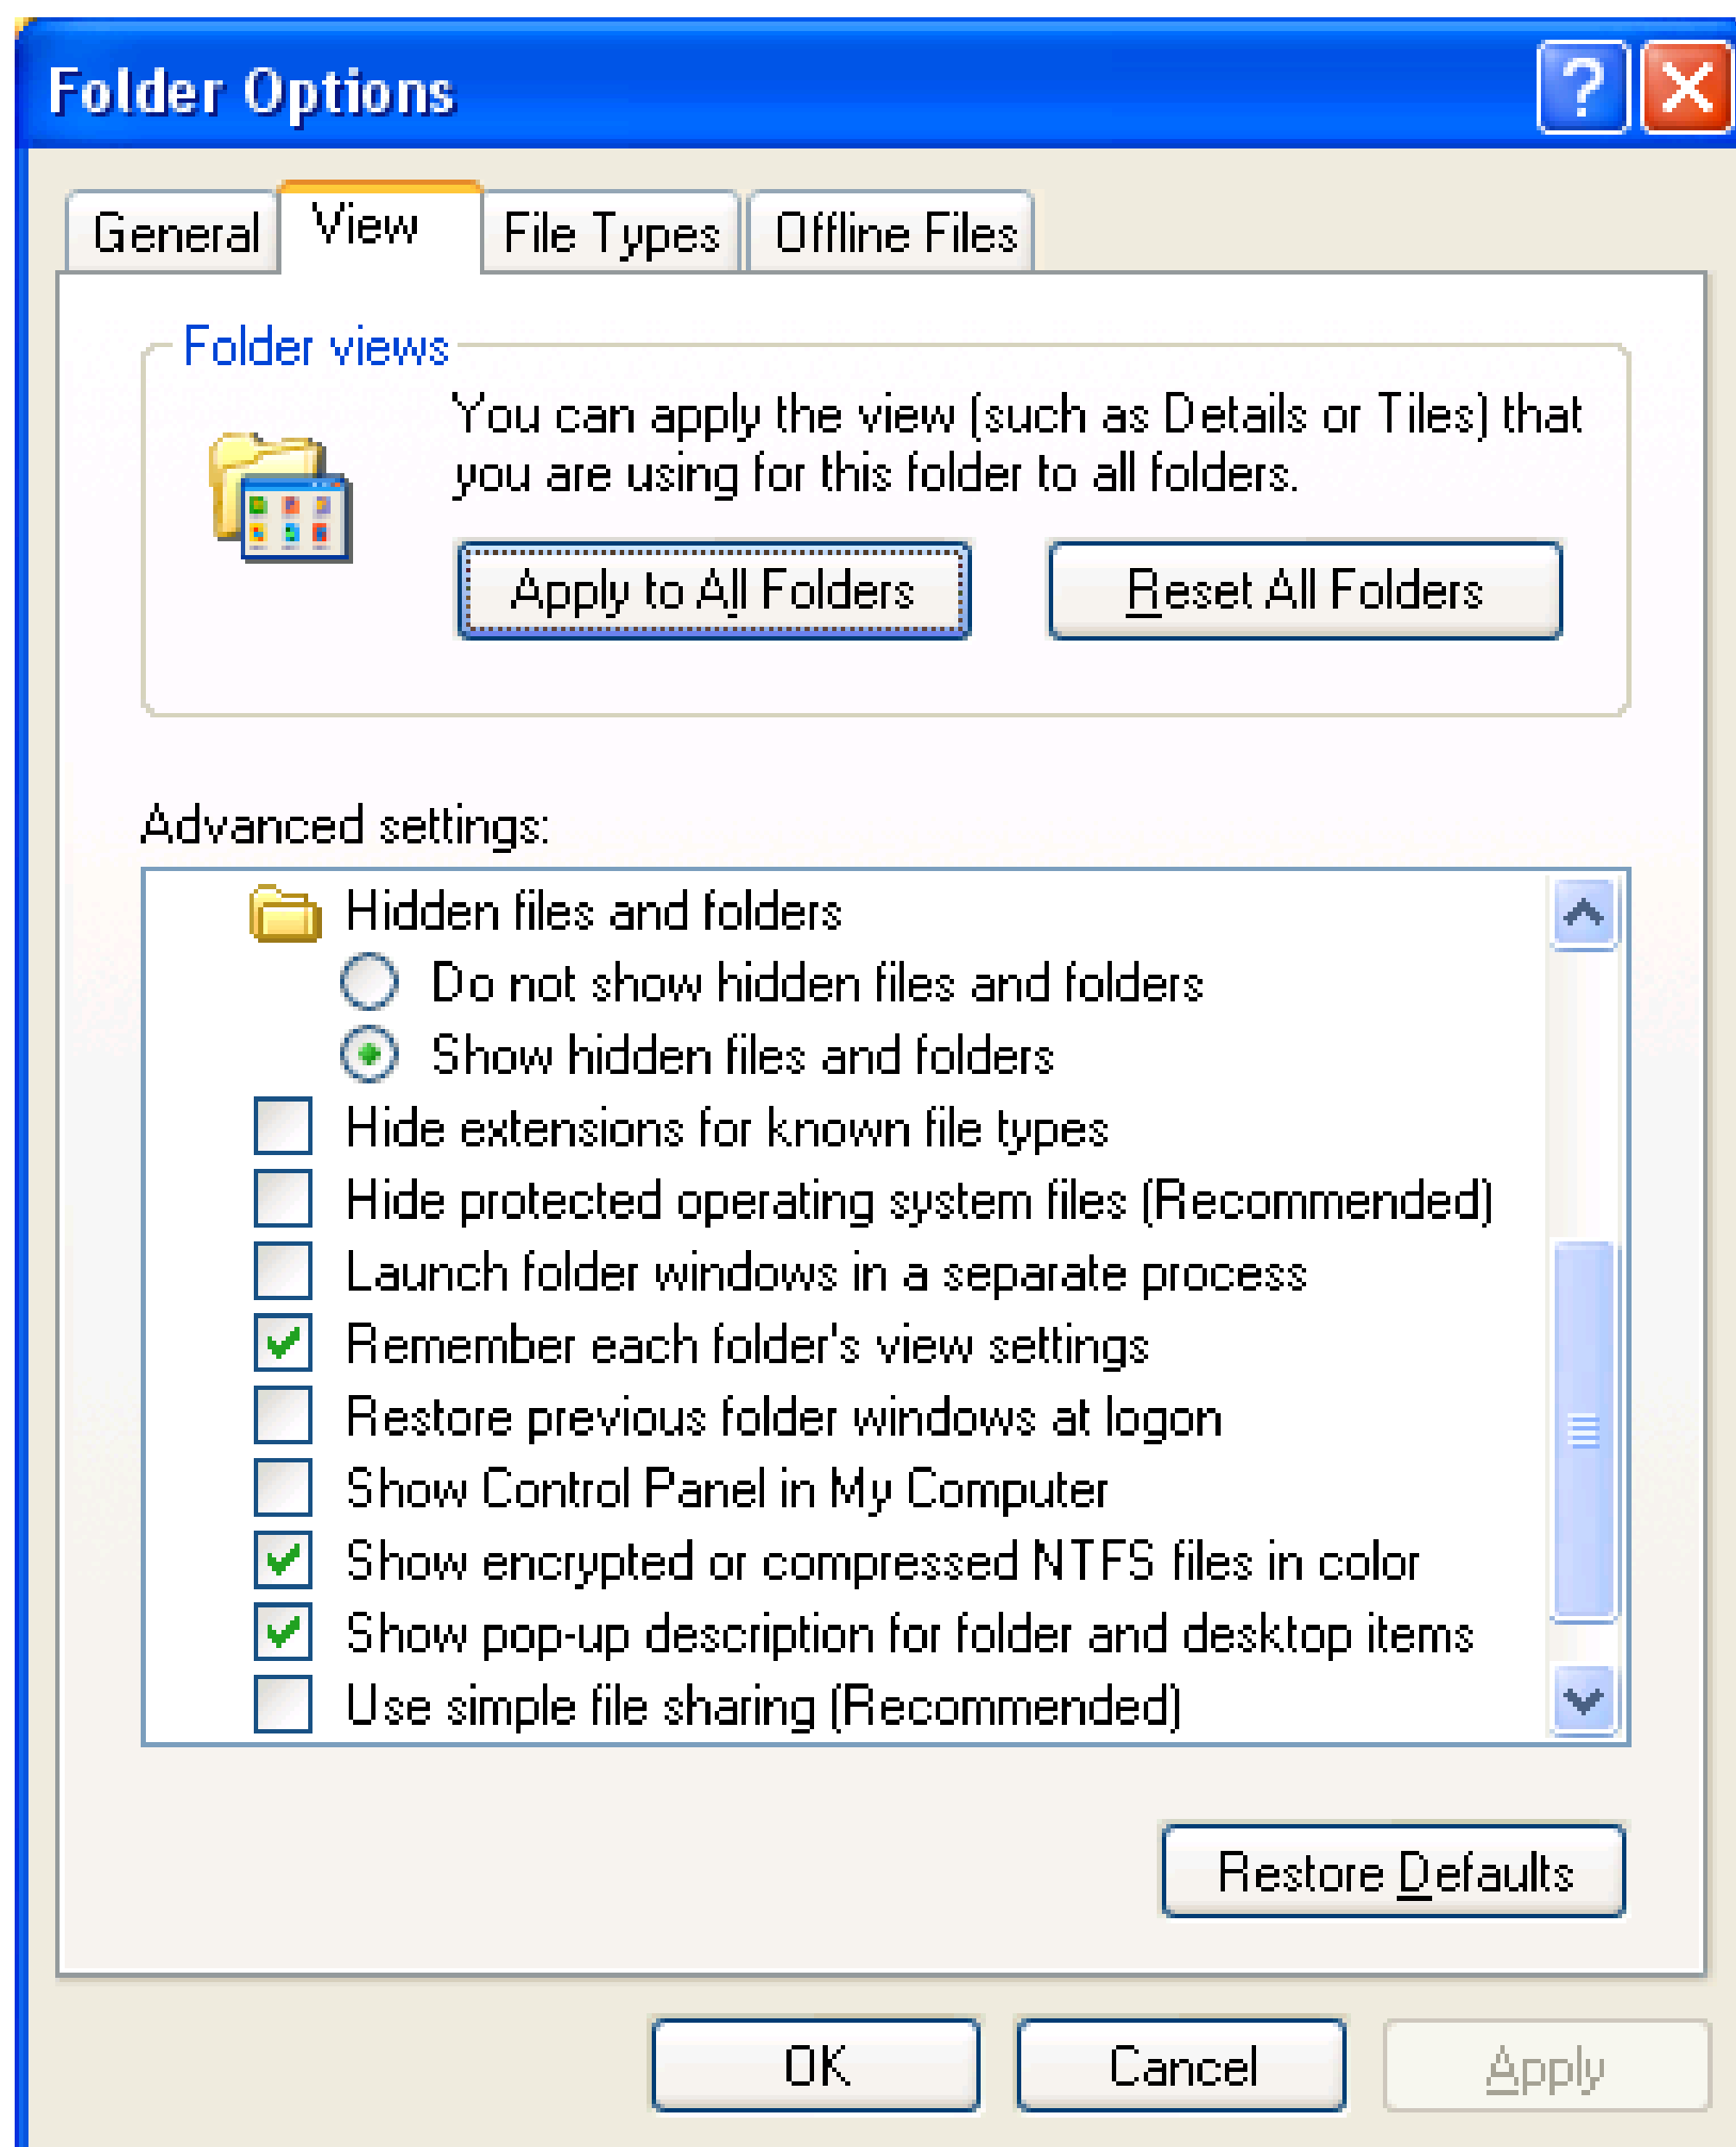

Archive	Previous version of SpotOn
Web	Web server files
Images	Sample button image files
TestFiles	Test files - sine wave tones, silence and sample frequency tests

Folder Access Rights

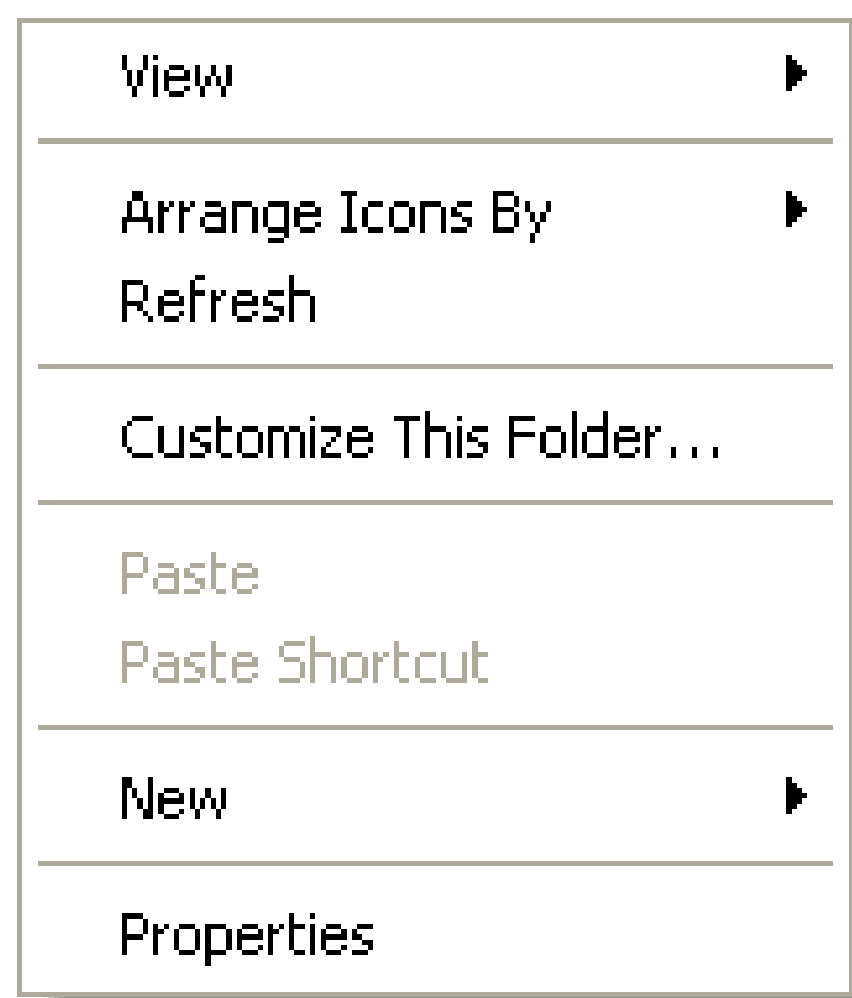

In some installations the Windows user account is based on a 'Restricted User' profile and this will not allow sufficient access rights to the Application Data folder. SpotOn will make an attempt at testing the access rights and show an error box if it detects a problem.

To set the access rights for the SpotOn Application Data folders: -

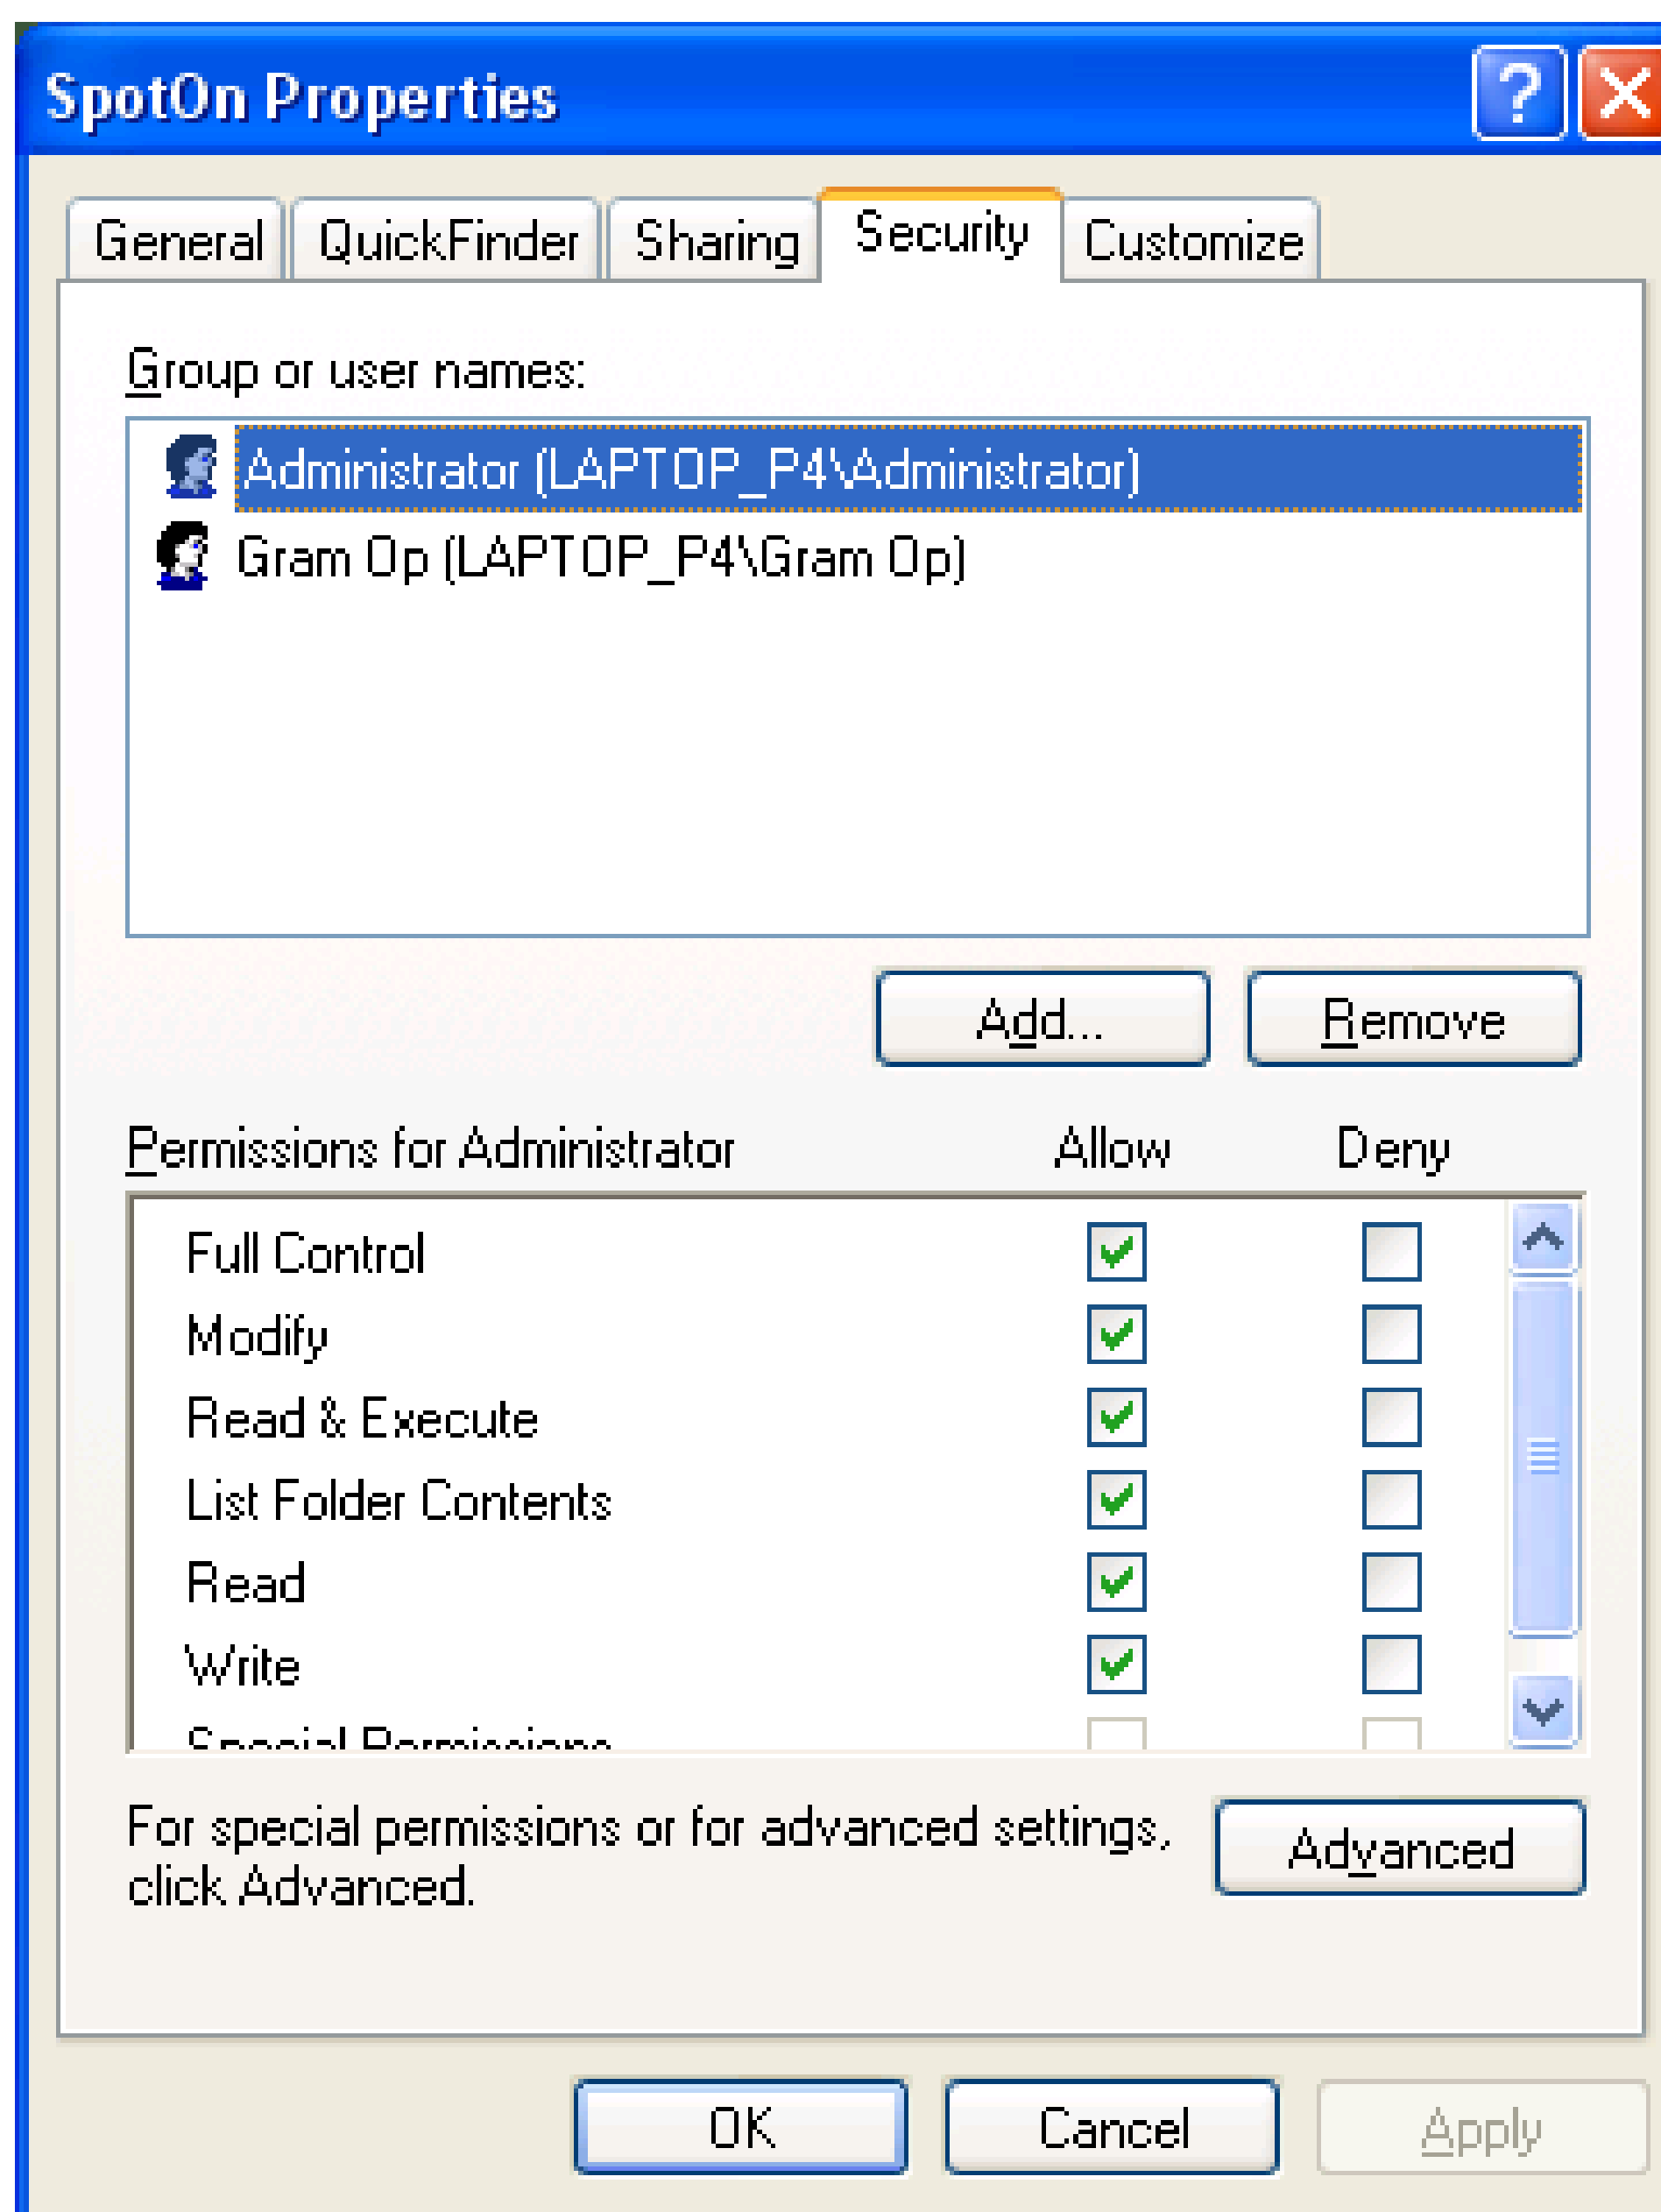

- 1, log on as Administrator
- 2, in Windows Explorer navigate to ..\Documents and Settings\All Users\Application Data\Serialtech\SpotOn\
- 3, if the Application Data folder is hidden use the Windows Explorer menu item 'Tools|Folder Options|View|Show Hidden Files and Folders'
- 4, in Windows Explorer uncheck menu item 'Use simple file sharing...' usually found at the bottom of the list

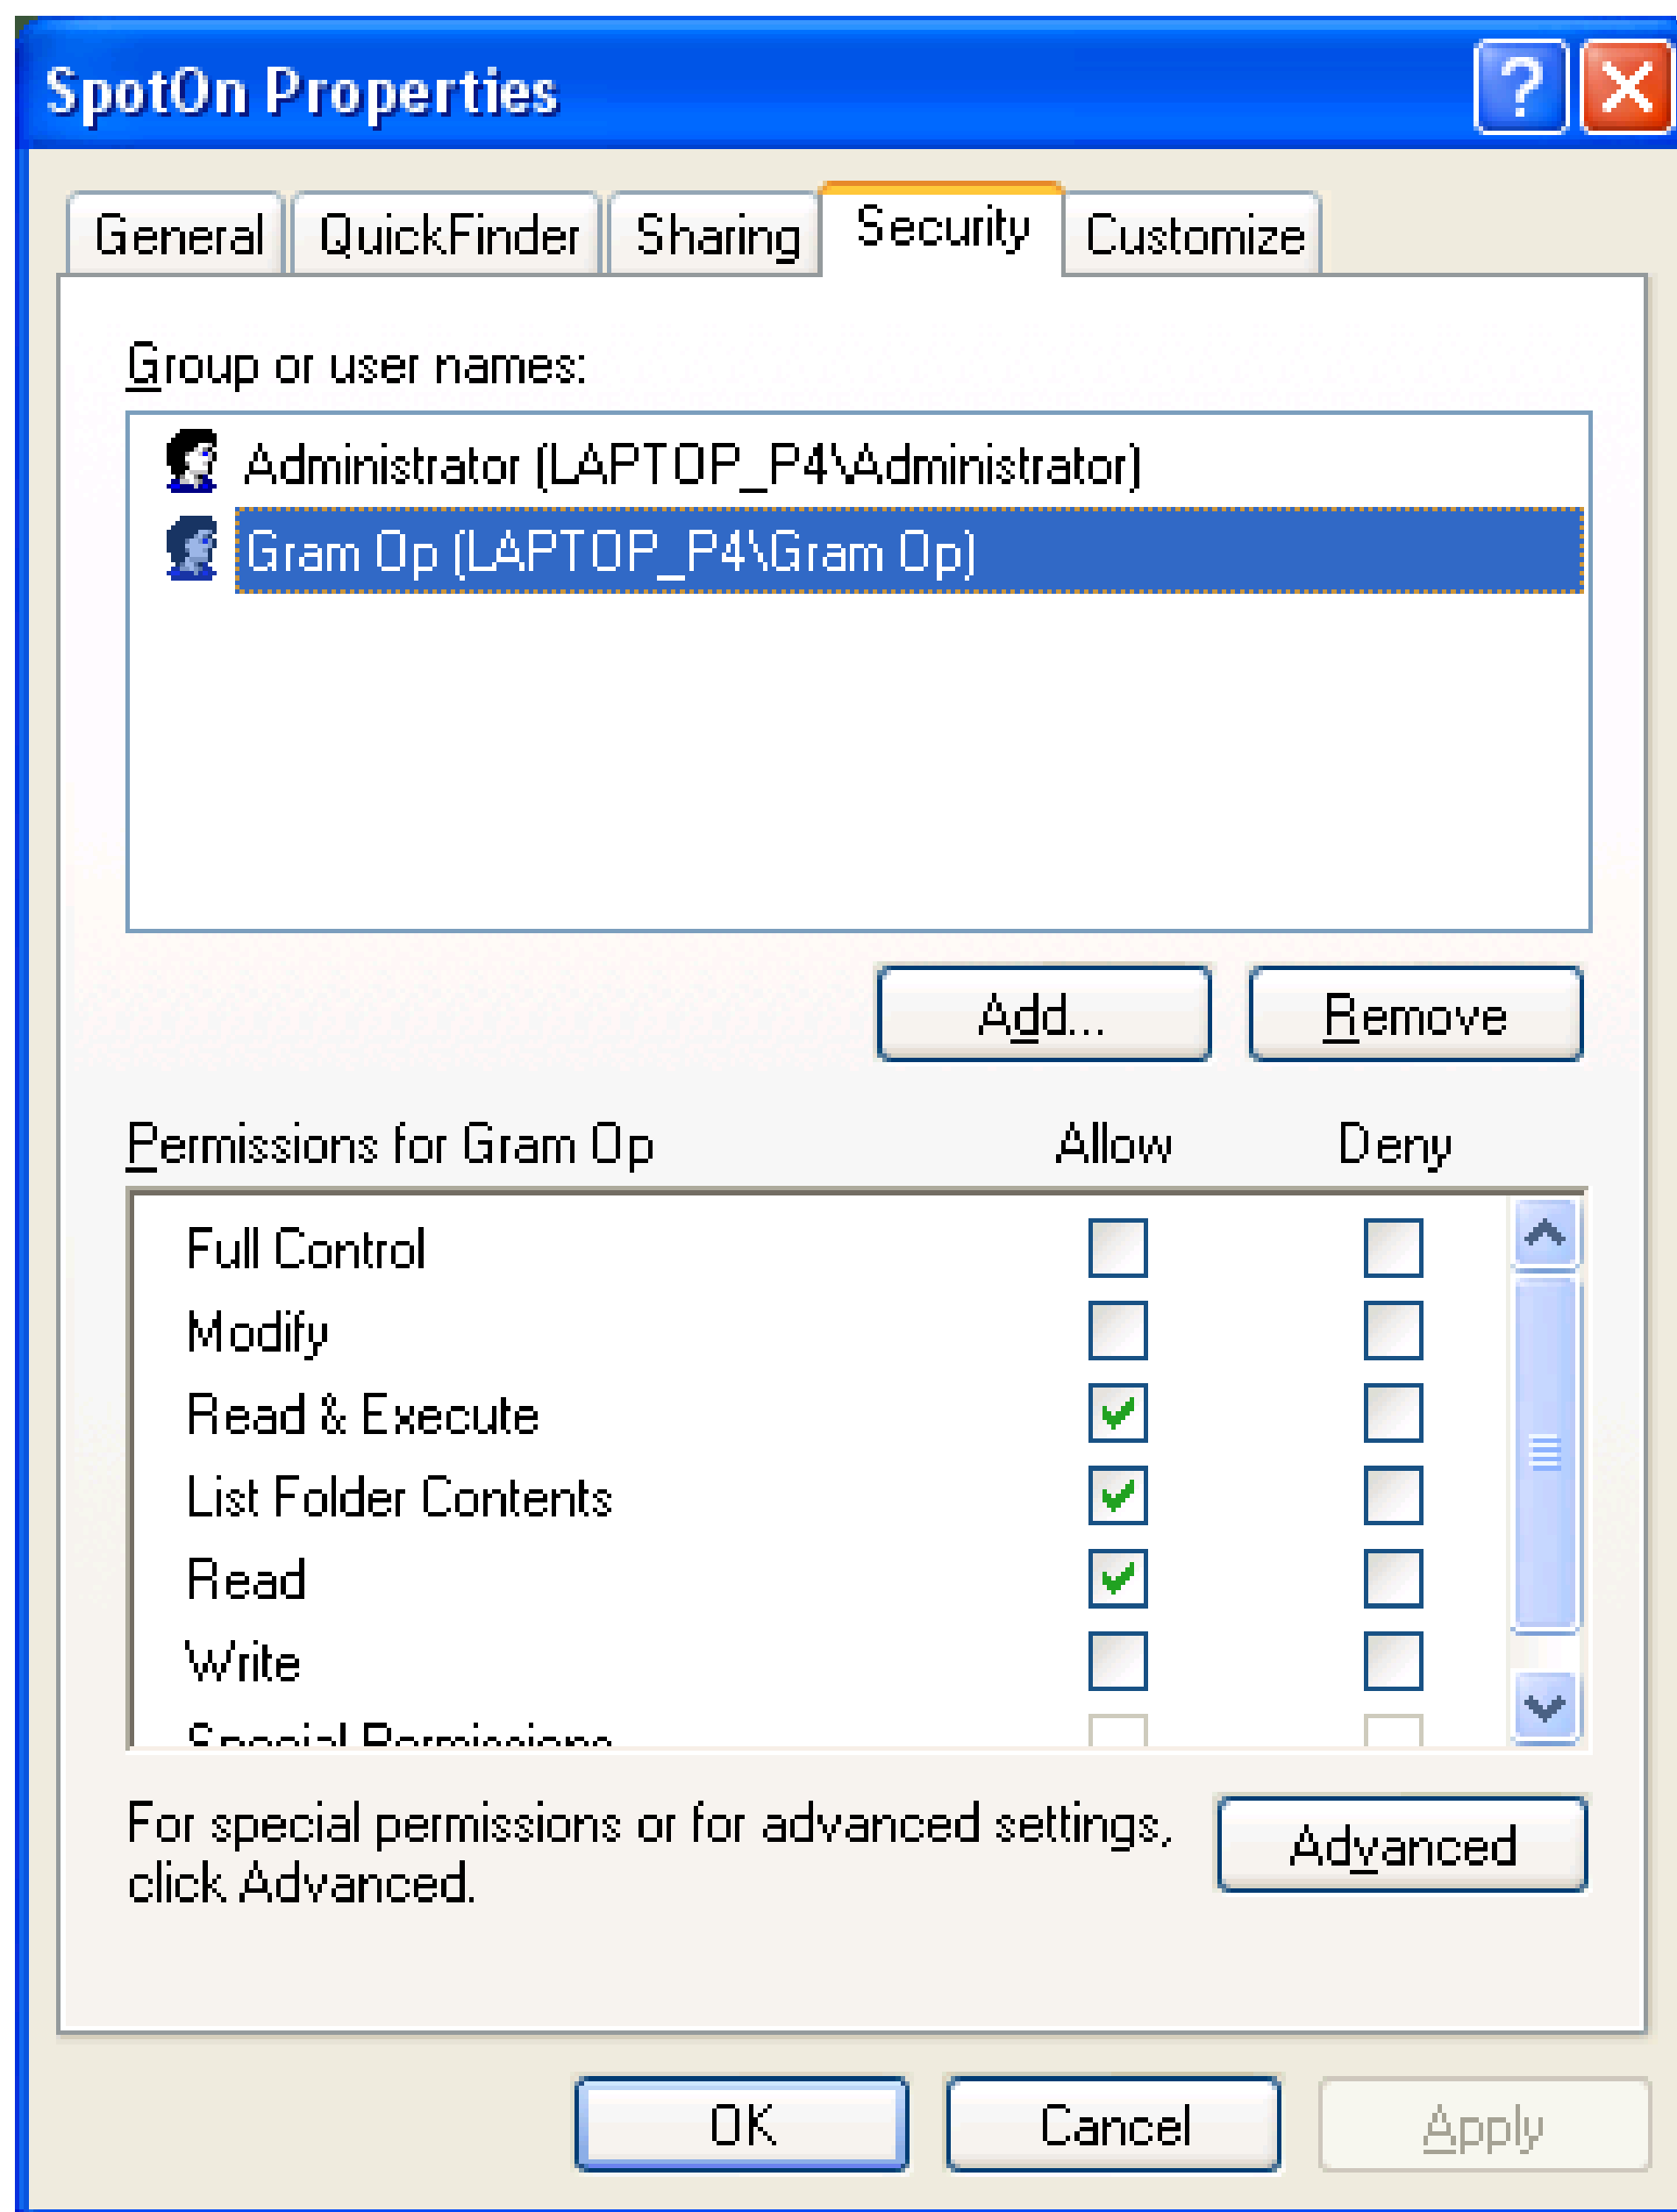

- 5, apply the changes
- 6, right-click in the right hand file pane of the folder display and select properties

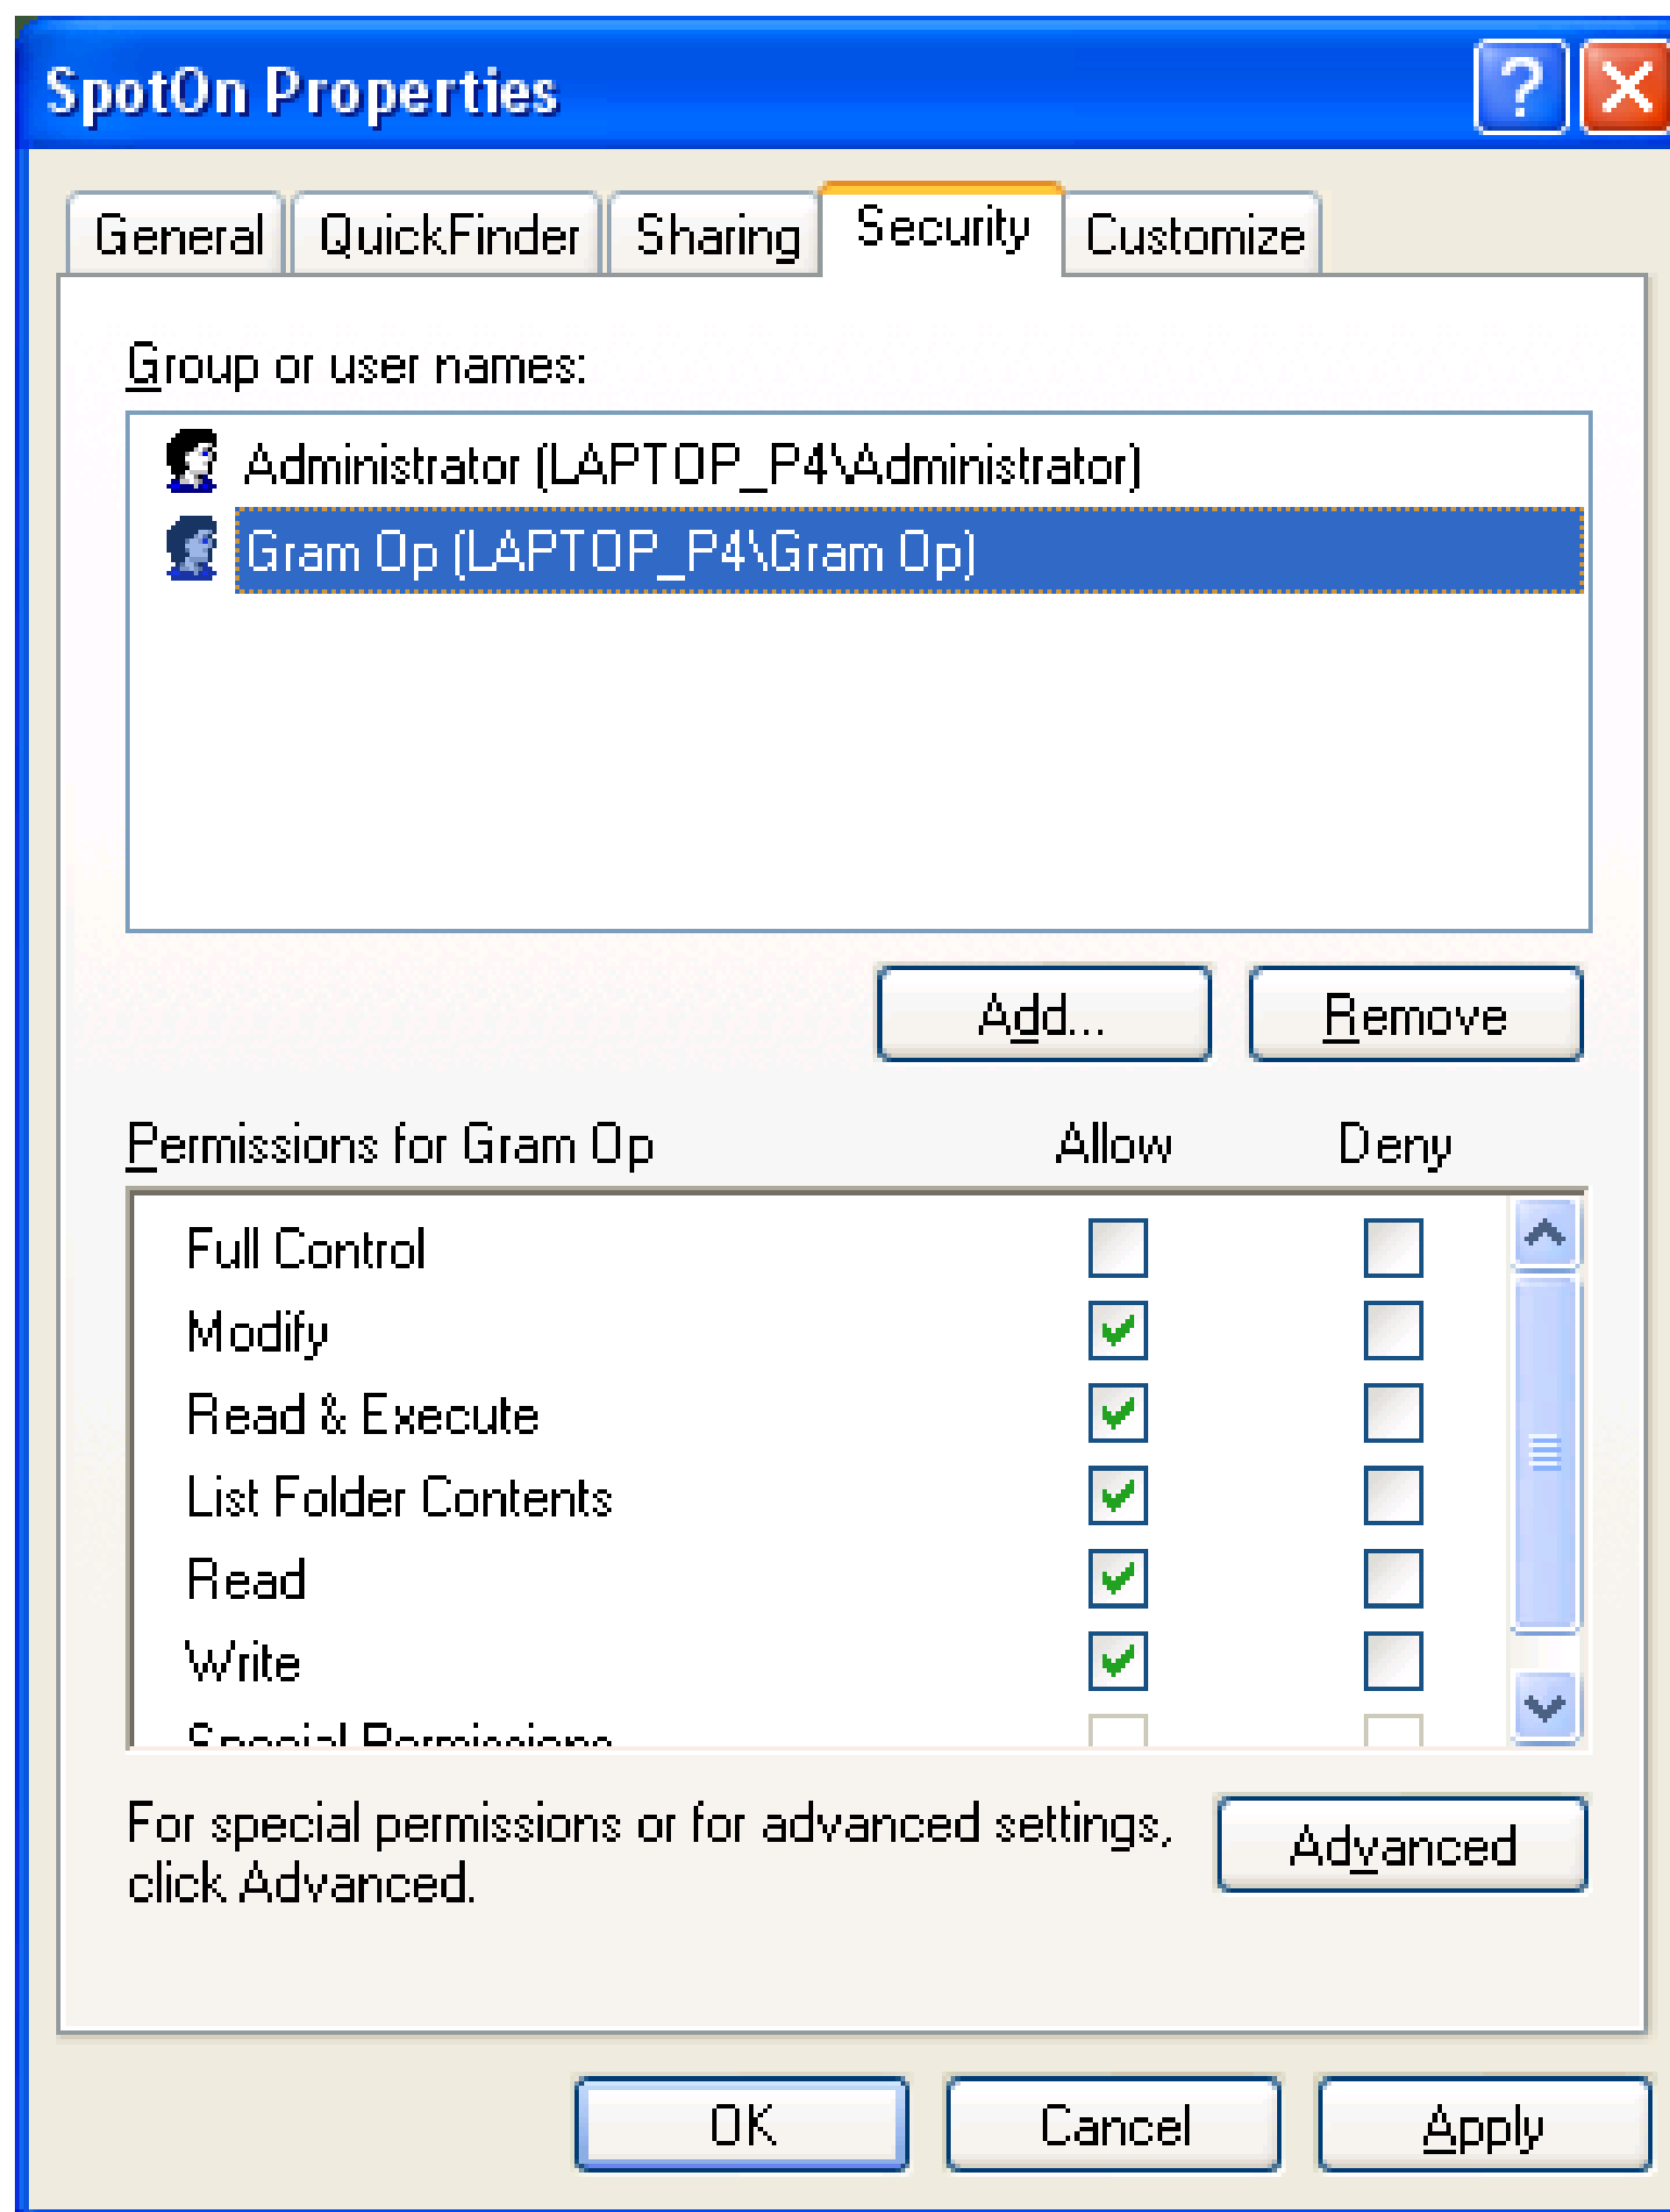

- 7, select the Security tab and the Administrator user, the permissions should be 'Full Control as shown below

- 8, select the user that will be operating SpotOn, if the user account has been derived from a 'Restricted User' profile then the access rights will be as below, which does not grant Write permissions

- 9, if necessary change the access rights by checking the 'Modify' checkbox to grant read/write access

10, click on Apply to save changes

Installation 2

Installation 2

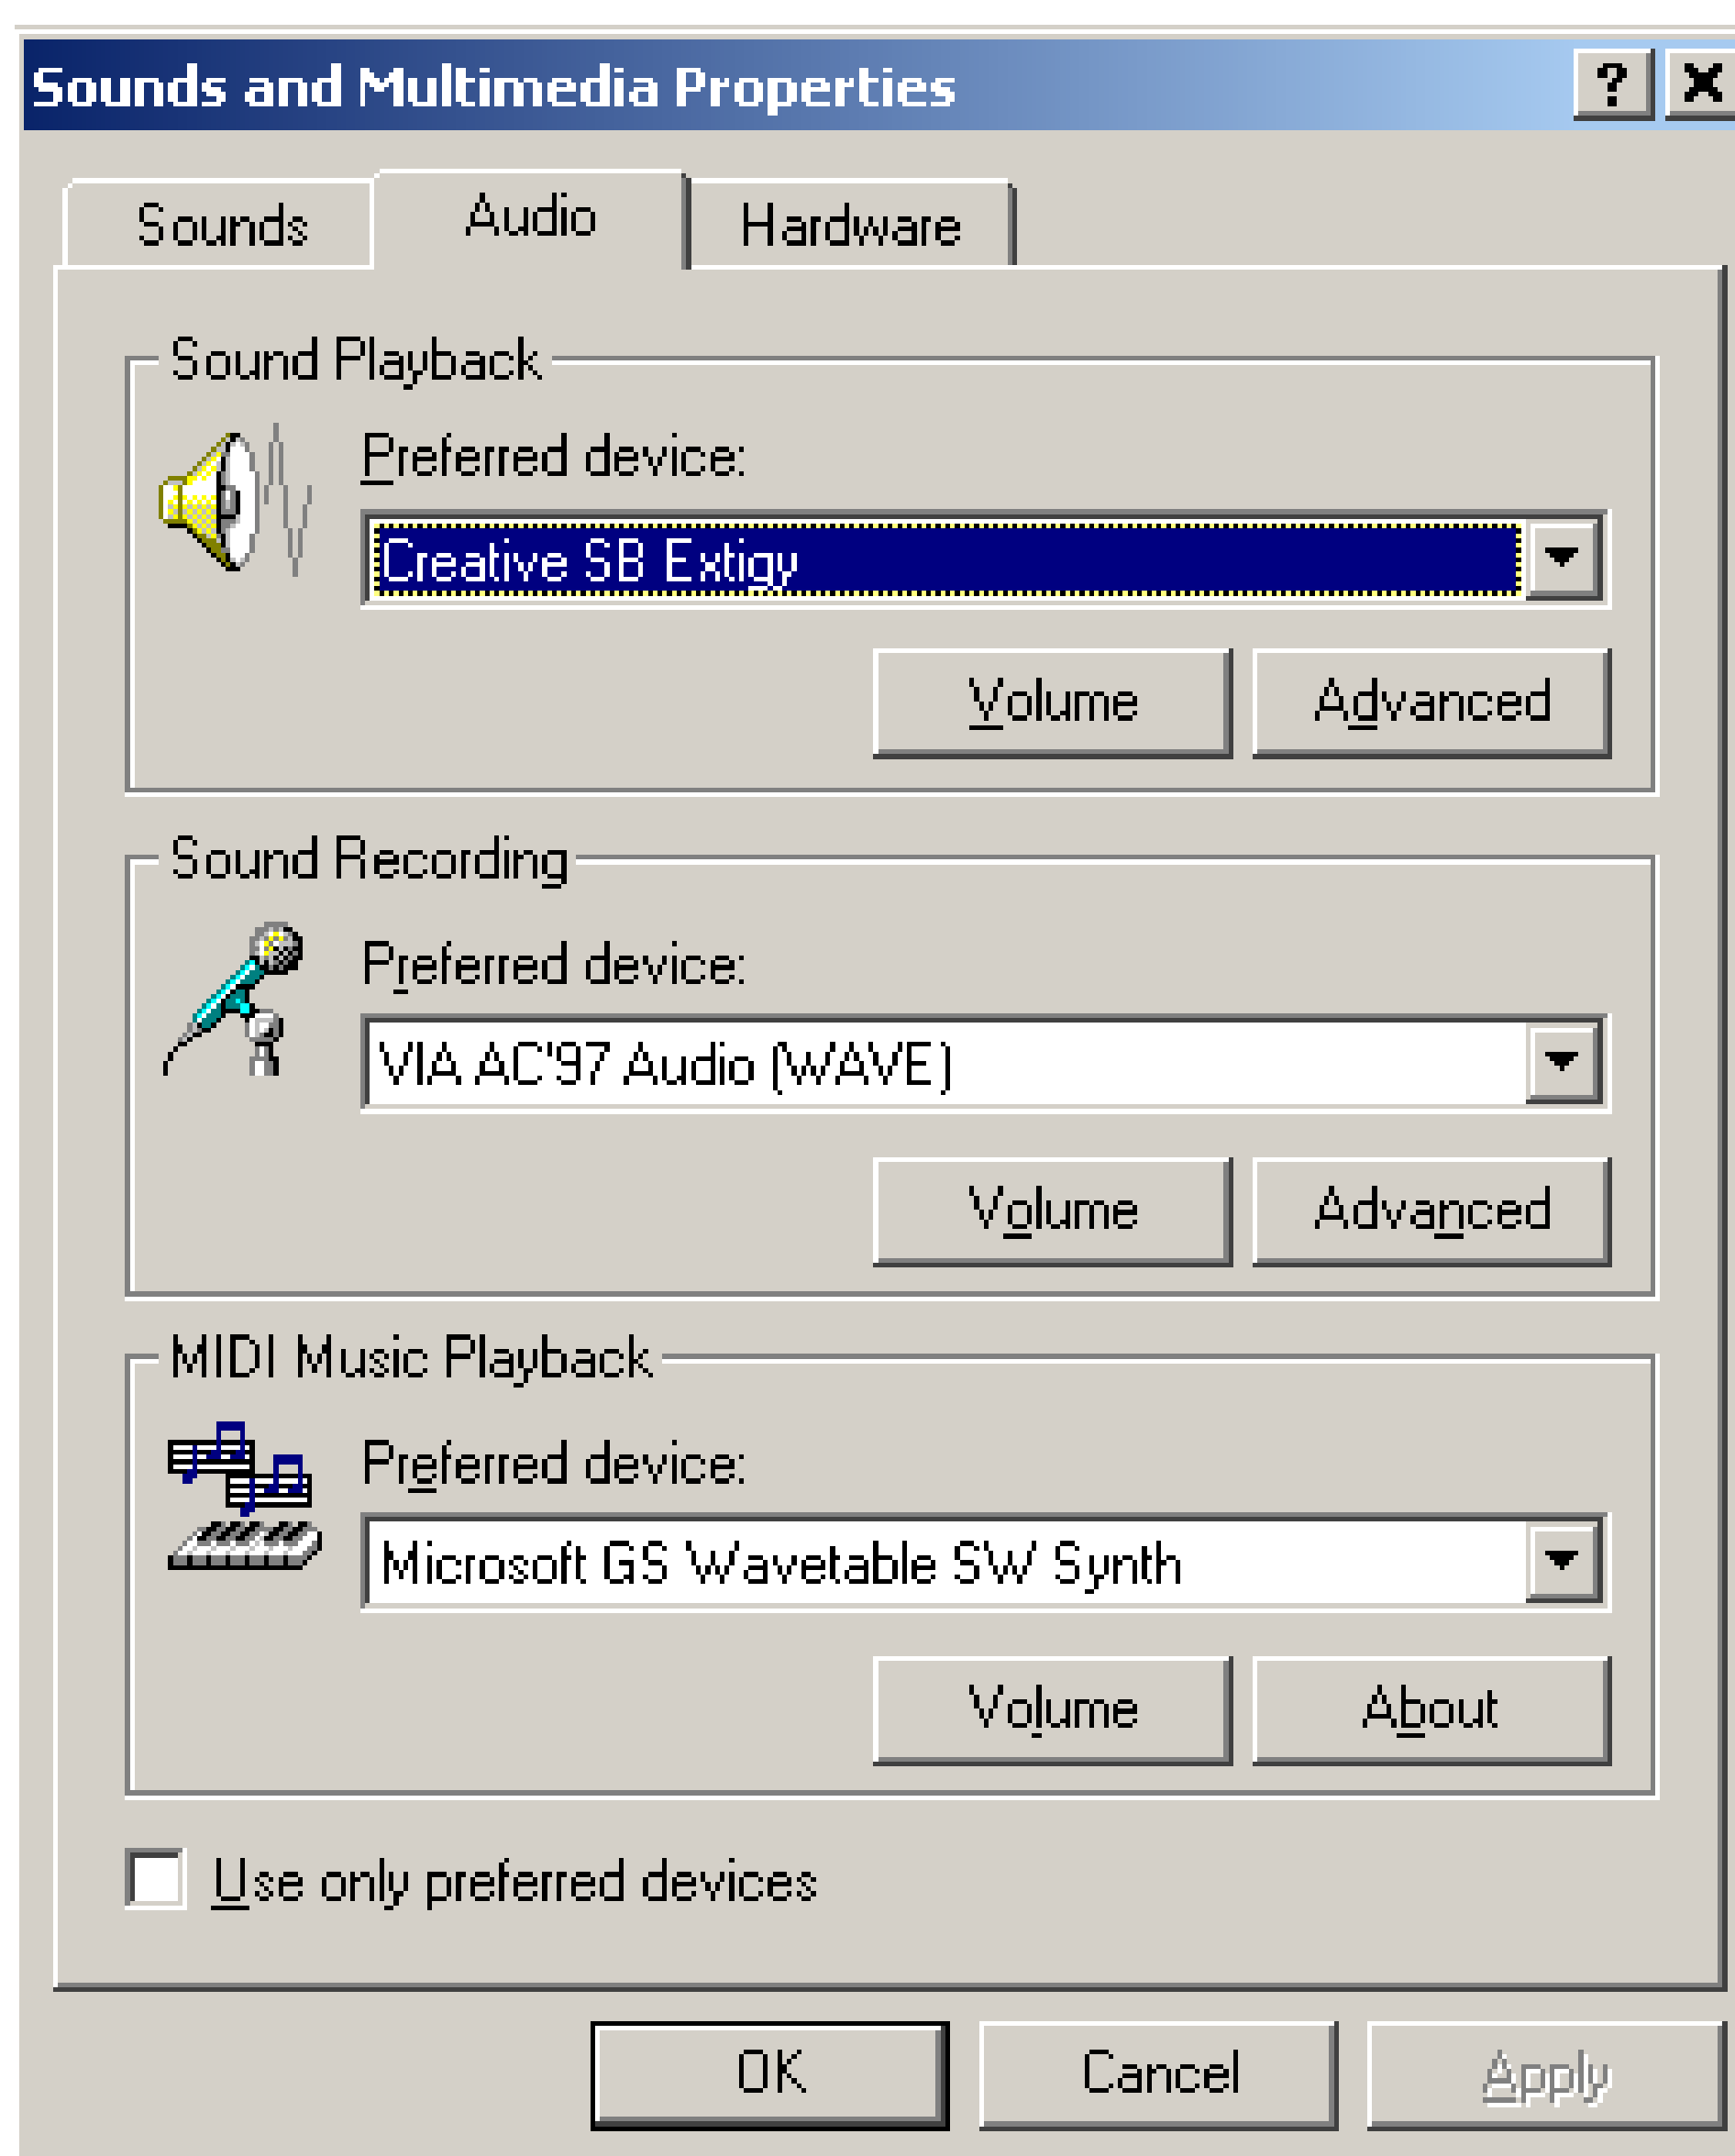

Sound Playback Preferred Device

When SpotOn is used on a single PC by several operators each with their own log-on, it is essential that the Sound Playback Preferred Device is the same for each user.

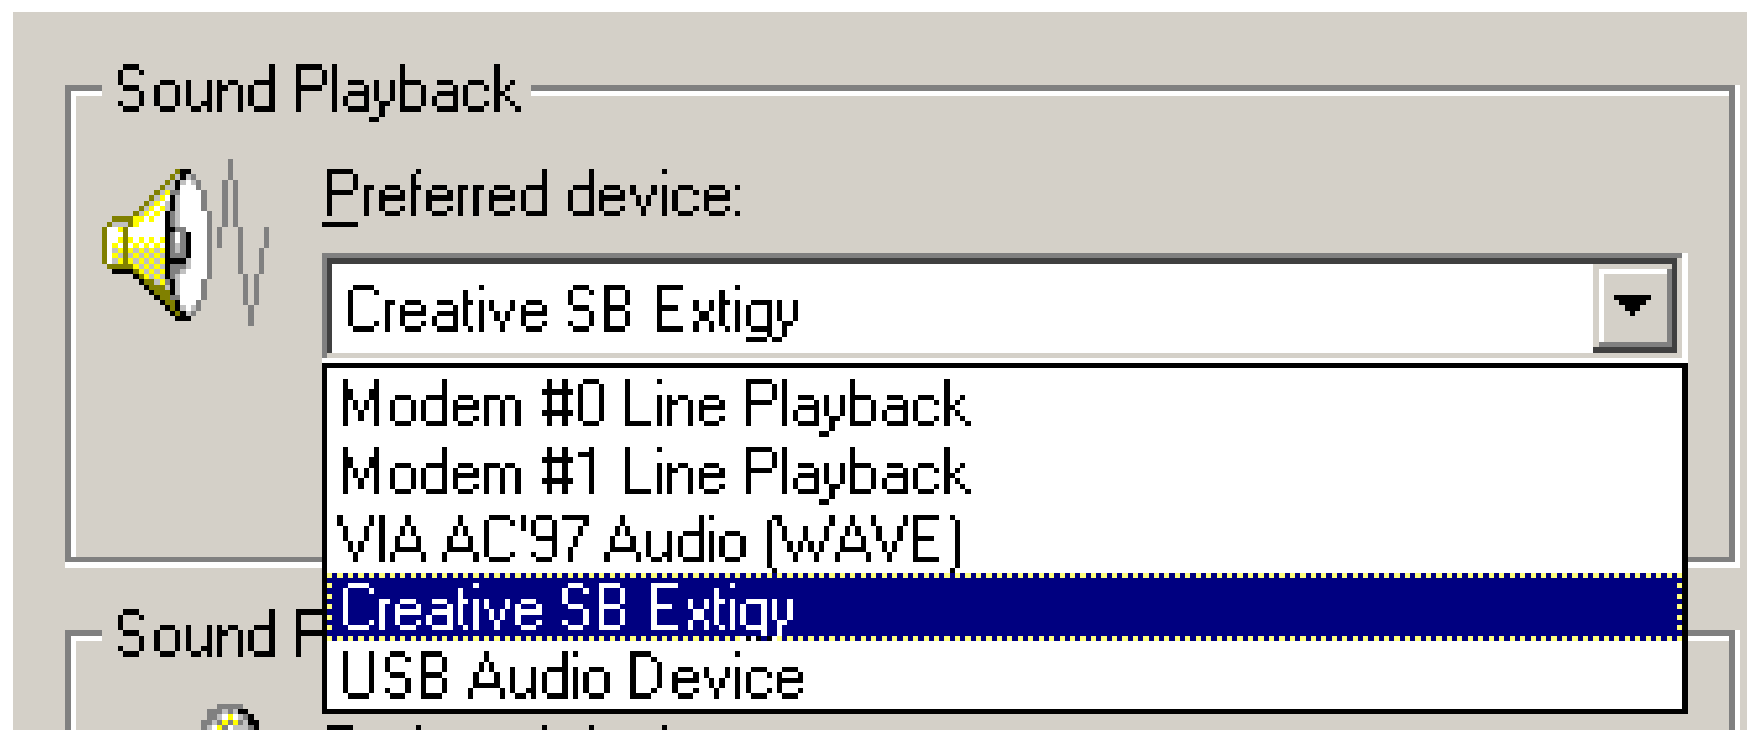

The Sound Playback Preferred Device is defined via the Windows Control Panel under the Sounds and Multimedia section.

Select the Audio tab

and then choose the required audio output device from the dropdown list

Power Management

Windows XP computers have a sophisticated power management system that can get in the way of the SpotOn application, therefore it is recommended that the following settings be made.

In the Windows Control panel, select the Power Options icon and then the first tab named Power Schemes.

Choose the 'Always On' scheme, which should have the settings shown below with the Monitor powering down after an hour of inactivity and the hard disk continuously running and standby mode disabled

Power Options

Power Options Properties

Power Schemes Advanced Hibernate UPS

Select the power scheme with the most appropriate settings for this computer. Note that changing the settings below will modify the selected scheme.

Power schemes

Always On

Settings for Always On power scheme

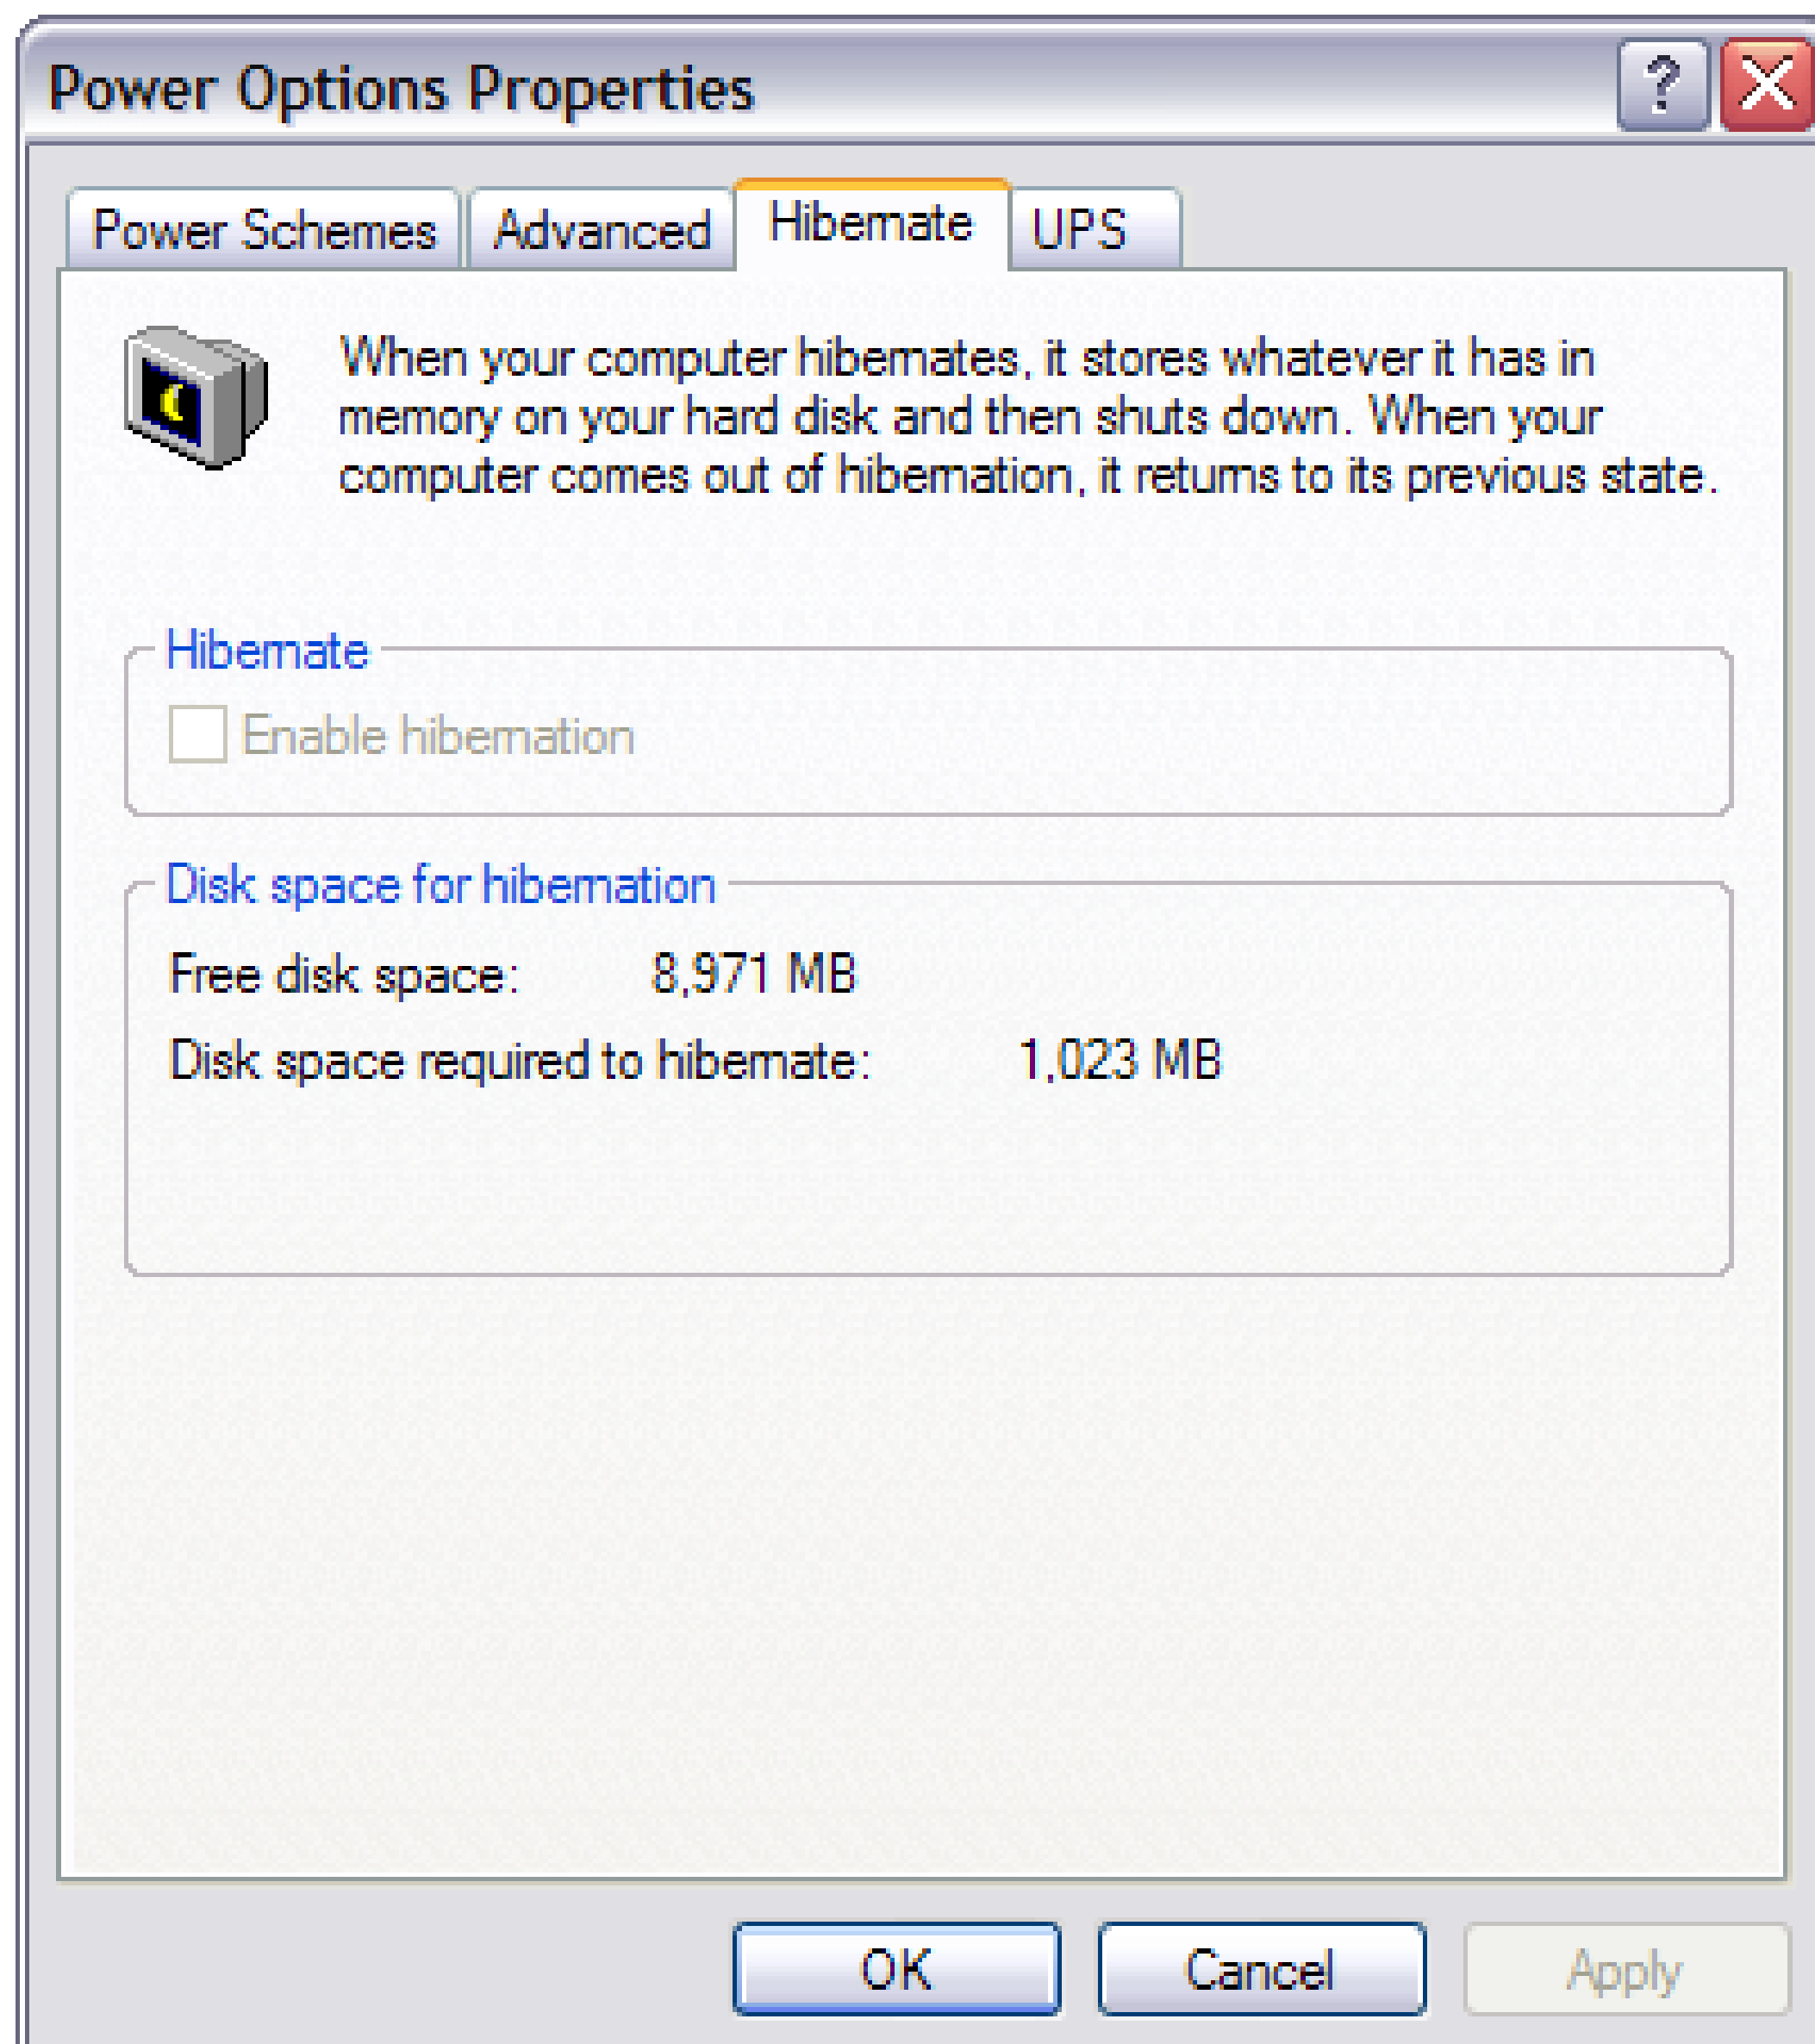

Turn off monitor: After 1 hour

Turn off hard disks: Never

System standby: Never

OK Cancel Apply

Also a very important setting to check can be found on the Hibernate tab, when running SpotOn the computer must not be allowed to enter its Hibernate mode, so the 'Enable Hibernation' option must be unchecked.

CPU Usage

SpotOn does not require a large amount of CPU time, but it does require continued and regular amounts of CPU time in order to update the sound card buffers.

There are some programs that take more than their fair share of CPU time and these might cause problems when running with SpotOn, the effect would be gaps in the audio output.

However looking on the bright side, under tests SpotOn can play out tracks without problems whilst a virus scanner is checking the hard disk and using 97% of the CPU time cooperatively.

Hard Disk Drives

As the audio information is read from continuously from disk, the speed or rather the seek time of the hard disk drive is important, therefore SCSI, fast IDE or SATA drives are recommended, large disk caches also boost performance. The audio data should preferably be stored on a non-system disk so separating the operating system from the data storage area. Regular defragmentation of the data storage disks will improve performance.

Microsoft DirectX

The Microsoft Windows operating system has a subsection named DirectX, the utilities contained in this are concerned with MultiMedia functions.

DirectX is split into various sections such as DirectShow (graphics), DirectInput (game controllers) and DirectSound (audio), SpotOn makes extensive use of the DirectSound functions.

Within DirectSound are drivers to handle the interface to the hardware of the 'sound card', the most common type of interfaces are 'WAVE' and 'WDM' (Windows Device Model).

'WAVE' is based on old technology and could be regarded as a legacy interface, the more modern 'WDM' interface is the one that allows Microsoft DirectX/DirectSound full access to the sound card.

SpotOn relies on the 'WDM' interface to operate correctly.

So any sound card chosen to be used with SpotOn should show in the manufacturers data sheet references to full DirectX/DirectSound 'WDM' driver compatibility, if in doubt please contact the sound card manufacturer.

Sound Cards

It is important that the sound card/s chosen should be fully compatible with the Microsoft DirectX/DirectSound API, consult the sound card manufacturers data for confirmation.

There is a wide choice of sound cards suitable for use with SpotOn as it make no great demands on the sound card performance.

Some sound cards which are aimed at the professional market may be unsuitable as they incorporate proprietary drivers that are not compatible with the Microsoft DirectX/DirectSound functions that SpotOn uses, these cards are often advertised with their own "virtual sound desk" software.

Another point to check when selecting a sound card is that it will allow several applications to use the sound card simultaneously, such as SpotOn being used for playout and a separate editing application preparing the audio files.

Audio Sample Frequency

SpotOn uses an audio sampling frequency of 44.1kHz or 48kHz and consequently attempts to set up the sound card to run at this same frequency, however current versions of the Windows DirectX code take control of this away from the application. In some instances if another program changes the sound card sample frequency after SpotOn has been started, then this can make tracks played out via SpotOn appear at the wrong speed. See Sound Card SetUp for details of how the card sample frequency is set.

A much smaller frequency error is present in all sound cards, that is they are not clocked at precisely 44.1kHz or 48kHz the consequence of this is that over several minutes the timing of the audio track with slip relative to real time.

Windows Volume Level Settings

At startup SpotOn will check the volume level settings of the audio outputs, if any of the settings (Master or Wave) are not 0dB then they will be reported in the dialog box shown below.

The levels can be reset to 0dB via the Volume Control option in the Engineering menu, in the Admin menu is the option not to display the Volume Level check results.

Update Check

If Web Hyperlinks are enabled SpotOn will attempt to check each week for new updates, if a new version is ready for download then a message dialog similar to the one shown below will appear.

Windows Vista and Windows 7

The latest version of Microsoft's operating system 'Windows 7' was released in 2009, SpotOn is compatible with Vista and Windows 7 but users should check that updated drivers for the sound card/s are available

Activation

Parallel/USB Port Security Key

SpotOn requires an external security key (dongle) before it will run, a key is supplied when the product is purchased.

The key plugs directly into the parallel printer port or a USB port on the PC, no user action is required to enable the key.

The parallel port key is designed to work with standard or bi-directional parallel ports and the latest 'intelligent' printers.

The program can be run on any PC which has the key fitted.

When using a USB key, note that Windows treats the same device in different USB ports (including hubs) as a different piece of hardware. This means that if the key has been set up on one port it should always be used in that port, otherwise Windows will report 'New Hardware Found' and start the hardware installation wizard.

When using a USB dongle the USB port power settings should be checked to ensure that the power is 'Always On' see [USB Power Management](#) for details.

The USB security keys along with many other devices are sensitive to discharges of static electricity. The USB ports on a PC can be used with memory sticks and external disc drives, the action of plugging in these devices can cause static discharges into the PC wiring. To avoid affecting the USB dongle with these discharges it is recommended that the USB security key is connected to a USB port that is isolated from other ports used for memory sticks.

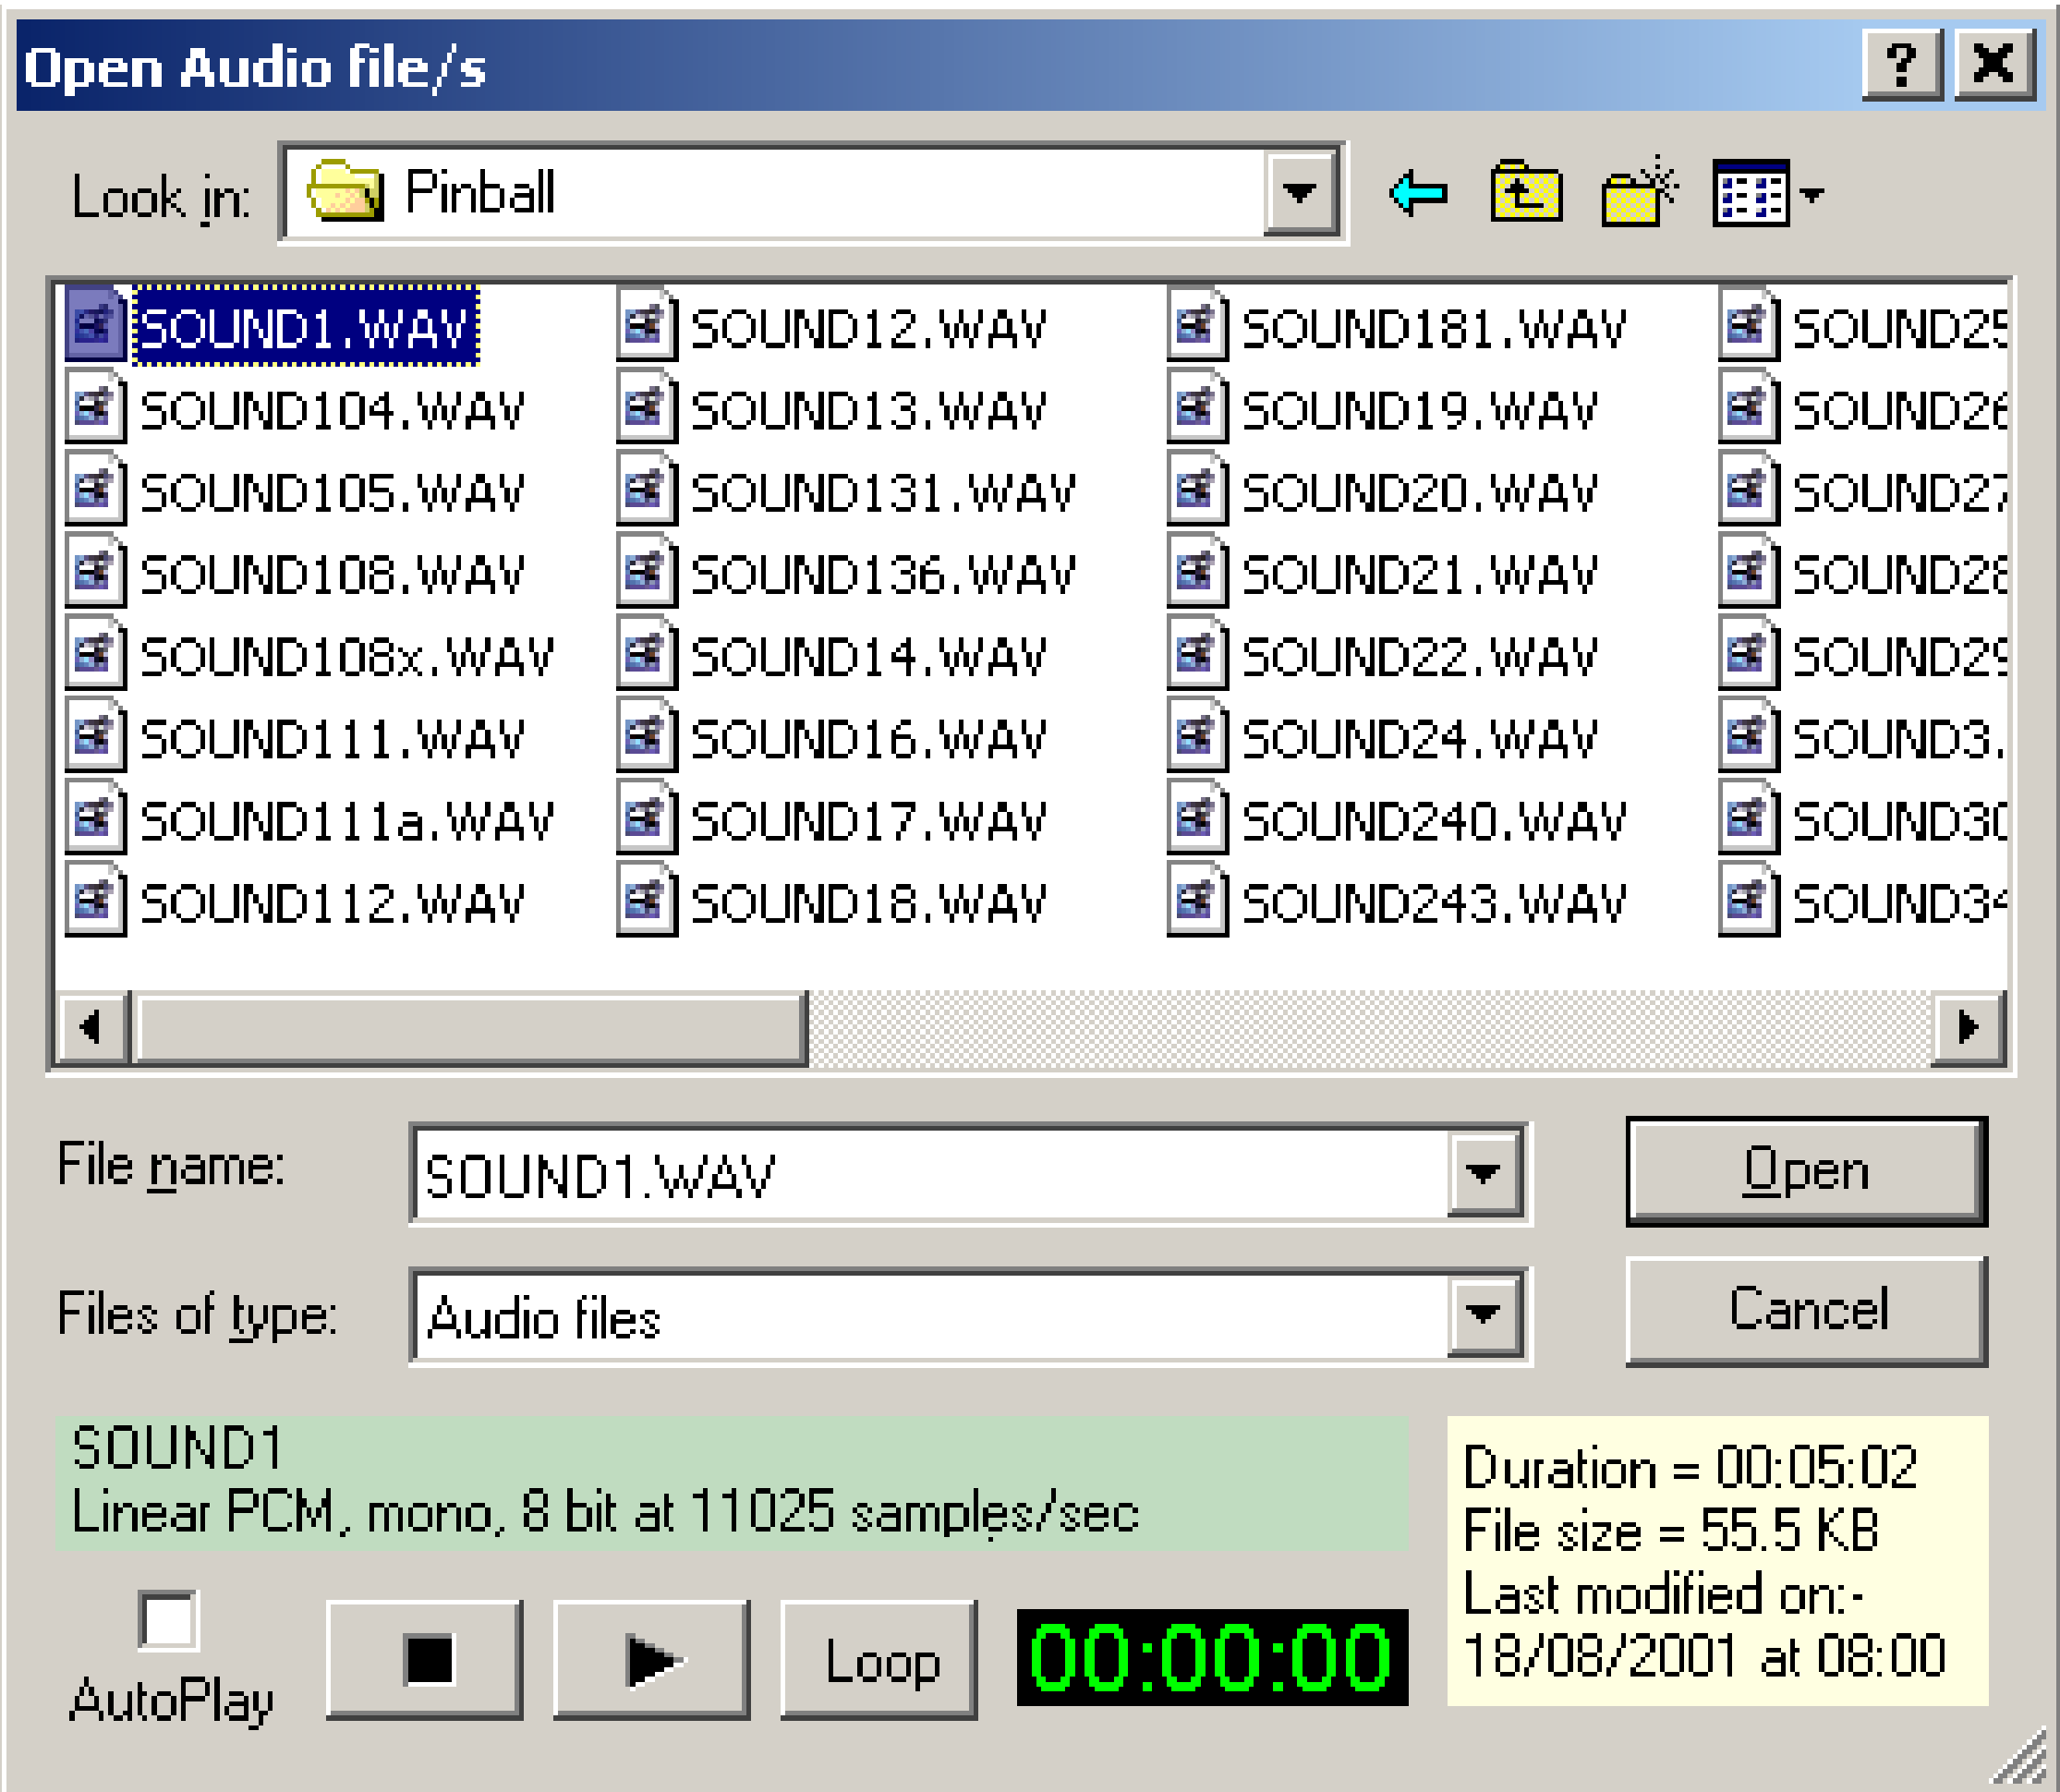

Getting Started 1

To load a track into an unassigned/blank button, right-click the button and selectLoad from the popup menu.

If the program options have been changed from their default settings, you may find that the popup menu is accessed by holding down the Shift key whilst right-clicking the button, see [Options|Mouse Function](#).

A standard file access dialog will appear listing common audio file types.

Navigate to the required file and click on Open, the file will then load into the button ready for use.

The track can be previewed before loading by using the controls at the bottom of the selection dialog, the track will be played out on the output assigned to be the [preview](#)

[output](#).

The filename or embedded description will be shown along with the track format and file details, the track can be played or looped.

The preview option is only available for linearly coded PCM WAV files, and files containing compressed data in MP3 or similar formats cannot be previewed at present.

If the track preview section is not visible it can be enabled via the [Admin|Use WAV Preview](#) option

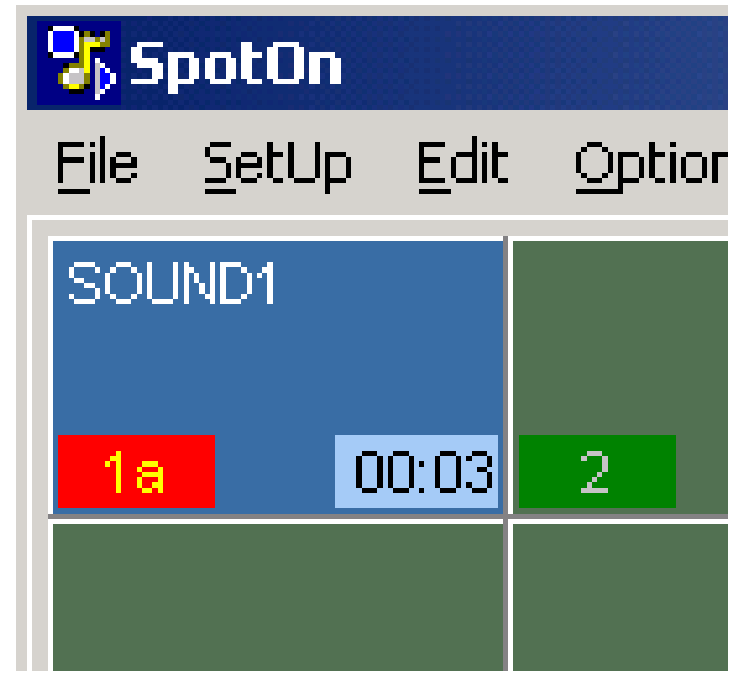

AutoPlay

To speed up selection of the correct track the AutoPlay facility can be enabled

If AutoPlay is enabled then as soon as a valid WAV coded track is selected in the file list it will begin playing on the [preview output](#).

Once loaded the track can be played out by left-clicking on the button at which point the track number '1a' will change from black on green to yellow on red text. The time remaining (mm:ss) at the lower right of the button will count down as the playout progresses, at 00:03 the colour of this text will change to black on light blue.

Note - in the button legend '1a' - '1' refers to the button number and 'a' to the output device

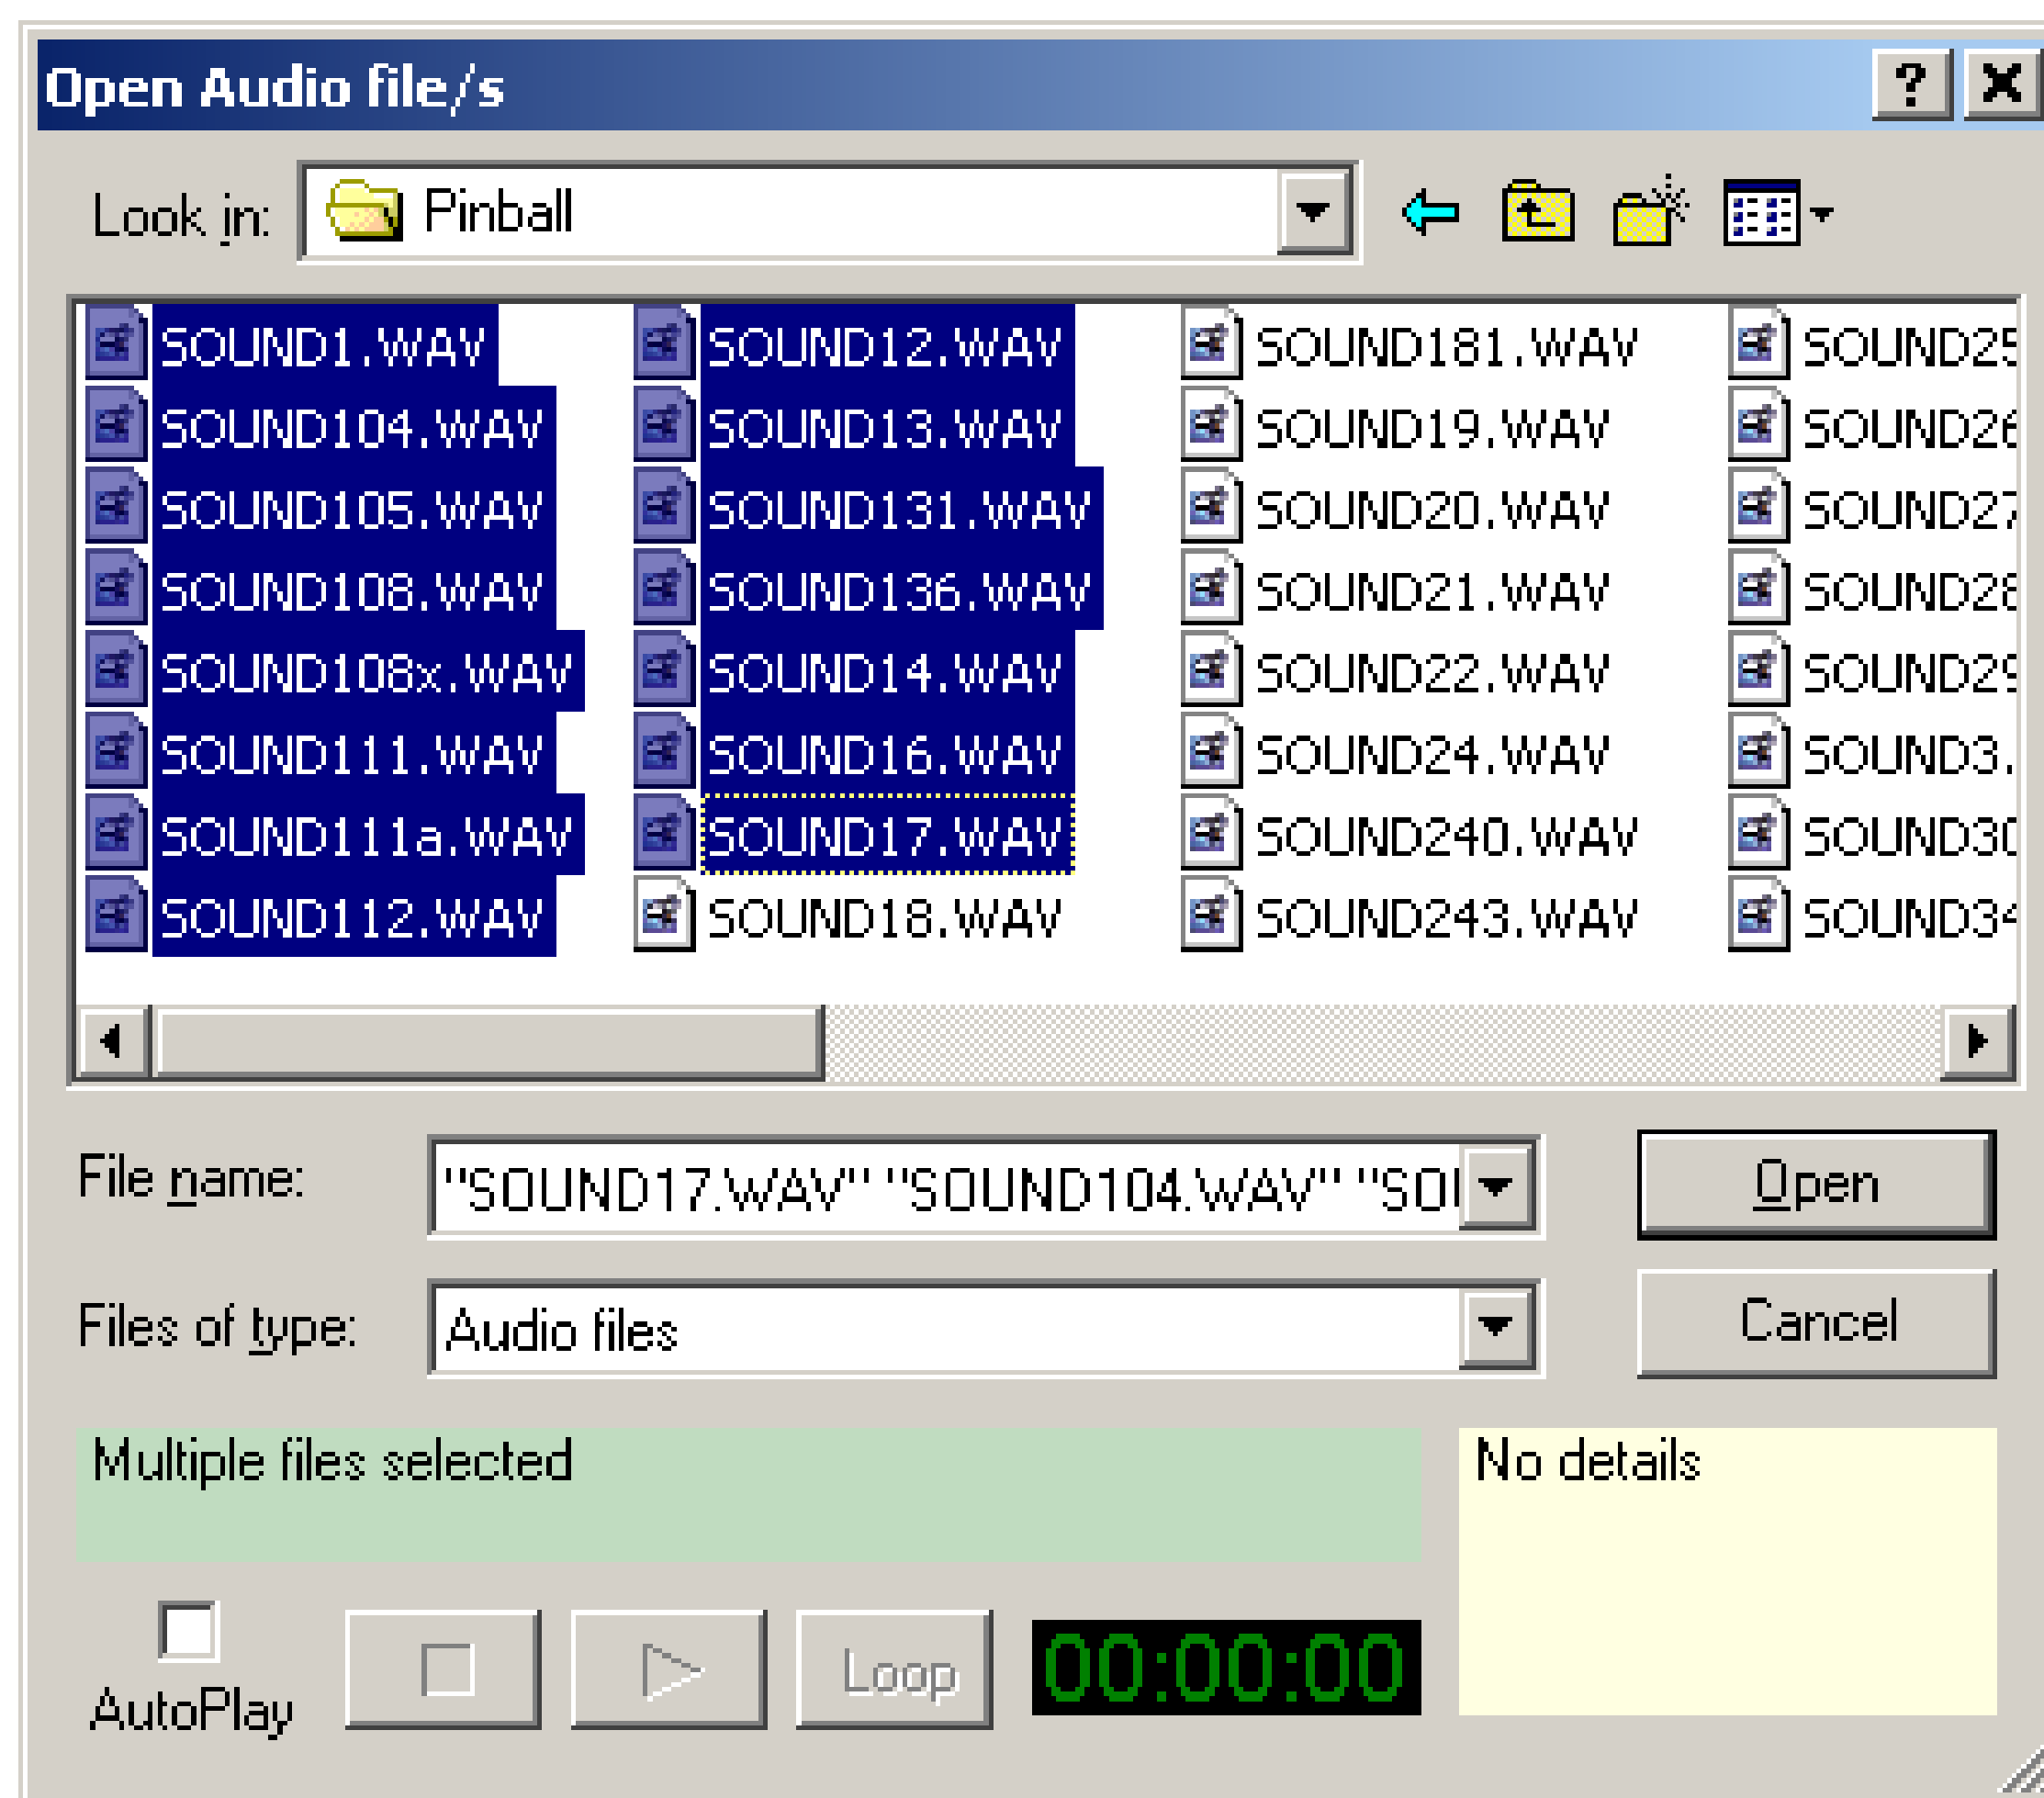

Repeated pressing of the left mouse button will alternately start and stop playout, when playout commences the track will always start from the beginning of the track. See [Options|MouseFunctions](#) for an alternative mode of operation.

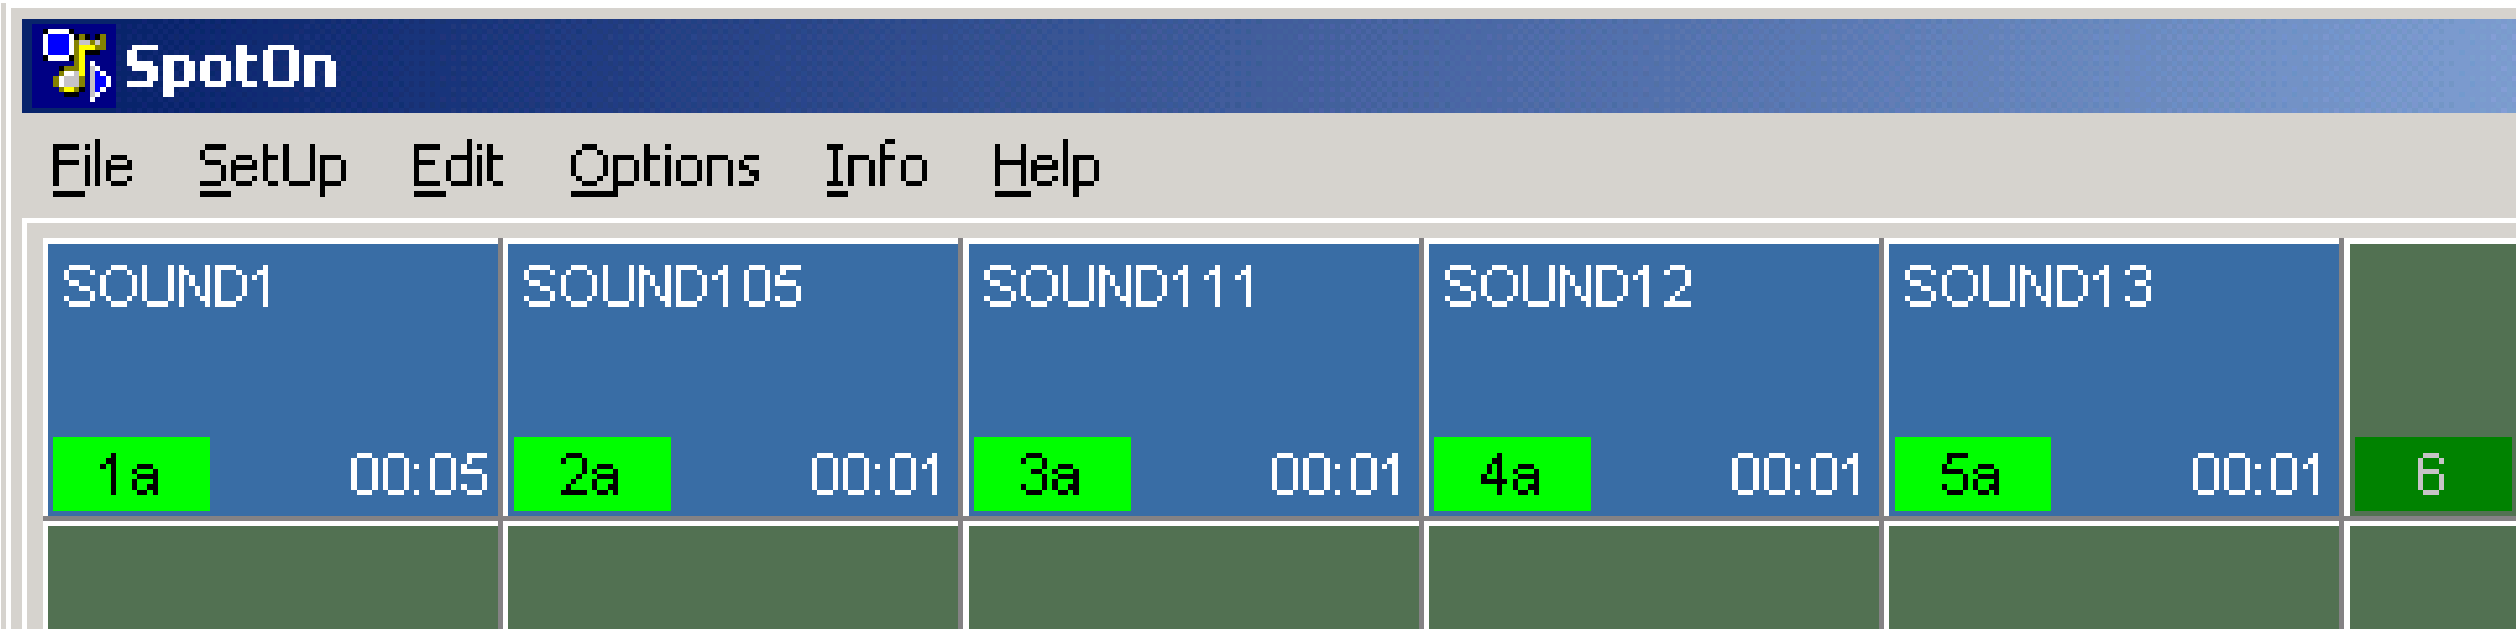

[Getting Started 2](#)

Getting Started 2

More than one track can be loaded into SpotOn by using the standard Windows multiple selection combinations of Shift+left-click for a block of tracks and Control+left-click for a non-contiguous list of tracks.

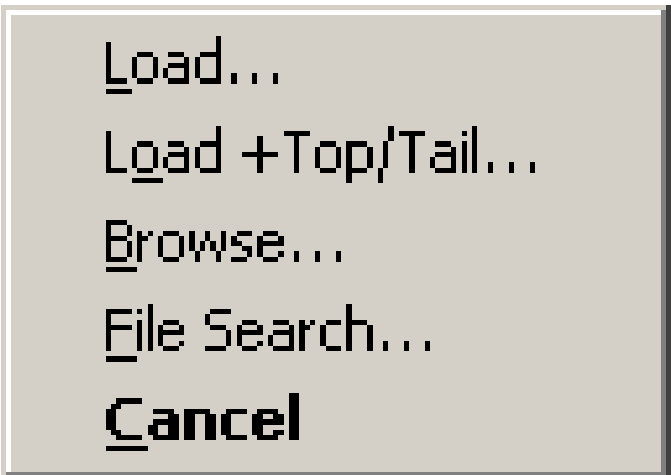

If the load action was started by right-clicking on button 1, the above Control click selection will result in the tracks being loaded into buttons as shown below.

Note that due to the sorting of files by Windows the exact order of the files in SpotOn may not be the same as that seen in the file selection dialog box - SpotOn will sort them into alphabetical order.

As an alternative it is possible to drag and drop tracks onto buttons, to use this facility navigate to the required tracks using the browse option

This will display a Windows Explorer navigation window.

From this selected file/s can be dragged from the Explorer window onto the SpotOn button/s, again multiple selections will load into consecutive buttons overwriting any previously loaded tracks.

As an alternative to selecting the Browse option, single or multiple files can be drag and

dropped from any Windows Explorer window that may be open.

[Getting Started 3](#)

Getting Started 3

Once a button has been loaded the button right-click menu will contain many more options.

C <u>u</u> t	L <u>o</u> op
C <u>o</u> py	S <u>t</u> op A <u>l</u> l o <u>n</u> P <u>l</u> ay
P <u>a</u> ste from 1	P <u>l</u> ay N <u>e</u> xt
P <u>a</u> ste C <u>o</u> lor	E <u>d</u> it with A <u>u</u> diti <u>o</u> n...
P <u>a</u> ste S <u>p</u> ecial	M <u>i</u> di...
S <u>w</u> ap with 1	A <u>u</u> di <u>o</u> ...
C <u>l</u> ear...	D <u>i</u> splay/H <u>o</u> tK <u>e</u> ys...
L <u>o</u> ad...	C<u>a</u>ncel

The items in the left hand column deal with the button as a whole, the items on the right cover the parameters of the track loaded into the button.

The Cut-to clipboard, Copy-to clipboard and Paste-from clipboard options allow tracks to be moved between buttons, Paste Colour will take the colour of the "Copied" button and paste it to a destination button enabling say, a set of buttons with similar sounds to have the same colour. Paste Special allows selected parameters to be copied to multiple buttons.

Swap will exchange the button that was "Copied" to the clipboard with the currently selected button.

Clear will remove all references to a track from a single button

Load displays file selection dialog for loading of a new track to this button.

Paste and Swap menus show the source button number that provided the data copied to the clipboard.

The first three items in the right hand column are options that can be checked or unchecked.

Loop	when checked will cause the track play command to start playing the track in a continuous loop, the track will loop between In and Out points if they are present
Stop All on Play	if this option is checked, when the track begins to play all other tracks being played will fade out using their individual fade times, this is indicated by a small solid square halfway up the right hand edge of the button. Alternatively tracks can be set to stop immediately without fades by muting the audio on this button (see Audio SetUp), in this case the solid square box icon is replaced by a square outline A further option is to stop all tracks on the current page only, here the button icon appears as a solid or outline diamond., this is enabled via the Midi selection see later
Play Next	checking this option will cause the track contained in the next numbered button to play when this track reaches the end, this is indicated by a small right facing arrow halfway up the right hand edge of the button. If the next numbered button is unassigned then no other track will be played

When the track on button 1 reaches the end or the start of its fade out, Button 2 will begin to play

When button 2 plays any other tracks that may be playing will be stopped using their fade out times

When button 3 is played it will also stop any other tracks that are currently playing and will then play button 4 when the track on button 3 reaches the start of the fade out.

Button 4 is set to loop continuously

Button 5 will stop all tracks on current page

Edit *EditorName* opens up the user defined WAV file editor, this editor is selected via [SetUp|Editor](#) menu. If an editor is assigned the name of the editor will be shown in the menu.

Midi see [Midi Assignment](#)

Audio see [Audio Setup](#)

Display see [Display Options](#)

Getting Started 4

The Status bar at the bottom of the main window shows hints and the state of several options.

Working from the left: -

Data Rate

The current data rate of the audio streams being read from disk in bytes/second, note SpotOn has a predefined limit of 20MBytes/sec at which point the status text will change to yellow text on red background. Once the limit has been exceeded no more tracks can be started until the data rate falls below the limit.

As a guide, a CD quality track has a data rate of 176kBytes/sec so the 20MBytes/sec limit should be more than adequate being equivalent to over 100 tracks.

When SpotOn is set to work with multi-channel audio tracks, that is where the number of channels contained in a track is more than two, this status panel has a default green background. The multi-channel mode is enabled using command line switches.

If the Play Stack is currently playing out a track then a new status bar panel will appear immediately to the right of the data rate panel, this Play stack panel will flash Yellow/Red, left-clicking on the panel will open up the Play Stack window.

SpotOn can playout buttons on a Preview output without affecting the main outputs, the Preview output is assigned with Global|Preview Output Assignment.

If Midi timecode is detected and Midi In is enabled then the timecode value will be shown with the addition of an 'm' suffix.

Similarly if SMPTE timecode is being used then it will be displayed but with the addition of an 'x' suffix indicating external timecode.

If the timecode is being derived from a button track then the suffix will be 'i' (internal)

If Timecode Chase mode is active then the timecode value will be shown in magenta text

Hints

Hint for the button under the mouse pointer, detailing file size, allocated output and any other modifiers. In this example 'A3' shows the allocated output port is A and suffix 3 indicates that it was the third button to be allocated to port A - this becomes important when utilizing sound card hardware mixers to produce smooth fades.

This panel will have a yellow background when Prep mode is active.

Midi In

The brown background to the text indicates no Midi In devices have been assigned, see menu SetUp|Midi Devices and would normally mean no Midi input triggers can be accepted. However, if Midi Loopback is enabled (see below) then clicking this panel will enable/disable the Midi In functions without the need for any real Midi devices, (used when the Midi out messages are internally looped back to the Midi In port).

If Midi loopback is on then the Midi Out panel text will be in lowercase

A Midi In device has been assigned but Midi In messages are not enabled clicking this panel will disable/enable Midi In.

A Midi In device has been assigned and Midi In messages are enabled, clicking this panel will disable/enable Midi In.

If multiple buttons are assigned the same Midi In note and are to be played out in overlapped mode the text will be underlined as will the Midi In note descriptions displayed on the buttons (see SetUp|Midi Devices for further details).

If the option to use Midi In over UDP is enabled then the text will be in italics

The panel text will flash red when incoming Midi In message is detected.

Midi Out

	A Midi Out device has not been assigned, see menuSetUp MidiDevices
	A Midi Out device has not been assigned, but Midi loopback is selected
	A Midi Out device has been assigned but Midi Out messages are not enabled, clicking this panel will disable/enable Midi Out.
	A Midi Out device has been assigned and Midi Out messages are enabled, clicking this panel will disable/enable Midi Out.
	The panel text will flash red when Midi Out message is sent.
	A Midi Out device has not been assigned, but Midi loopback is selected and is enabled
	Midi Out over network is enabled when text is underlined, example shows Midi over Network enabled but no real Midi device selected
	When Network Master enabled the text is shown in blue, example shows Network master enabled with a Midi device selected and Network Midi Master active

GPI In

A GPI In device has not been assigned, see menuSetUp|GPI Triggers

A GPI In device has been assigned but GPI In events are not enabled

A GPI In device is assigned and GPI In events are enabled, clicking this panel will disable/enable GPI In

The panel text will flash red when a GPI In event is detected.

PBus

When PBus control is enabled the text in the GPI In panel is shown underlined

A GPI In device has not been assigned and PBus Control is enabled

The panel text will flash cyan when a PBus trigger event is detected.

GPI In device has been assigned and PBus Control is enabled

Shift right-clicking on the GPI In panel will toggle the PBus control enabled/disabled

Links

Links Off

Groups and Master/Slave links are disabled

Links On

Groups and Master/Slave links are enabled, clicking this panel will disable/enable button linking

HotKeys

HotKeys Off

HotKeys are disabled

HotKeys On

HotKeys are enabled, clicking this panel will disable/enable HotKeys, if Overlapped mode is selected and there are duplicate Hotkeys assigned the text will be underlined

HotKeys On

Play Mode

Play/Menu

Mouse button functions are - Left Button alternatively plays and stops track, Right button brings up menu

Mouse button functions are - Left Button plays and right button stops track, shift+right button brings up menu

Mouse mode can be changed by left clicking on the panel or via menu Options|Mouse Functions

When using a touchscreen to control SpotOn sometimes it may be necessary to debounce the "presses" (left-clicks) made by the user so that the track is not restarted unintentionally. Under the options menu the debounce time can be set and when in use it is indicated by the lower right status panel text being shown in white on blue as below.

The five button attributes MidiIn, MidiOut, GPIs, Links and Hotkeys above can be displayed as highlighted button numbers by right clicking the appropriate status bar panel.

The panel will change colour to orange and the numbers on the buttons that have those attributes are also set to orange, the remaining button numbers are set to dark grey

211a	00:01	212a	X00:02	213a	00:01
10kHz_16_4 4_AB_0		10kHz_16_4 4_AB_0		10kHz_16_4 4_AB_0	
219aG2	00:20	220aG2	00:20	221aG2	00:20

Similarly the output assignments can be shown on screen by right-clicking the mouse mode panel on the right hand side of the status bar. This will offer a popup menu listing all the available audio outputs, selecting one of them will highlight the buttons on the screen as described above.

The button highlight can be used to show buttons with a specific sample rate, this mode is selected by shift right-clicking the mouse mode panel.

The button highlight can be used to show buttons with a specific number of channels, this mode is selected by control right-clicking the mouse mode.

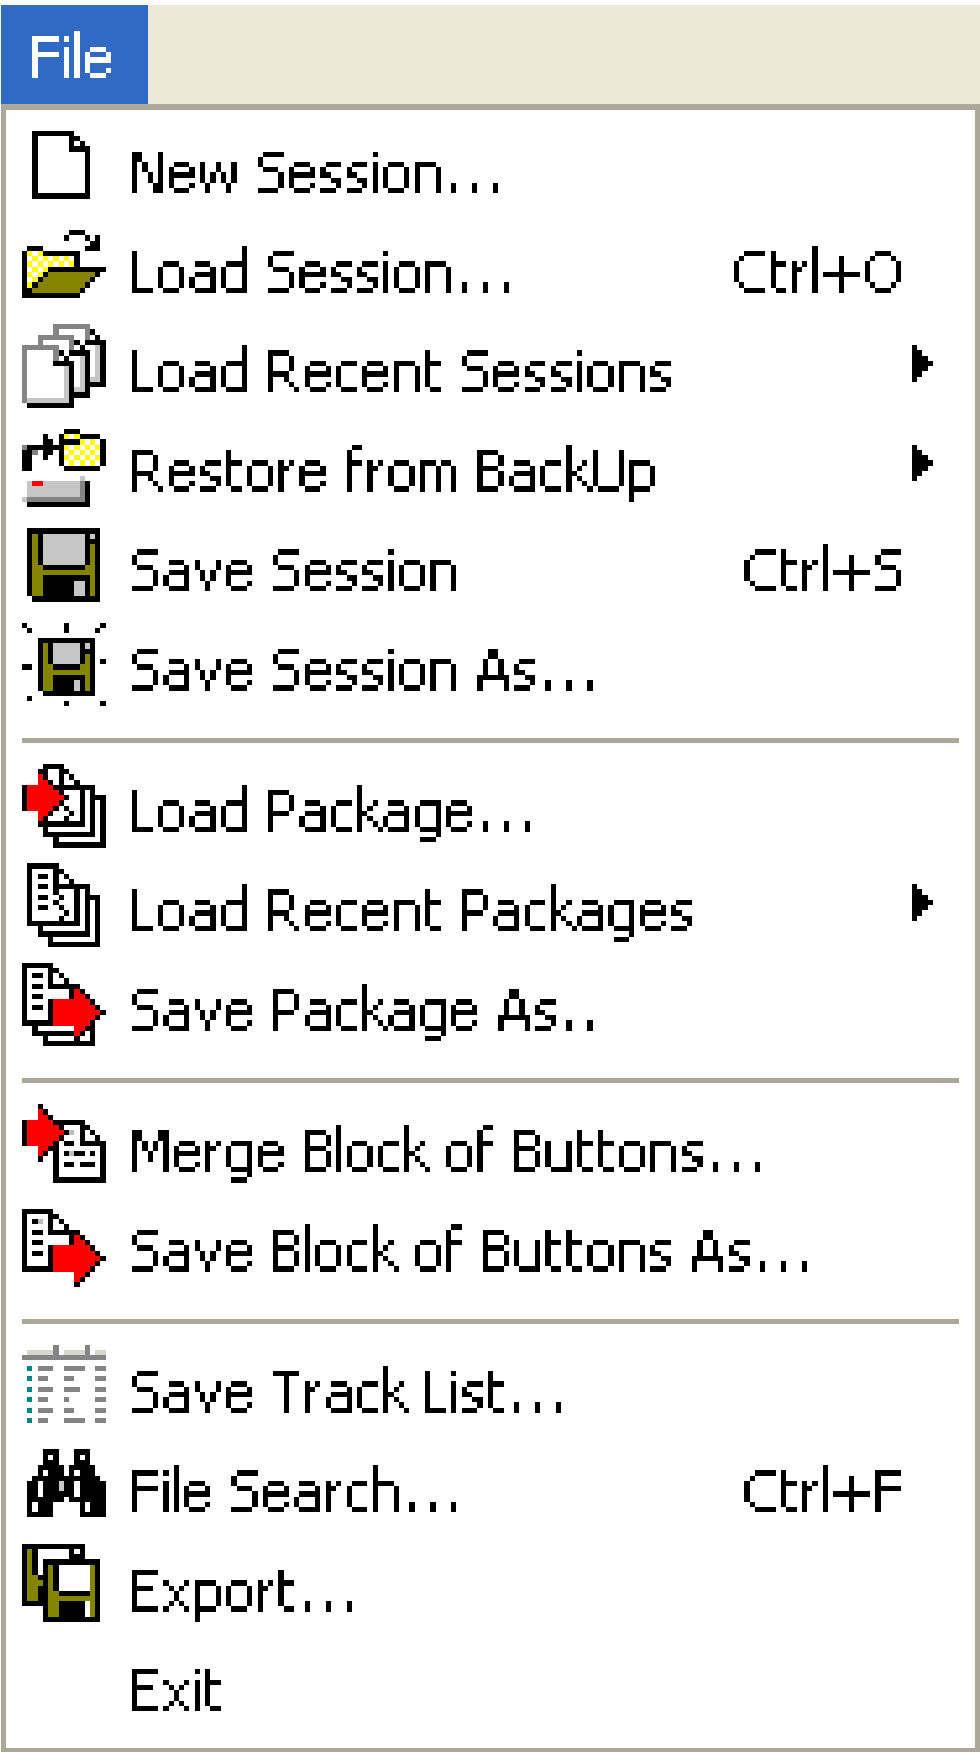

Finally the button highlight can be used to show buttons with a specific bit depth, this mode is selected by shift+control right-clicking the mouse mode.

In all the highlighting modes the action will automatically cancel after 5 seconds or can be cancelled manually be right-clicking the panel a second time.

Example of a typical screen layout

File Menu

New Session	Clear all pages to start a new session
Load Session	Load data file containing complete setup information
Load Recent Sessions	Displays a list of recently accessed Sessions
Restore from BackUp	Restore session from timed backup file
Save Session	Save data to last loaded/saved disc file
Save Session As	Save data to a specific file
Load Package	Load file containing setup information and audio files
Load Recent Packages	Displays a list of recently accessed Packages
Save Package As	Save file containing setup information and audio files
Merge Block of Buttons	Load block of consecutive buttons
Save Block of Buttons	Save a block of consecutive buttons
Save Track List	Save track data in a spreadsheet compatible format
File Search	Opens an external file search utility
Export	Export copies of tracks to single folder
Exit	Close down SpotOn and save debug status files

New Session

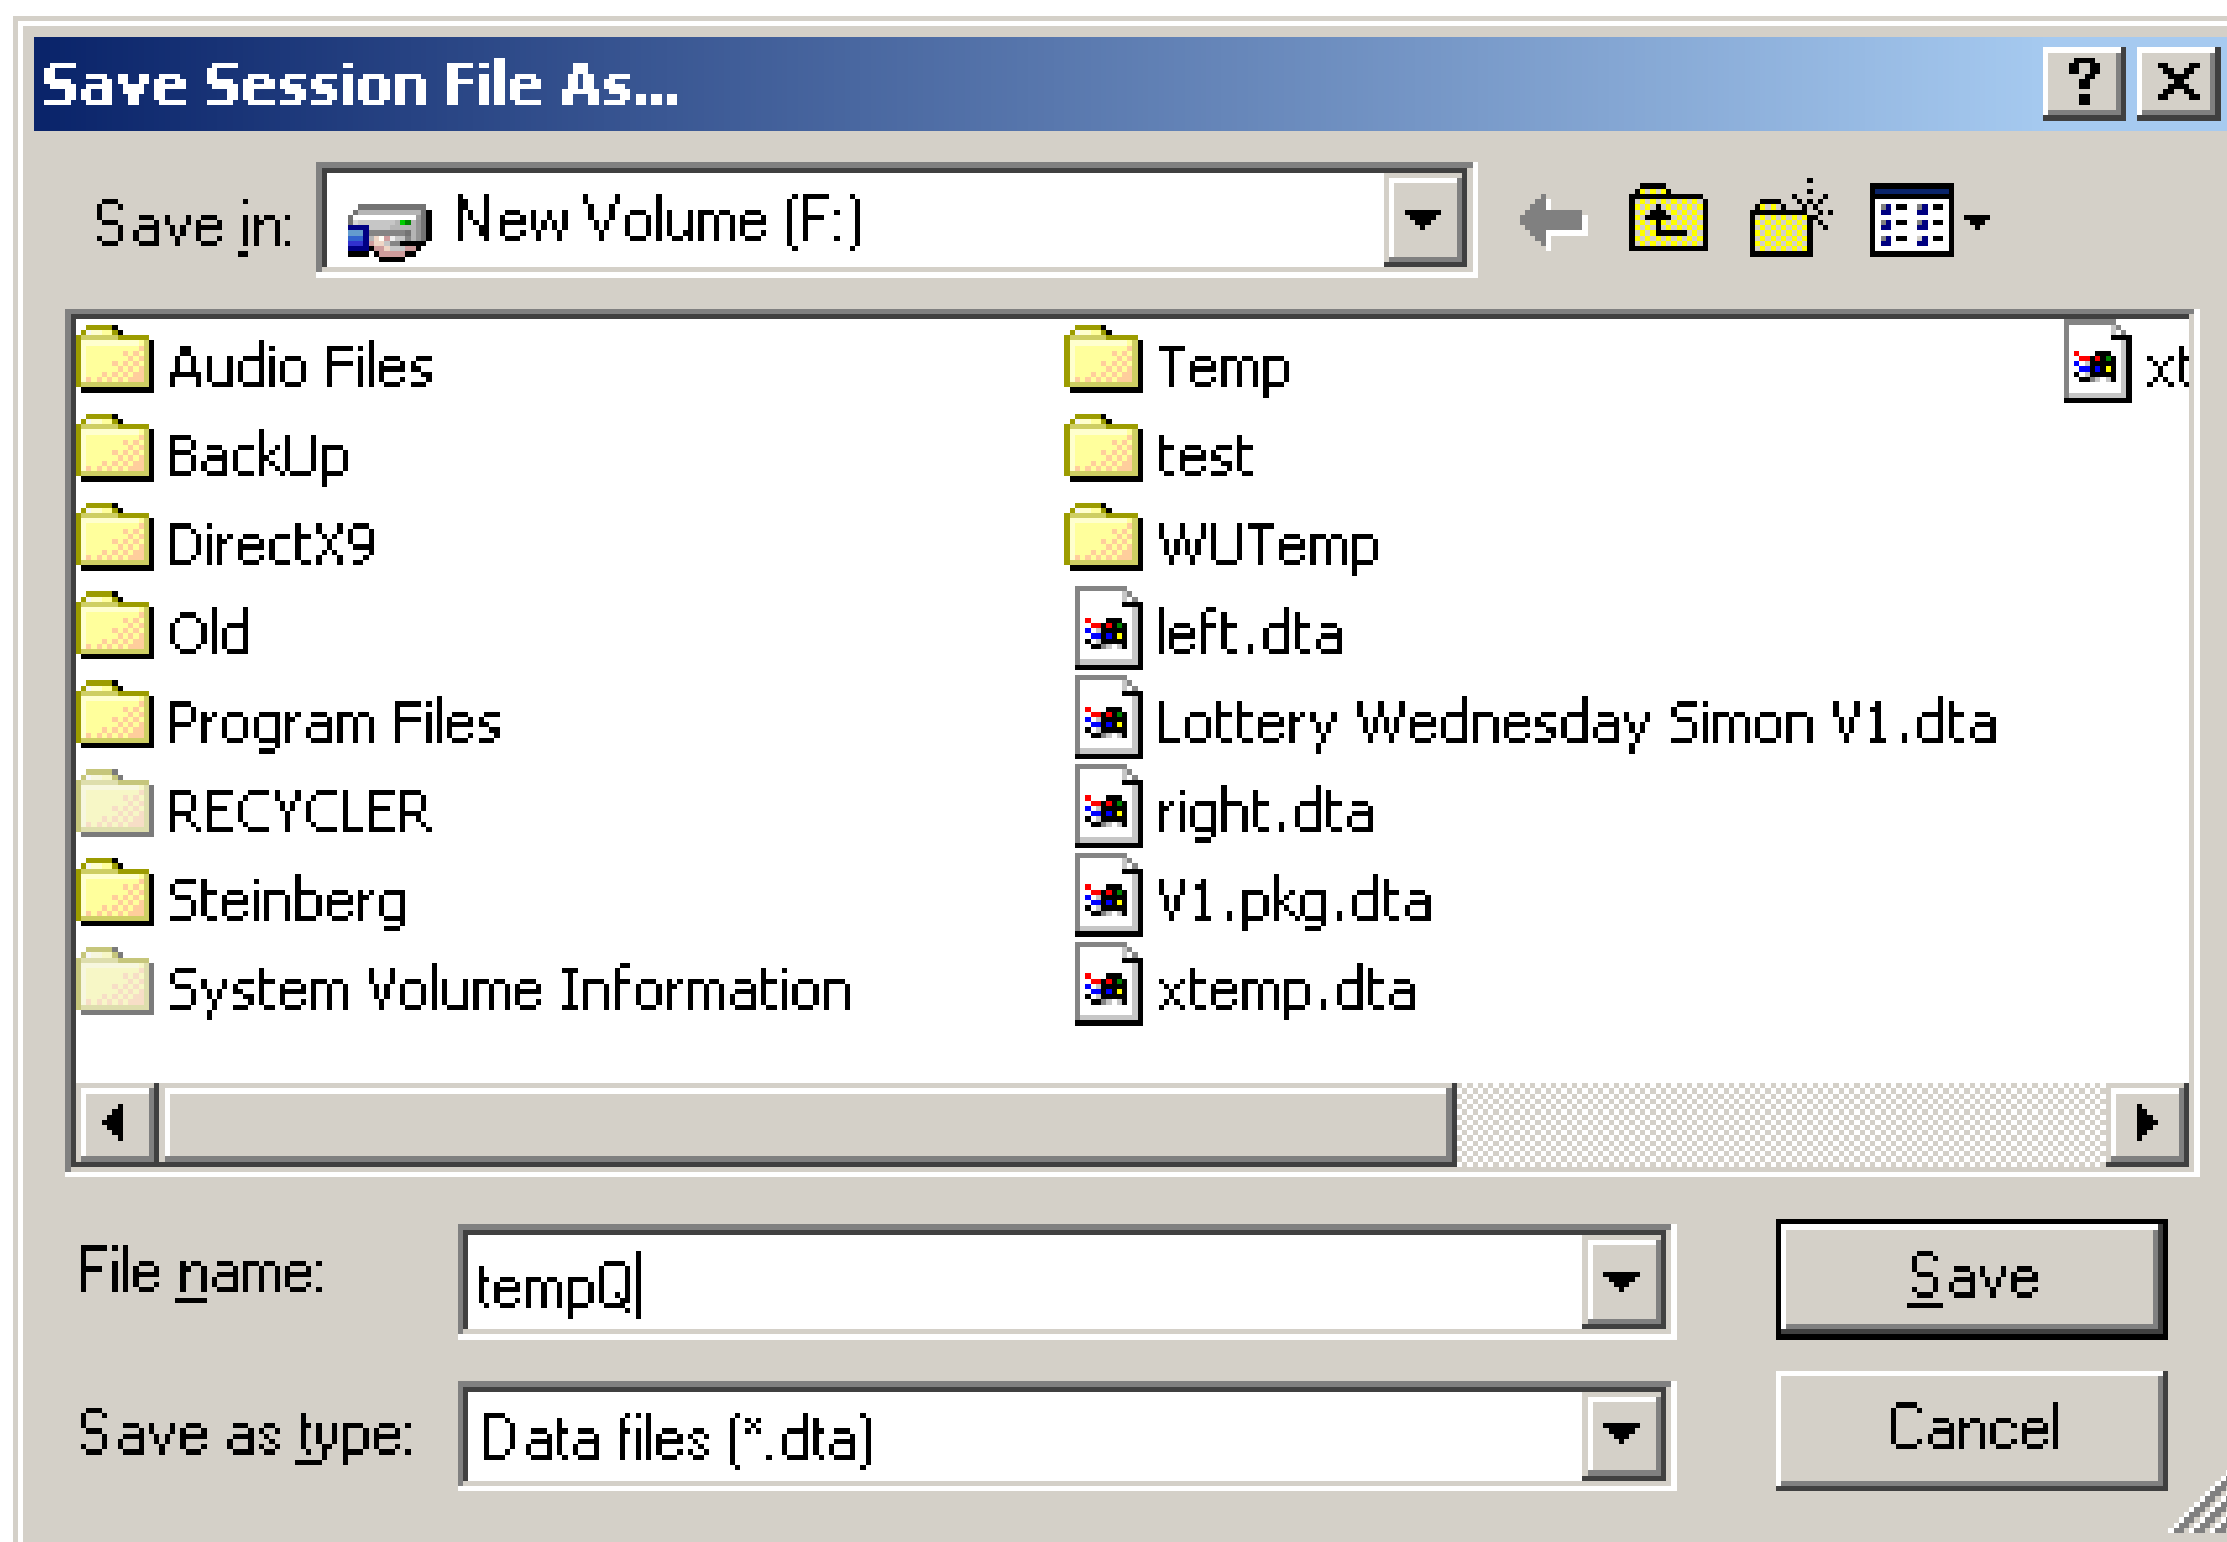

In addition to clearing all the buttons this option will load the file ~newsession.dta if it is present in the Application Data folder, this file can be saved just as any other session file so allowing loading of a customised new session.

Application Data folder = ..\Documents and Settings\All Users\Application Data\Serialtech\SpotOn\

Load Session

Load a new session into SpotOn see Load Sessionpage for an explanation

Save Session As

This saves the current session to disc, for SpotOn to locate the files the extension must be '.dta' this is added automatically. In the example above the file would be saved as 'tempQ.dta'.

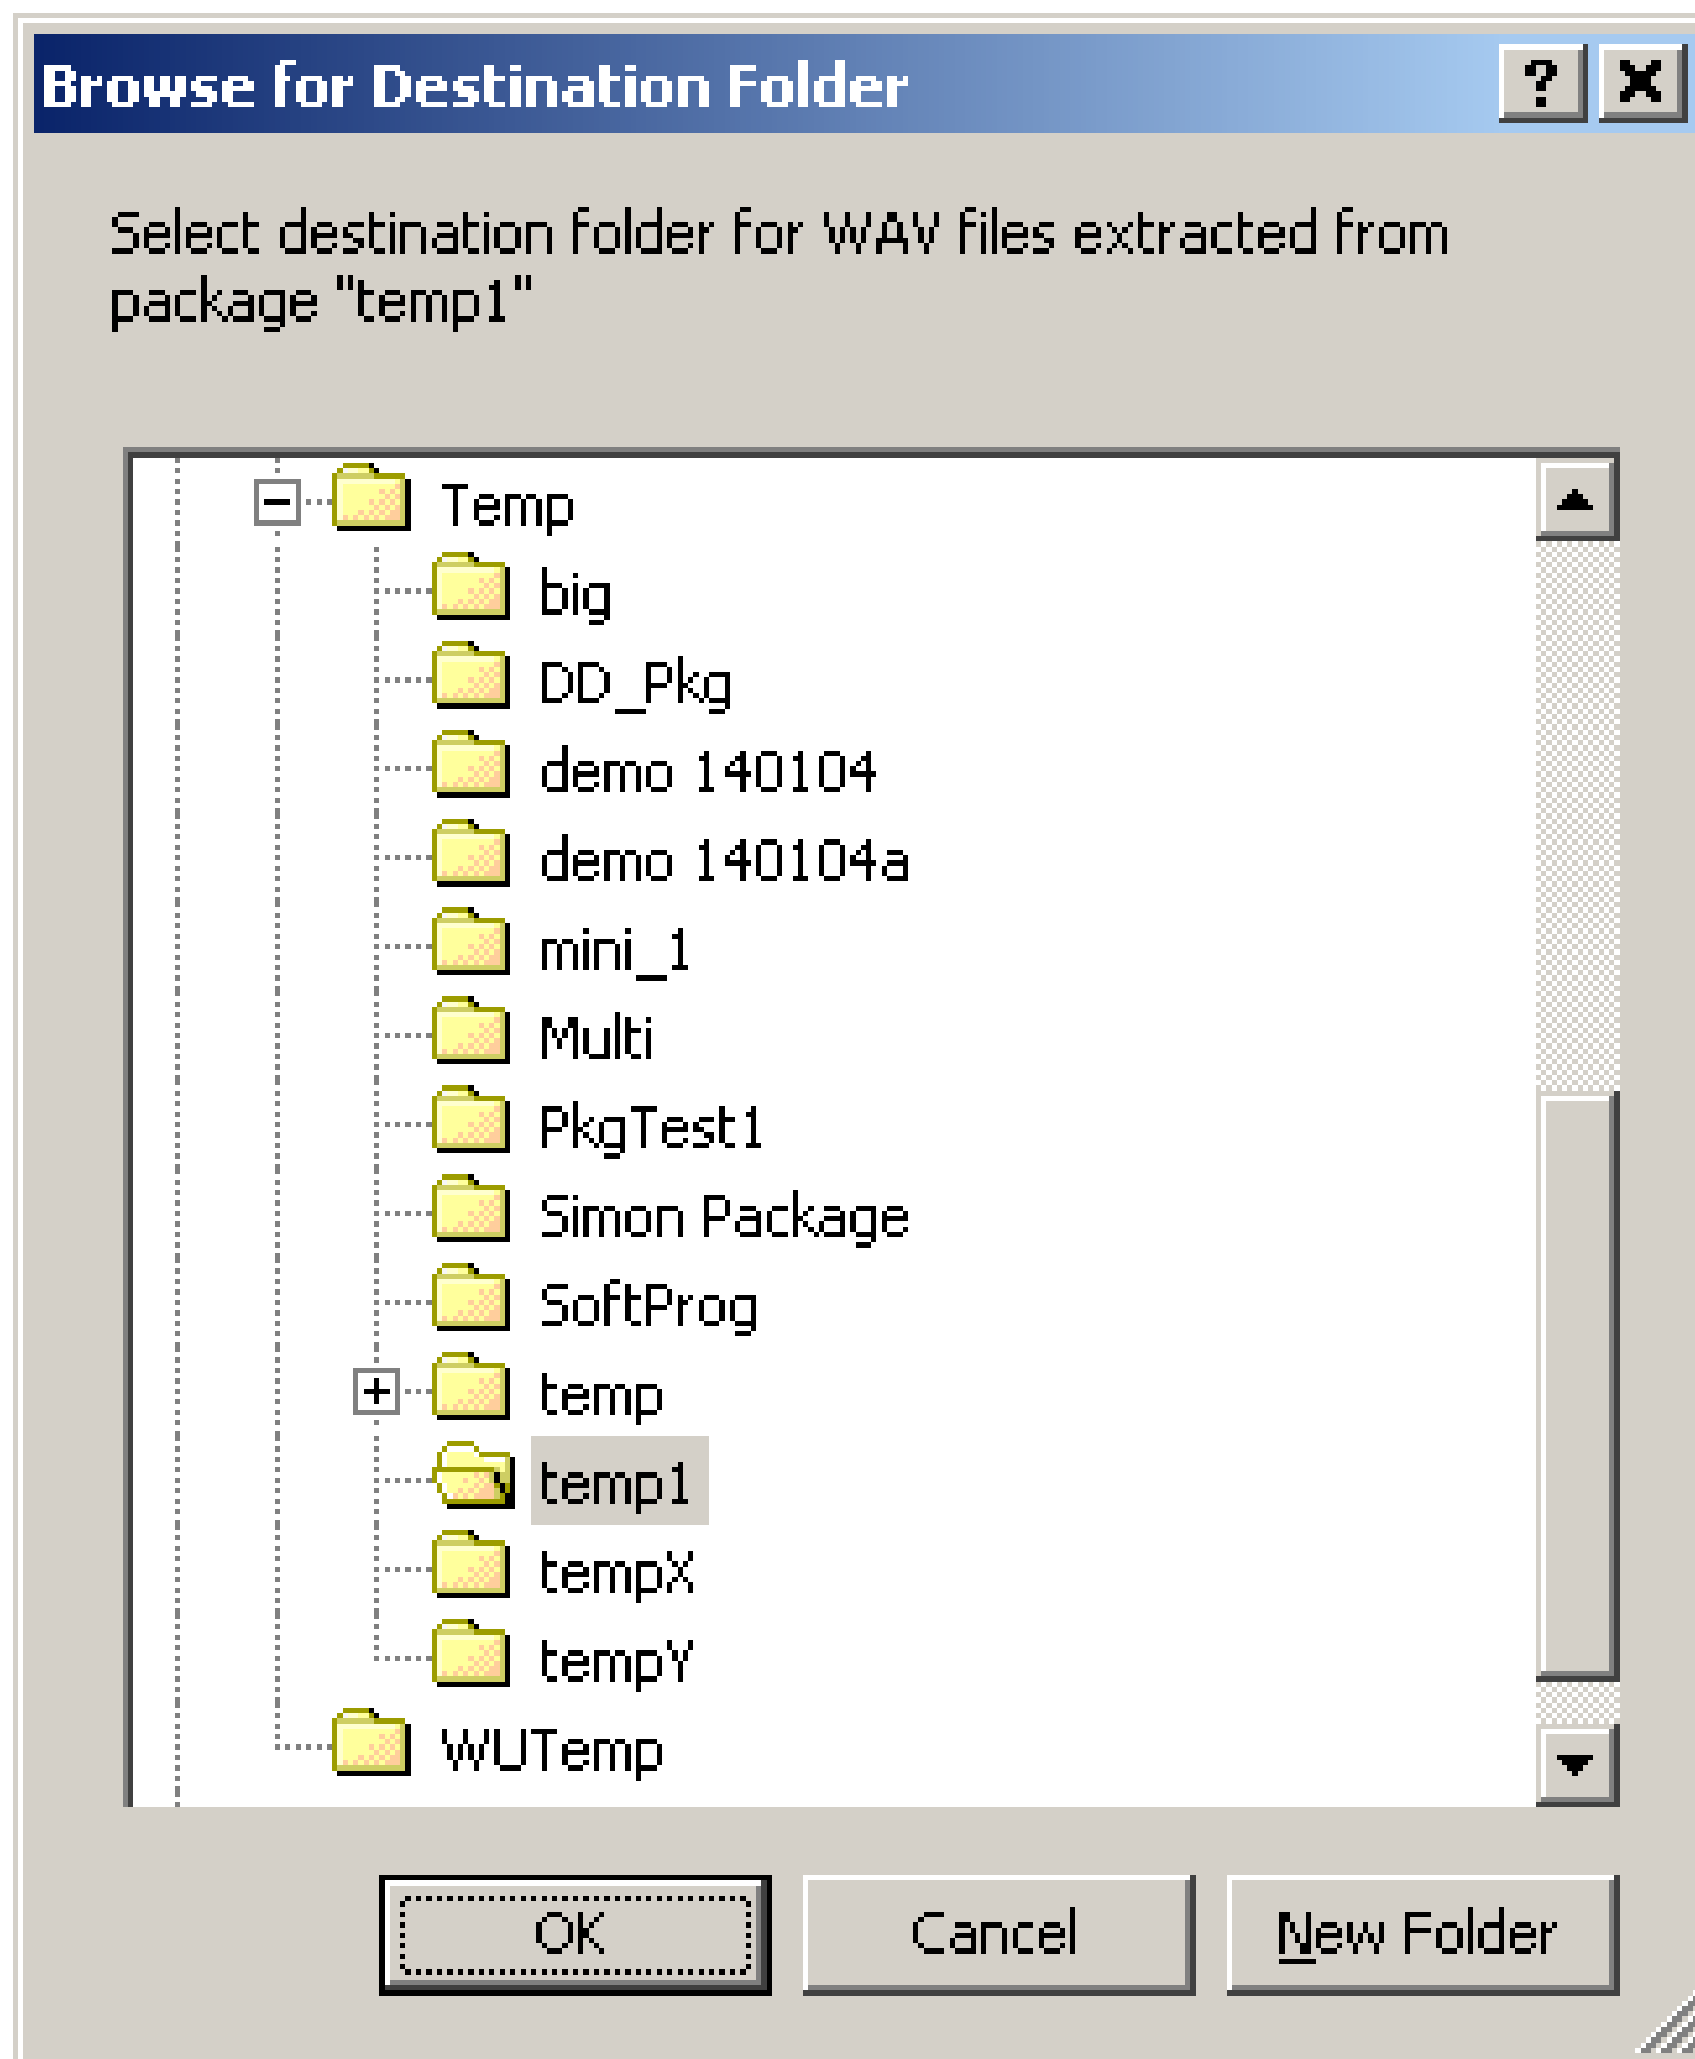

If an invalid file extension is entered as part of the filename then it will be rejected.

Restore from BackUp

To restore a session from the automatic backup files, select a file based on the time and date that is most likely to contain the data required

Load Package

A Package file (*.pkg) can be loaded to recreate a complete setup including replacing the audio WAV files, as this may take up a large amount of disc space the location of the extracted audio files can be changed during loading from the default of SpotOn\Package Media\ to a more appropriate location, the default location is set via Admin|File Folders

If SpotOn detects that the package being loaded was built with a version of the program that is more recent than the current version, then the warning dialog box below will appear.

Clicking Yes will open the Package Converter utility, the Package Converter utility used must be the latest version and that can be found on the Serialtech web site - PackageConvert.zip .

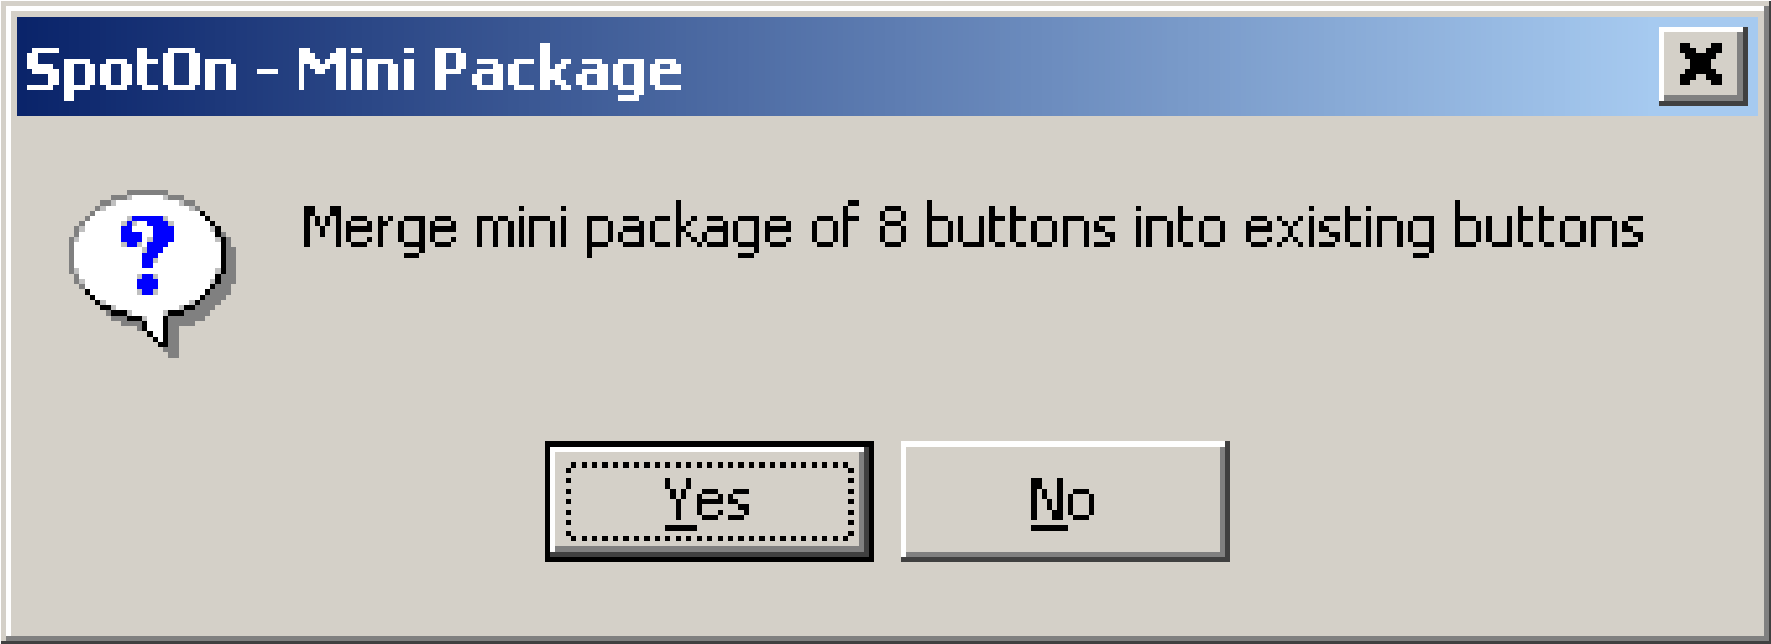

If the loaded package file contains less than the maximum number of buttons (<320) - a

Mini package - then the option will be offered to merge the buttons into a specific place within the existing buttons.

If Yes is selected all buttons in SpotOn will be cleared and then loaded from the Mini package starting at button 1.

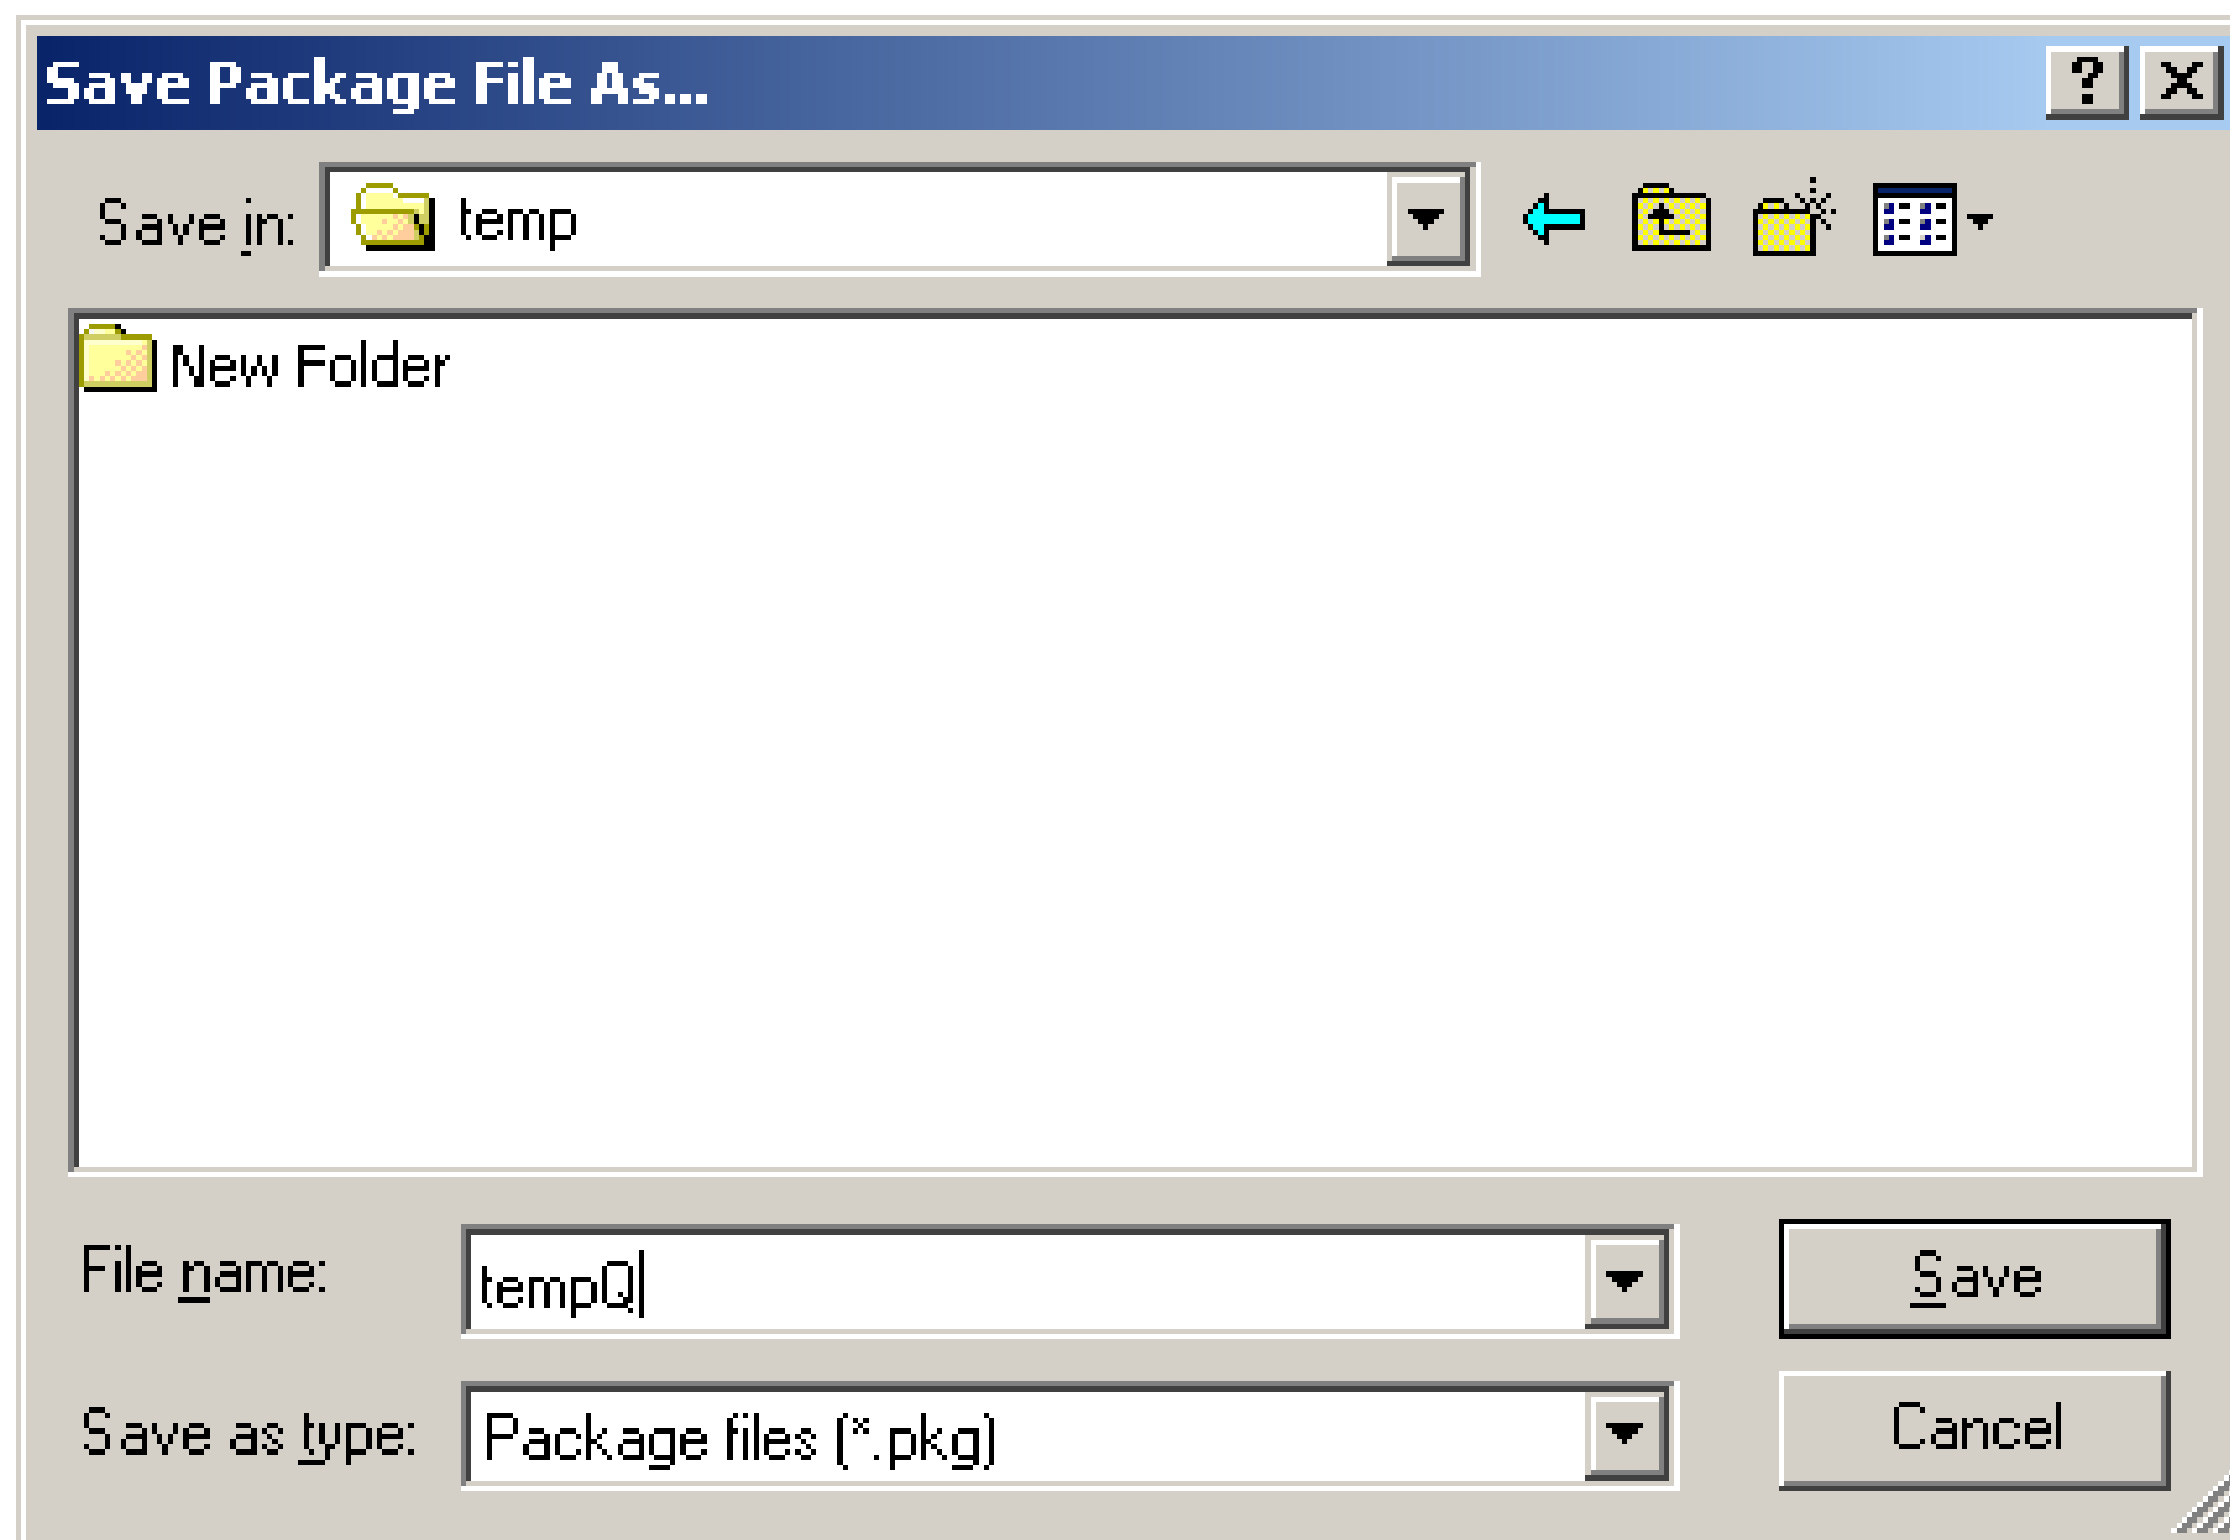

If No is selected a further option is offered defining where the mini package will be merged into the existing set of buttons

Default positioning starting at button 1, can be changed as below to start on any button.

Depending on the length of the original filenames and the length of the name of the new folder, it is possible that the length of the overall path name may exceed the limit set by Windows. If this is the case then the filenames will be truncated but remain unique.

Save Package As

This option will save all the individual button settings along with the audio WAV files, consequently the resulting package file (*.pkg) can be very large, with CD quality audio the file will take up approximately 10MB for each minute of audio saved.

This package file can then be reloaded into the same computer or another computer running SpotOn to recreate the original setup.

There is a utility program provided with SpotOn called UnPackageWAVs that can extract the audio WAV files from the package file, this may be useful when working offline without access to SpotOn to review the audio material. The utility can also export audio tracks with the trim and gain settings applied by SpotOn.

A Package can contain any number of consecutive buttons between 1 and the maximum of 320

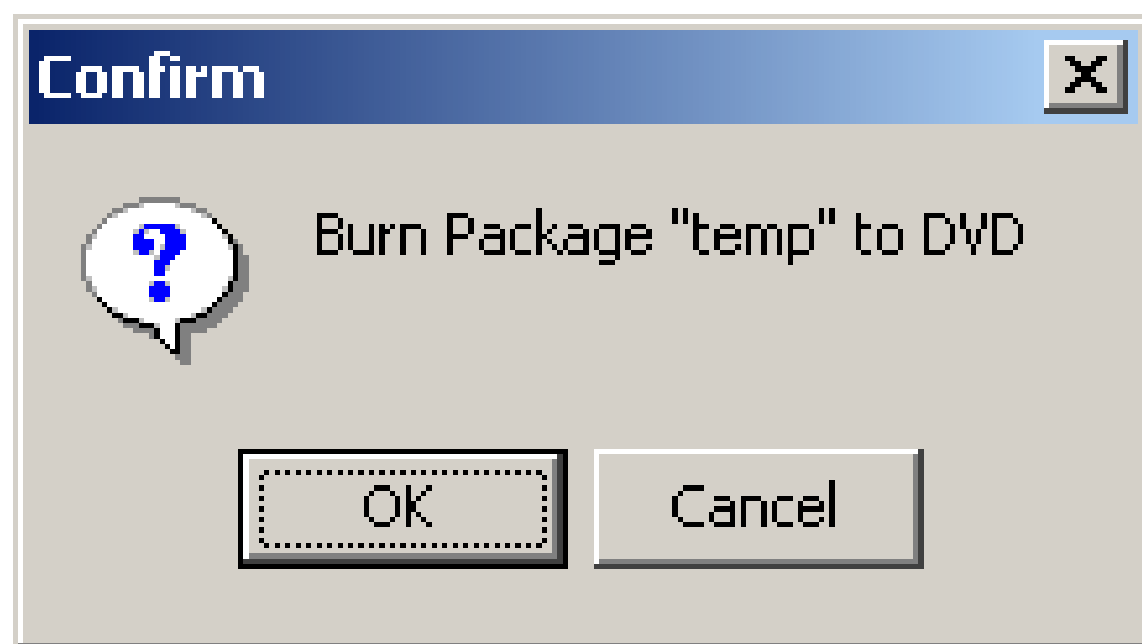

If the package does not contain all buttons then it is termed a Mini Package and can be merged into an existing set of buttons.

This saves the current package to disc, for SpotOn to locate the files the extension must be '.pkg' this is added automatically. In the example above the file would be saved as 'tempQ.pkg'.

If an invalid file extension is entered as part of the filename then it will be rejected.

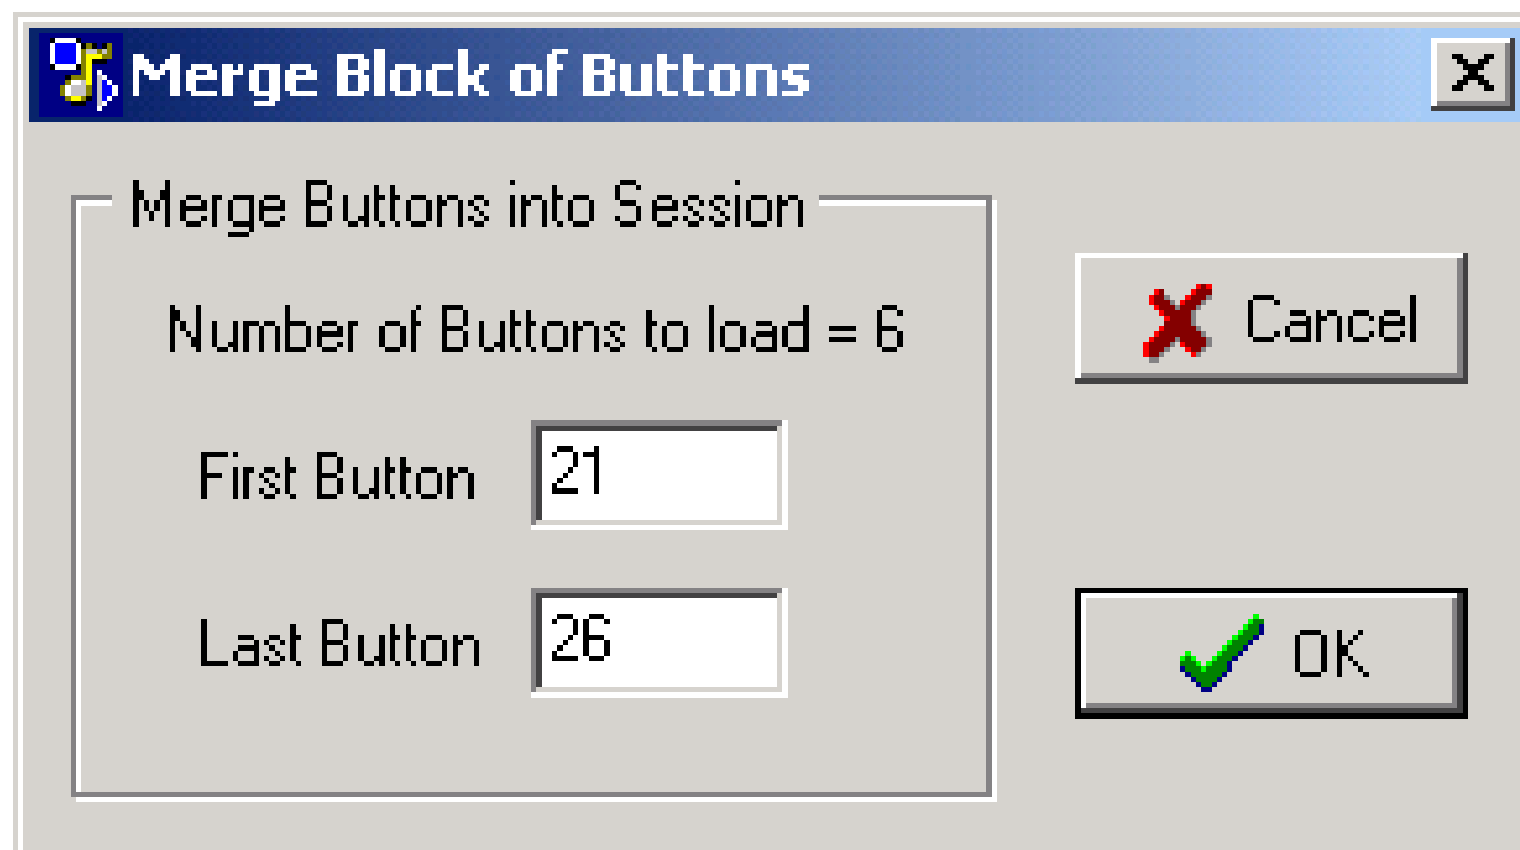

If a CD/DVD burner utility has been assigned then after the package has been saved there is then the option to burn it to CD or DVD.

Merge Block of Buttons

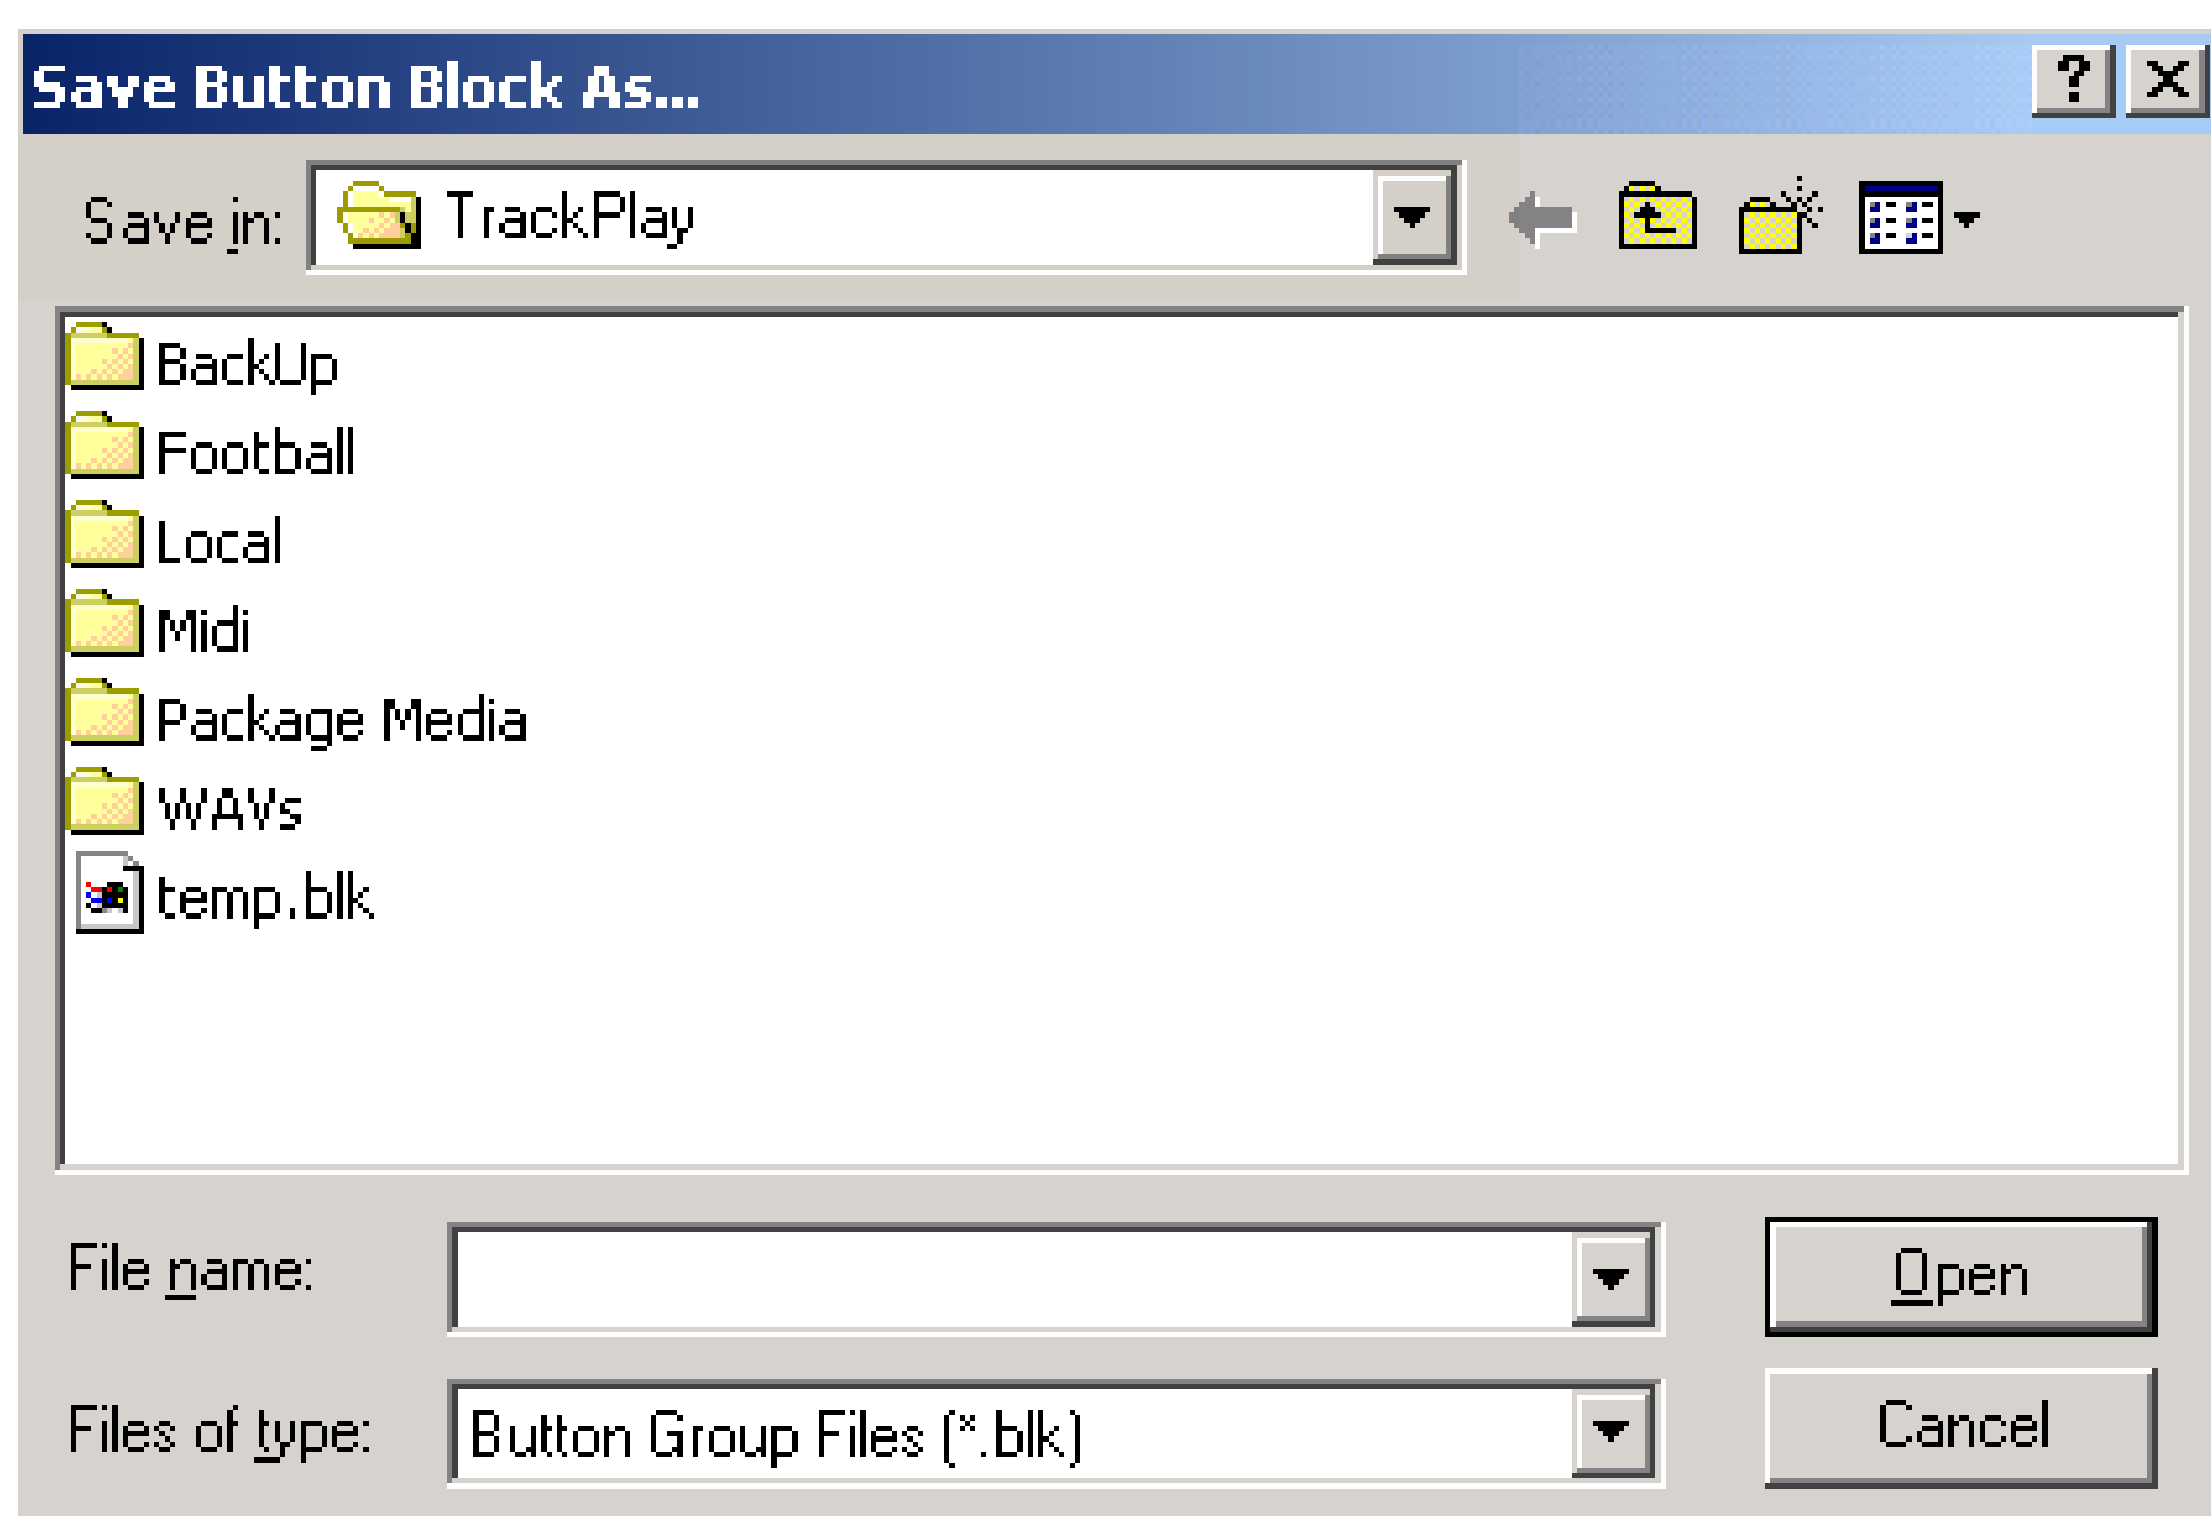

Having selected the file to retrieve the block of buttons, the first button of the sequence has to be defined, the number of buttons to be loaded is fixed in the file

Save Block of Buttons

A continuous numerical run of buttons can be saved to a file, this can be used for a set of tracks that are commonly used and can be imported into new setups

Select a file to store the block of buttons

Then select the continuous range of buttons to save

If an invalid file extension is entered as part of the filename then it will be rejected.

Save Track List

A Track List contains the settings of the assigned buttons the data is saved as both a text file (*.txt) and a comma separated variable (*.csv) file

A typical section of a Track List file (*.csv) imported into MS Excel

	A	B	C	D	E	F	G	H	I	J	K	L
1	#	TrackName	Length	Output	Gain	Left	Right	Speed	Trim In	In Point	Trim Out	Out Poi
2	2	SOUND1	00:00:05:02	a	0dB	0dB	0dB	0%	No	00:00:00:00	No	00:00:05

File Search

The menu item will run an external file search utility this utility may be customised to the type of files required, the utility is selected via SetUp|Searchand the default program is SpotOnSearch

Export

For convenience SpotOn provides an export facility to copy all the currently used audio files to a single folder, this does not change the files or locations used by the application.

The destination folder is then selected

Next an option to export the files only from the buttons on the current page or from buttons on all pages is presented

If a filename is found in the destination folder that is the same as any of the files being exported a warning dialog will be shown

Exit

This option will close down SpotOn and save a debug status file ~StatusLog.txt to the application data folder, found at: -

Windows 7 - C:\Program Data\Serialtech\SpotOn

Windows XP - C:\Documents and Settings\All Users\Application Data\Serialtech\SpotOn

Windows 2K - C:\Documents and Settings\All Users\WINNT\Application
Data\Serialtech\SpotOn

This file is only overwritten when SpotOn is closed via the File|Exit route, exiting the program with the more usual Windows close button leaves the file intact.

This mode will be useful in debugging problems, if a problem should occur close down SpotOn and then save the ~StatusLog.txt file to another folder, then zip the file and Email it to SpotOn@serialtech.com along with a detailed description of what problems occurred.

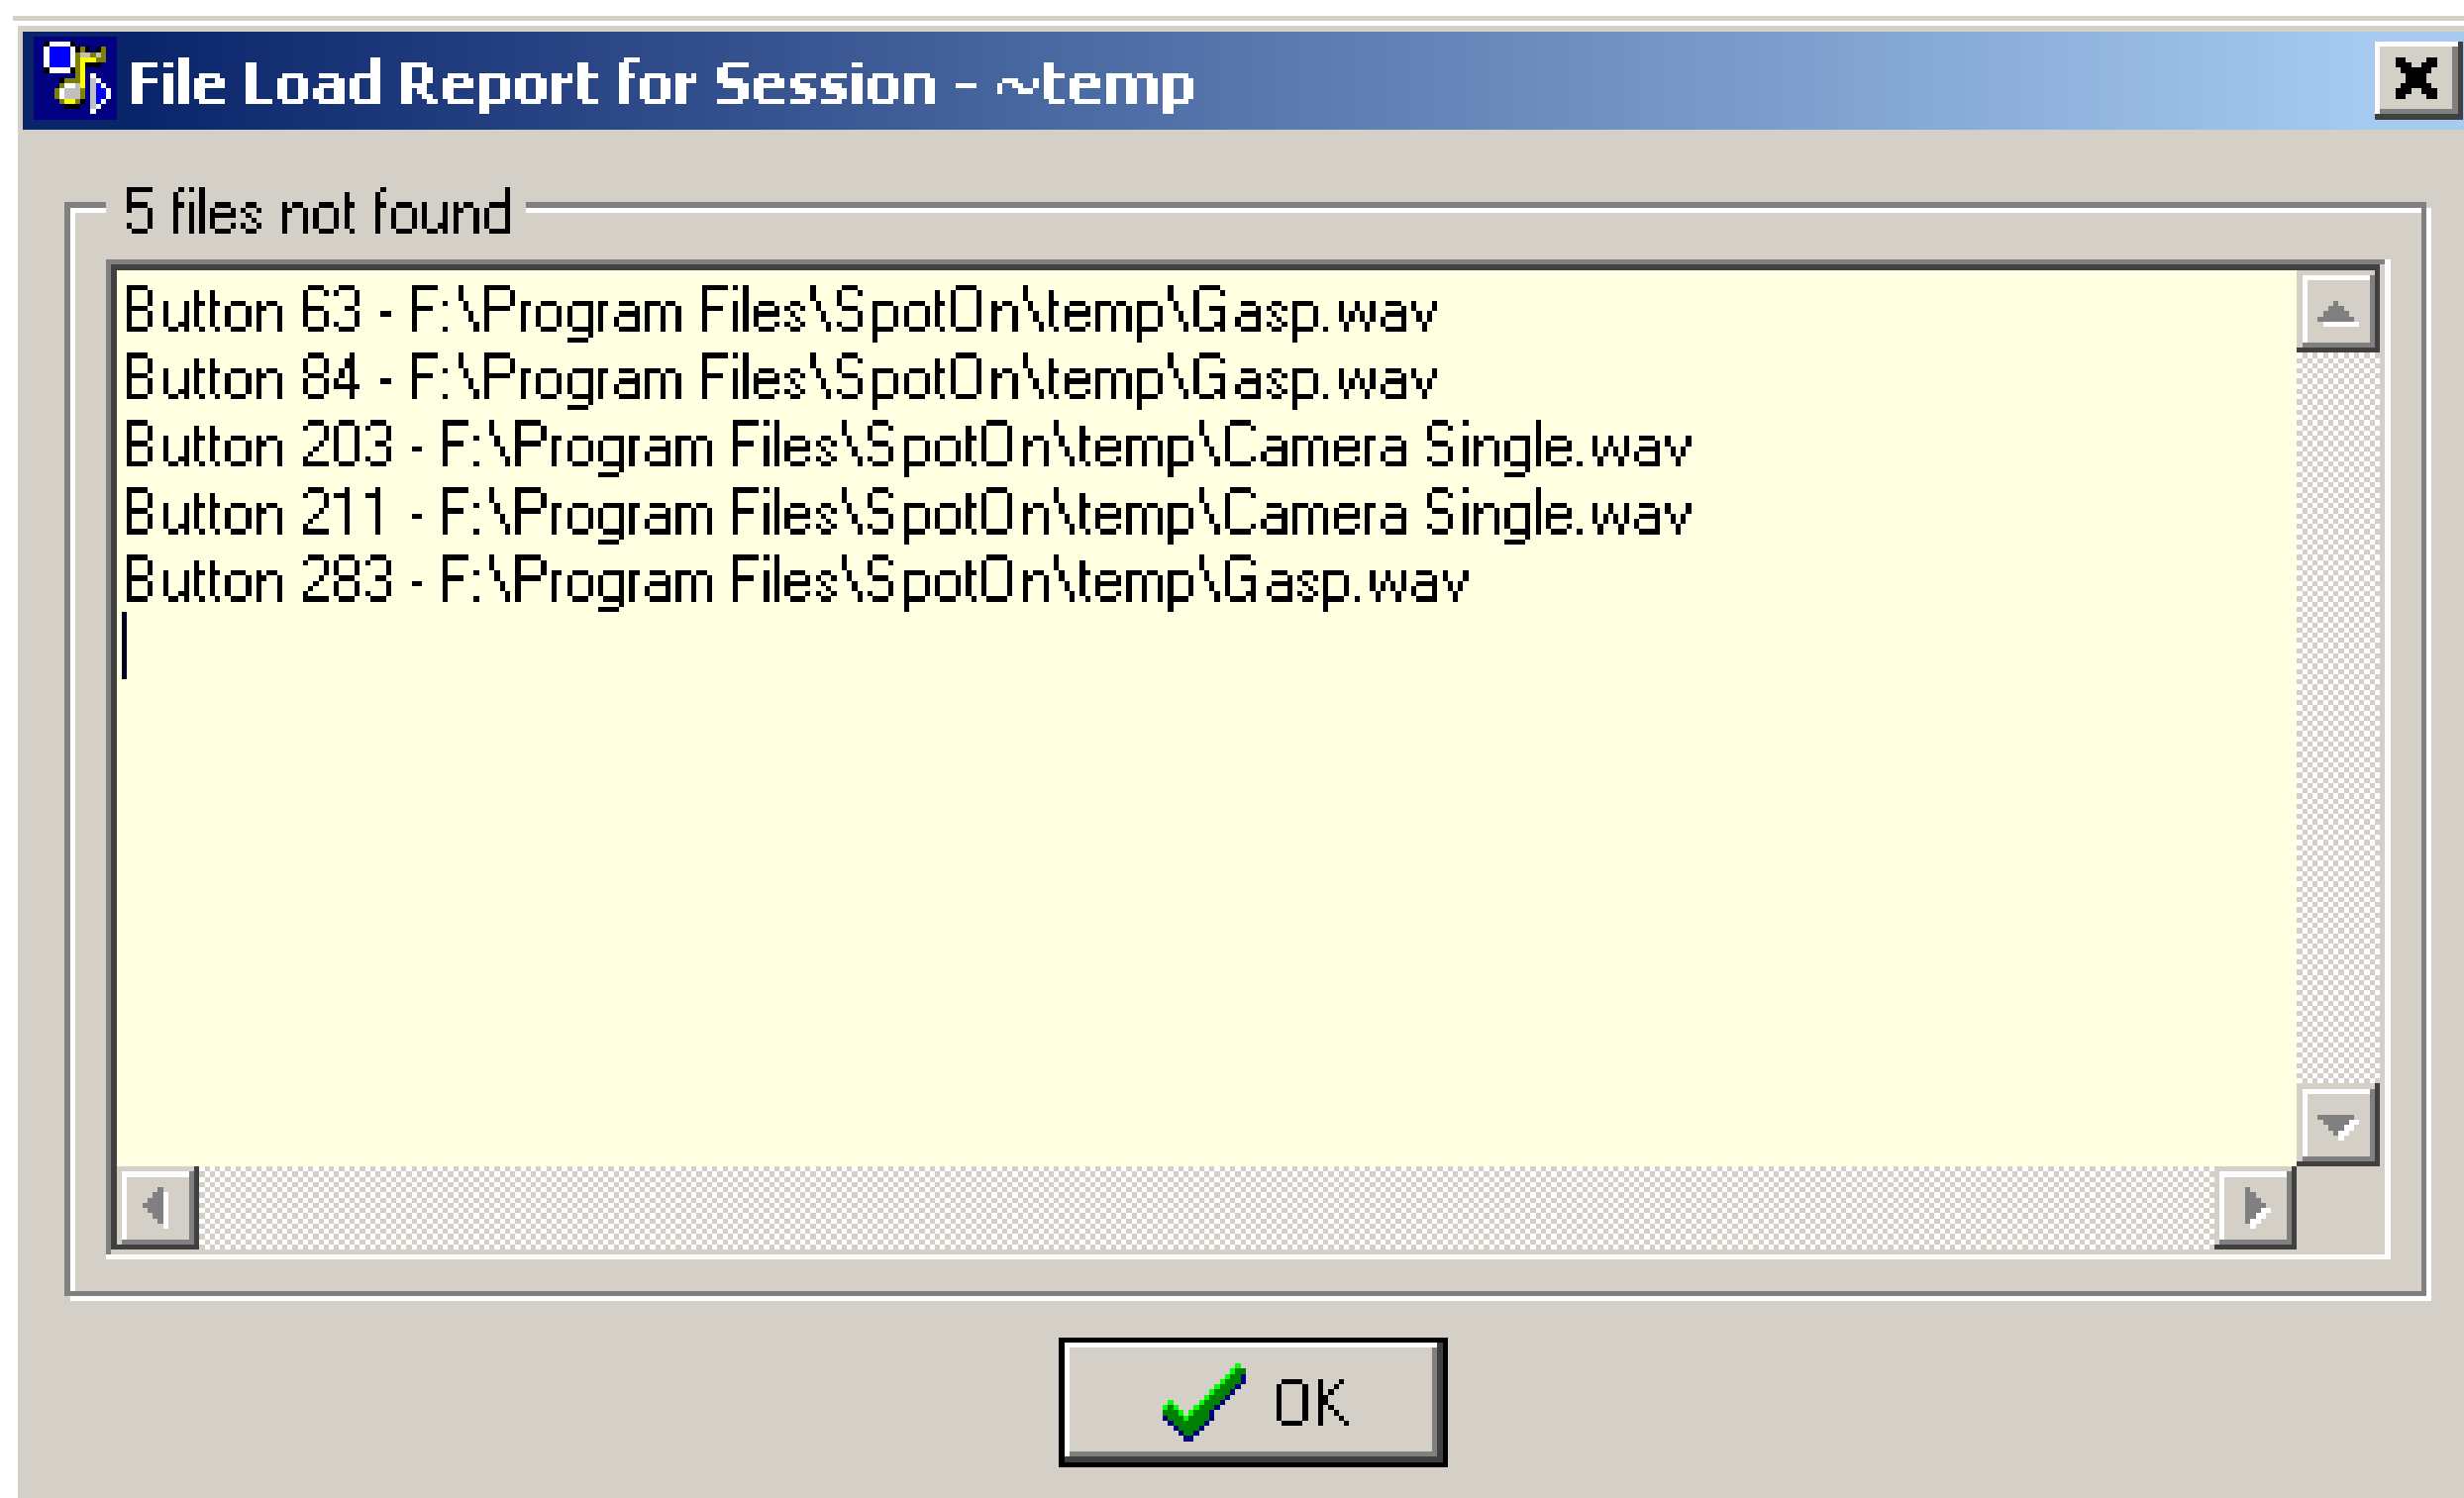

More comprehensive debug logs can be saved via the Global|Utilities menu

Load Session

Load Session

This option will load the selected session file which will contain the button assignments and any parameters that have been set such as Master/Slave links, Hotkeys etc., to achieve this the audio tracks are assumed to be in the same location (disk drive/folder) as they were when the session was saved.

However it is possible that the audio tracks have been moved or possibly deleted, in this case SpotOn will report any missing files as shown below along with their last known location.

If the Try Remote Files option is checked, then the program will also attempt to search for the missing files in the location from which they were originally loaded eg CD or remote disk drive and then report as below.

Here there are two entries for each button, the first for the local copy of the file and the second for its original location, these reports are saved to the log file which can be viewed via Info|Logs

SpotOn will also detect audio files with a timestamp that is not the same as that when the session file was saved, usually indicating the file has been recently edited.

In this case if the playlist information has changed and it is possible the new playlist entries will be merged with the originals, also any fade out points that are now beyond the end of the file will be reset to default values.

This loading report is copied to the Event logs found under Info|Logs|Eventsso that any parameters changed can be reentered.

As a result of the possibility that some audio tracks may not be found or timestamps have been changed unintentionally by copying files, it is recommended that the session and audio data are saved together in a Package .

File Not Found

If files cannot be found, the buttons concerned are shown with the text 'File not found' instead of the Trackname

Note: It is important that a copy of the original session file is made using Windows Explorer before any attempts are made to recover missing files, this is to ensure the original session data is not inadvertently modified.

The right-click menu on this button contains an extra entry 'Locate File'

Choose Locate File to find the missing file and copy it to the original location where SpotOn was expecting to find the file or to copy it to a new location and modify the session file accordingly.

The Locate File dialog is shown below, on the left hand side is the procedure for locating/copying the file and on the right hand side the file locations.

Folder locations: -

Working down from the top right - the Original Remote File location points to the original source of the track, this could be a CD or server which maybe no longer accessible, in which case it will be shown in red text.

Original Remote file location:-
T:\STwain5.wav

The Original File location is where SpotOn expected to find the file, again this will be shown in red text if the location cannot be accessed

Original Local file location:-
G:\STwain5.wav

The Replacement WAV location is where SpotOn will now look for the audio file

Replacement WAV file:-

Once a replacement file has been located it can be copied to a new location, SpotOn will change the references to the audio file to point to the new location, the 'Change' button opens a folder selection dialog allowing the new location to be specified.

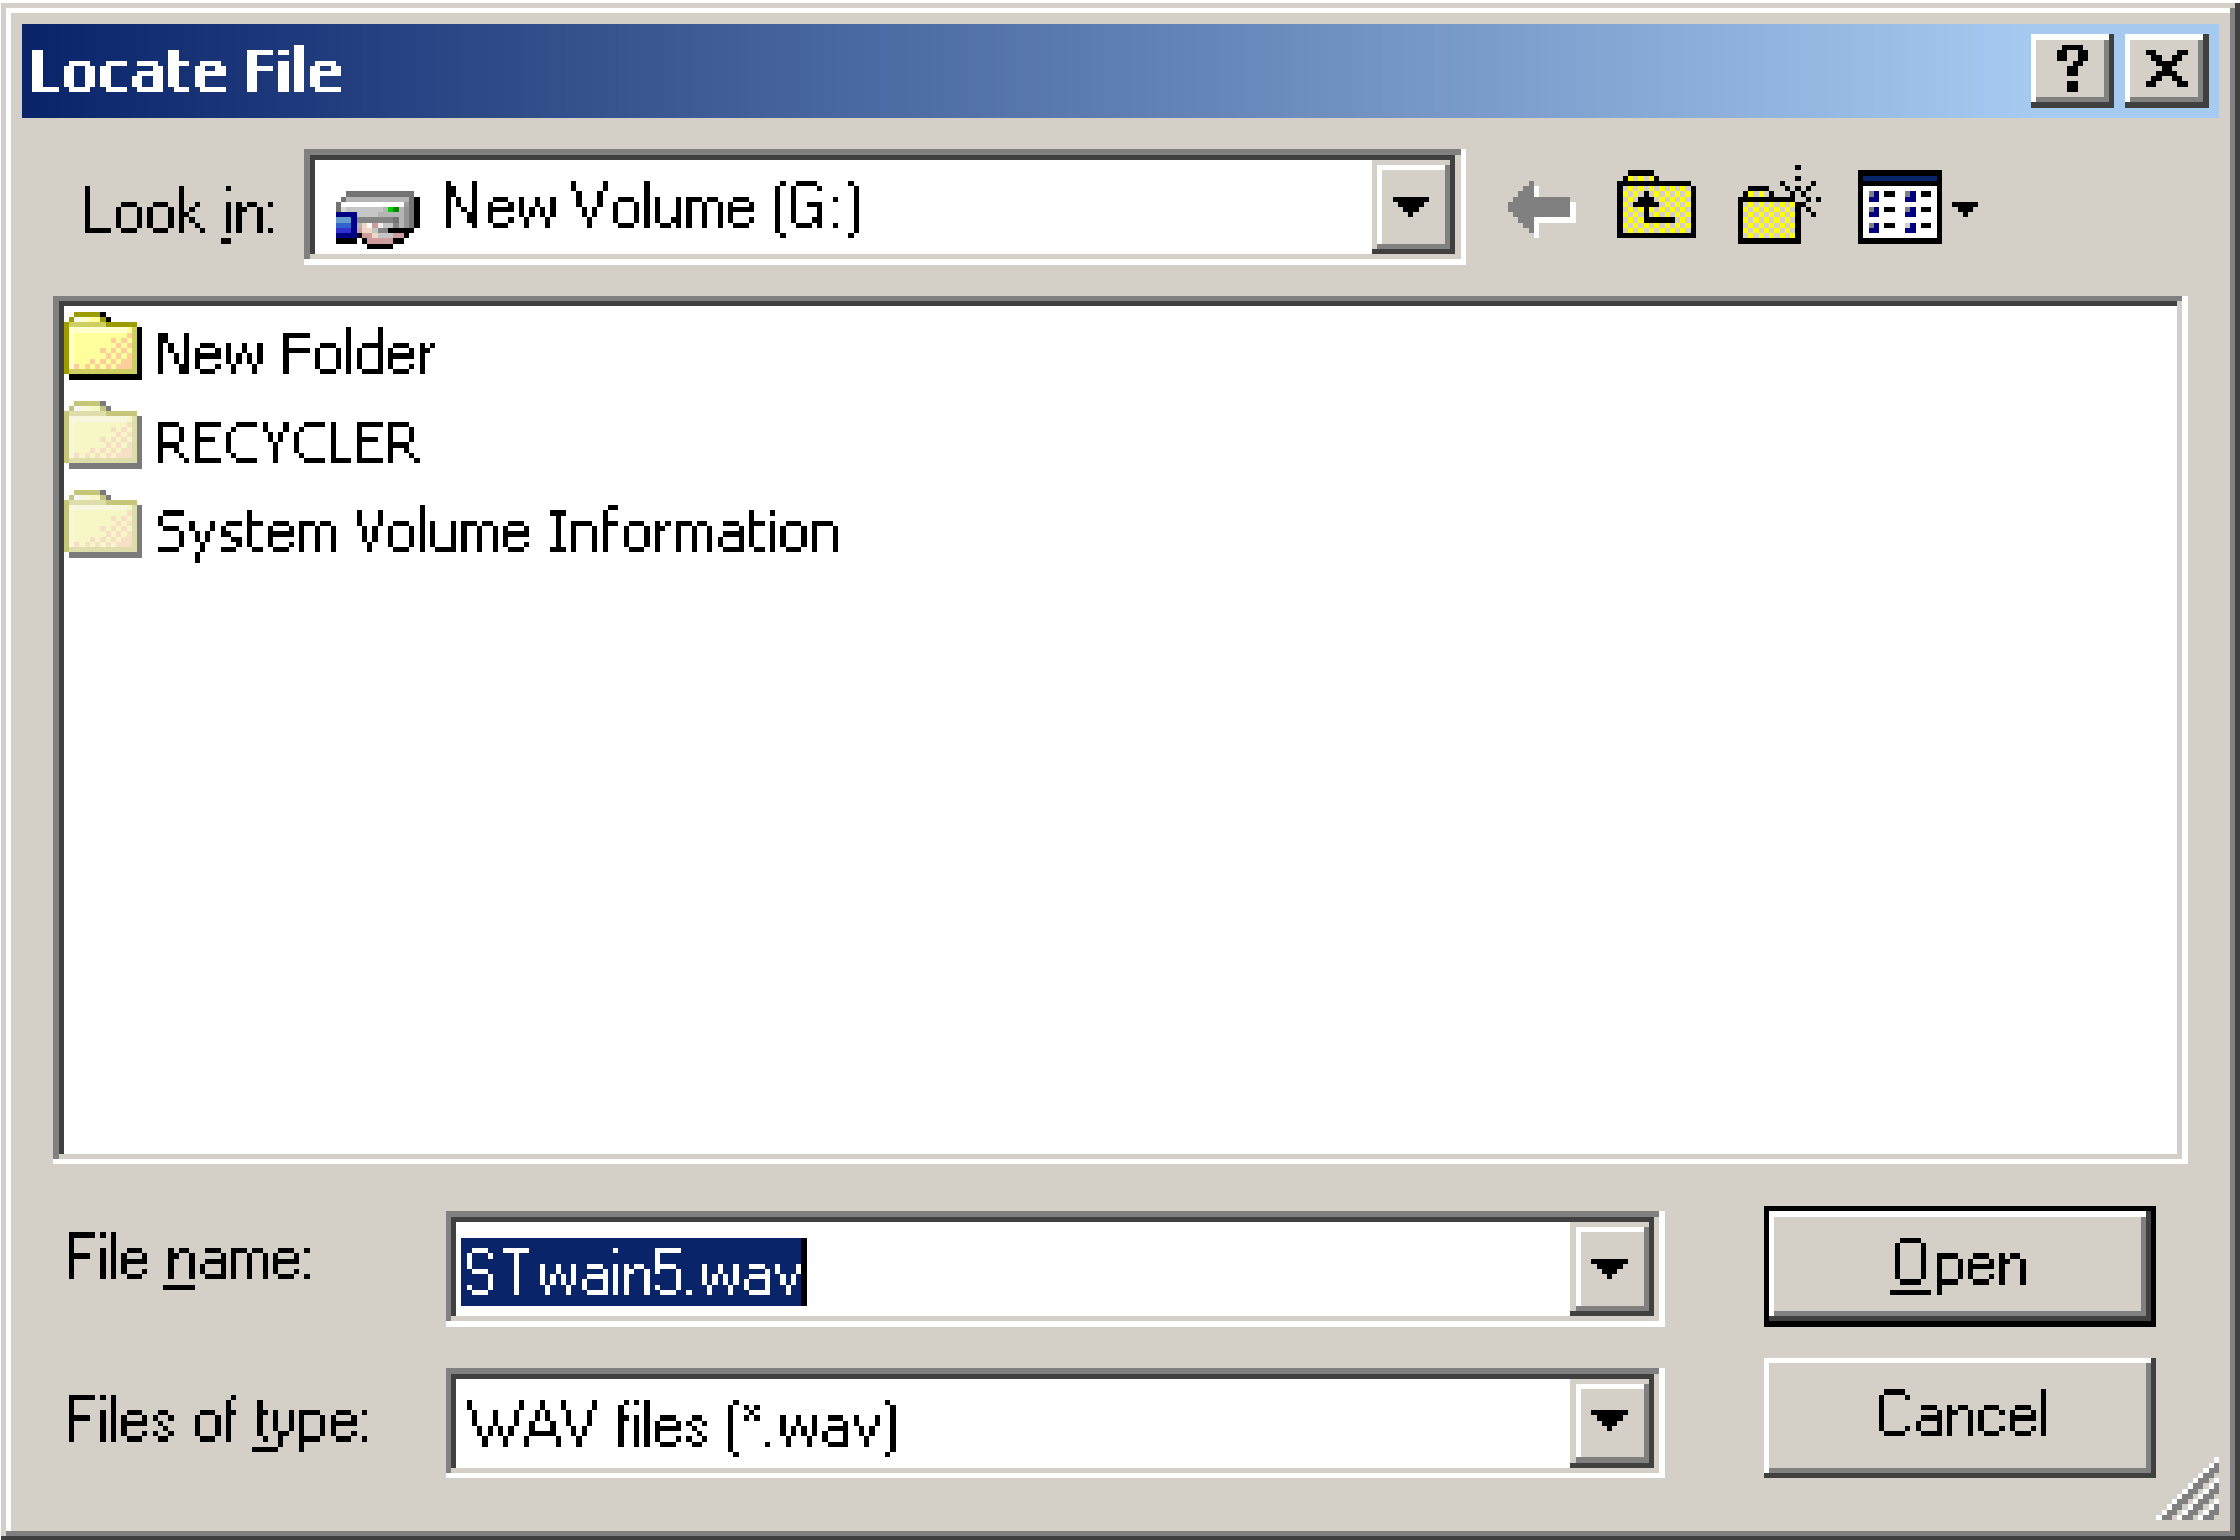

Lastly the session file that contains the changed filenames can be either the default current session or another new session file, the 'Change' button allows a new session file name to be entered

Procedure: -

On the left of the dialog are listed the three steps to find the missing file, the steps are selected via hyperlinks indicated by blue text which is underlined when active, the vertical green bar shows the current step in the procedure.

The first step is to locate the missing file, clicking on Browse will display a file dialog window

Here the file named 'STwain5.wav' no longer exists but in this case it is know to have been moved into the New Folder.

Once a replacement file has been assigned it is shown on the right of the dialog as a Replacement WAV file and the bar highlight on the far left moves to step 2

The hint panel at the bottom of the window give brief notes on the options available

Locate File Missing from Btn 18
✕

Missing file - "STwain5"

Procedure

1, [Browse](#) to locate Replacement WAV file

2a, Copy Replacement file to [original location](#)
or
2b, Modify Session file to use Replacement file in its [current location](#)
or
2c, Copy Replacement file to new location and modify session accordingly

3a, Reload Session
or
3b, Reload session and select next button with missing WAV file

Original Remote file location:-
T:\STwain5.wav

Original Local file location:-
G:\STwain5.wav

Replacement WAV file:-
G:\New Folder\STwain5.wav

Optional new location for Replacement WAV file:- Change...

Modify WAV file paths in current Session and save to:- Change...
Current Session...
F:\xtemp.dta

2a - Replacement WAV file can be copied to the original location stored in the Session file
2b - Modify the loaded session to use the Replacement WAV file in its current location and resave session or save to another specified session
2c - The Replacement WAV file can be copied to a new location but a new location has not been assigned

Some of the three options in step 2 may be disabled.

2a will be disabled if the original location does not exist on the computer, this may happen if a session has been copied from another computer or the computer disc drive configuration has been changed.

2b will always be enabled

2c is initially disabled until a new location is specified via the section below

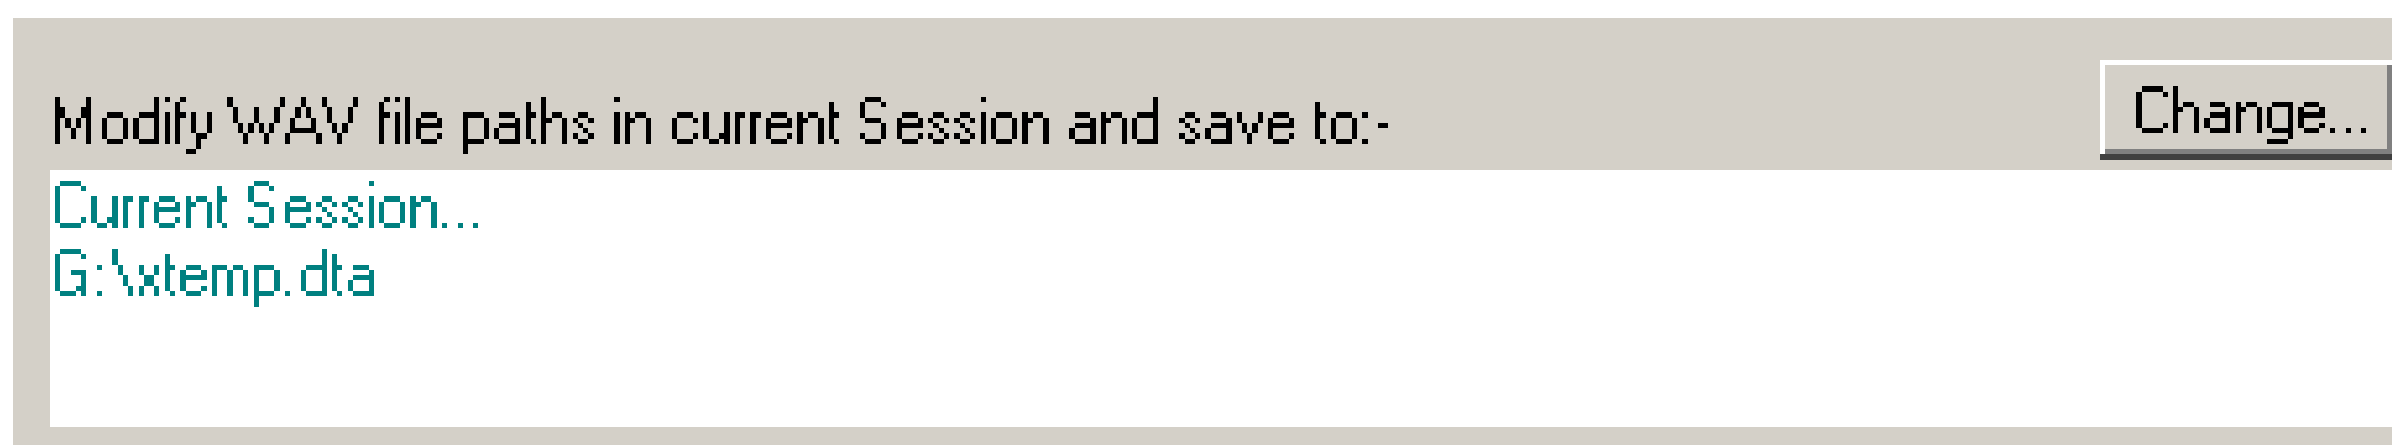

Click on the Change button to define a new location for the replacement WAV file

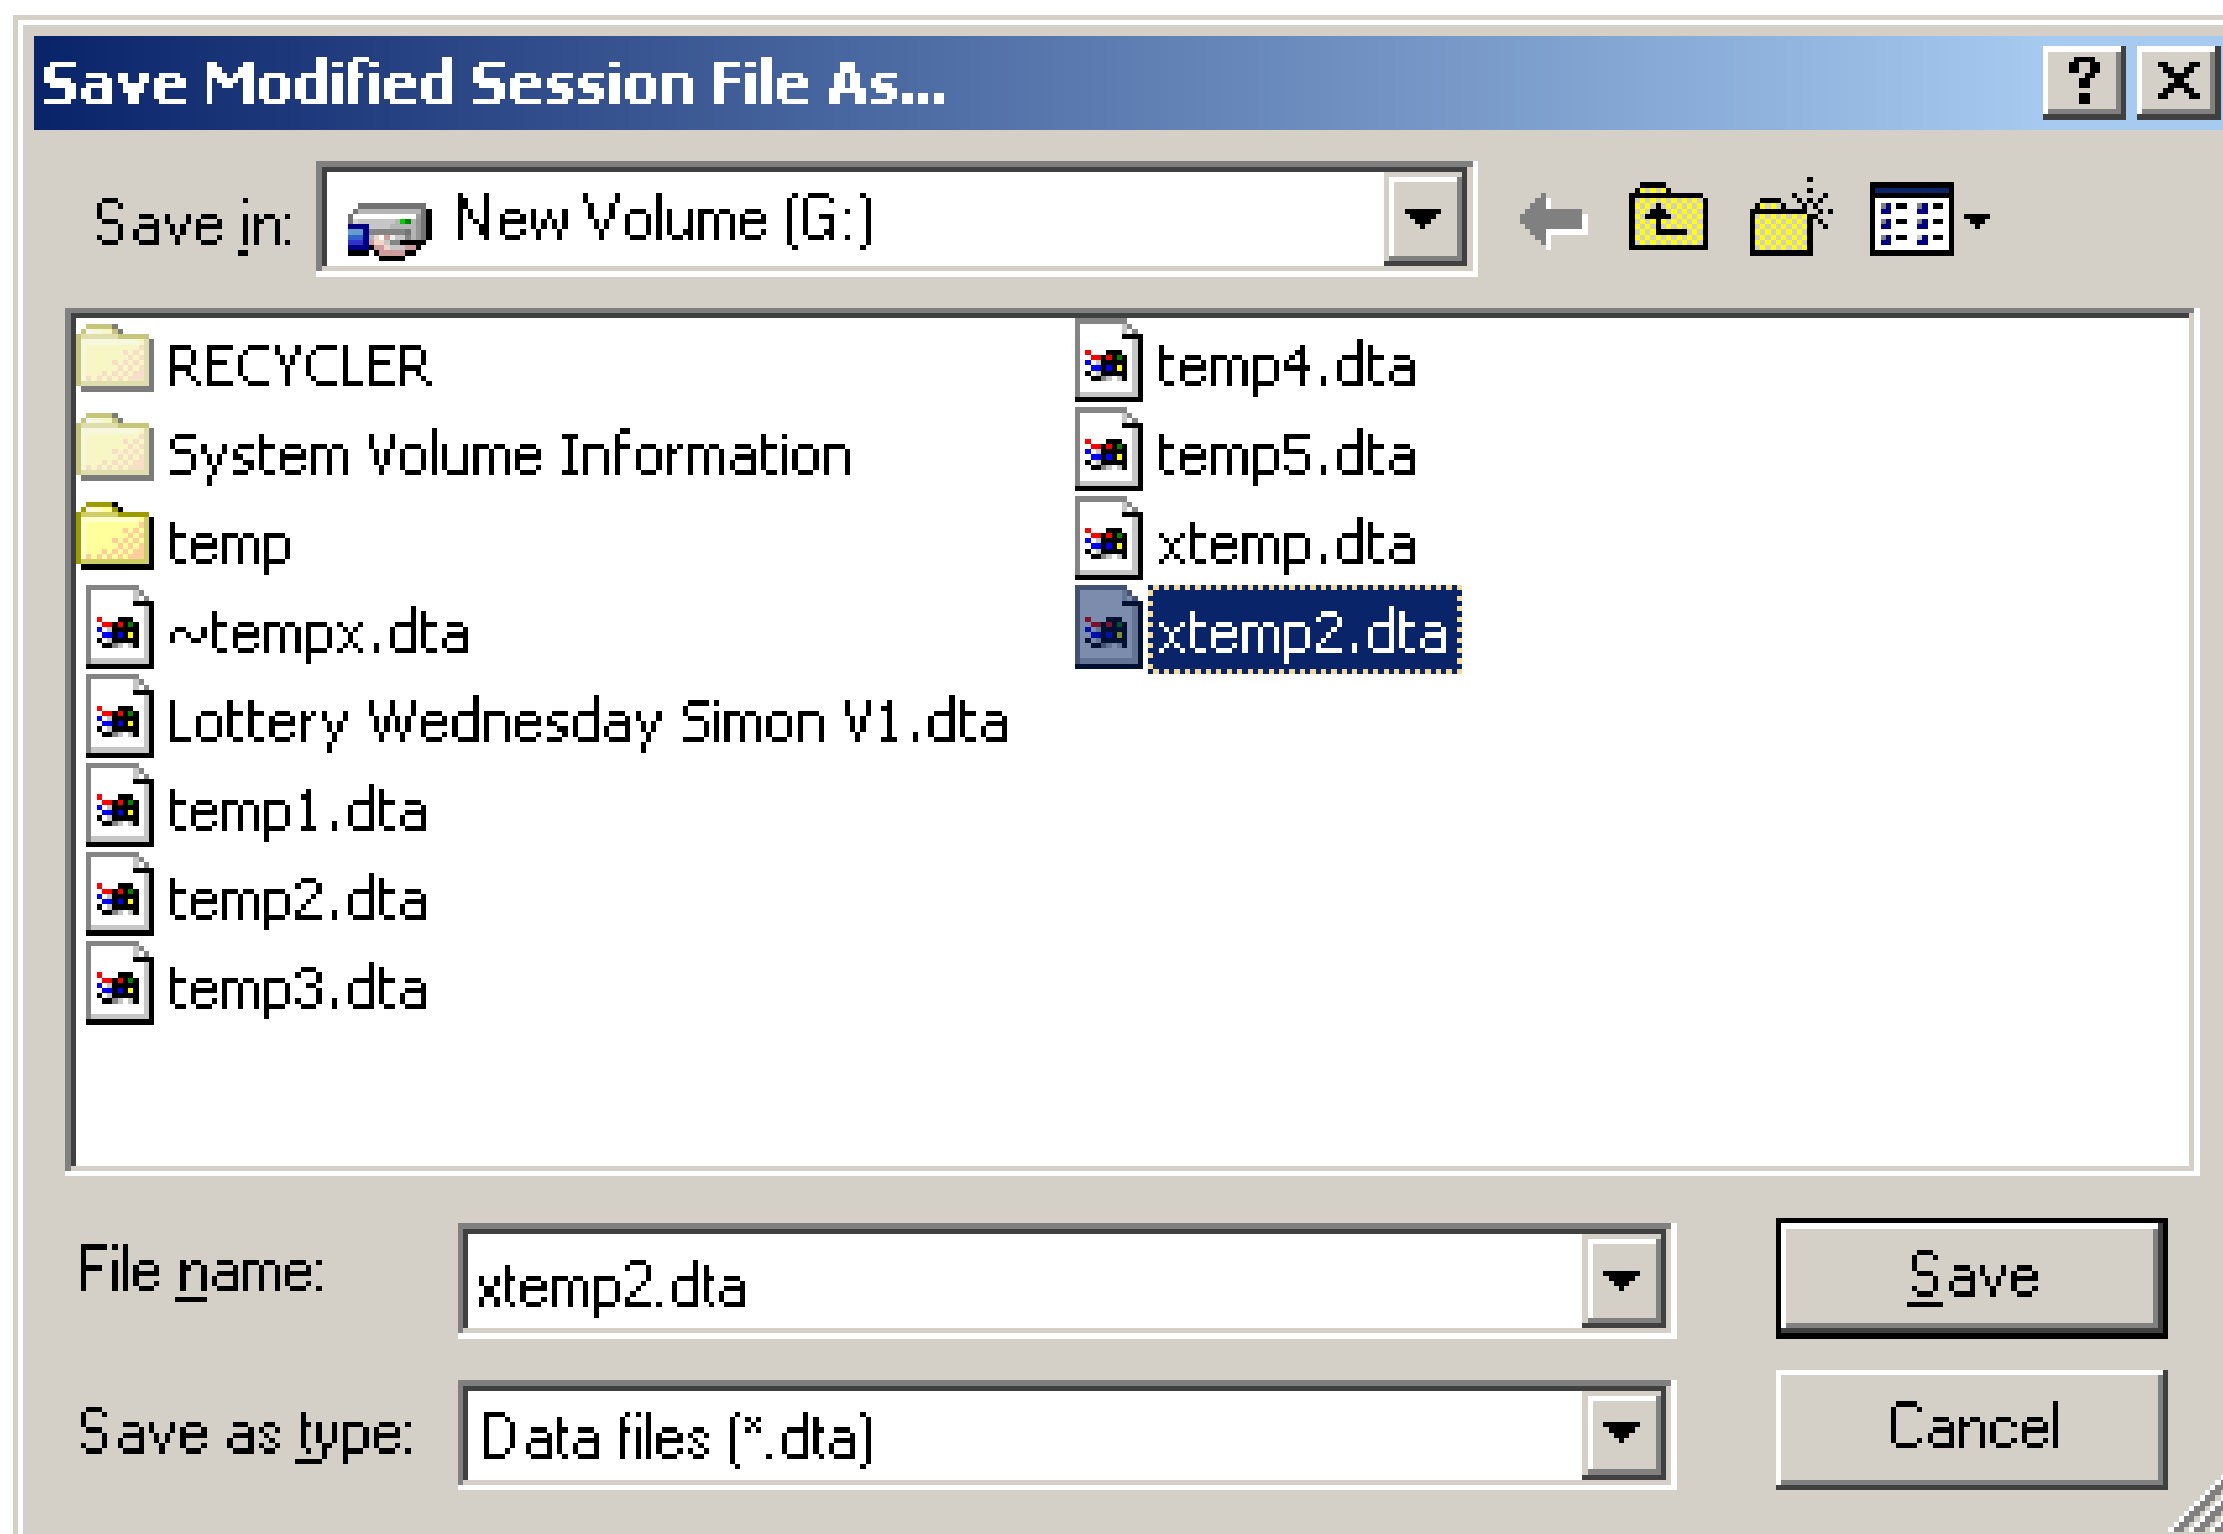

The alternative location is now specified and item 2c is enabled

When the available options change the hint panel text is highlighted to indicate that it has been updated.

If the session data is to be modified the default is to modify the currently loaded session, alternatively another session name can be assigned by using the Change button

This displays a dialog box where the new session filename can be entered

This is then reflected in the main dialog window

Clicking on any one of the options 2a, 2b or 2c will then move to step 3.

If when copying a file, a file of the same name is found in the destination folder a warning dialog will be shown

Finally on step 3 the two options are to reload the current session or to reload and select the next button with a missing WAV file.

Choosing 'select next button' will cause SpotOn to scan the remaining buttons for missing files and if the missing audio file is found in the same folder as the previous missing file then the session will be automatically modified with the new location.

Locate File Missing from Btn 18

Missing file - "STwain5"

Procedure

1, [Browse](#) to locate Replacement WAV file

2a, Copy Replacement file to [original location](#)

or

2b, Modify Session file to use Replacement file in its [current location](#)

or

2c, Copy Replacement file to [new location](#) and modify session accordingly

3a, [Reload Session](#)

or

3b, Reload session and [select next button](#) with missing WAV file

Original Remote file location:-
[G:\STwain5.wav](#)

Original Local file location:-
[G:\STwain5.wav](#)

Replacement WAV file:-
[G:\New Folder\STwain5.wav](#)

Optional new location for Replacement WAV file:-
[F:\Audio Files\STwain5.wav](#)

Change...

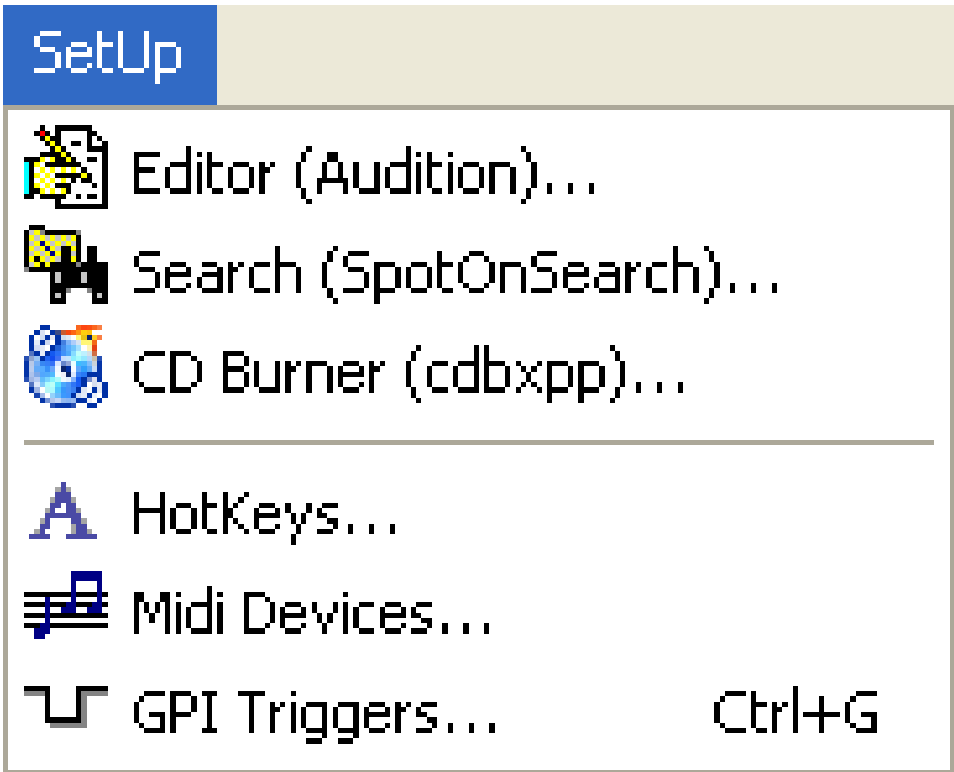

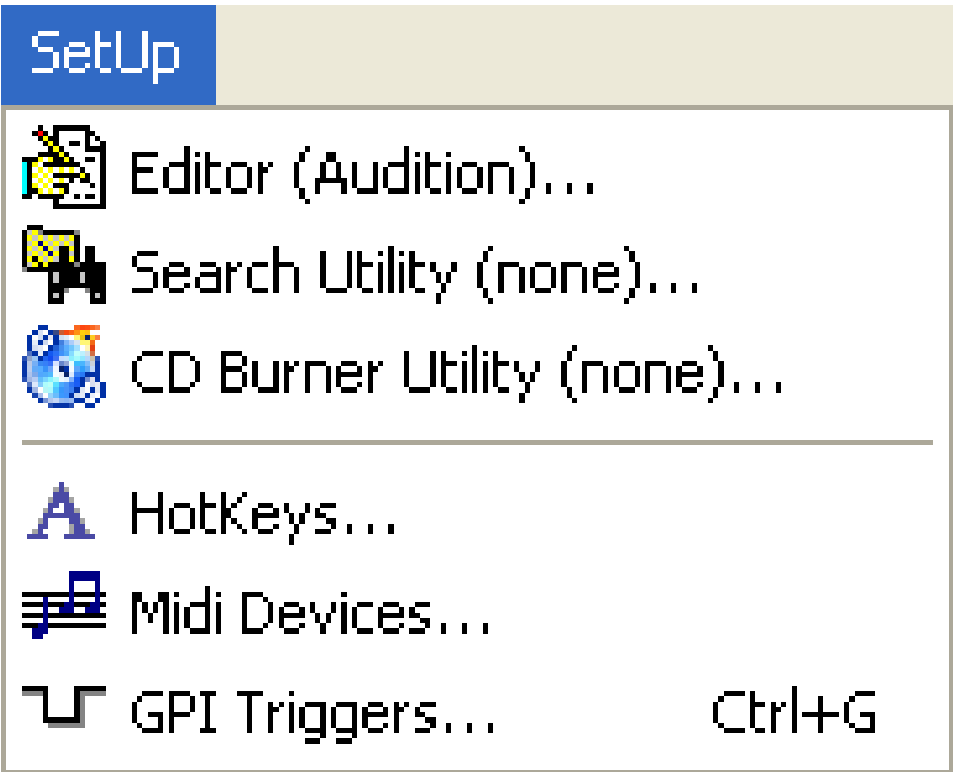

Modify WAV file paths in current Session and save to:-
[Alternate Session...](#)
[F:\xtemp2.dta](#)

Change...

3a - Close dialog and reload Session file

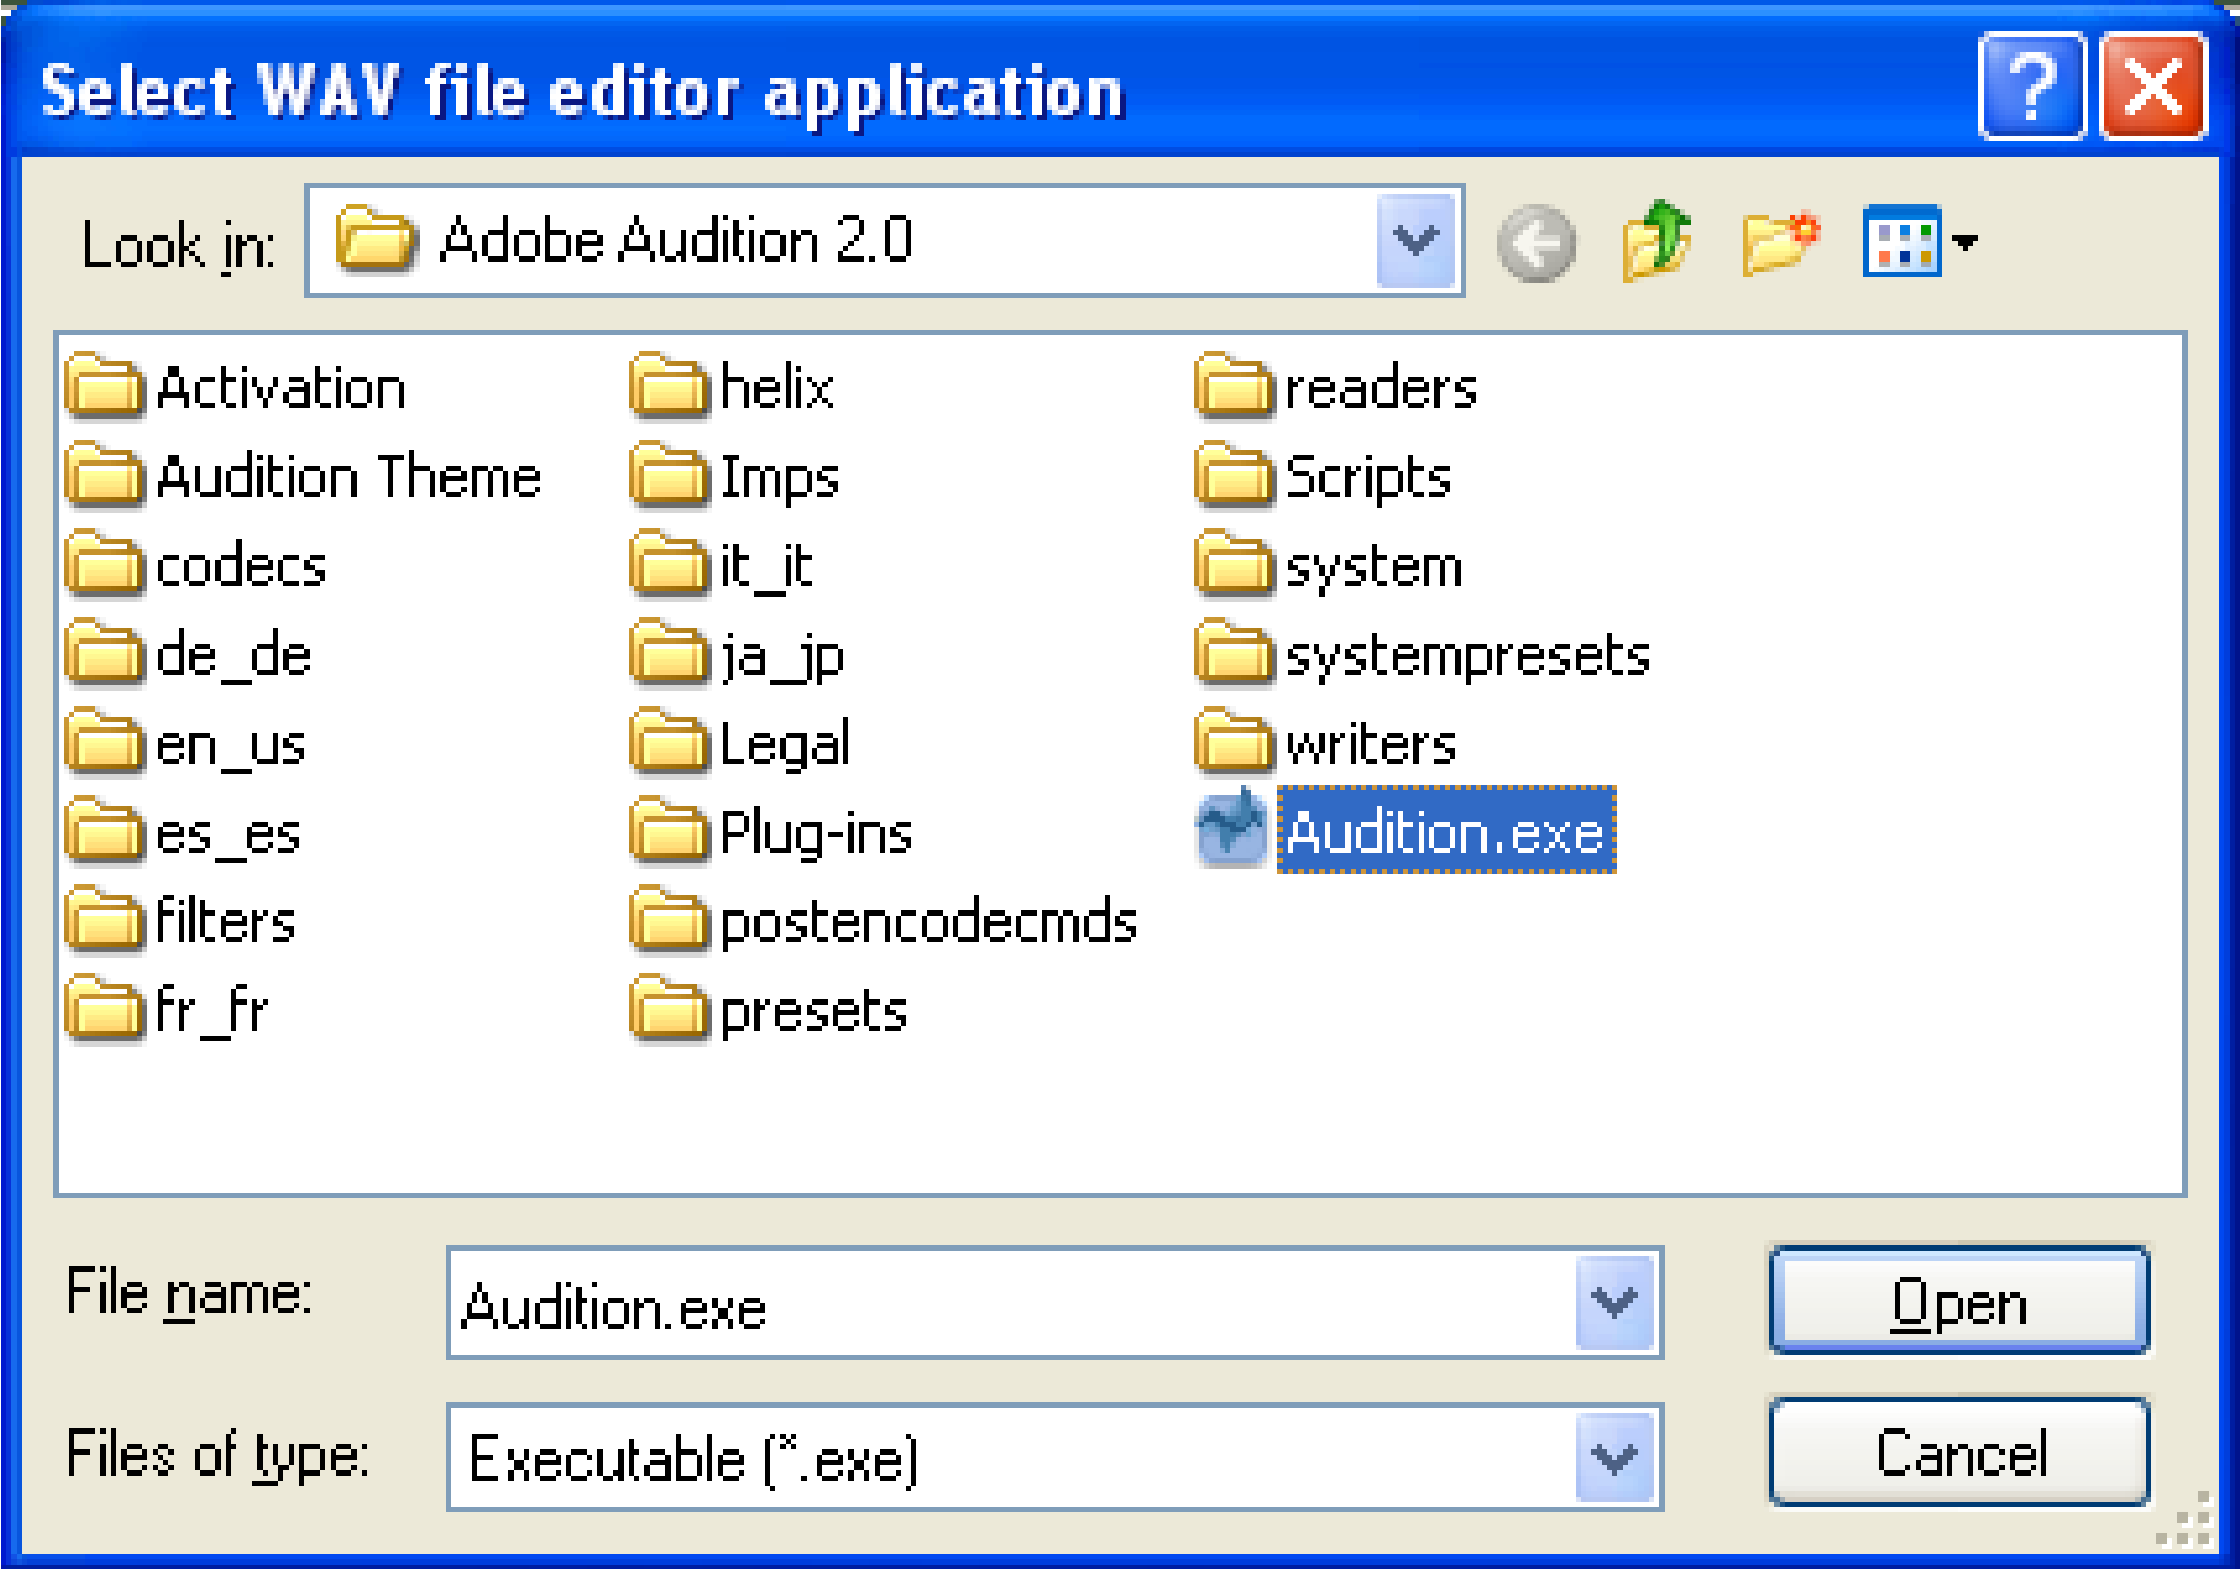

3b - Close dialog, reload Session file and reopen Locate File dialog with the next button having a missing track

SetUp Menu

Editor

Opens a file selector dialog to select an external WAV file editor, the editor application can then be called via the Edit option in the [Button Menu](#), the current editor name is shown in the menu item, a user selected editor is saved within the session file.

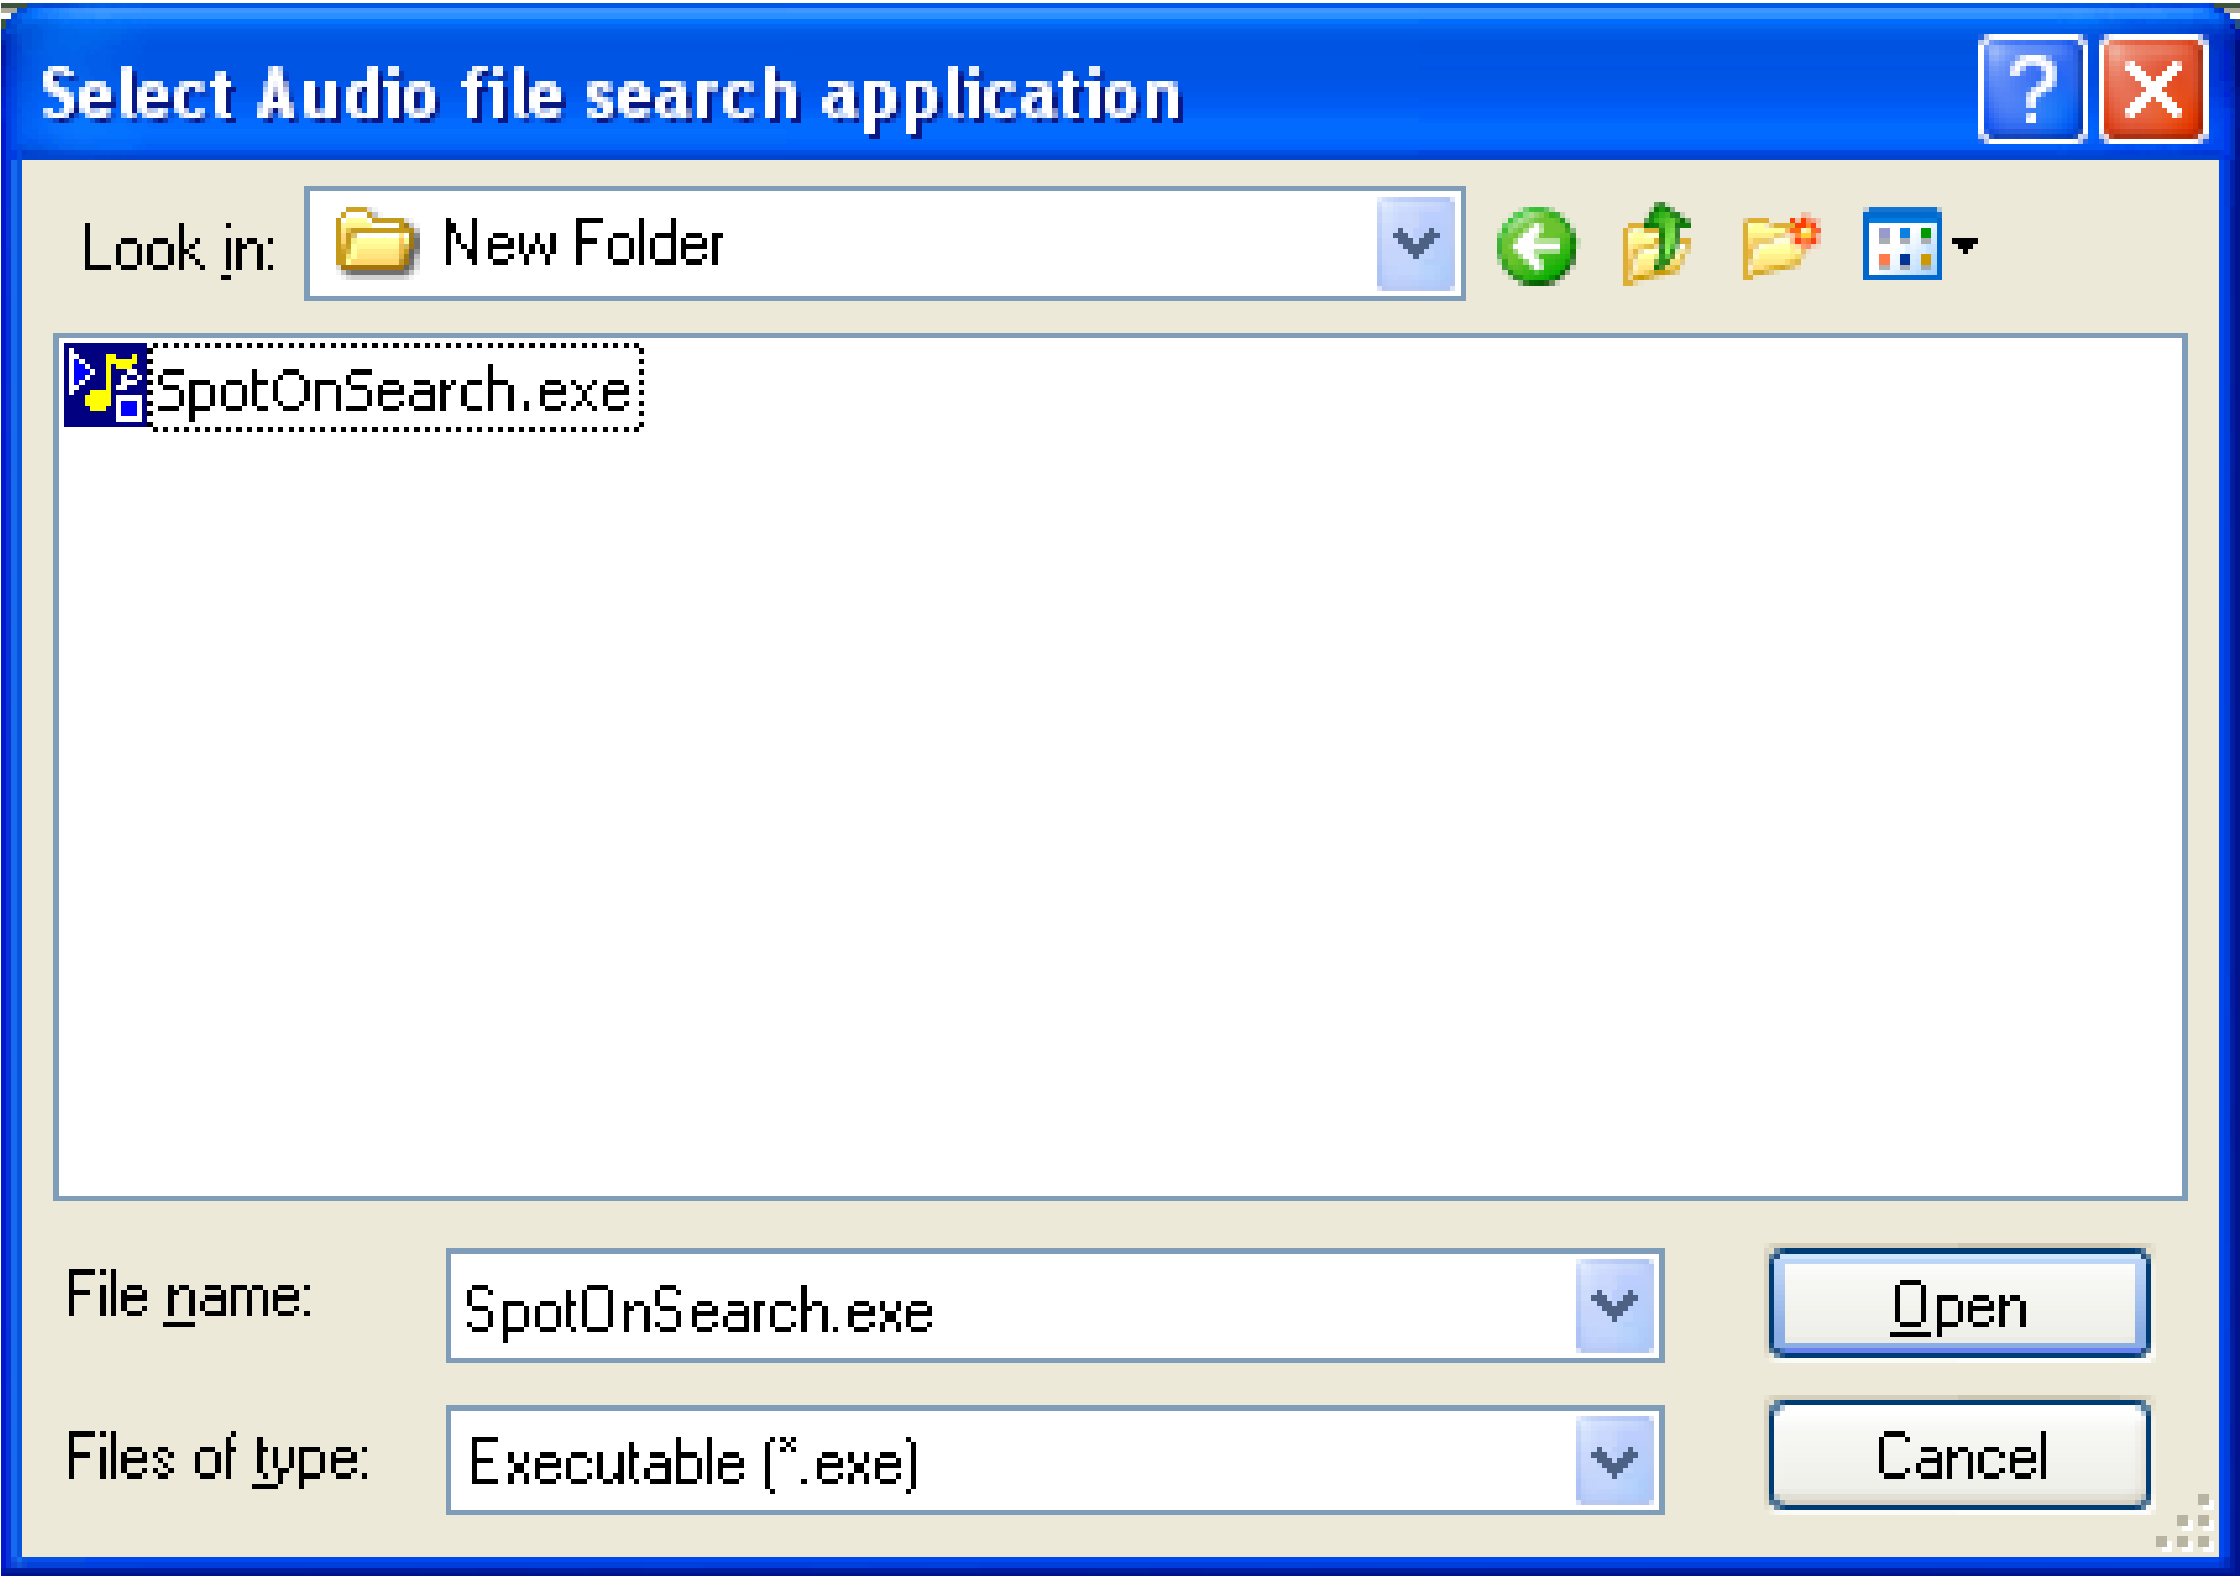

Selecting Cancel from the Editor select dialog will offer the option to clear the existing selection.

Search

Opens a file selector dialog to select an external file search utility, the utility can then be

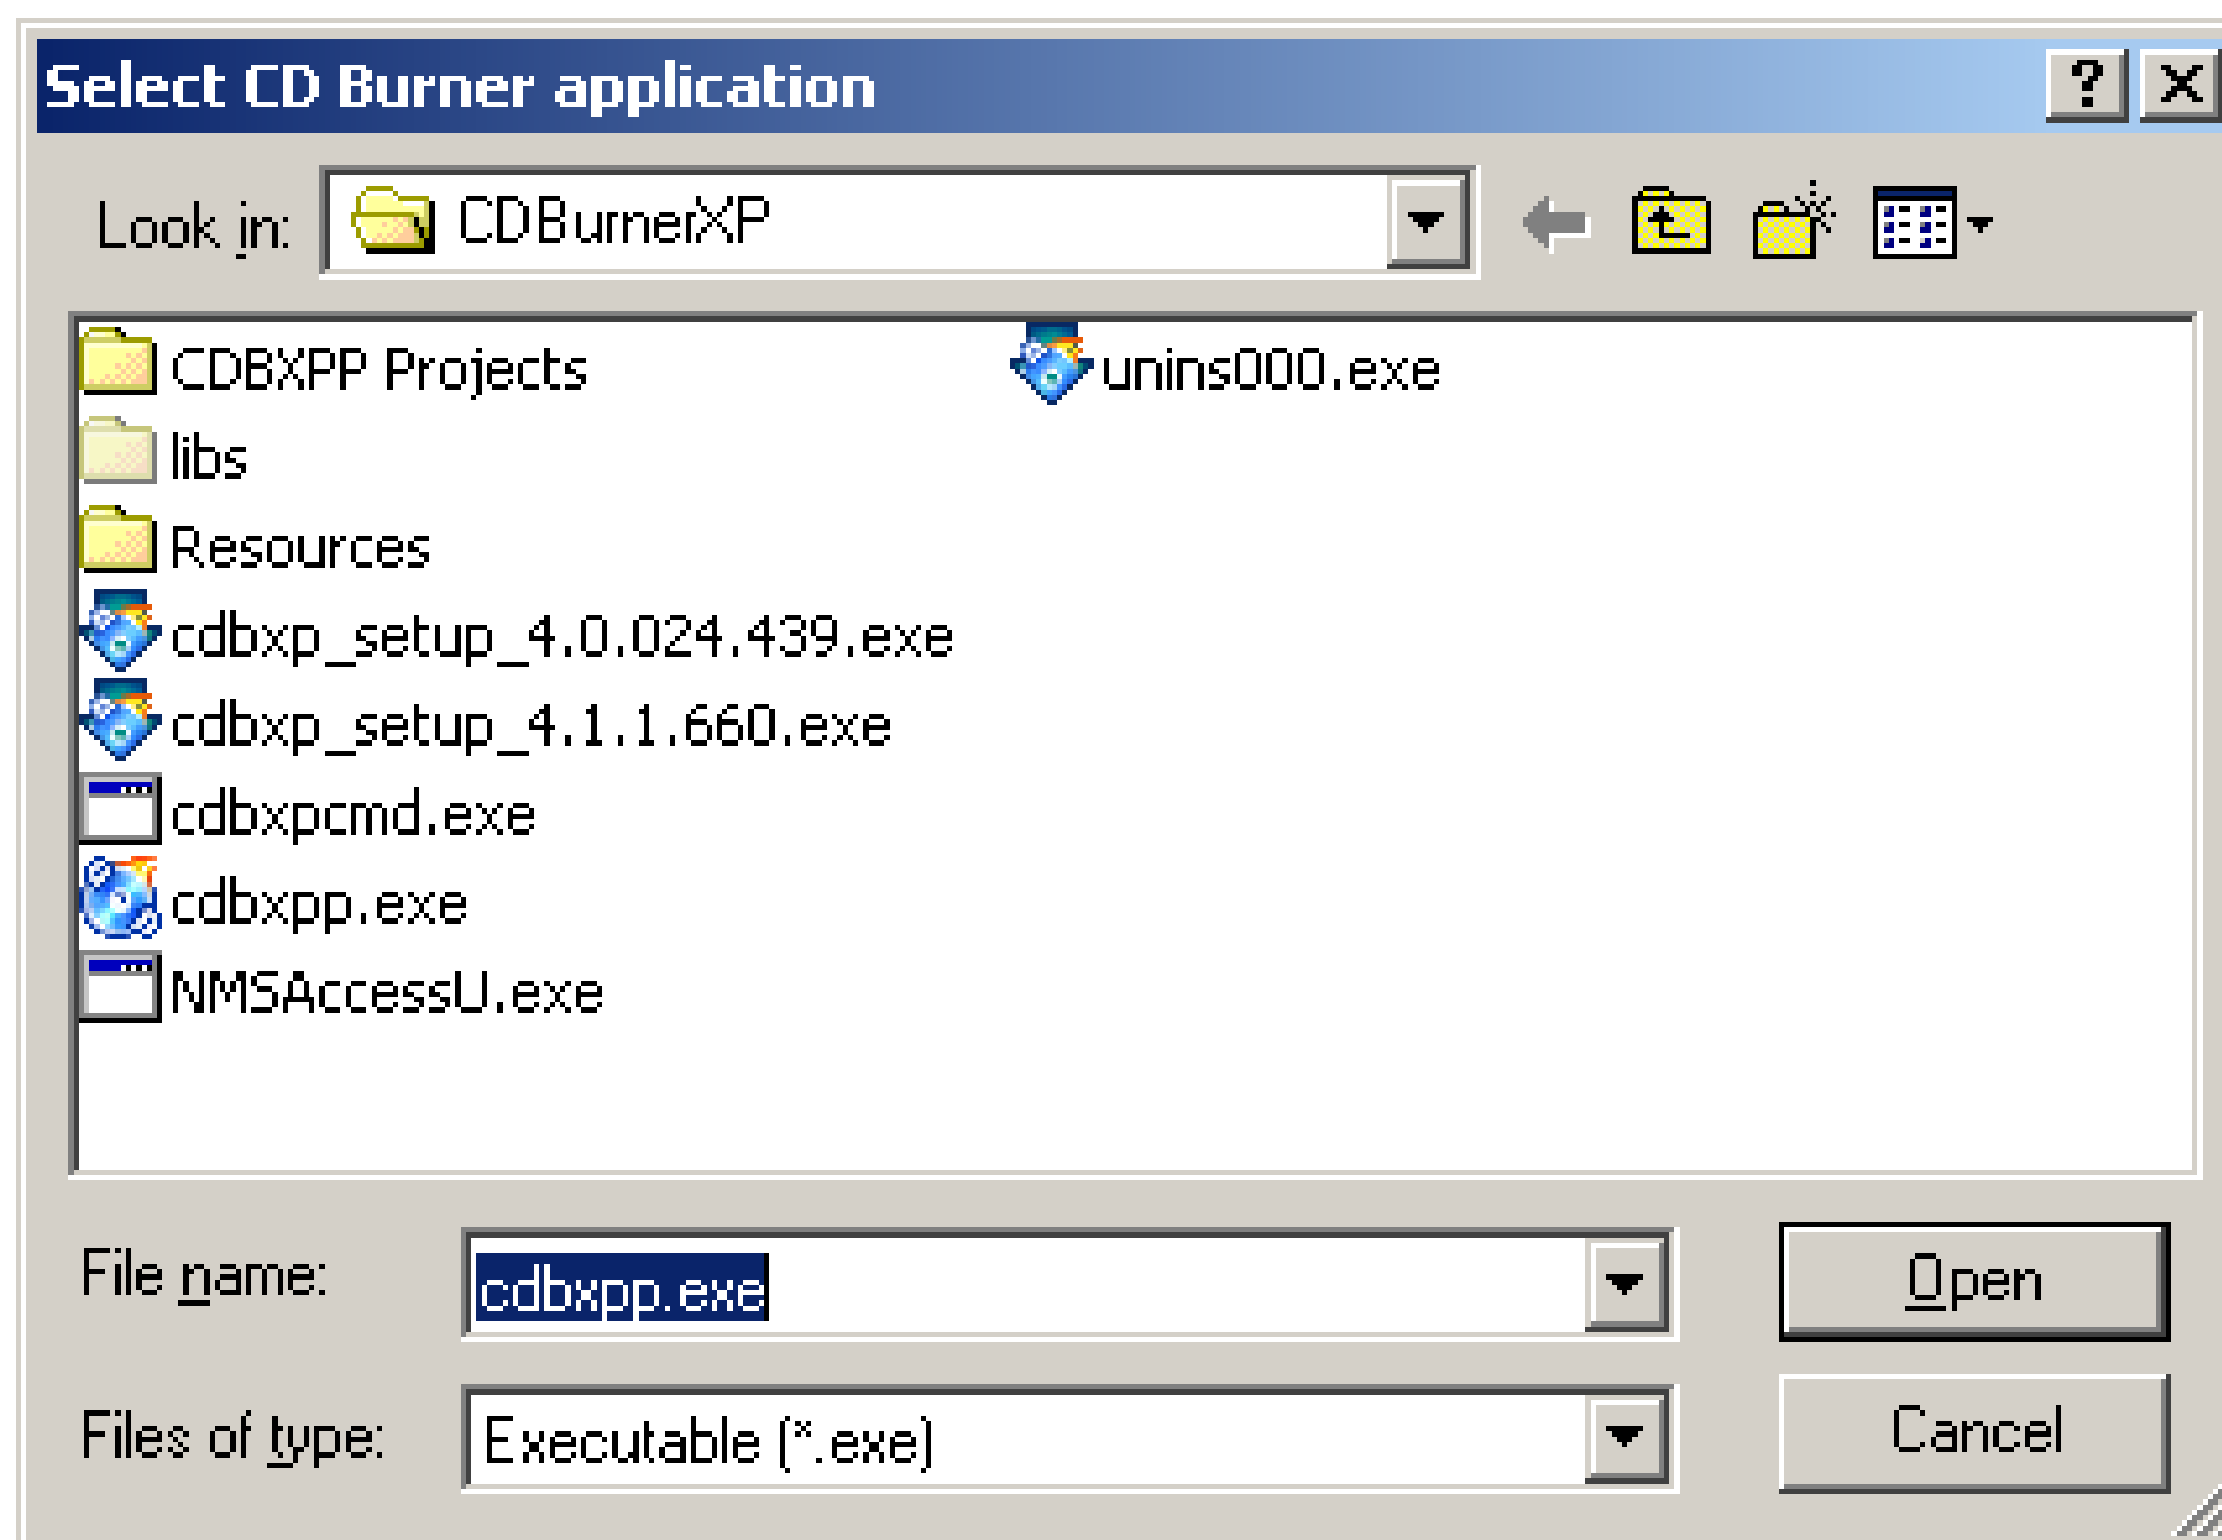

called via the Search option in the [File Menu](#), the name of the current search utility is shown in the menu item. A utility [SpotOnSearch](#) is packaged with the SpotOn for this purpose.

Selecting Cancel from the Search select dialog will offer the option to clear the existing selection.

CD Burner

Opens a file selector dialog to select an external CD Burner utility. SpotOn is configured to use a third party CD burner utility "CDBurnerXP", the latest version of which can be found at <http://www.cdburnerxp.se> .The utility can then be called via Ctrl+B or the CD Burner option in the [Global Utilities](#) menu, the name of the current utility is shown in the SetUp menu item shown above.

Selecting Cancel from the CD Burner select dialog will offer the option to clear the existing selection.

HotKeys

The action of pressing HotKeys can be handled in different ways.

The top selection in the setup dialog box Global/Paged defines the scope of the HotKeys, defining whether the HotKey press is restricted to act only on the currently selected page or applied to all pages globally.

The Ganged/Overlapped setting defines how buttons assigned to the same HotKey should act when the HotKey is pressed.

In Ganged mode all the buttons with the same HotKey will act together, alternatively in Overlapped mode the buttons with the same Hotkey will play in numerical sequence, starting with the first button not currently playing or with the least amount of time remaining if all buttons with the same HotKey are already playing.

Hotkey overlapped play action can also be triggered by a mouse left-click on a button, see [Advanced Operation](#) for further explanation

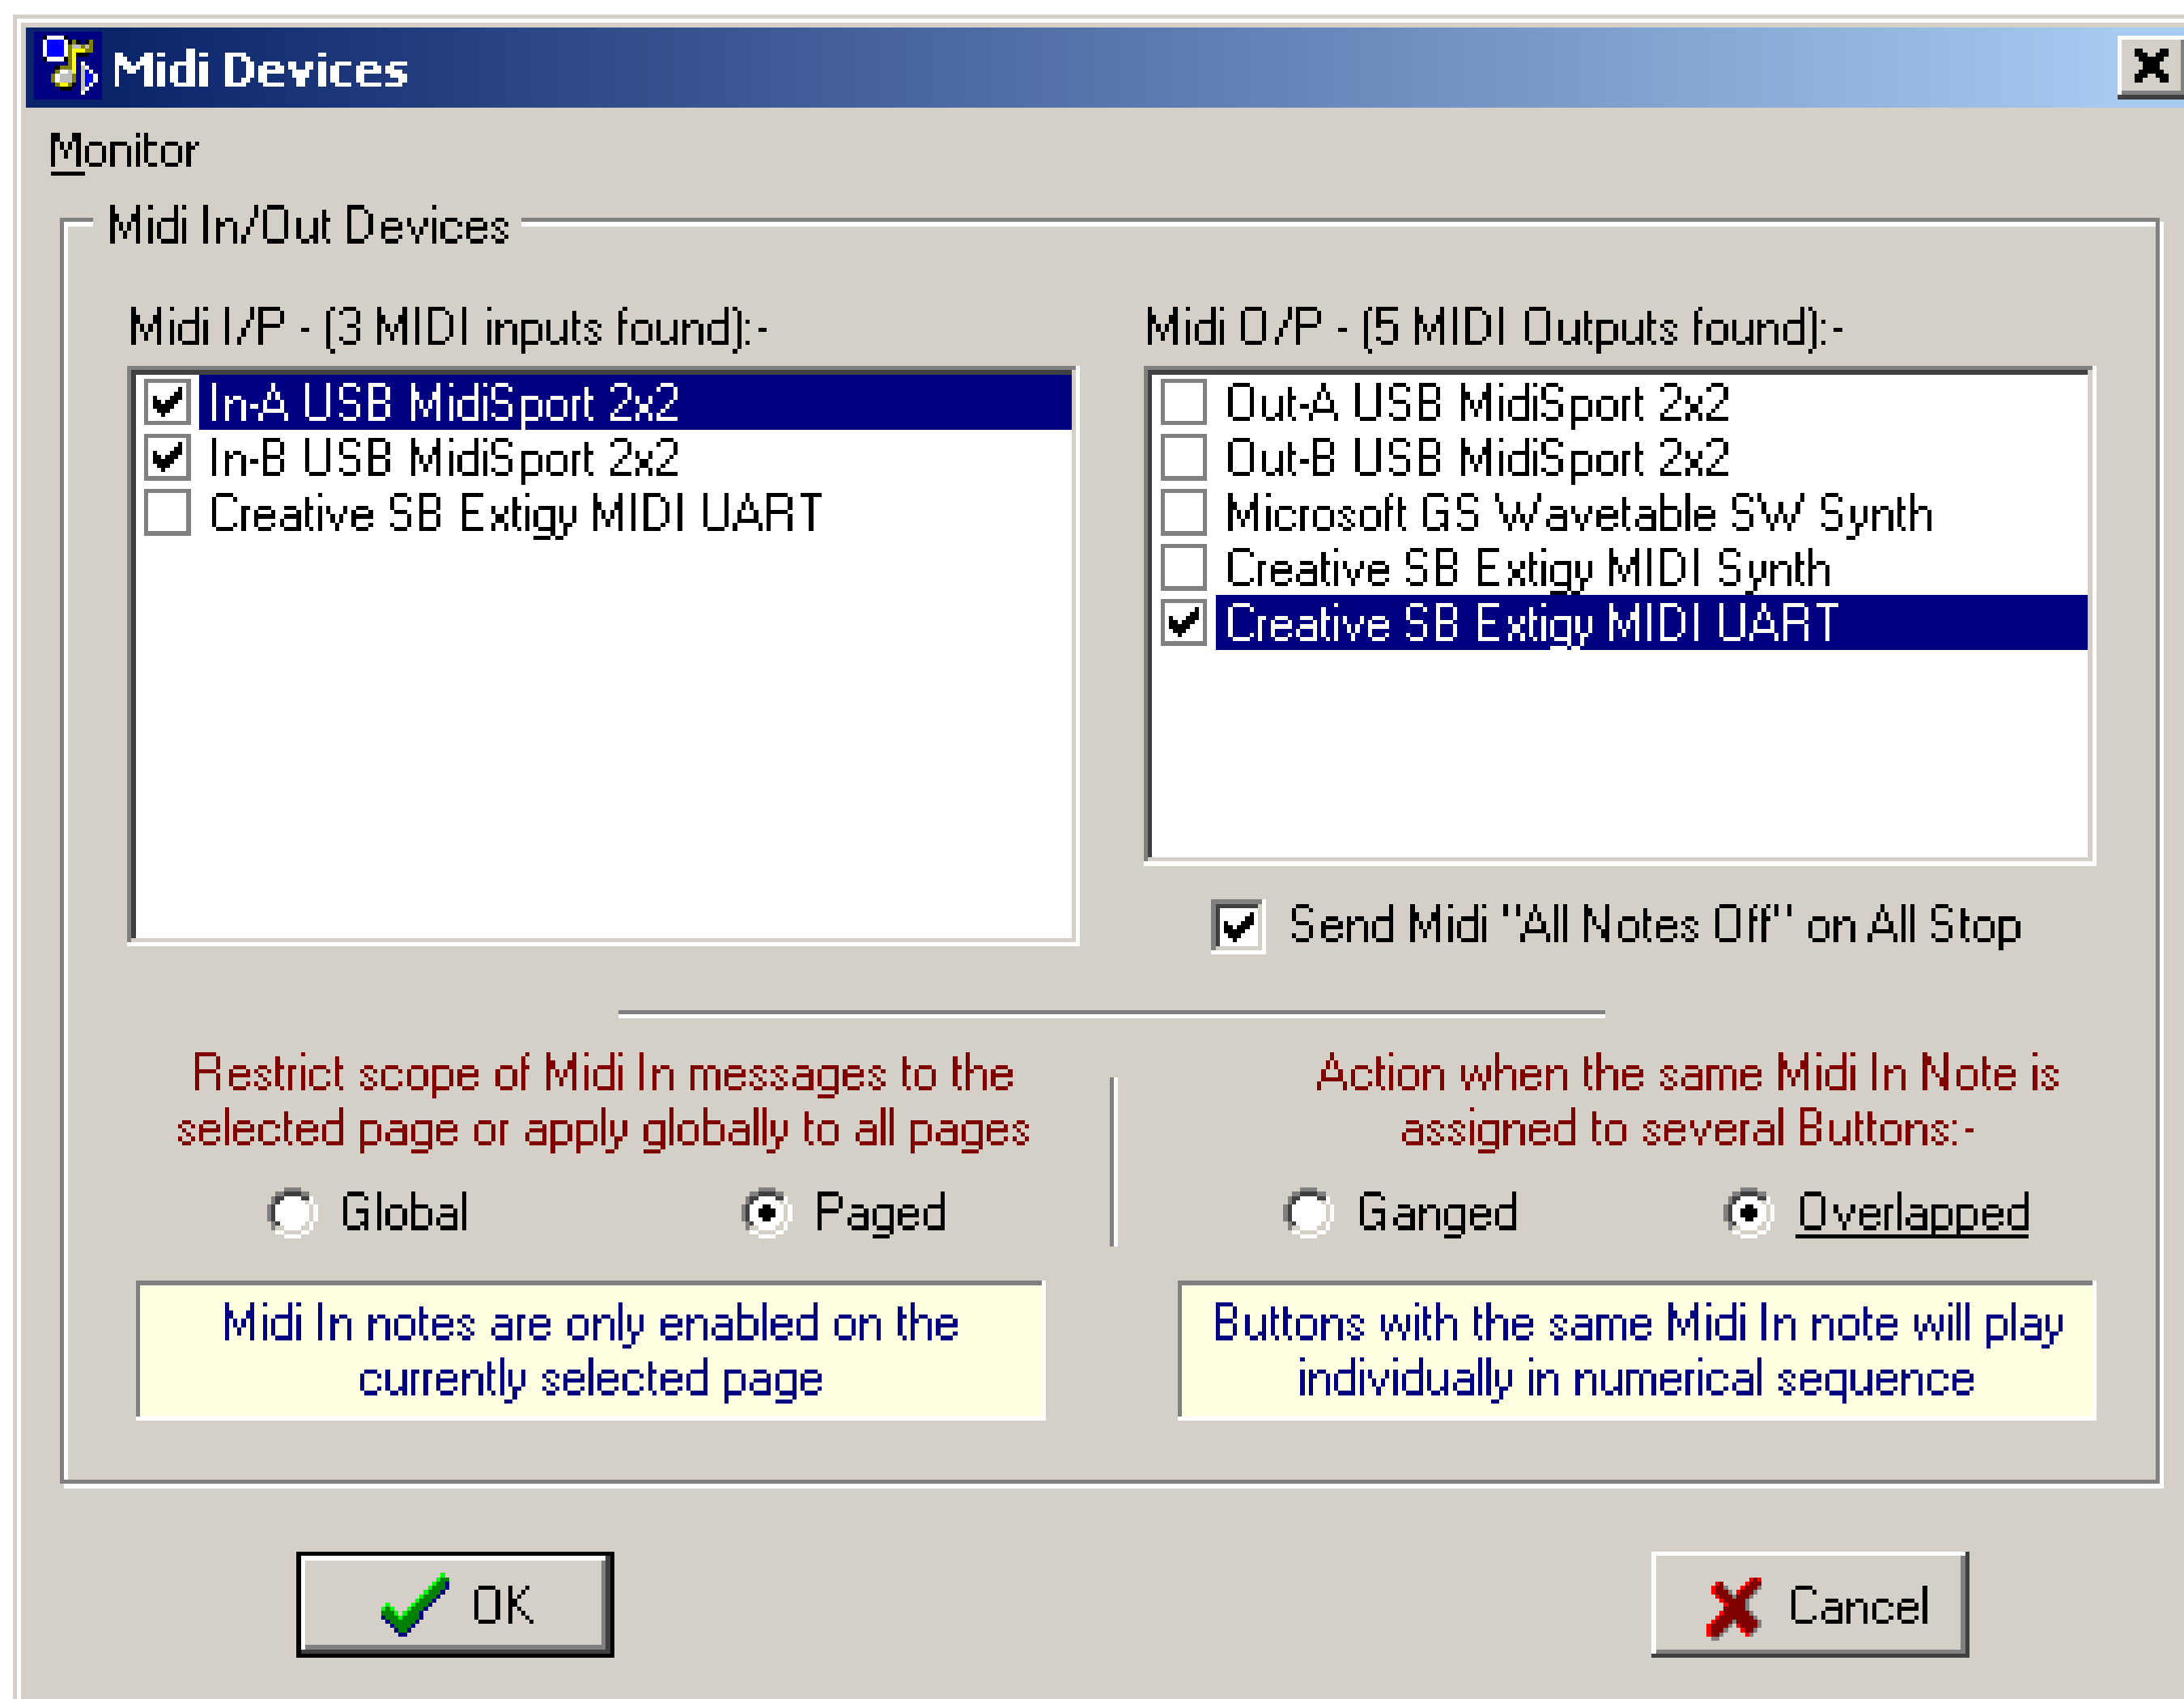

If the HotKeys are currently disabled then the message below will be shown.

Midi Devices

The Midi In and Out ports are set using the dialog box below, these are set globally and are not saved in the individual session data files.

One or more Midi In devices can be selected along with multiple Midi out devices.

If either the Midi In or Midi Out options are disabled then a message will be shown at the bottom of the dialog box

There is also an option to send the Midi message "All Notes Off" to all Midi Out channels when Escape or All Stop buttons are pressed

The action of the Midi In notes can be restricted to act only on the currently selected page by selecting Paged option as shown below. Midi In notes can be set to act across all pages by selecting the Global option.

When more than one button is assigned the same Midi note the buttons can be played in one of two ways, Ganged or Overlapped (duplicate hotkey assignments operate in a similar way).

In Ganged mode all buttons with the same Midi In note will play when that Midi In message

is received.

Alternatively in Overlapped mode each button with the same Midi In note will play individually on each successive Midi In message. The order in which the buttons are played is numeric starting with the first button not already playing.

The Overlapped mode is suited to effects that need to be repeated but have a long reverberation time, just stopping and restarting the audio would be incorrect, so in Overlapped mode the previous effect is left running whilst a new copy of the effect is played out.

The Midi Note text displayed on the buttons will be underlined if it forms part of an overlapped sequence.

See [Advanced Operation](#) for further explanation

Selecting the Monitor menu item from the Midi devices window displays a listing the timestamped incoming midi messages. If Midi timecode is detected it will be shown at the top of the window in green text, if no Midi timecode is present the text will be in red. Midi timecode is also displayed in the [Data Rate panel](#) on the main window status bar.

The most recent Midi messages are shown at the top of the list, the Run and Stop buttons control the logging of the messages, clear will delete all entries in the list.

GPI Triggers

External GPIs can be used via the computer game port to trigger playing of buttons see [GPI](#)

[Assignments](#) this menu item can access via the Ctrl+G keyboard shortcut

GPI Assignments

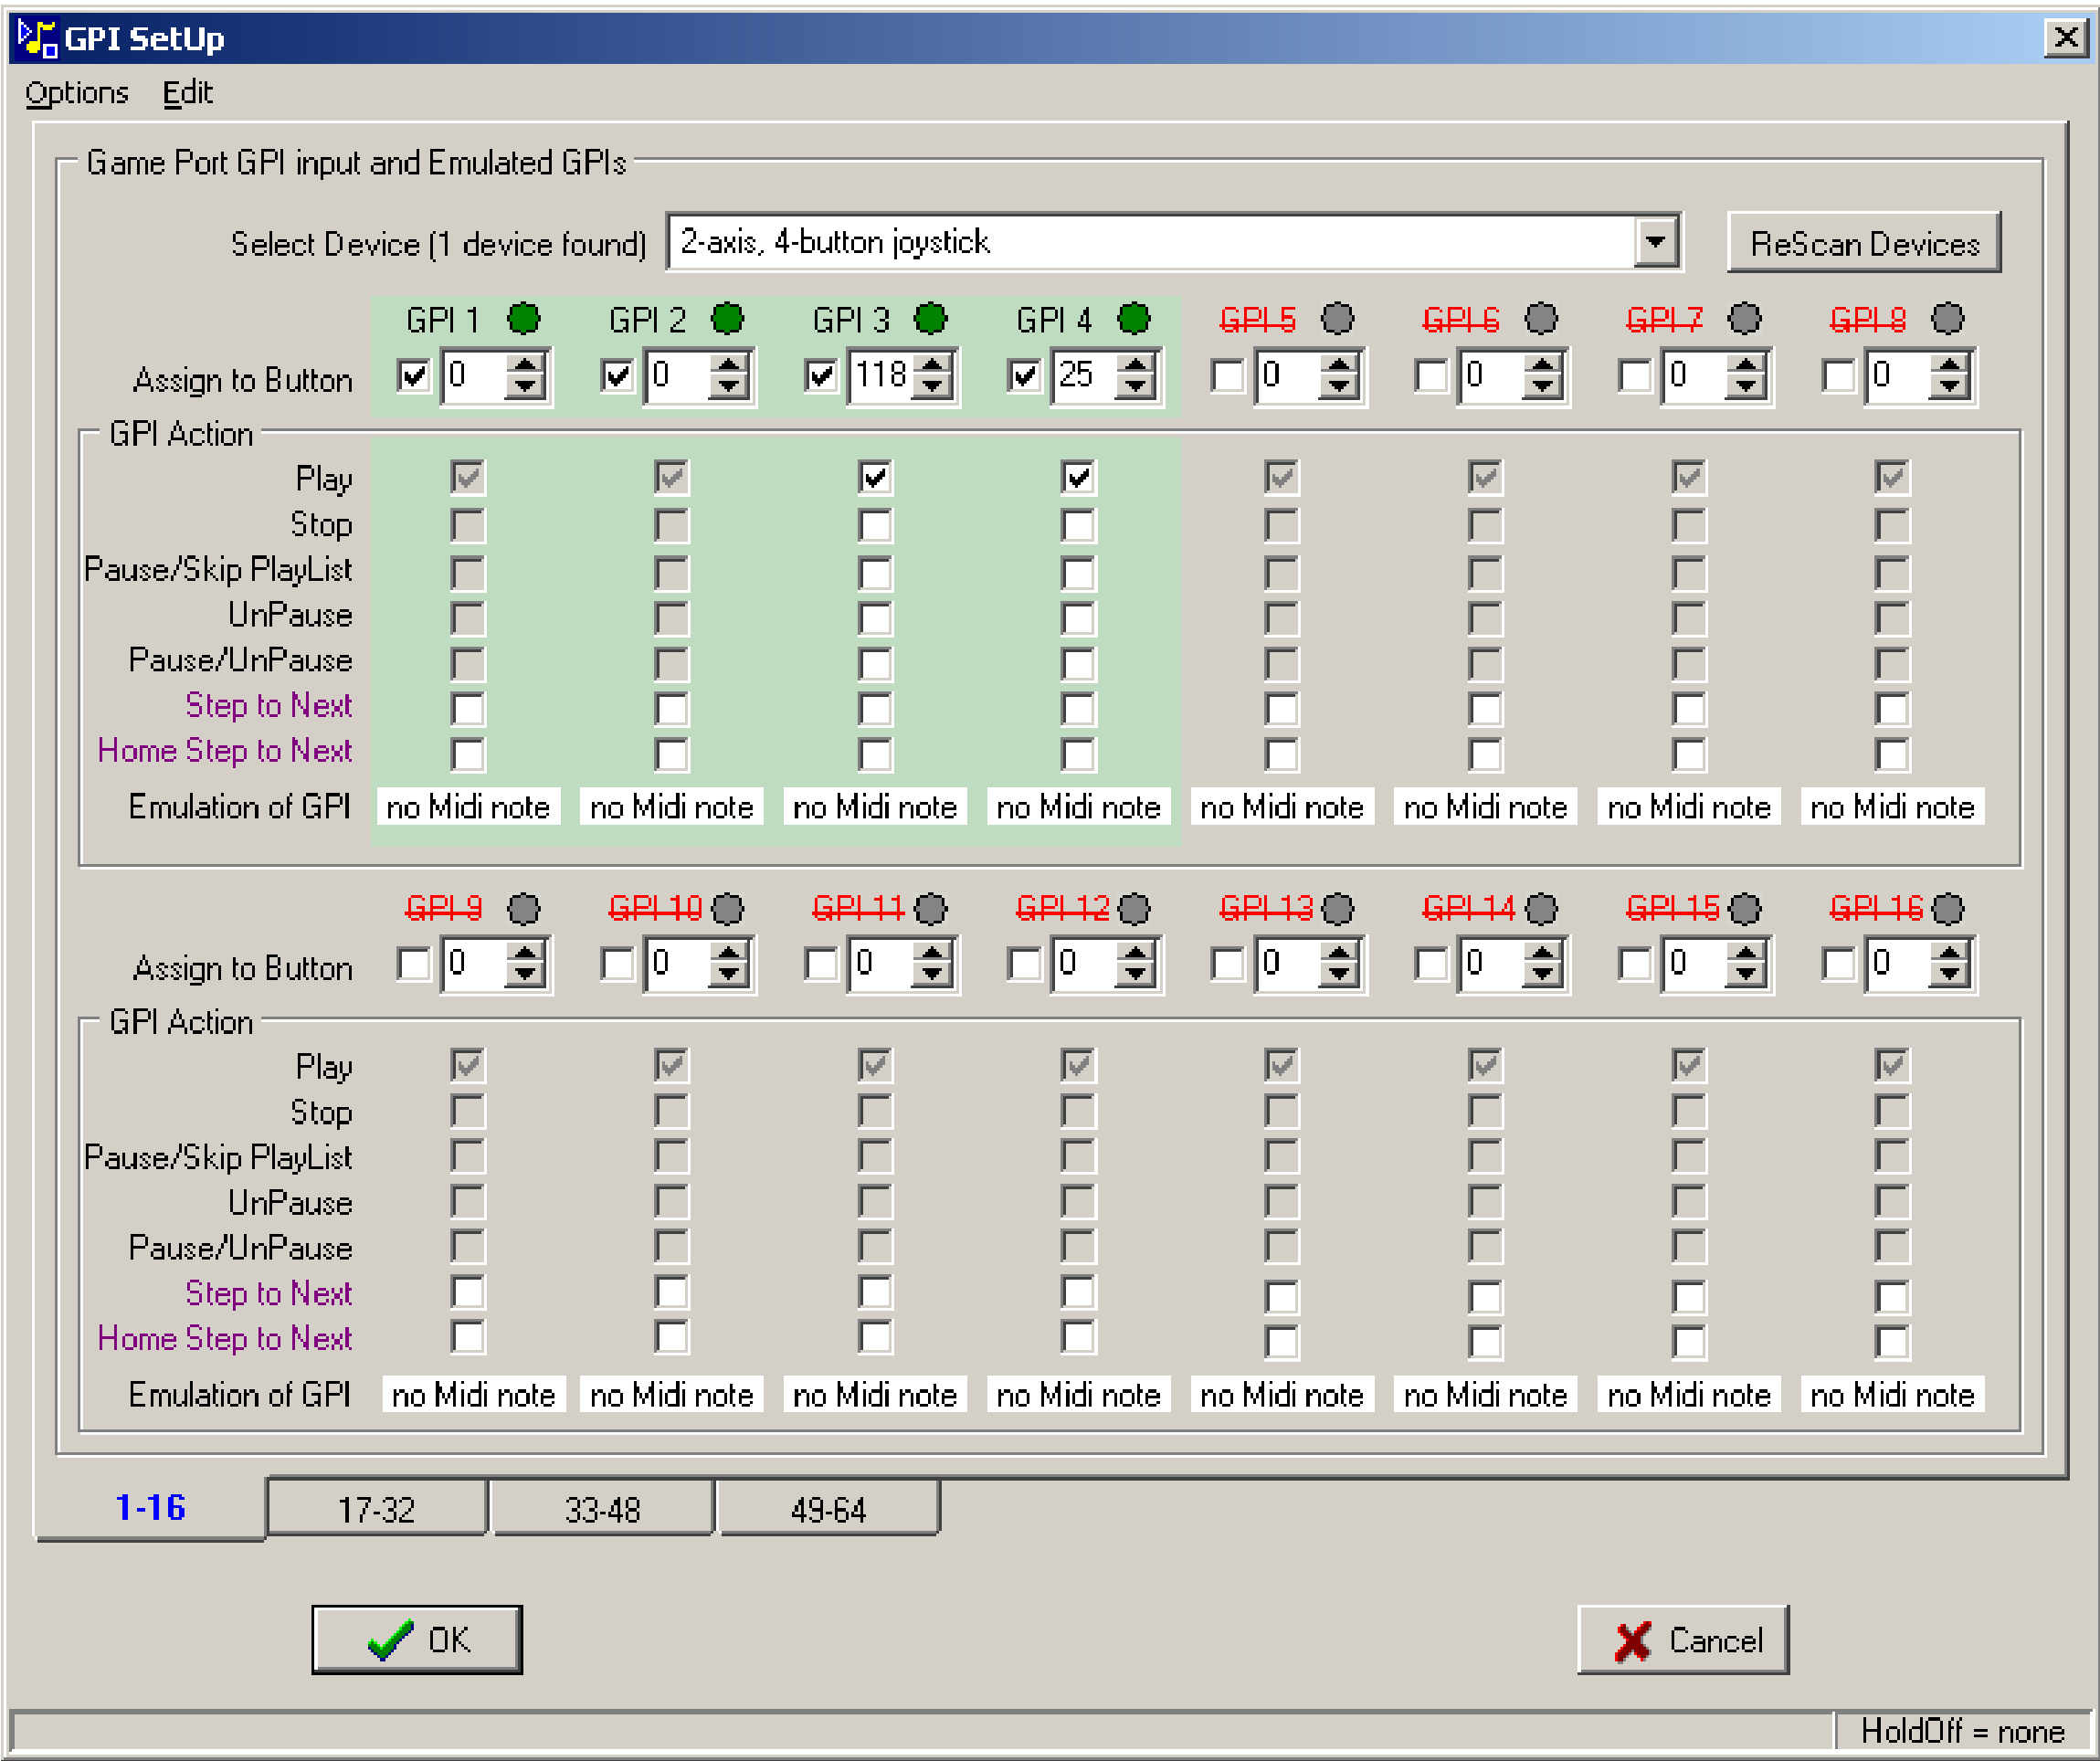

SpotOn accepts inputs from up to 64 GPIs (General Purpose Interfaces), the first four of these are most simply implemented via the PC Game Port using the joystick button connections . A USB joystick can also be used, however some internal wiring modifications to the joystick will be required to extract the switch contacts.

Any joysticks detected as being connected to the computer when SpotOn was run will be shown in the drop down list.

A PC Game Port card can be used to provide GPI inputs 1..4, with GPIs 5..64 typically triggered by Hotkey, Midi or time based emulation of GPIs - see later.

Joystick Selection

In the image below only one joystick was found and it has 4 buttons that can be used, these are assigned to GPI 1..4, "LEDs" for the remaining GPIs are shown in grey.

The area with a green background indicates that only GPI 1..4 can be 'real' GPIs from a game port card, the other GPIs will be emulated in some way.

If more than one joystick device was detected then they will appear in the drop down list

If the configuration of the GPI devices has changed the list can be refreshed by clicking on the ReScan Devices button which will clear the selection and fill the list with the devices currently connected.

If a GPI device (joystick) is disconnected whilst in use then the display will show something like this

If GPIs are enabled the status bar of the main window will also indicate a disconnected device by flashing the GPI panel black/white

Disconnecting the GPI lead from the computer whilst SpotOn has it selected is not recommended, the GPI device should be deselected before it is unplugged, see GPI wiring suggestions .

The next image shows the result when a 4 button joystick is detected, the red text in the GPI 1 box indicates that value (button number) has been changed since the dialog box was opened and hence is not a true mimic of the actual GPI assignment

The checkboxes immediately to the left of the GPI button number allow the GPI to be enabled/disabled, in the disabled mode the display is as shown below.

The devices connected to the game port are only checked when SpotOn starts up, if there are any changes to the attached devices then the ReScan Devices button must be clicked or SpotOn restarted before they are registered.

The choice of joystick device is applied globally and is not saved in the individual session data files.

If the GPI In triggers are disabled via the GPI In On/Off menu option then the message below will be shown.

Button to GPI Assignment

The up/down nudge buttons associated with the GPI channels assign the button that will be controlled when the GPI becomes active, a button value of zero disables that GPI channel from controlling a specific button.

Under the nudge buttons are seven rows of checkboxes - Play, Stop, Pause, UnPause, Pause/UnPause, Step to Next and Home Step to Next.

Row 1 is the default action of Playing a track when the GPI becomes active.

Row 2 can be set to Stop a track when the GPI becomes active.

Row 3 can be set to temporarily Pause a track when the GPI becomes active, the Pause action is not available when the button has an active PlayList so this item will trigger a Skip PlayList item operation

Row 4 similarly will release the Pause and continue playing the track from the point it was paused.

Row 5 allows a single GPI to alternately Pause and UnPause a track

Row 6 enables the Step to Next Track function see Options|Step To Next Track, if selected the GPI will issue a Play command to successive buttons each time it becomes active, (an option to skip over muted buttons is available under Options menu).

Row 7 of checkboxes provides the facility to reset the Step to Next operation by forcing the next button to be played to be the top left button on the current page, equivalent to pressing the Home key on the keyboard.

Note that when both Step to Next and Home Step to Next are checked SpotOn will first Home the selection to the top left button and then play that track and step to the next button.

In the example below GPI 1 will play successive buttons and GPI 2 will reset the next button to be the top left button.

Selecting any Step to Next checkbox will automatically set the GPI button value to zero.

Silence	Sound 1	Sound 2	Sound 3
1a 00:01	2a 04:30	3a 03:29	4a 04:18

In this case if GPI 1 is asserted "Sound 2" will play and then SpotOn will step to button 4 ready to play "Sound 3"

Silence	Sound 1	Sound 2	Sound 3
1a 00:01	2a 04:30	3a 03:29	4a 04:18

If GPI 2 is now asserted the Step to Next sequence will be reset to select button 1 which could well be a silent button that stopped all others, allowing the sequence to be reset at any time.

Silence	Sound 1	Sound 2	Sound 3
1a 00:01	2a 04:30	3a 03:29	4a 04:18

Emulation of GPI

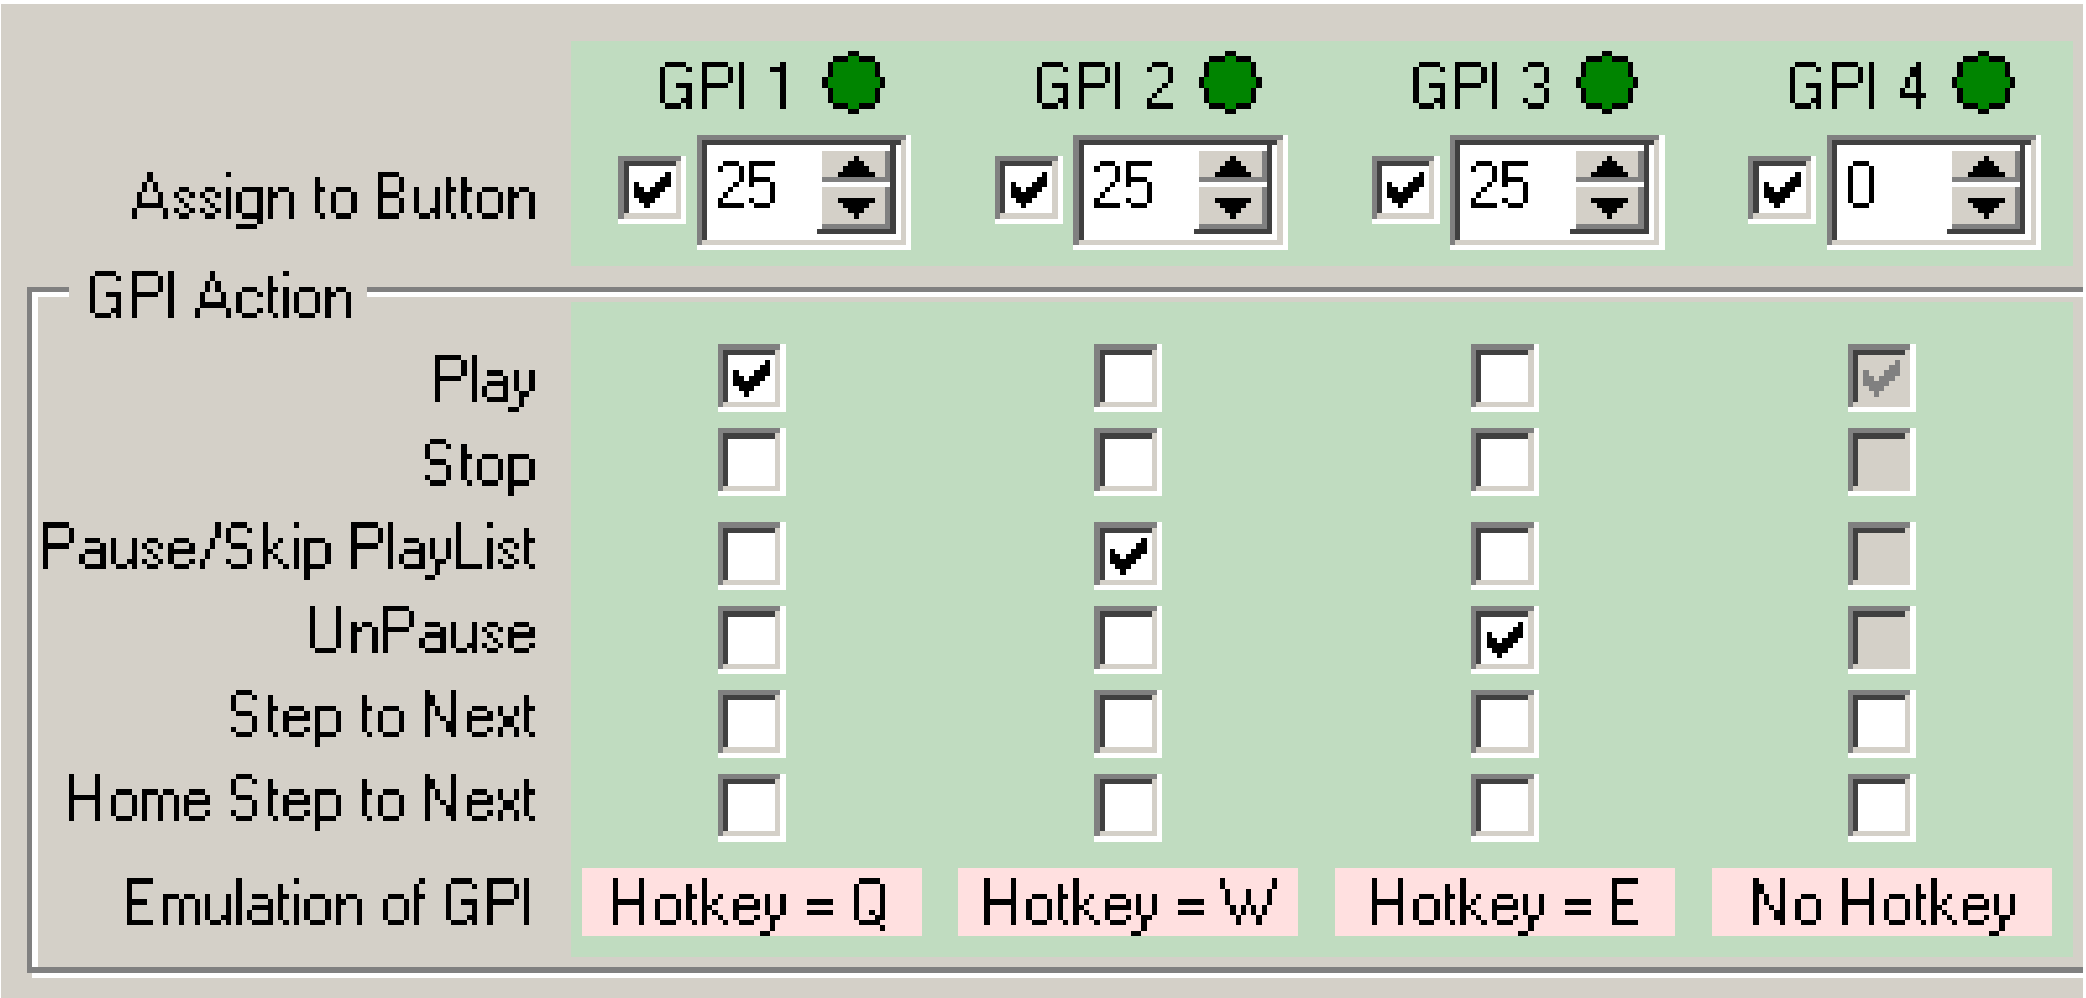

Using the emulation selection boxes, a match to Hotkey, PC clock time, incoming Midi note, Midi timecode or a source of SMPTE timecode can be used instead of an external GPI to trigger the GPI action, right-click the selection box for options

Emulation of GPI by Hotkey

Assign the Hotkey to the GPI by pressing the appropriate keyboard key

The image below shows Hotkeys Q, W, E assigned to GPIs 1..3

The same Hotkey can be assigned to button and to a GPI emulation

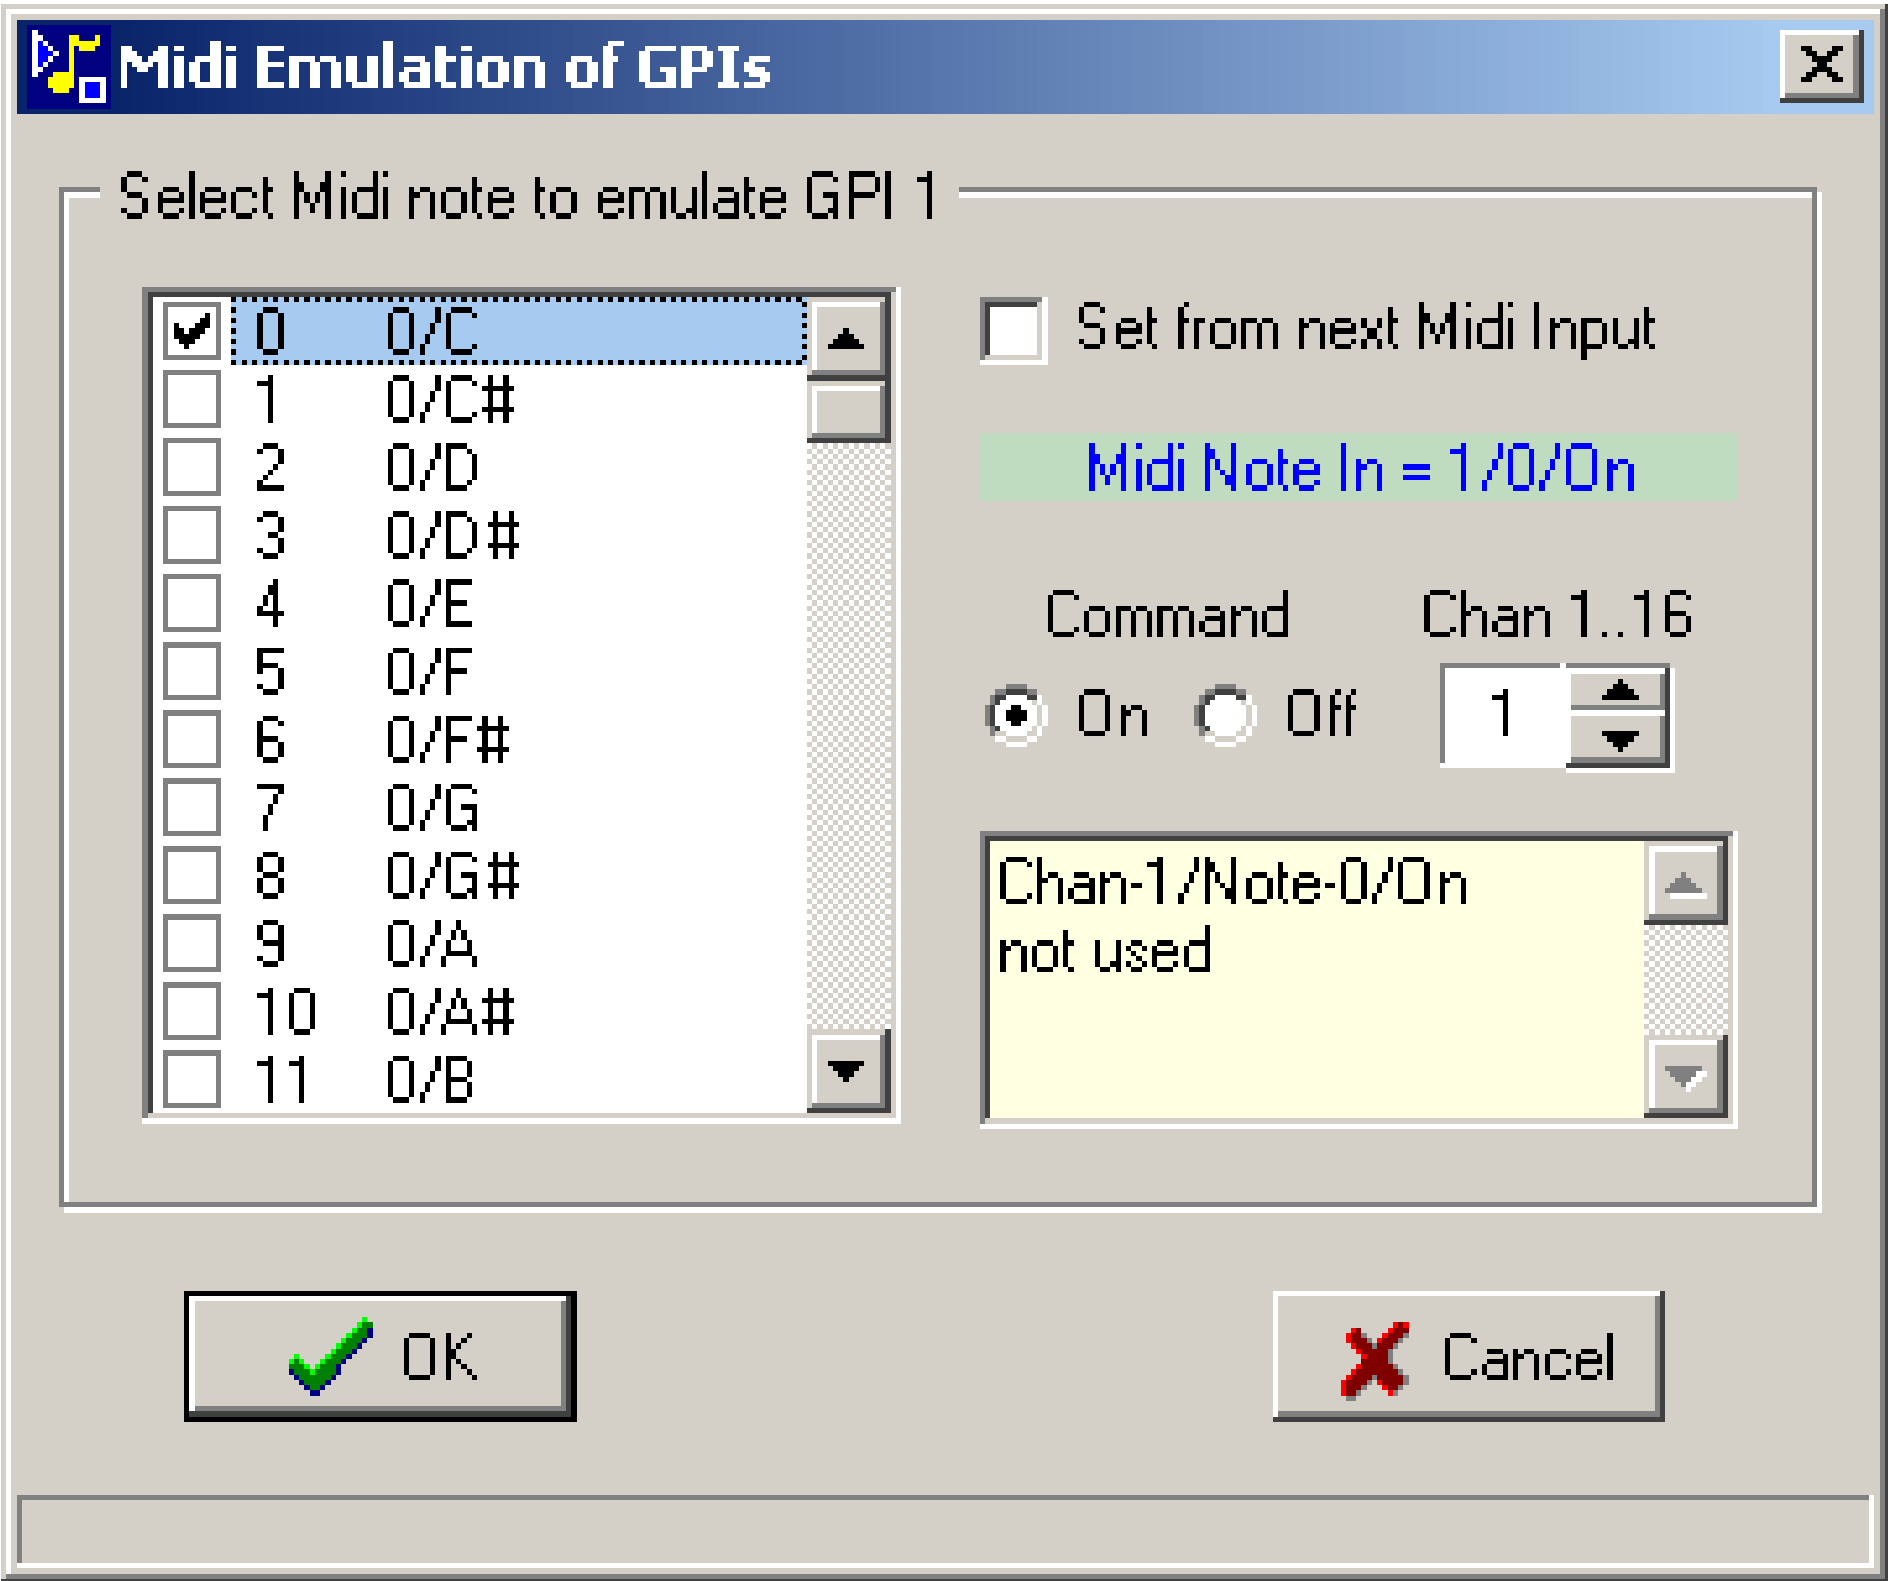

Emulation of GPI by PC Clock

The PC internal clock can also be used to trigger GPI actions

the precision of the time setting is restricted to 1 second for the PC clock source, the "Now" button is enabled in this mode to allow quick entry of the current time of day.

Emulation of GPI by Midi Note

Select Midi Note In to display a Midi Note dialog box.

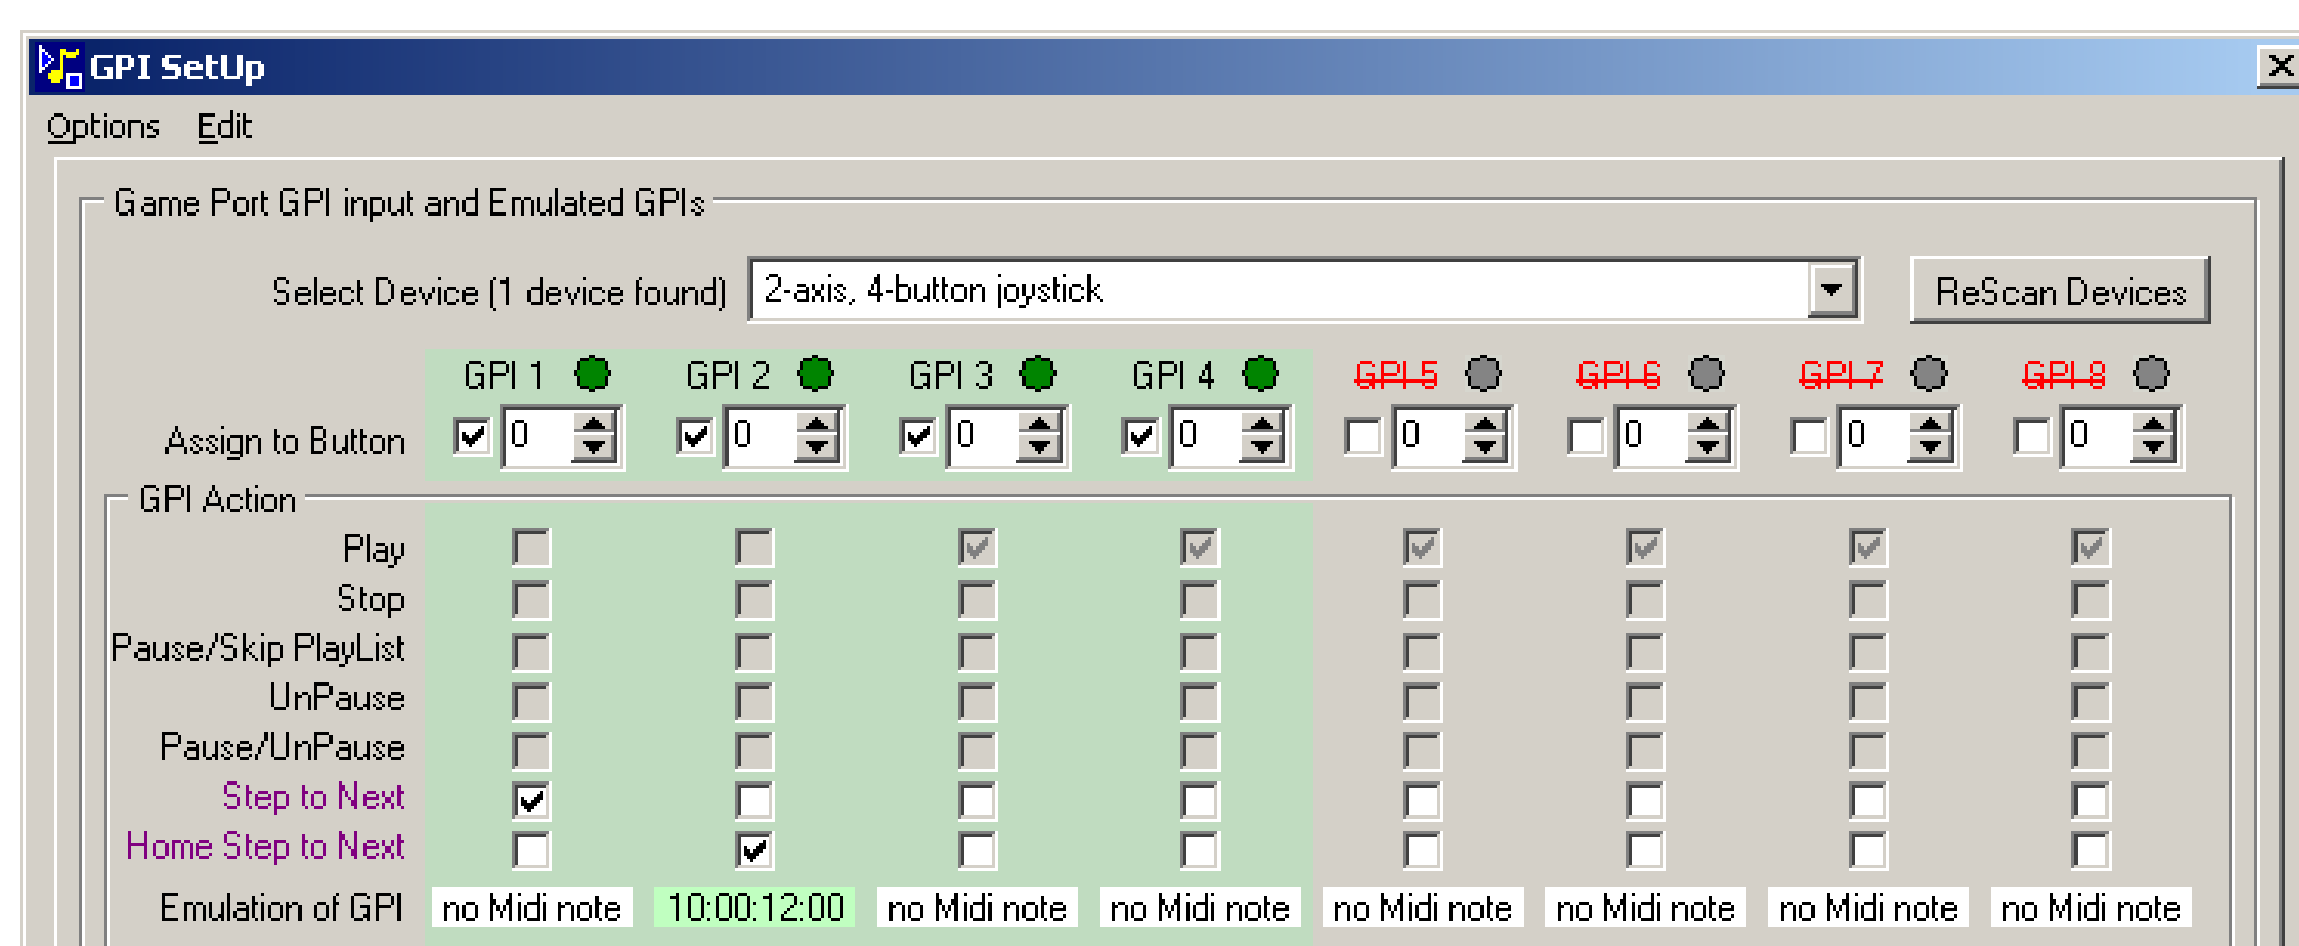

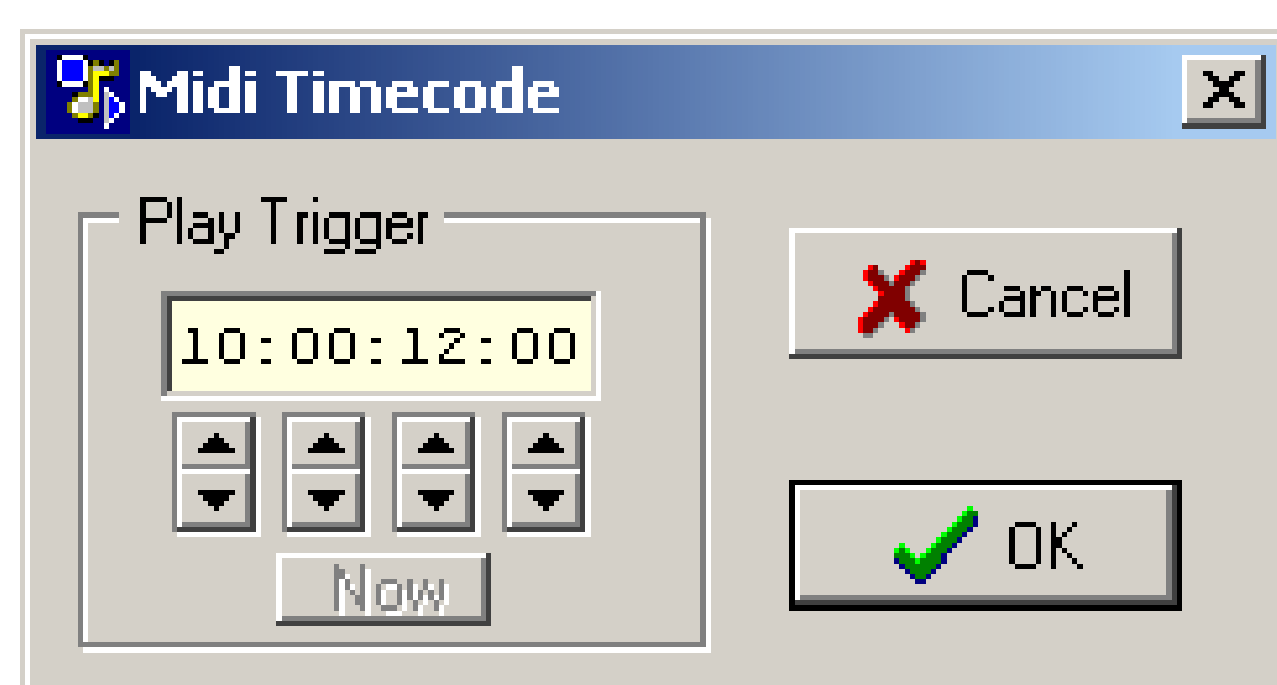

The Midi note can be automatically assigned by checking the box shown below, this will set the Midi note from the next Midi note to be received by SpotOn.

Here the Note On message for note 60 on channel 9 has been selected to emulate GPI 2

Now the selected Midi note will cause the GPI 2 action to be performed.

Emulation of GPI by Midi Timecode

The fourth option is to trigger from a Midi timecode stream

When any GPI with a time related trigger mode (PC Clock, Midi timecode or SMPTE timecode) is enabled and GPIs are enabled globally then the GPI In status panel background will flash to red whilst SpotOn is armed waiting for the time trigger.

Immediately after the time related GPI is triggered the associated GPI will be disabled to avoid subsequent false triggering.

As an alternative triggering mode the GPI can be rearmed when the detected timecode is earlier than that set as the trigger point, this is selected via the right-click pop menu item Auto Arm Timecode

To indicate the GPI is in the Auto Arm mode the Midi timecode value is shown underlined.

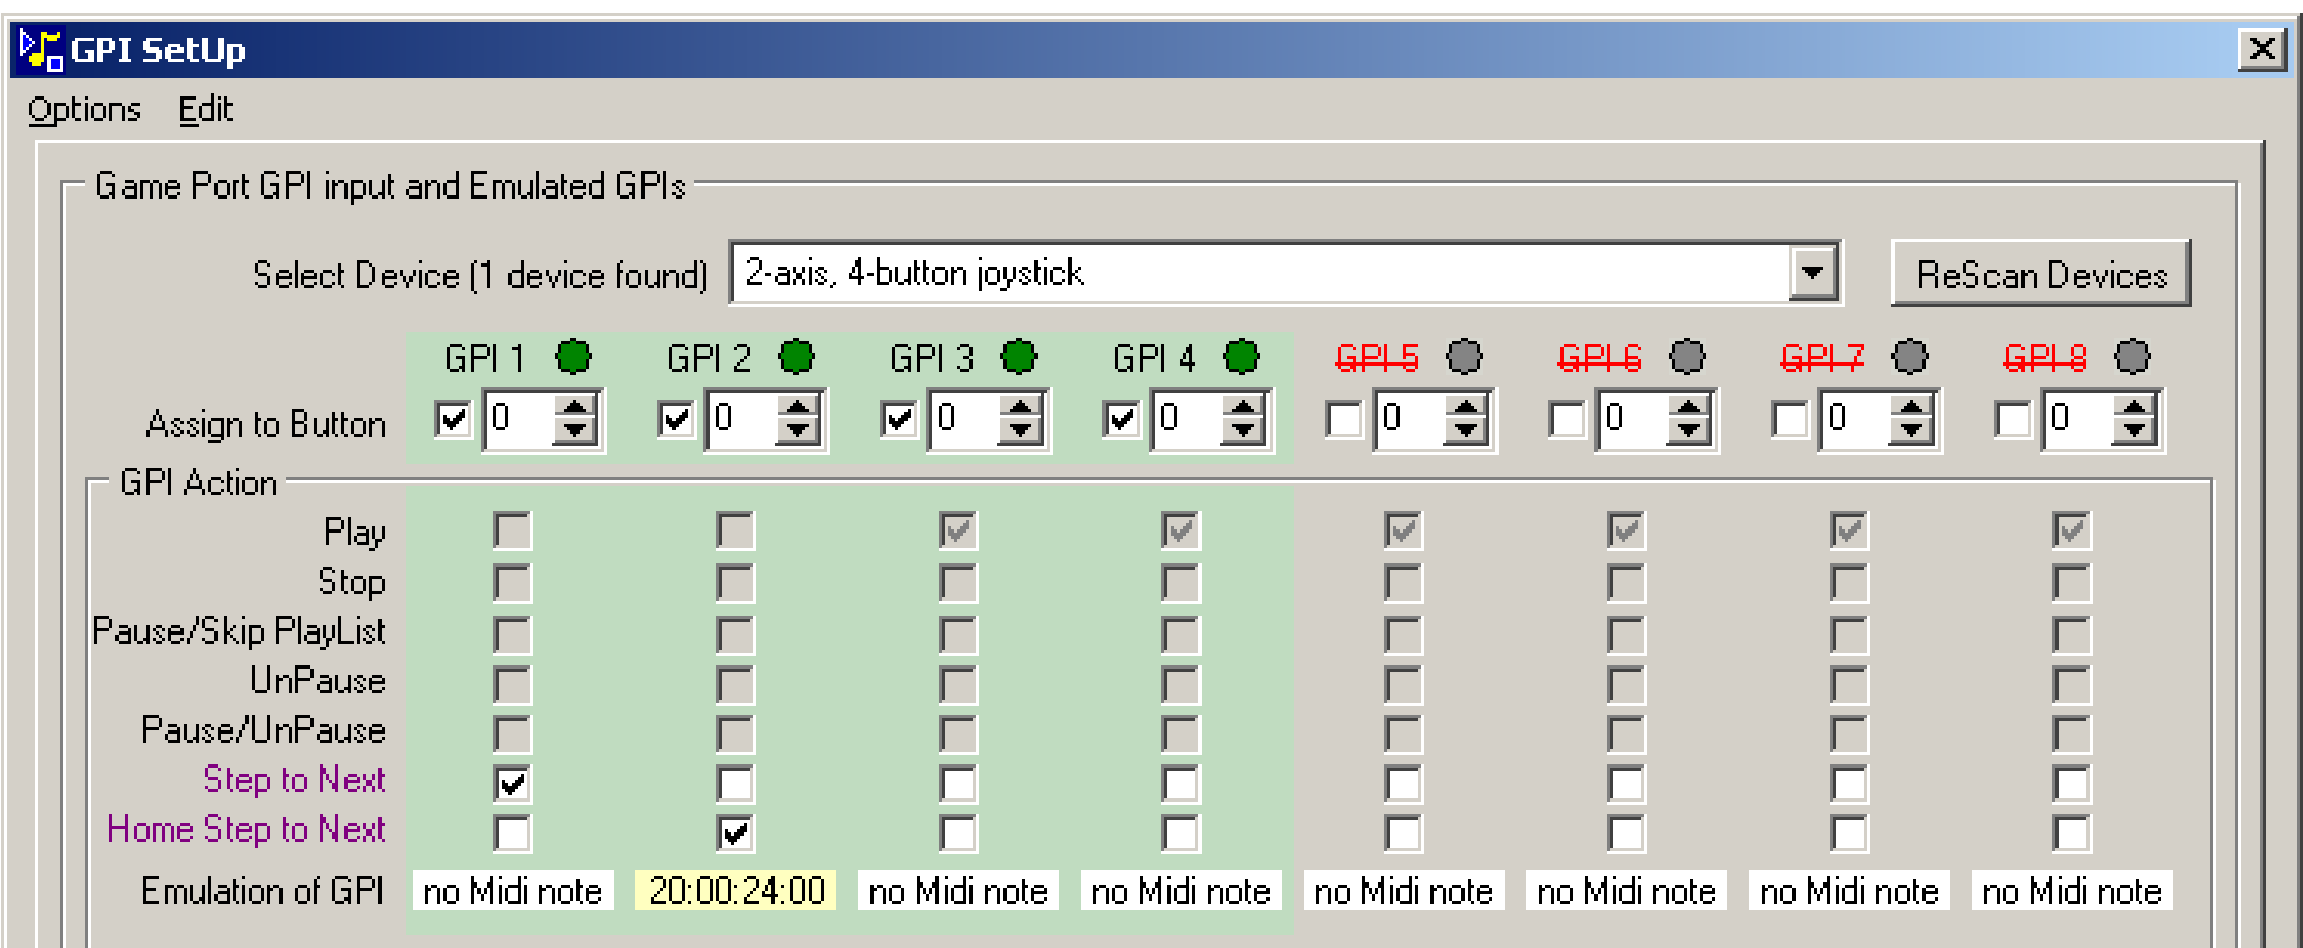

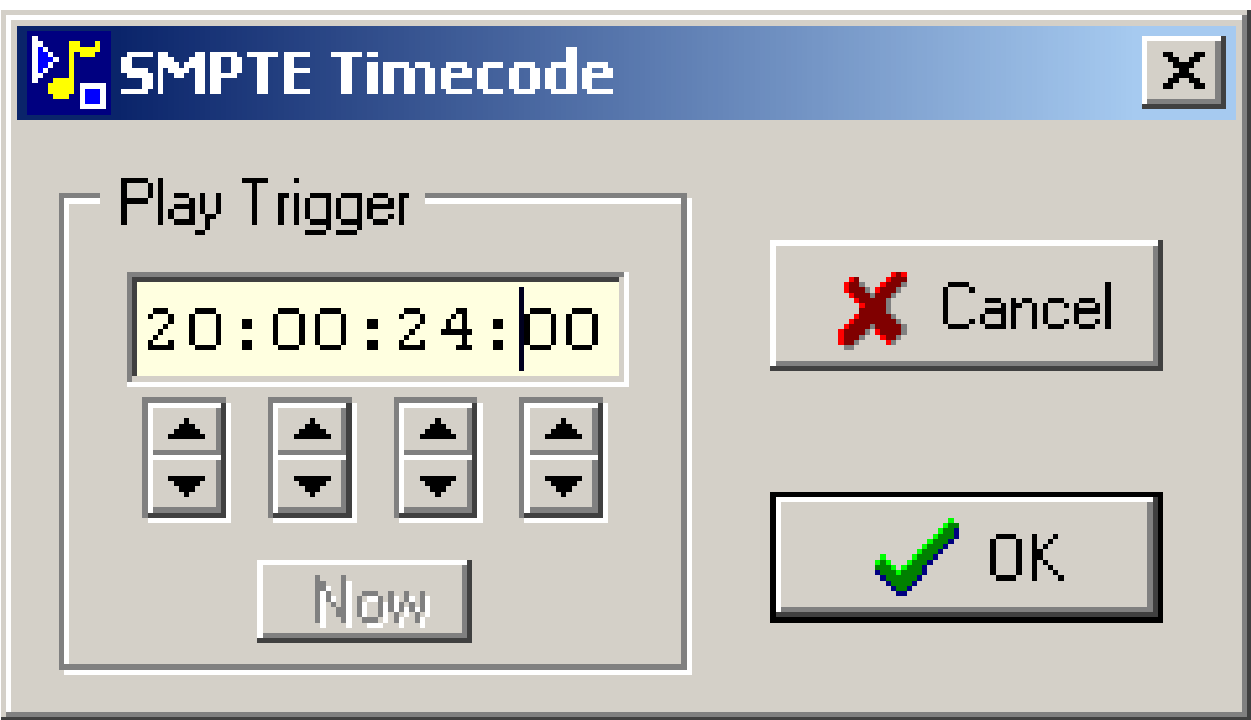

The Auto Arming function can be disabled for all GPIs via the Options|Auto Arm Ext/Midi Timecode GPIs main menu option.

When the Auto Arming is disabled the associated popup menu item will be greyed out

Emulation of GPI by External SMPTE Timecode

SMPTE LTC timecode can be read by SpotOn and used to trigger a GPI in a similar way to Midi Timecode described above.

There is a Global enable for SMPTE timecode triggering in Options|Use SMPTE Timecode and a setup dialog accessed via Engineering|External Timecode

When any GPI with a time related trigger mode (PC Clock, Midi timecode or SMPTE timecode) is enabled and GPIs are enabled globally then the GPI In status panel background will flash to red whilst SpotOn is armed waiting for the time trigger.

Immediately after the time related GPI is triggered the associated GPI will be disabled to avoid subsequent false triggering.

As an alternative triggering mode the GPI can be rearmed when the detected timecode is earlier than that set as the trigger point, this is selected via the right-click pop menu item Auto Arm Timecode

To indicate the GPI is in the Auto Arm mode the Midi timecode value is shown underlined.

The Auto Arming function can be disabled for all GPIs via the Options|Auto Arm Ext/Midi

Timecode GPIs main menu option.

When the Auto Arming is disabled the associated popup menu item will be greyed out

SMPTE timecode nudge :-

A hotkey shortcut is available to nudge the SMPTE timecode settings by shift+right clicking on the GPI In panel on the status bar.

The popup menu shows the last adjustment made along with options to nudge the trigger point earlier or later

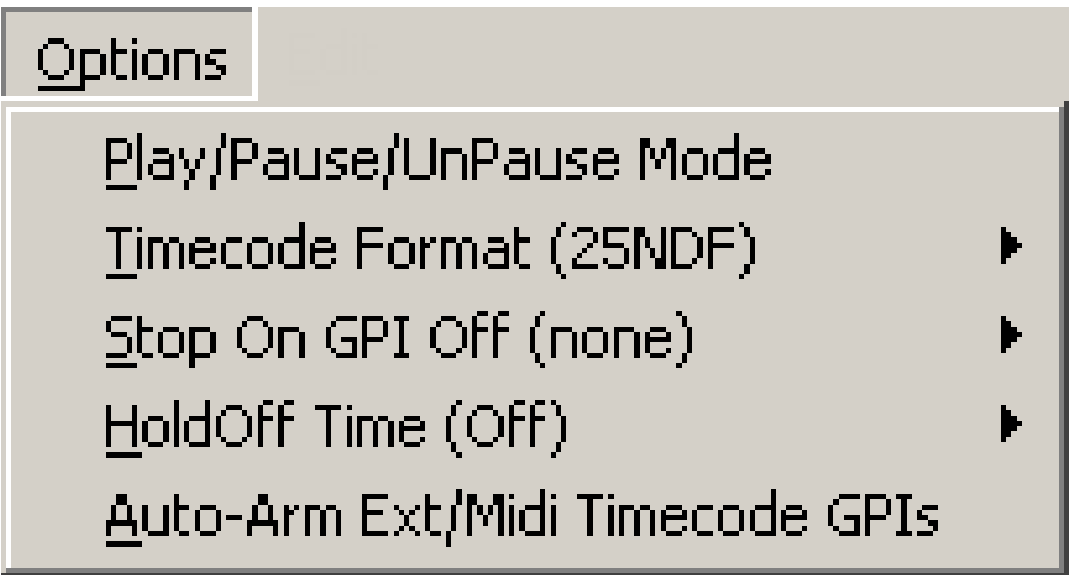

GPI Indication

When a GPI channel is active then the LED will change to show red

The GPIs can be globally enabled/disabled via the main menu Options|Use GPI Initem and also by clicking the main window status bar panel

The text in the main window status panel briefly flashes red when an incoming GPI is detected

Menus-Options

Play/Pause/UnPause

Checking the Play/Pause/UnPause option will change the default Pause/UnPause action to be Play/Pause/UnPause and the screen legends will follow accordingly.

When Pause/UnPause is selected as a GPI action, successive GPI pulses will alternately Pause and UnPause a playing track, however if the track is neither Playing or Paused then the GPI is ignored.

With Play/Pause/UnPause checked in addition to the action described above the track will begin Playing if a GPI pulse is detected when the track is stopped i.e. not Paused and not Playing.

So the sequence of events could be GPI pulse 1 = Play, GPI pulse 2 = Pause, GPI pulse 3 = UnPause.

Timecode Format

The timecode received by SpotOn either via Midi or external SMPTE inputs and used to trigger GPIs can be one of a variety of frame rates: -

- 24NDF 24Hz non-drop frame
- 25NDF 25Hz non-drop frame
- 30NDF 30Hz non-drop frame
- 29.97DF 29.97Hz drop frame

Selecting the appropriate format changes the timecode display and editing dialog boxes.

Stop on GPI Off

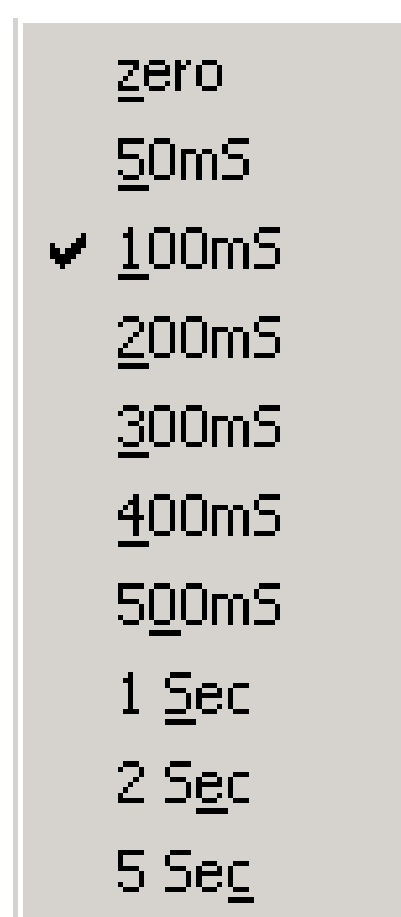

Normally the assertion/closure/forcing low of the GPI input is the only transition recognised and will Play the assigned button, if the menu option StoponGPIOff is selected then the off transition of the GPI is also detected and will Stop playout of the assigned button. GPI 1..4 can be individually set to react to the GPI off state.

HoldOff

As it is likely that the source of the GPI signal will be a manually operated switch, there is the chance that the switch contacts will bounce so sending unwanted signals. To avoid this there is a selectable HoldOff period under menu Options|HoldOff Time

The range of HoldOff is 0..5 seconds

The currently selected HoldOff period is shown in the right hand panel of the status bar and applies to all GPI channels

AutoArm

Auto-Arm Midi timecode GPIs - this is a master enable for all the GPIs emulated by Midi timecode, a warning will be shown in the lower part of the window when this option is active.

When this option is checked, any GPI set to trigger from a Midi timecode and individually AutoArmed, will be re-armed when the timecode value detected is earlier than the trigger timecode.

This mode allows multiple passes without the need to arm/enable the GPIs on each pass.

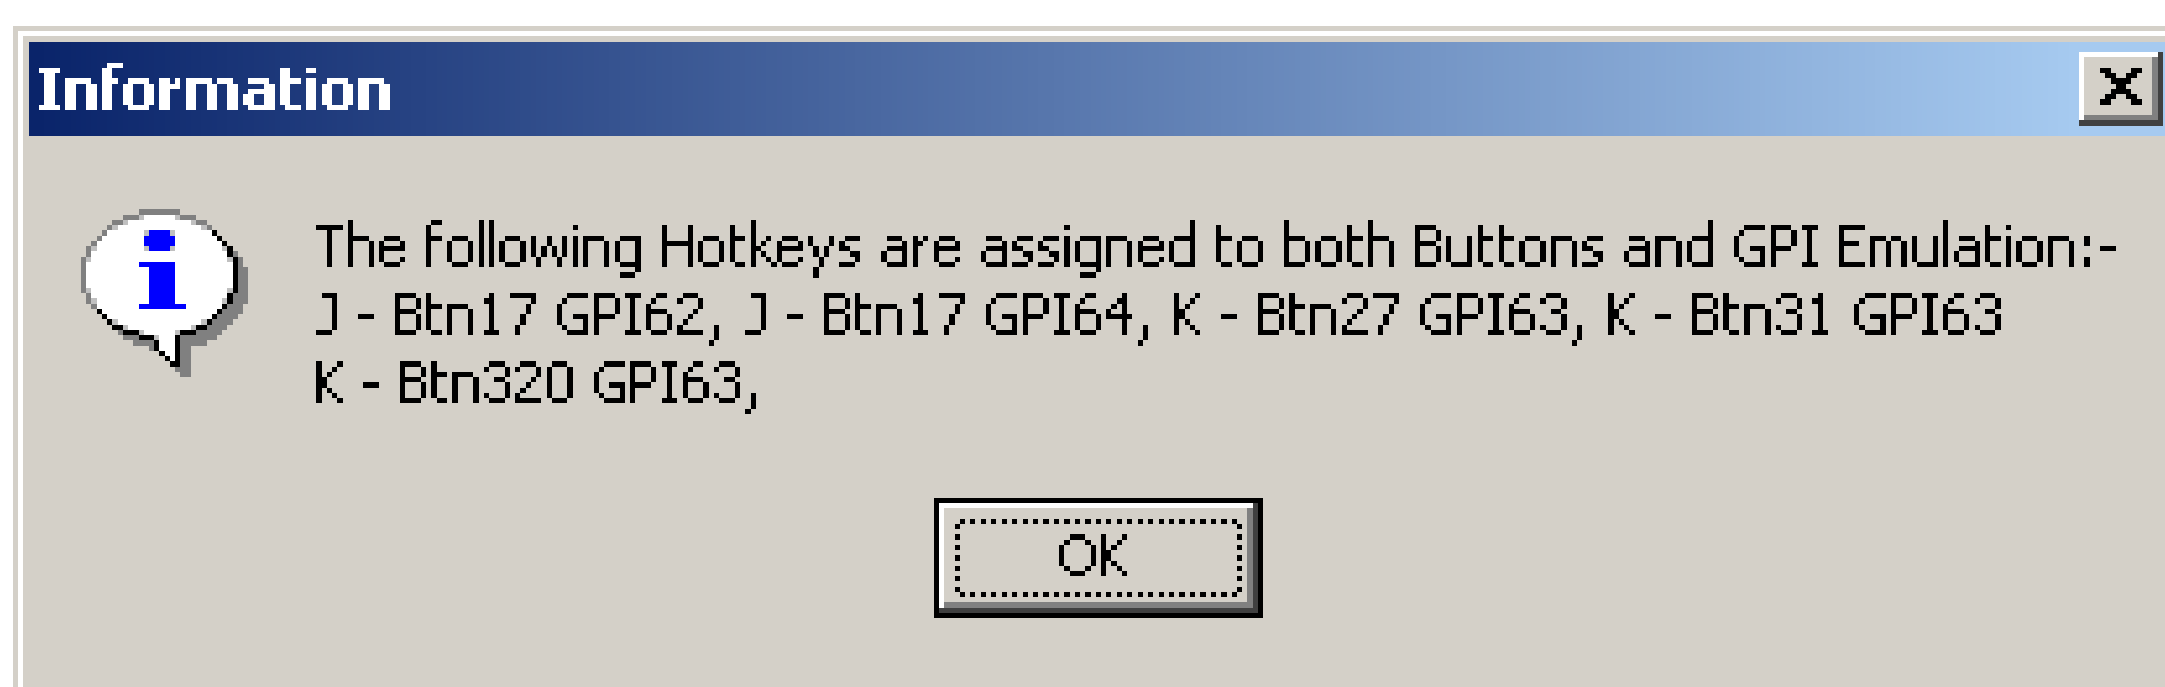

Menus-Edit

The Edit menu contains three items: -

- a, clear all the GPI button assignments
- b, set all GPIs enabled
- c, set all GPIs disabled

On exiting the GPI Setup dialog a message box will appear warning of any Hotkeys that are assigned directly to Buttons and also selected as GPI emulation triggers.

Display

If the main menu Display|Show GPI In Icons option is checked then buttons assigned a GPI will have a diamond shape on the centre left of the button image.

This diamond shape will have an internal + sign if more than one GPI is controlling a specific button

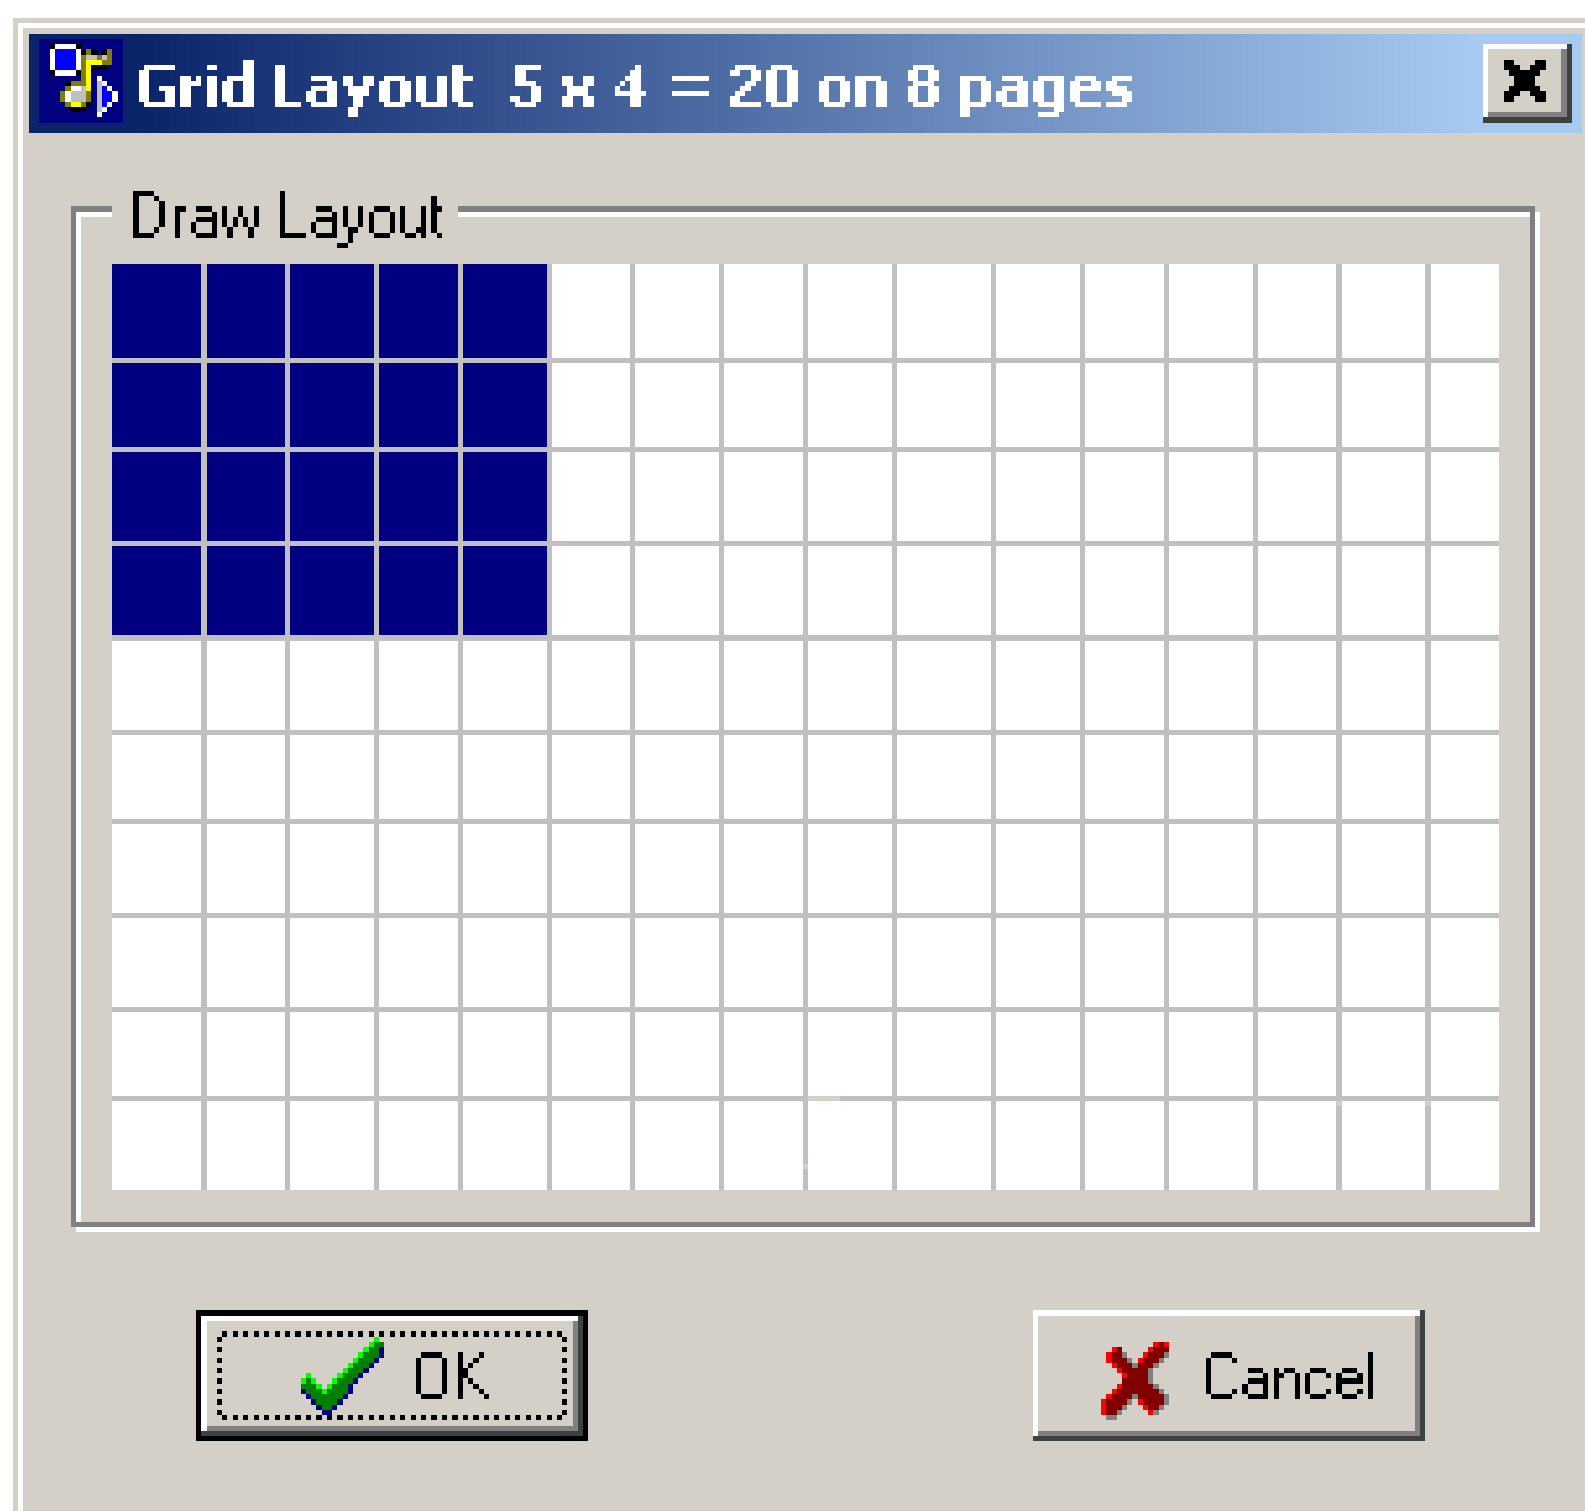

Display Menu

Layout

SpotOn can display the buttons in a number of different configurations ranging from 8 pages with 1 button per page to 160 buttons per page across 2 pages.

Use mouse to drag the layout to the desired configuration

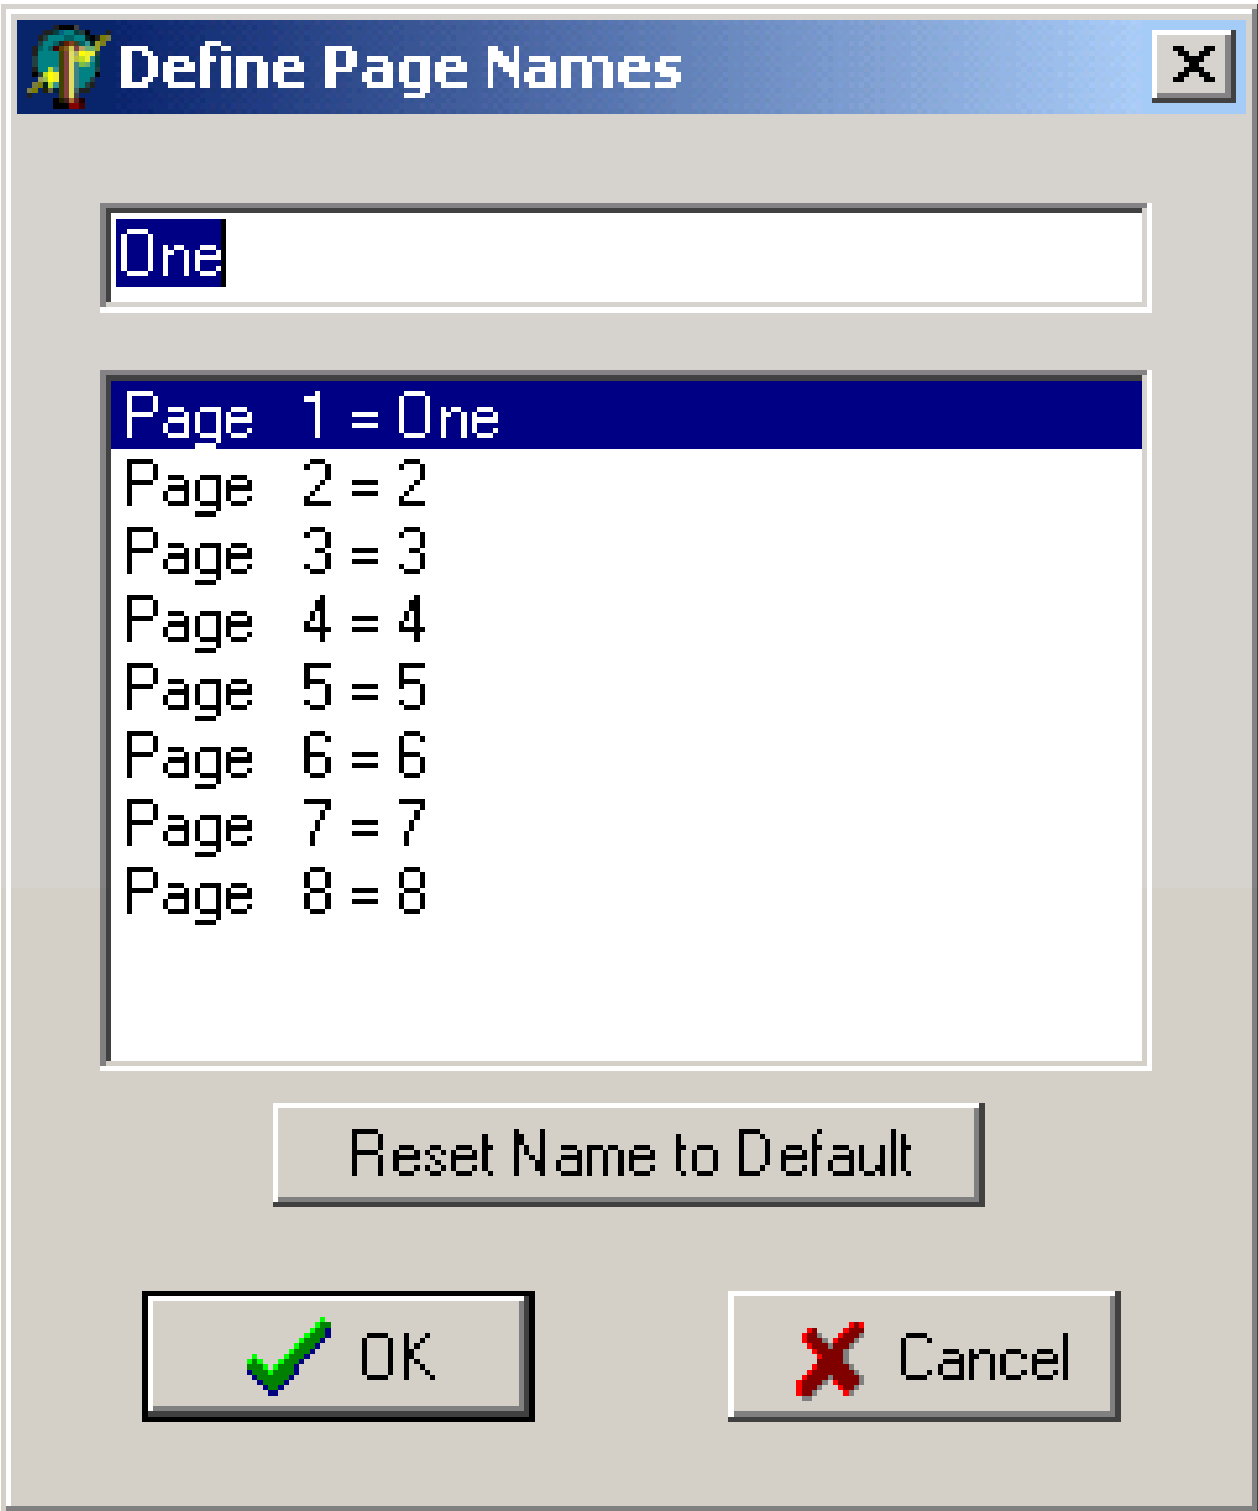

SpotOn has access to maximum of 8 pages of buttons, the number of pages actually available depends on how many buttons per page are displayed.

In the case below there were 48 buttons per page over 6 pages giving 288 buttons, pages 7 and 8 are therefore unavailable, buttons in the range 289 to 320 are hidden as they do not form a complete page.

Page Names

By default the page names are numbers 1..8 these can be changed to something more

meaningful, as the size of the page tabs are restricted only short names are suitable

All the page names can be returned to the defaults of 1..8 using the Reset option, a confirmation dialog is shown before the names are changed

Another method of accessing the page name editor is to right-click the tabs

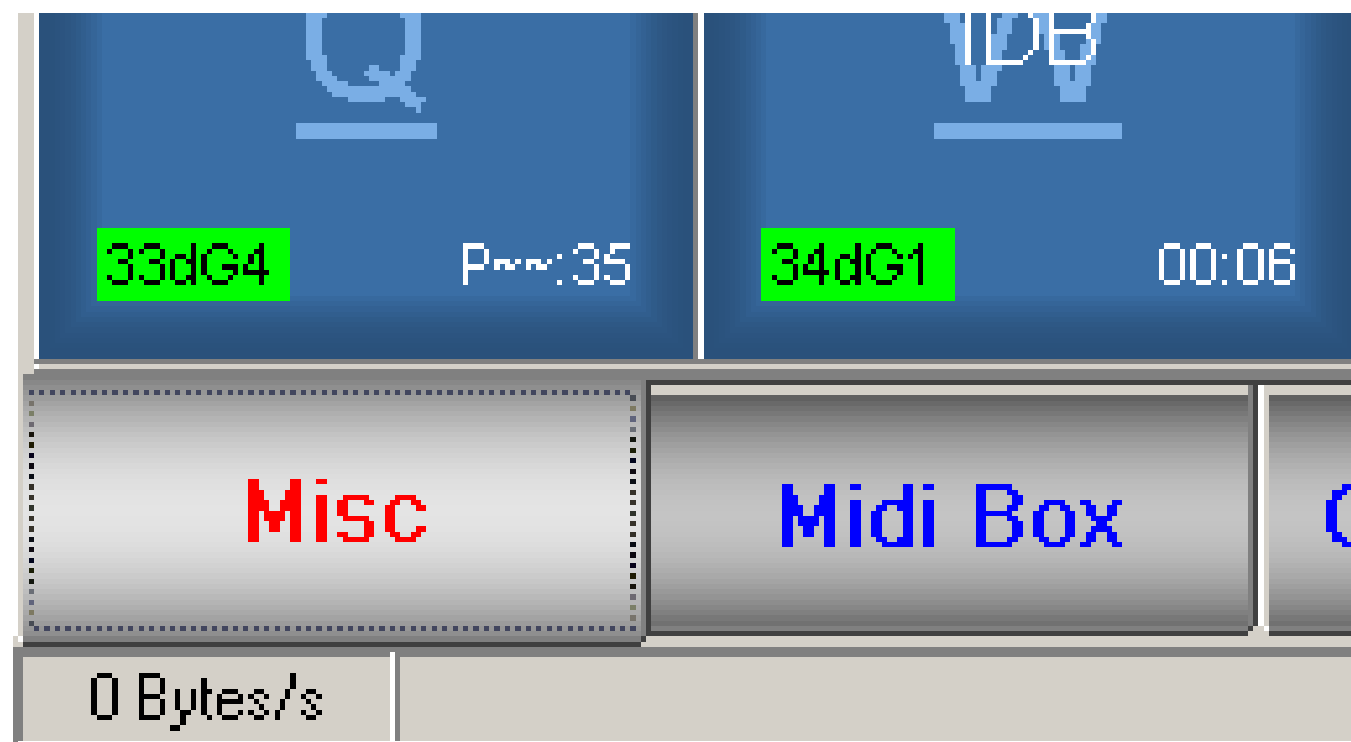

Page Tab Height

The height of the page tabs at the bottom of the screen can be set to any of three levels

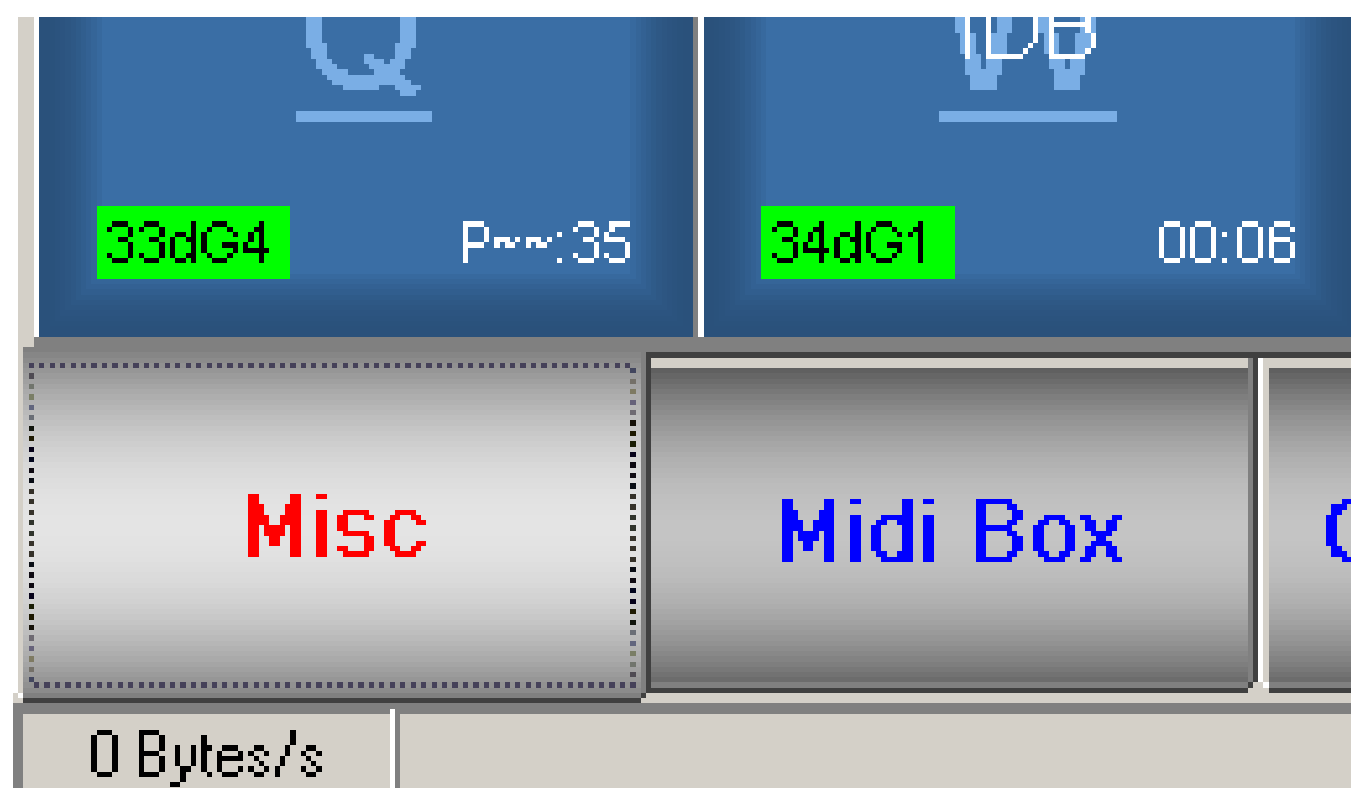

Small: -

Medium: -

Large: -

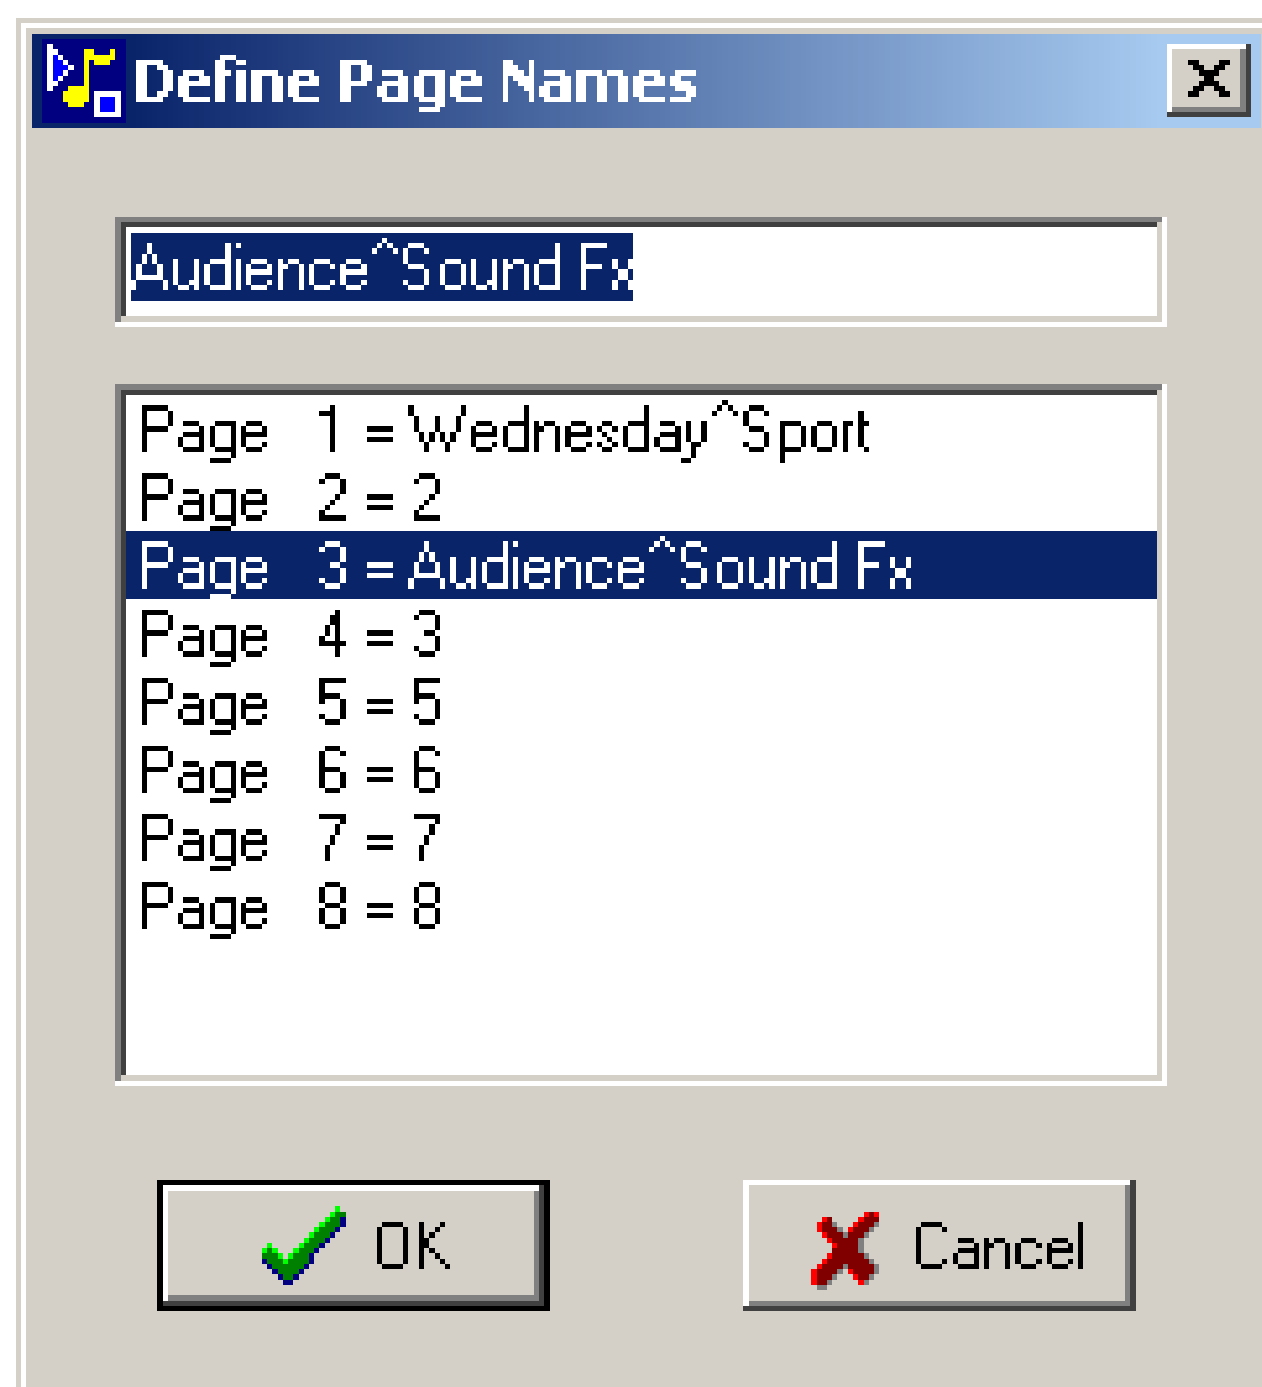

The larger sizes are more suited to operation via a touchscreen, on the Medium and Large settings the tab text will be word wrapped onto two lines

Depending on the width of the tab and the text the word wrapping may or may not be acceptable, however there is a feature that can force text onto the second line.

This is achieved by inserting a caret character '^' into the text at the point where the line break should appear.

(On most UK language keyboards the caret character is usually found as Shift+6)

The resultant text is then correctly split over two lines

Status Bar Height

The height of the status bar at the bottom of the screen can be set to any of three levels

Small: -

Medium: -

Large: -

The larger sizes are more suited to operation via a touchscreen.

Bevel Edge Width

The width of the shaded edge of the buttons can be adjusted with this option

Button Trigger Size

The size of the graphic appearing on the button can be set to one of three sizes Small, Medium or Large.

Hotkey Text

If a button has a Hotkey assigned it will normally be shown in dimmed text in the centre of the button, to aid visibility of the track name the hotkey indication can be disabled with this option.

Midi In Text

As an alternative to the hotkey text display the buttons can show the Midi In Channel/Note assignment.

The button text display can be either HotKey, Midi In or none

Button Triggers

SpotOn buttons can be triggered in a variety of ways, essentially these can be split into two groups: -

Local	button click, PlayNext, Master/Slave...
Remote	GPI, Timecode, Midi...

To aid the operator identifying if particular button was triggered by some type of remote control, a Button Trigger graphic can be displayed on the button.

This graphic is shown when the button is triggered by Midi, GPI, UDP, TCP, PBus or Timecode

Edged Midi/HotKey Text

In order to improve visibility of the button Midi and HotKey text this option will add a drop shadow effect to the text

Elapsed Time Count

By default the display at the lower right of the button shows the time remaining - counting down to zero.

As an alternative the display can be changed to show the Elapsed time - counting up from zero

This option applies globally and has a keyboard shortcut of Ctrl+T

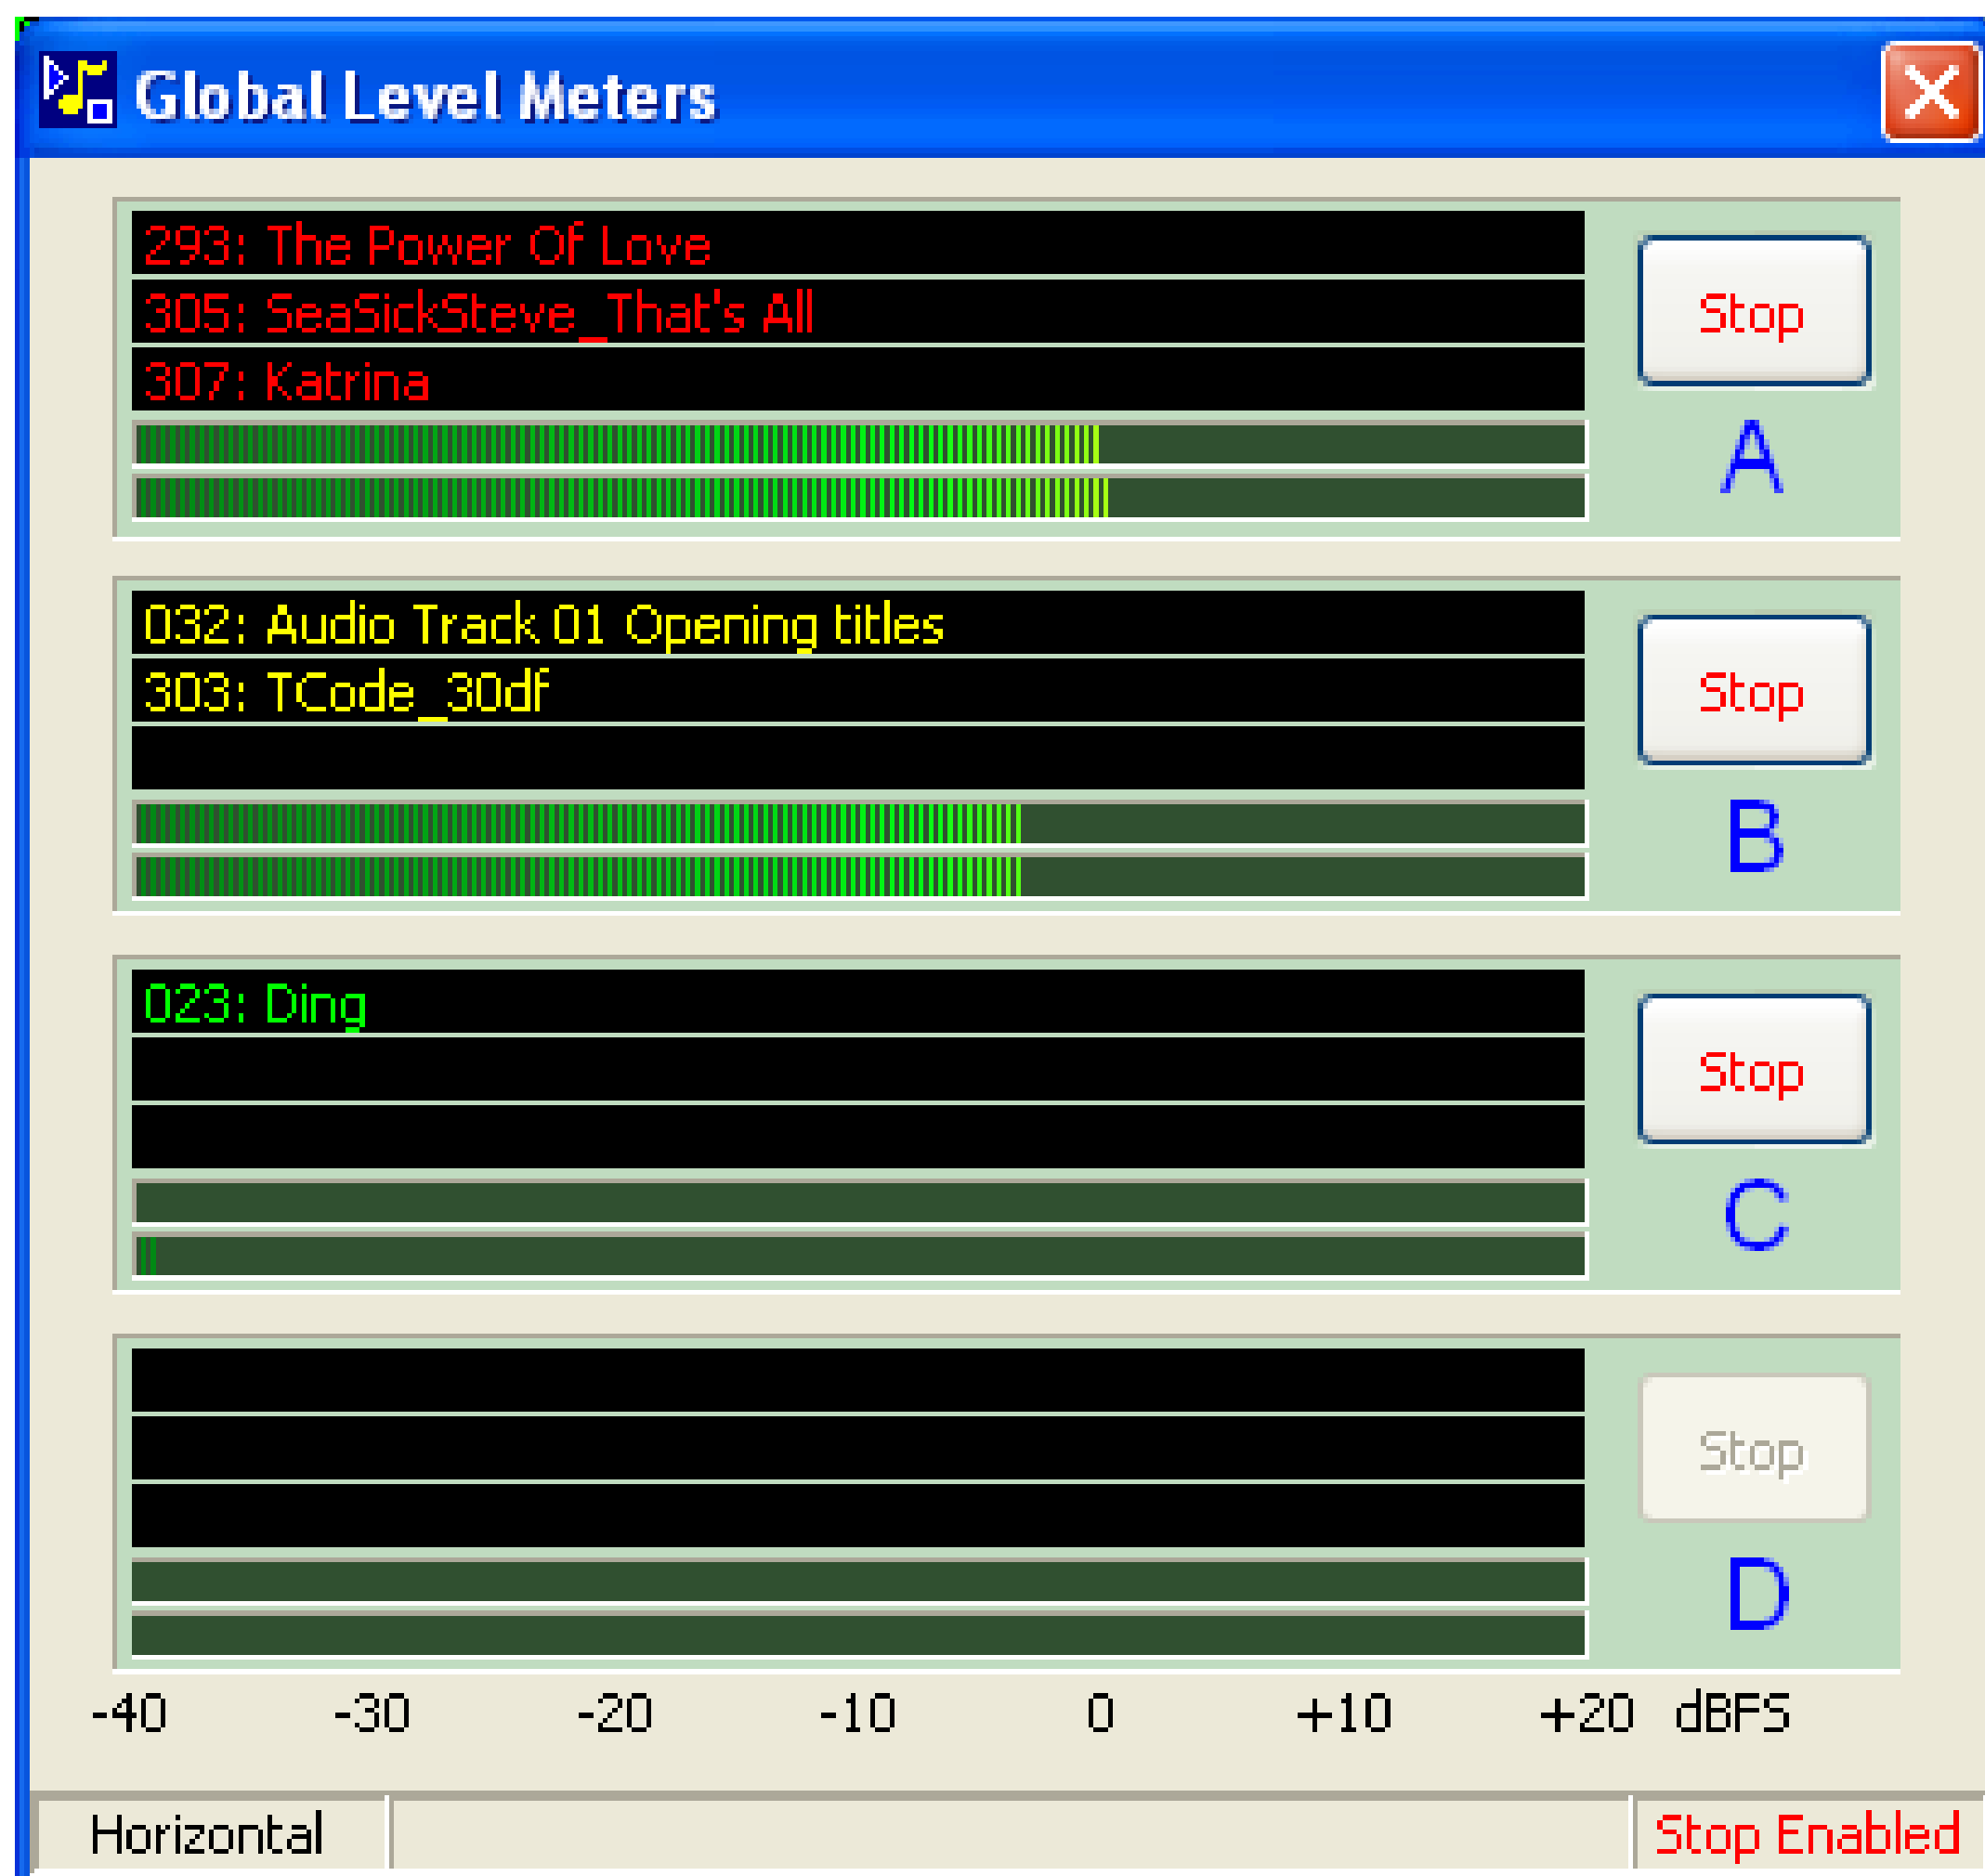

Level Meters

A window showing the signal level on the first 4 outputs can be displayed with this menu item or via the Ctrl+L keyboard shortcut.

The buttons playing on specific outputs are listed in numerical order up to a maximum of 3, the text is coloured according to the number of buttons contributing to the output.

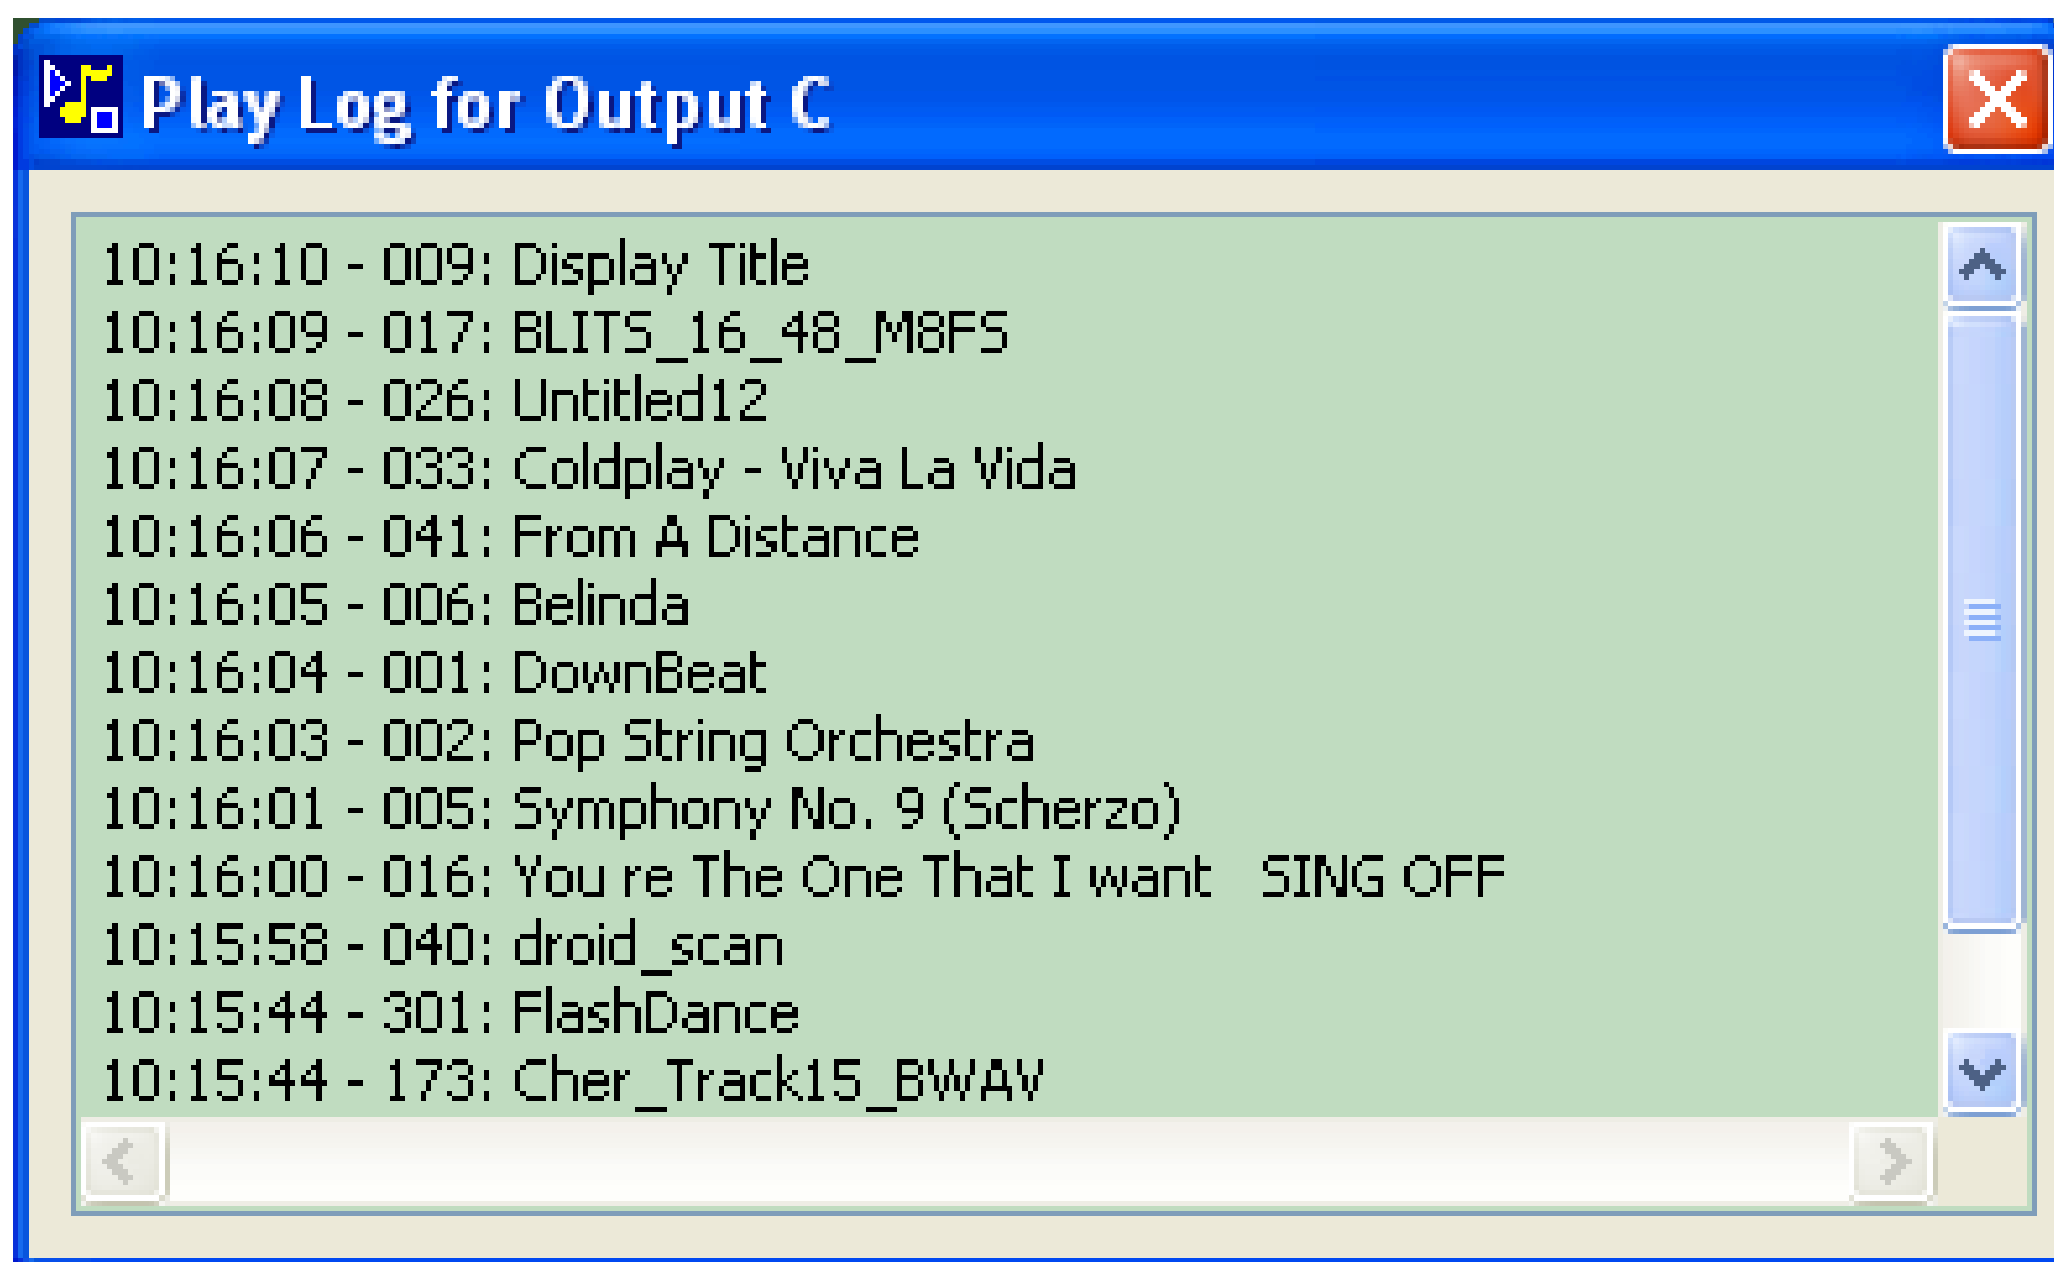

- | | |
|--------|-------------------------------|
| Green | One button playing |
| Yellow | Two buttons playing |
| Red | Three or more buttons playing |

The Stop buttons on the right of the window allow all buttons on those specific outputs to be stopped, the Stop buttons are enabled by clicking the bottom right status bar panel

Individual buttons can be stopped by right-clicking on the appropriate entry

Right-clicking on the output letter "C" offers a timestamped listing of the last 100 tracks played on that output

An alternative vertical Level Meter display is available by left clicking the lower left status bar panel on the Level Meter window.

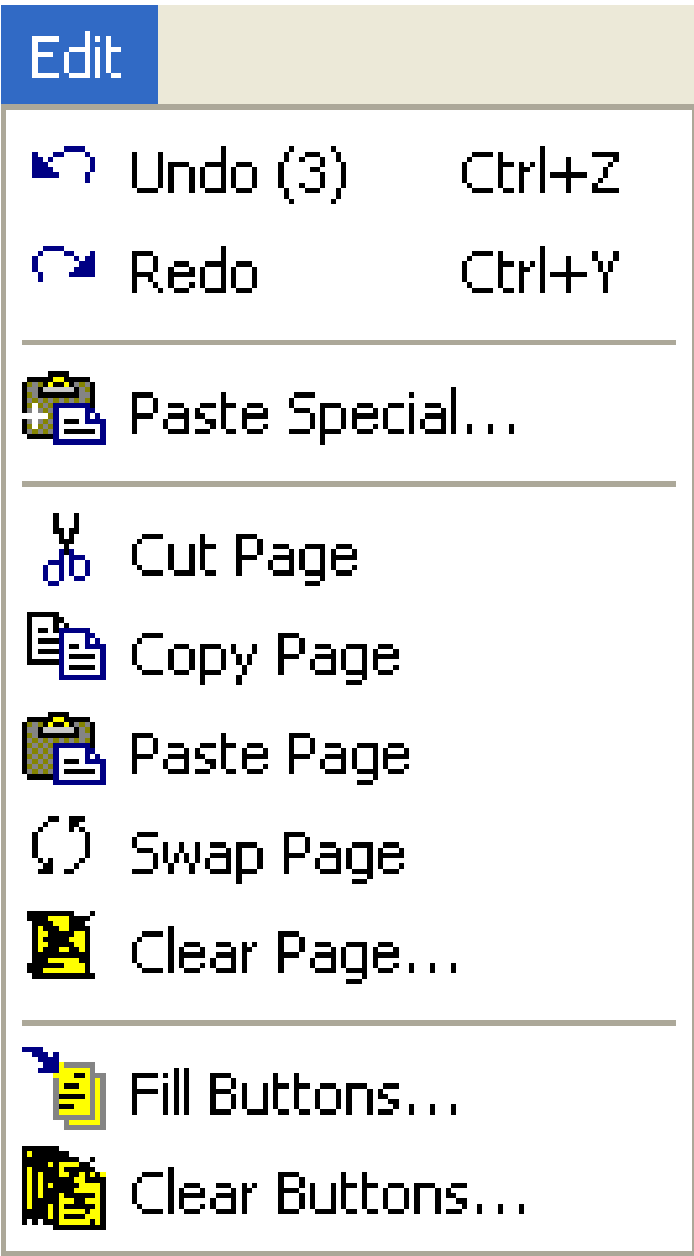

This simple display mode does not list the track names, but the number of tracks contributing to an output can be found by moving the mouse pointer over the output bargraphs.

The right-click option to show the list of recent tracks played on a specific output is still available in this mode.

Timecode Display

A floating window showing currently selected timecode reference

Edit Menu

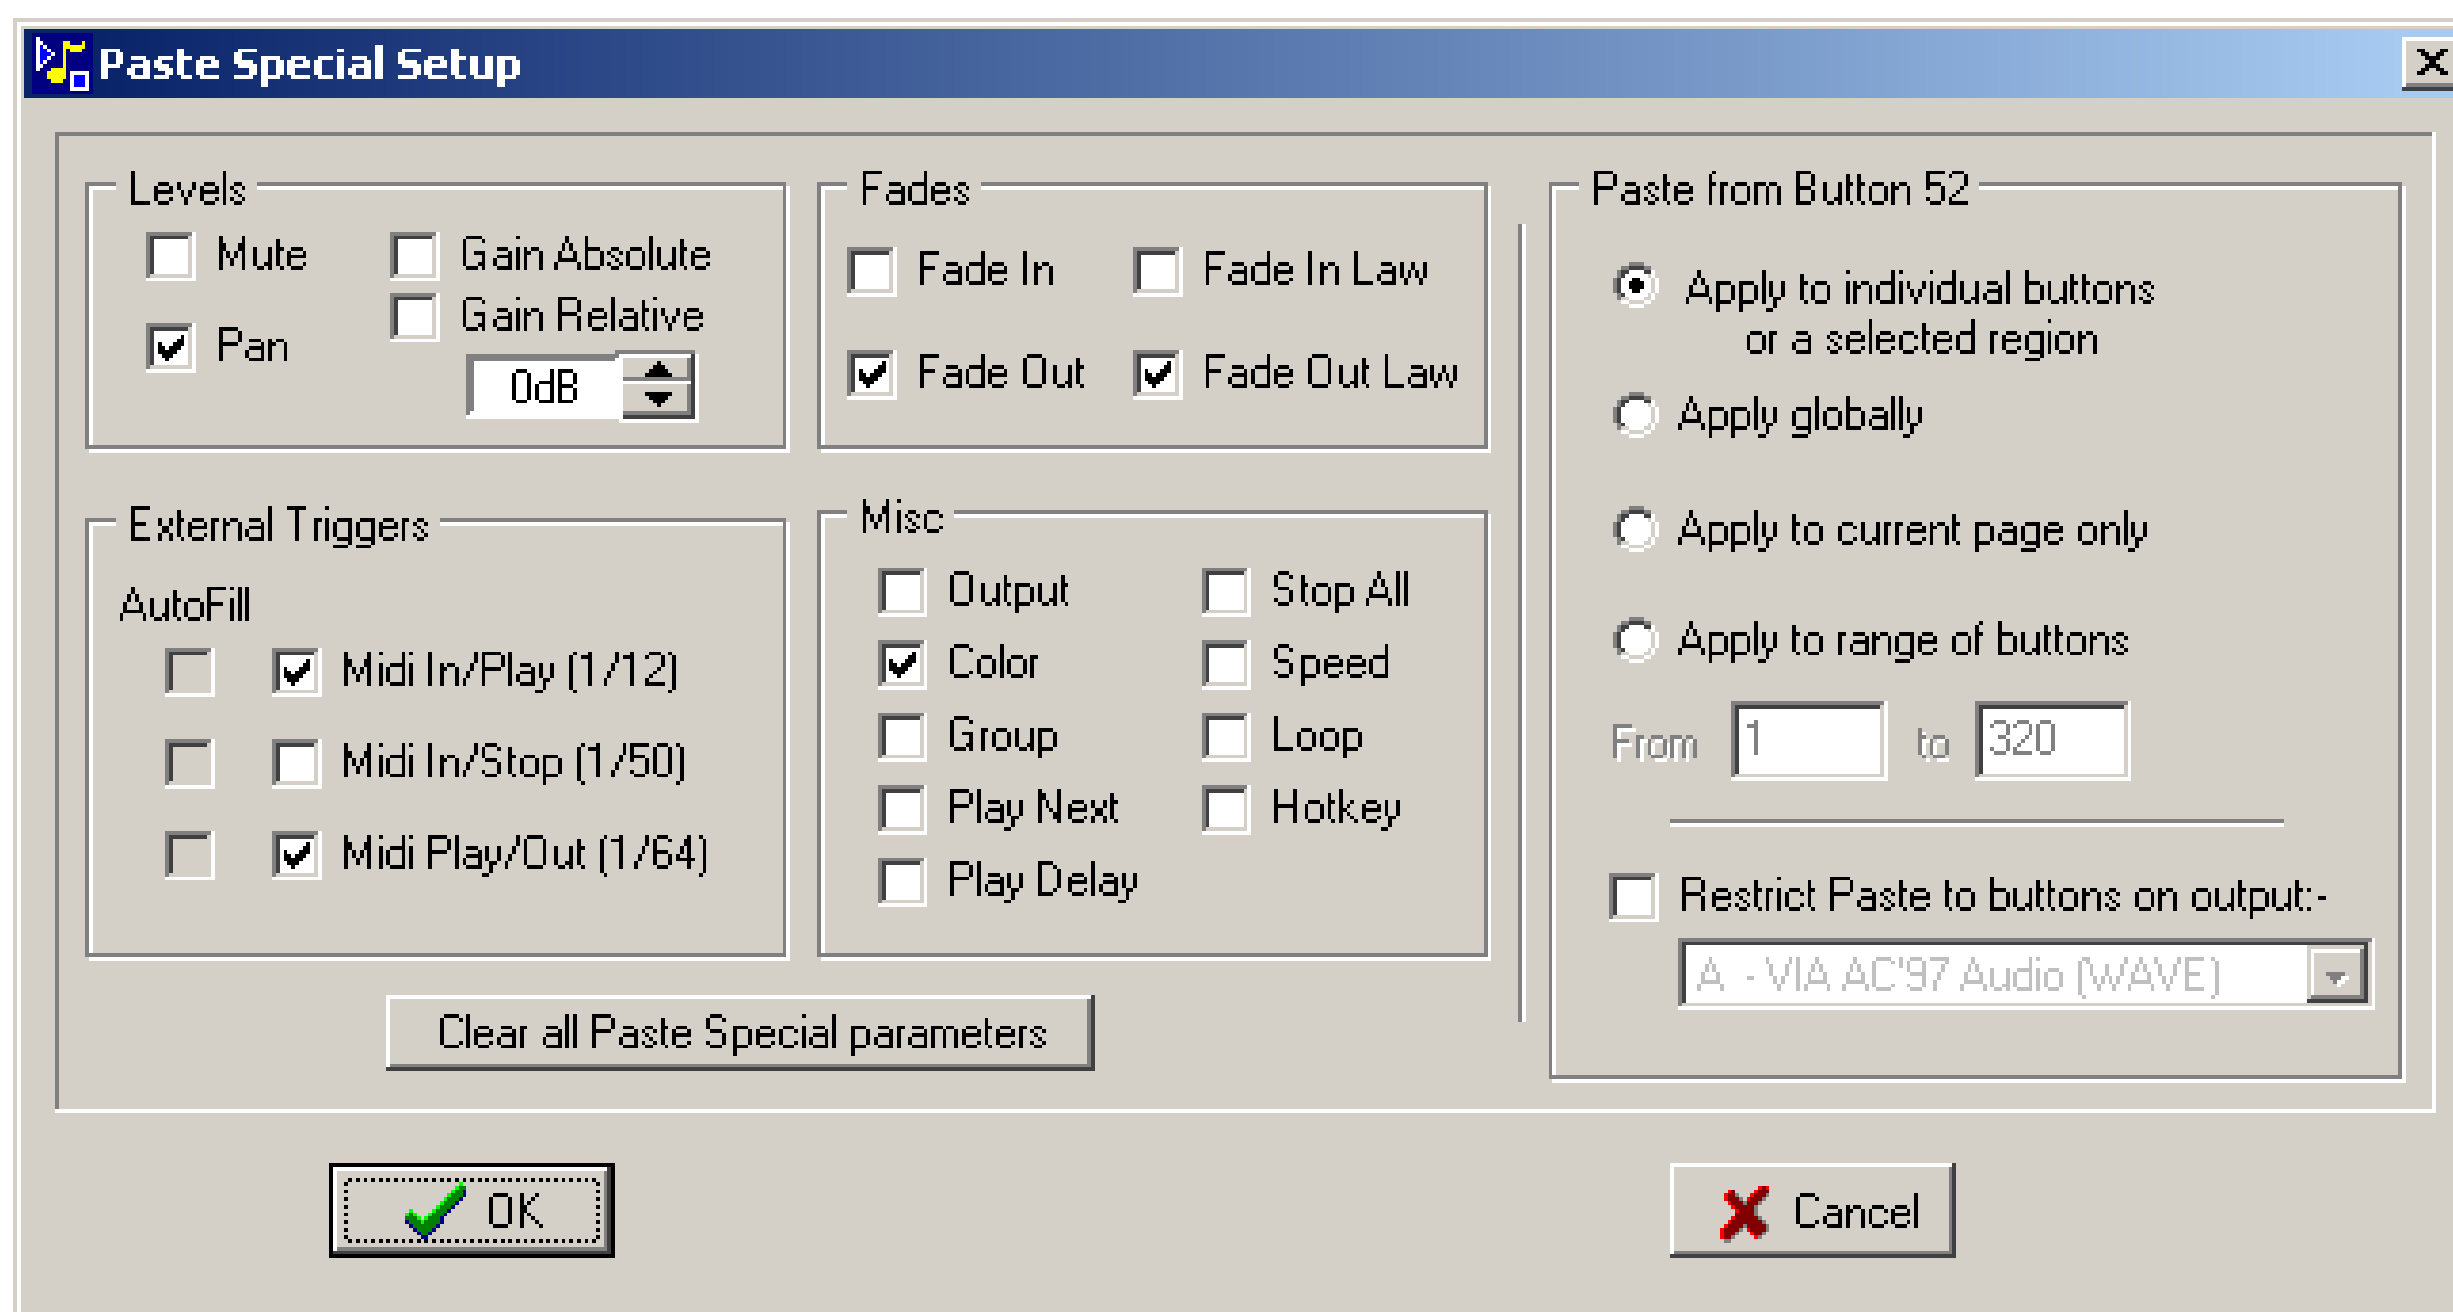

Undo	Undo last change
Redo	Redo last Undo
Paste Special	Selectively paste button parameters
Cut Page	Copy current page to clipboard and then clear current page
Copy Page	Copy current page to clipboard
Paste Page	Paste clipboard contents onto current page
Swap Page	Exchange page contents of current page with those last copied to clipboard
Clear Page	Clear contents of current page
Fill Buttons	Load a sequence of buttons with the same audio file
Clear Buttons	Clear all buttons

Paste Special

The Paste Special option available at both button and page level can be used to copy/paste certain parameters from one button to one or more other buttons.

First the source button is selected that has the parameters to be pasted and the button is copied to the clipboard using the button popup menu Copy item

The main menu Edit|Paste Special dialog allows the selection of the parameters to be pasted, below Pan, Midi Out, Fade Out and Colour have been chosen, the Fade law checkbox is automatically checked when a fade time is selected.

On the right hand side of the dialog is the section where the range of target buttons are defined, the default is single individual buttons.

The parameters can now be pasted onto existing buttons using the button popup menu Paste Special option

The status bar hint will indicate which parameters will be pasted, in this case Pan, Fade Out duration, Midi In to play and Color have been selected.

If a gain adjustment is required to be applied to several buttons and their relative gain settings must be maintained, then the Gain Relative option should be used, in the example below the gain of each button on which Paste Special is used will be increased by 3dB.

If more than one consecutive button is to be modified then other Paste Scope options can be used

Paste from Btn 52 with scope

☒ Apply to individual buttons or a selected region

☐ Apply globally

☐ Apply to current page only

☐ Apply to range of buttons

From to

☐ Restrict Paste to buttons on output:-

- 1, One individual button at a time
- 2, All buttons across all pages
- 3, All buttons on current page only
- 4, A defined range of buttons
- 5, Further restrict above selection to only act on buttons assigned to a specific output

If a range of buttons 10..18 is required then the entry will look as below

Paste from Btn 52 with scope

☒ Apply to individual buttons or a selected region

☐ Apply globally

☐ Apply to current page only

☒ Apply to range of buttons

From to

☐ Restrict Paste to buttons on output:-

When the Paste Special dialog is exited a further confirmation dialog will be shown with a summary of the changes about to be applied

Midi In/Play, Midi In/Stop and Midi Play/Out paste options have 'AutoFill' modifiers, when checked these will fill the selected range of buttons with a Midi note based on that of the copied button.

The Auto Fill modifier is only enabled when Paste Midi In/Play, Midi In/Stop or Midi Play/Out are checked and the Paste Scope is set to be a range of buttons

Pasting a range of buttons with Auto Fill checked will set the Midi notes of the pasted buttons to: -

Midi Note of copied Btn+ 1, Midi note of copied Btn+2, Midi note of copied Btn+3....

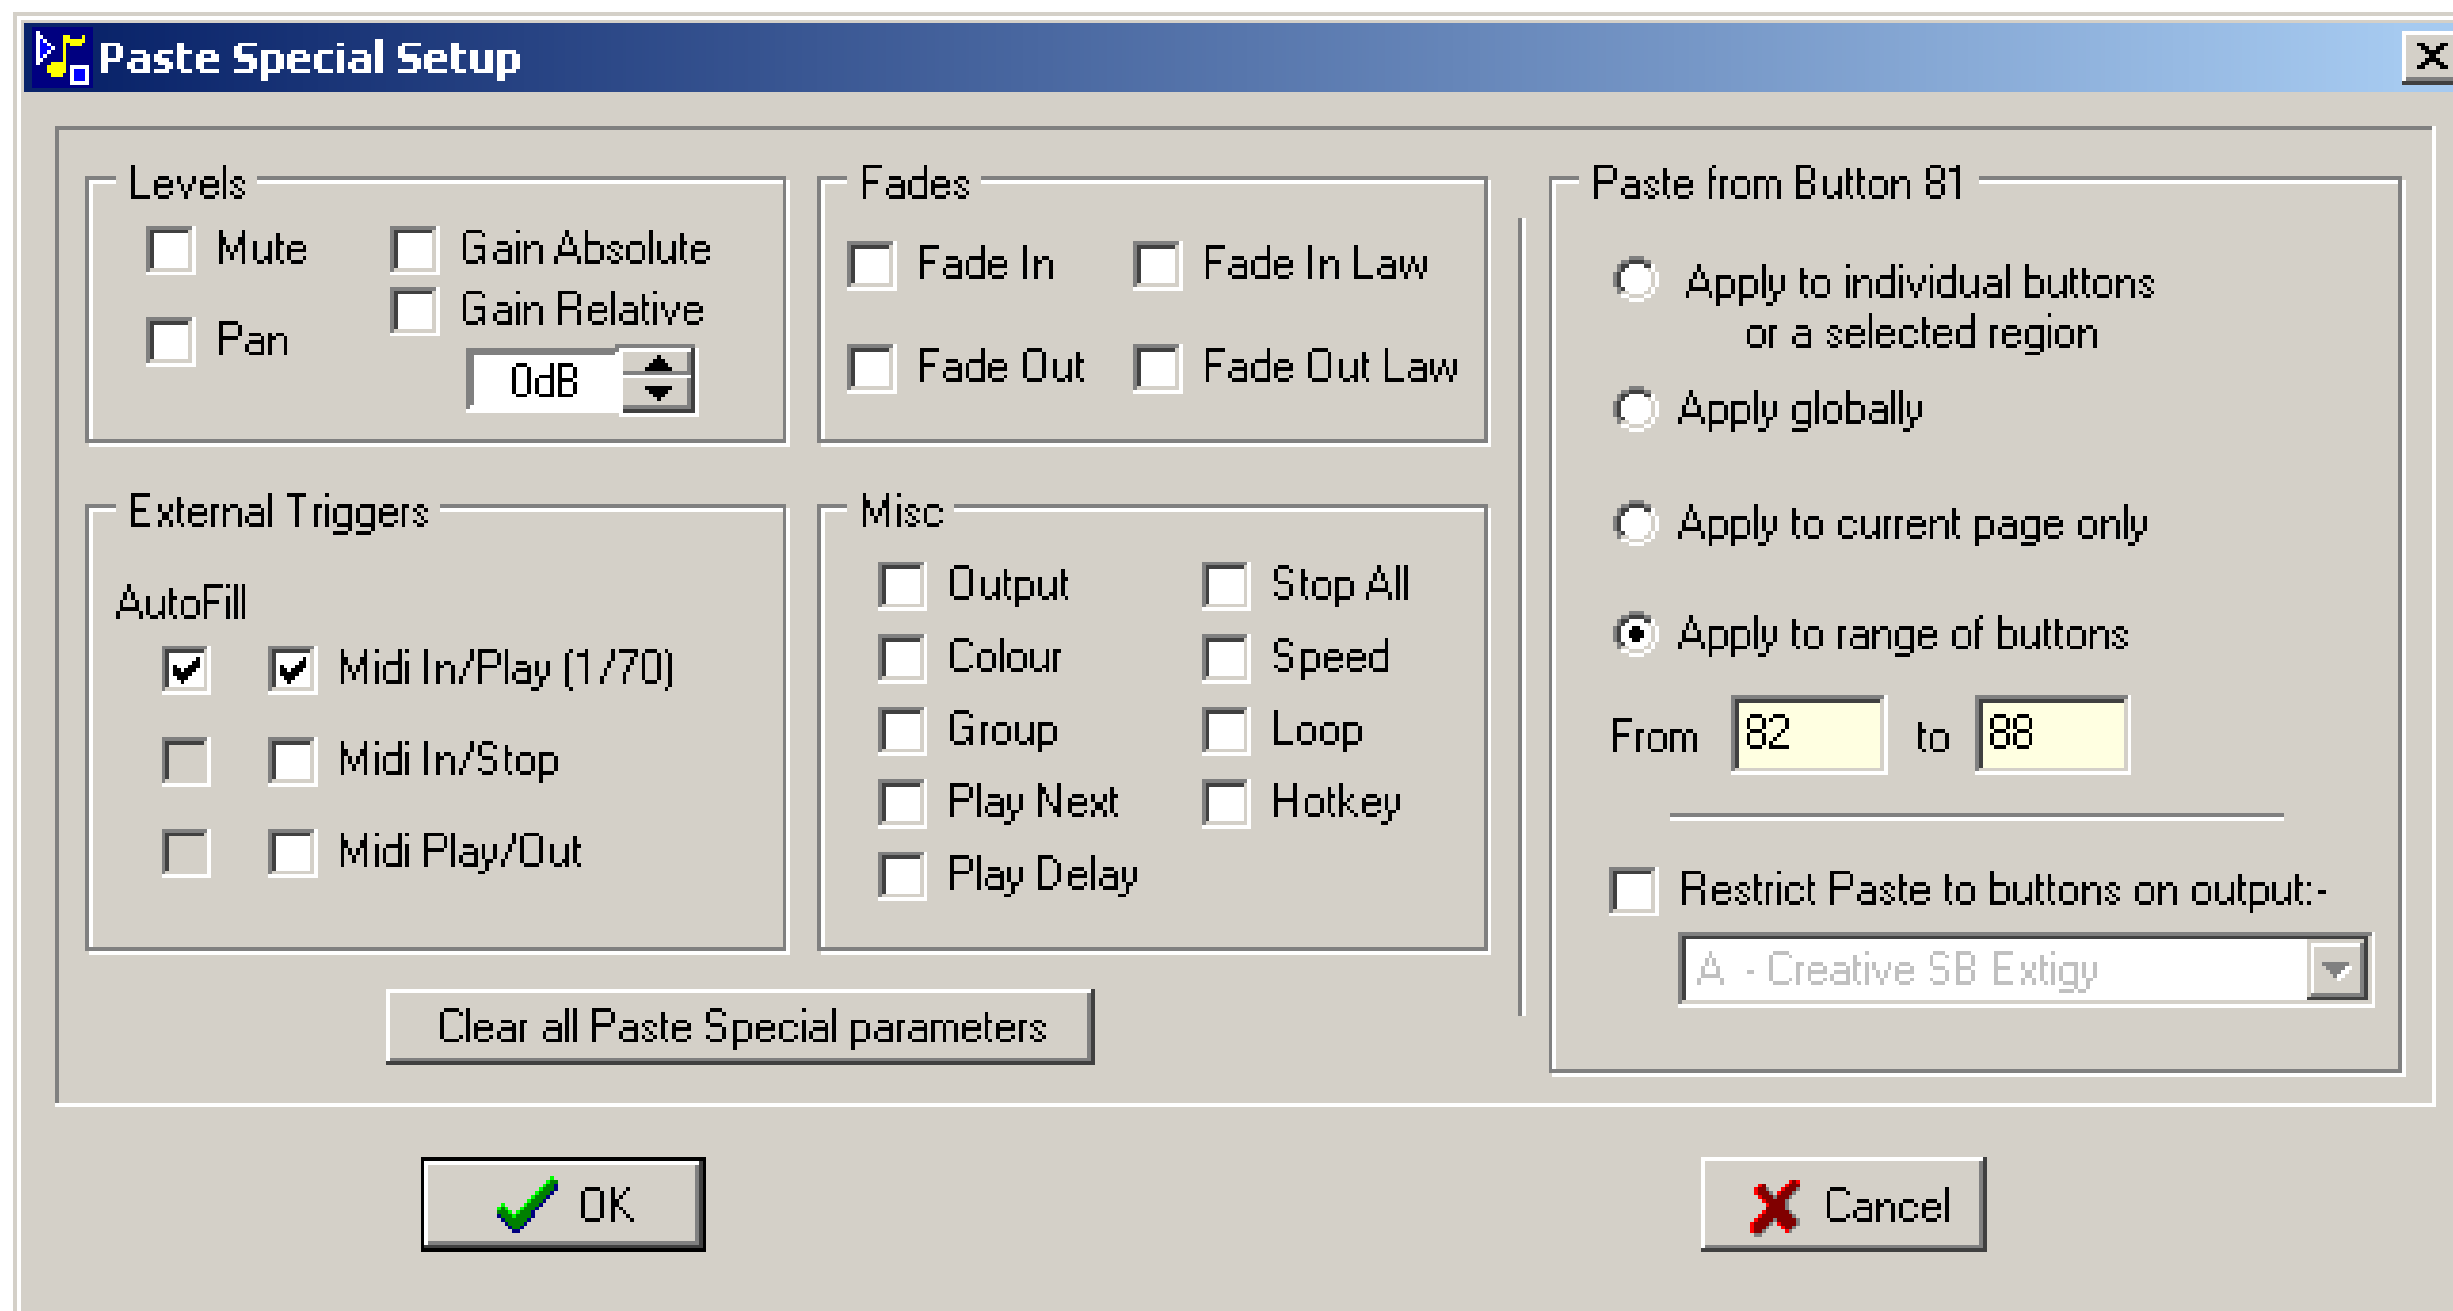

In the example above this would be in Channel/Note format: -

First button pasted >1/13, second button pasted >1/14, third button pasted >1/15...

The pasted Midi Channel number is always the same as the copied button.

As an example, button 81 has Midi In/Play allocated to note 1/70

If the Midi notes on buttons 82..88 are to be assigned notes 1/71..1/77, then the procedure is to copy button 81 to the clipboard, and to use Paste Special SetUp to Auto Fill the buttons 82..88 as shown below

A prompt dialog appears confirming the changes

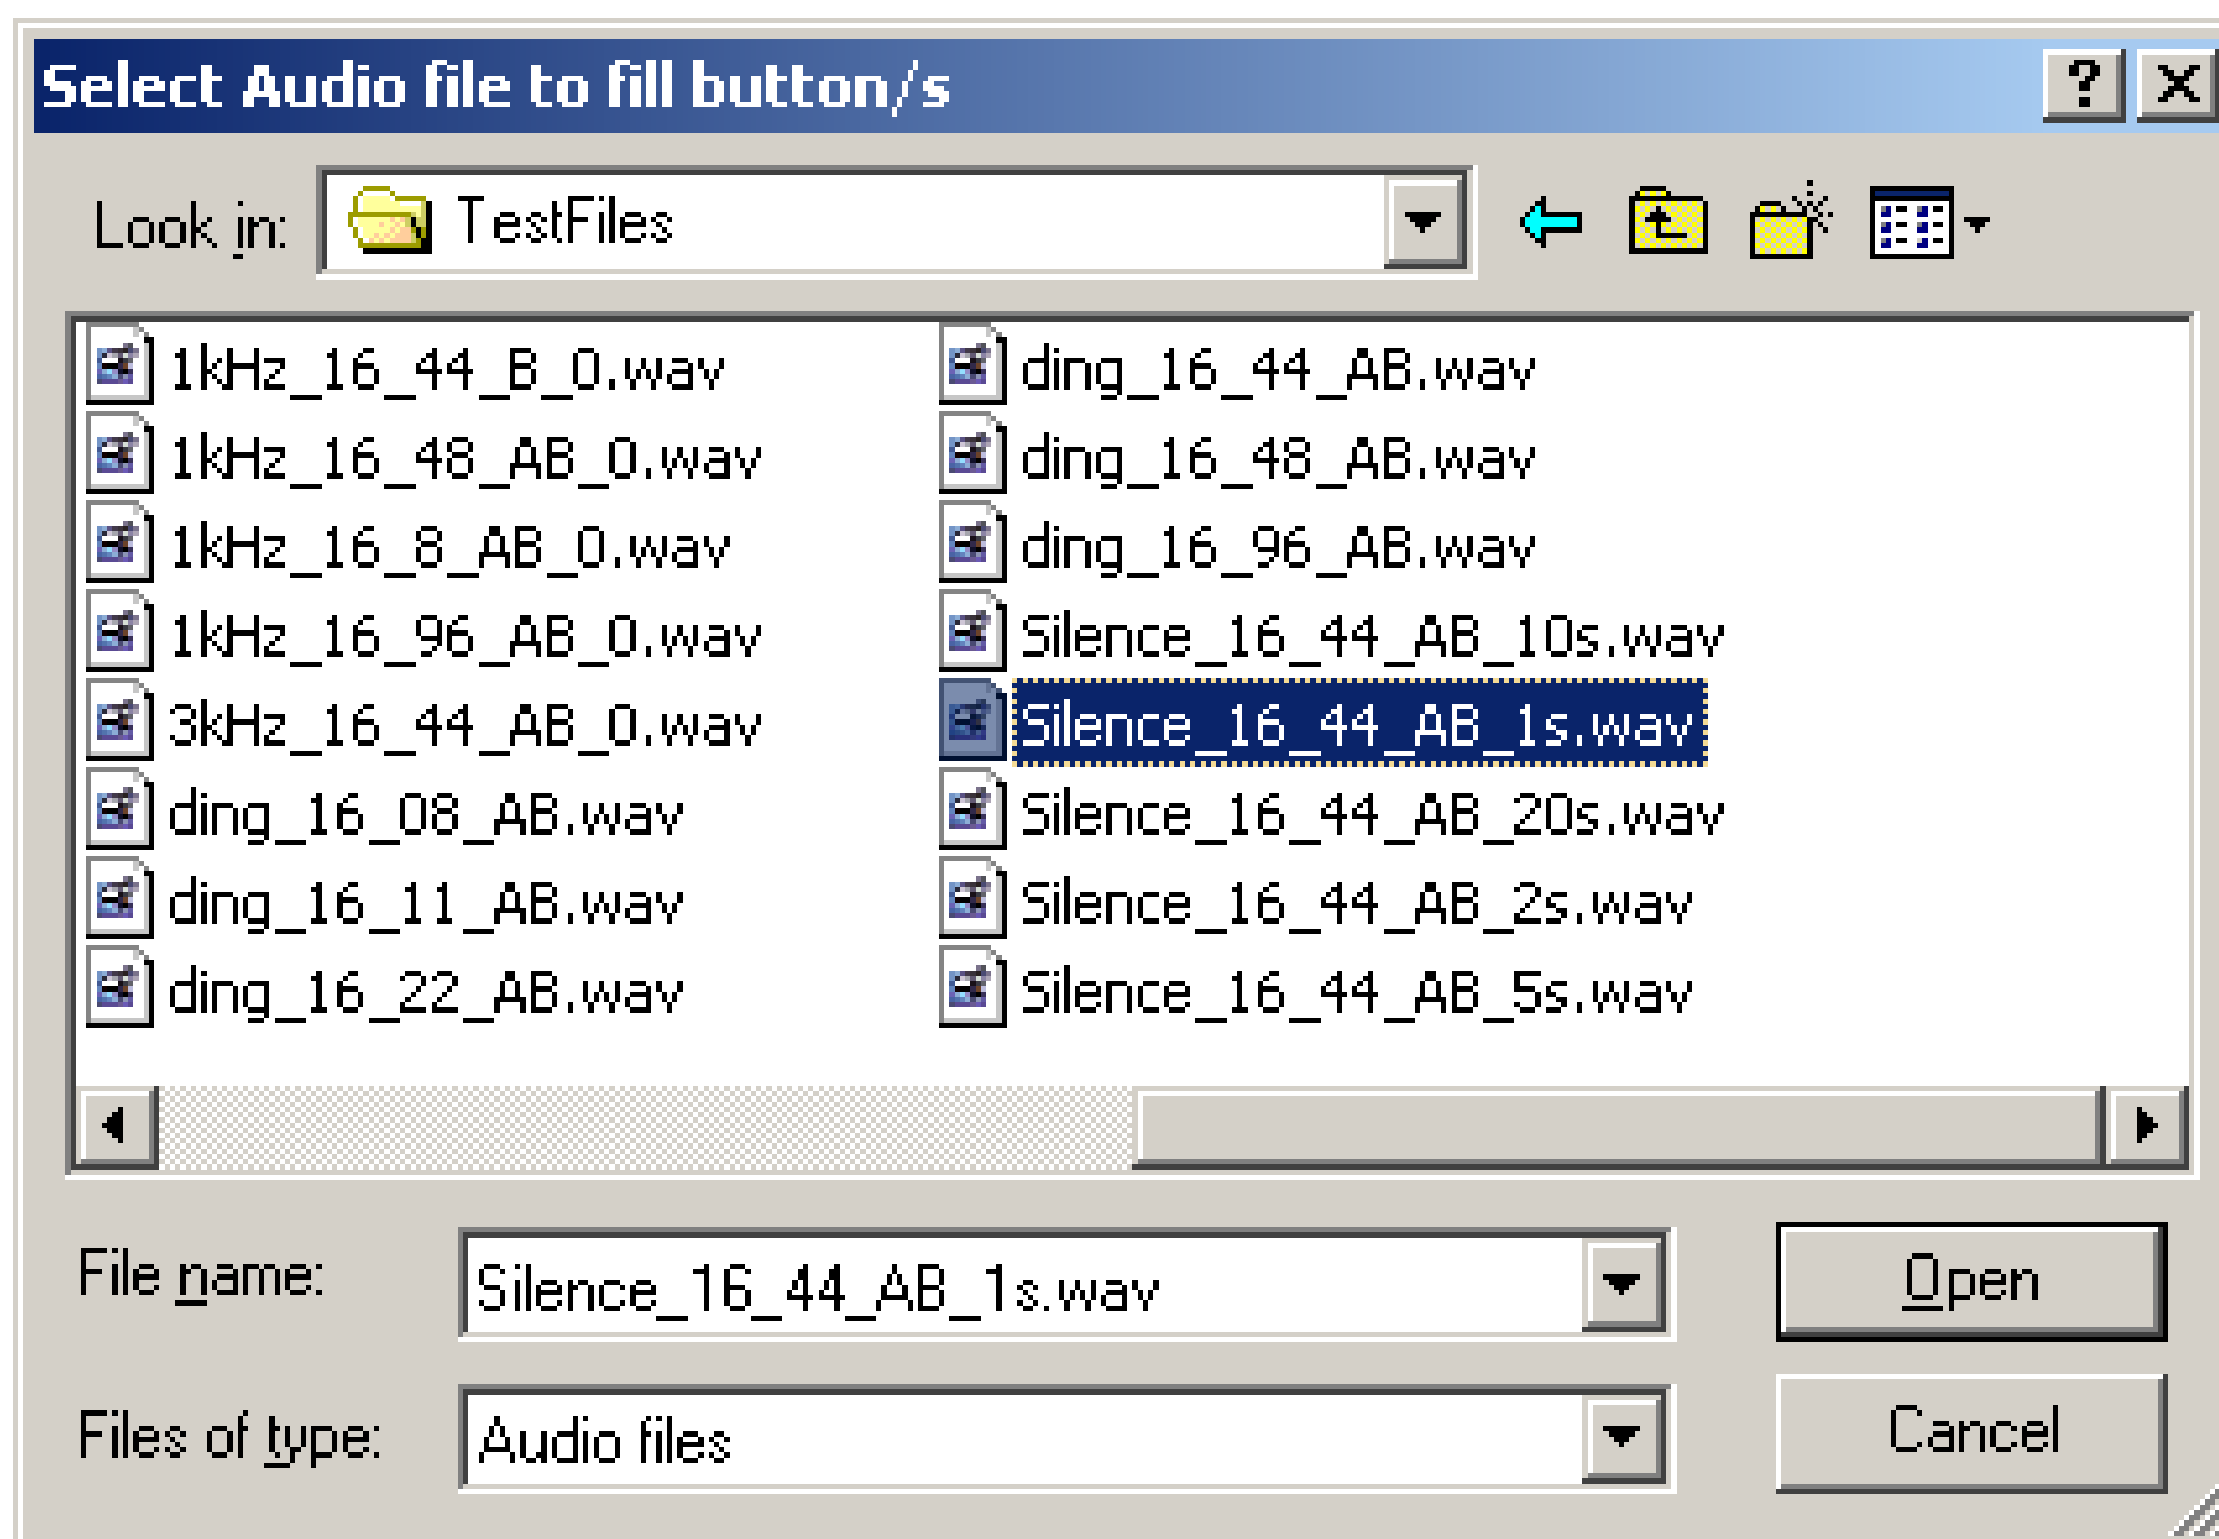

The result then becomes: -

If the option to restrict the Paste Special action to buttons only on a specific output the prompt box will appear as below.

Fill Buttons

This option provides a quick method of loading the same audio file into a range consecutive buttons, this may be required when setting up SpotOn so that all spare buttons are loaded with for example 1 second of silence.

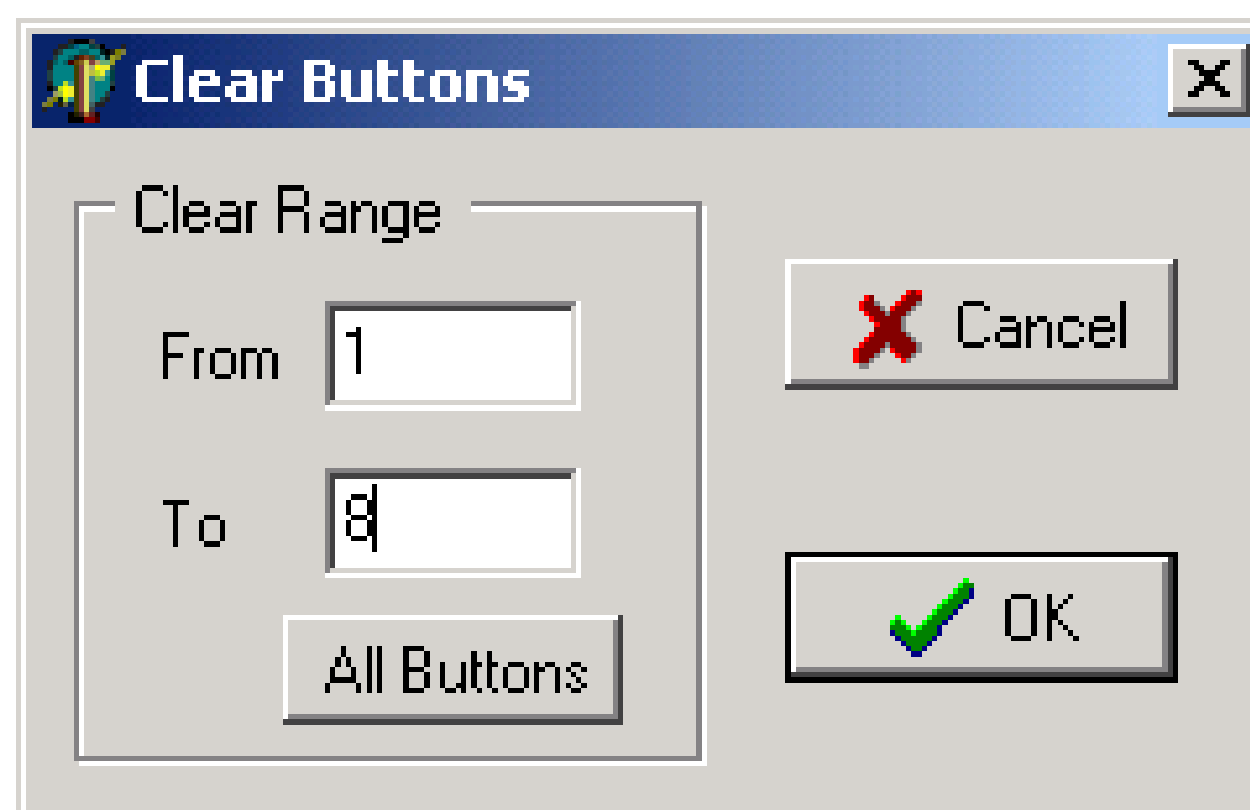

The first dialog box to be presented allows selection of the audio file followed by a further dialog defining of the range of buttons to be loaded

Finally a confirmation dialog box before the buttons are loaded.

Clear Buttons

To clear tracks from one or more buttons enter the first and last button numbers then click OK

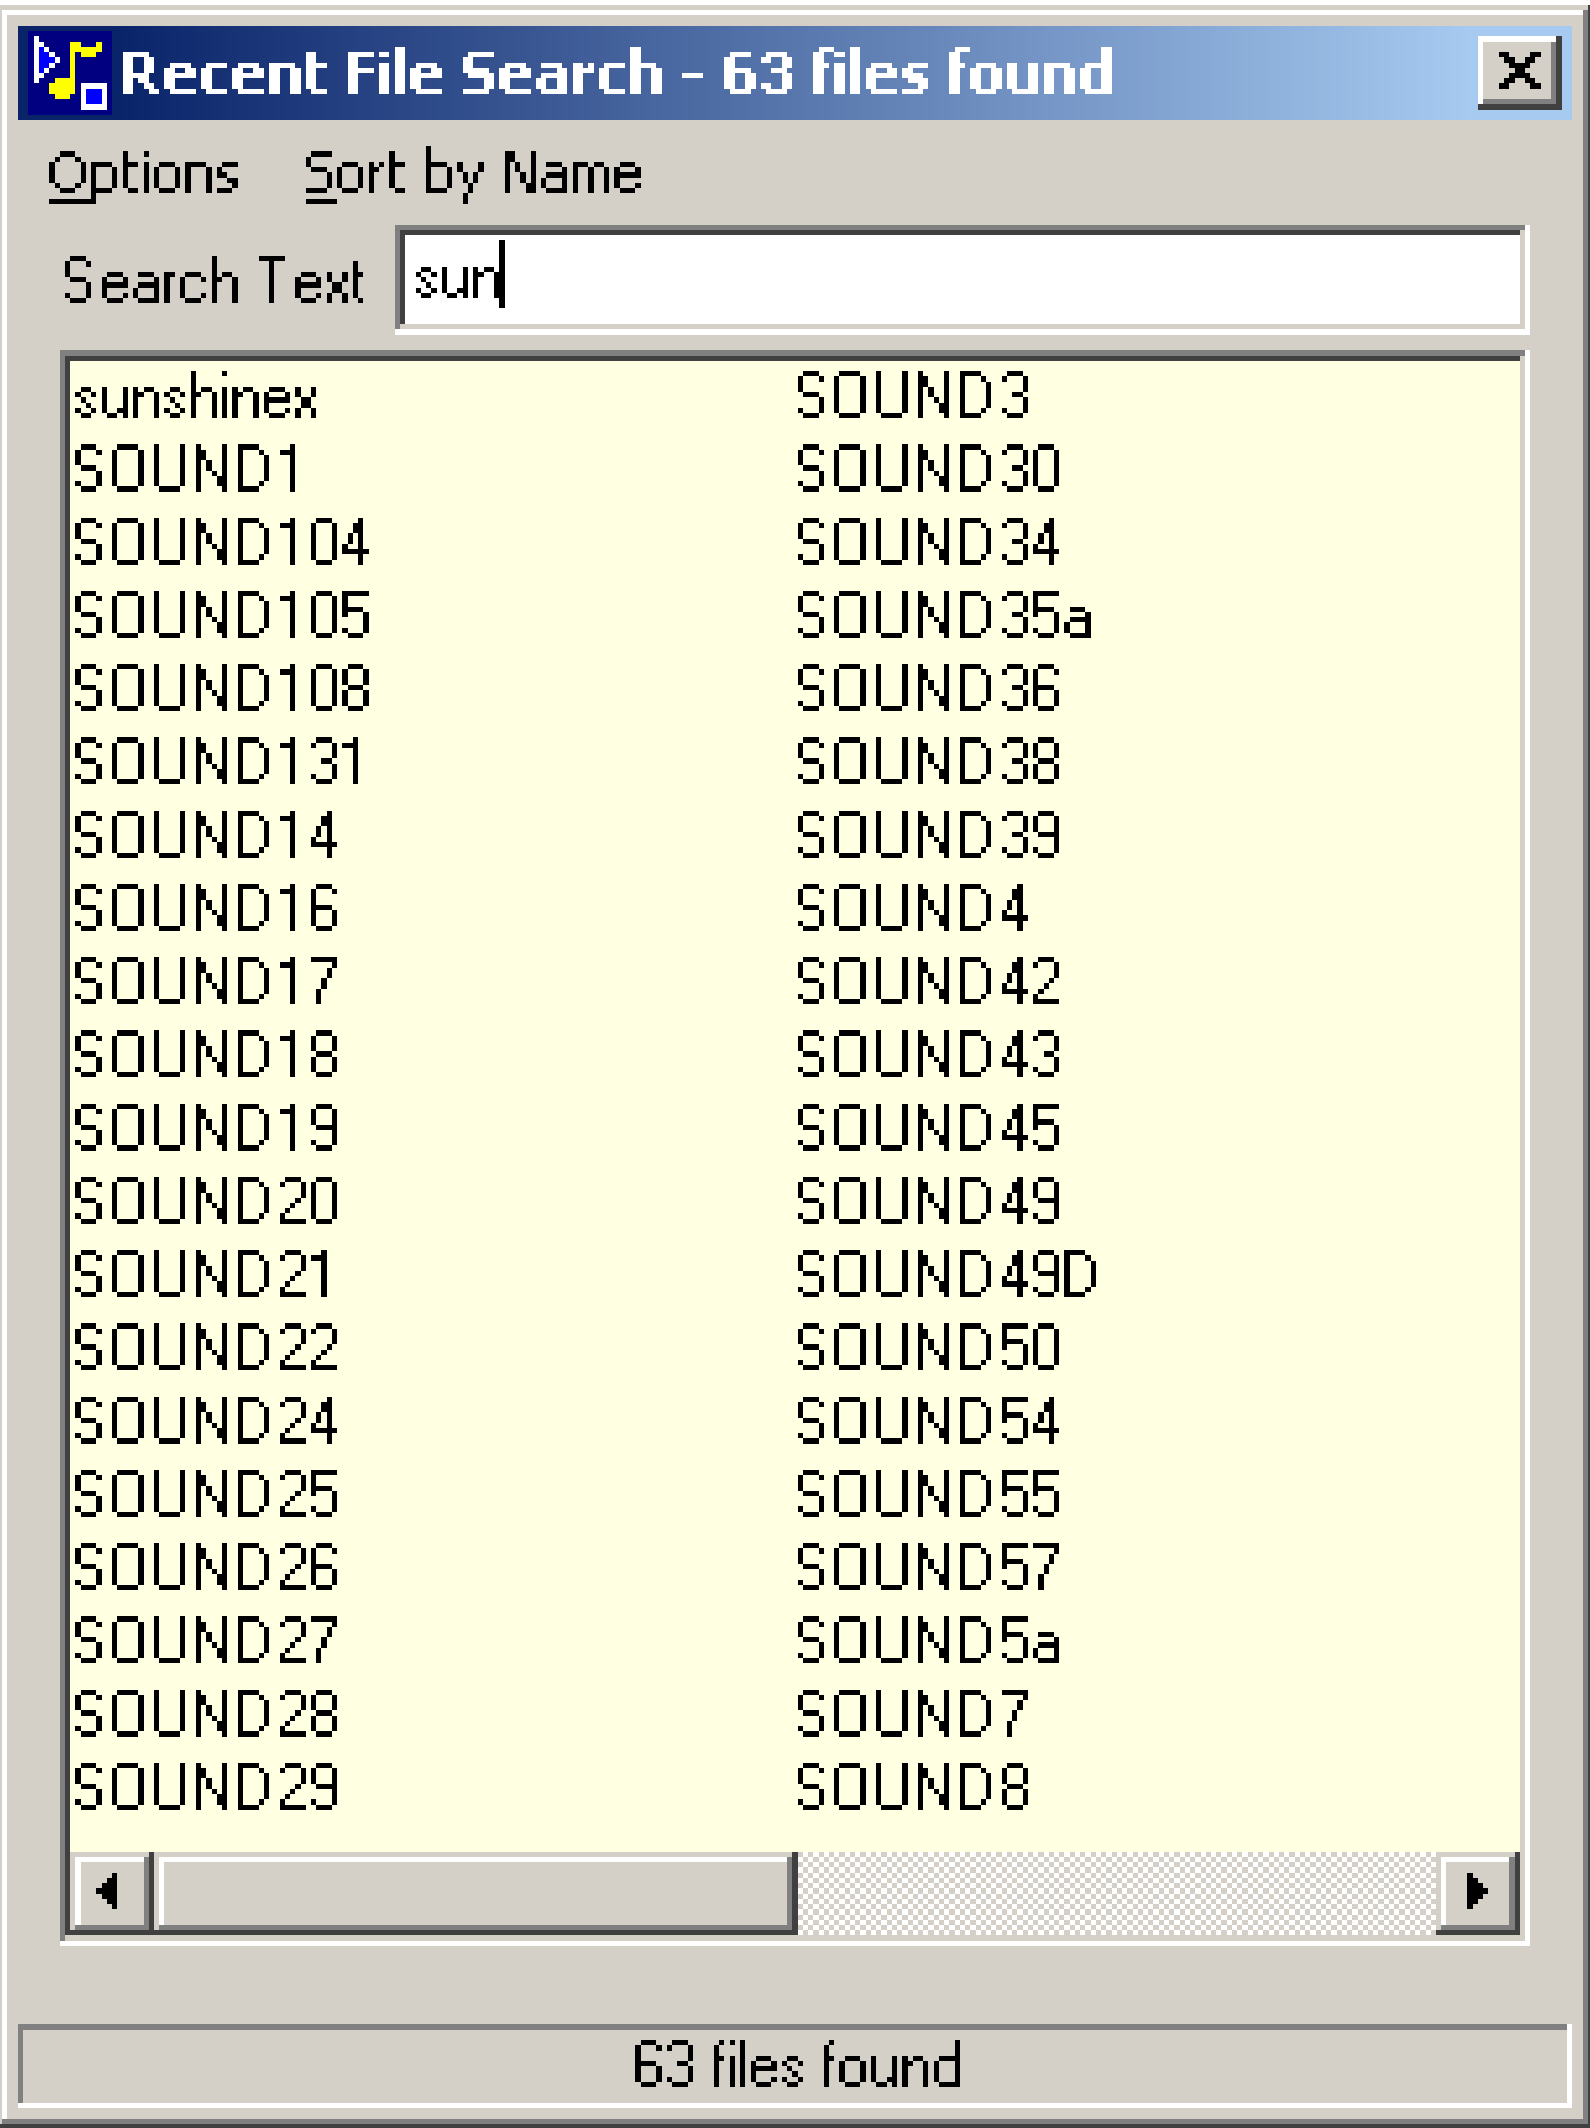

Click on "All buttons" to enter the full button range

A confirmation dialog is shown before the buttons are cleared.

Search Menu

The Search menu will display a popup window similar to that shown below containing the 1000 most recent files loaded into SpotOn.

The names listed are the disk filenames or display names if they were altered when loaded into SpotOn. They can be searched by typing directly into the Search Text edit panel, here 'sun' has been entered and the file 'sunshine' has been moved to the top of the list.

Once the required file has been located it can be selected and then dragged and dropped on to the appropriate main window button. Drag and Alt+Drop will automatically Top/tail track before it is loaded onto the button

The actual location of the audio file is show in the search window status bar.

Sorting Search List

By default the list of tracknames will be sorted in ascending alphanumeric order.

The 'Sort by' menu allows the list to be sorted in alphanumeric order or with the most recently loaded tracknames at the beginning of the list.

Remote Files

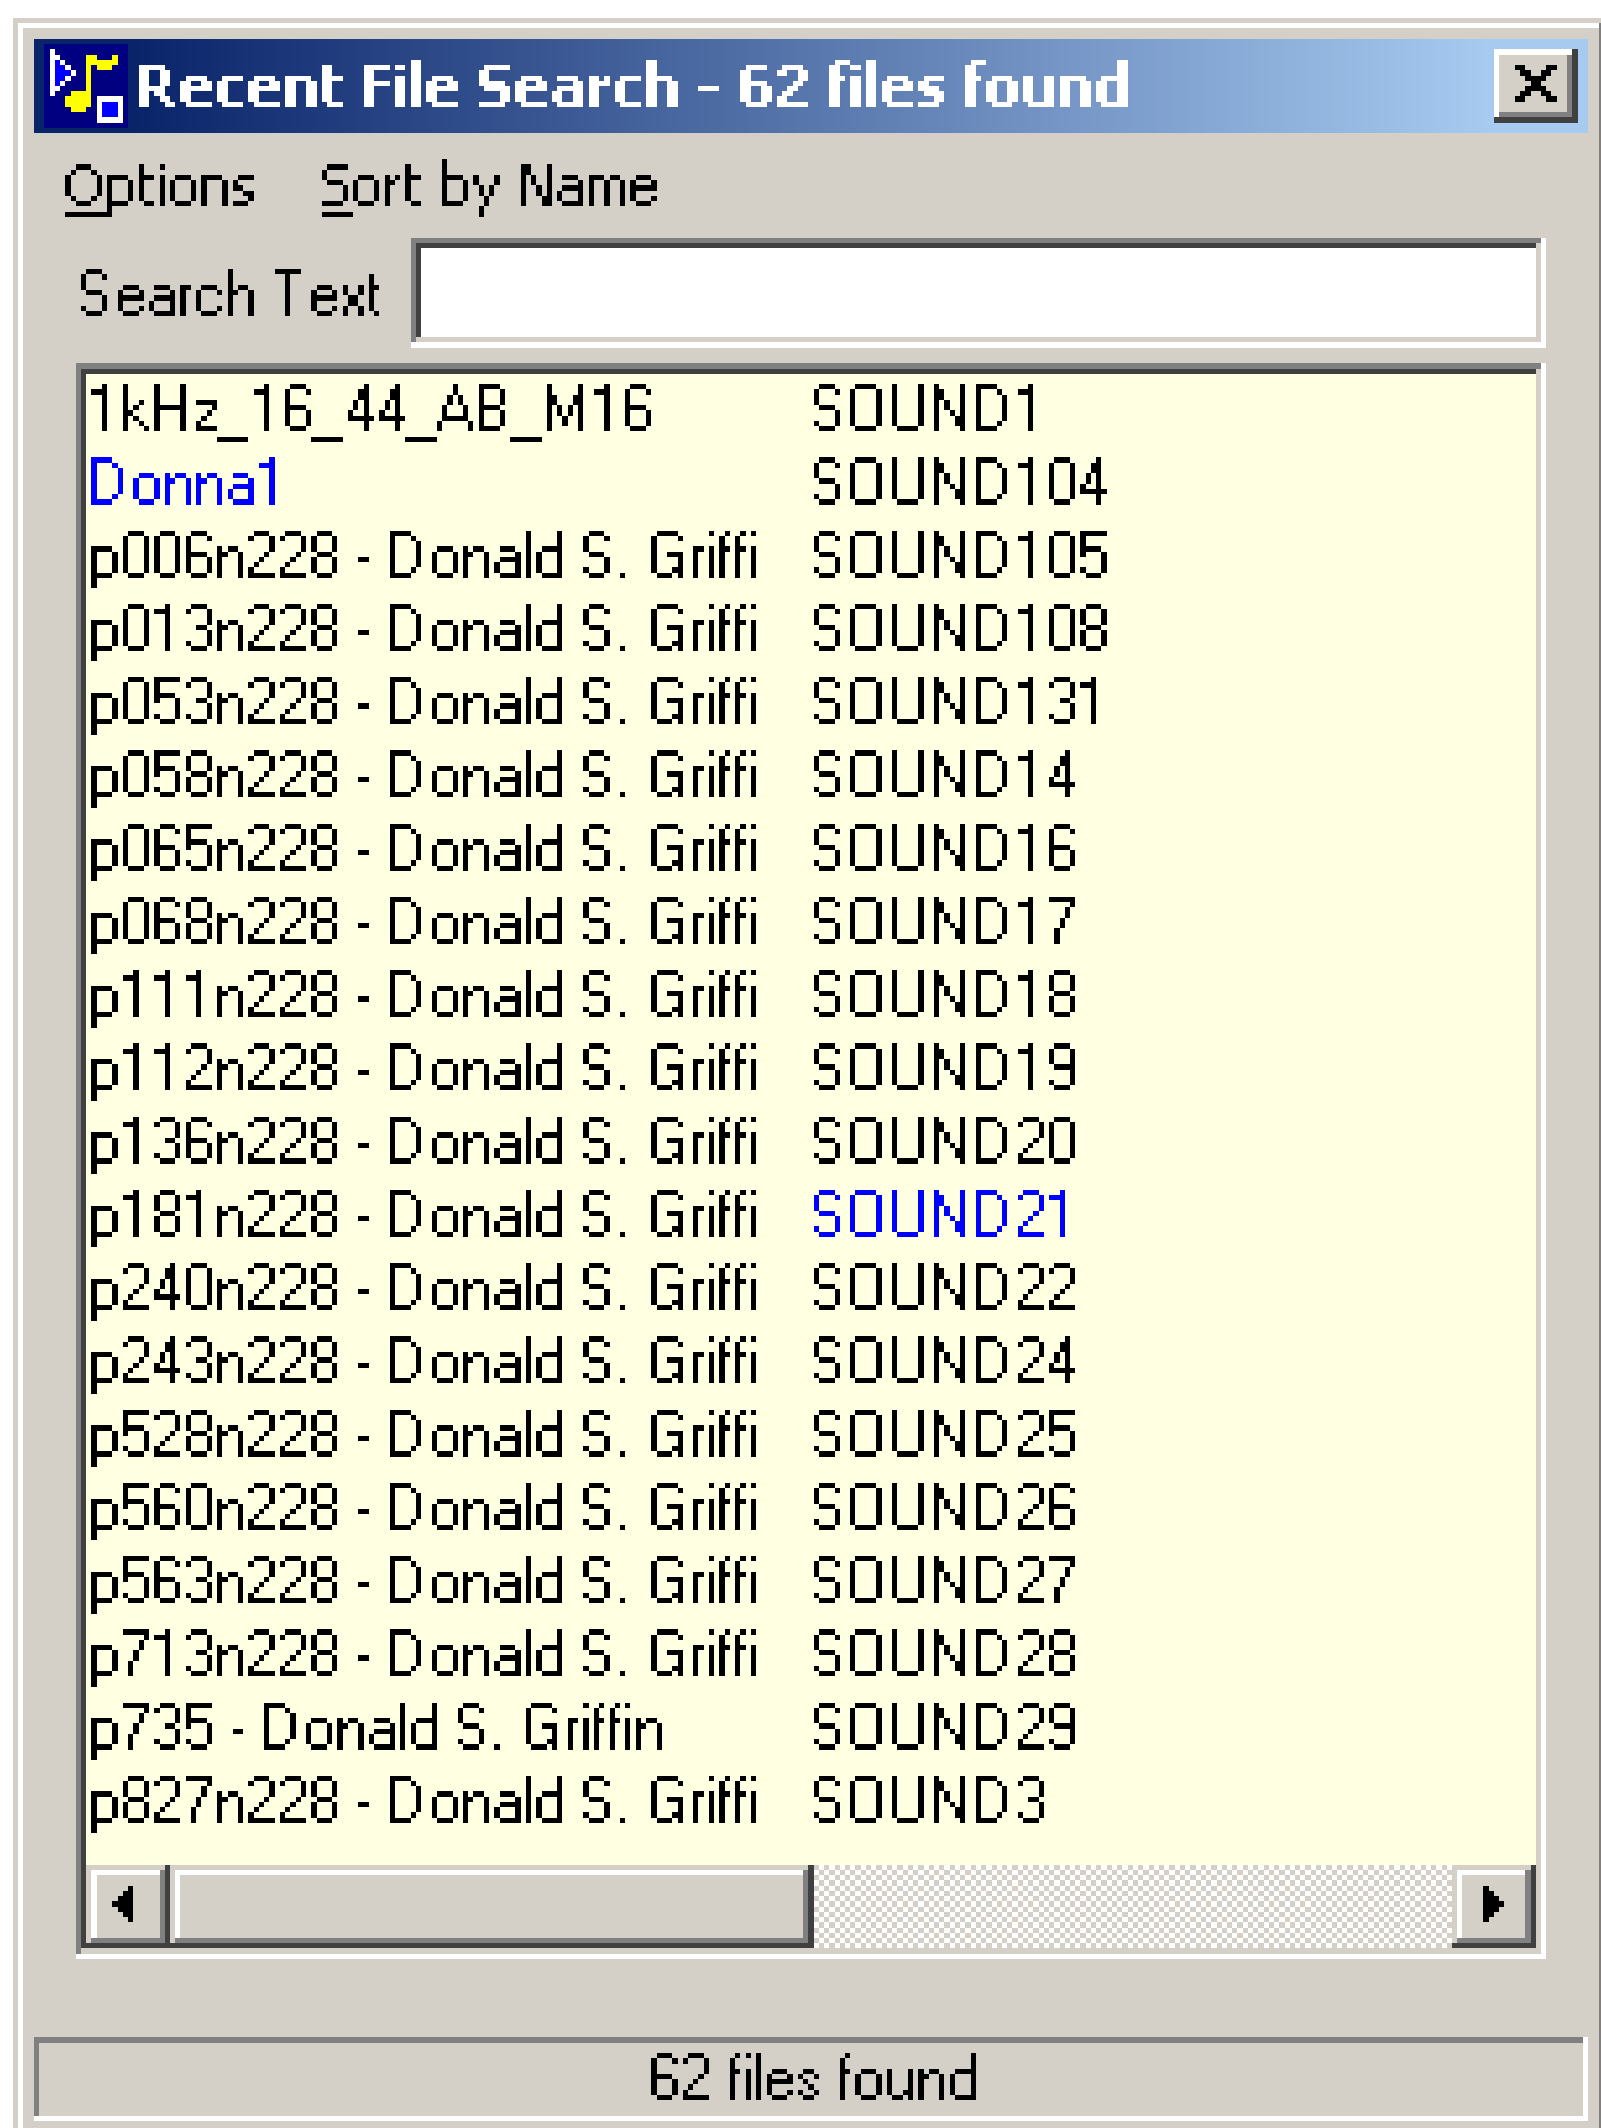

Tracks sourced from remote file locations are included in the list only if the [Try Remote Files](#) option is selected, in that case any remote files will be shown in red text.

WAV files containing Copyright or Comment fields

WAV files can contain embedded text fields detailing copyright, artist, creation date etc., the Options menu allows files having entries in either the Copyright or Comments fields to be highlighted in the search list.

Checking the Highlight Comments option displays the file name in blue if it has an associated comment field.

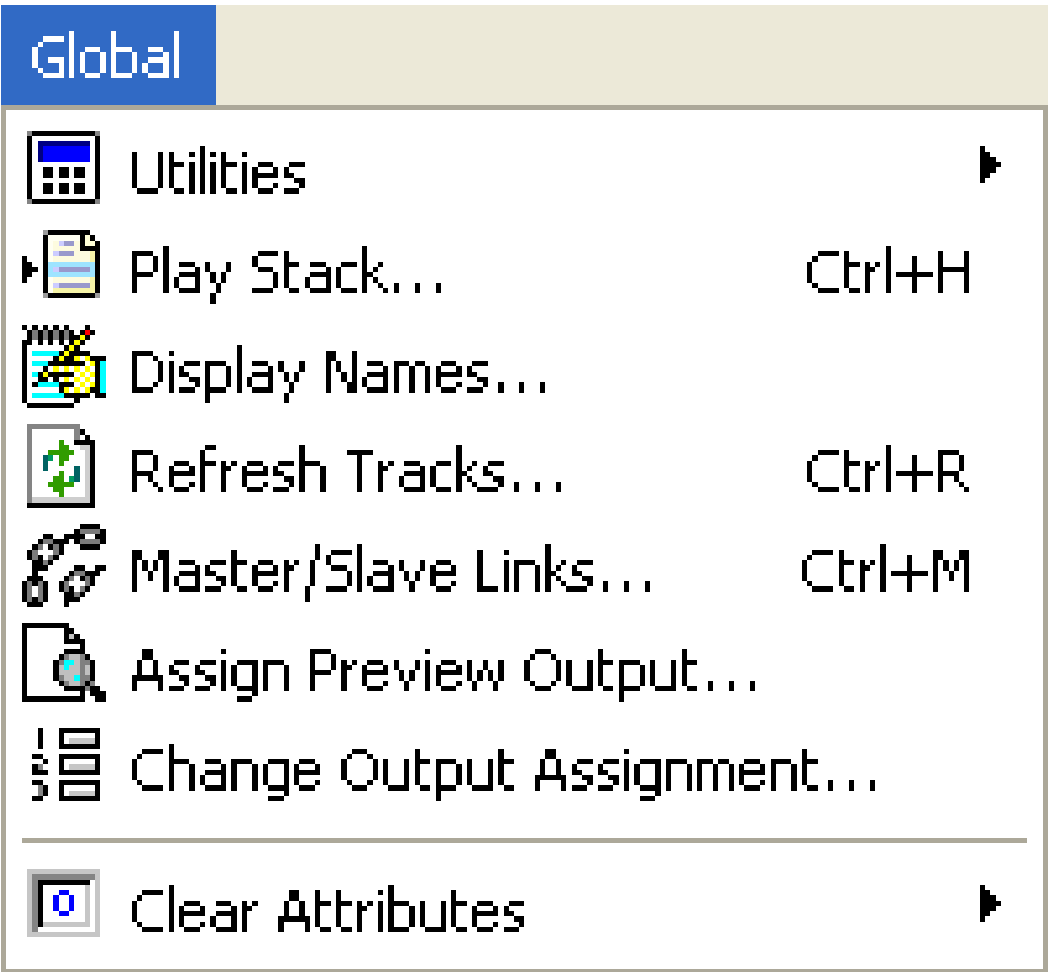

Selecting the file will show the comments in the upper status bar

Preview Track

The tracks can be previewed individually by double-clicking files in the results list. So for example the entries for 'Sound21' and 'Sound22' can be compared by double-clicking the names, right-clicking will stop the track as will closing the Search window.

The previewed audio will be played on the output that was selected as being the 'Preview Output' via Global|[Preview Output Assignment](#).

Global Menu

Utilities	Assorted utilities giving information about current session
Play Stack (Ctrl+H)	Simple track player utility
Display Names	Edit display names and change track/button allocation
Refresh Tracks (Ctrl+R)	Update tracks that have been modified since being loaded
Master/Slave Links (Ctrl+M)	Setup links between Master buttons and Slave buttons
Assign Preview Output	Sets output to be used when previewing tracks
Change Output Assignment	Change audio output device for some or all buttons
Clear Attributes	Clear selected attributes

Utilities

Session/Package Viewer	View contents of SpotOn Session and Package data files
Extract Tracks from CD	Extract tracks from CD and save to disc as WAV files
Session File Analyser	Analyse usage of audio files in sessions
Generate Timecode	Generate a timecode WAV file
Package Converter	Convert Packages to be compatible with previous versions
DirectShow Filters	Setup parameters for third party audio decoders
Click Track	Generates a click/count in track
Statistics	View audio file size and source folders
Copy Logs to Debug Folder	Save a set of SpotOn files for debugging
Save Page Images	Save images of the active pages to disc
Burn Tracks from Session to CD	Burn tracks from the whole session to CD using CDBurnerXP
Burn Tracks from Current Page to CD	Burn a selection of tracks to CD using CDBurnerXP

Utilities-Session/Package Viewer

Session/Package viewer allows the contents of either a SpotOn session or package to be examined, it will list the button number output device and track title. The information can be selected and pasted to the clipboard for use outside of SpotOn

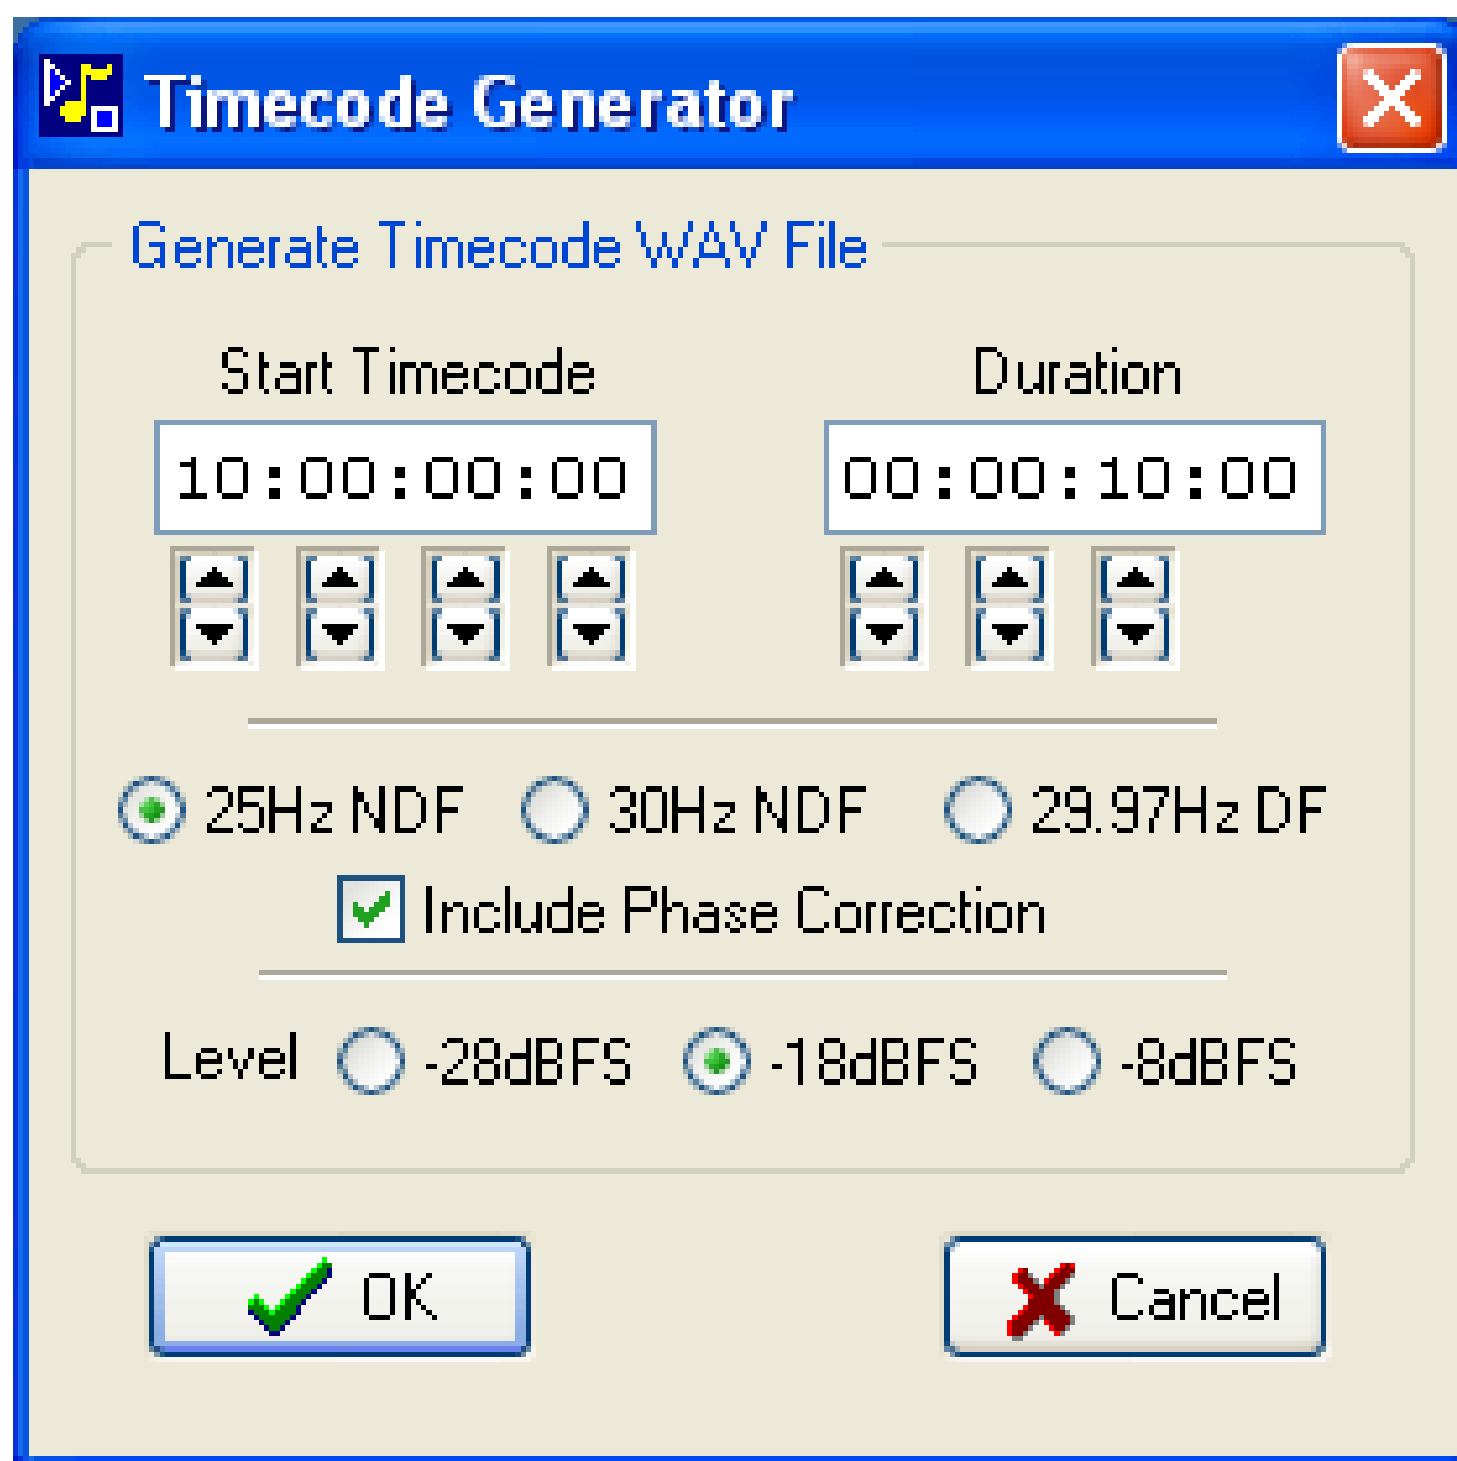

Utilities - Session File Analyser

Session File Analyser is an application that runs external to SpotOn and is described on the Session Analyser page.

Utilities - Generate Timecode

Occasionally it may be necessary to link the audio on a button with SMPTE timecode, this utility can create a WAV version of SMPTE timecode which when loaded onto a button can be played alongside the main audio with a Master/Slave link.

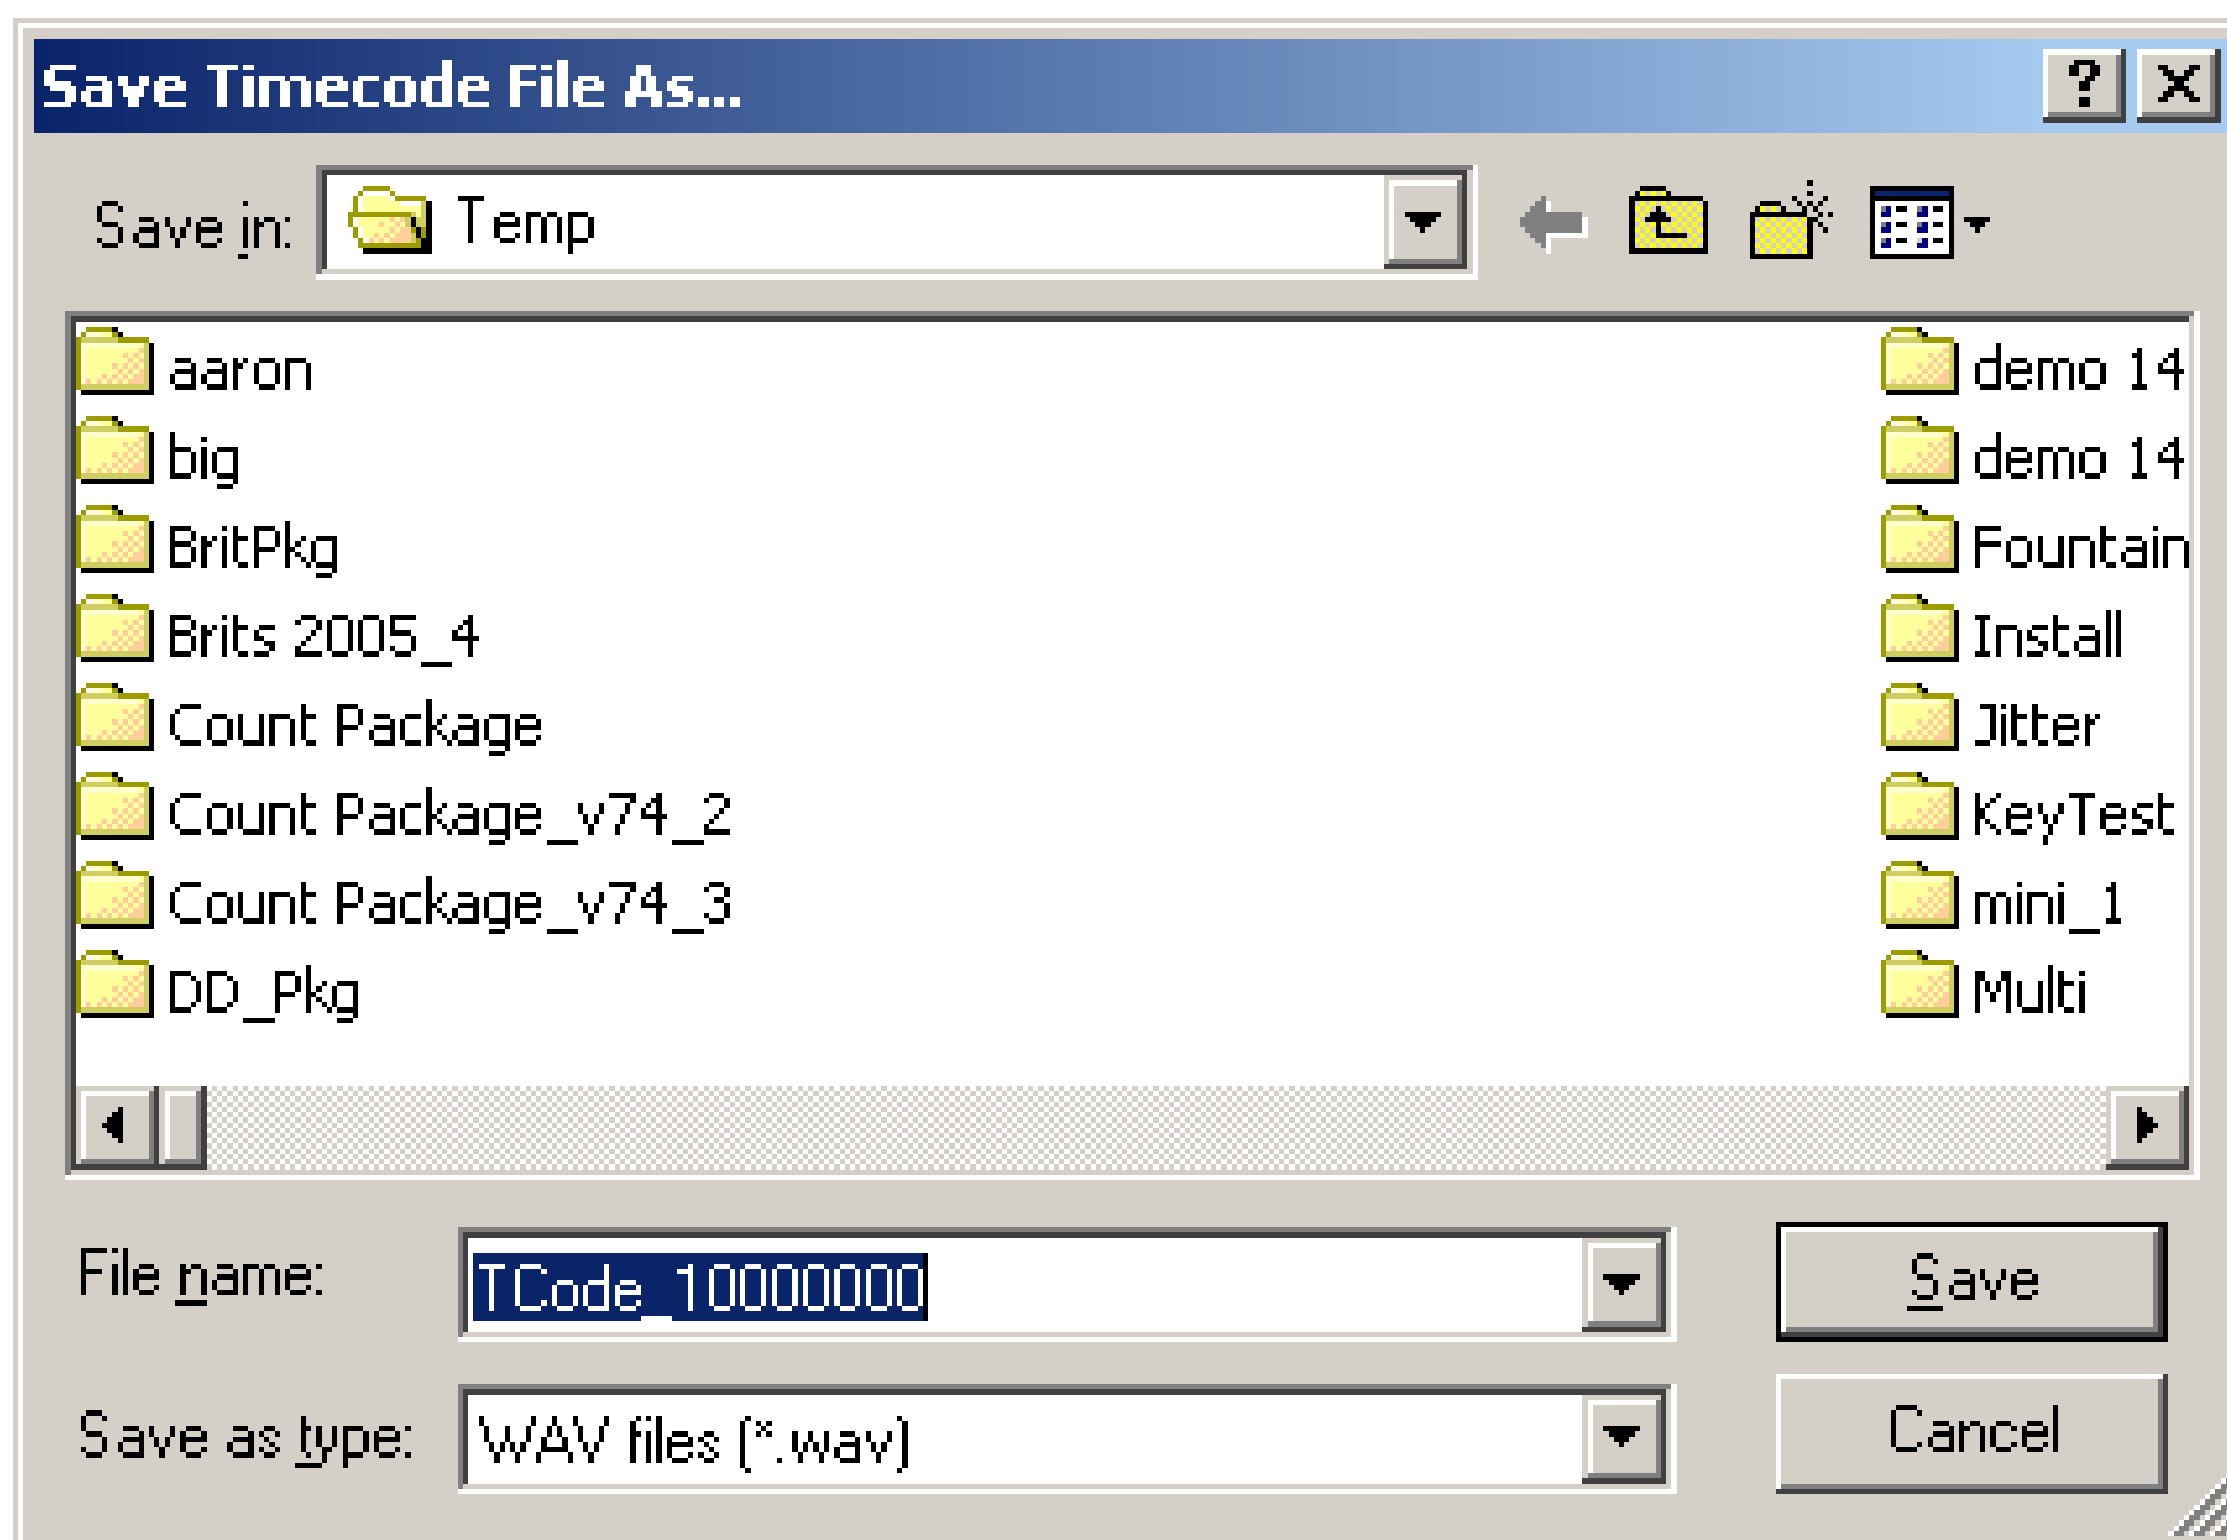

The first dialog box allows entry of the start timecode and the duration of the timecode track, in the example below timecode in the range 10:00:00:0 to 10:10:00:00 will be generated.

Options are available to set the timecode frame rate and signal level, -28dBFS equates to -10dBm.

The Include Phase Correction option allows a flag to be set in the timecode waveform to ensure the absolute phase of the sync word is maintained, most decoders can accommodate either setting.

Next the filename and location of the resultant timecode file is set.

Finally a Wait window is displayed showing the timecode generation process, the cancel button will abort the operation.

Utilities - Package Converter

Package Converter is an external standalone application that will convert SpotOn Packages from one version to another, this is used to convert packages built with more recent versions of SpotOn to run on older installations.

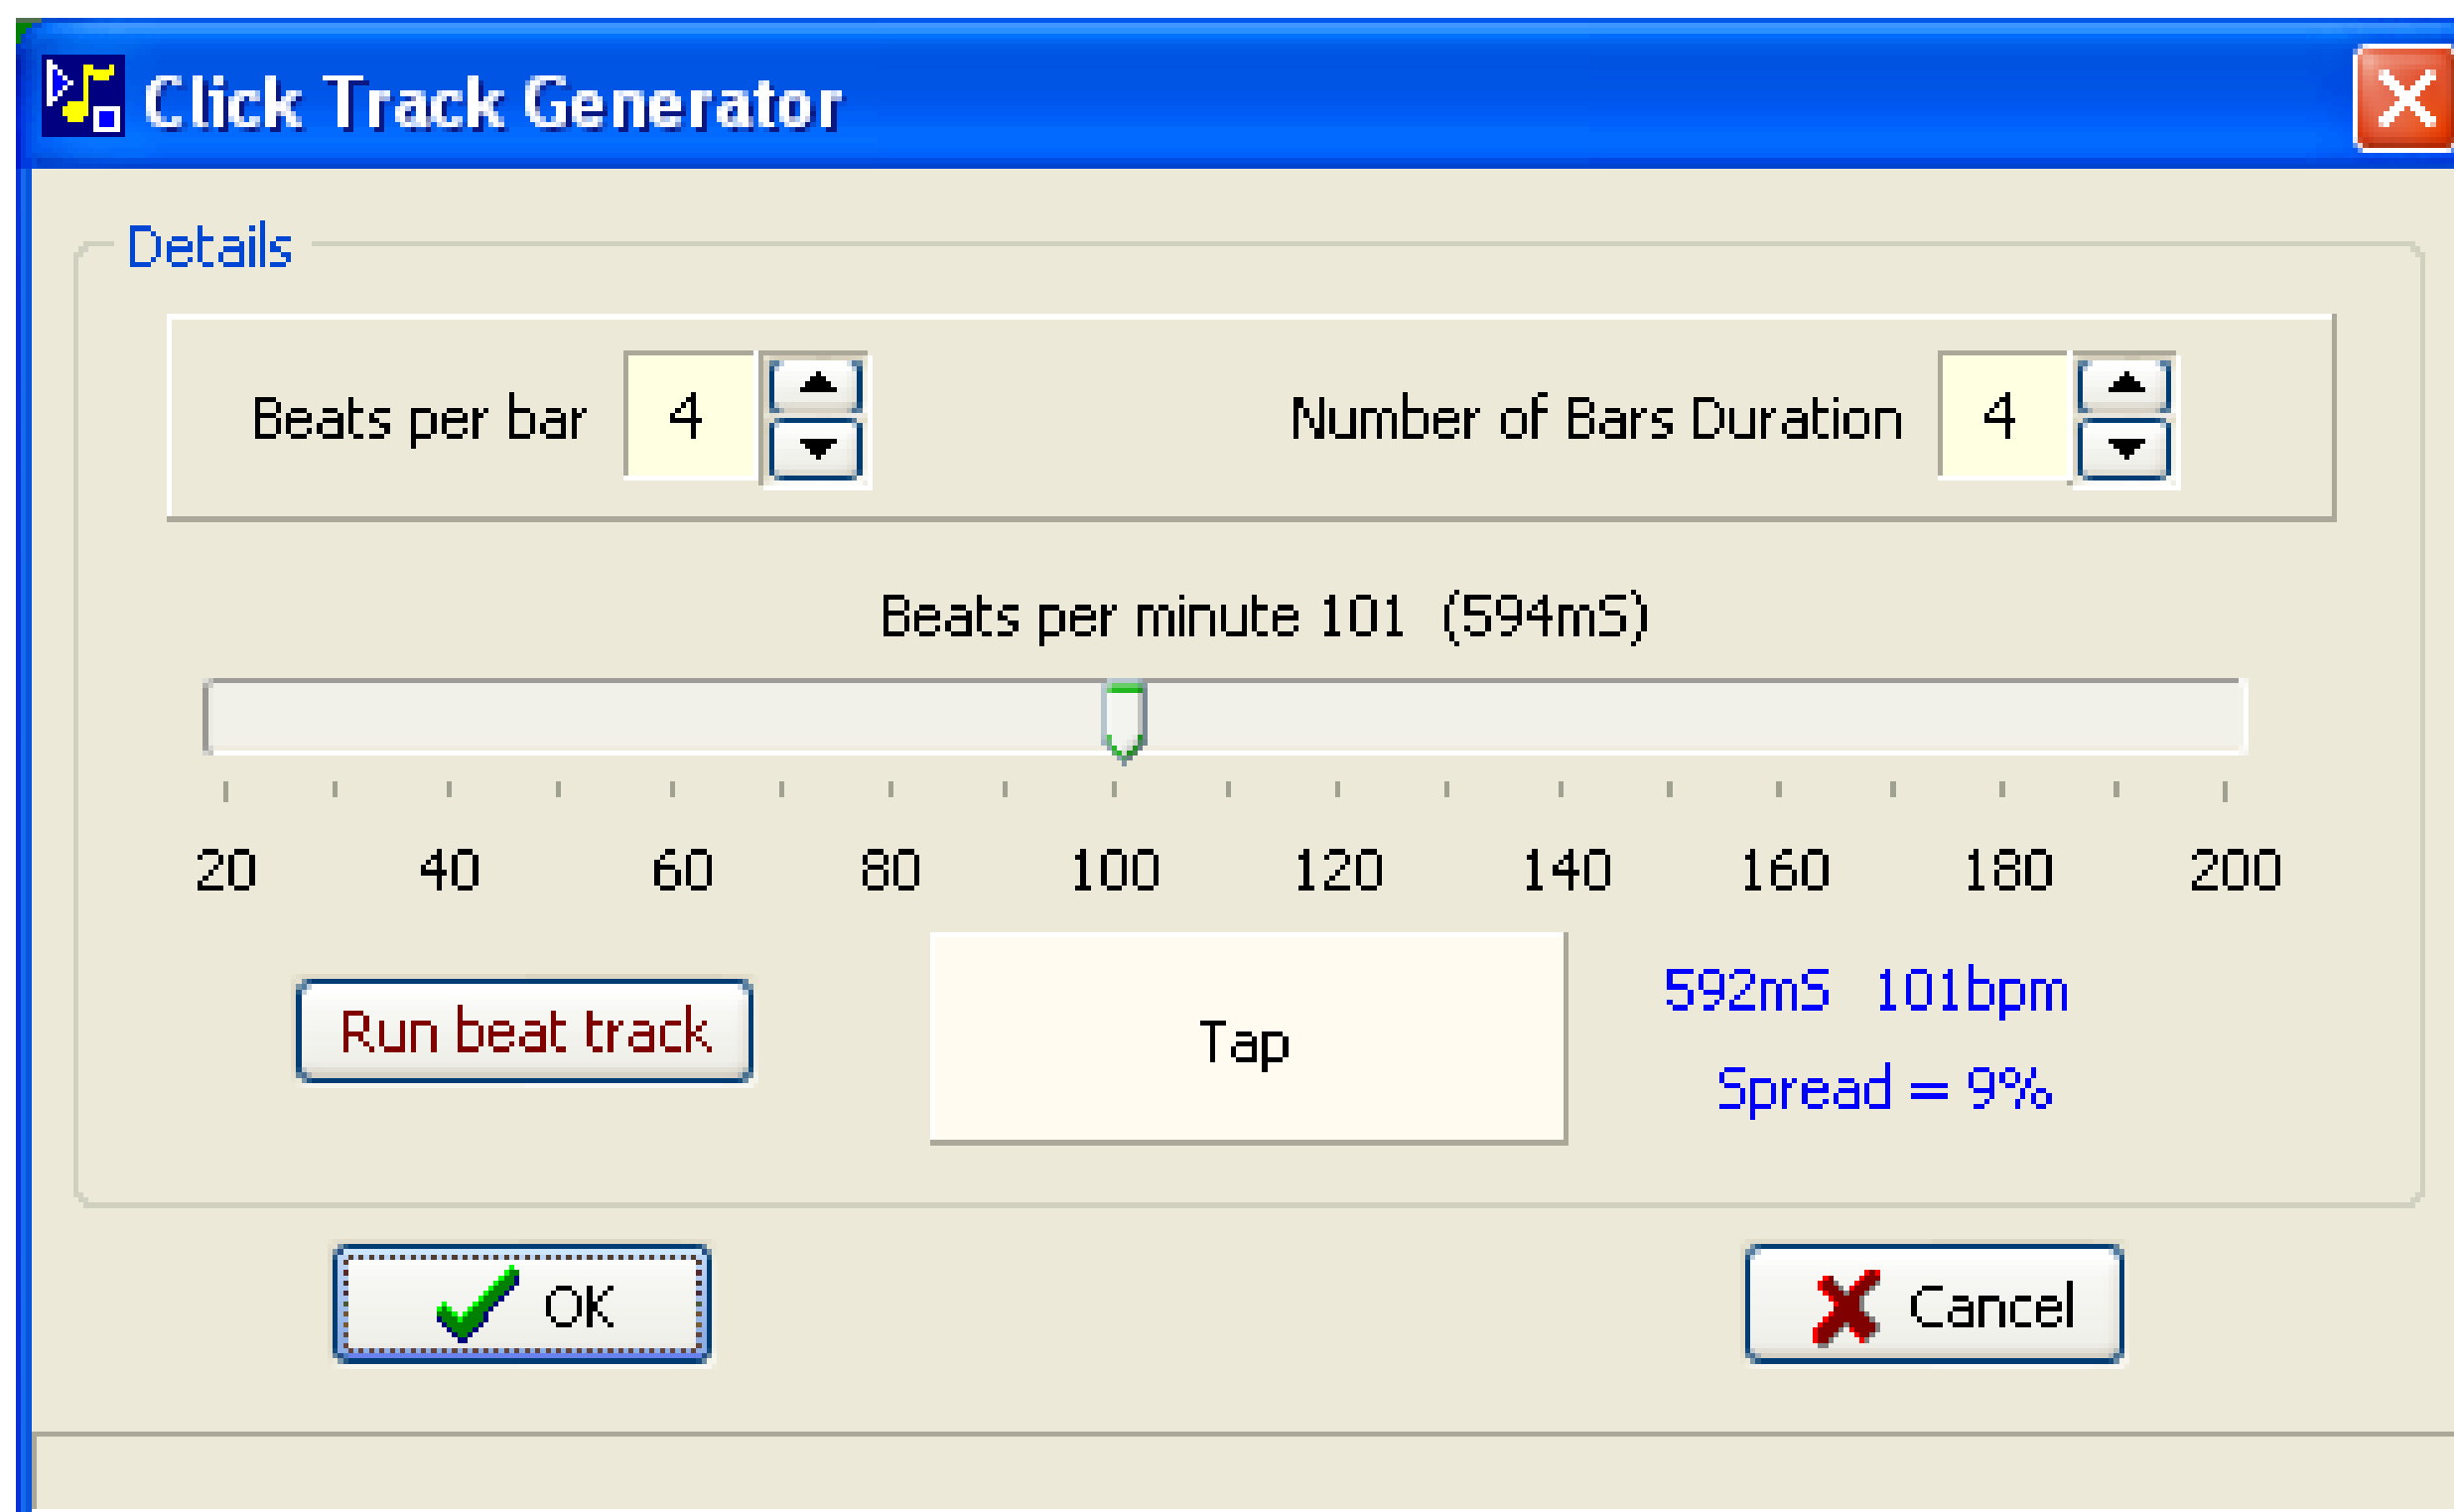

Utilities - DirectShow Filters

Compressed audio files have to be decoded into uncompressed PCM WAV format before SpotOn can play the file, some of the DirectShow filters that perform the decompression have parameters that affect their output, the default settings are shown on the Decoders page

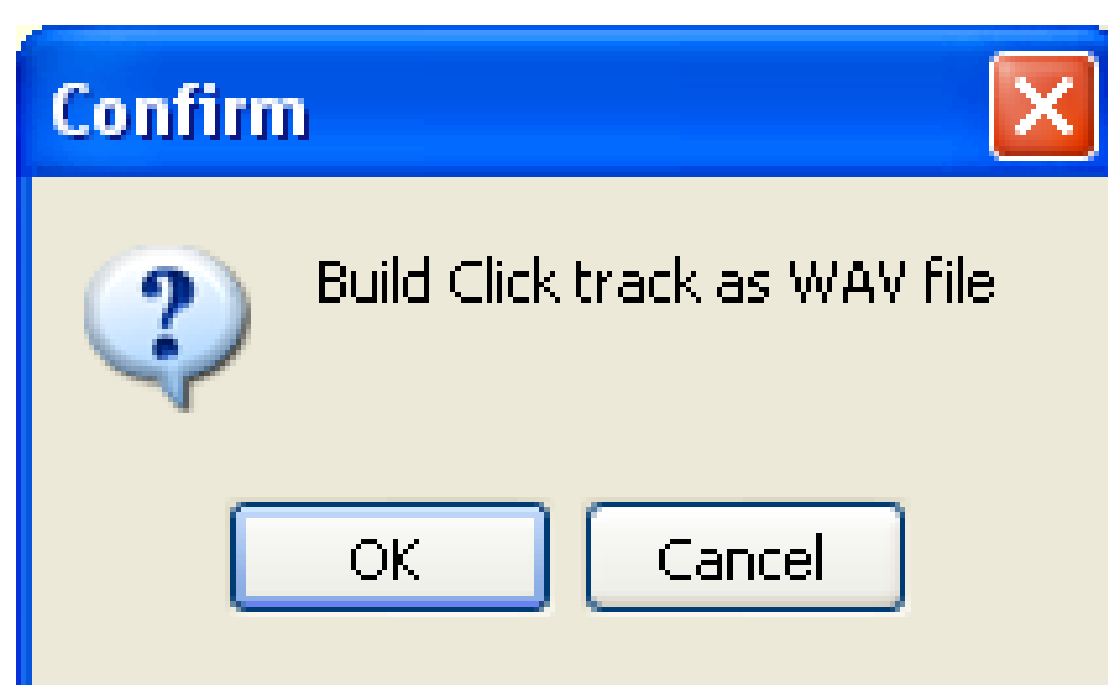

Utilities - Click Track

A click track can be used as a timing reference or count in for musicians, SpotOn can generate a wide range of click track formats.

The parameters are set in the dialog shown below, the taps and beats can be previewed via the Preview output

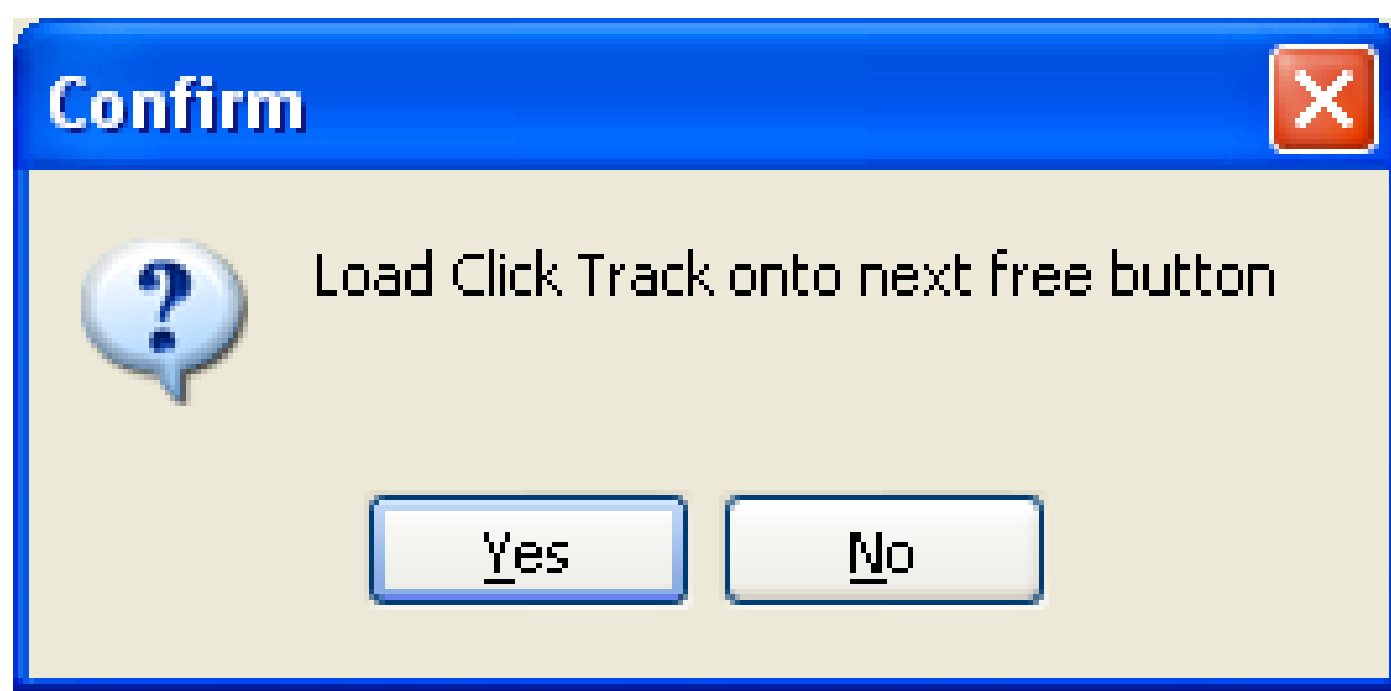

Clicking on OK will start building the file.

The file will be saved as a single channel 16 bit 48kHz wav file.

If the track is to be used immediately it can be loaded onto the next free button on SpotOn

Utilities - Statistics

Statistics show results of analysing the current session data, and is presented in two graphs

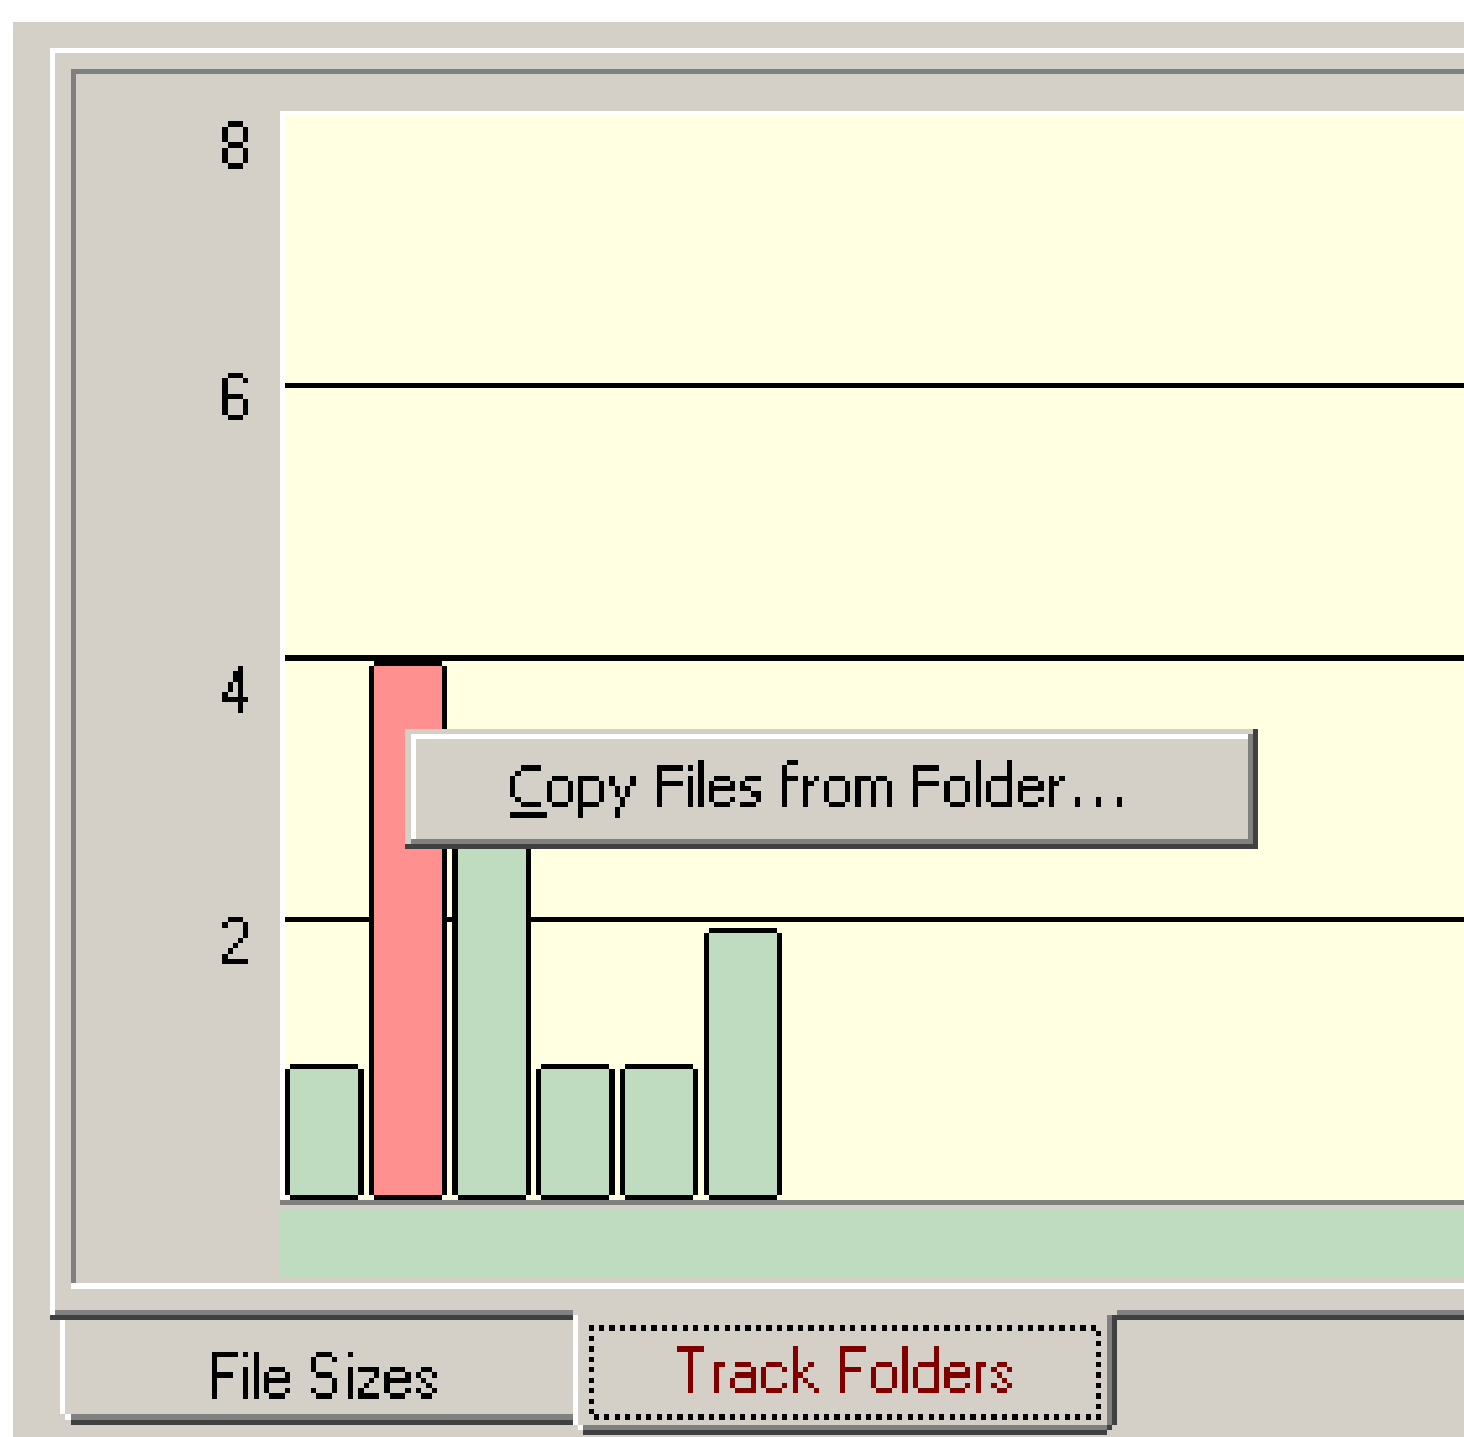

File Sizes displays a plot of file size for each button loaded, so that very large files can be identified.

Track Folders displays the 'fragmentation' of the session, meaning how many different folders are used to store the audio files. In the above example the 20 files are spread across 4 folders, with 3 folders each containing one file and another holding the remaining 17.

When files are loaded from a networked or removable disc they are copied to the local disc into a 'Local Files' folder, as defined in the File Folders menu. This folder is highlighted in red in the Track Folders display to indicate that some files are held in the general 'Local Files' folder and not in a more relevant folder associated with a show/programme.

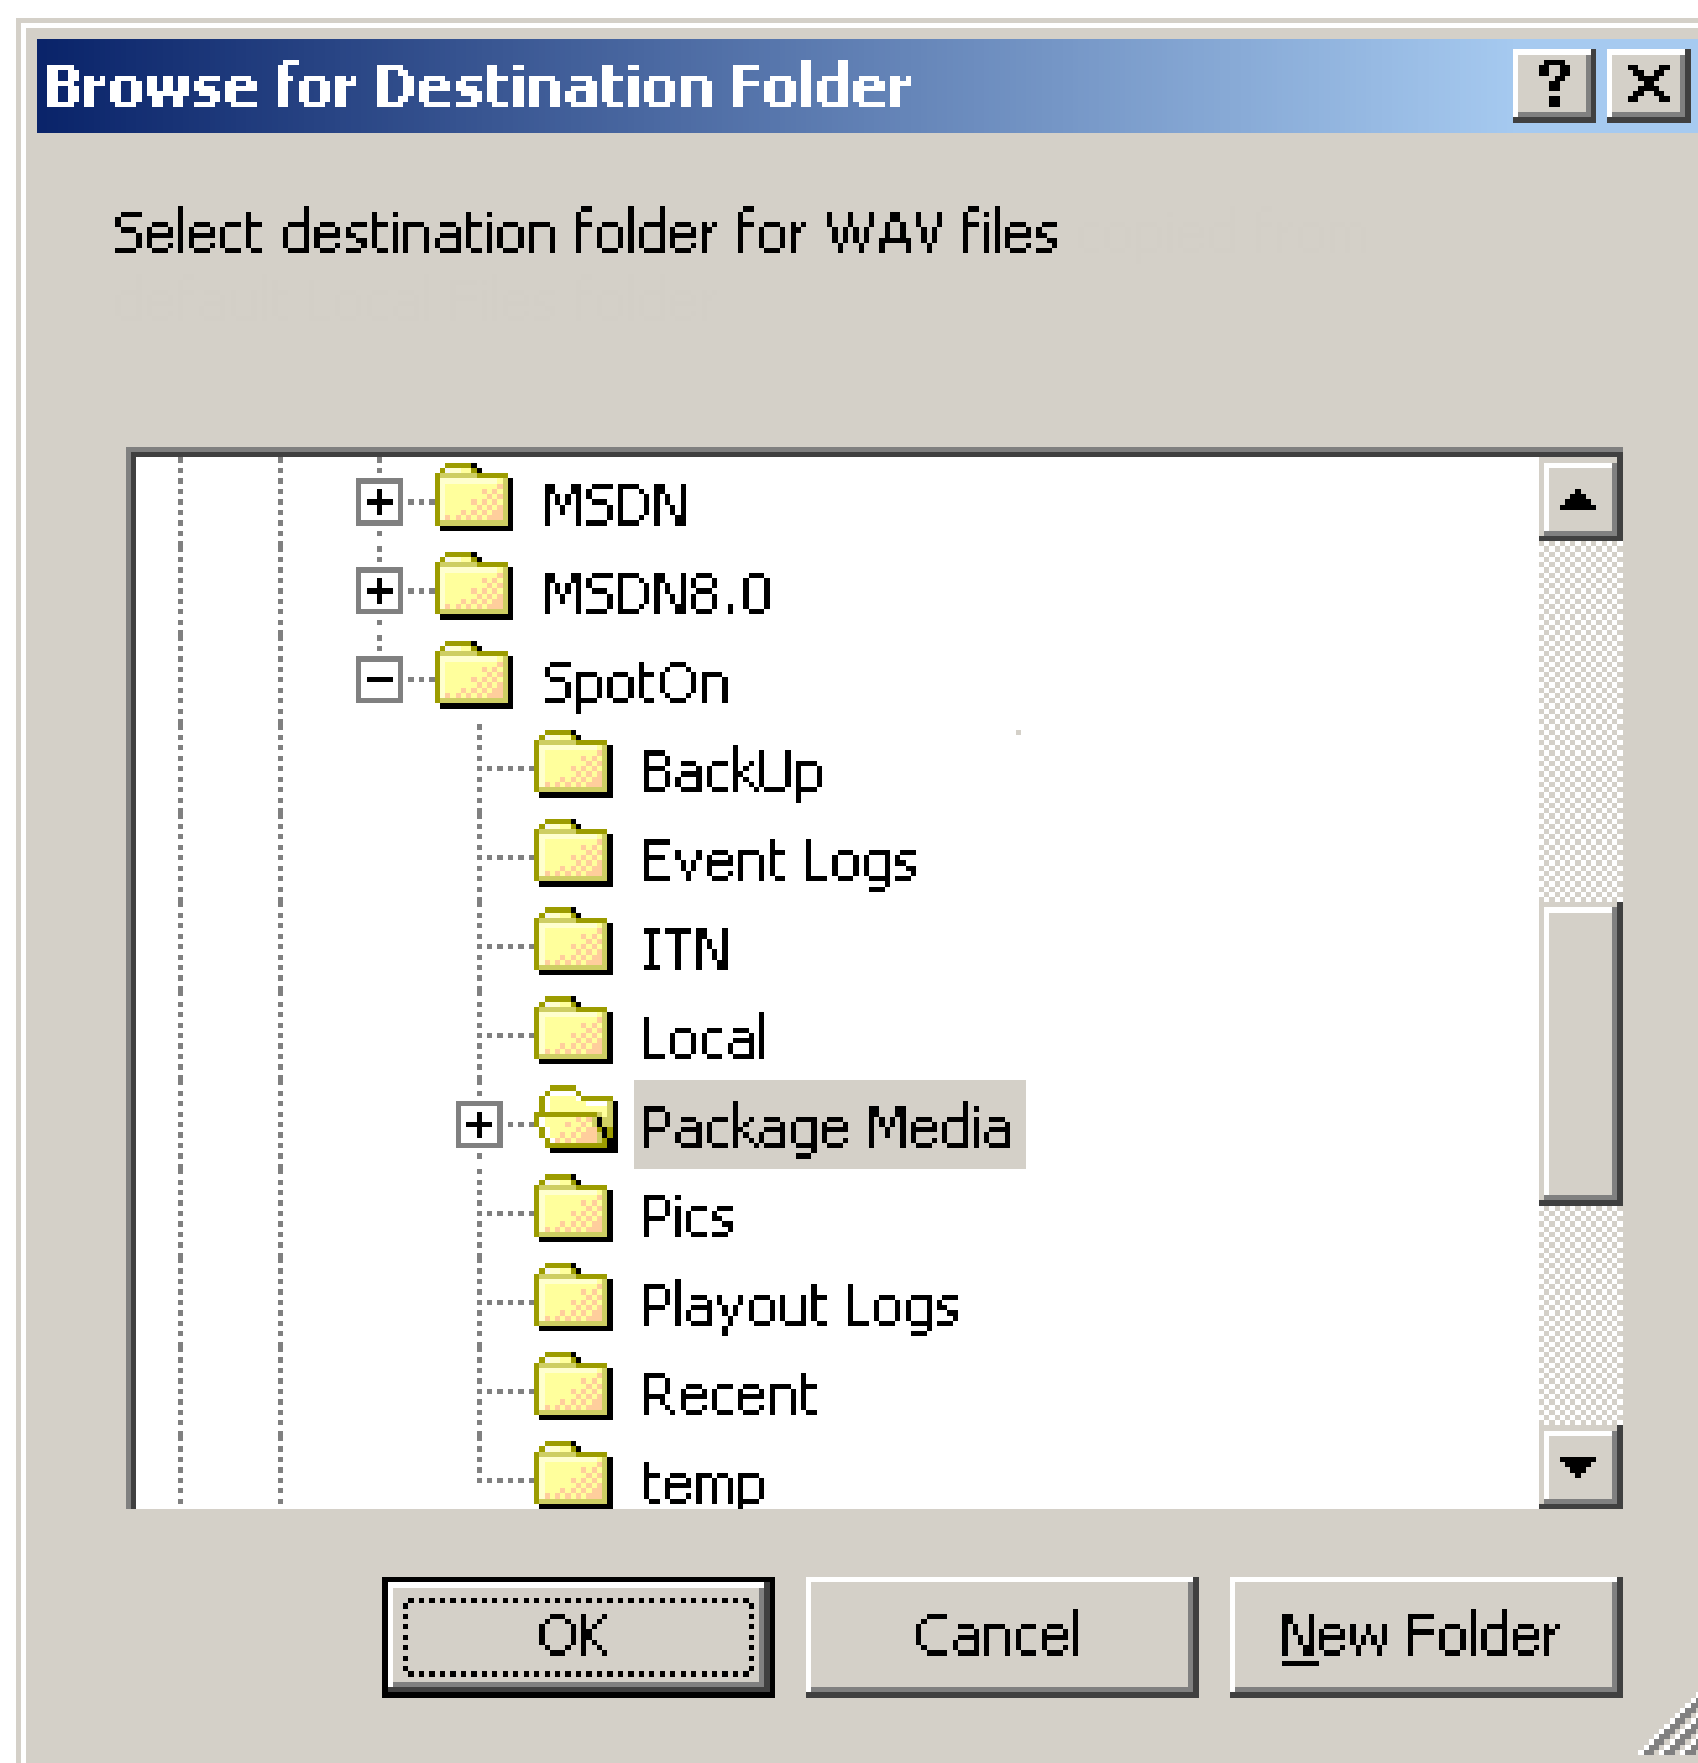

Right-clicking on any will show a popup menu

Clicking on the Copy Files menu item displays a dialog box confirming the the files are to be copied

Next the new destination folder is selected

Finally a further confirmation before the files are copied.

If a file of the same name already exists in the new folder then it will not be overwritten

Utilities - Copy Logs to Debug Folder

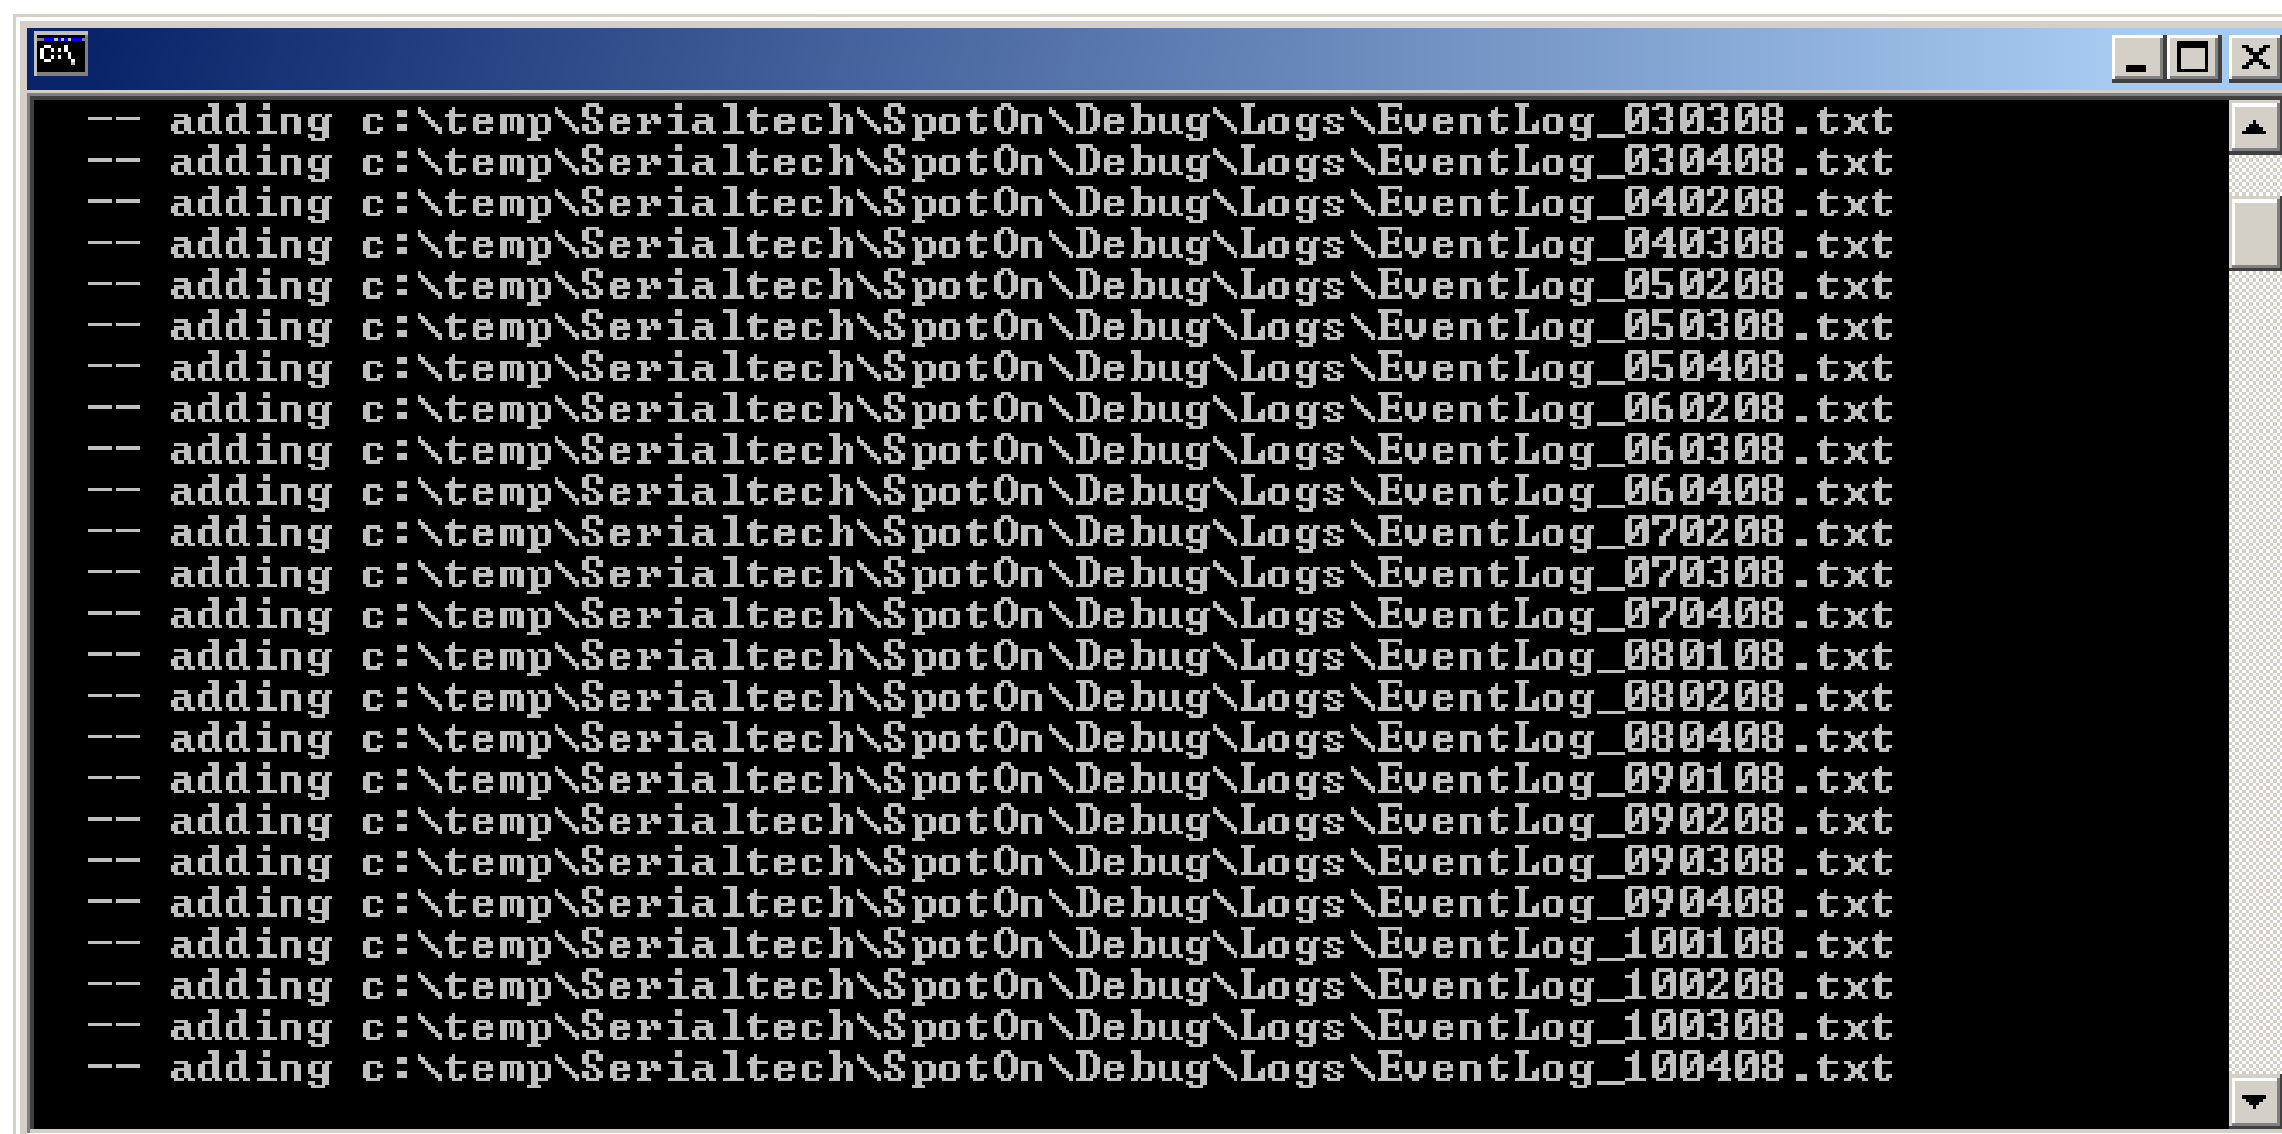

A sub menu on this item allows the date range of log files to be specified, Playout, Event and Error logs are all included.

Selecting one of the above options will display a confirmation dialog warning that the contents of the \Debug folder will be deleted, this folder is only used by SpotOn for debug

log files and no other files should be present.

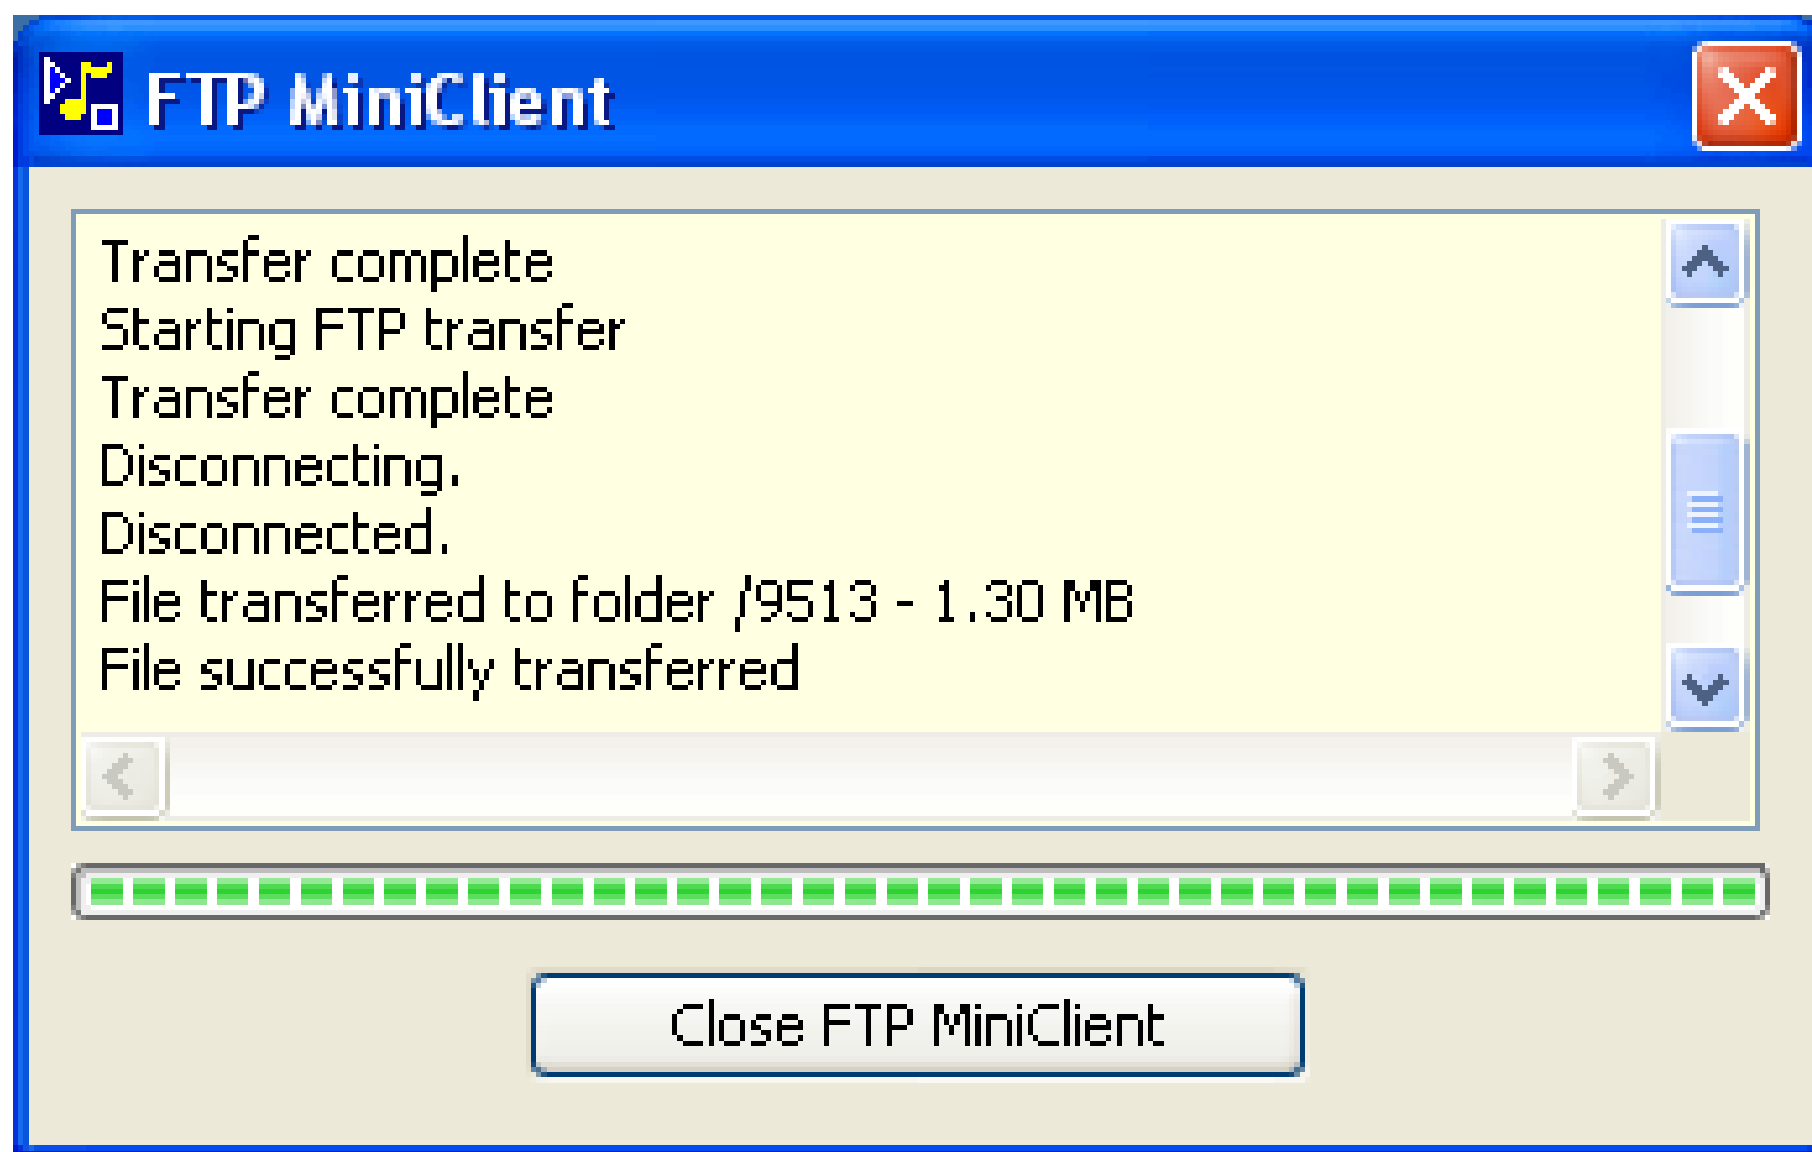

After the files have been copied a Debug.cab file is created and whilst this is being built a command line window will appear showing the compression progress

Next an option to transfer the debug files to a FTP server is offered, this uploads the files directly to a server so they can be analysed

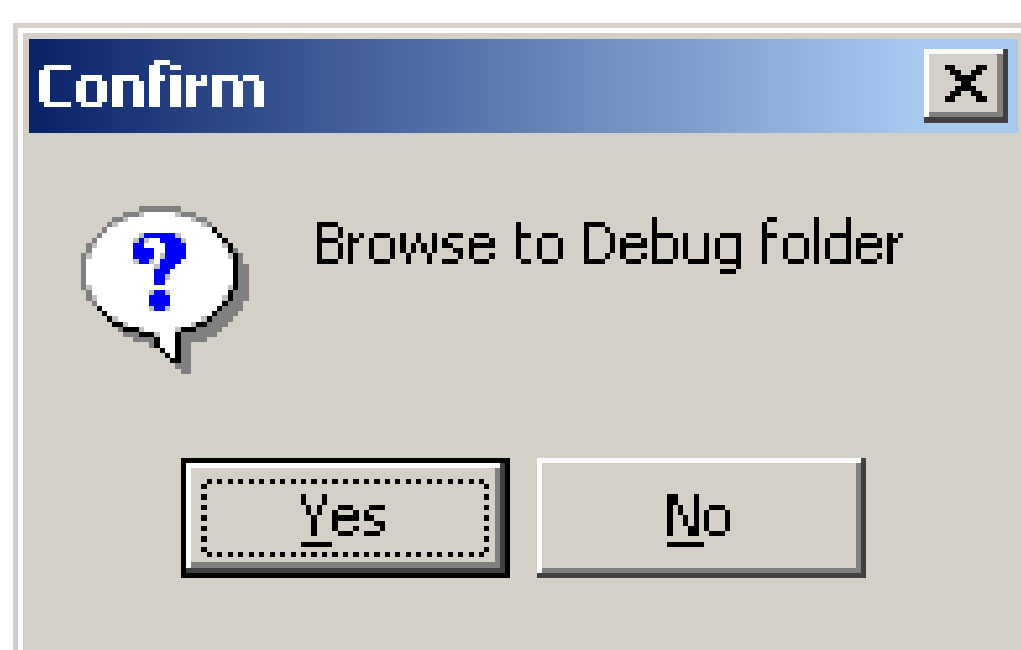

Selecting OK will open a FTP MiniClient window

Clicking on Send Logs for analysis will start the file transfer

When completed close the window to continue

On completion of the copy/compression/FTP process there is the a final option to display the contents of the \Debug folder

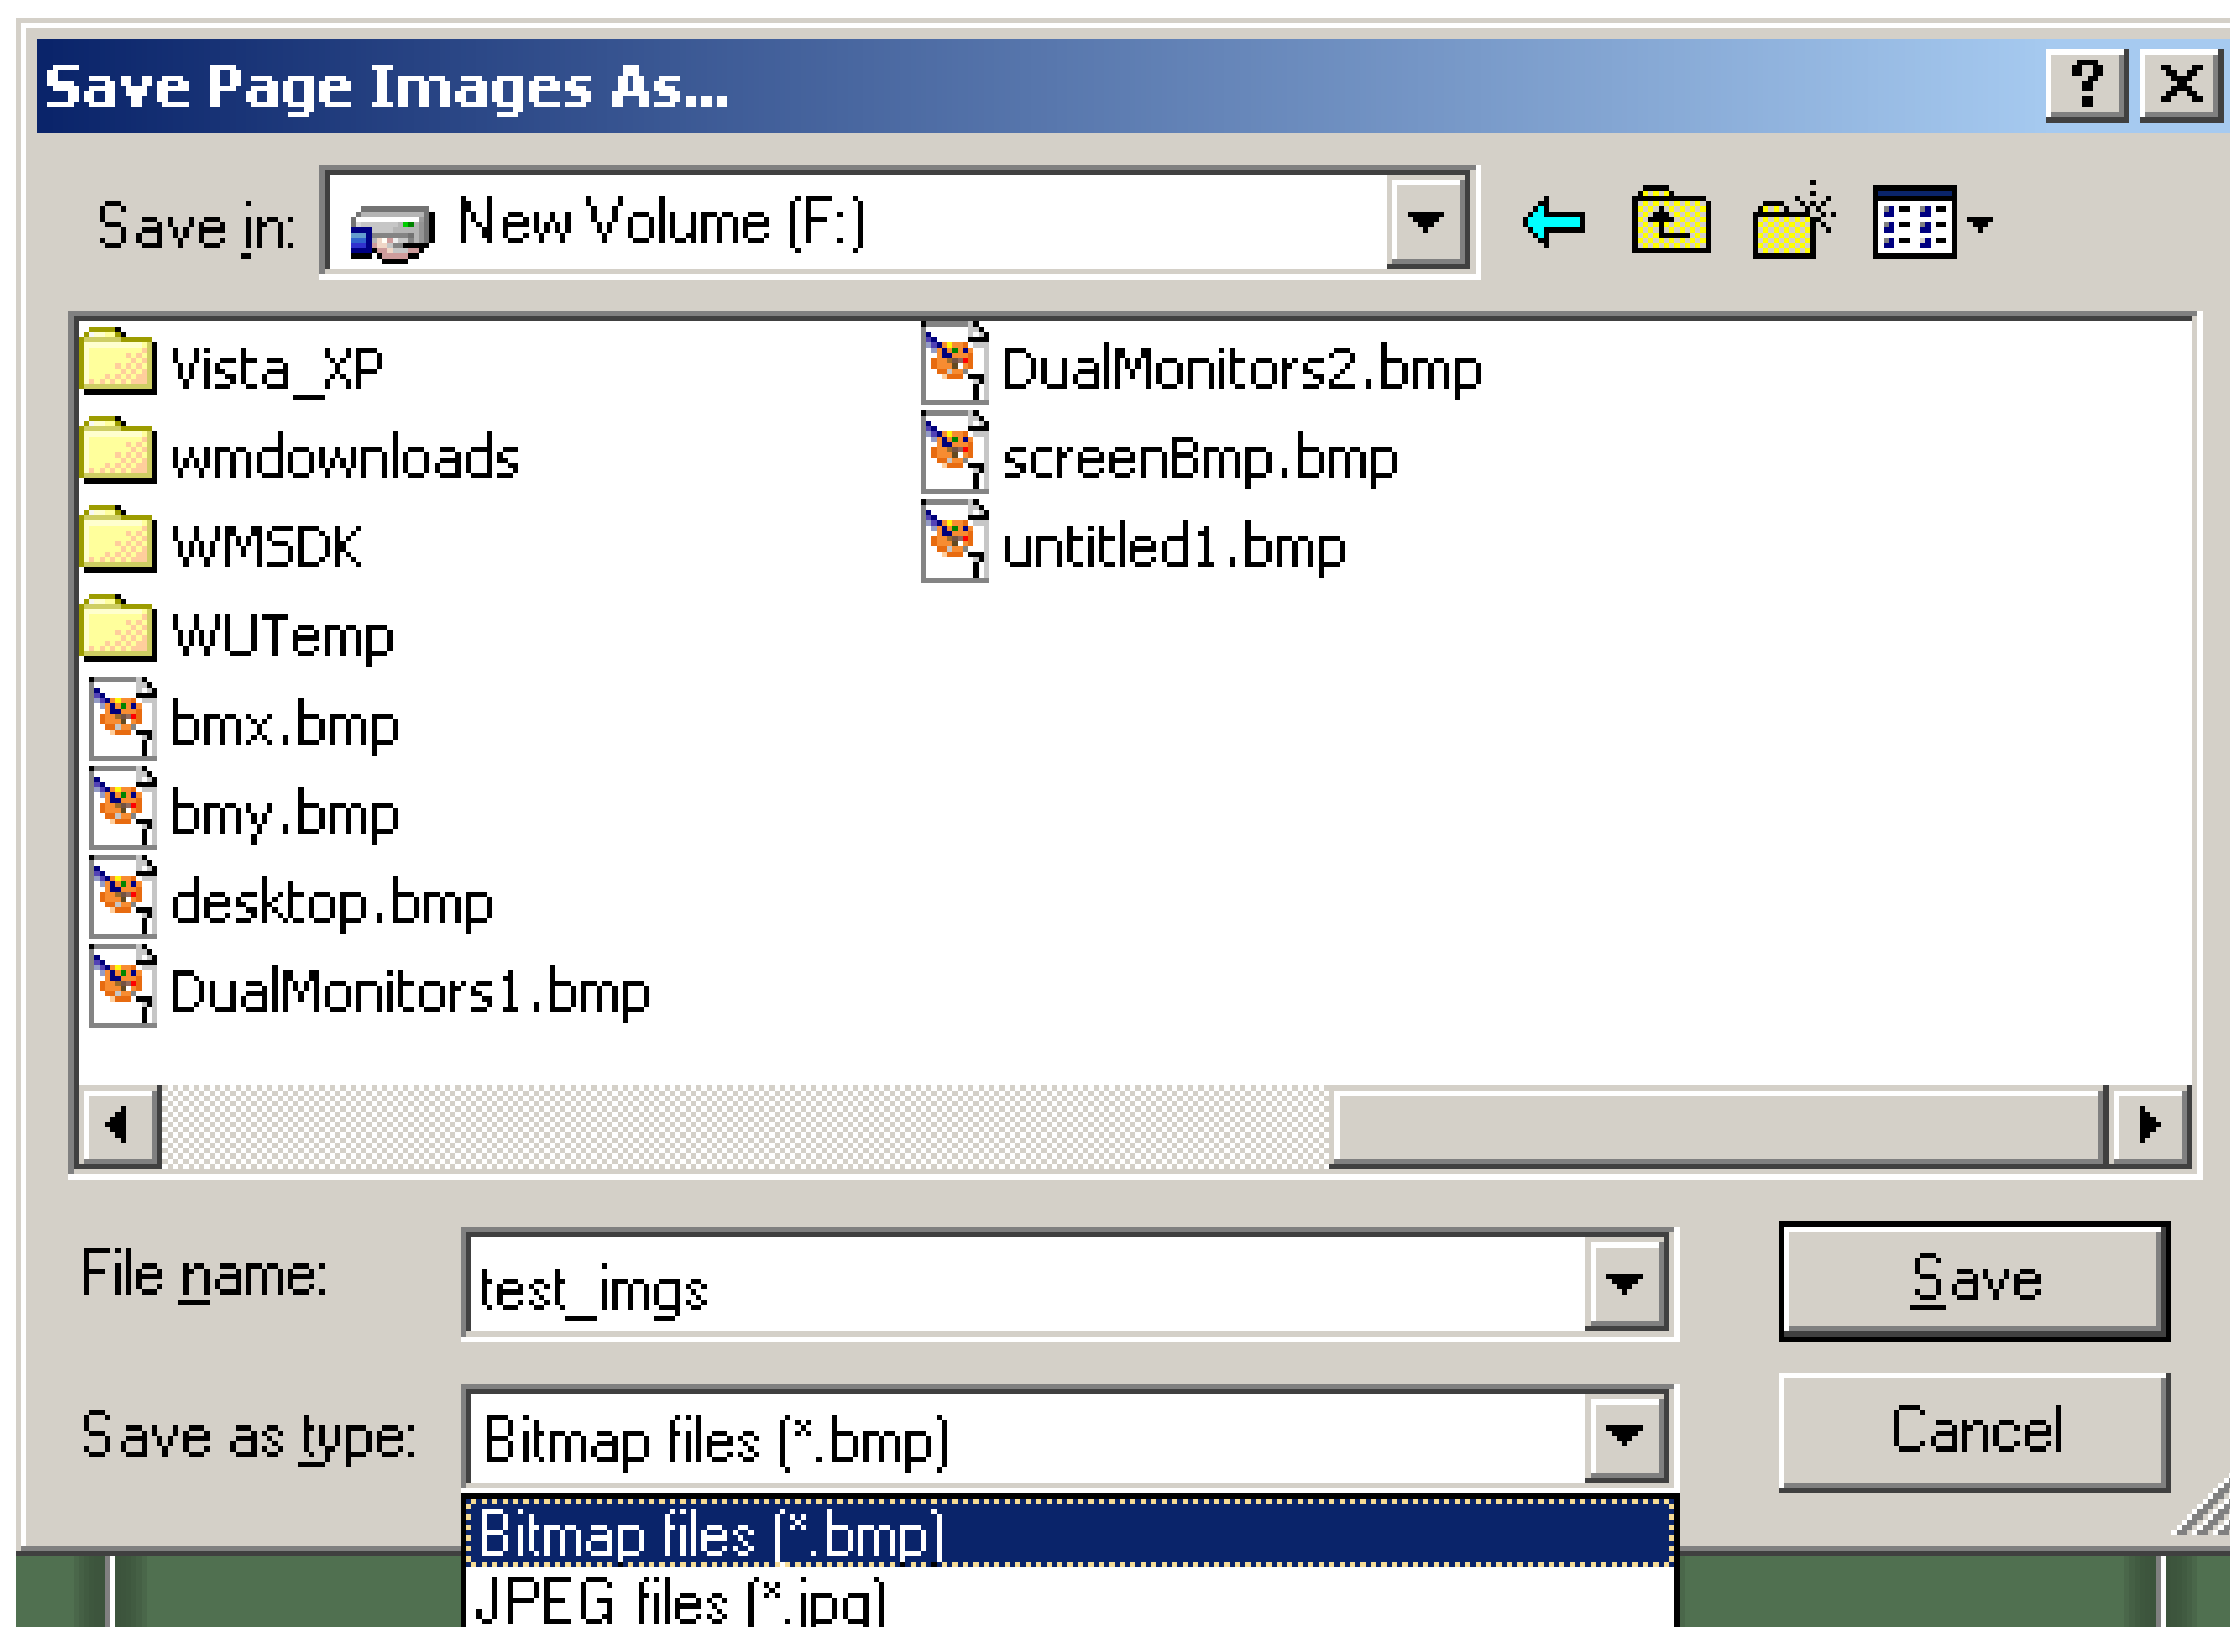

The "Debug_Logs.cab" file can then be sent for analysis if required.

Utilities - Save Page Images

To assist in passing information between SpotOn operators this menu option allows the SpotOn pages to be saved to file as either Windows bitmap or JPEG images.

The dialog box below allows the location of the image files to be set.

As the images are saved SpotOn will cycle through all available pages and then return to the originally displayed page.

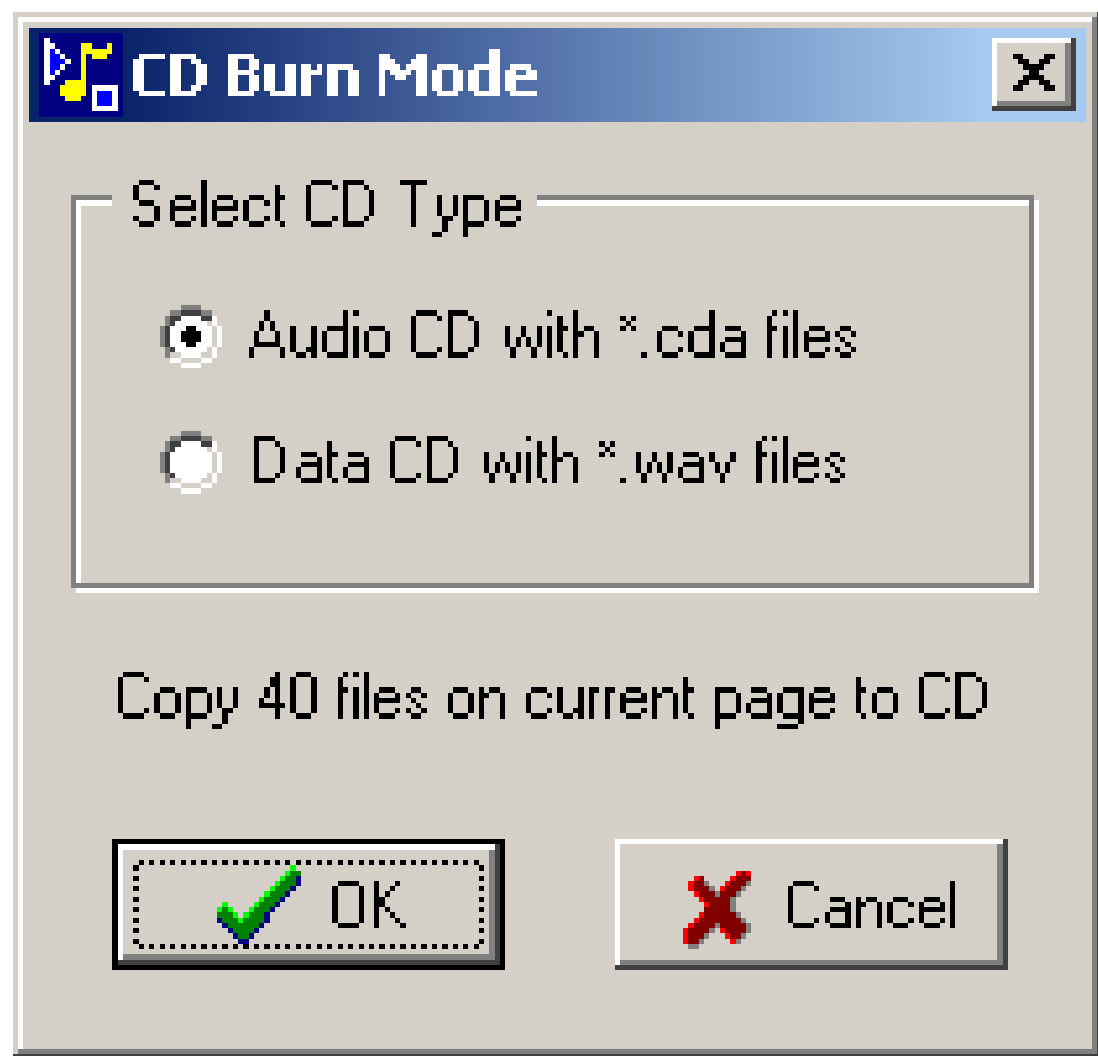

Utilities - Burn Tracks to CD (Ctrl+B)

SpotOn is configured to use a third party CD burner utility "CDBurnerXP", the latest version of CDBurnerXP can be found at <http://www.cdburnerxp.se>

In order for SpotOn to access the utility the location of CDBurnerXP has to be assigned in the SetUp menu .

By default all the tracks on the current page or session are selected for burning, alternatively a source region can be used with non-contiguous selections on a single page.

Next the type of file to burn onto the CD is selected to be either an Audio CD compatible with CD players or a Data CD containing the original *.wav files for use with a computer.

Note the files burned to CD are the original files without any modifications applied by SpotOn, i.e. gain, pan and trims adjustments are not copied across. However, in the case of MultiChannel files being saved to *.cda tracks then the file will be mixed down to stereo.

The adjustments made by SpotOn to a track can be rendered to a copy of the track from the Trim window.

Clicking OK will open up the CDBurnerXP utility where the tracks to be burned can be edited or previewed

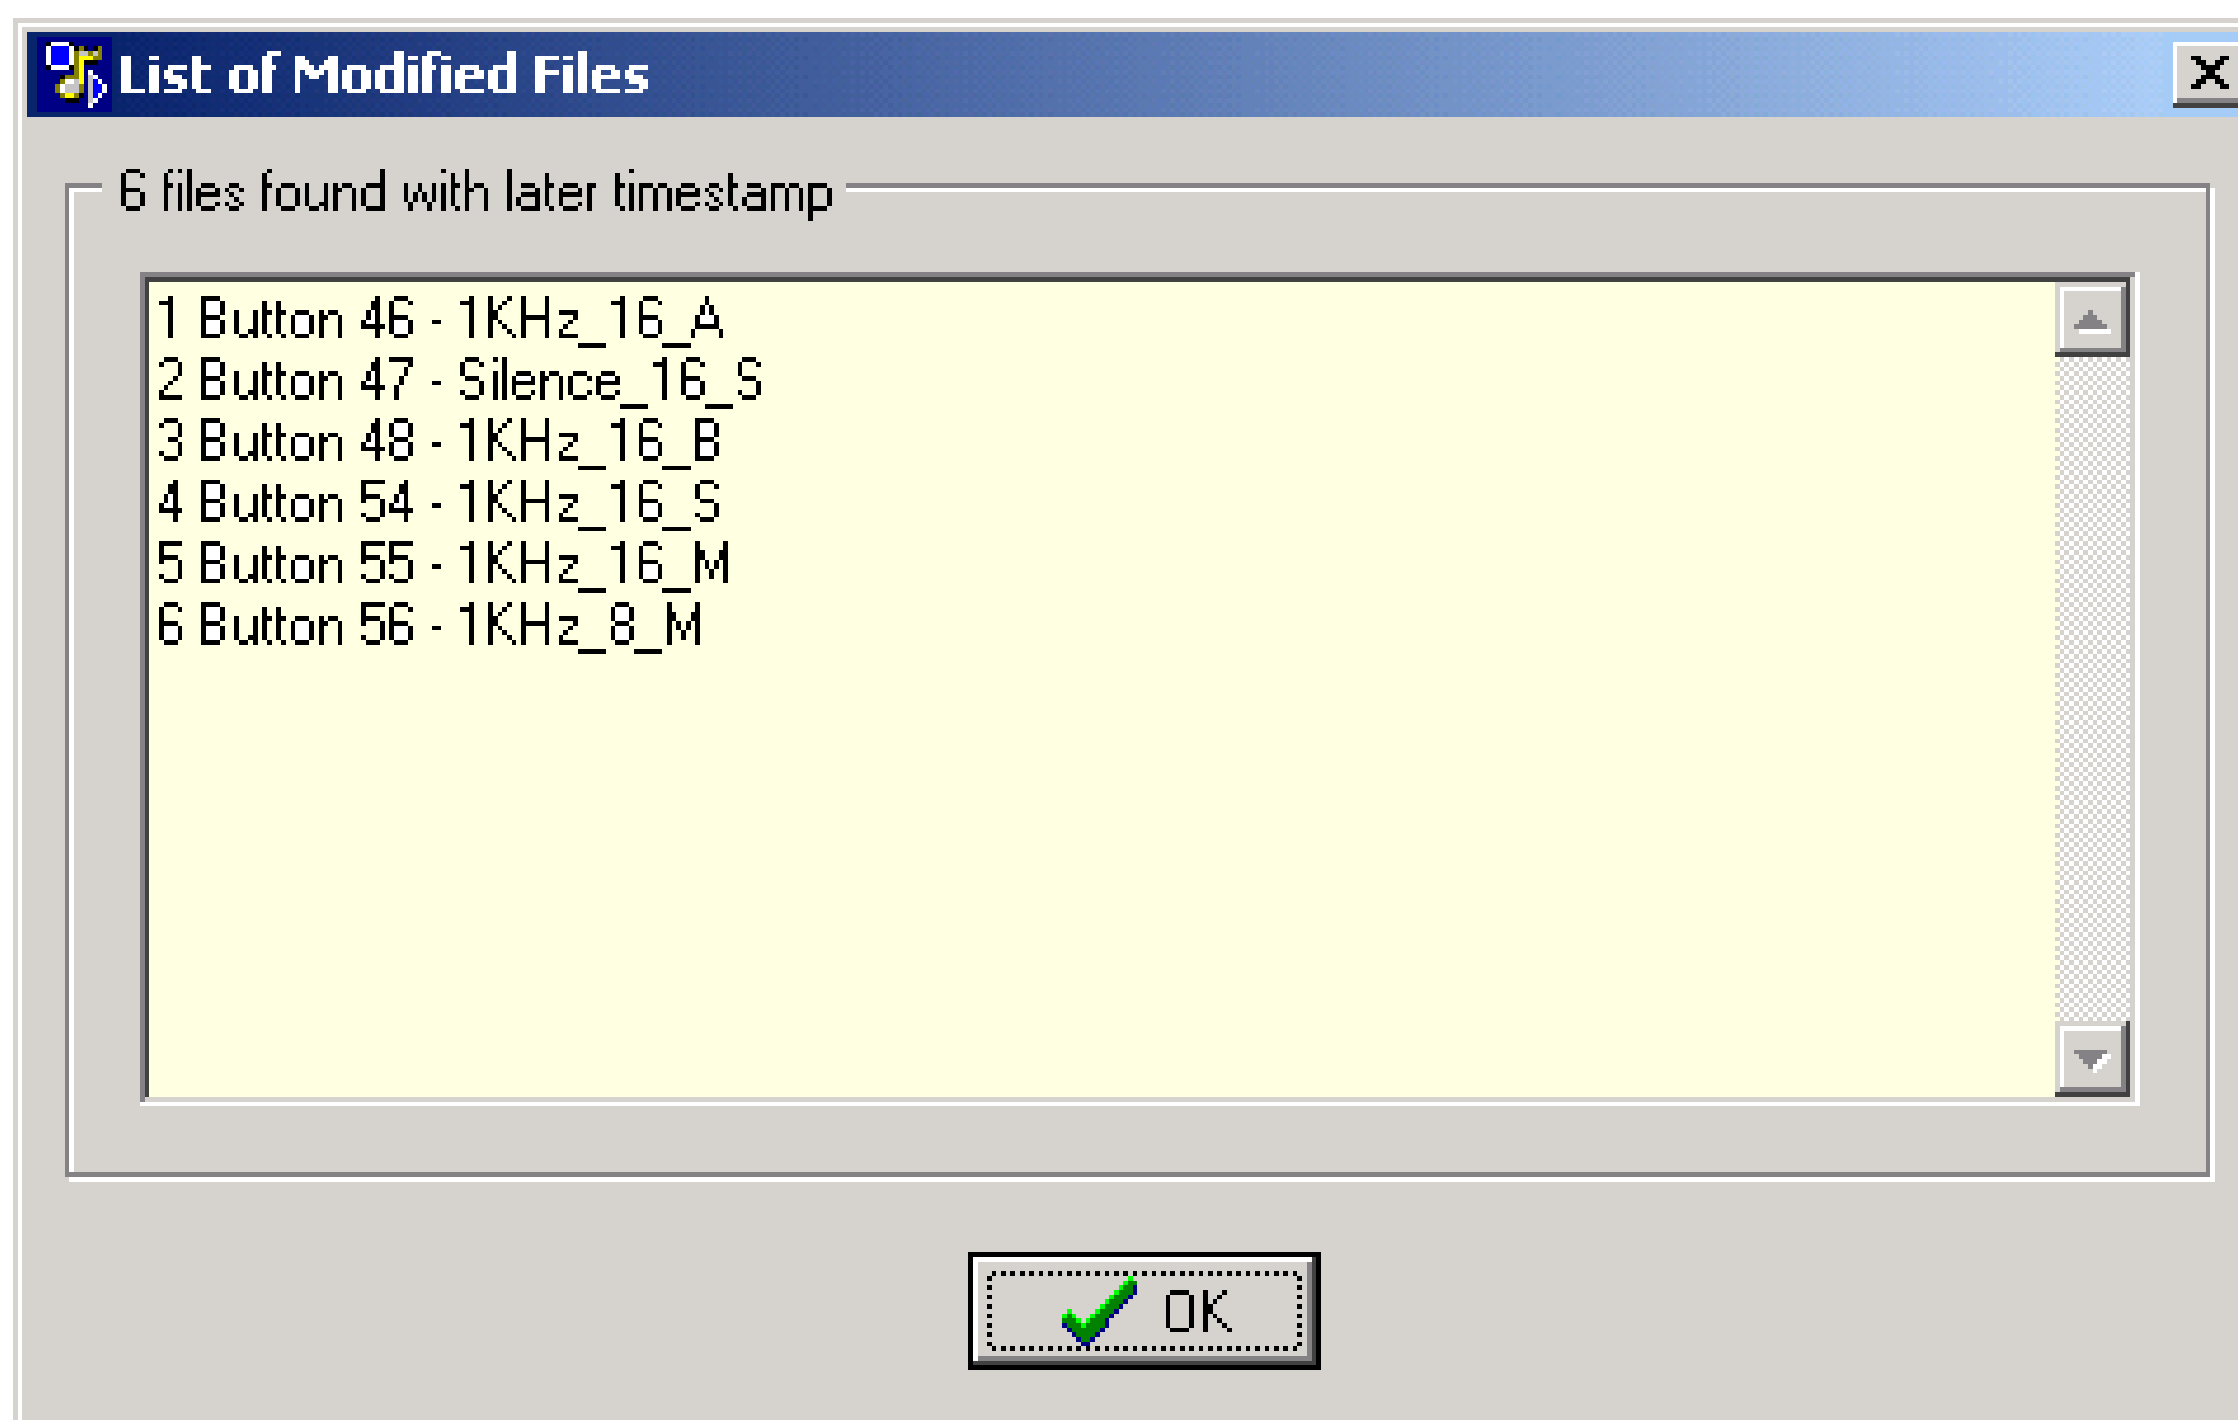

If no utility has been assigned or the file cannot be found the following message will be displayed.

Refresh Tracks (Ctrl+R)

If any tracks have been edited with an external WAV file edit application and then resaved, SpotOn will not know about the change until restarted or the button tracks are refreshed.

SpotOn could well be confused if audio files currently in use are modified externally, due to the information extracted from the audio file when originally loaded into SpotOn now being incorrect.

To avoid this situation clicking Refresh Tracks (Ctrl+R) will scan the disk files and compare the timestamps with those of the tracks currently loaded, files with more recent timestamps will be listed as shown below.

Following this dialog box is another to confirm that the updated tracks are to be loaded.

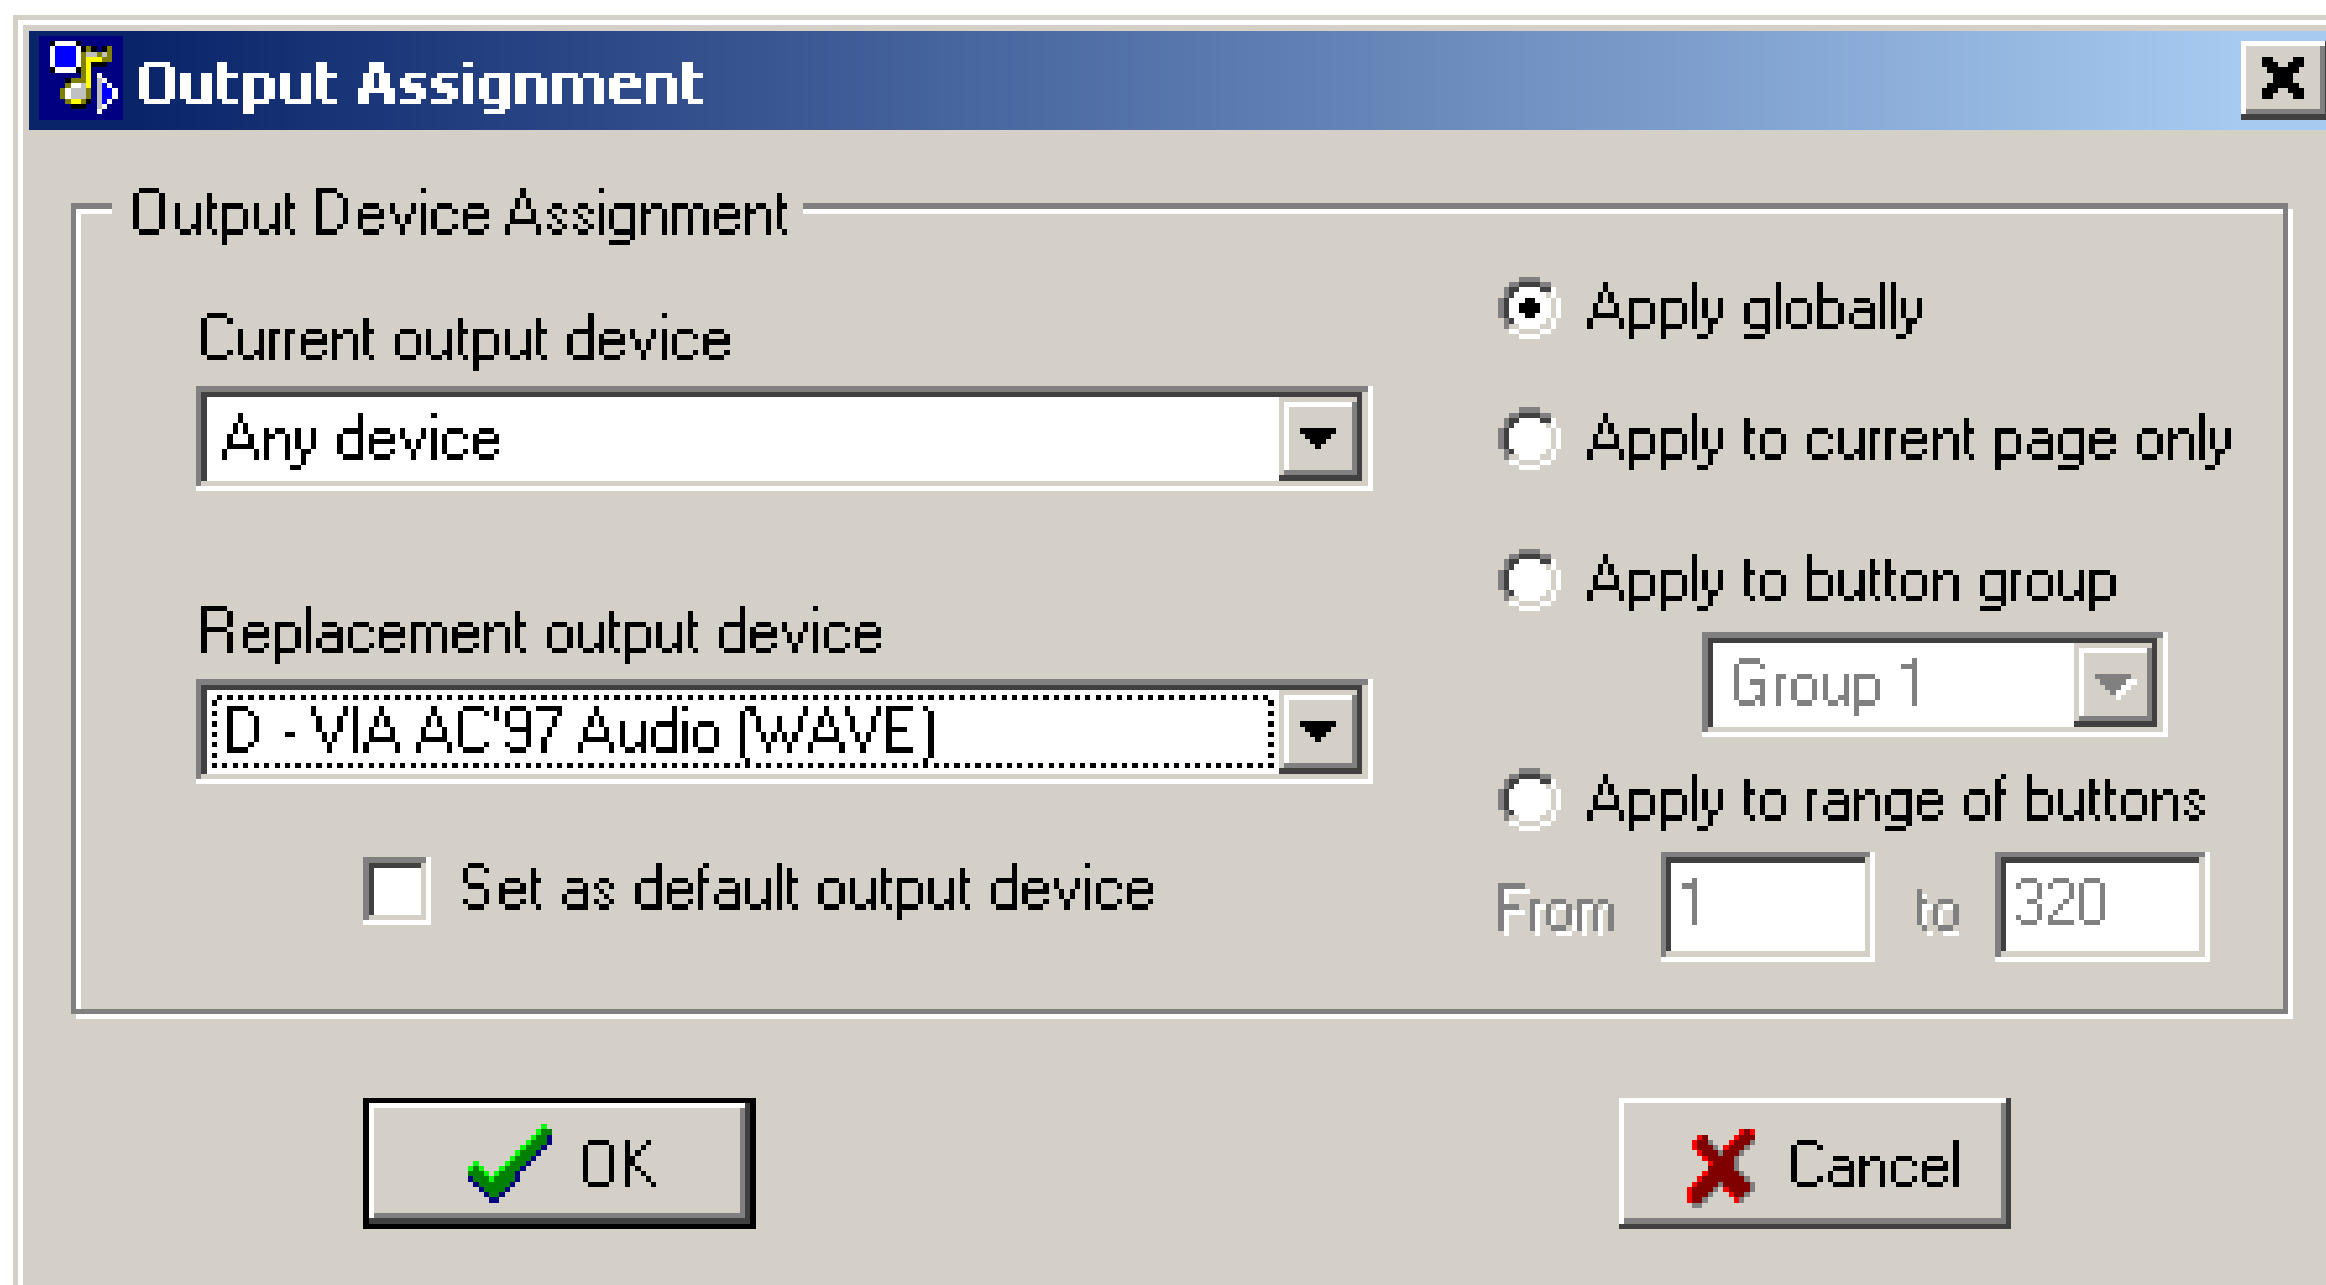

Playlist item selection and fade out times may be reset by this process, so the parameters of the buttons using these files listed must be checked and rehearsed before use.

When using the Advanced Editing option the tracks must be refreshed on completion of any editing operation

Change Output Assignment

This option can globally change all buttons to use a specific audio output or only change those buttons already using a certain port.

The upper drop down box selects to audio output to be changed, and the lower box the output port that will be used instead.

In the example above "Any device" is selected in the upper box and output "D" in the lower box, this will change all button to use output D. On the right hand side of the window the scope of the changes to output assignment can be set to either global, the current page, buttons on a specific group or a range of sequential buttons.

Clicking OK will show the confirmation dialog box.

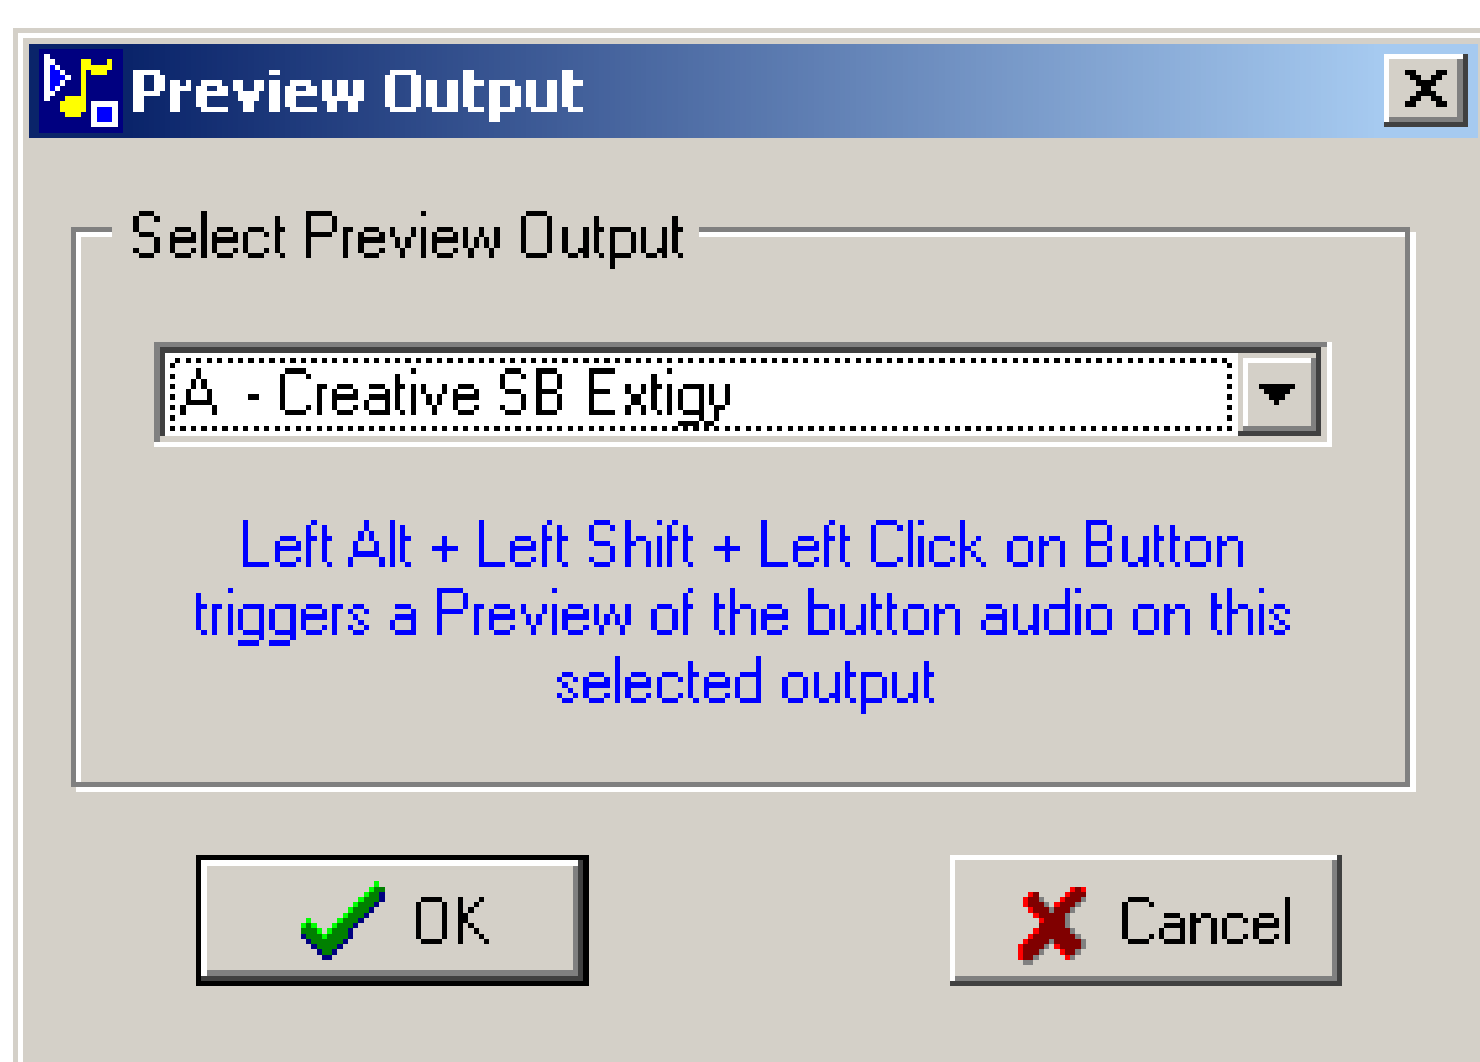

The second example below defines output device "E" in the upper box, in this case only those buttons that are currently using output E will be changed to output D.

Checking the Set as Default option will cause any subsequently loaded track to be assigned to the output selected in the lower box.

Preview Output Assignment

When tracks are played they use their assigned output, however tracks can be previewed via an alternative output, this dialog box sets the Preview output.

To enter the Preview mode from the main window press and hold left Shift and left Alt keyboard buttons, at this stage the DataRate panel will change colour to yellow and show "Pvw Mode".

Left-clicking on a button will now play that button on the Preview o/p only. The button preview can be stopped by holding down the left Shift and left Alt keyboard buttons and left or right clicking the button (depending on the mouse options selected).

The Preview playout is completely independent of the usual playout mode, so buttons can be played out of the normal outputs whilst being previewed, only one button can be previewed at any one time.

The button being previewed is shown with a crosshatch rectangle

The time display will not count down during preview.

Clear Attributes

Reset All Midi In Triggers

Remove all the Midi In Note settings from all buttons

Reset All Midi Out Triggers

Remove all the Midi Out Note settings from all buttons

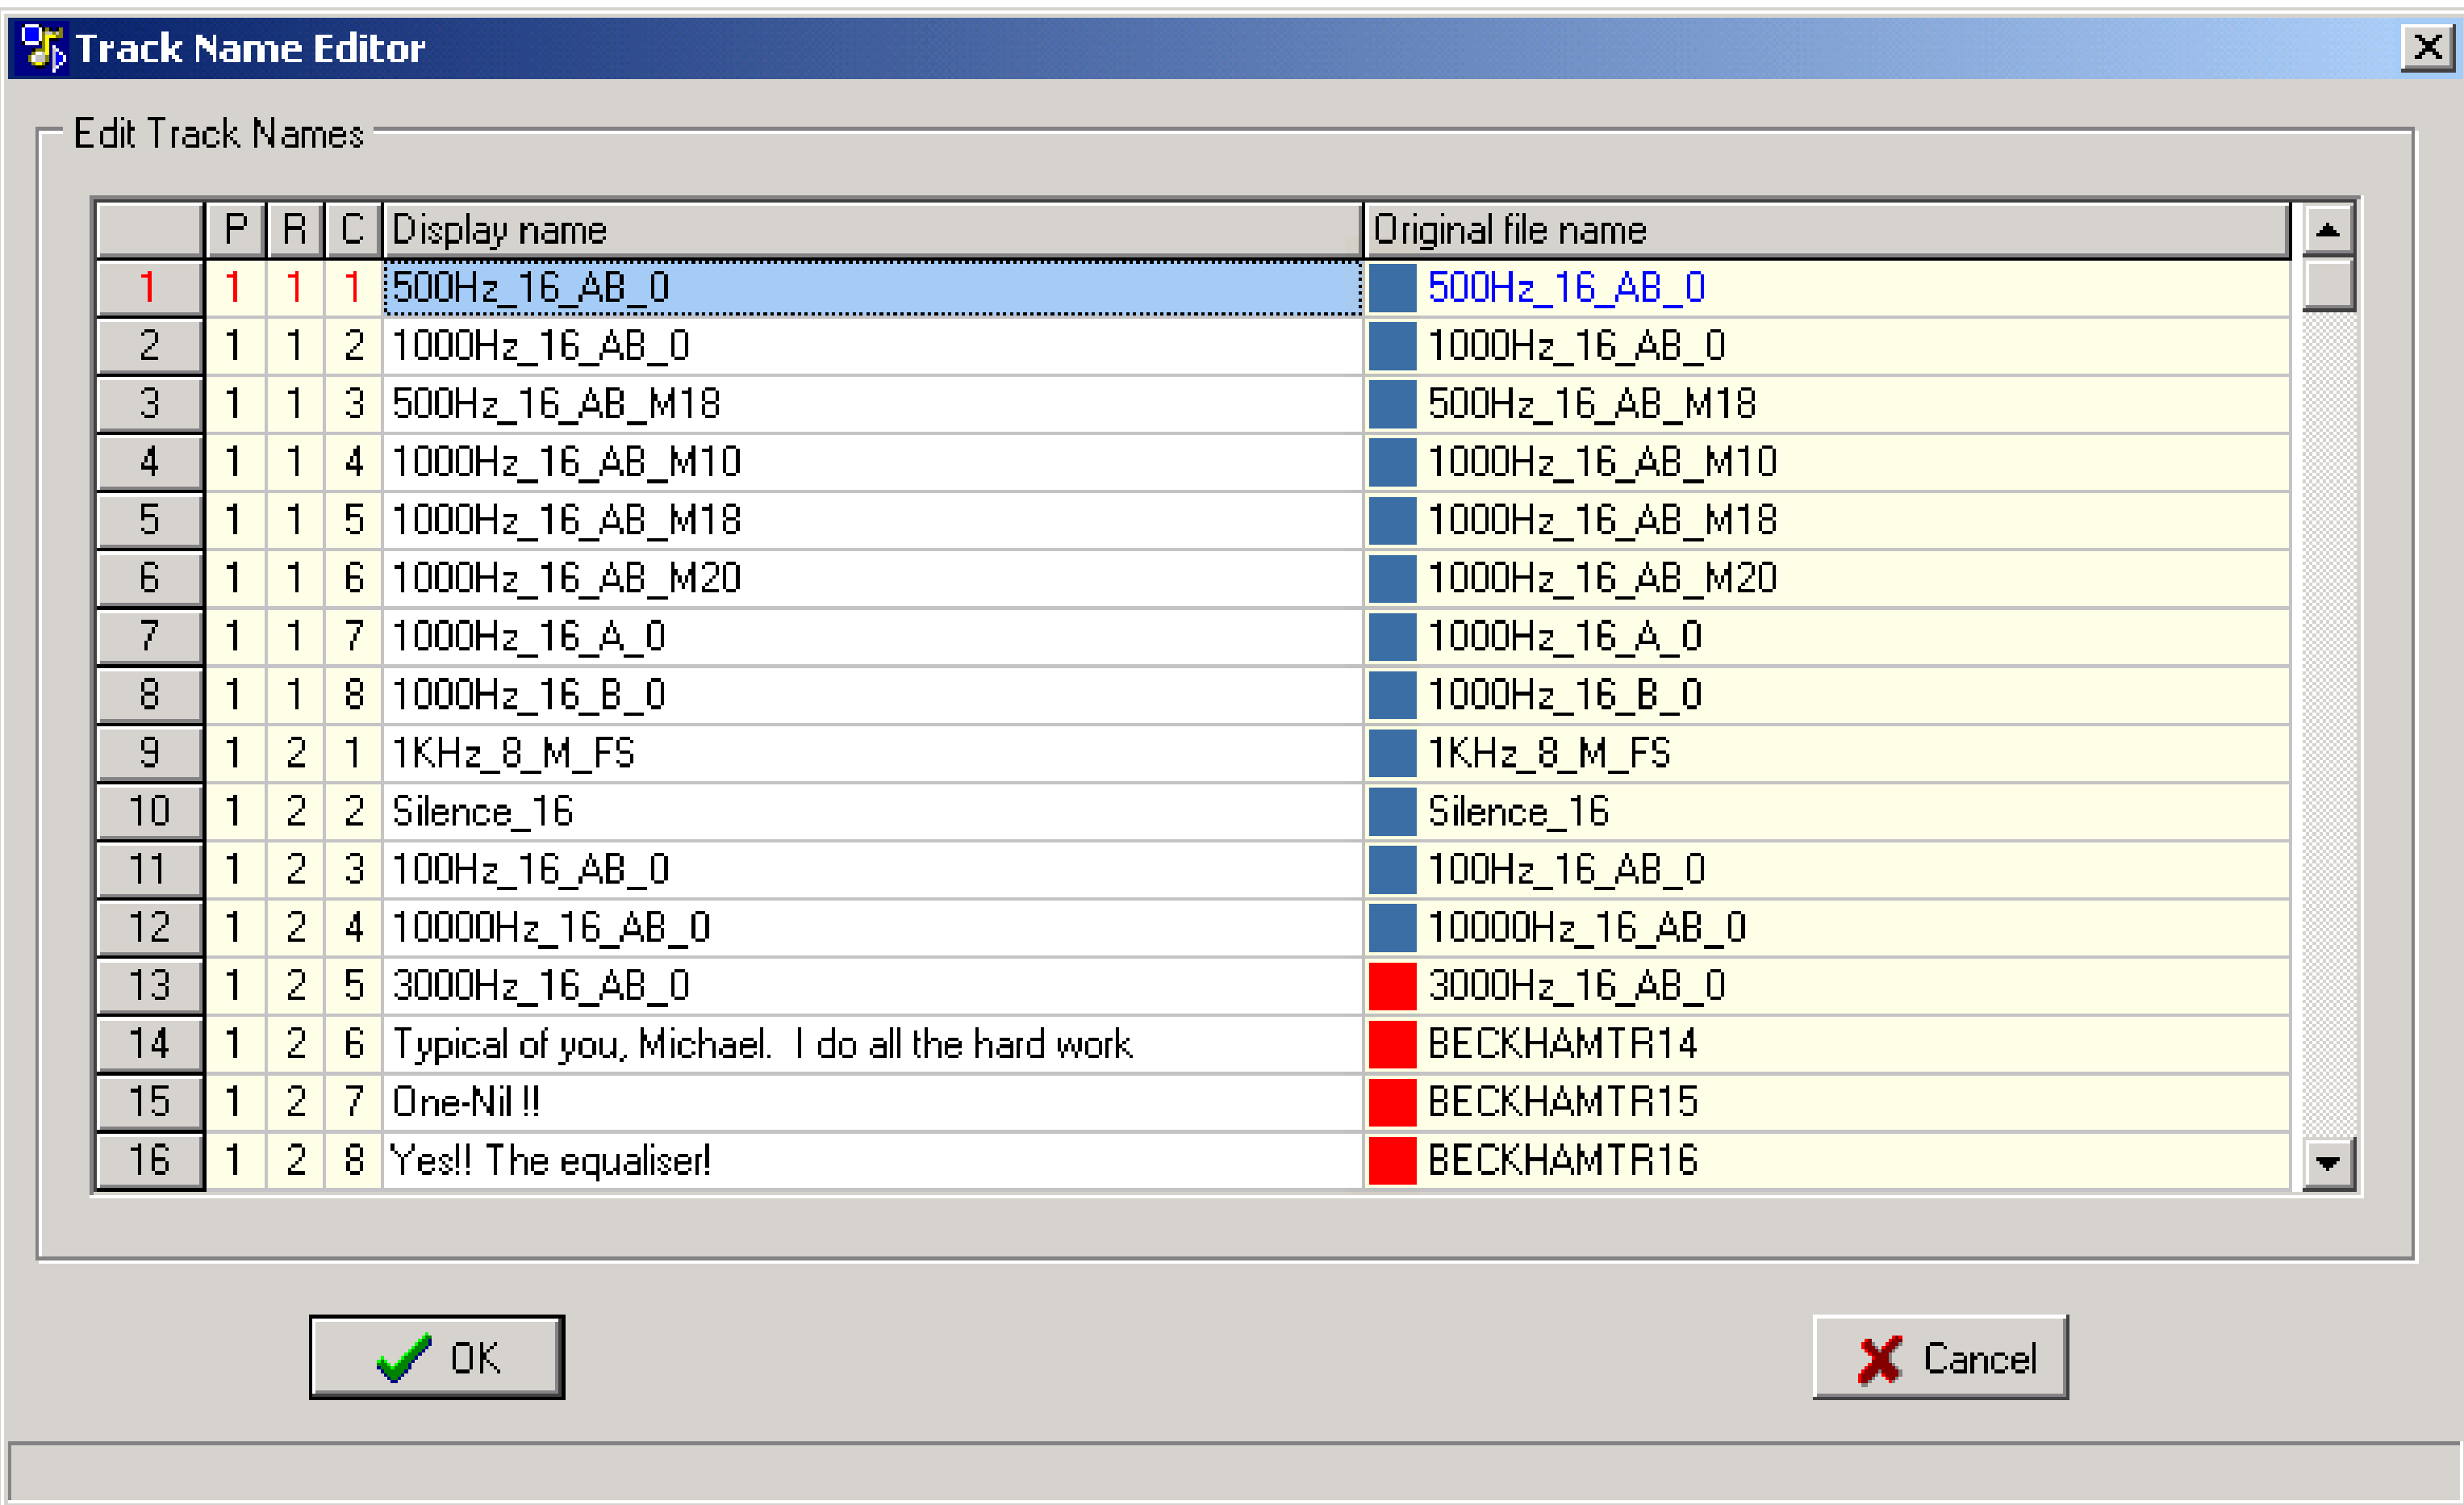

Display Names

Single button display names can be edited using the button menu Displayoption, if a large number need to be changed then the window below is more appropriate.

The left hand column show the button number, columns P, R, C show the page, row and column respectively.

The final two columns contain the display name and the original file name

The display name can be edited by first selecting the cell and then double clicking to invoke the text editor

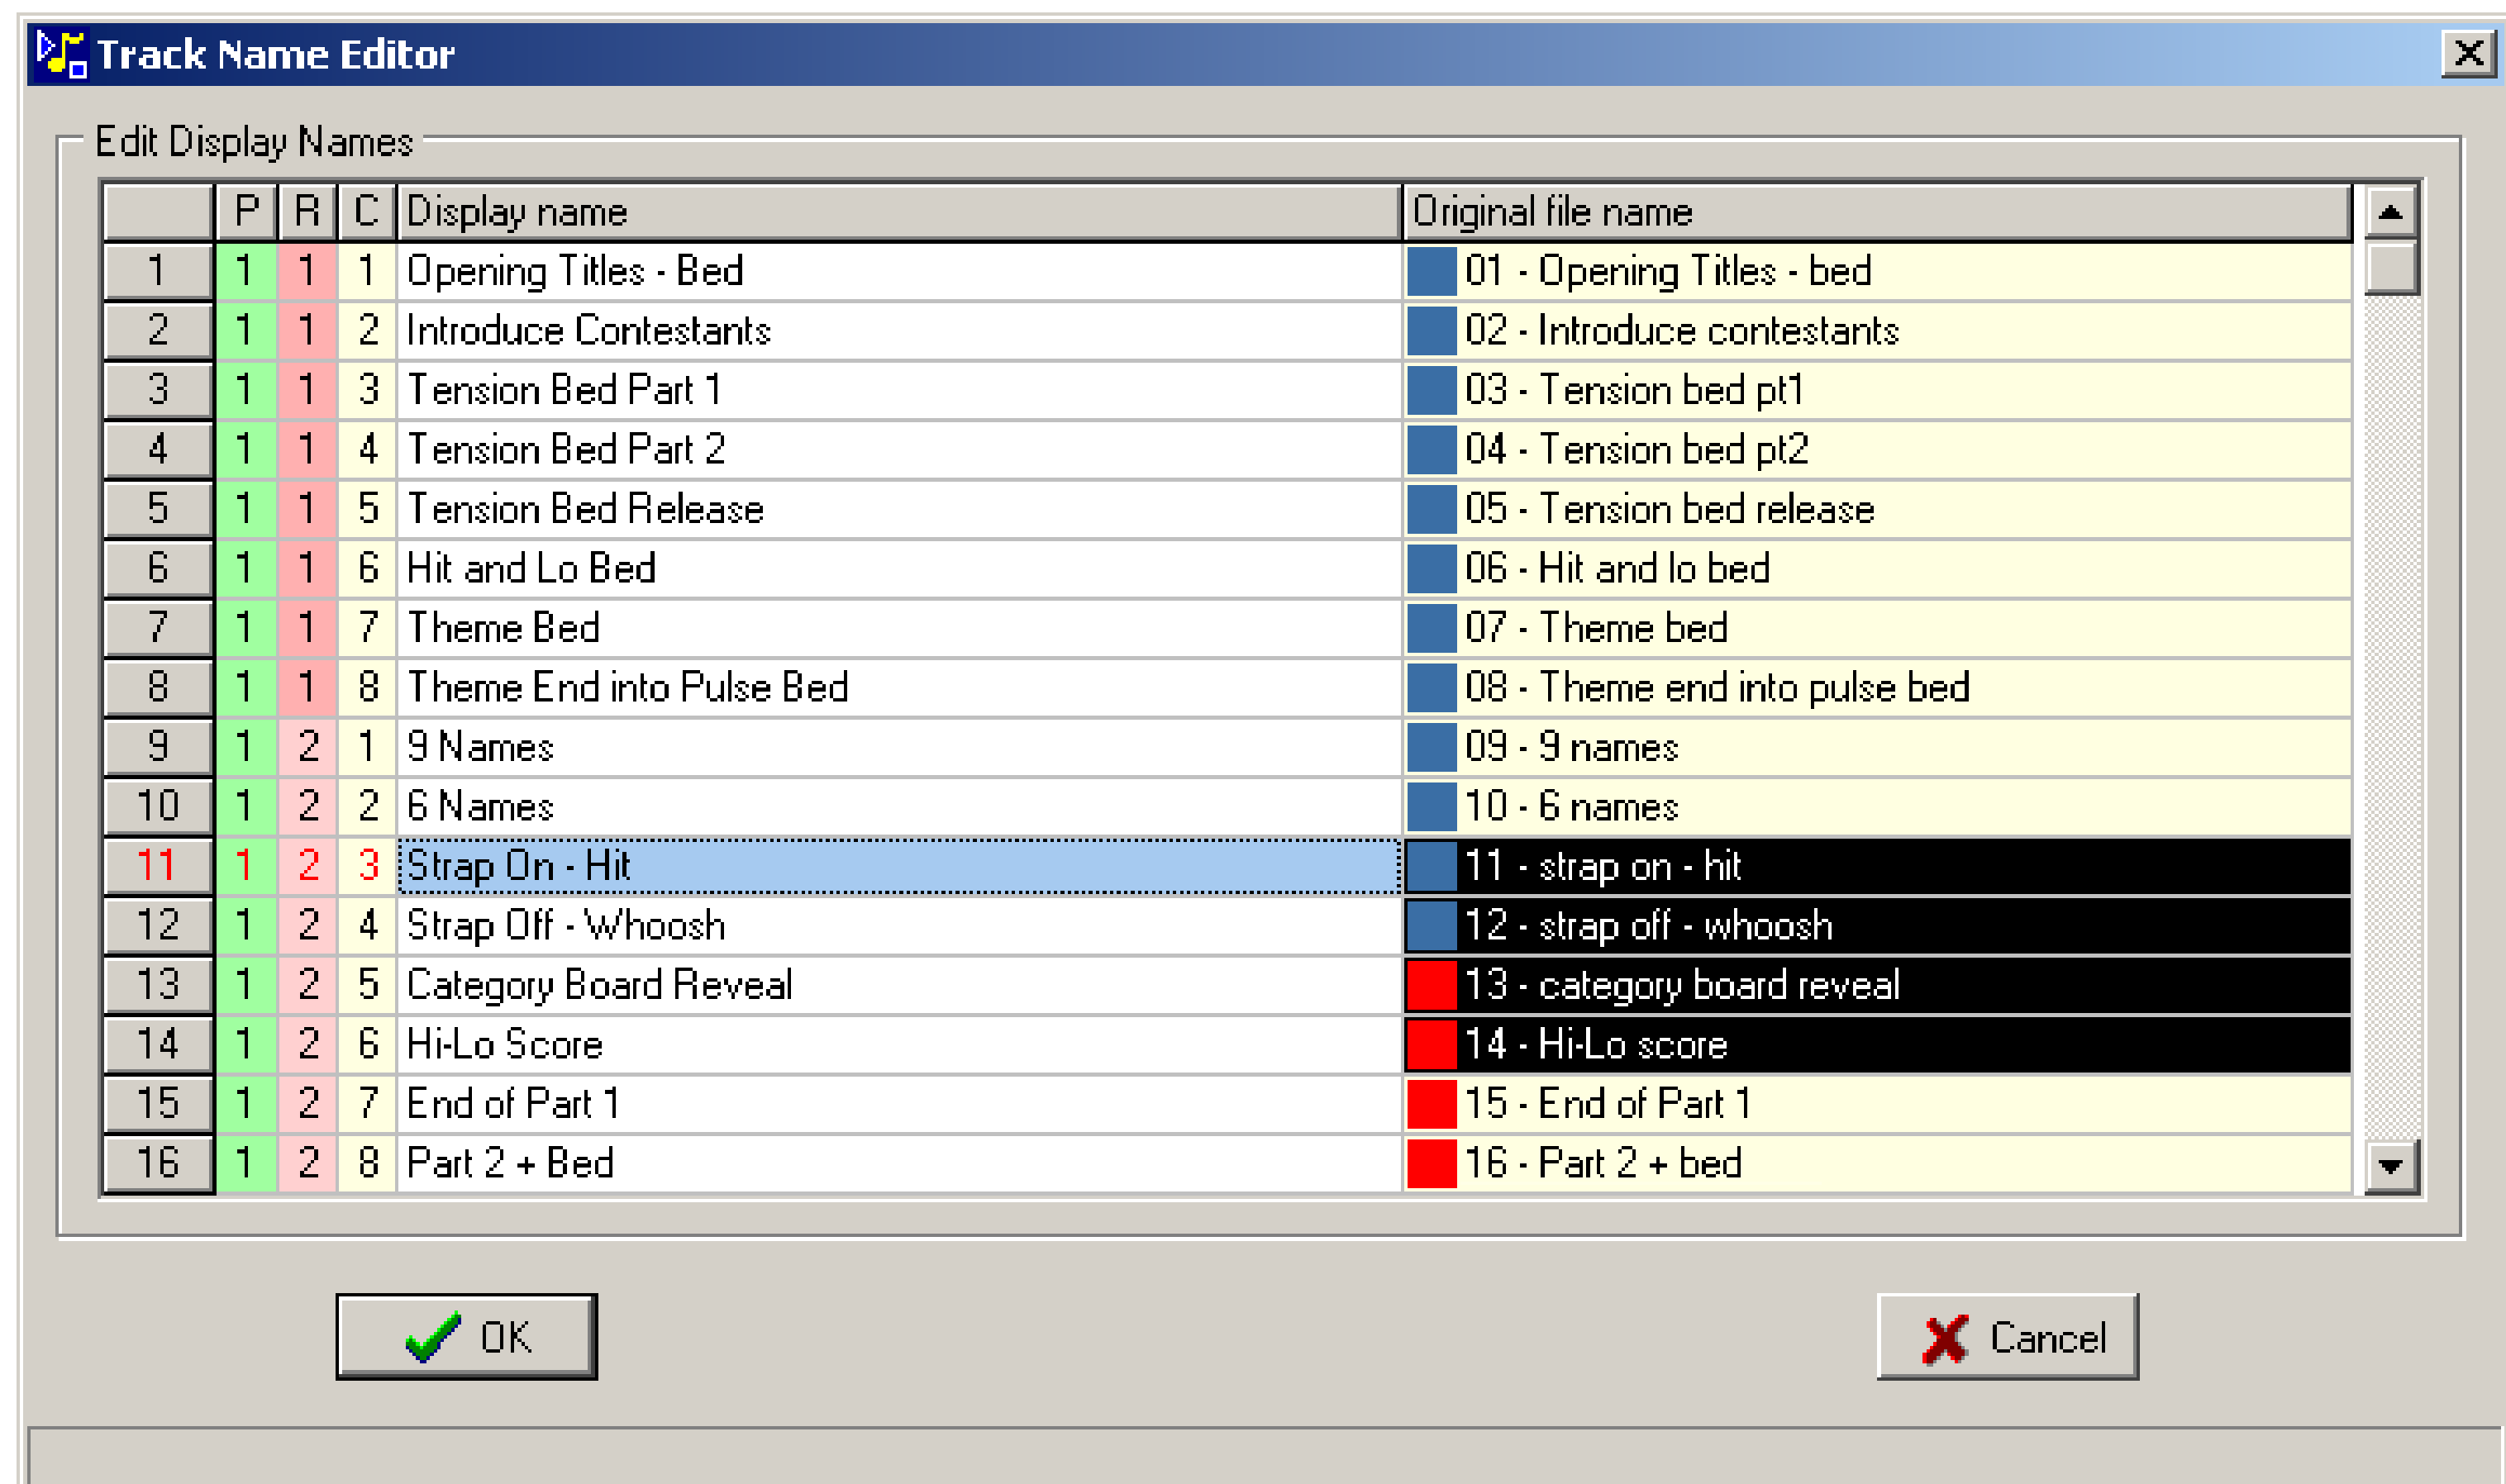

Another use of this window is the ability to reorder the tracks on the buttons

The entries in the right hand column can be dragged and dropped into new positions either singly or in blocks, button entries cannot be copied or cleared from this window.

To move a single track, simply click and hold down the left mouse button on the track in the filename column and drag the mouse within the column to the new location, the track will be inserted above the drop point.

To move multiple track the Windows shift+click selection method is used.

If in the example below the tracks 11..14 are to be cut and pasted between tracks 5 and 6, first select the tracks to be moved by clicking on track 11 in the filename column then shift+clicking on track 14 in the same column. The selected tracks will be shown in white on black text.

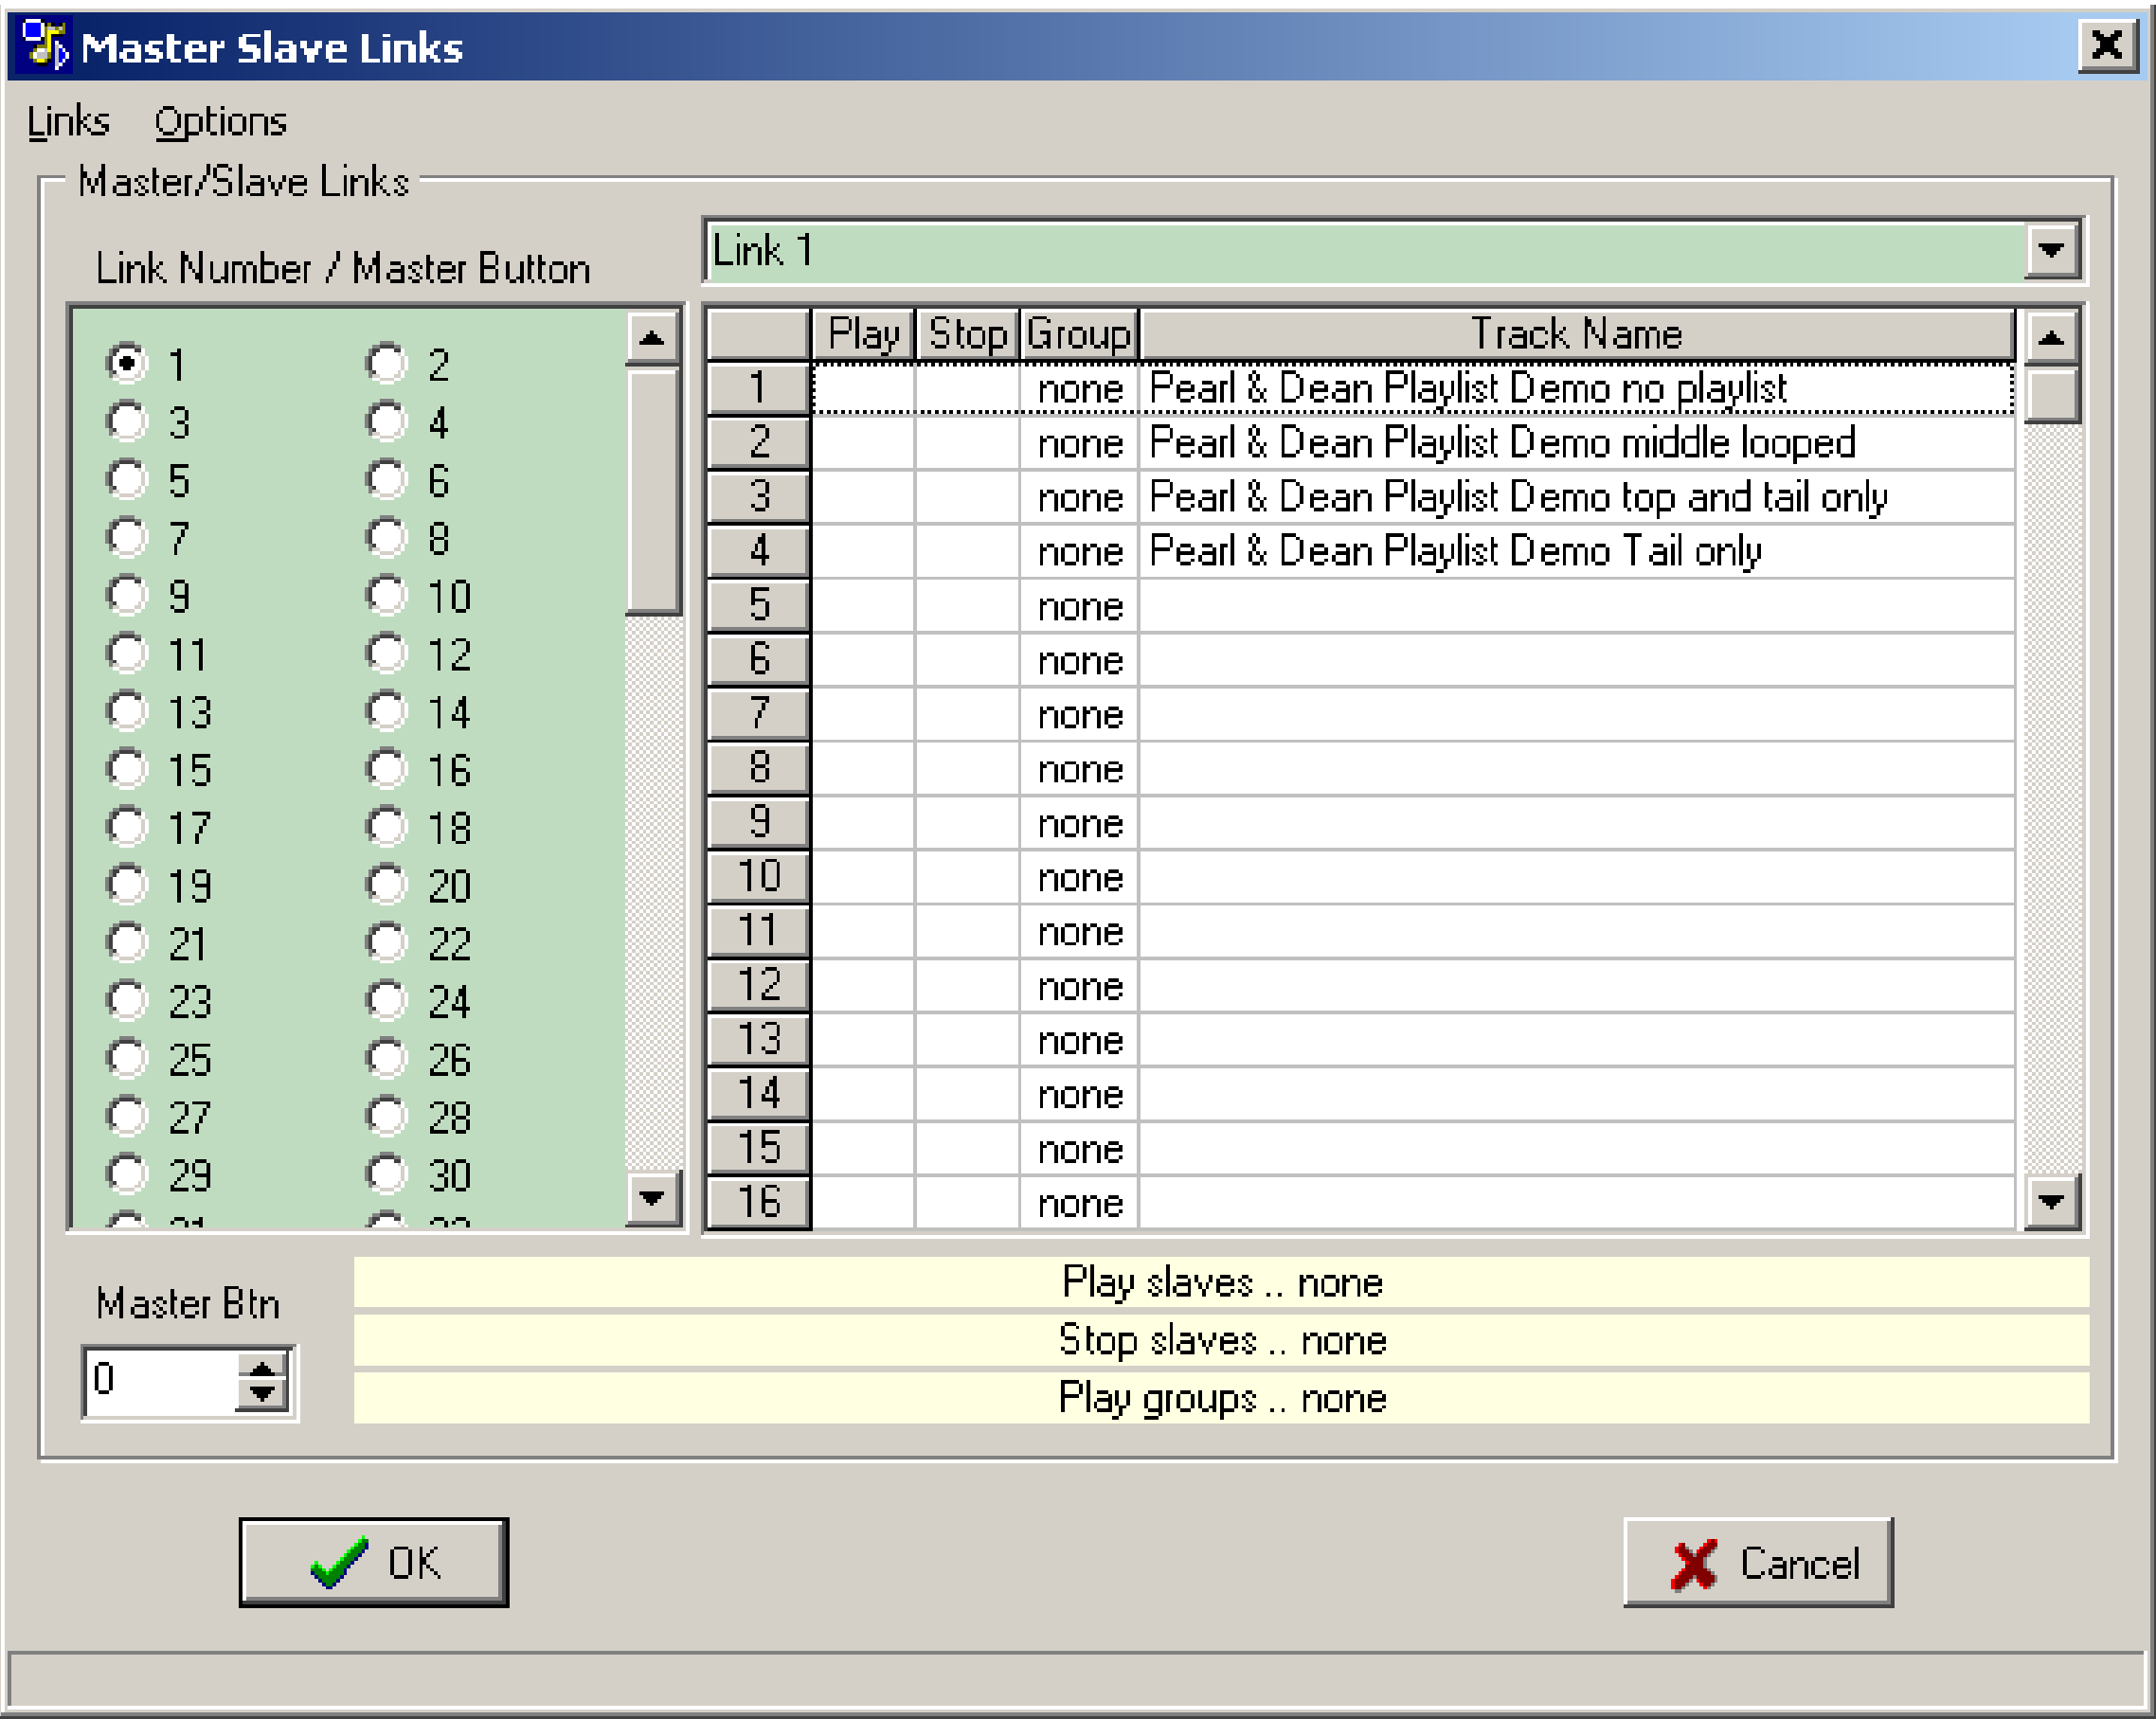

Now click and hold down the left mouse button anywhere in the selected area, then drag the mouse to the entry for track 6 in the same column.

Release the left mouse button and the selected tracks will be inserted above track 6 as shown below

Master/Slave Links

Buttons can be linked together so that one button (Master) can Play or Stop any number of other buttons (Slaves), alternatively buttons may be grouped so that playing any button in the group will stop all others in that group.

Special features such as Voice Over, Pause/UnPause and AutoPan can also be control via Master/Slave operation.

Links

There are 100 Links that can be used, clicking on the left hand panel will select the appropriate link for editing, or alternatively selecting the link from the drop down list, the currently selected link is highlighted in blue text

The Master button for a link can be typed in to the spin edit box or allocated by clicking the button number on the left hand side of the list, the selected Master button is highlighted in blue

Master Btn
5

3		none
4		none
5		none
6		none

A link can be deleted by entering 0 as the Master Button or clicking the top left cell in the display grid - shown in orange above.

Play Slaves (those that will Play when the Master button is played) and Stop Slaves (those that will Stop when the Master is played) are allocated by clicking the appropriate cell in the list

Master Slave Links

Cancel

Similarly for link 4 buttons 39,40 will play and buttons 42,43,44,45,46 will stop when the master button 41 is played

A summary of the allocated buttons is shown at the bottom of the button allocation list

The individual links can be named by typing into the drop down list selection

The links can be sorted into Master Button order using the Global|Sort Master/Slave Links option

If the Master/Slave links are currently disabled the message below appears at the bottom of the dialog box

The Links menu allows for the link names to be reset to their default of Link 1.. Link 99, and all Groups and Links to be cleared.

In addition the Links can be analysed and broken links displayed, a broken link is defined as one where the Master button is unused or all the Play and Stop slaves are pointing to unused buttons.

An option to delete all broken links is available

An additional menu is available by right-clicking the Play or Stop columns.

	Play	Stop	Group	Track Name
1			none	dinn 16 08 AR
2				
3				
4				
5				
6			none	
7			none	
8			none	

Play Groups

As an alternative to using Links for collections of exclusive buttons Groups may be more appropriate.

There are 25 separate button groups and only one button assigned to a particular group can be playing at any one time, so playing a button will stop all other buttons in the group.

By default the buttons will not be assigned to any group and will show as "none" in the Group column

Left clicking on the appropriate group cell will increment the group number and then roll back to none.

Right clicking the group cells displays a popup menu

Selecting an item will set the group value for that button, the screen shot below shows 5 buttons assigned to group 3.

The Play selection on button 7 is coloured red as it belongs to a Master/Slave link and is now invalid - Groups and Play Links cannot act on the same button and will be automatically deleted on exiting from the Links dialog.

	Play	Stop	Group	Track Name
1			none	SOUND1
2			3	SOUND2
3			3	SOUND3
4			none	SOUND4
5			3	SOUND5
6			none	SOUND6
7	✗		3	SOUND7
8		✓	3	SOUND8
9			none	
10			none	
11			none	
12			none	

The summary text in the lower part of the window shows the number of buttons assigned to each group.

Play groups .. G3:5

SOUND2	SOUND3	SOUND4	SOUND5	SOUND6	SOUND7	SOUND8
2dG3 00:12	3dG3 00:12	4d 00:12	5dG3 00:01	6d 00:12	7dG3 P00:09	8dG3 P00:04

As an alternative to setting up the Play Groups in this dialog box the groups can be assigned from the main screen by shift+ctrl right-clicking on a button

If the Groups and Master/Slave links are disabled then the group selections will be greyed out

Buzzer Groups

In the above description of Play Groups there were 25 exclusive groups numbered 1..25, and 4 buzzer groups with legends A..D

Buttons assigned to Buzzer Groups act slightly differently to Play Groups, in that if any button that belongs to a buzzer group is played all other members of that buzzer group are prevented from being played for the duration of a timeout period.

Options

Buzzer Group Timeout (zero) ▶

✓ zero	10s
0.5s	15s
1.0s	20s
1.5s	25s
2.0s	30s
2.5s	35s
3.0s	40s
3.5s	45s
4.0s	50s
4.5s	99m

The intended use of this is in "Bell and Buzzer" rounds in quiz shows where only the first person in a team to press the the 'bell' or 'buzzer' actually triggers the sound effect, other presses are locked out.

This Buzzer Group mode of operation is only available when the Play command is received from an external source ie GPI or Midi, HotKey and mouse click operation is not affected by the presence of Buzzer Groups.

The Buzzer Group timeout can be set between zero and 99 minutes, with the longer timeouts it will often be necessary to reset the timeout period, say for the start of the next quiz round. The timeouts can be reset either by toggling the GPIs off/on or by use of the special play group 25.

Play group 25 is shown in the group selection windows as 25! meaning that is acts differently from groups 1..24.

When any button in group 25 is played directly (not with a Play Next) it will play and also clear the Buzzer Group timeouts. In practice this could be a button loaded with silence and operated by an external GPI triggered by someone supervising the quiz game.

Play Stack

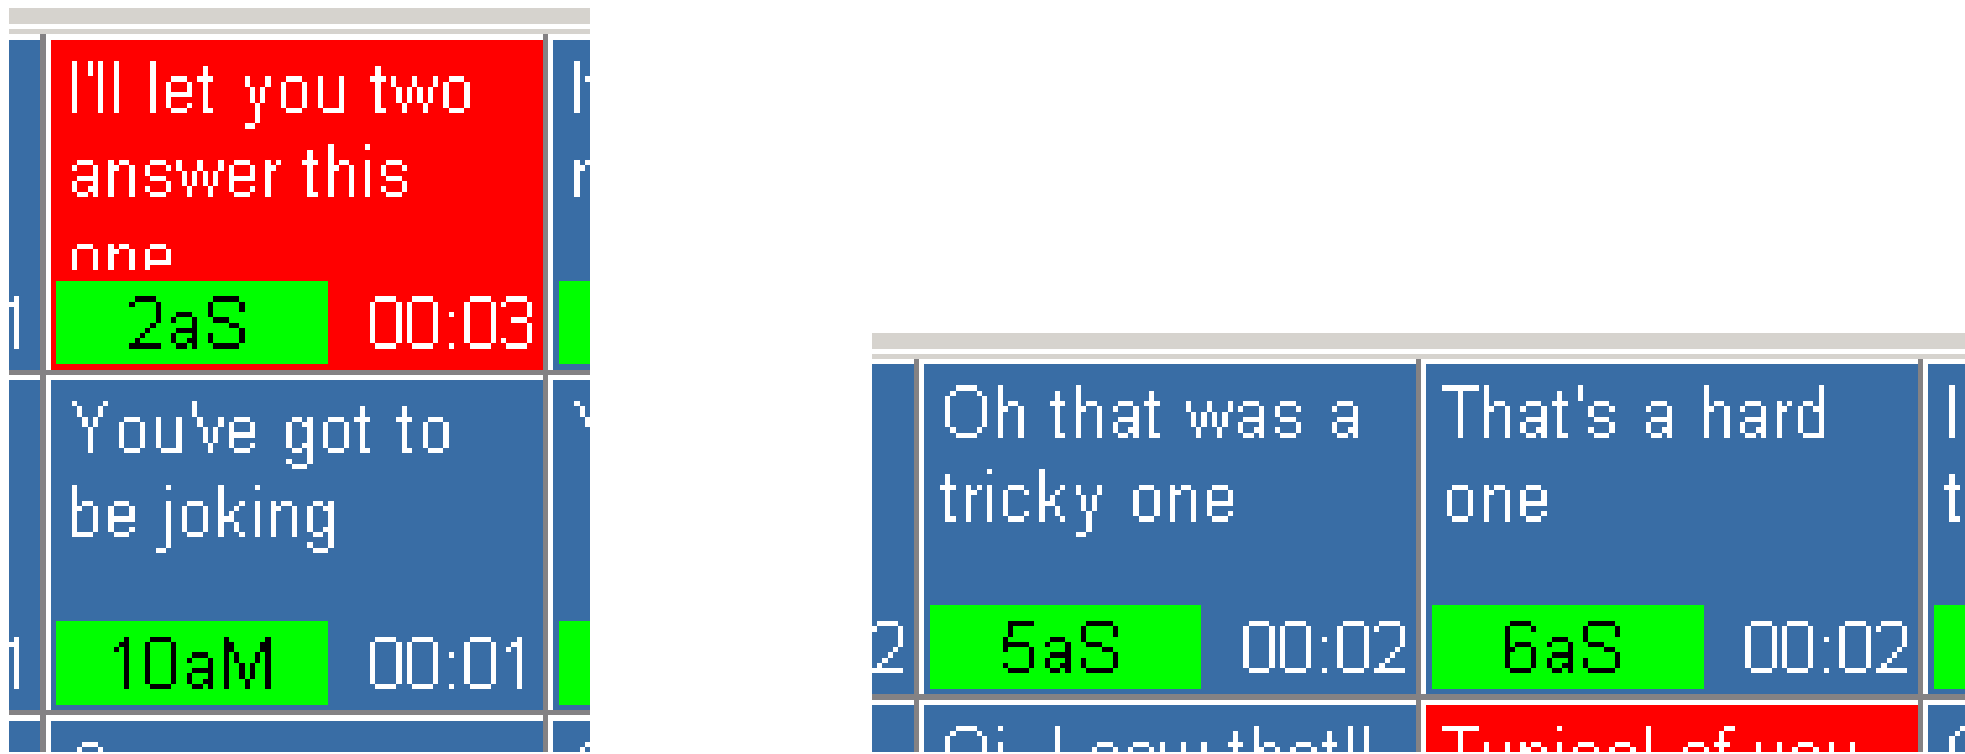

Play group 24 has a secondary function in that it will fade out any tracks playing in the Play Stack window.

Display

The Groups and Master/Slave Links can be enabled via the Optionsmenu or by clicking the status panel below

The button displays change to indicate any links, here button 10 has an M suffix to the button number indicating it is a Master and buttons 2, 5 and 6 have an S (Slave) suffix.

The status bar gives more information showing which Link the Master or Slave buttons are acting on.

Voice Over

Voice Over mode is a special case of Master/Slave links where the gain of the Play Slave/s is reduced under control of the Master track - Stop slaves have no meaning in this mode and will be deleted.

The Slave track/s would be already playing and when the master 'voice over' track is played the gain of the slave/s will be reduced using the fade time and law of the master track - this means the Fade In and Fade Out of the master track must be non-zero.

To convert a Master/Slave link to be a VoiceOver link: -

First select an existing link - in this case #17 that has a master button 35 and one play slave button 34

Right-click the link number - the link must be assigned a Master button for the popup options to be displayed

Check the Voice Over master option, at which point the link number will be underlined and the 'tick' in the play column will change to a fade down/up image.

<input type="radio"/> 15	<input type="radio"/> 16	32		none	
<input checked="" type="radio"/> <u>17/35</u>	<input type="radio"/> 18	33		none	
<input type="radio"/> 19	<input type="radio"/> 20	34		none	darkside
<input type="radio"/> 21	<input type="radio"/> 22	35		none	Pop_String_Orchestra_KOS145_1_21

This means that track 34 will be faded down for the duration of the master track 35

The amount of gain reduction is set on each individual slave via the Audiobutton menu

When the Master/Slave setup window is closed a check is made of the buttons acting as Voice Over masters, if any have zero Fade In or Fade Out times a warning prompt box will appear indicating which buttons have to be modified.

AutoPan

The AutoPan feature allows one or more slave buttons to have their Pan setting modified under the control of a Master button.

In a similar way to the Voice Over mode described above the pan transition is triggered by the Fade In and Fade Out of the Master track.

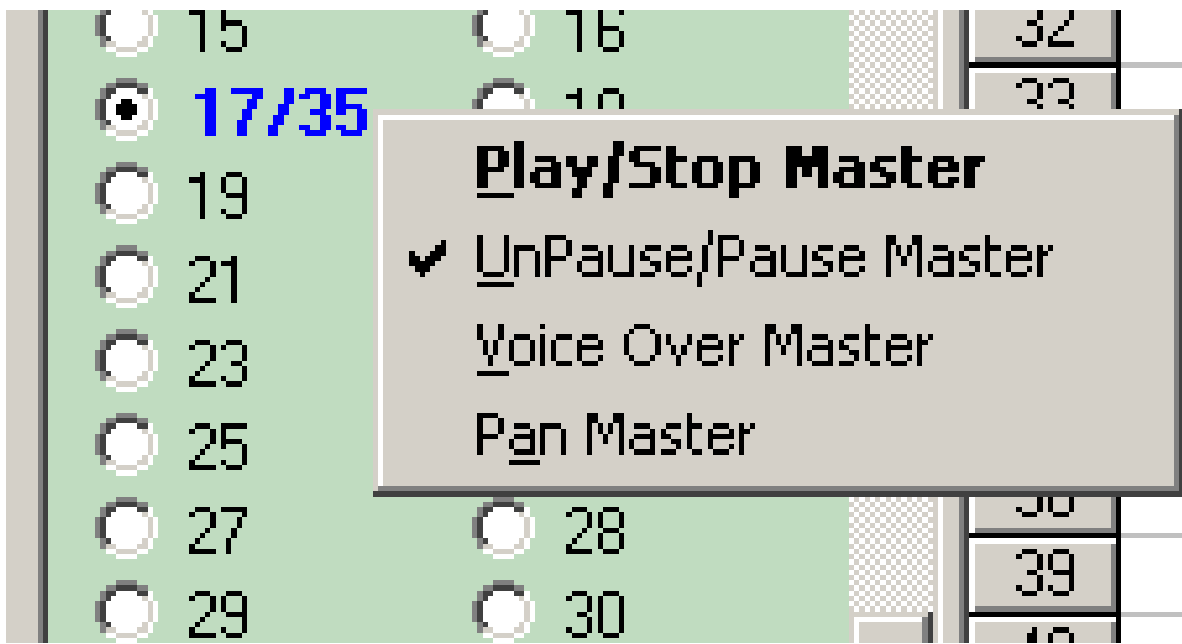

For AutoPan the starting point is the normal Pan value defined in the Audio Setup dialog, the end value is an alternative value defined in the Audio SetUpdialog by right-clicking the pan bar.

The AutoPan mode is selected by right-clicking the appropriate Link number and checking Pan Master

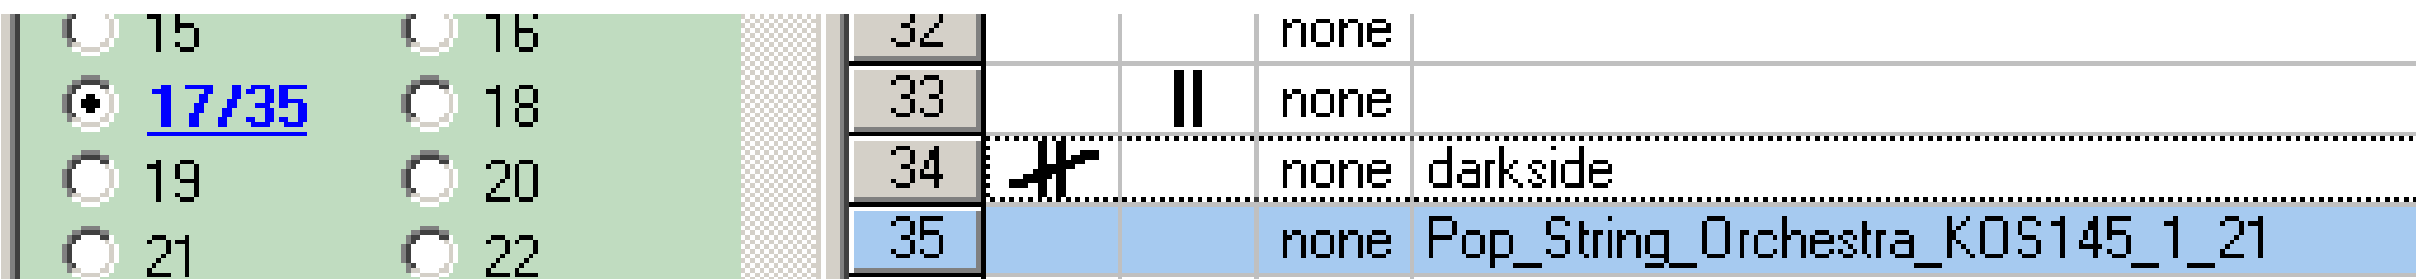

The selected play slave entries will have a double headed arrow displayed indicating that button is now an AutoPan slave.

UnPause/Pause

The UnPause/Pause mode is selected by right-clicking the appropriate Link number and checking UnPause/Pause Master

The selected stop slave entries will have a double line displayed indicating that button is now an Pause slave and similarly the selected Play slaves will have a double line with diagonal cross indicating the button is an UnPause slave

Link Diagrams

With a complex set of Master/Slave links it is often difficult to establish which buttons are linked, an example is shown below. The Master Slave setup dialog window can provide the information but not in a readily useful format.

A keyboard shortcut Ctrl+Shift+left mouse press can be used to show the master/slave links graphically, using the key combination on button 15 shows button 14 is a play slave

(line is green).

		sample_3	temp		
	4	5aS 00:04	6aS 00:09	7	
	sample_7	sample	sample	sting	
	14aMS 00:04	15aM 00:04	16aM 00:04	17aS 00:04

	34	35aS 00:52	36aS 00:04	37	

If instead of just using Shift+Ctrl+Left mouse press to display the existing links Shift+Ctrl+left mouse drag can create new links.

Below the Shift+Ctrl+Left mouse button has been dragged from button 52 to 54 drawing a thick read line, releasing the left mouse button as in 'drag and drop' will show a confirmation dialog.

The next unused Master/Slave link will be selected for this new link - in this example link 13

Play and Stop links can also be deleted using the same drag/drop method, for example if the mouse is Shift+Ctrl drag and dropped between buttons 52 and 54 as below

then a prompt dialog will ask if the link is to be deleted.

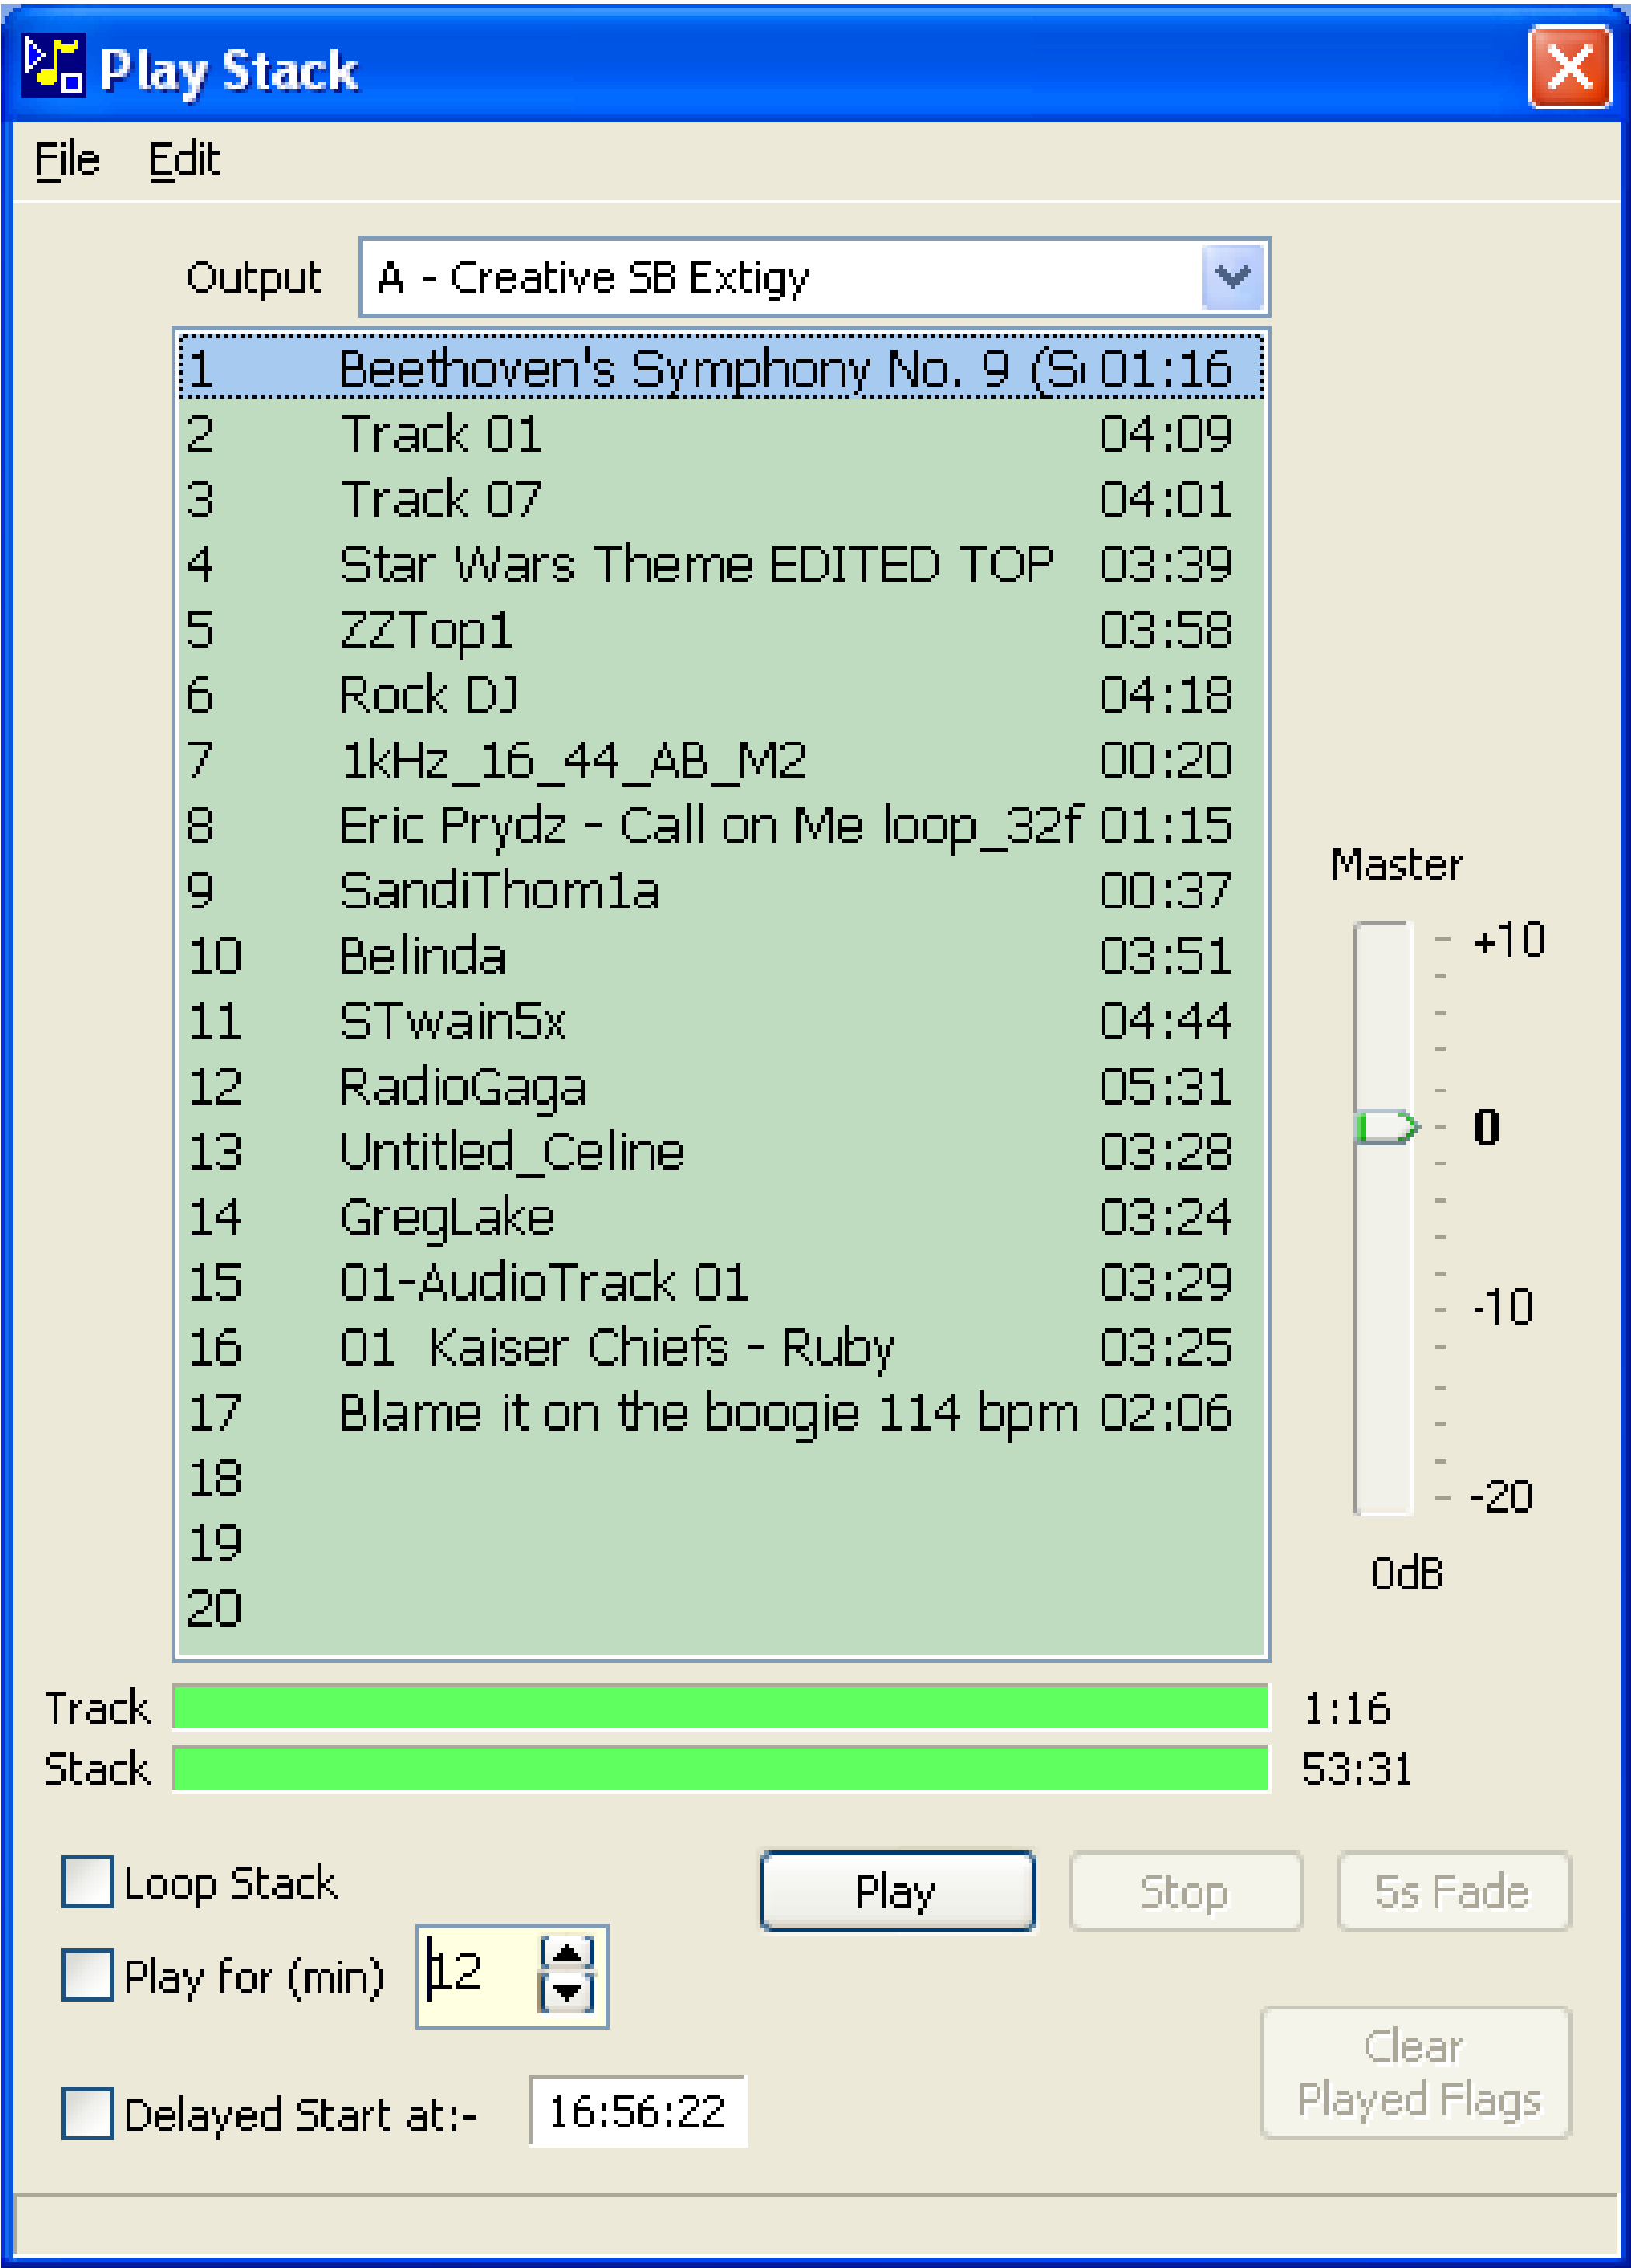

Play Stack

A Play Stack is built into SpotOn and runs independently of the main SpotOn operation, the intended use is for playing out audience 'warm up' or interval music.

The stack can be set to play a set of tracks and fade out after a predetermined time or loop until stopped manually.

A fade out of the Play Stack can be triggered from the main SpotOn window by playing any button in [Group 24](#).

Tracks can be loaded by Ctrl+Left click drag (copy button mode) from the SpotOn buttons or by right-clicking an entry in the Play Stack and selecting Load/Insert.

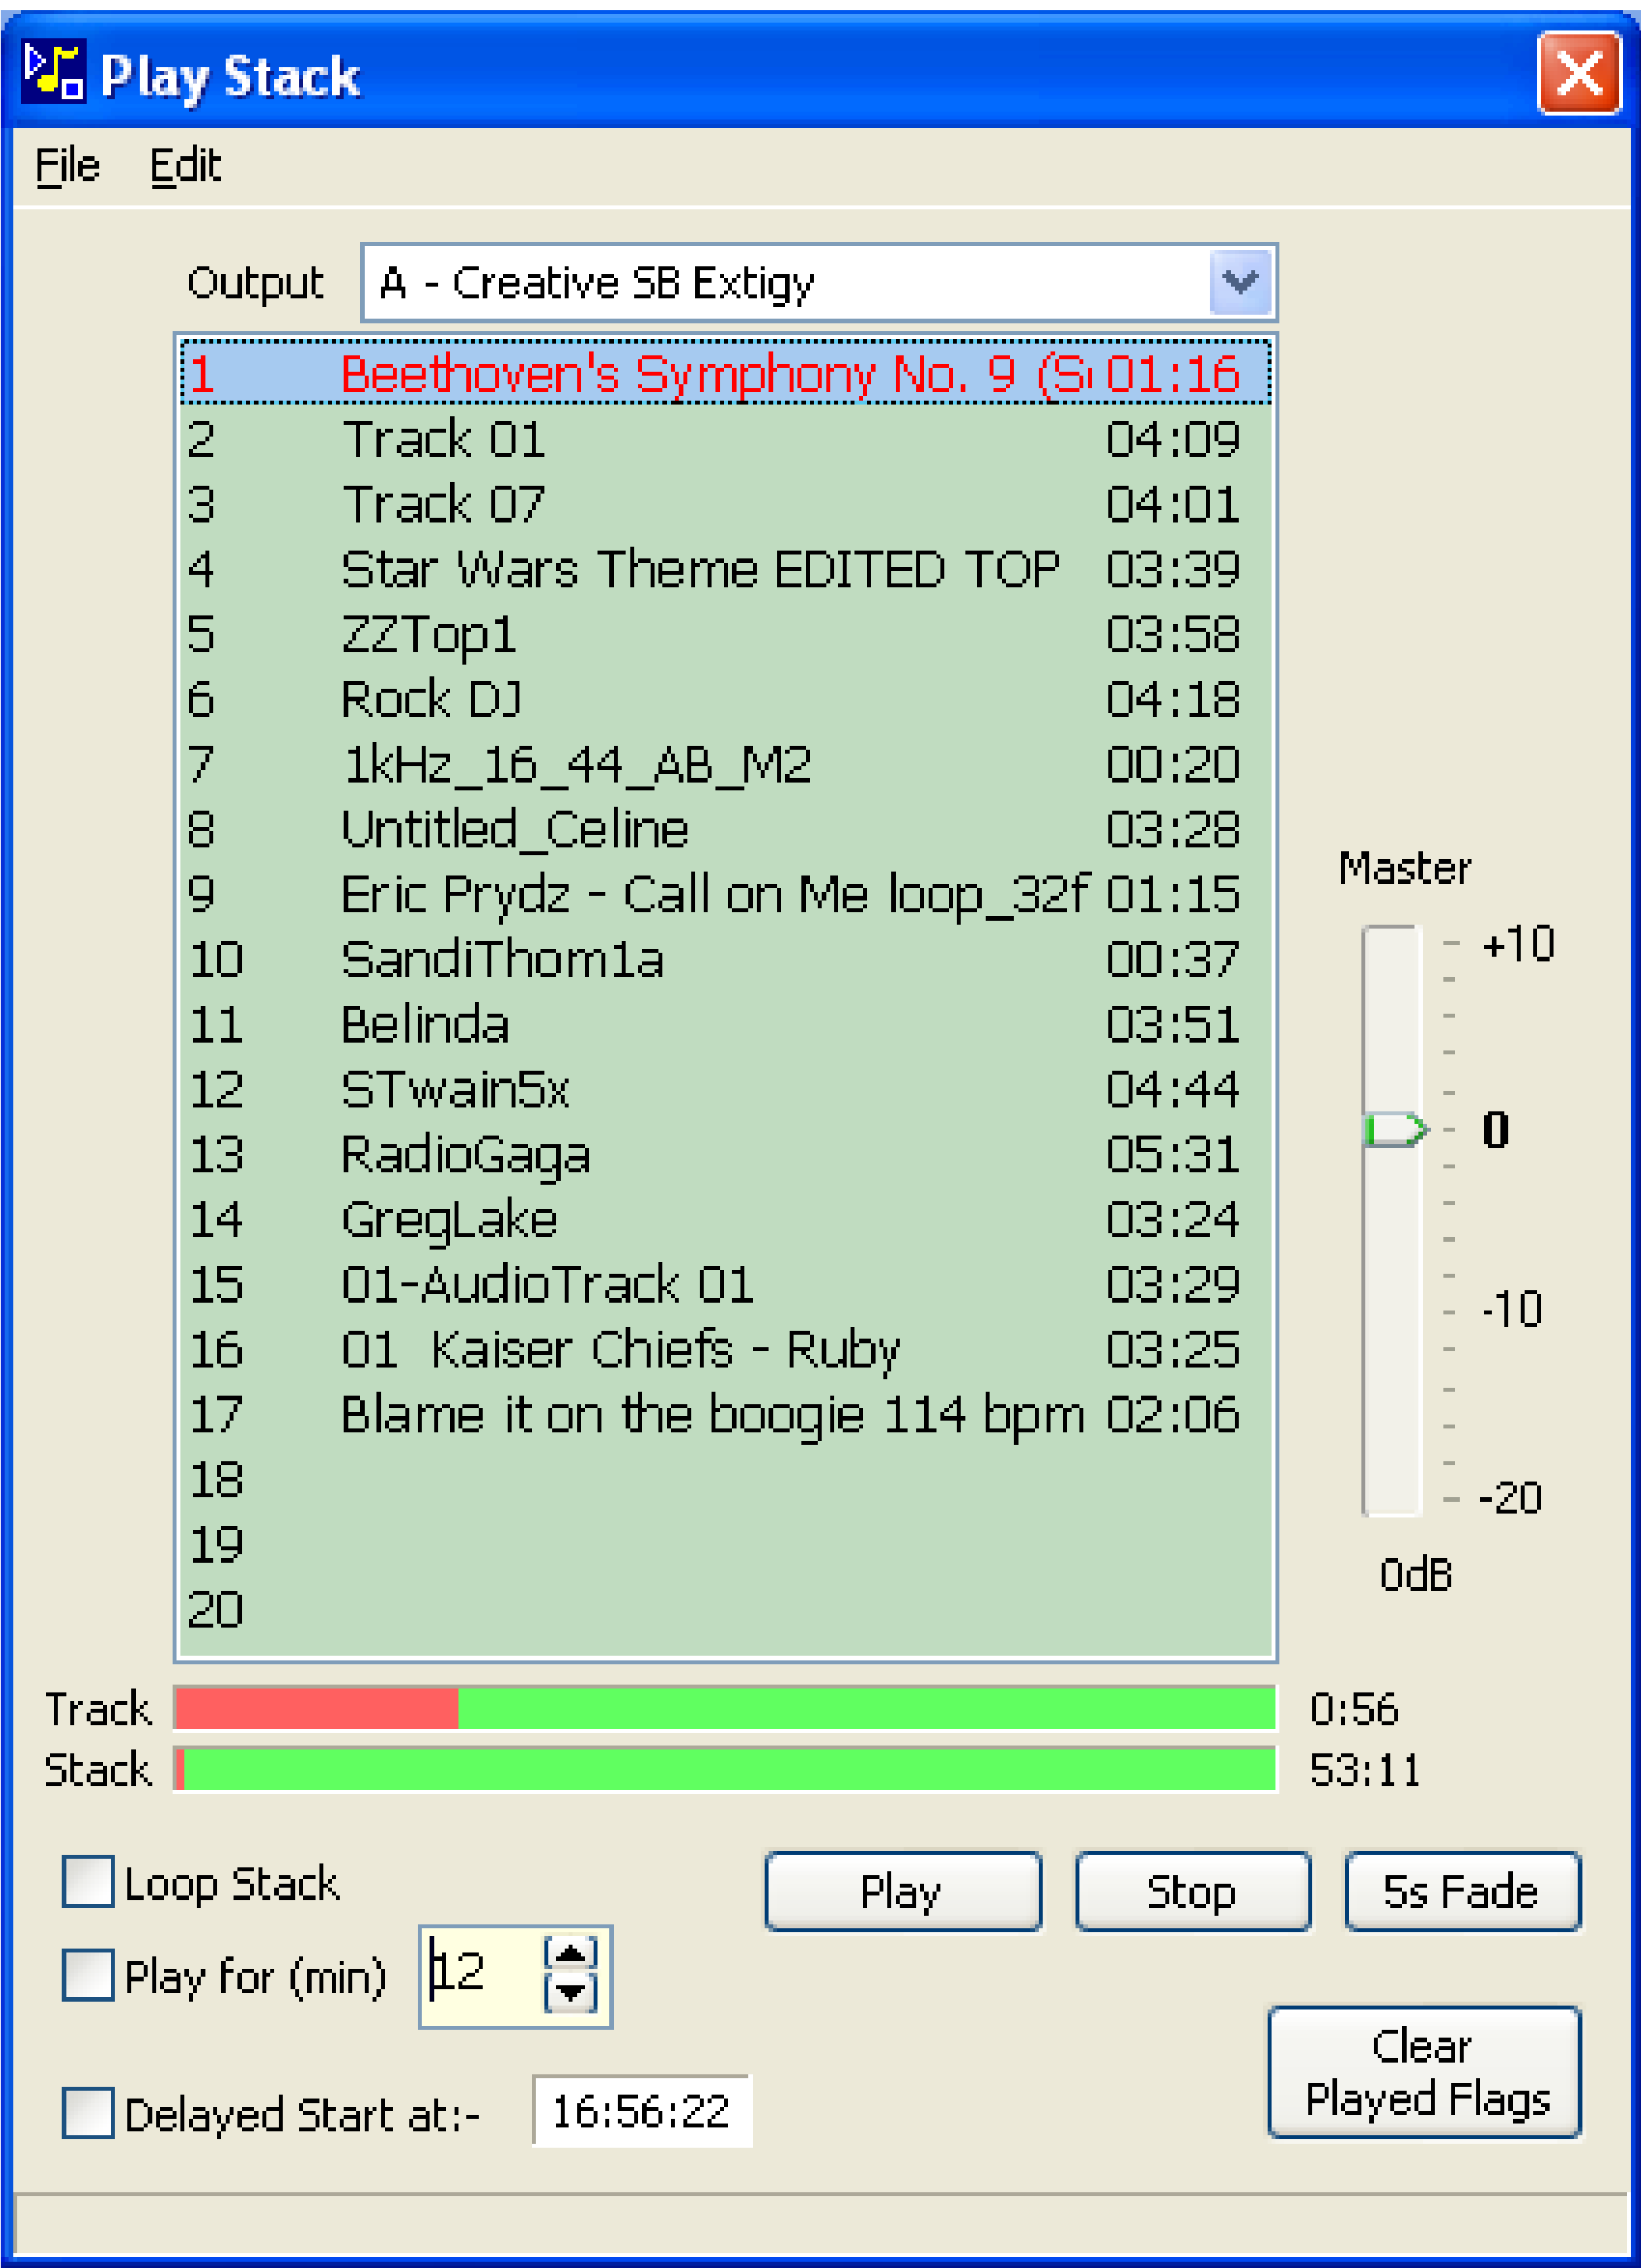

The image above shows 17 tracks loaded and track 1 highlighted, the track names are taken from the audio filenames and truncated to fit the screen, there is no option to change the displayed track name.

Clicking on Play will start playing the stack in sequence from the highlighted button, the two bargraphs below the track list show the time remaining for the track on the upper bargraph

and the time remaining in the whole stack on the lower bargraph.

The track entry will be shown in red text when it is playing.

When the 'Loop Stack' checkbox is checked as shown below, the lower bargraph is disabled as the duration of a looped stack is infinite.

Tracks can be drag and dropped within the stack to change the playout order, in the example below, track 13 is being dragged and when dropped will be inserted above the track shown with yellow text and become track 8. Tracks currently numbered 8..12 will be moved down the stack one position and be renumbered.

1	Beethoven's Symphony No. 9 (S	01:16
2	Track 01	04:09
3	Track 07	04:01
4	Star Wars Theme EDITED TOP	03:39
5	ZZTop1	03:58
6	Rock DJ	04:18
7	1kHz_16_44_AB_M2	00:20
8	Eric Prydz - Call on Me loop_32f	01:15
9	SandiThom1a	00:37
10	Belinda	03:51
11	STwain5x	04:44
12	RadioGaga	05:31
13	Untitled_Celine	03:28
14	GregLake	03:24
15	01-AudioTrack 01	03:29

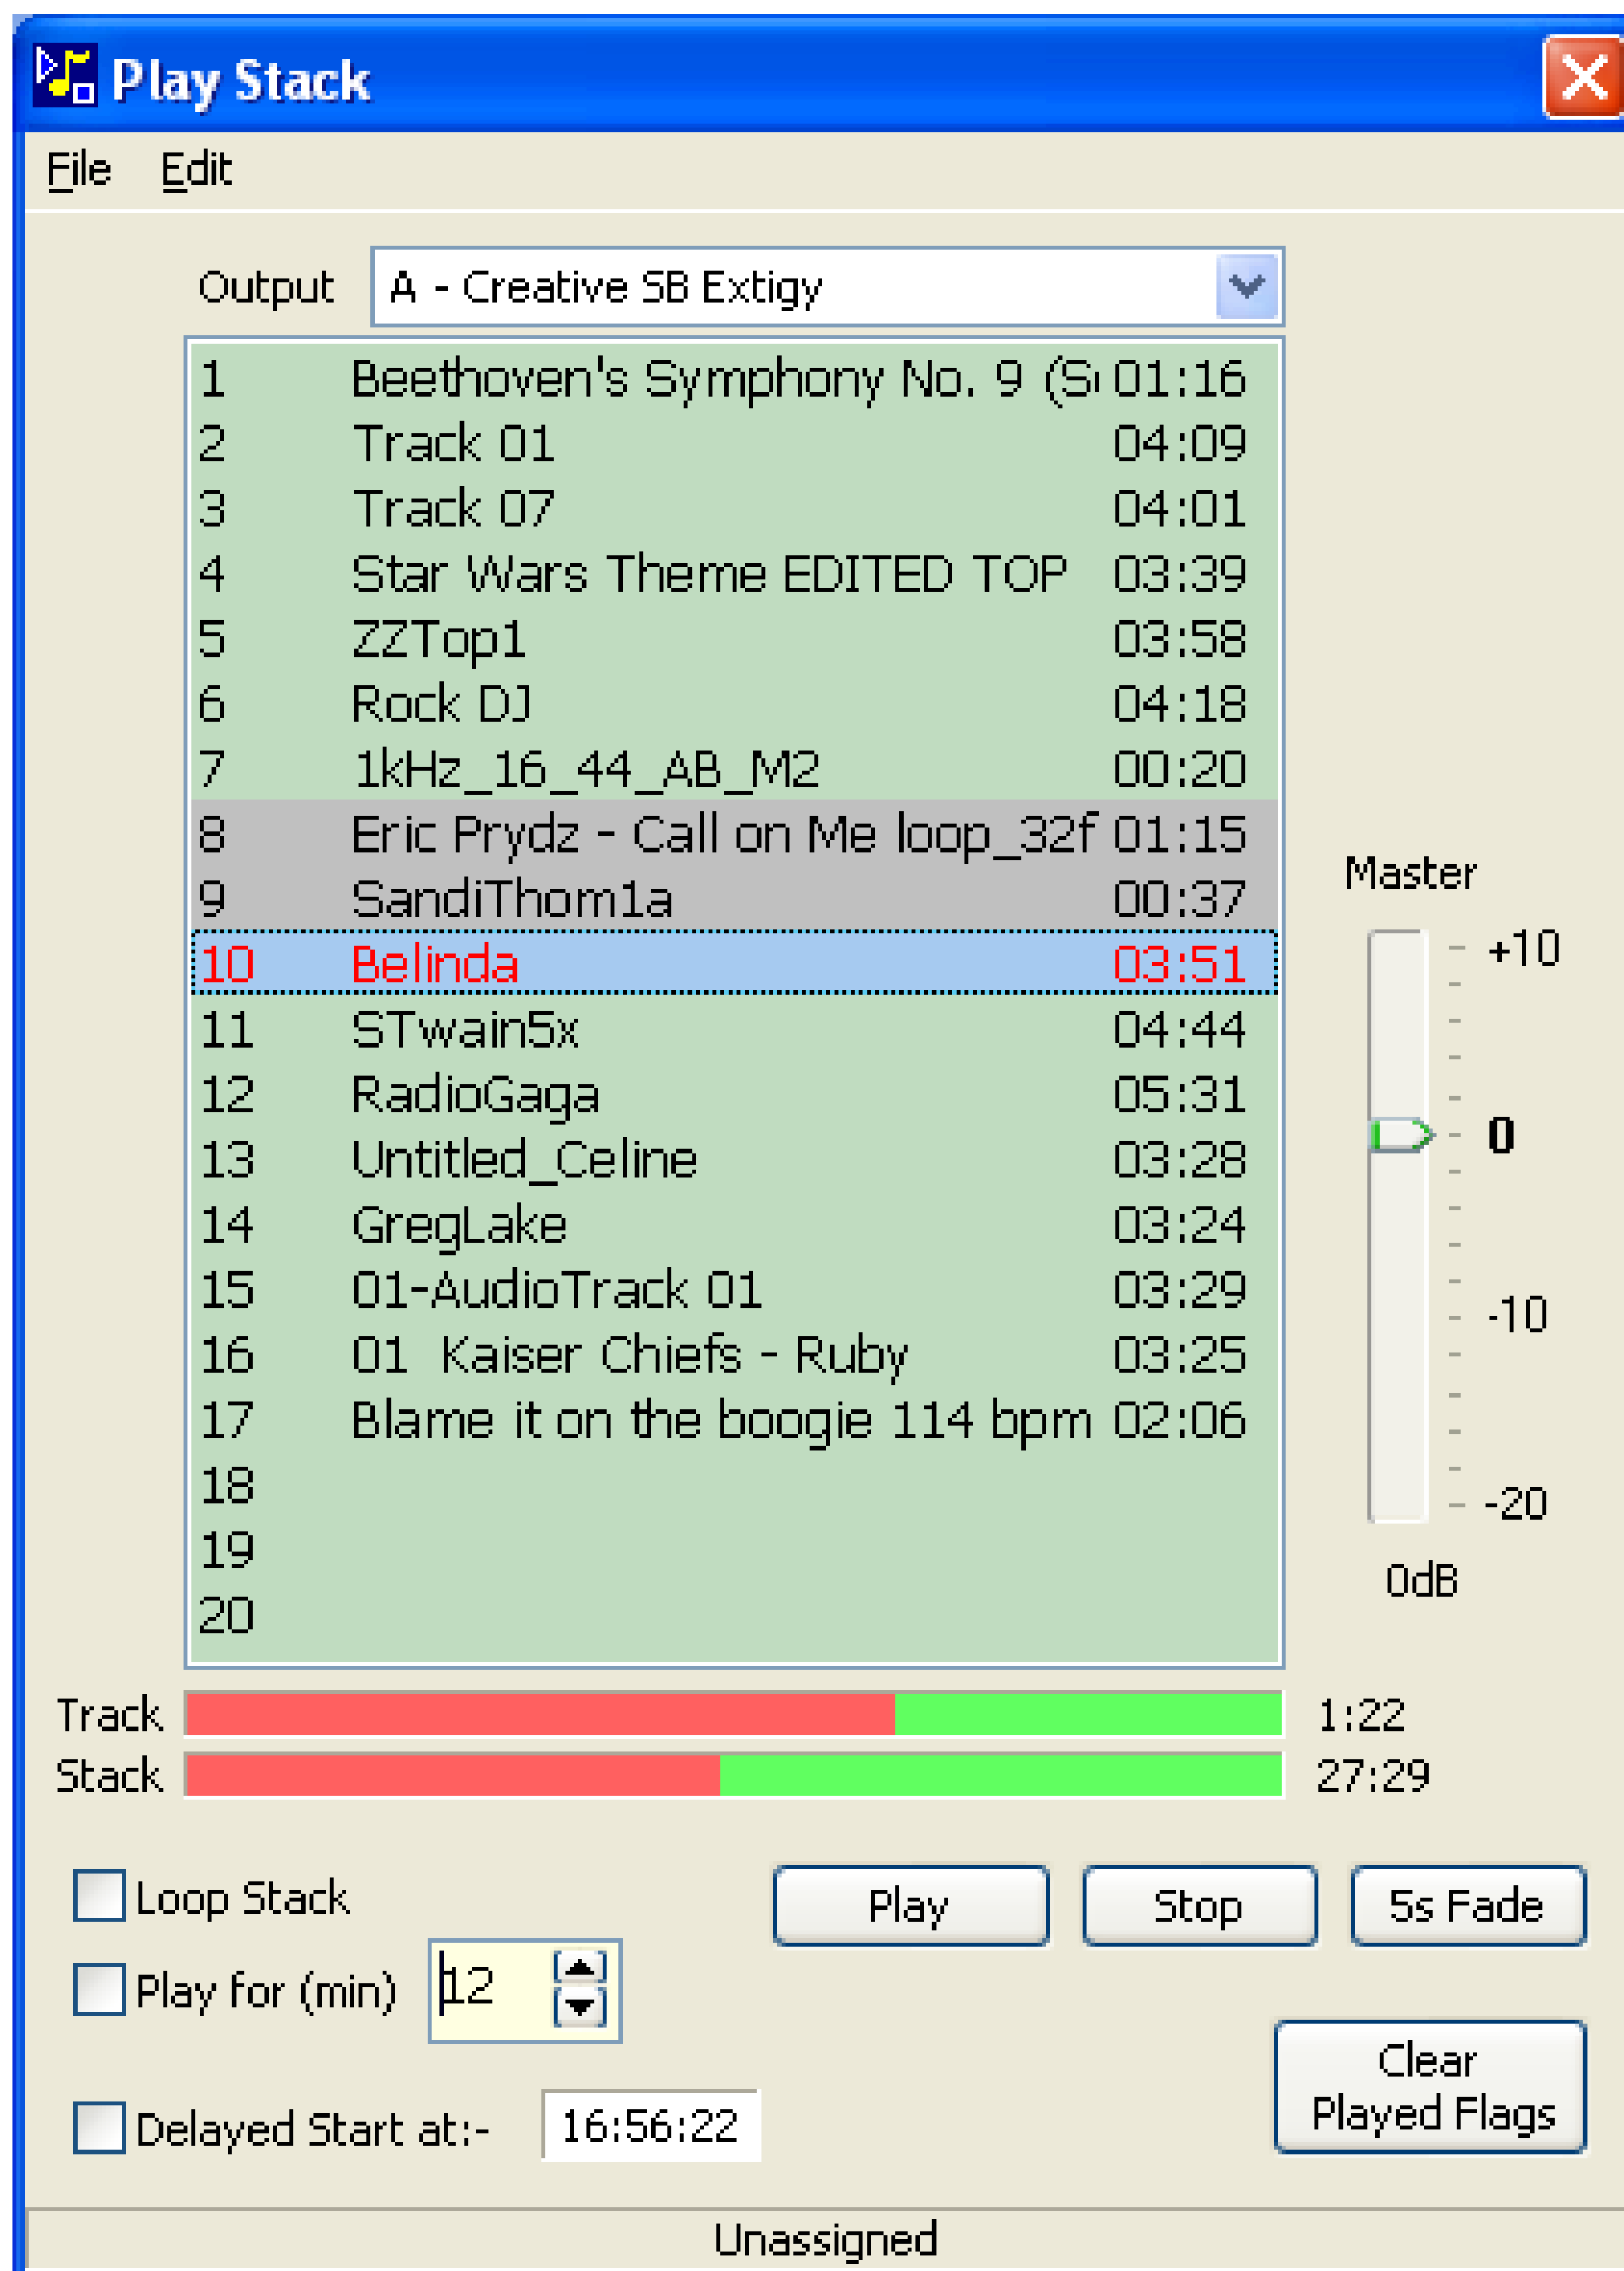

Stack after drag/drop of track 13

1	Beethoven's Symphony No. 9 (S	01:16
2	Track 01	04:09
3	Track 07	04:01
4	Star Wars Theme EDITED TOP	03:39
5	ZZTop1	03:58
6	Rock DJ	04:18
7	1kHz_16_44_AB_M2	00:20
8	Untitled_Celine	03:28
9	Eric Prydz - Call on Me loop_32f	01:15
10	SandiThom1a	00:37
11	Belinda	03:51
12	STwain5x	04:44
13	RadioGaga	05:31
14	GregLake	03:24
15	01-AudioTrack 01	03:29

Tracks in the stack can be freely rearranged whilst the stack is playing, the only restriction is not to remove the track currently playing.

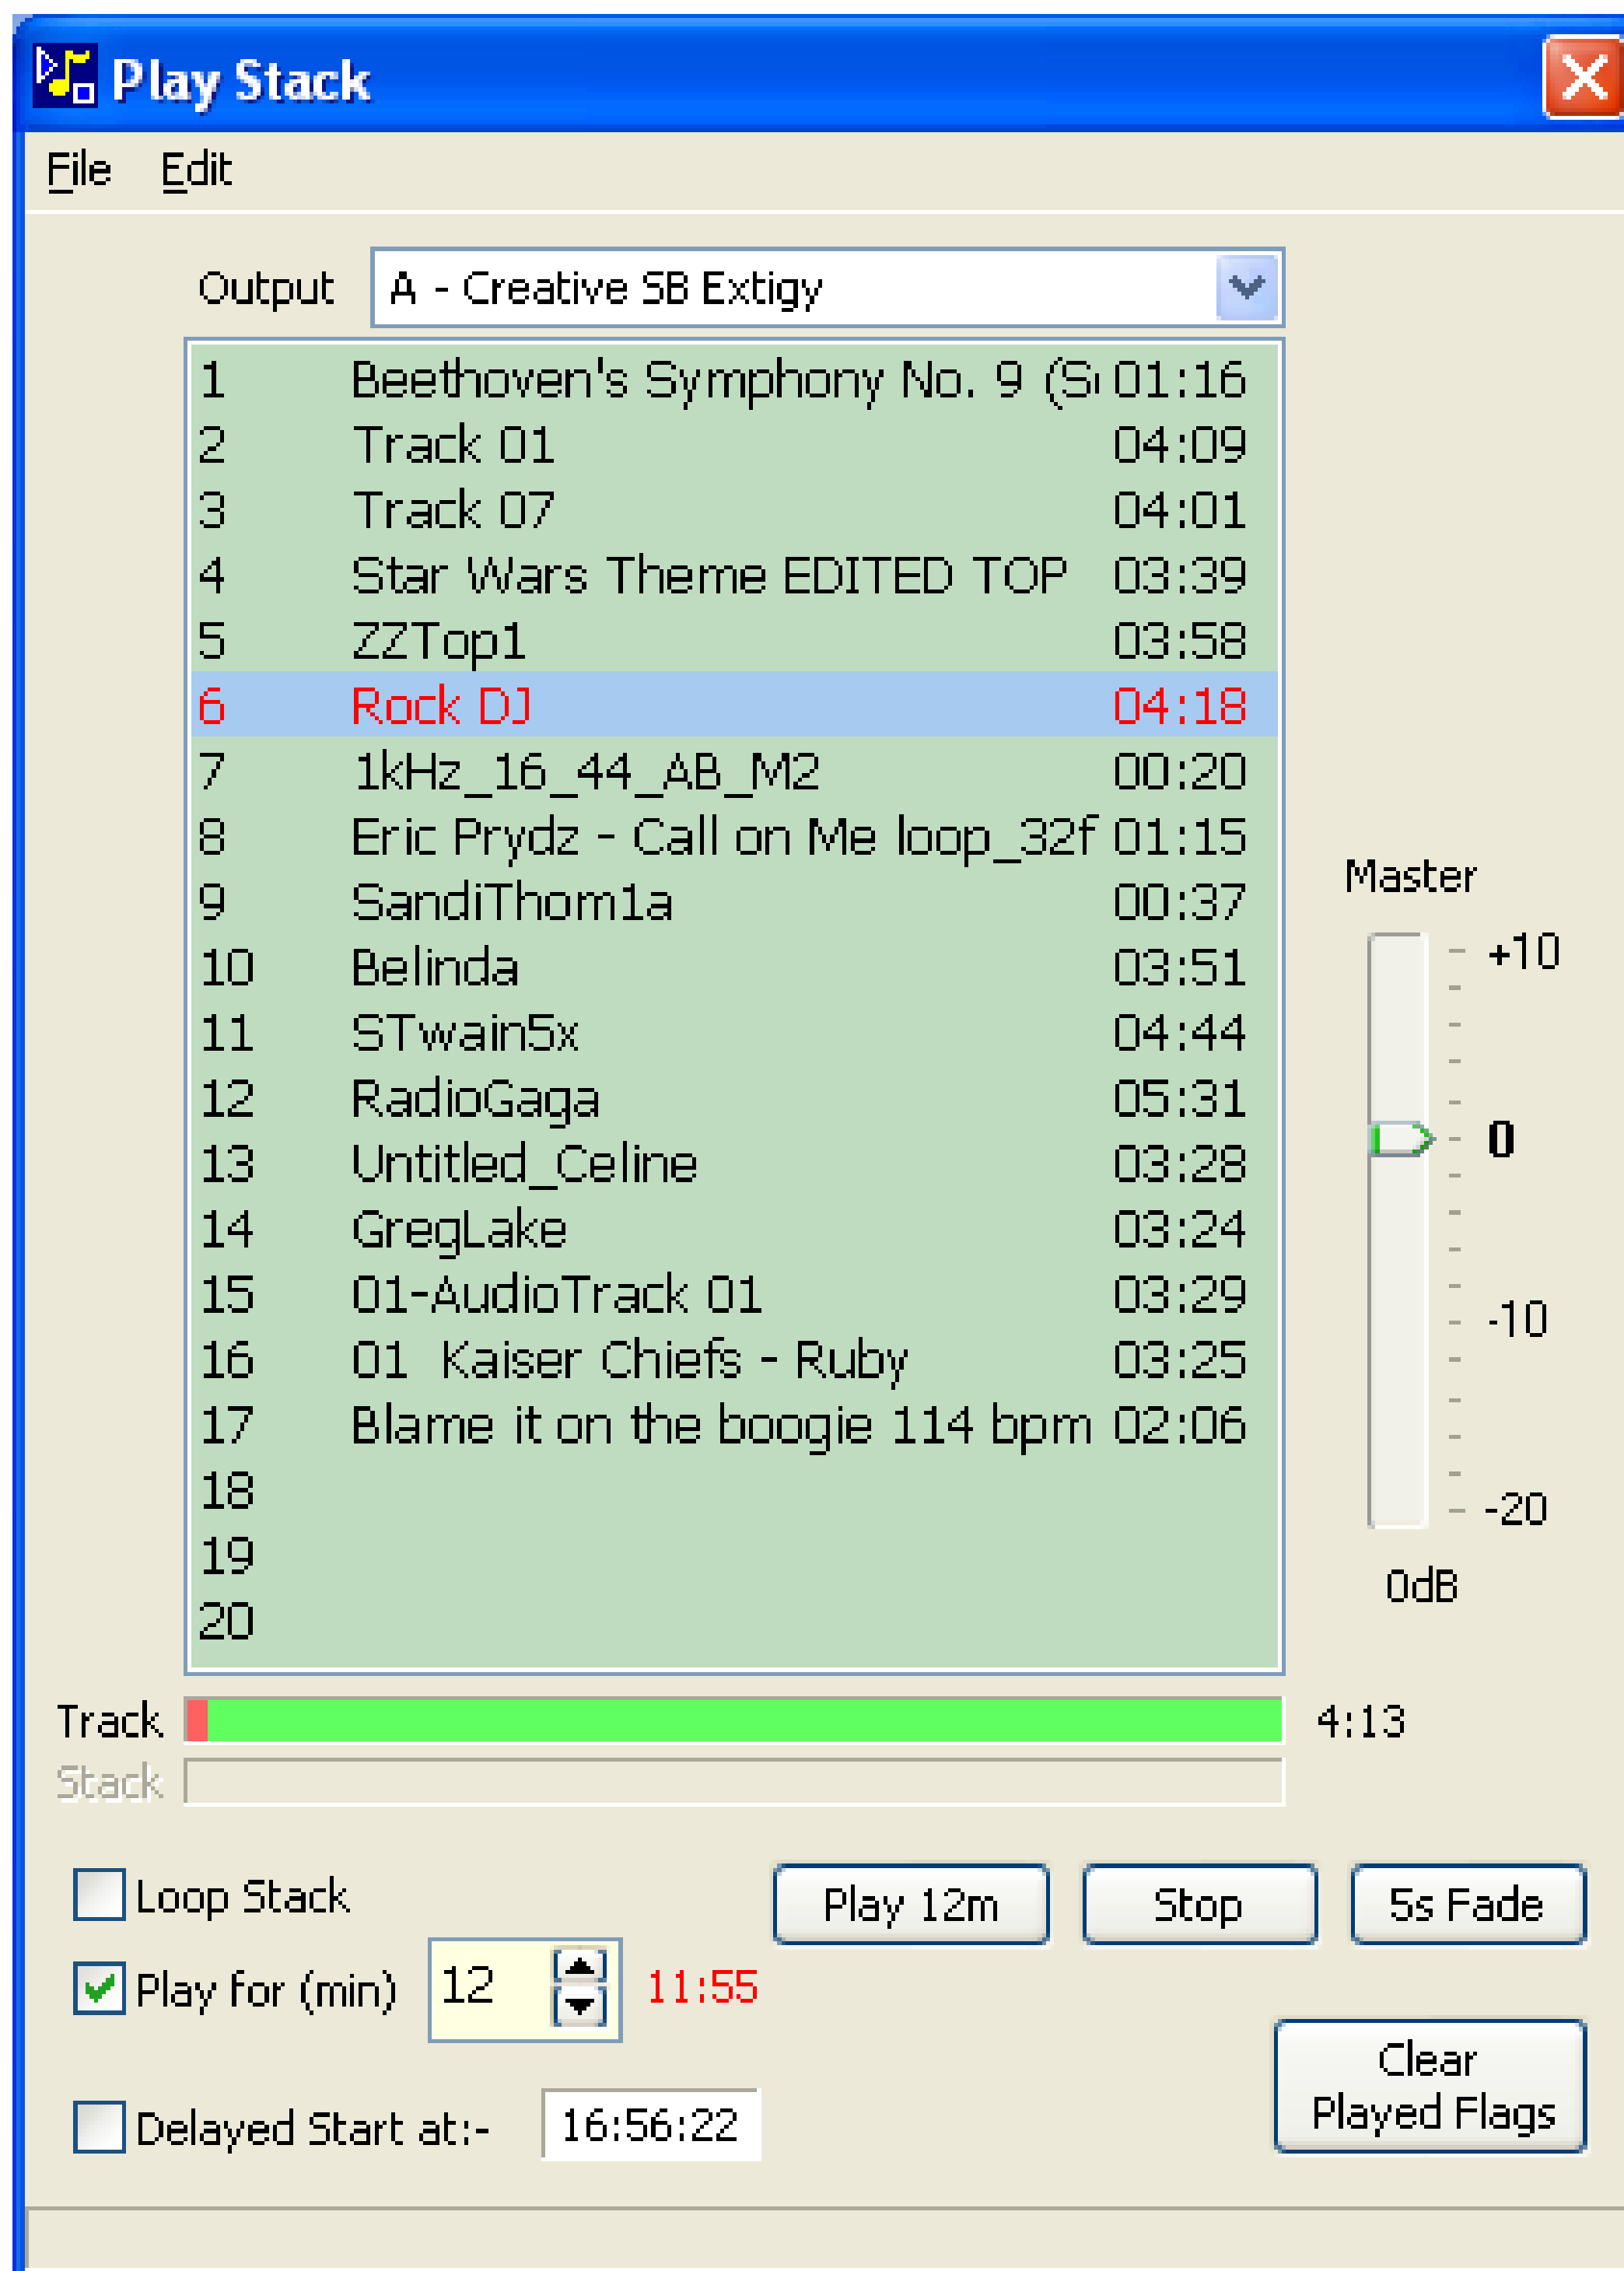

An internal flag is set as tracks are played out and the text background of the played track changes to grey, this is only an indication of the track already played and has no effect on the operation of the Play Stack.

The flags can be cleared by clicking on the 'Clear Played Flags' button

The Play Stack can be set to play for a defined length of time in the range 1..90 minutes, at the end of the time the track will fade out and stop.

This mode is set by checking the 'Play for (min)' checkbox and entering a value in the duration by typing directly or using the up/down buttons.

When the Play button is pressed a time remaining count down is shown in red text to the right of the duration.

The Stack Play button can be triggered from the PC clock.

Right-clicking on the time panel displays an editor dialog

When active the start time text will be shown in red, at the point the start time is reached the stack will begin to play and the text will be shown as invalid and the checkbox cleared.

When the Play Stack window is closed it will remain active and has just been hidden, it can be reopened via the SpotOn Global|Play Stack menu.

If the Play Stack is playing a track and is then closed the track will continue to play and the SpotOn status bar will show a red/yellow flashing panel with the text 'Play Stack'

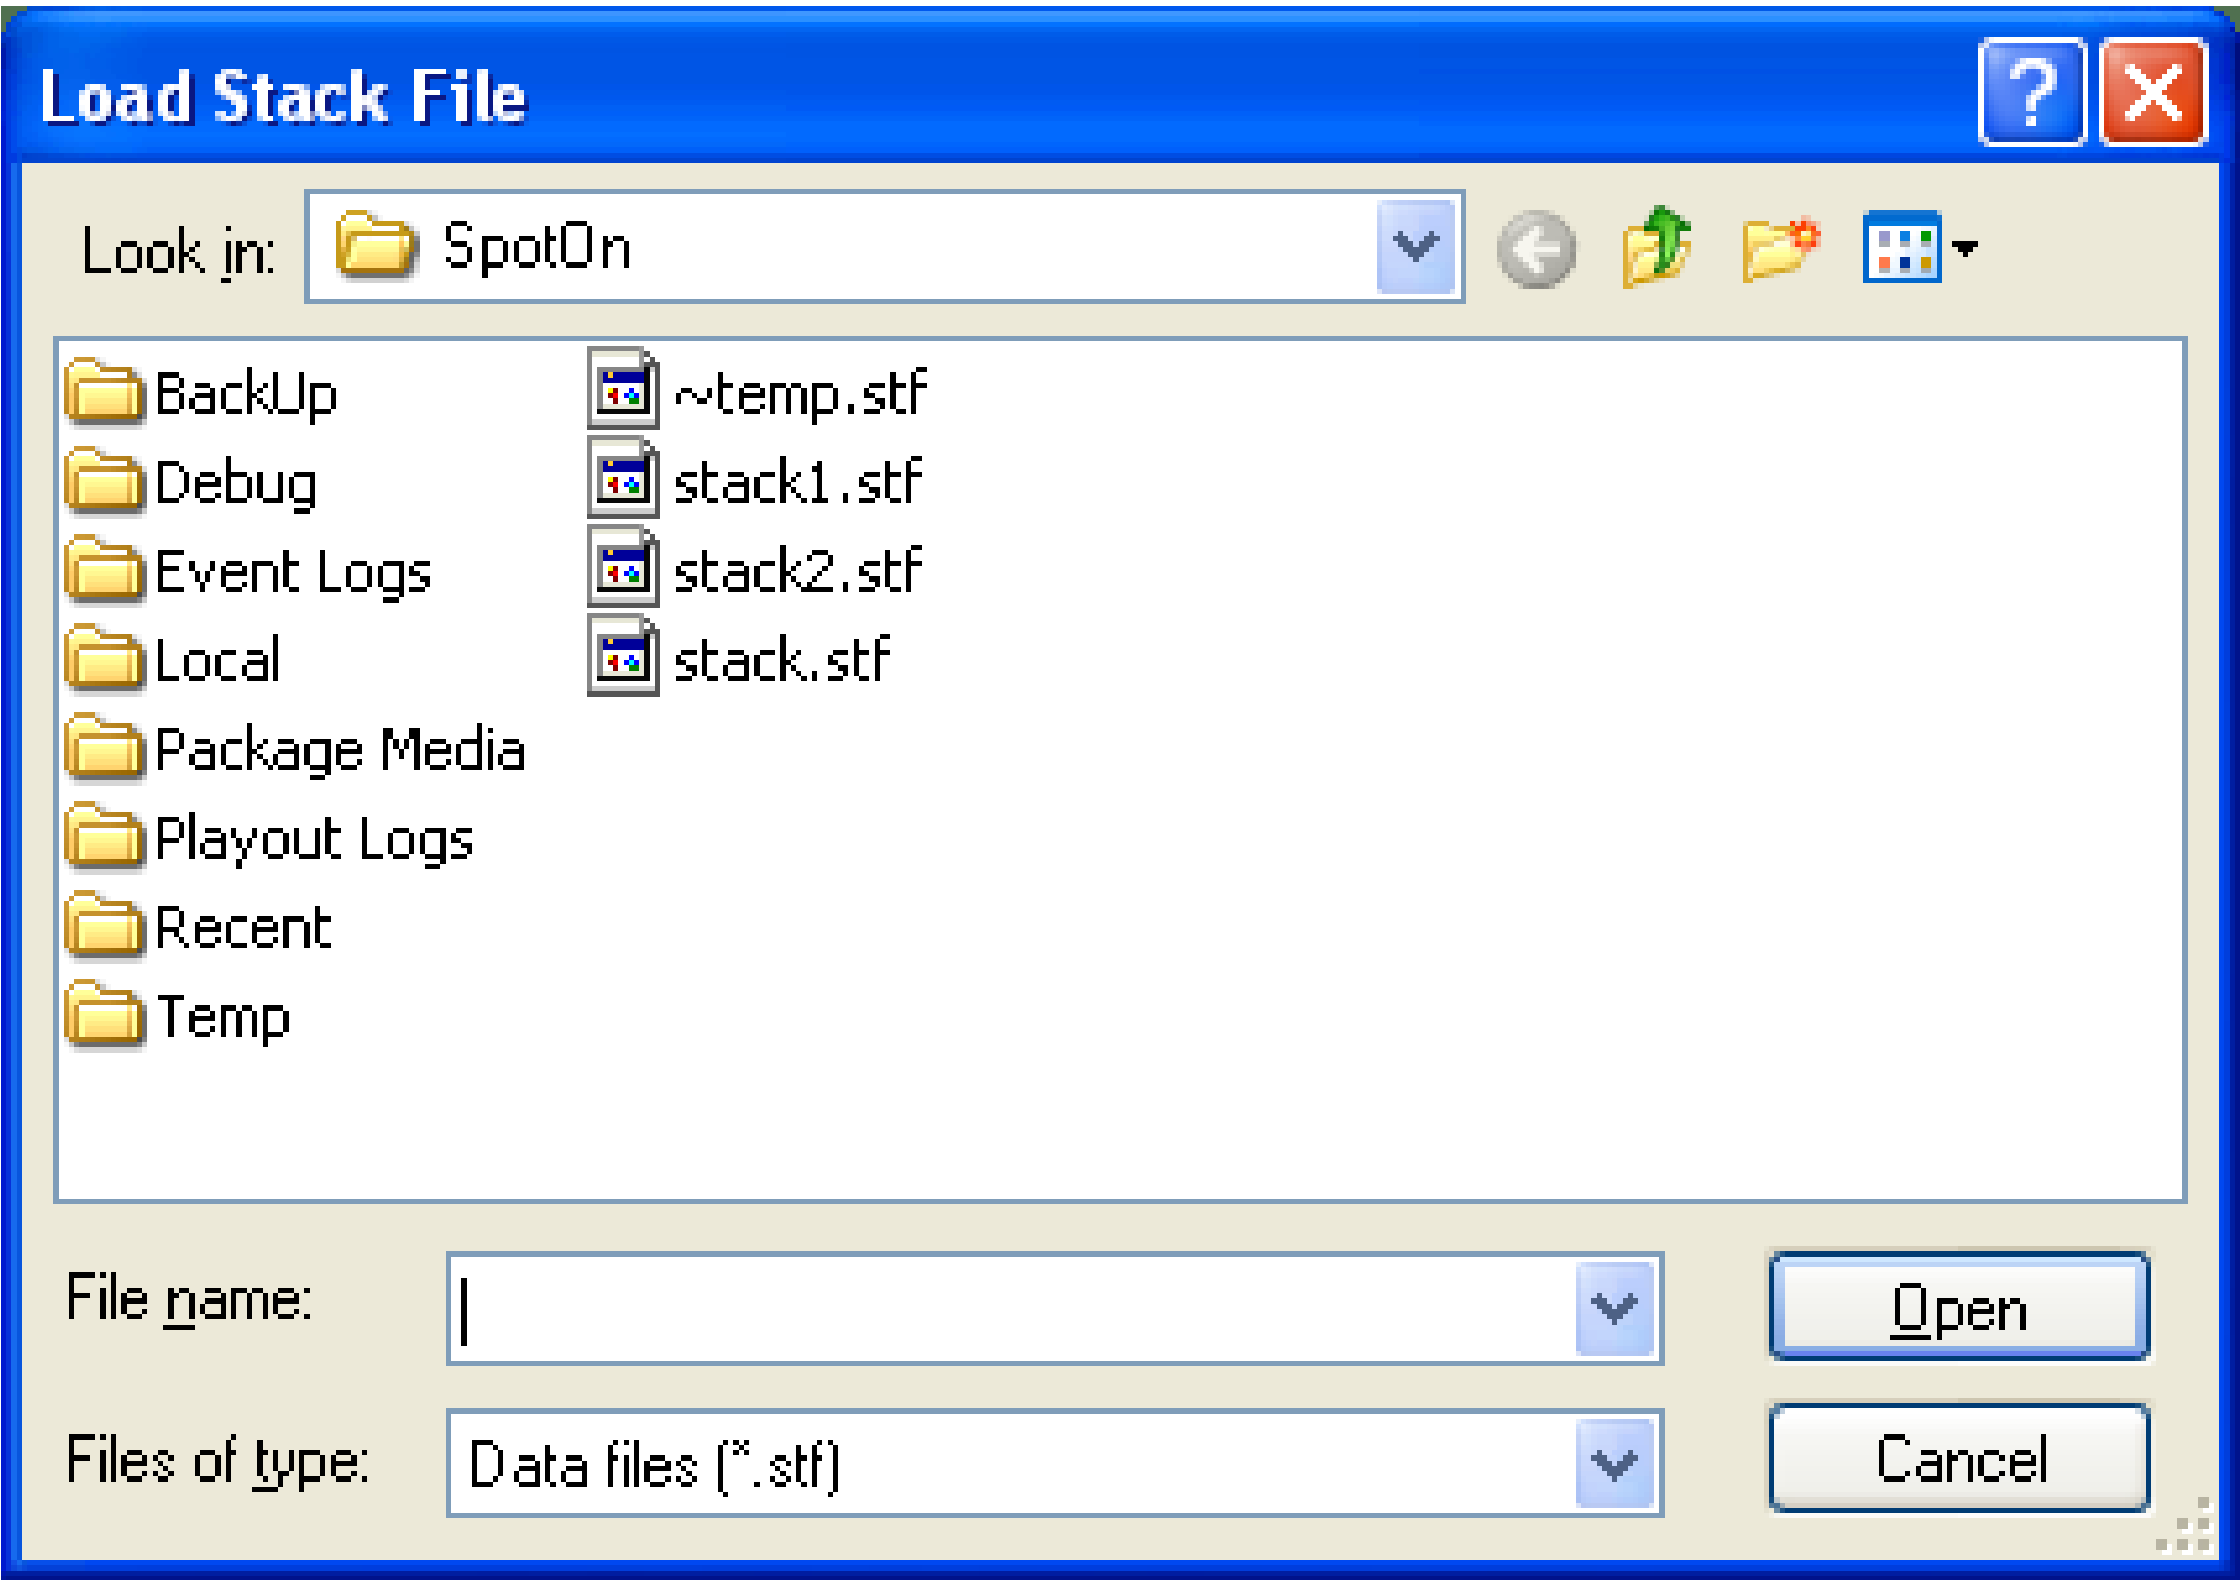

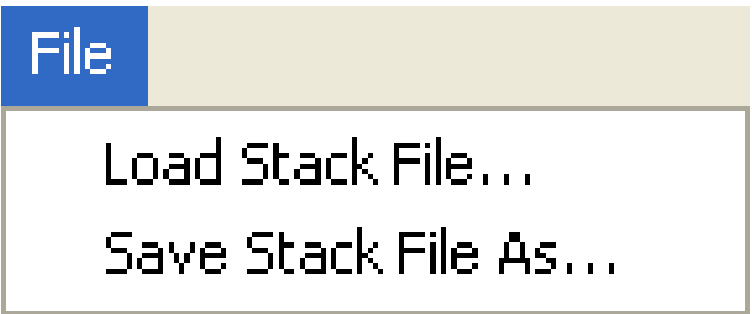

Clicking on the flashing status bar panel will reopen the Play Stack window

Playing a button in the main SpotOn window that is assigned toGroup 24 will trigger a fade out of any Play Stack track currently playing.

Menus

The File menu allows basic loading and saving of the Play Stack tracks and configuration, only the track filenames are saved and the Play Stack relies on the audio files staying in the same location on the local disc drives.

Menus - File

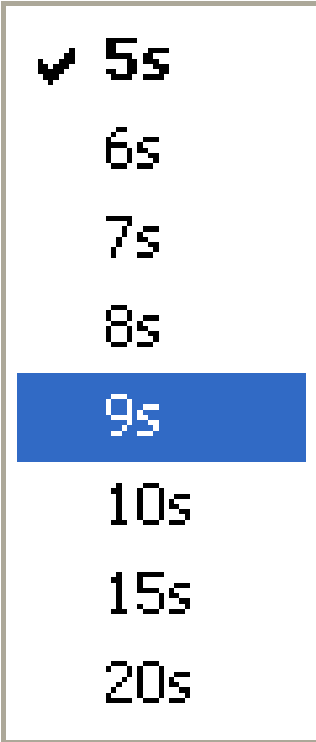

The Play Stack files are saved with the .stf file extension which may be associated with other programs, the only effect of this is that the icons shown along side the files will be different.

Menus - Edit

The Edit menu gives 32 levels of Undo/Redo and two options that act on all tracks

Fade Out will set the fade out time to any of the values shown below, this fade time is used at the end of a 'Play for' time or whenever the 'xs Fade' button is clicked and applies to all tracks.

If the fade out is in progress the Fade Out button text will change colour to red and count down to the end of the fade time.

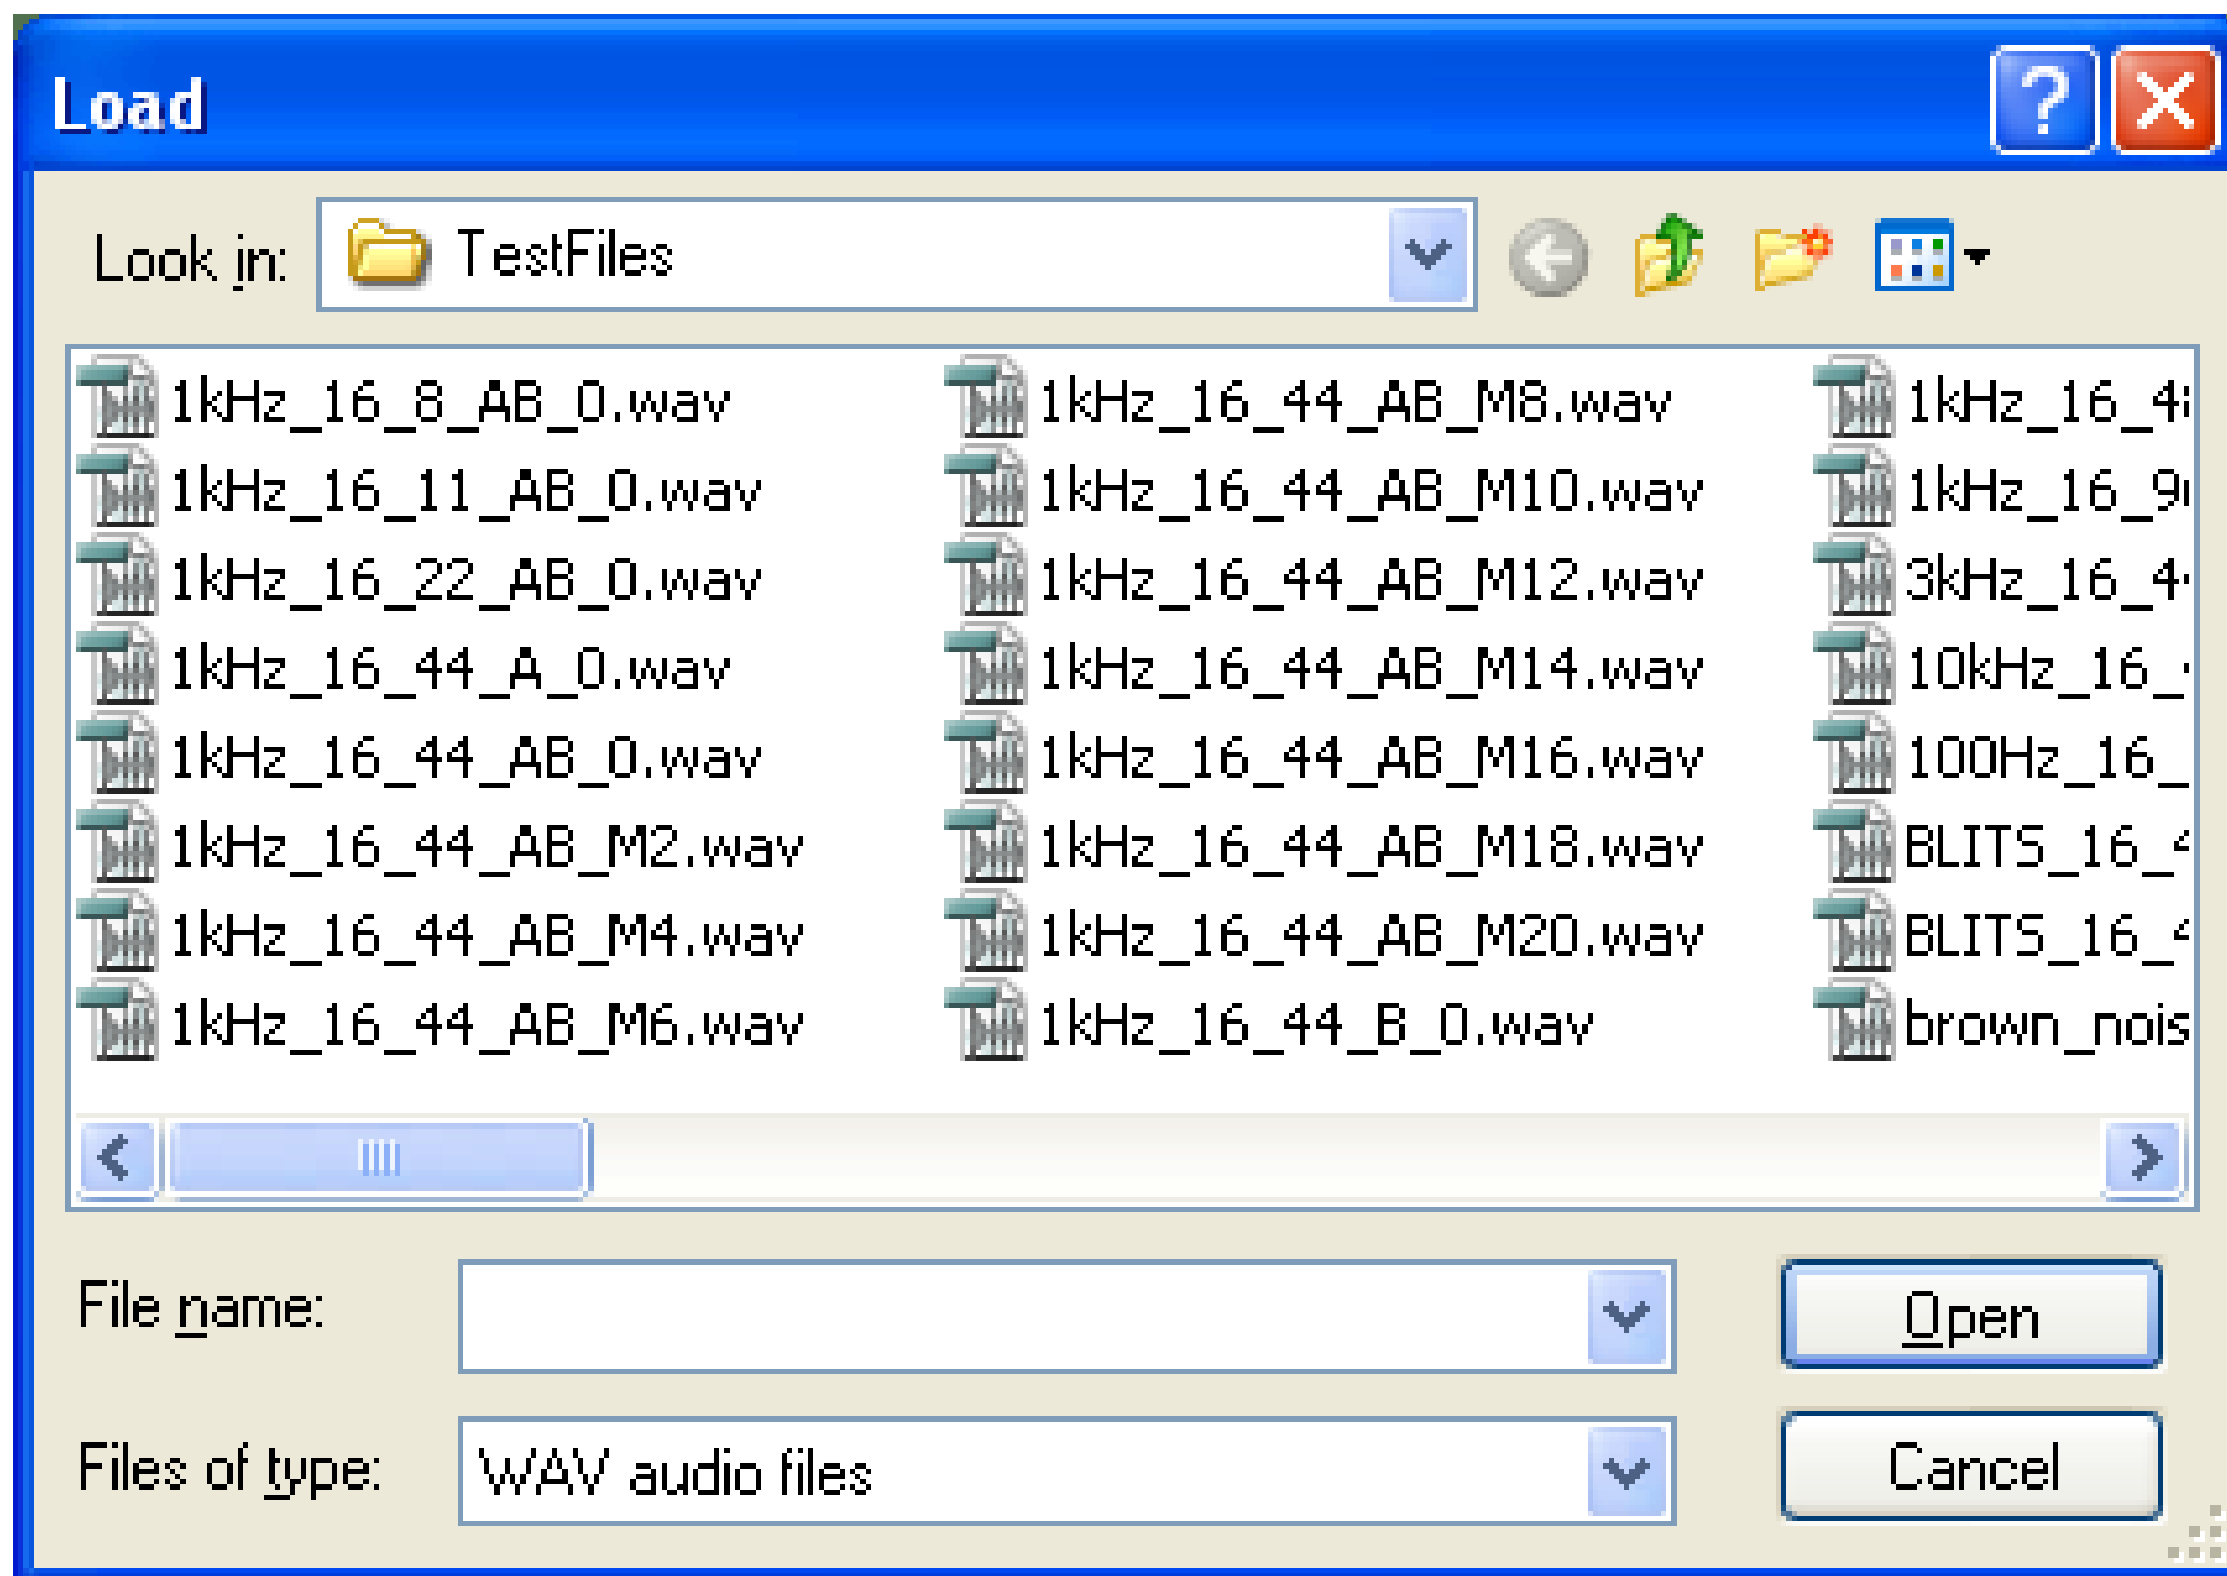

The 'Clear All Tracks' option will remove all tracks from the stack.

Menus- Track

The right-click menu on the tracks allows changes to be made to the individual entry.

Right-clicking on a blank track offers the load option.

Play Stack uses the same default folder locations as SpotOn, however only *.WAV files can be loaded.

Right-clicking on an existing track will offer more options.

Insert will load an new track immediately above the highlighted track.

Remove Track deletes the track from the list and moves the remaining tracks to fill the gap.

Play Delay sets a pause before the track starts to play, this can be set on an individual track or globally using Play Delay for all Tracks

✓ zero

1s

2s

3s

4s

5s

6s

7s

8s

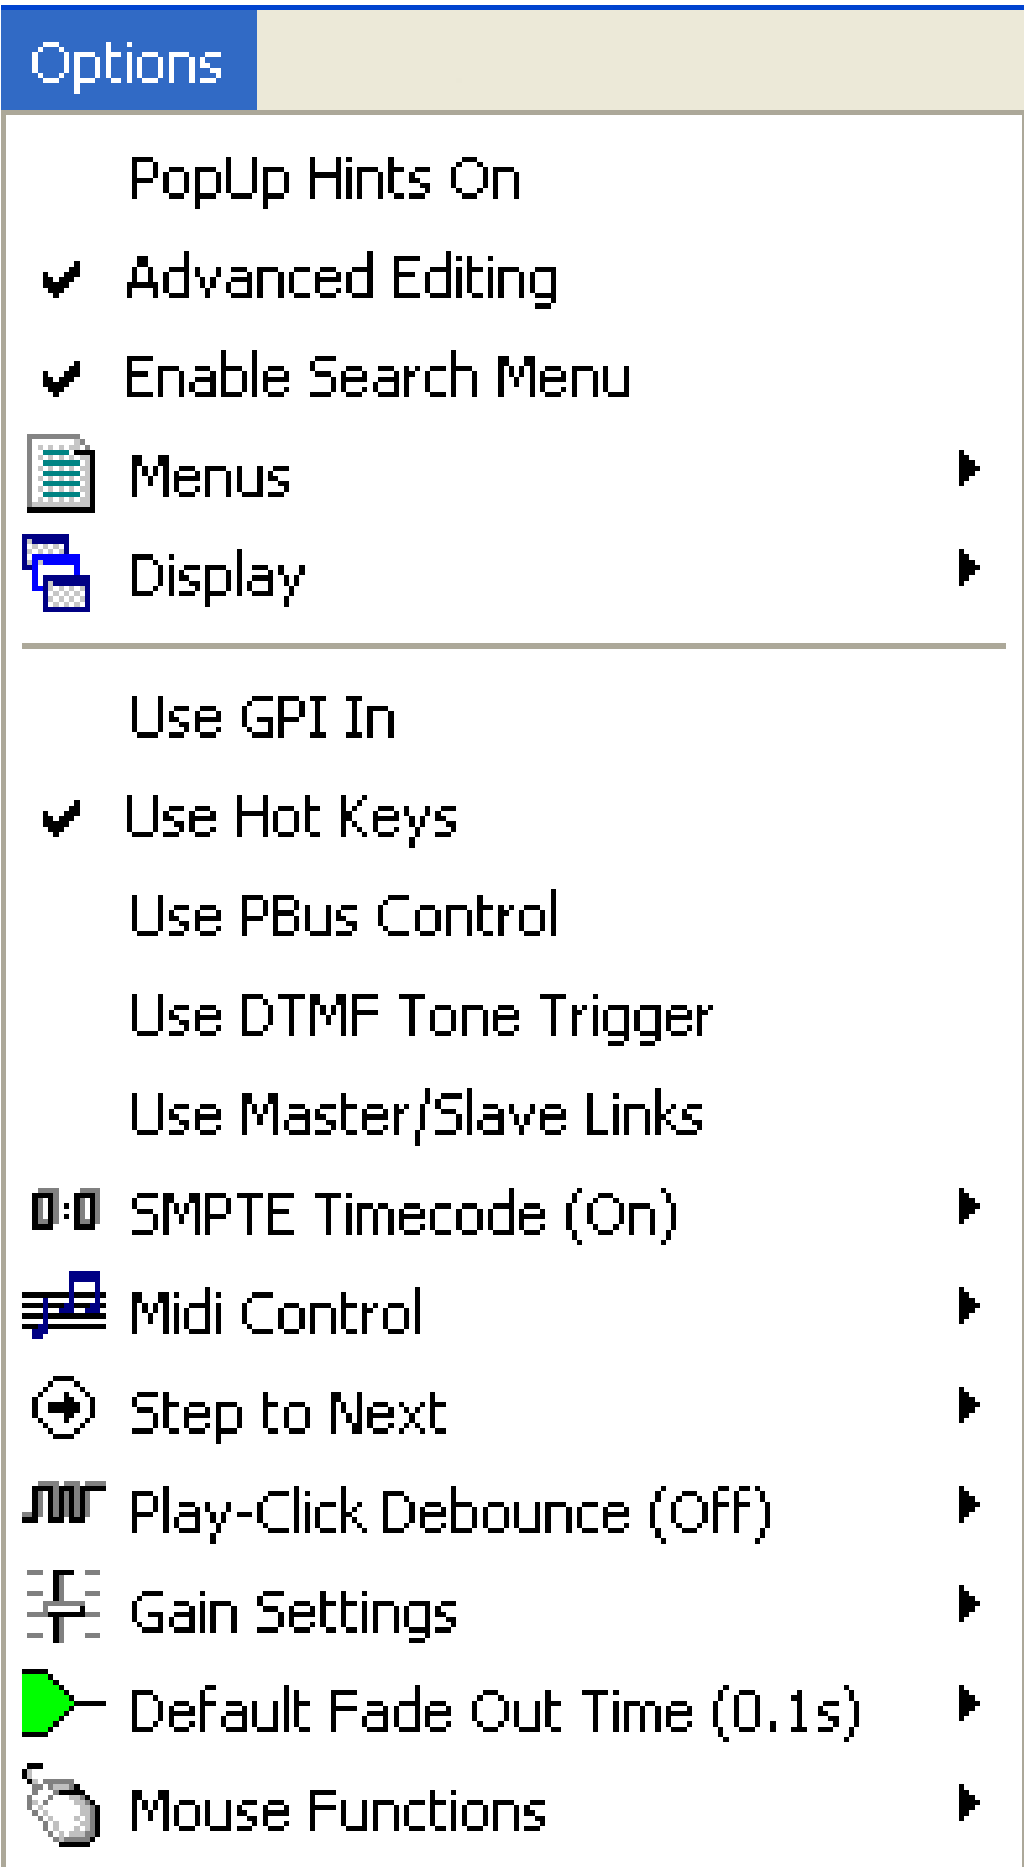

9s

If track 6 was set to have a Play delay of 7sec the entry in the list would show 'd7'

4	Star Wars Theme EDITED TOP	03:39
5	ZZTop1	03:58
6	d7 Rock DJ	04:18
7	1kHz_16_44_AB_M2	00:20
8	Untitled_Celine	03:28
9	Eric Prydz - Call on Me loop_32f	01:15

The Delay counts down when the track is played.

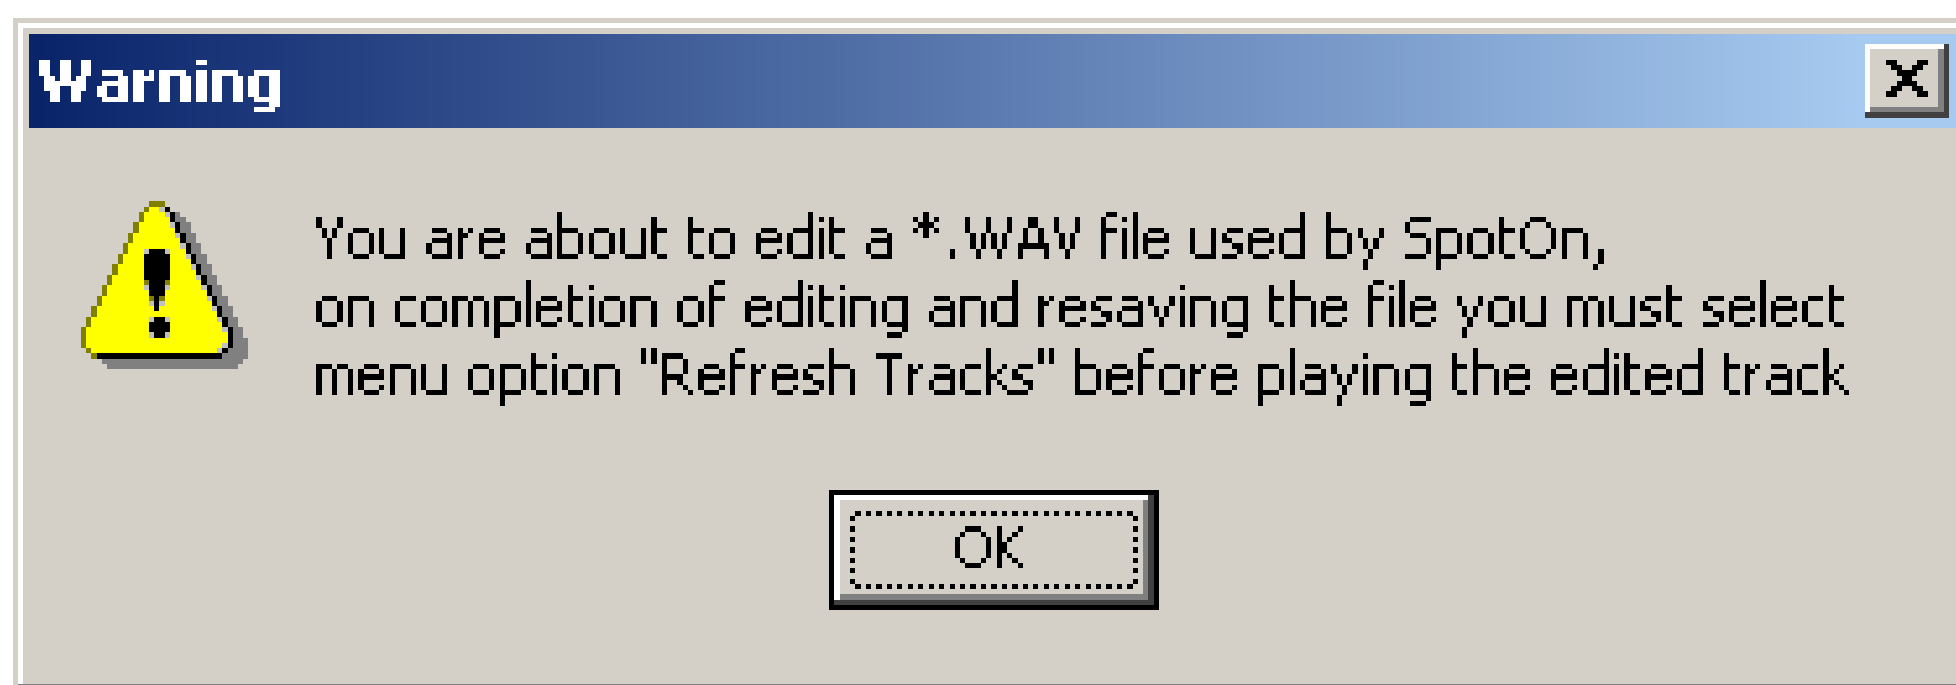

Options Menu

PopUp Hints On	toggle popup hint on/off
Advanced Editing	allow editing of loaded WAV files
Enable Search Menu	enables Search menu item on main menu bar
Menus	set main and popup menu options
Display	general display options
Use GPI In	enable GPIs from game port
Use Hot Keys	show button hot keys
Use PBus Control	enable remote control of SpotOn via a PBus serial link
Use DTMF Tone Trigger	enable triggering from external DTMF tones
Use Master/Slave Links	enable master/slave links
SMPTE Timecode	enable int/ext SMPTE LTC timecode to trigger buttons directly and via GPIs
Midi Control	Midi enabling options
Step to Next	enable juke box mode
Play-Click Debounce	use hold off time between touchscreen presses
Gain Settings	set overall gain offset and fade in/out depth
Default Fade Out Time	set fade on all subsequently loaded tracks
Mouse Functions	change function of mouse buttons

Advanced Editing

When this item is checked it allows the user to edit the audio data file being used by SpotOn, a warning message box is shown prior to any editing operation reminding the user that this mode is active.

Menus

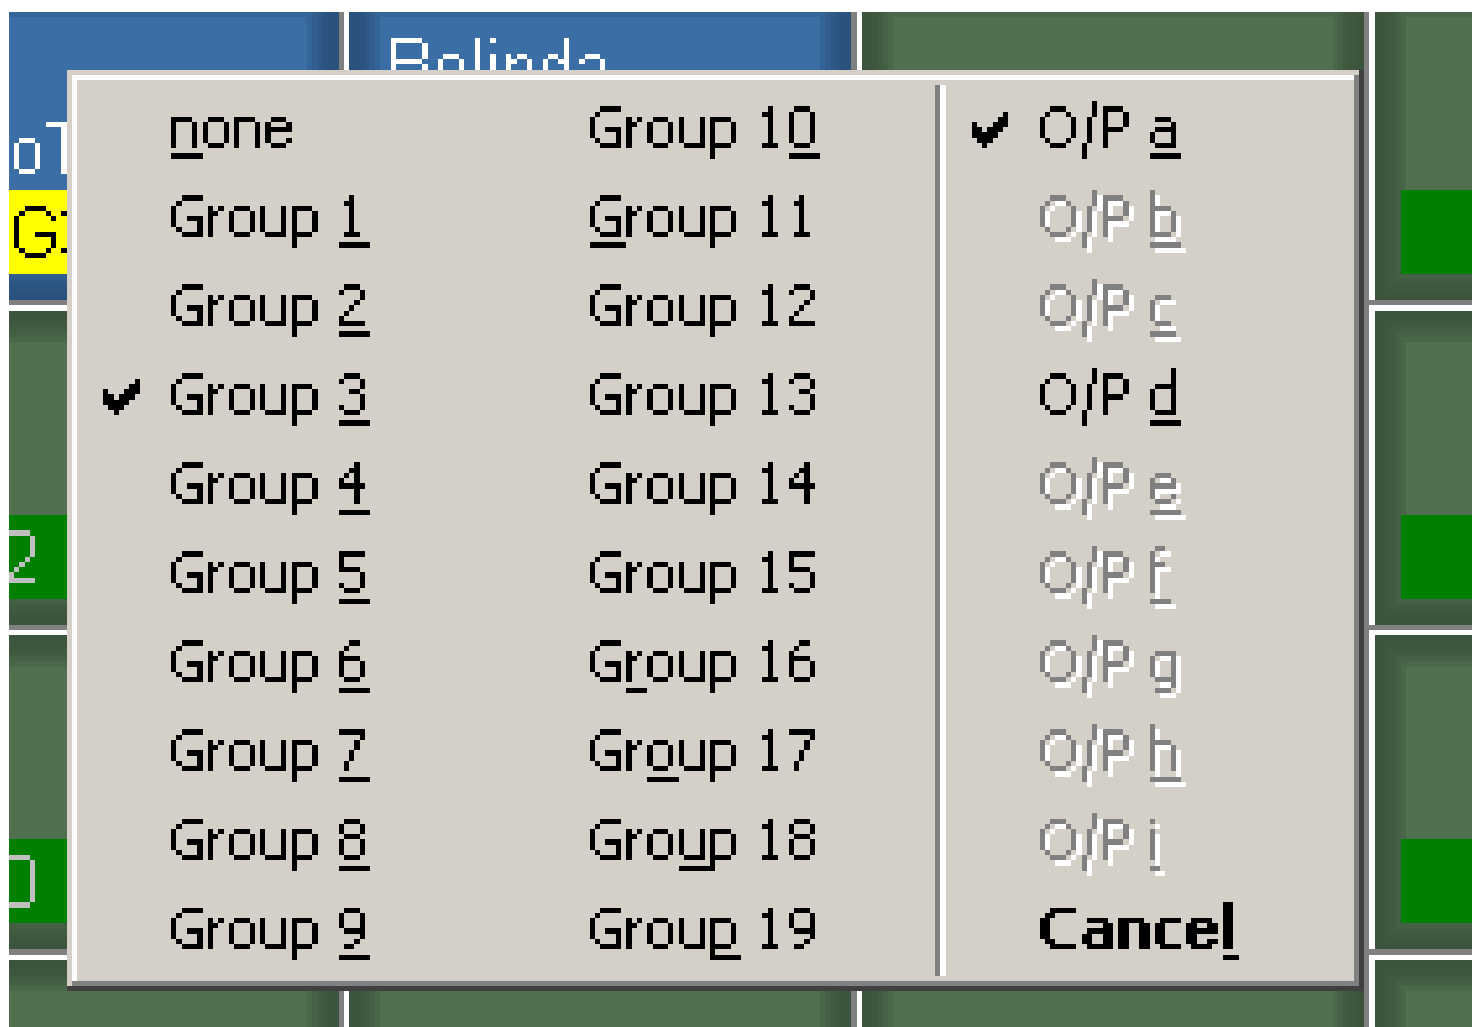

Menu Icons will toggle menu graphical icons on/off

The Group/Output selection option changes the format of the button popup menu when a button is shift+ctrl right-clicked, with the option unchecked the full range of Group assignment is available.

With the item checked only Groups 1..19 are available for selection but in addition the output device can now be assigned to any of the first nine output devices.

Start Maximised	on start up display is maximised to full screen, only when loading Blank Session
Start with Blank Session	SpotOn starts without loading previous session
Start with 'New' Session	SpotOn loads a default template session
Auto Show Session Notes	show notes window on opening sessions
Bring to Front with Scroll Lock	bring main window into focus whenever Scroll Lock is pressed
Individual Button Fonts	allows Trackname font to be set separately for each button
Use Friendly Output Names	use names defined in Output Device Assign
Button Images	allows bitmap images to be shown on buttons
Disable Button Text	removes all text from all buttons allowing button images to be seen in full
Highlight Buttons Playing	draws flashing corners on the buttons that are playing
AutoLoad Button Images	automatically loads button images associated with audio files
Show Tracks Already Played	indicate tracks that have been played in this session
Reset Tracks Played	clear Tracks Played indications (Ctrl+U)

Display - Start with Blank Session

Instead of loading a temporary file on start up to restore the state of the program to be the same as when it was last shut down, this option when checked loads a blank session file.

Display - Bring to Front with Scroll Lock

Hotkeys will only trigger SpotOn buttons when SpotOn is the active application, for instance if Adobe Audition is being used and the SpotOn hotkey "F1" is pressed the key press will be handled by Audition and not SpotOn.

In order to ensure that SpotOn is the active application before using hotkeys the Scroll Lock key can be used to make SpotOn active.

It is recommended that a double press of Scroll Lock is used so that the Scroll Lock state is left unchanged, very few applications make use of the Scroll Lock state but some unusual behaviour may be noticed when navigating spreadsheets if Scroll Lock is on.

Display - Individual Button Fonts

With the Individual Button Fonts option checked the font used to display the Trackname on each button can be changed independently.

Display - Button Images

Normally a button consists of a flat or shaded edge plain colour background with text and symbols drawn on top

Images can also be used as the button background

The images are enabled by this menu option and the specific image is allocated to the

button via the button right-click Display properties dialog.

Highlight Buttons Playing

In addition to the flashing button number the corners of the button can flash in sync with the button number.

Show Tracks Already Played

With this option checked the colours of the buttons played will be set to black, so indicating those tracks already used. The button colours can be restored by using the Reset Tracks Played option or the Ctrl+U keyboard shortcut.

Segment of screen before any track is played

Same segment after playing buttons 2,4,15,18,25 and 28

Extra bed X 25aMS 03:35	Extra release 26b 00:08	Extra button 27bS 00:24	Extra ball 1 28bM 00:02	Extra ball 2 29bM 00:02	Extra ball 3 30bM 00:02	

Hot Keys

Each button can be assigned a hot key so that individual tracks can be played out directly from the keyboard, this option enables the assigned HotKeys.

The HotKeys as assigned to buttons via the Button right-click menu

SMPTE Timecode

The options are to enable/disable triggering from all SMPTE timecode sources and to use the Timecode Trigger List

Step To Next Track

This allows consecutive tracks to be played out by pressing the spacebar or GPI/Midi signals, when this option is selected the track number of the active button will be shown with a white background or the button will have white diagonal corners. The active button can be changed by navigating around the page with the cursor keys, left, right, up and down arrow keys along with Home and End

Pressing the spacebar will play the currently active track and make the next button active ready for payout.

This newly active button can be played at any time by pressing the spacebar, see GPI Assignments for triggering function externally.

if Skip over Muted Buttons is checked then buttons that are muted (have the muted box checked in audio setup dialog box) will be ignored when playing out using the spacebar and the next non-muted button will be selected as the next to play.

Similarly Skip over PlayNext buttons will ignore buttons in a PlayNext sequence as these buttons will be played automatically when the first button in the sequence is played.

The next button to play can be highlighted via the Options|Display|HighlightStep to Next option.

Home and End keys will position the highlighted key to the top left or bottom right buttons respectively.

When a button is assigned the virtual HotKey '=' it can be used as an alternative Home position, pressing Alt+Home will scan backwards through the buttons and move the Step to Next highlight to the previous button assigned '=' as a HotKey.

Play-Click Debounce

When using a mouse left-click or touchscreen press to play a track, SpotOn will respond to every action. This can present a problem when using a touchscreen in that the "button" may not be pressed cleanly with the possible consequence of a double press being detected.

The debounce options in this menu prevent the button being pressed in the XXmS after the initial press so masking out any secondary/unintentional presses.

Default Fade Out Time

zero	0.6s
✓ 0.1s	0.7s
0.2s	0.8s
0.3s	0.9s
0.4s	1.0s
0.5s	User = 2.1s

To minimize the abrupt audio transition when tracks are stopped before the end a default fade time can be used, this setting applied to all subsequently loaded tracks.

A setting of zero will produce audible clicks if the signal level is significant at the time the track is stopped, a worst case is shown below with full level tone stopped mid cycle.

A range of value 0.1s to 1.0s are available along with a user defined value that is saved with the session data.

Midi

Use Midi In	respond to incoming Midi messages
Use Midi Out	generate Midi outgoing messages
Act as Network Master	send Midi out via Network link to a slave SpotOn computer
Midi Loopback Out> In	internally loop outgoing messages back to the input, without the need for an external wired link
Enable Fast Midi Mute	specialist option for handling very fast Midi In messages
Use Midi Velocity as Initial Gain	use the Velocity data in Midi messages to set the initial gain of the track, when unchecked only Velocity=0 is tested see below
Convert Velocity=0 to Note Off	test midi message for zero velocity and translate into a Note O message

Gain Settings

The overall gain offset of the audio played out by SpotOn can be set to 0dB or -10dB, when -10dB is selected the level of individual tracks can be increased by up to 10dB.

The depths of the Fade In and Out applied to tracks is globally set by this option

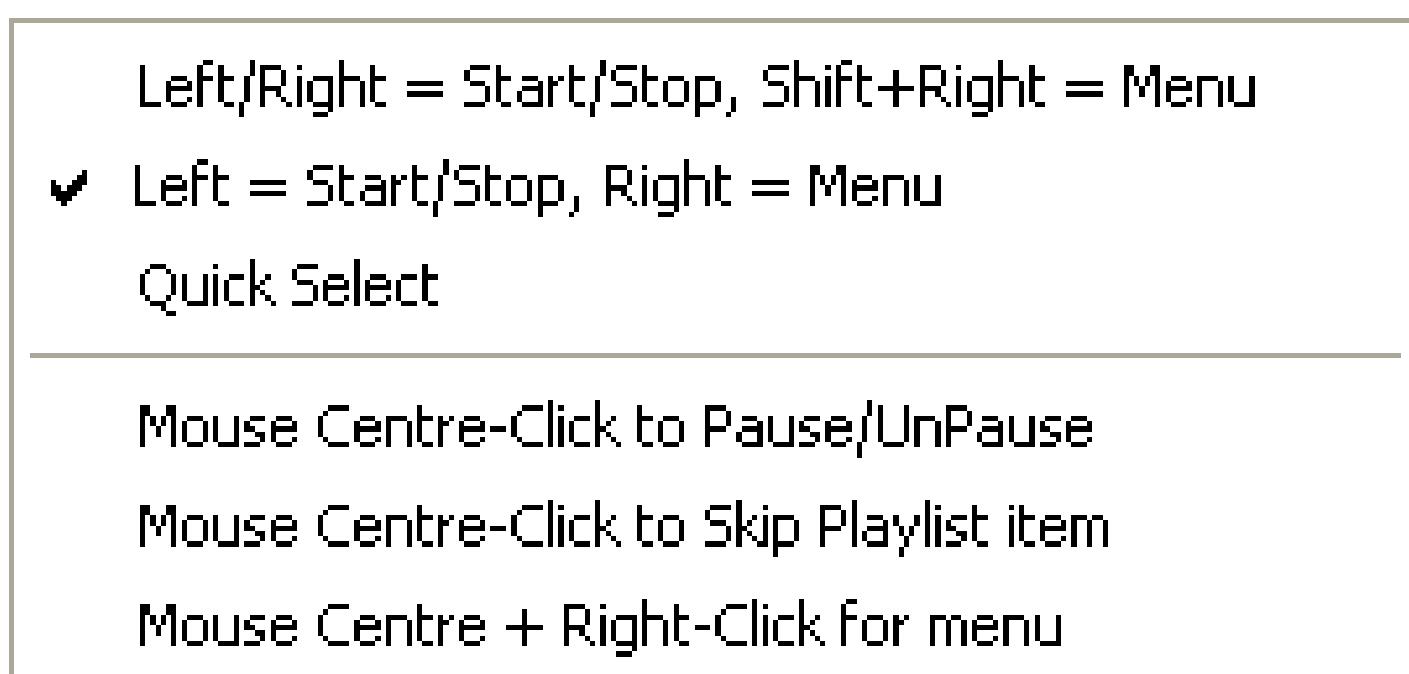

When using the AutoTrim feature the threshold for detecting audio can be set globally over the range -20dBFS..-50dBFS

A modifier can be applied to the AutoTrim feature where the calculated In and Out points are expanded by a short time to include any leading or trailing transients.

Mouse Functions

The functions of the left, right and centre mouse buttons can be changed with this option

Play/Stop: -

The default setting is alternate clicks of left mouse button to start and stop the track with the right mouse button used to bring up the popup menus.

If required this action can be changed to have the left and right mouse buttons start and stop the track respectively with Shift + right-click accessing the popup menus.

With the Quick Select option checked the mouse left/right button action can be changed by clicking on the lower right hand panel in the main window status bar.

Pause/Skip/Menu: -

When using pointing devices with a centre button this can be assigned to a Pause/UnPause function, this only operates on tracks that do not contain a Playlist.

If the track does contain a Playlist the centre click can be set to cause the current Playlist section to move onto the next section on completion of the next loop, see Advanced Operation

As an alternative to using the keyboard Shift key the centre mouse button can be used to display the button menu.

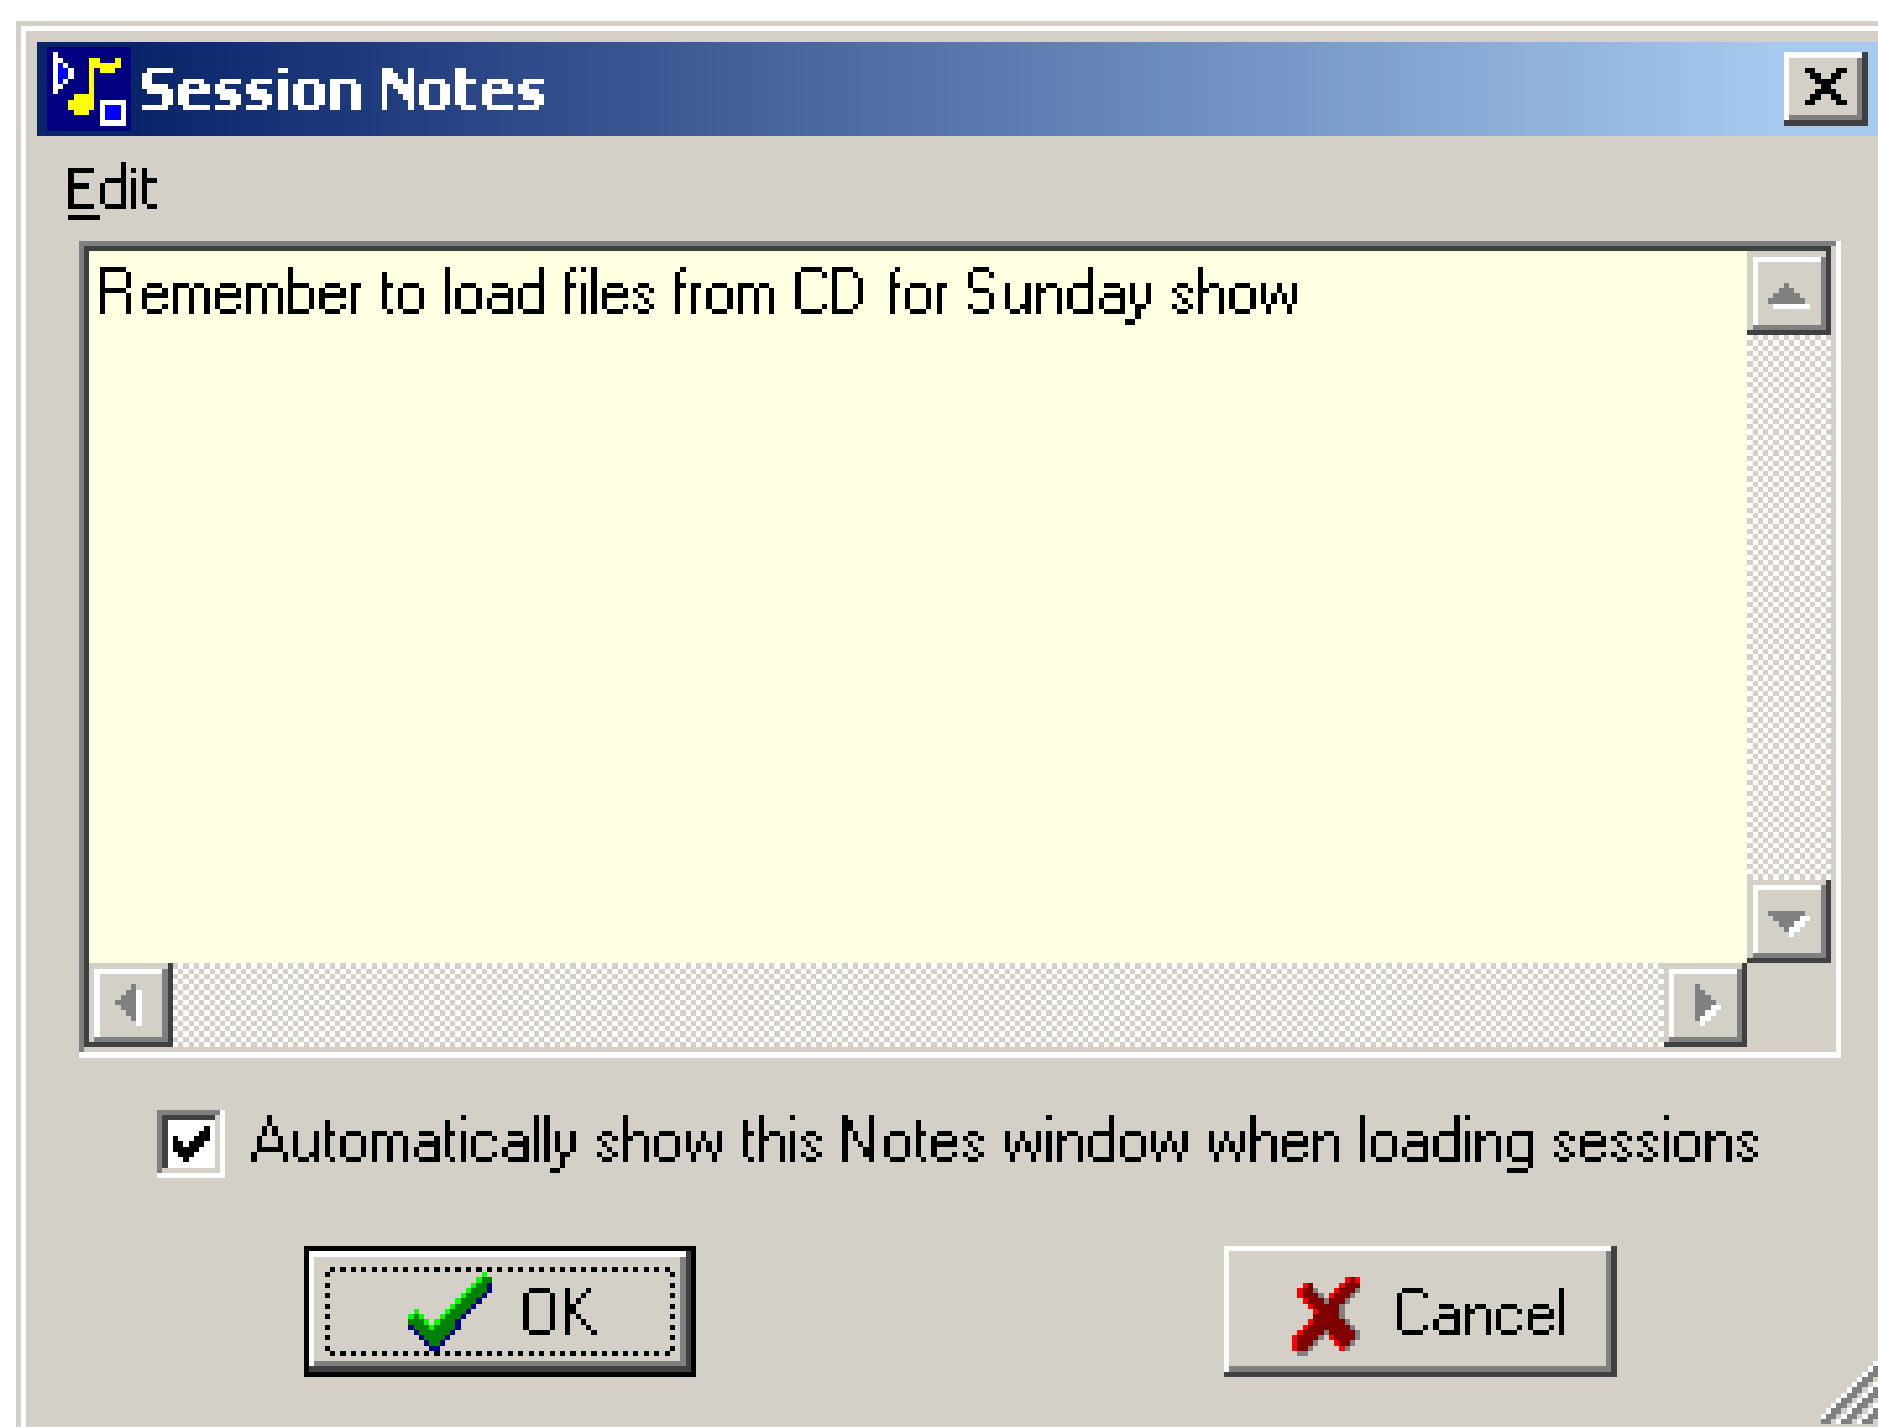

Note that in some installations using a Keyboard, Video and Mouse (KVM) switch the mouse centre+right key combination is a shortcut to change the KVM selection.

Info Menu

Session Notes

Provides a free text entry note pad which is saved with the session file

If the item in Options|Display|Auto Show Session Notes is checked then this window will be shown each time a session is loaded and the notes field is not blank.

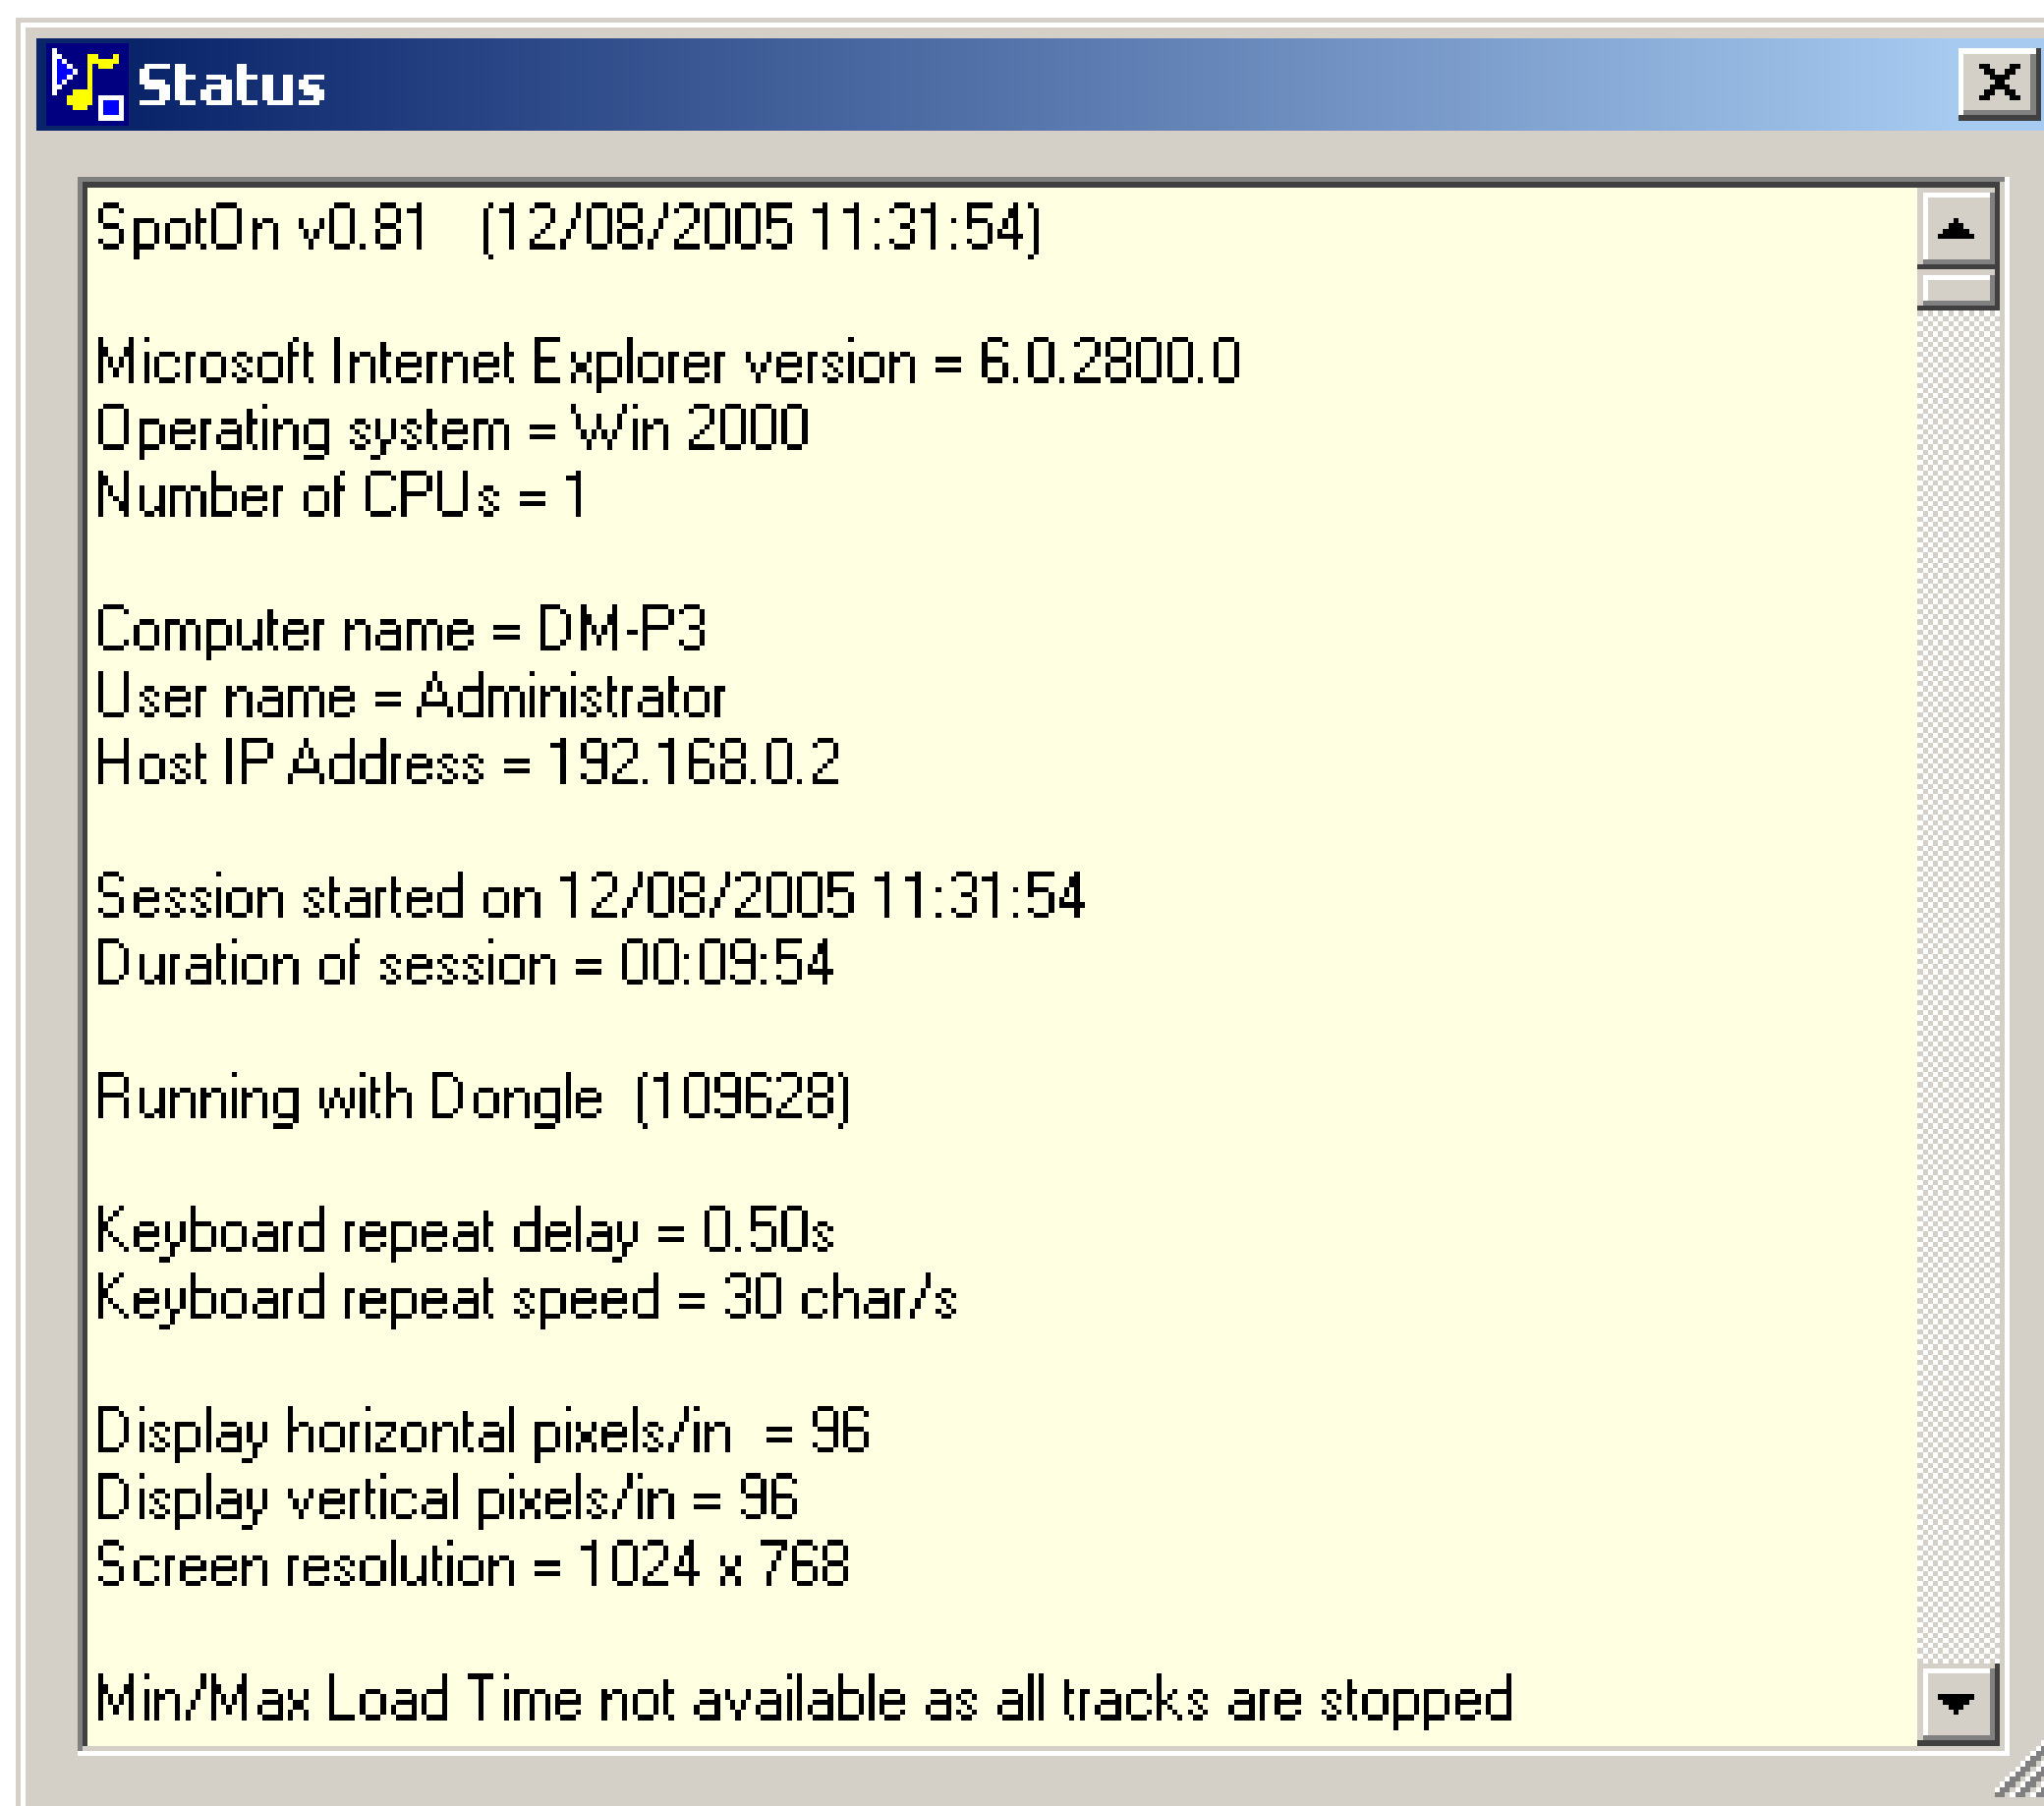

The checkbox on this window can be unchecked to stop the window automatically showing for the remainder of the SpotOn session.

If the item in Options|Display|Auto Show Session Notes is unchecked, the notes window will not be automatically shown.

The notes field can be cleared using the menu item below.

Status

A selection of status information is listed in this panel only the first few items shown below will be of general use.

If is necessary to copy some of the status information, right-clicking on the display will offer the option to copy to the Windows clipboard either all the text or just the selected text.

Logs

A range of user activities are logged and can be viewed via this menu item, the activities are split into two pages - Playout and Events.

The Playout page shown below lists all the buttons that are played out against a timestamp along with other information describing the track and is intended for use with royalty payment logging.

Activity Logs - Playout

☒ OK ☐ Cancel

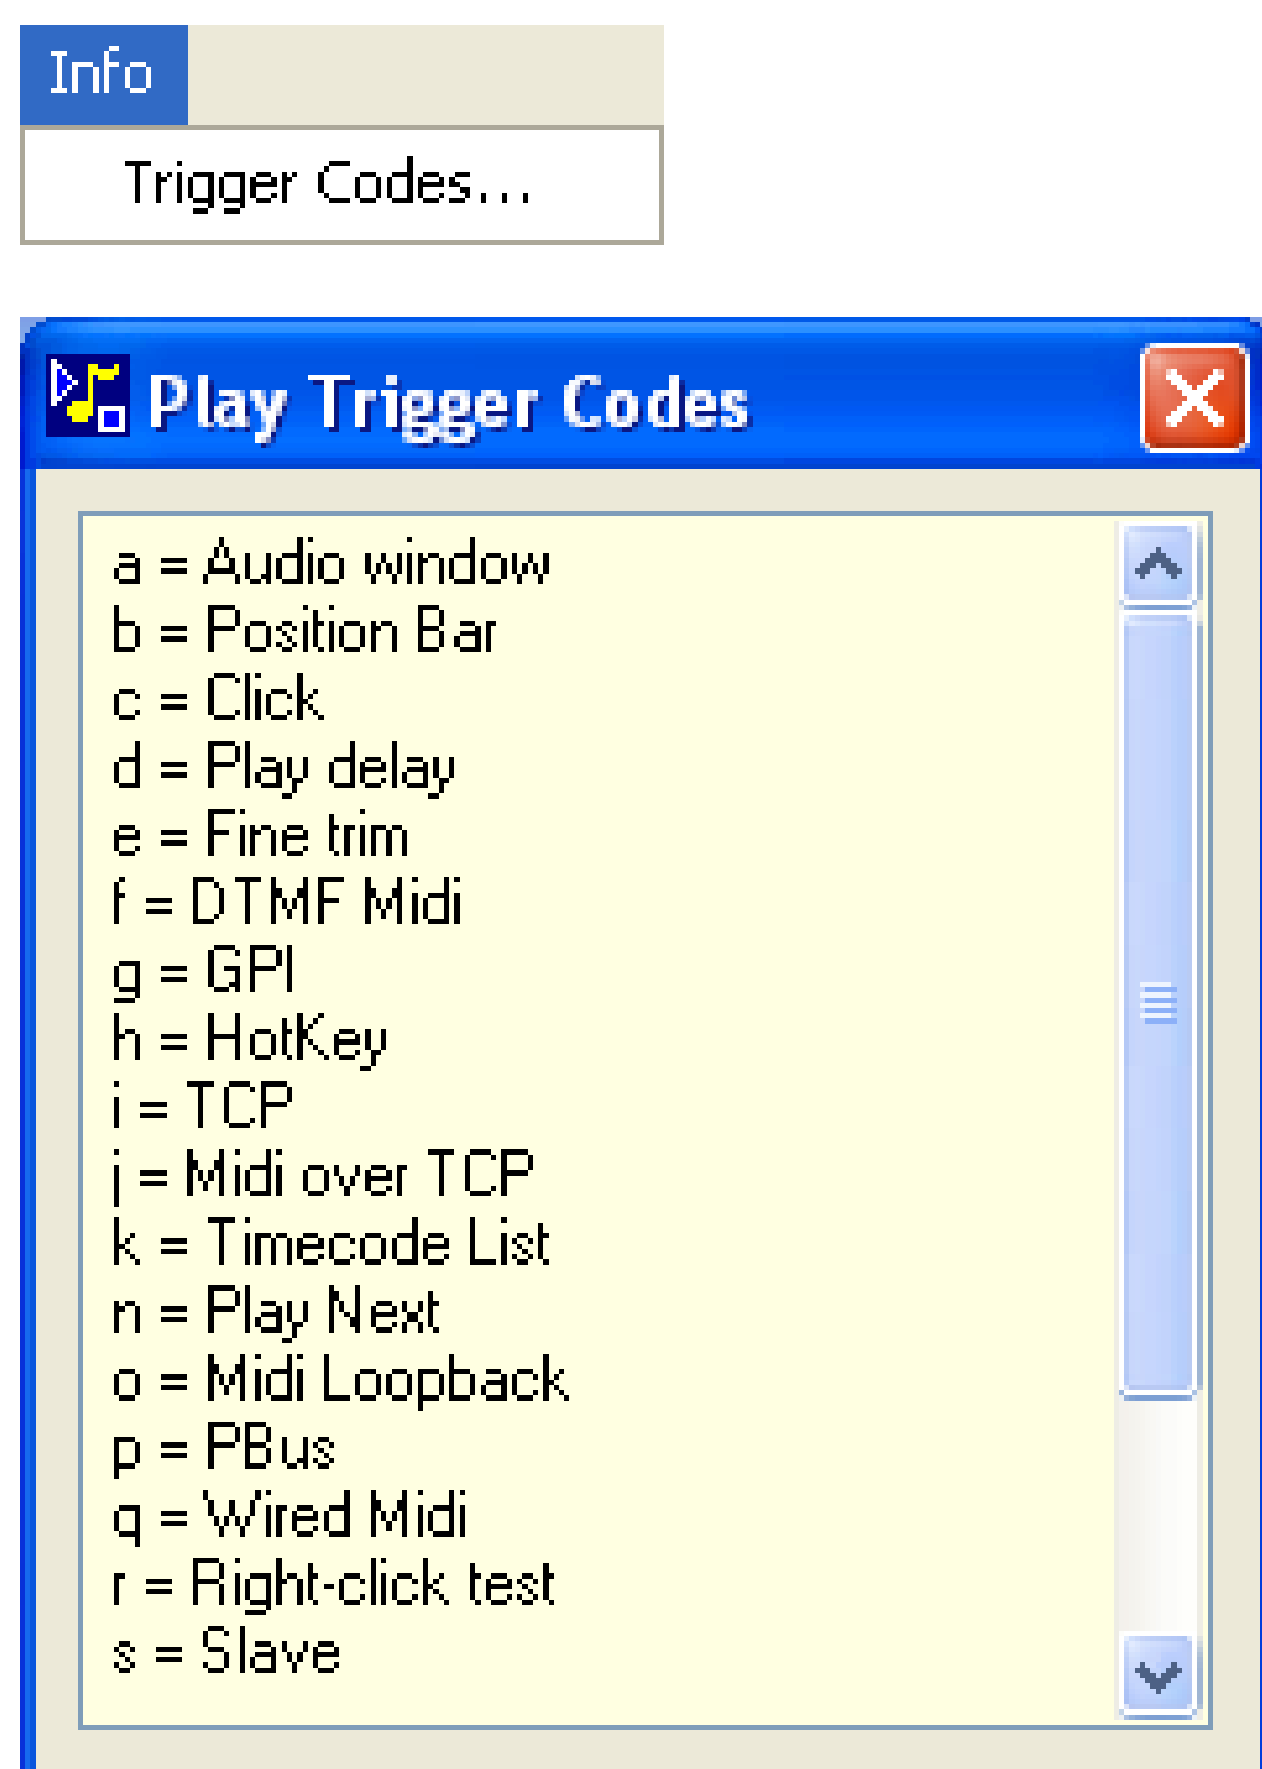

The Playout Log columns to be included in the file can be selected and also restricted to specific outputs, this option is only available when saving a highlighted selection of the current Playout Log which includes 2 or more lines.

The lower case suffices appended to the button numbers indicate the method by which the button was played, these can be any one of the following: -

- a Audio dialog Play
- b Position bar
- c Mouse Click
- d Play Delay
- e Fine Trim
- f DTMF Midi
- g GPI
- h Hotkey
- i TCP message
- j TCP Midi message
- k Timecode list
- n PlayNext
- o Midi loop back
- p PBus message
- q Wired Midi (ExtMidiLo..ExtMidiHi)
- r Midi test
- s Slave
- t Trim window Play
- u UDP message
- v Midi over UDP message

- x Start time archived to log
- y AutoPlay
- # WAV Preview dialog
- @ Click track
- [Timecode stack
-] unPause
- (Preview
-) Centre click
- ~ Effect setup dialog
- ^ Output Assign

The trigger codes can be listed via the Info|Trigger Codes menu

The duration column shows the length of time a track was playing before it was stopped, the column will show a value of ??:??:?? whilst a track is playing.

With long track or tracks that loop the duration cannot be entered for some considerable time after they were started, the consequence of this is that the duration may not be correctly entered into the archived Playout Logs. To avoid this there is an option in the Engineering menu forcing the archive to only be updated when all tracks are stopped, if this option is selected then the title bar will change as shown below.

The Playout logs are saved to disc in the default folder with one log for each day SpotOn was used. The number of logs stored in the default folder is limited to 28, the oldest existing logs are deleted to maintain the maximum number of logs at 28.

However, Playout Logs can be stored in a user defined folder assigned via File Folders, the number of files stored in the user defined folder is unlimited.

The second page shows other activities such as GPI in, Midi In/Out, files loaded/saved and system errors.

Item	Time	Action
1	12:34:34	All Stop
2	12:35:42	Package loaded - F:\Program Files\SpotOn\ITN\Simon Package.pkg
3	12:36:36	GPI In On
4	12:36:36	GPI-1 On at 12:36:36:632
5	12:36:36	GPI-1 On at 12:36:36:832
6	12:36:37	GPI-1 Off at 12:36:37:112
7	12:36:37	GPI-1 On at 12:36:37:192
8	12:36:37	GPI-1 Off at 12:36:37:453
9	12:36:37	GPI-1 On at 12:36:37:513
10	12:36:37	GPI-1 Off at 12:36:37:713
11	12:36:54	Midi In On
12	12:37:00	Midi In L:0/9/On at 12:37:00:456
13	12:37:04	Midi In L:3/13/On at 12:37:04:301
14	12:37:11	Midi Out 0:0/12/On at 12:37:11:221

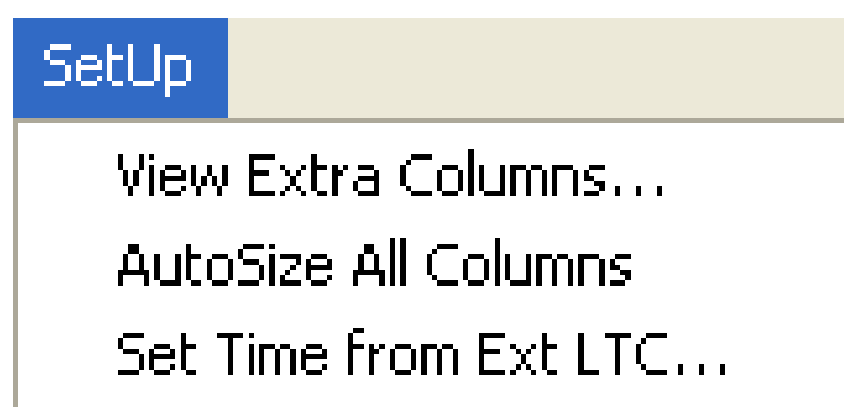

The Event logs are saved to disc in the default folder with one log for each day SpotOn was used. The number of logs stored in the default folder is limited to 28, the oldest existing logs are deleted to maintain the maximum number of logs at 28.

The main menu has option to save to disk either the entire log or just the highlighted section and also access archived logs - this is more applicable to the Playout logs where tracks played a few days ago can be located.

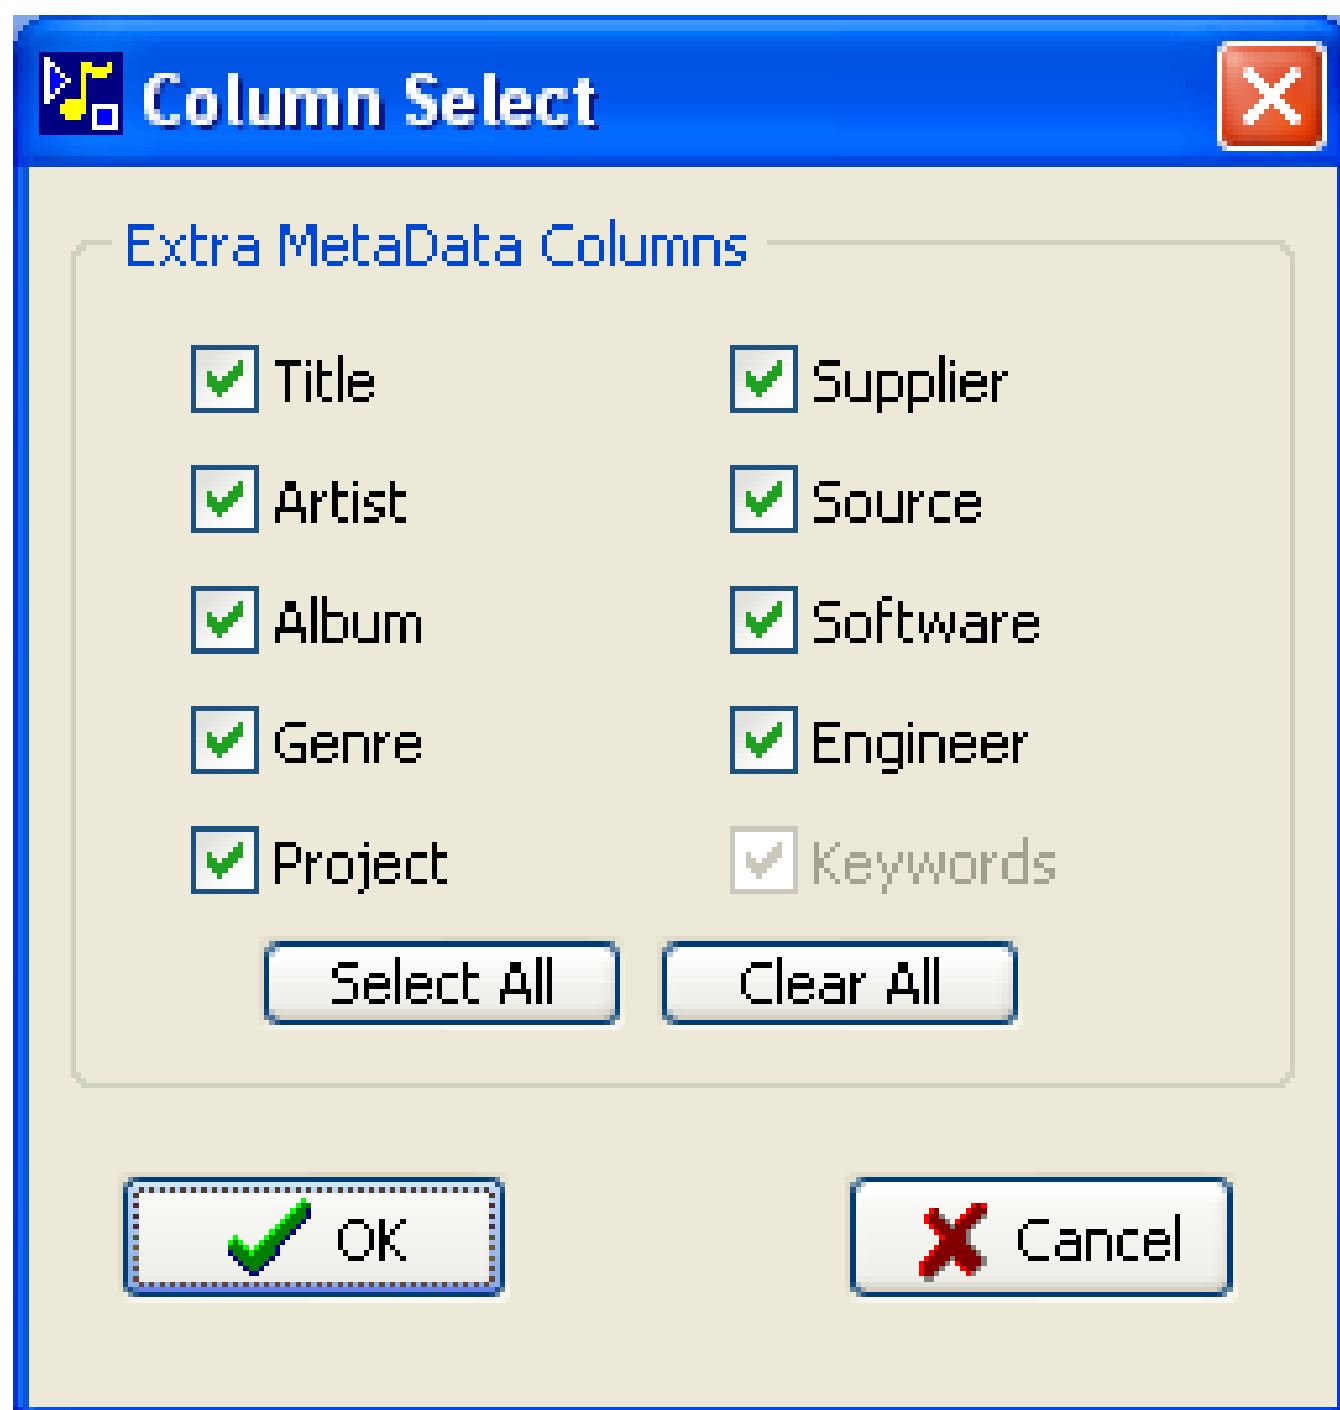

Both of the logs are automatically saved to disk when SpotOn closes.

The last item in the menu is 'Copy Logs to Debug Folder' this option is only enabled when in Engineering mode and is used to copy a selection of recent logs to a folder for debugging purposes, see Debug Logs

The SetUp menu Column options are only enabled whilst viewing the Playout log

in SpotOn v0.96 and above the playout log can display additional metadata, the columns shown can be selected via the View Extra Columns option

The width of the individual Playout log columns can be autosized by double clicking on the column header, alternatively all columns being shown can be autosized with the Autosize All Columns option

The timestamp applied to both the Playout and Event log entries is based on the PC clock, this can be set to the correct time by using the Windows Internet Time Server option or from an external LTC signal

Local Files

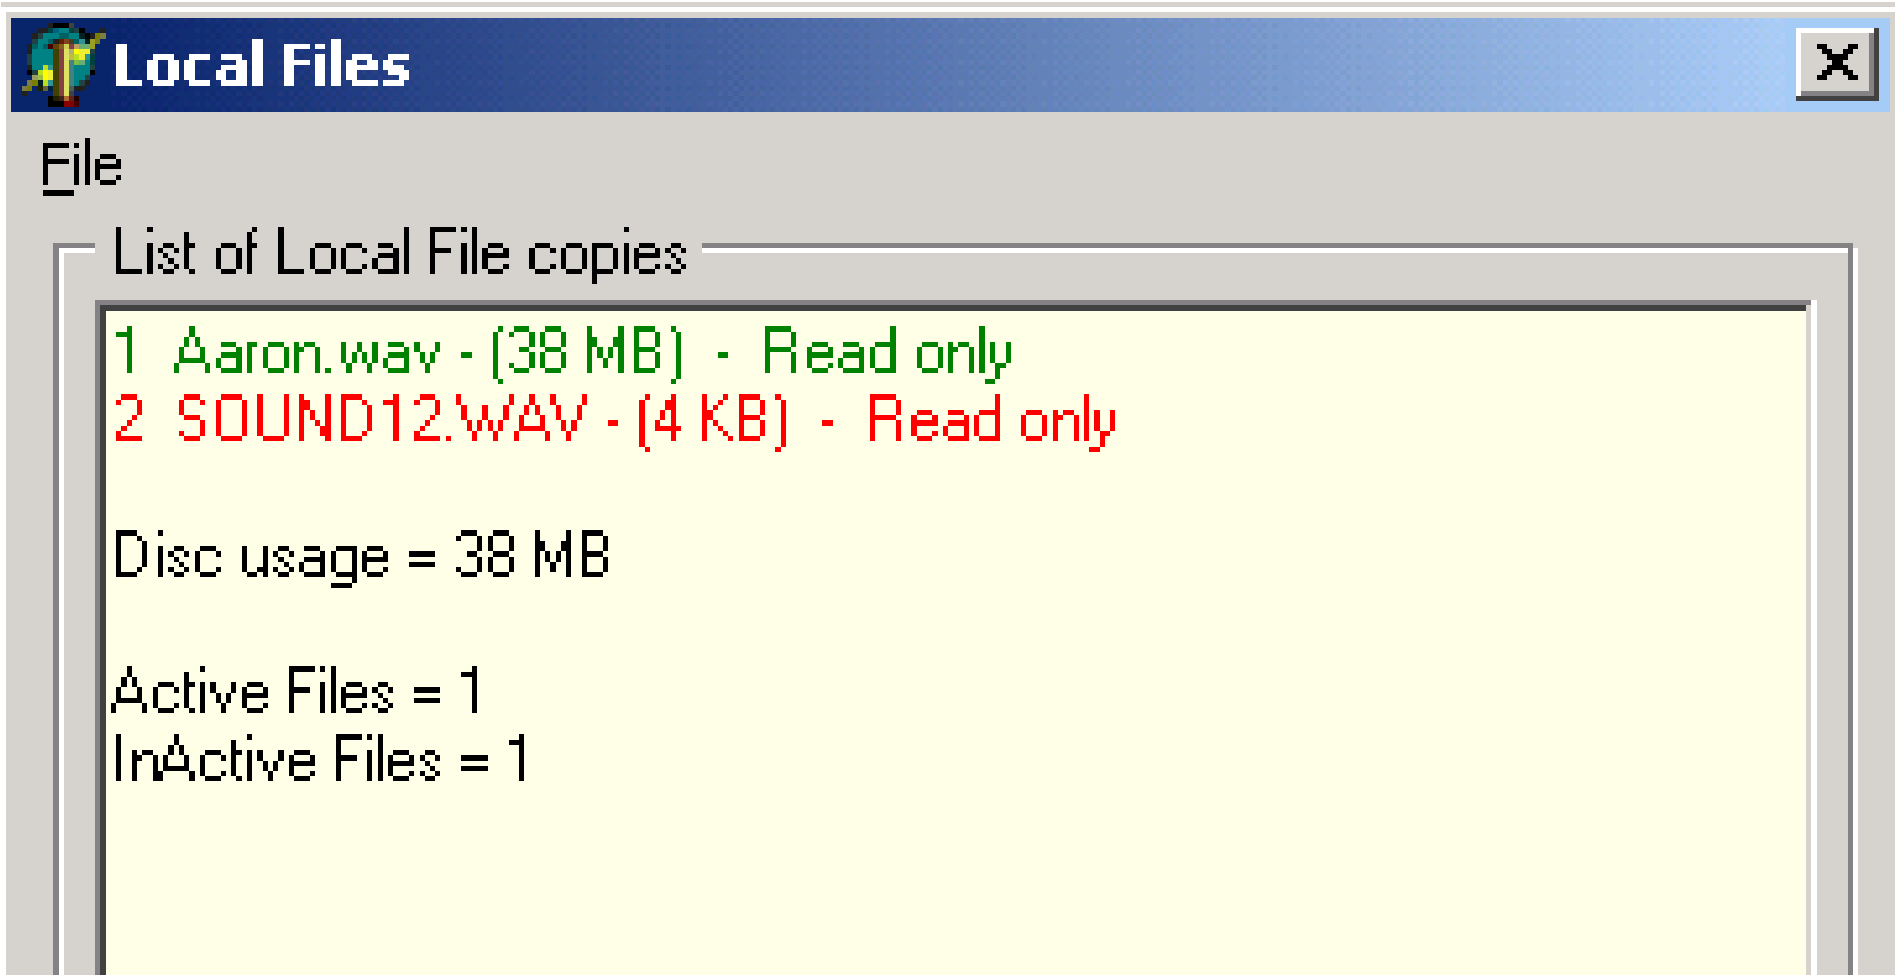

This menu item has been disabled

Each time SpotOn loads a button with an audio file located on a non fixed drive it copies the file to a local directory.

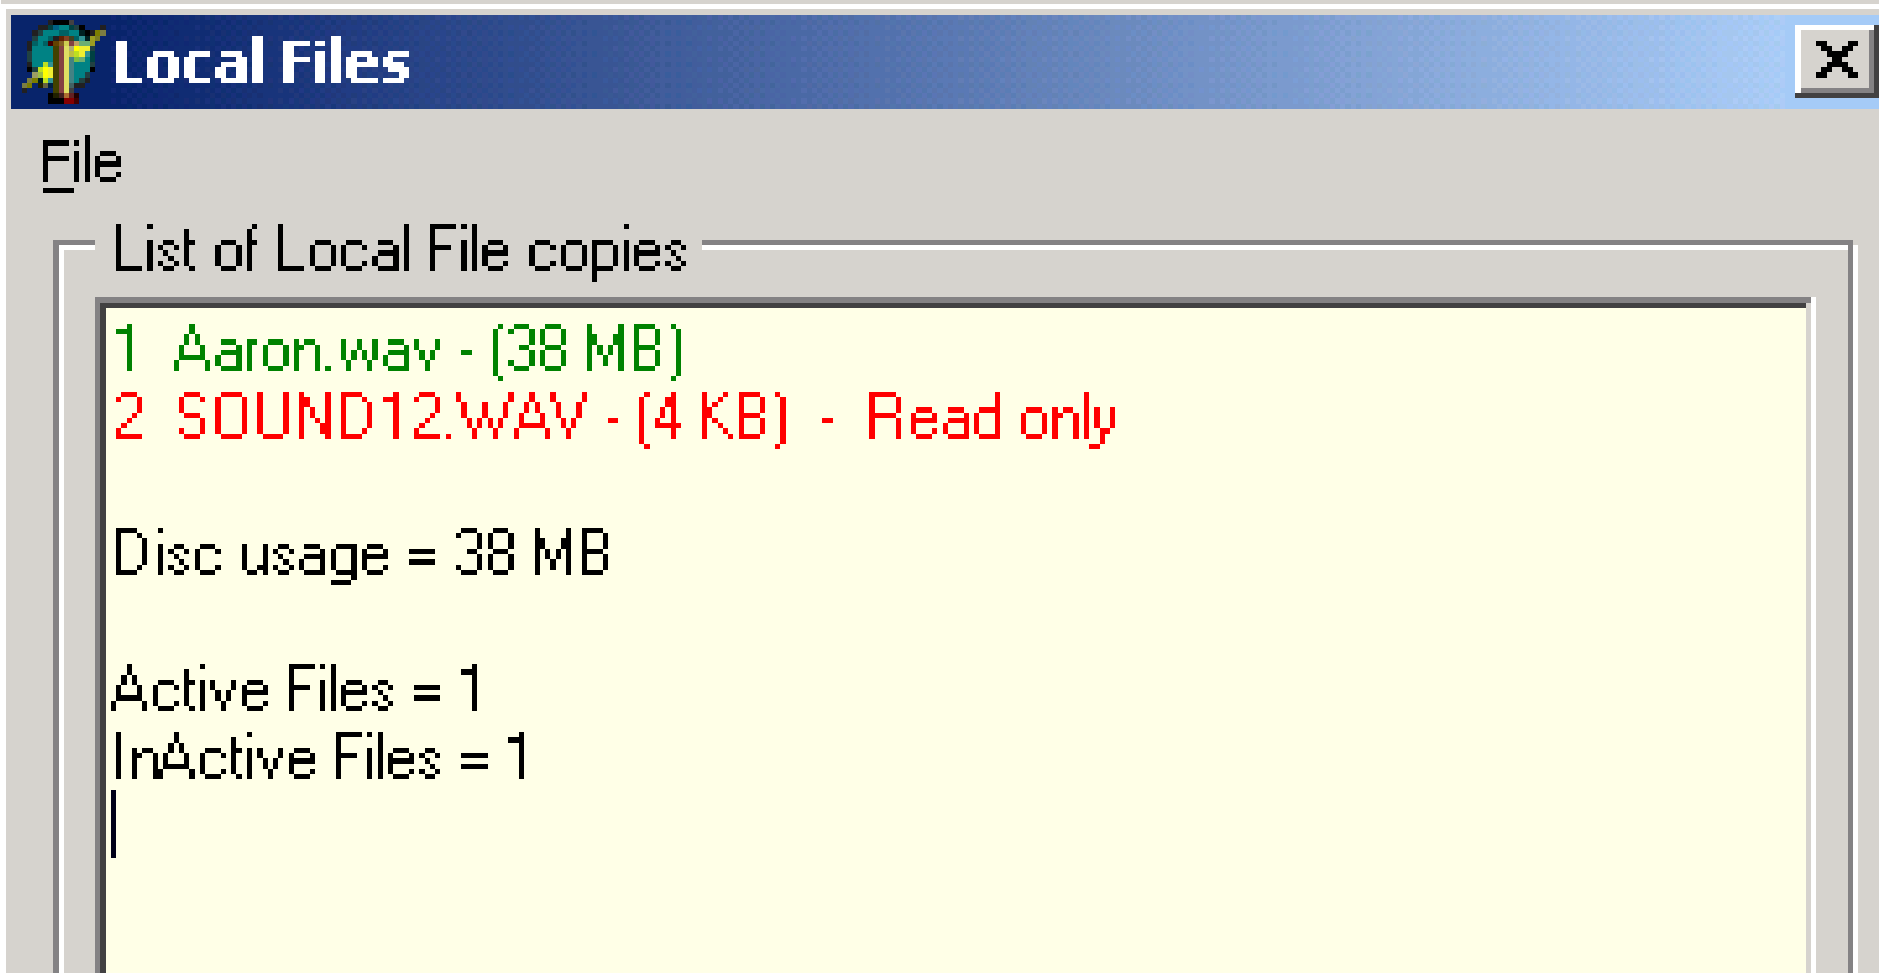

After sometime there may be files stored in this local directory that are redundant and can therefore be deleted, the file names coloured red are in use in the current session of SpotOn.

The items coloured green are not in use in the current session - but maybe used by others and be referenced in their data files.

The file Aaron.wav below is shown as not used but write protected and therefore cannot be deleted.

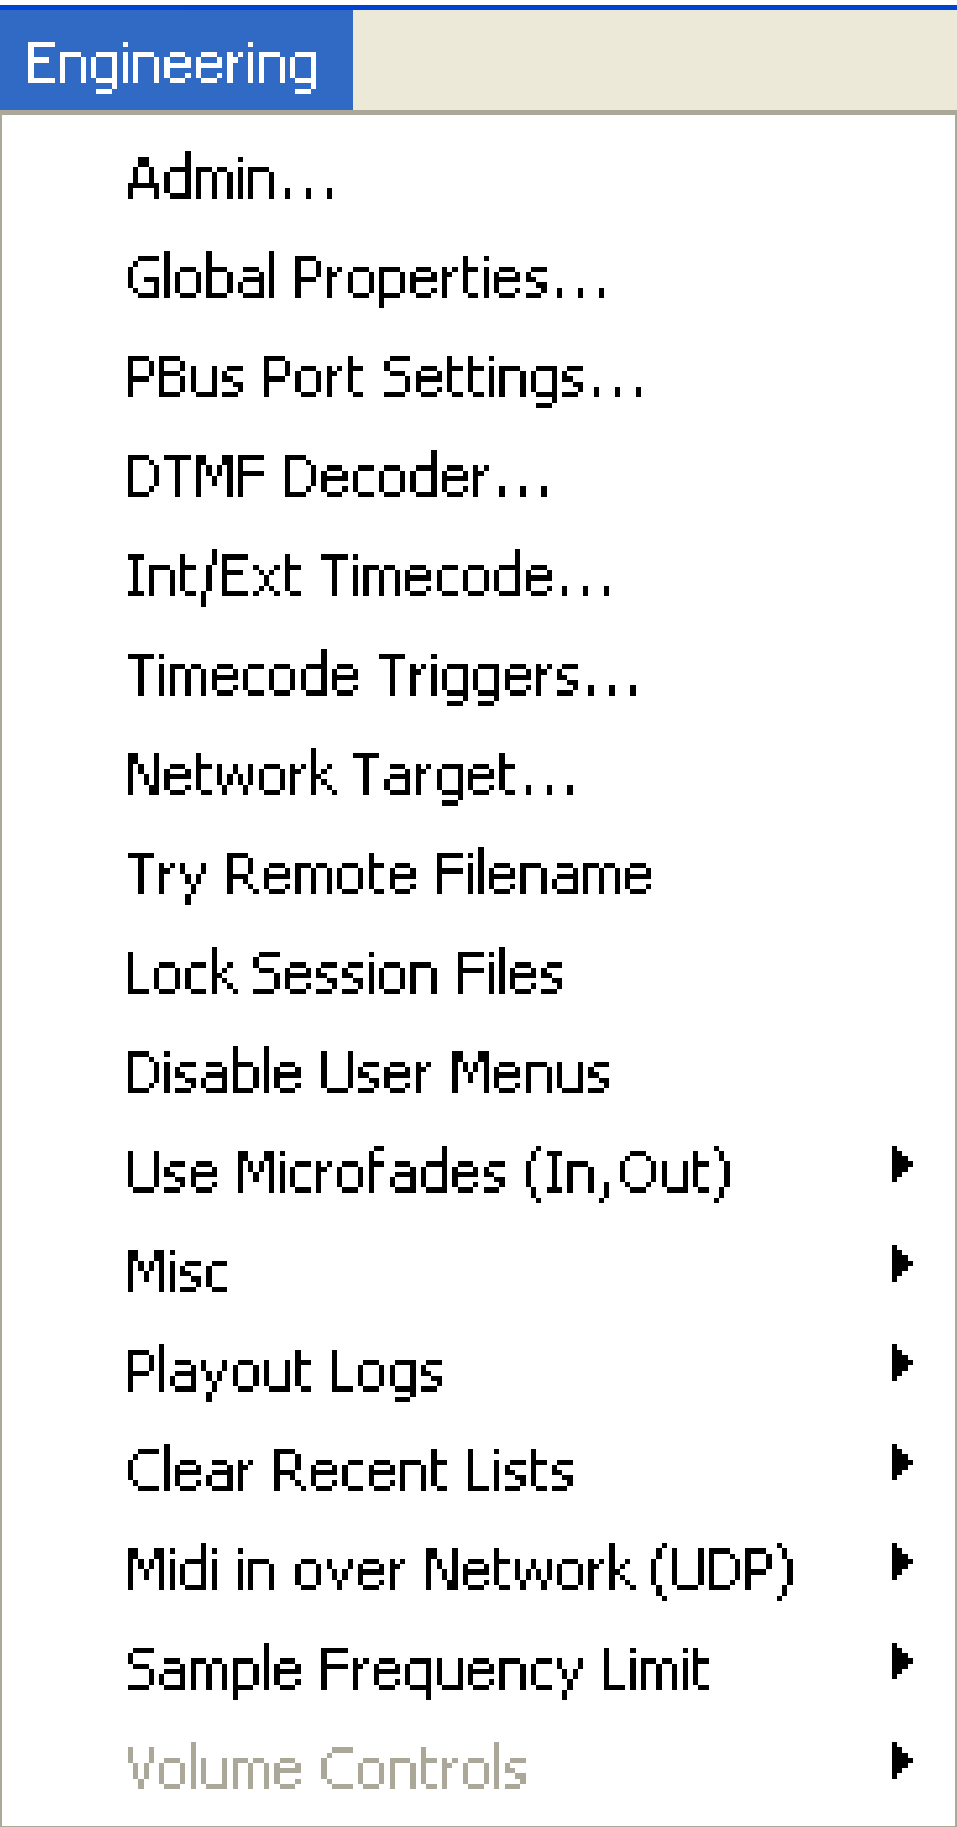

If the file was not write protected it would appear as below

Using the File menu the unused files can be deleted from the Local directory

Engineering Menu

The Engineering Menu contains options to be set by an advanced user

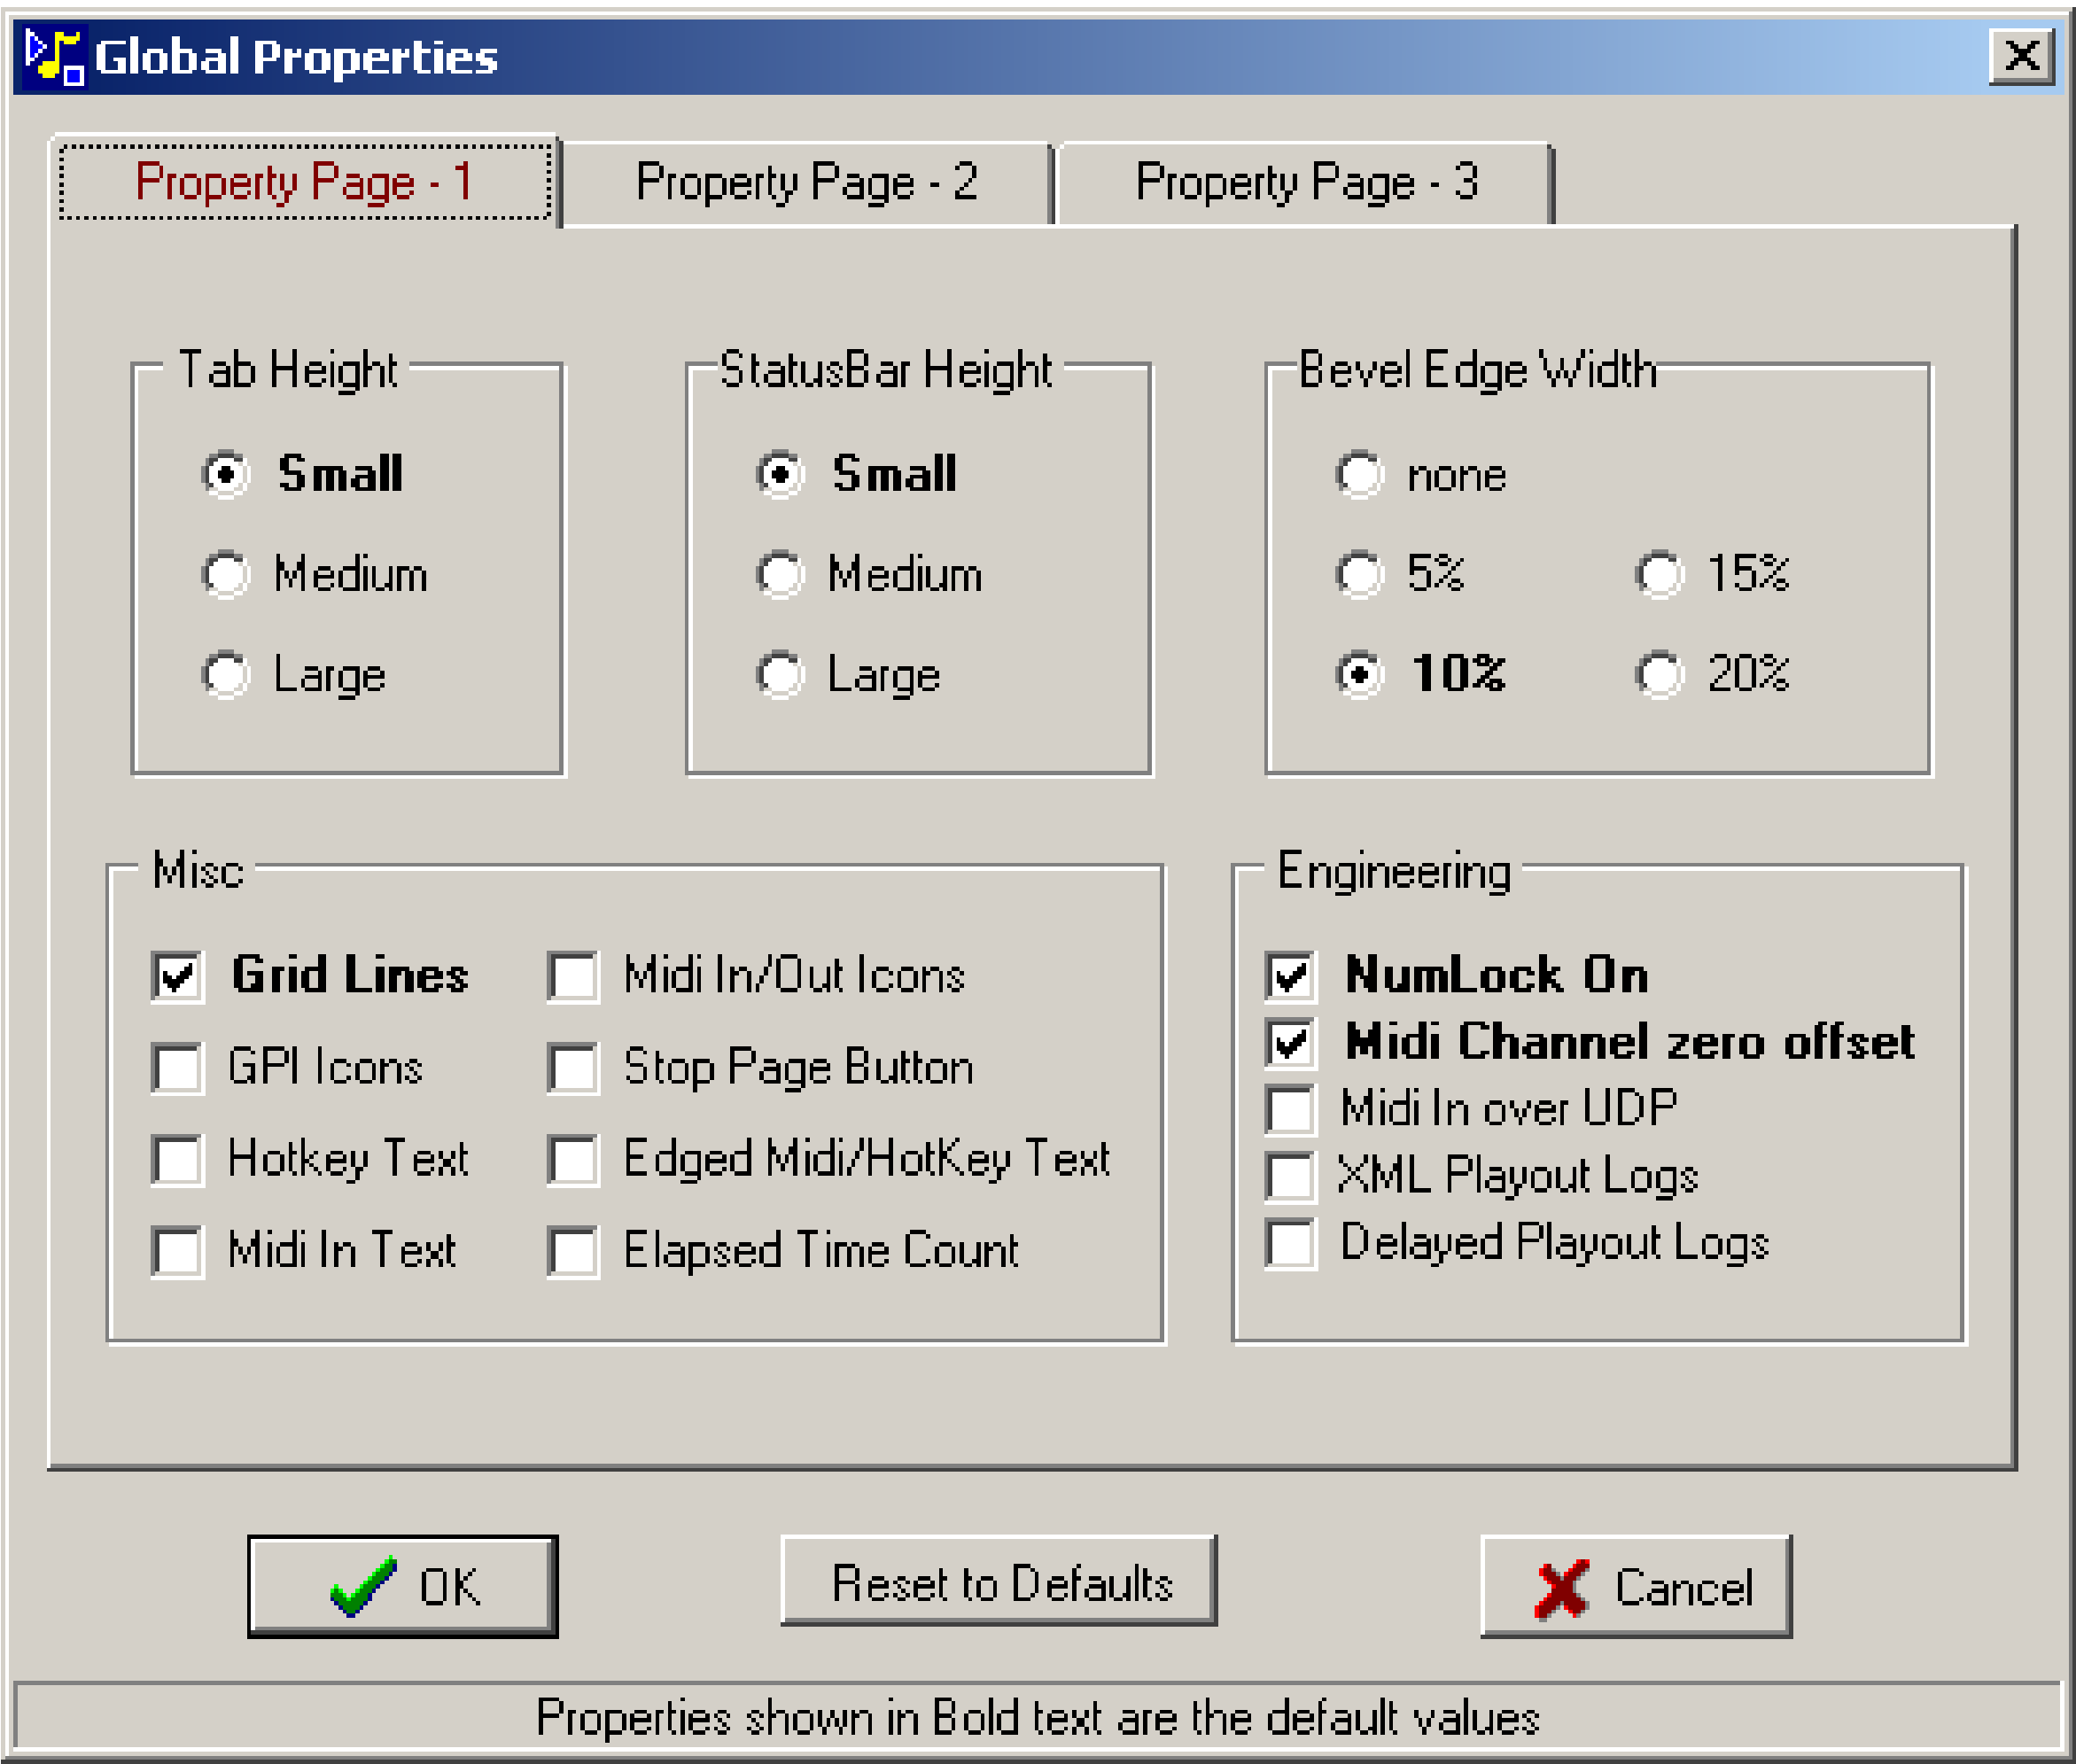

Admin	Administrator menu options
Global Properties	Set range of property values
PBus Port Settings	Settings for receiving PBus commands
DTMF Decoder	Settings for receiving external DTMF tones
Int/Ext Timecode	Input settings for SMPTE or Button timecode
Timecode Triggers	Trigger buttons from a list of SMPTE timecodes
Network Target	Assigns target computer address
Try Remote Filename	search remote locations for audio file
Lock Session Files	Set loaded track files to be read-only
Disable User Menus	Disable menu items for simple playout operation
Use Micro Fades	Render precision fades for Fade Out and short Fade In durations
Misc	Assorted Settings
Playout Logs	Options for generating/copying playout logs
Clear Recent Lists	Clear history lists in File menu
Midi In over Network	Enables Midi messages received via a Network connection
Sample Frequency Limit	Set highest sample frequency that SpotOn will allow in WAV files
Volume Controls	Adjust levels of Windows volume controls for each output - option disabled

Admin

Provides password protected access to the Administrator menu options

Global Properties

The Global Properties option allows a large number of the menu options to be viewed and set within one dialog window.

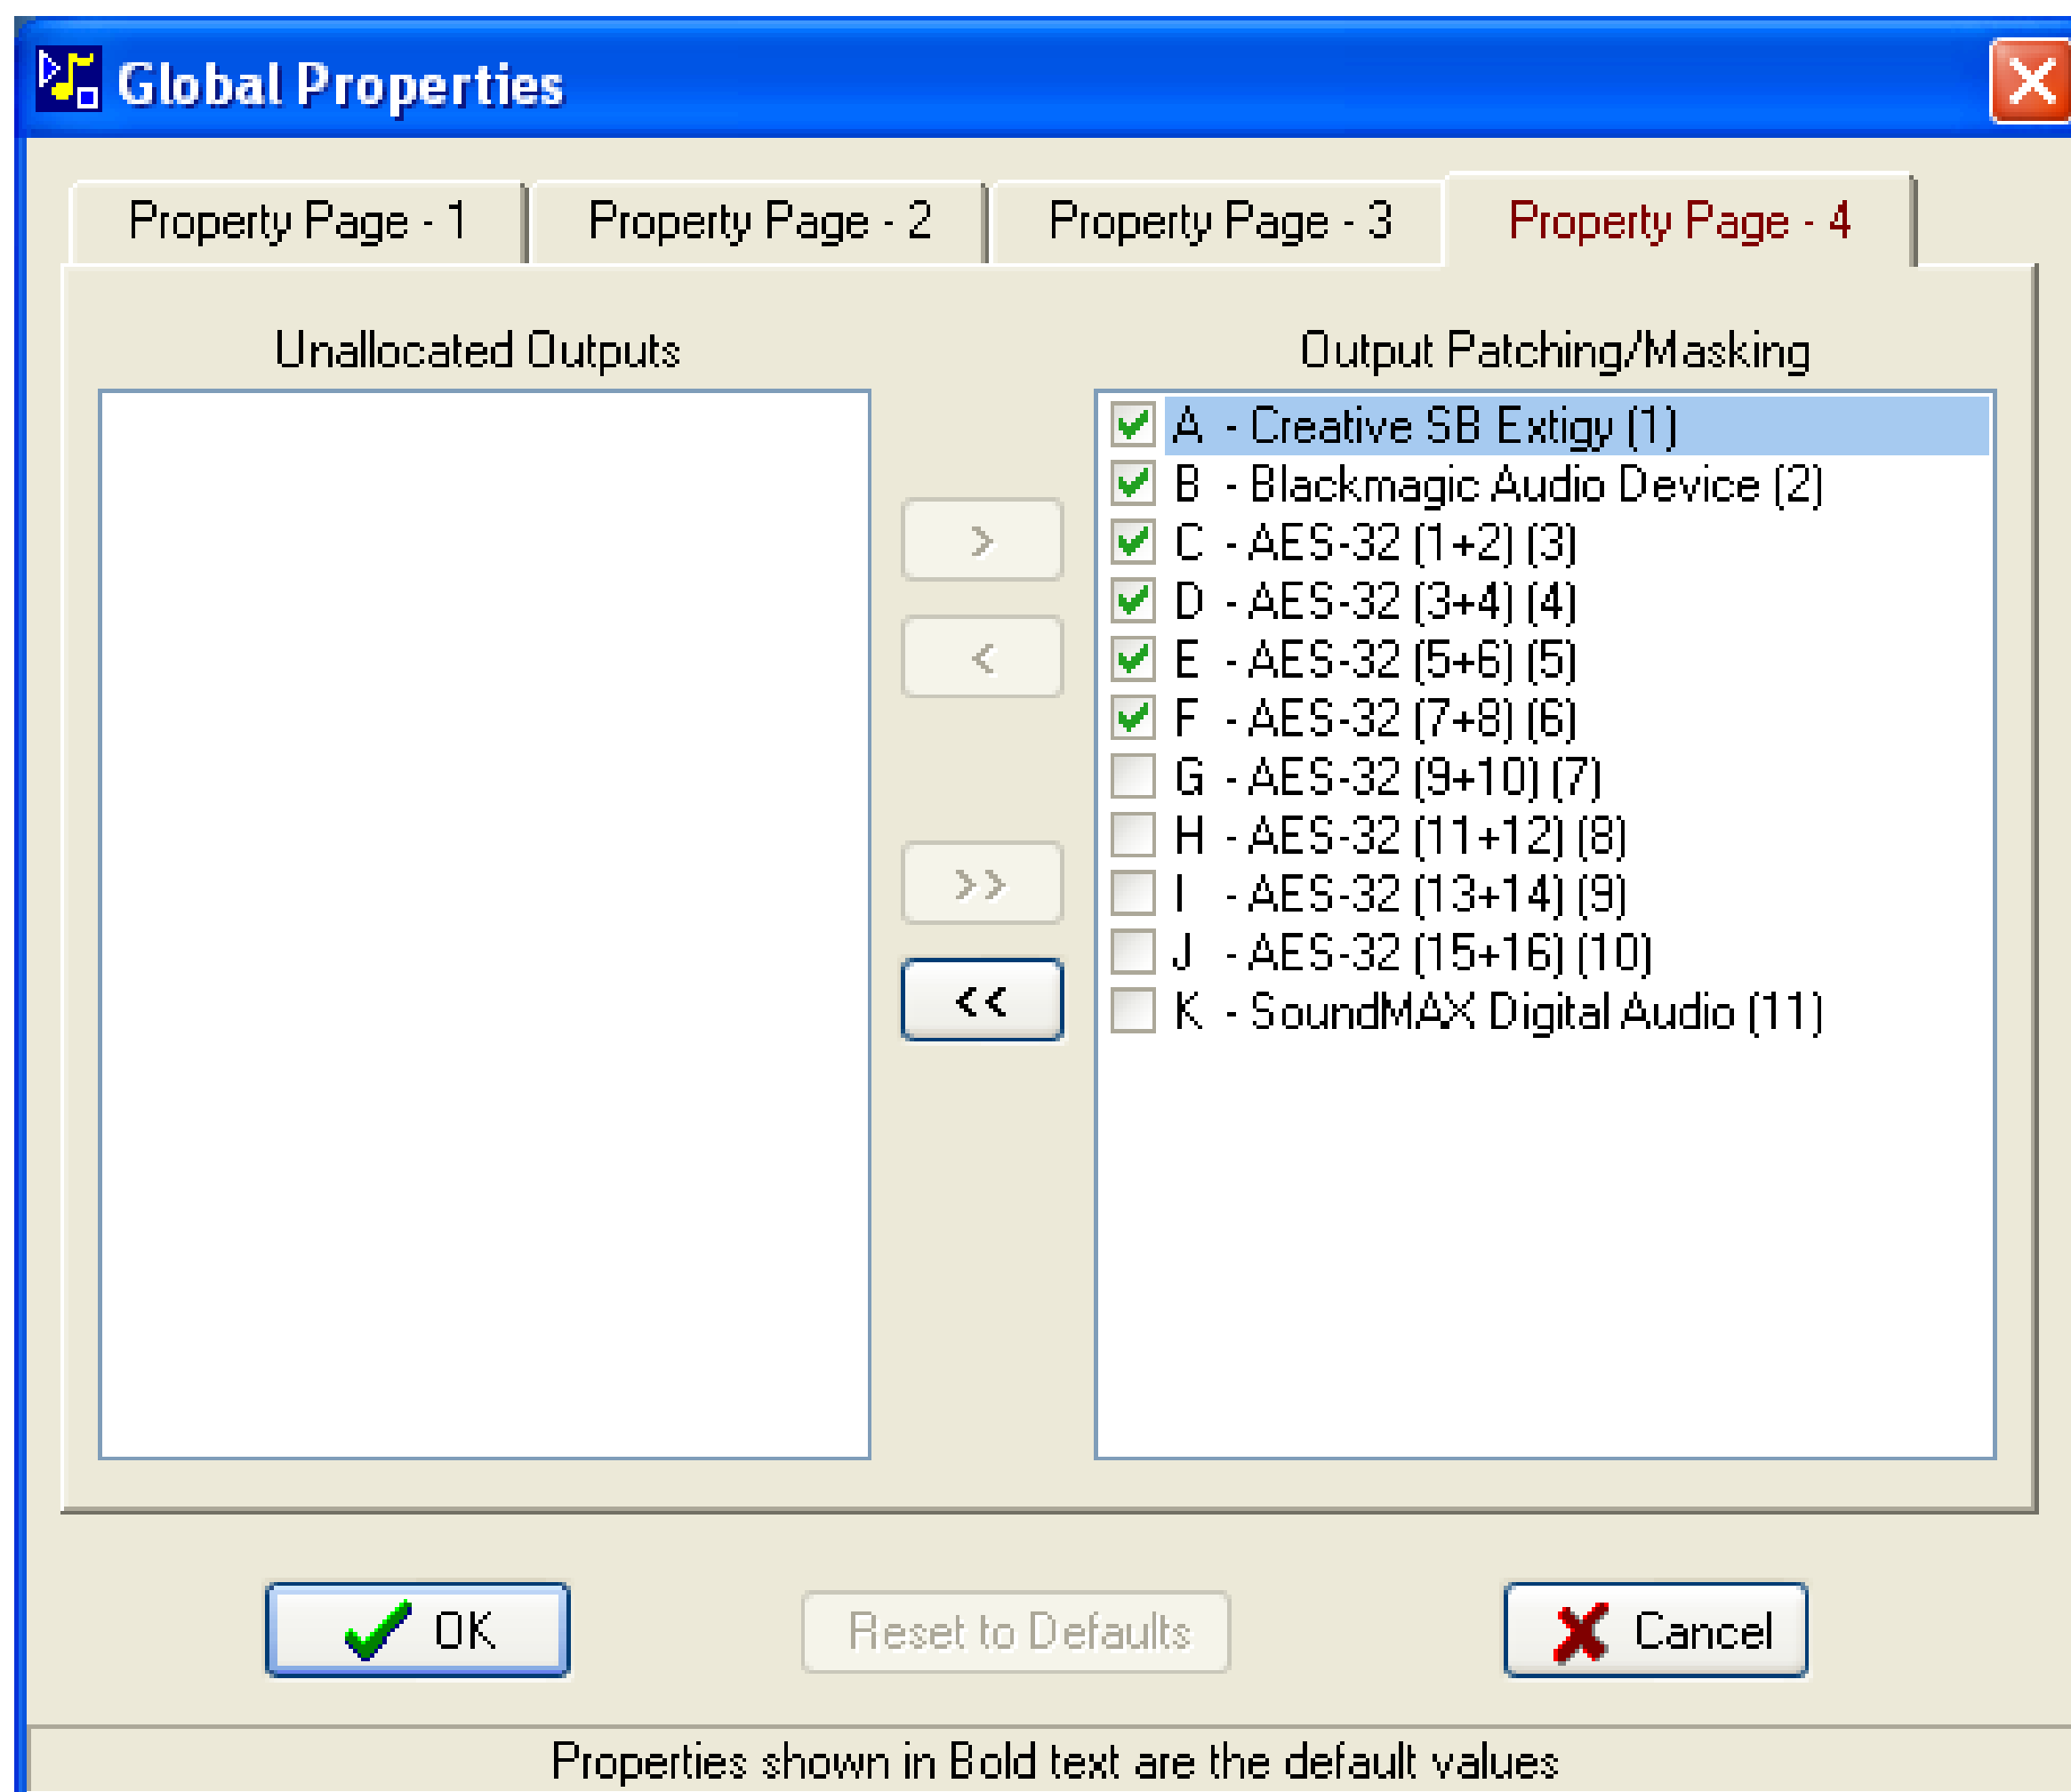

The default values are shown in bold text

The 'Reset to Defaults' button will set all properties on all pages to the default values.

The 4th property page is only accessible when Admin mode is enabled, this page is a slightly more sophisticated version of the Output Assignment dialog.

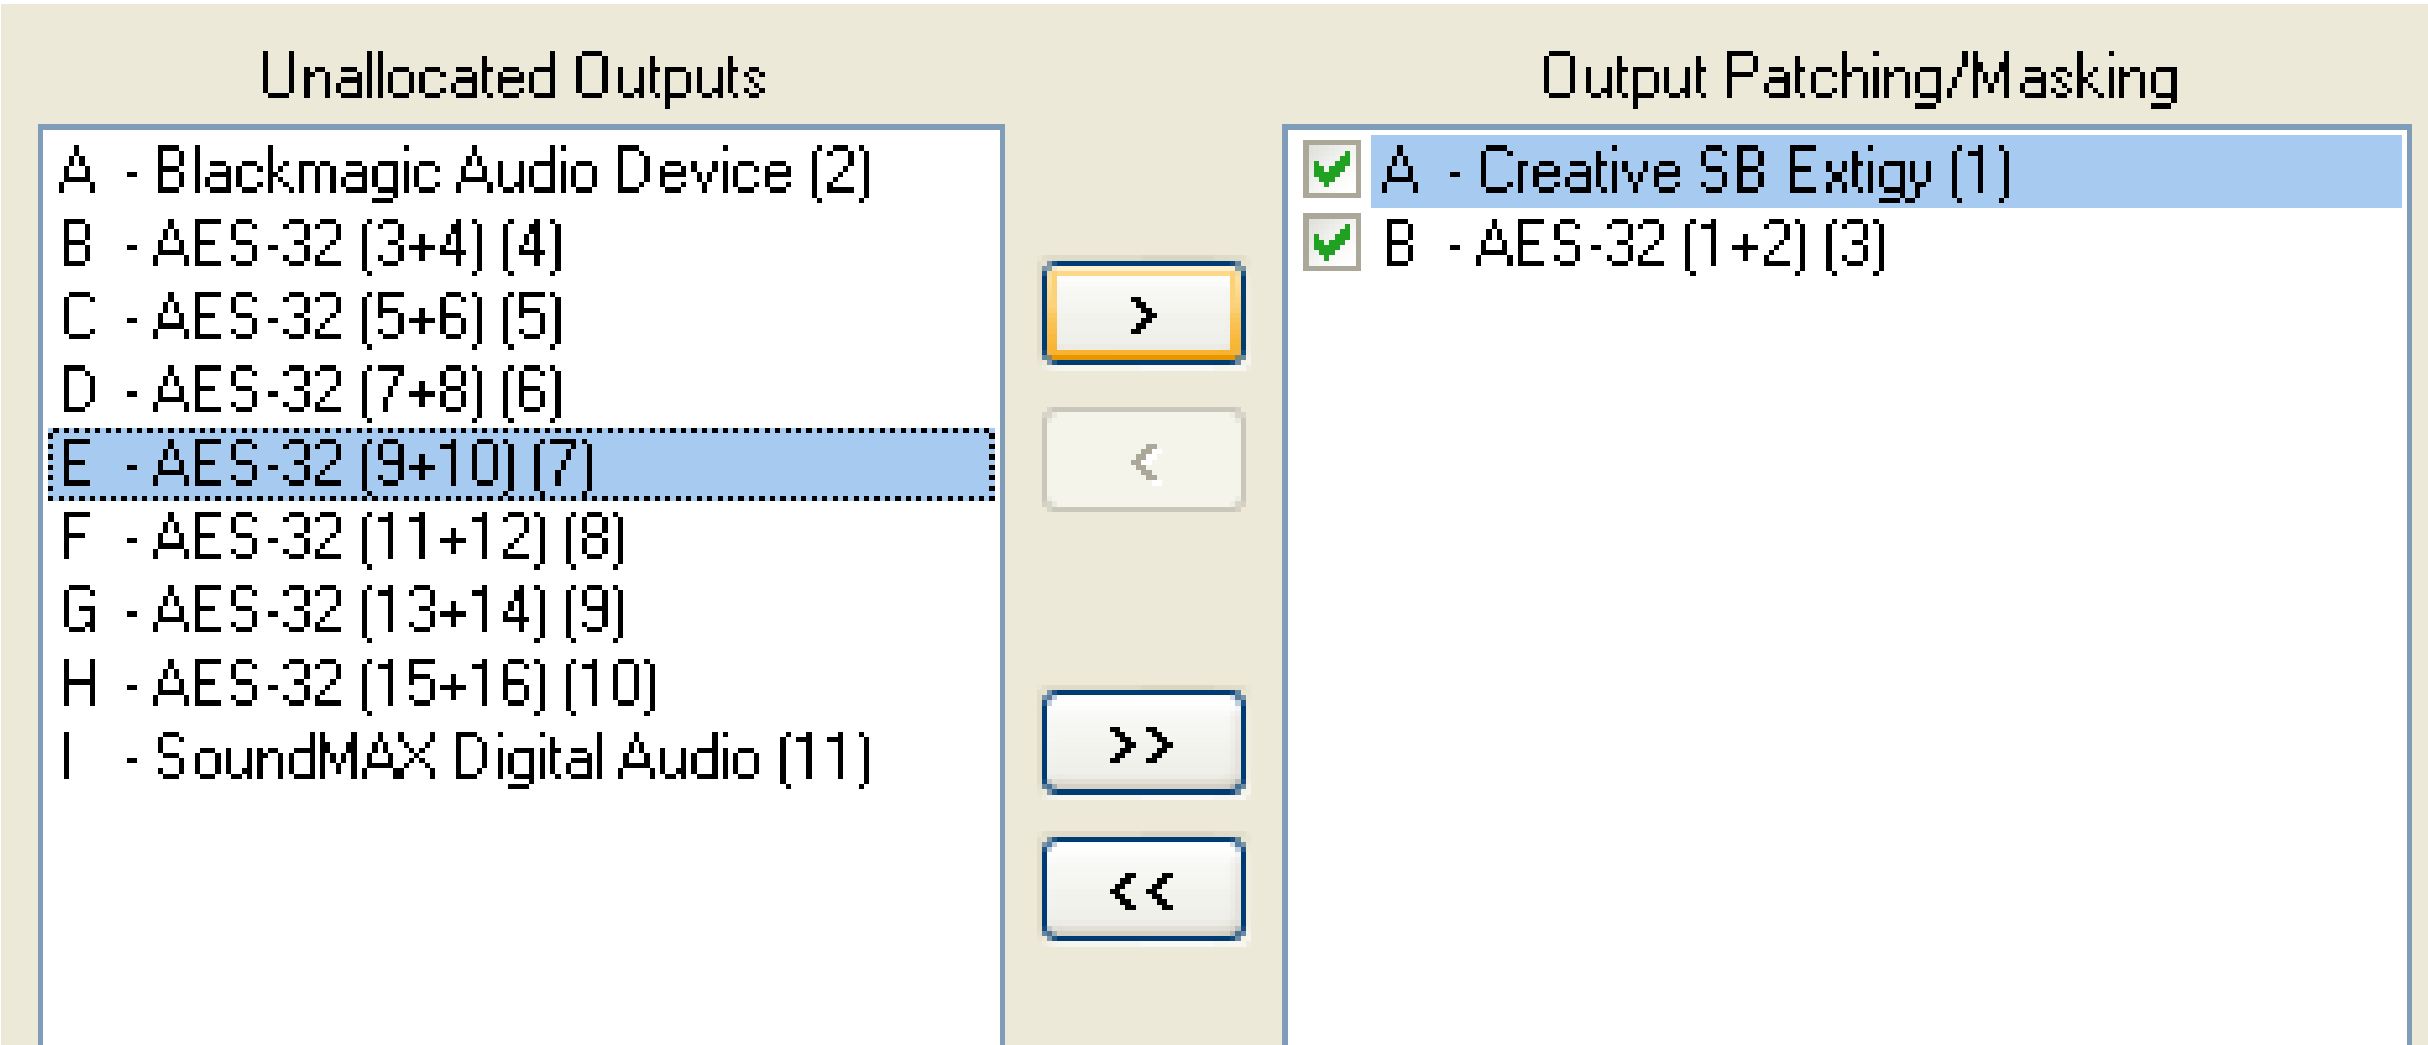

Initially the current output device configuration is shown in the right hand panel

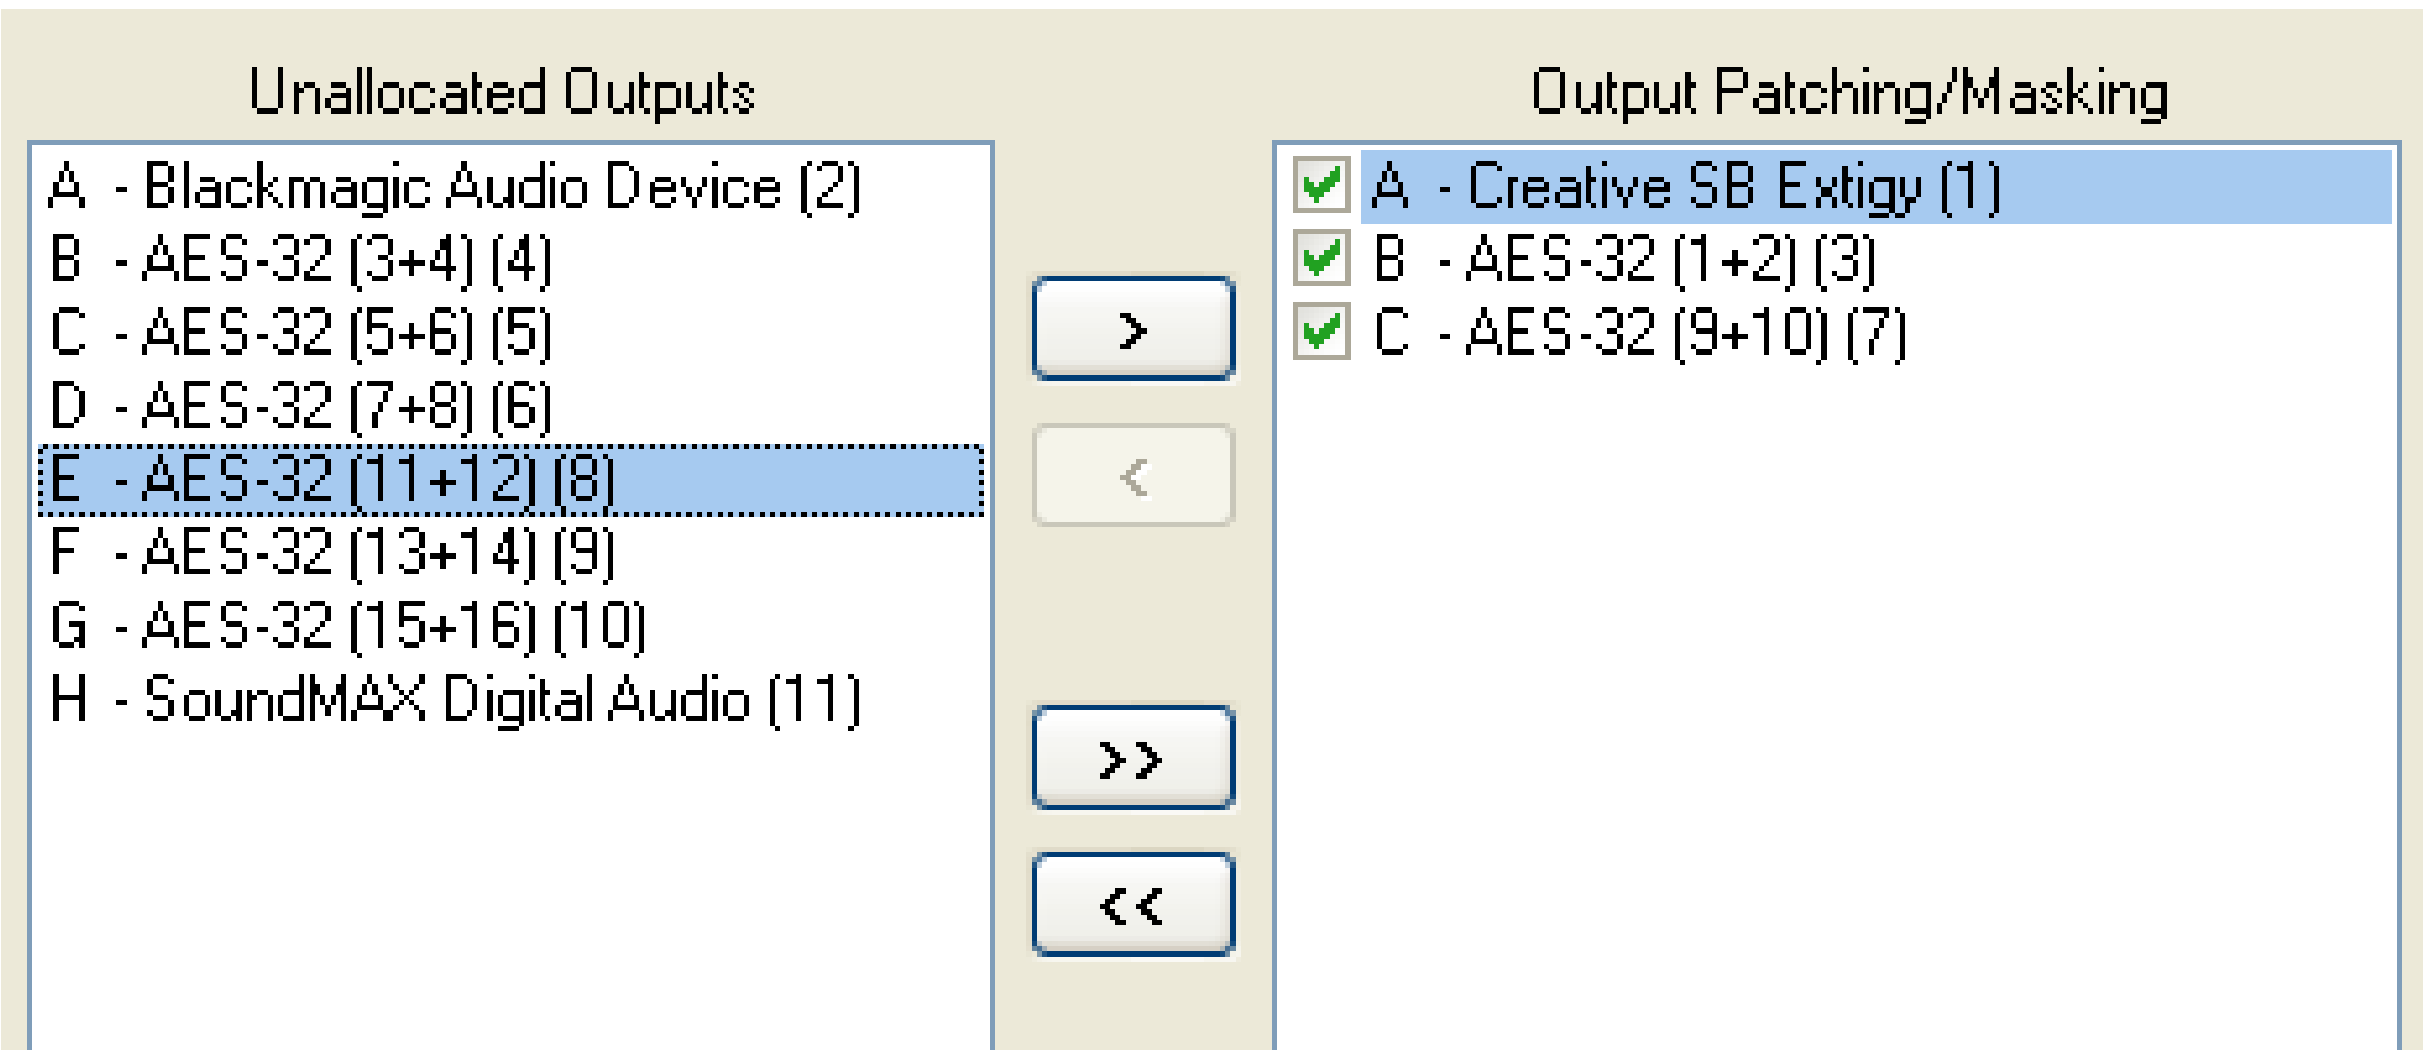

Clicking the << button will move all except the default output device into the left panel.

Now the output order can be built up by highlighting a entry in the left panel and clicking > to move the output in to the right hand panel.

The moved entry will be automatically 'unmasked' (checkbox ticked)

Continue moving entries until all the required outputs are in the right hand panel

Finally move all the remaining entries across to the right hand panel by clicking >>

These items will be entered as masked.

The order of the items in the right hand panel can be changed by left drag/dropping.

Try Remote Filename

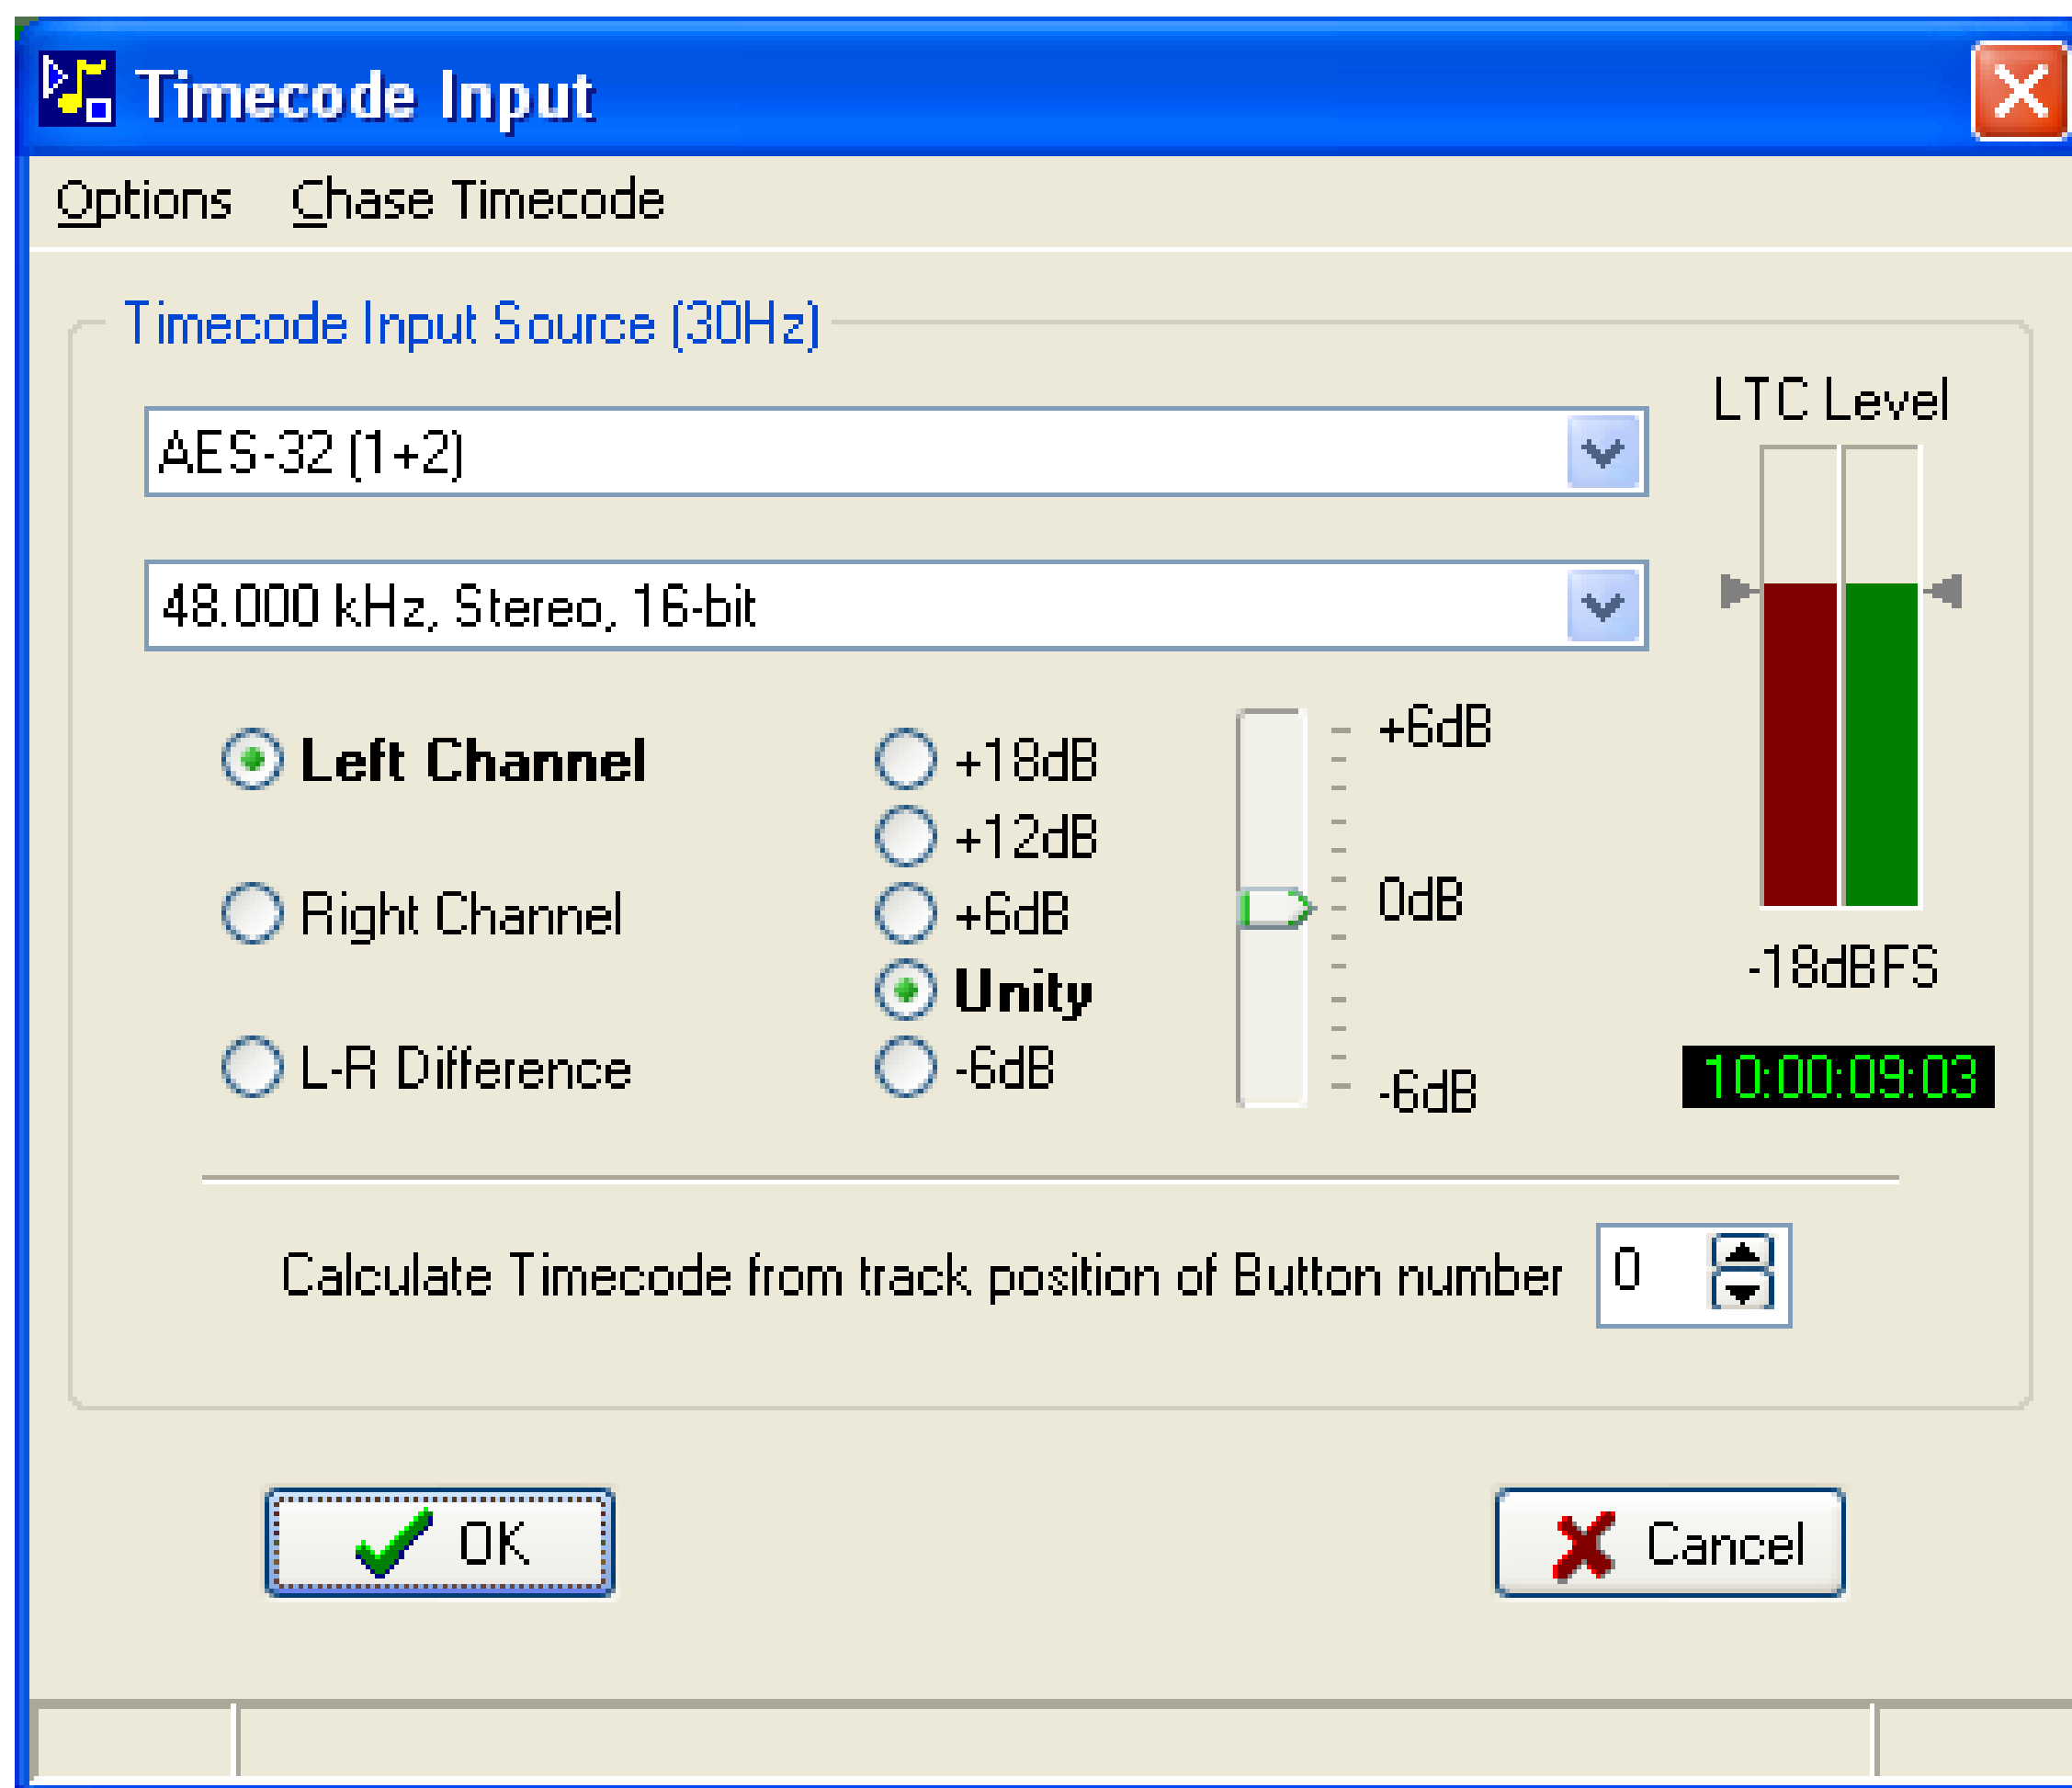

When loading a session file it is possible that some audio material referred to has been deleted from the local drive, in this case if the track assigned to a particular button cannot

However, if the Try Remote Filename option is checked then the original file location will also be tested to see if the file is still in that location, if it is it will be copied to the local drive. The disadvantage of this is that if network drives are being used and are offline, the timeout can be quite long making the program unresponsive.

SetUp for PBus control see PBus Control

Int/Ext Timecode

SpotOn can decode external SMPTE longitudinal timecode from a selected audio input or take the elapsed time timecode of a nominated button and use it to trigger GPIs or cause AutoPlay buttons to chase the timecode.

The analogue audio timecode (LTC) should be connected to an audio input channel and the channel selected from the upper drop-down menu.

The lower drop-down menu selects the sample rate and bit depth for the timecode signal - this is fixed at 44.1kHz and 16 bit.

The bargraphs on the right hand side of the window show the signal levels for left and right channels, immediately below is the calculated average signal level and the decoded timecode value.

The timecode can be decoded from the Left or Right channels or the difference between the two channels, the last option is a facility to use a balanced feed of LTC with an unbalanced stereo input as might be found on a Laptop computer.

Coarse and fine gain adjustment are available to compensate for low level inputs, if possible the level should be set to match the markers (-18dBFS) on the level bars .

The default options are shown in bold text.

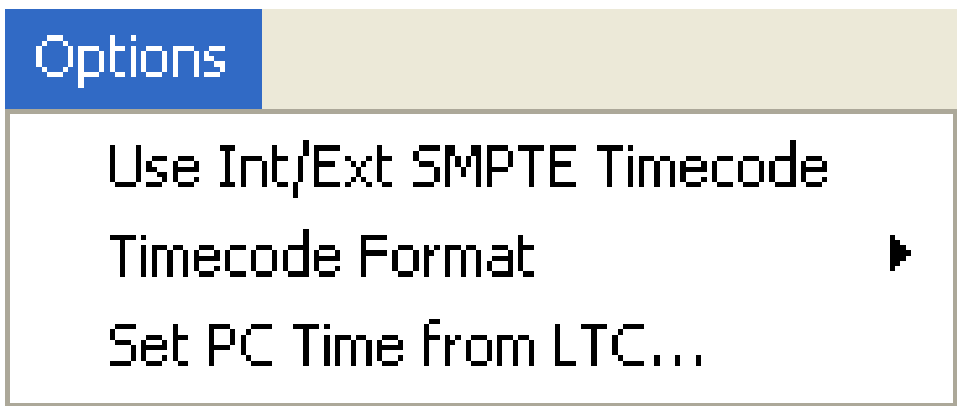

To use the alternative of deriving the timecode from a button select a non zero value in the button number box

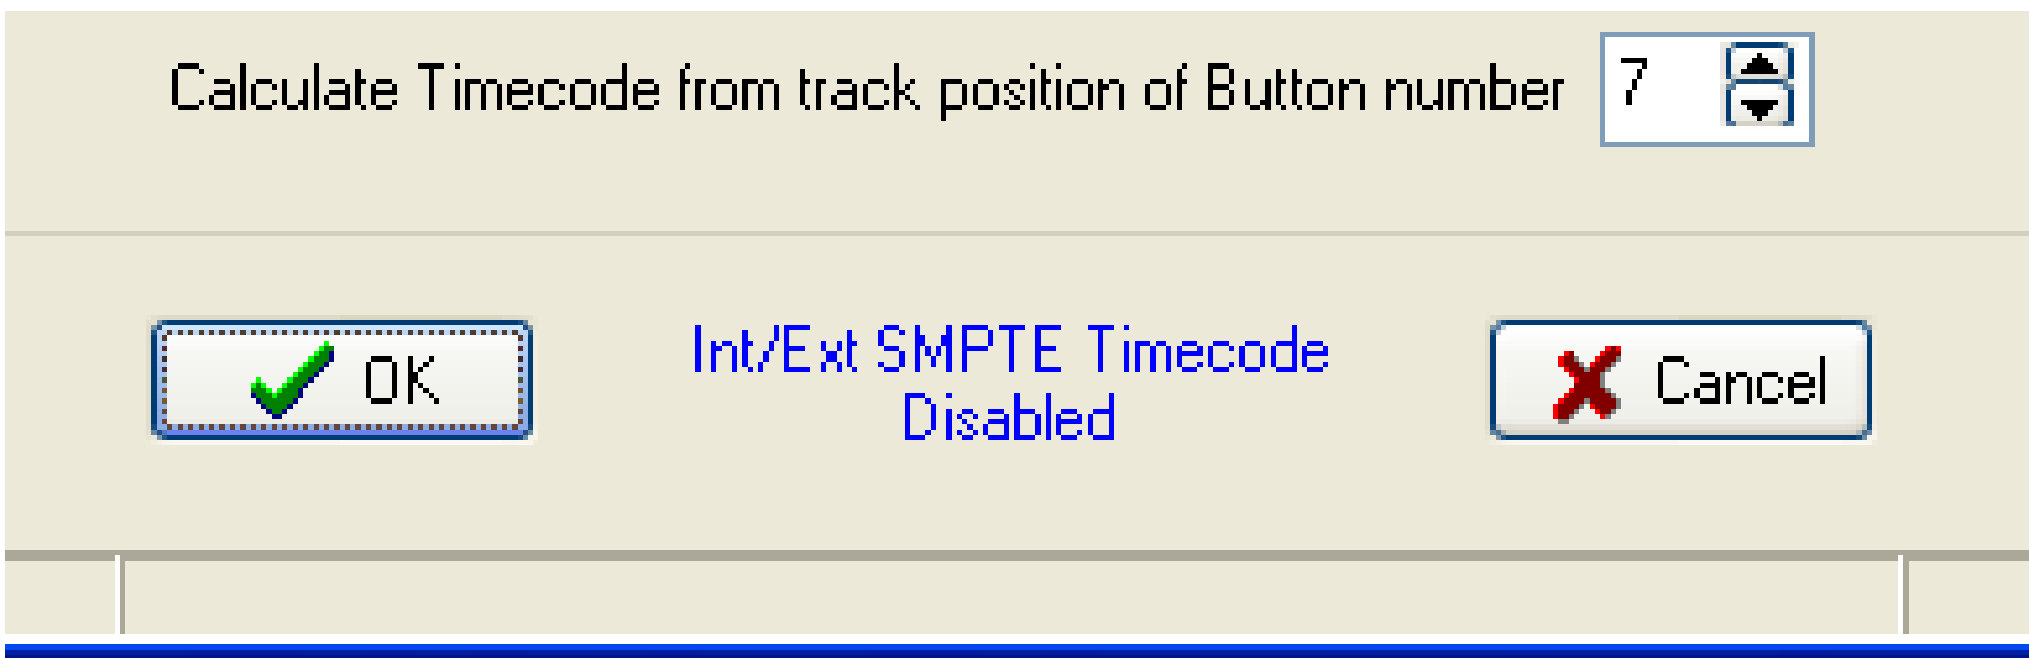

The action of selecting a non-zero button number will set the audio input to None, similarly setting the audio input selection to anything other than None will set the button number to zero.

The timecode is calculated from the current absolute position within the track and does not take into account any In Point that may be set.

If the button number is set to 321 (which exceeds the highest button number available) the timecode will be based on the PC internal clock.

The Use Int/Ext SMPTE Timecode item duplicates the item in the Options menu and can disable/enable all the timecode facilities, if disabled a message will be shown in the lower part of the dialog.

Timecode format to be changed from the default of 25Hz non-drop frame.

Additionally the external LTC signal can be used to set the PC clock, a prompt dialog box is shown with the current error

Access rights of the current user may restrict the ability to change the PC clock settings.

The timecode chase function allows AutoPlay buttons to chase external timecode, this function is enabled by checking 'Chase to Timecode On', alternatively this option can be set via a command line switch /ChaseTCode.

Chase Timecode

+/- 2 frames

+/- 3 frames

+/- 4 frames

✓ +/- 5 frames

Timecode Triggers

The Timecode Trigger List offers a method of triggering buttons from incoming timecode as an alternative to emulated GPIs

DTMF Tone Trigger

SpotOn can decode DTMF tone sequences and trigger buttons via associated Midi notes 16/100..115

Network Target

If a Target follow Master setup is required where two SpotOn computers have identical packages loaded and one computer is to track the other then 'This PC as Network Master' should be checked on the Master computer and 'This PC as Network Slave' checked on the Target computer.

When loading packages onto other computers, the computer name and dongle number are automatically checked against those embedded in the package file to ensure the Networked messages are not looped back to the same computer.

On the status bar of the Master computer the MidiOut panel should have underlined text indicating it is a Network Master

Midi Out On

On the Master computer enter the computer name or IP address for the Target computer.

IP Address or Name of target SpotOn computer

Laptop_P4

If only the computer name of the target computer is known, the current IP address of that computer can be found by clicking on LookUp IP Addr.

SpotOn waiting...

Looking Up IP Address...

if the look up is successful then the IP address will be displayed proving that the computer is or was recently connected to the network

IP Address or Name of target SpotOn computer

Laptop_P4

Look Up IP Addr 192.168.0.3

if the look up fails then Not Found is shown indicating that no computer of that name is currently on the network

SpotOn will accept either the Target computer name or its IP address, entering the computer name is preferred on networks operating DHCP where the computer IP addresses are not fixed.

Other than loading the packages the following should be set automatically on exiting the dialog

On the Master computer "Use Midi Out " in the Options menu must be enabled.

On the target computer "Use Midi In over Network|Midi In over UDP" in the Engineering menu and "Use Midi In " in the Options menu must be enabled.

Master Computer

Network Master - checked
Enter name of Target Computer
Use Midi Out - enabled
Load package

Target Computer

Network Master - unchecked
Use Midi In over Network (UDP) - checked
Use Midi In - enabled
Load same package as Master

Midi In over Network

SpotOn can accept conventional Midi messages supplied via the sound card or game port, it can also respond to Midi messages passed to the computer running SpotOn via a network connection and is enabled by checking the UDP and/or TCP options.

The Midi In On mimic on the main window status bar will be in italics if either option is checked.

See UDP/TCP Commands for further information and details of non-Midi commands that can be sent over UDP

Playout Logs

Save XML Logs	Generate XML formatted playout logs as well as plain text logs
Delay Log BackUp	Delays backup of Playout logs until all tracks are stopped, this ensures that the play duration time in the log is correct

When Delayed Log BackUp is selected the Playout log display window title bar indicates the selection.

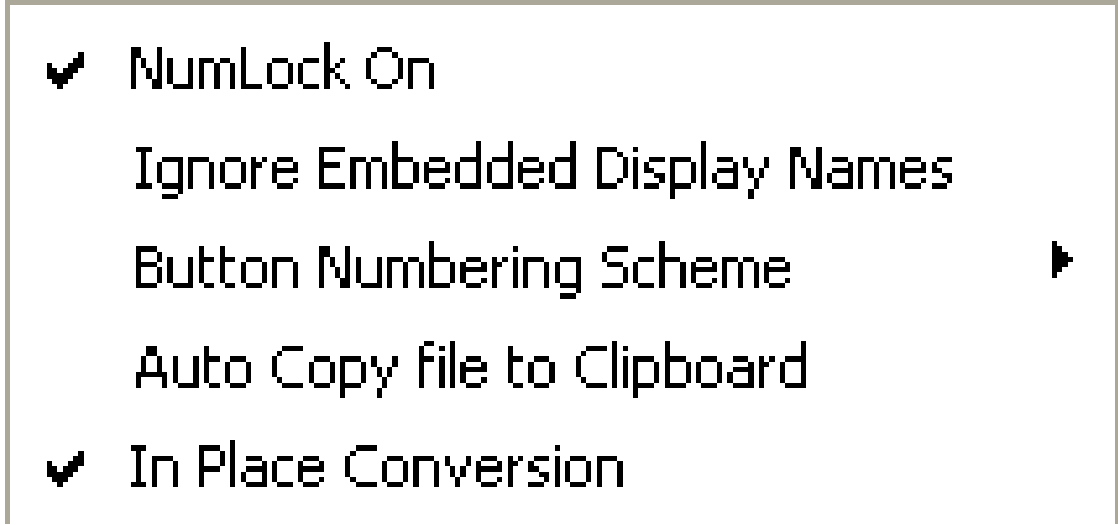

Lock Session Files

To avoid accidental deletion or modification of files loaded into a session they can be set to be Read-Only for the duration of the session by using this option which is saved within the session and package files.

Disable User Menus

If the SpotOn is to be used purely for playout and no loading or editing facilities are required then this option will disable all the main menus and the right click options.

Misc

NumLock On	Set NumLock on at start up
Ignore Embedded Track Names	Ignore embedded track names when loading audio files
Button Numbering Scheme	Arrange the numbering of tracks
Auto Copy file to Clipboard	When checked the button popup menu Copy action will also copy the button WAV file to the Windows Clipboard so that it can be "Pasted" to a new location outside of SpotOn
In Place Conversion	Save 24>32 bit conversions and decompressed files to source folder

Misc - NumLock On

When checked set the keyboard NumLock state to be On at start up

Misc - Ignore Embedded Track Names

Audio files can have a 'Display name' embedded in the file along with the audio data, by default SpotOn uses this name if it is present as the Trackname when loading the file.

When this option is checked SpotOn will ignore the embedded 'Display Title' and make up a Trackname from the filename of the audio track when the file is initially loaded

Misc - Button Numbering Scheme

In some instances the default numbering of the buttons on the pages may not be suitable so a range of alternative schemes is available: -

Normal (numbers increase on subsequent pages)	1	2	3	4	5	6
	7	8	9	10	11	12
	13	14	15	16	17	18
	19	20	21	22	23	24
Paged in Rows (numbers the same on all pages)	1	2	3	4	5	6
	1	2	3	4	5	6
	1	2	3	4	5	6
	1	2	3	4	5	6
Paged in Columns (numbers the same on all pages)	1	1	1	1	1	1
	2	2	2	2	2	2
	3	3	3	3	3	3
	4	4	4	4	4	4
Paged in Rows/Columns (numbers the same on all pages)	1	2	3	4	5	6
	7	8	9	10	11	12
	13	14	15	16	17	18
	19	20	21	22	23	24
Paged in Columns/Rows (numbers the same on all pages)	1	5	9	13	17	21
	2	6	10	14	18	22
	3	7	11	15	19	23
	4	8	12	16	20	24
Paged in 2 Blocks per page (numbers the same on all pages)	1	5	9	1	5	9
	2	6	10	2	6	10
	3	7	11	3	7	11
	4	8	12	4	8	12
Normal but with Column/Row order (numbers increase on subsequent pages)	1	5	9	13	17	21
	2	6	10	14	18	22
	3	7	11	15	19	23
	4	8	12	16	20	24

Clear Recent Lists

Recent history lists available from the File menu and the File Search history can be cleared with this option along with the button image associations, note Undo does not operate with these actions.

Sample Frequency Limit

The sample frequency of WAV files can be any value - typically 8,000.. 96,000 samples/second, at the higher sample frequencies and especially with 32 bit samples the data rate can become very high and the application will slow down as more CPU time is absorbed during playout.

The default value is 48kHz which should be sufficient for most purposes.

Volume Controls - menu item disabled

Each audio output device on a PC has its own set of mixer controls these can be accessed with this menu option

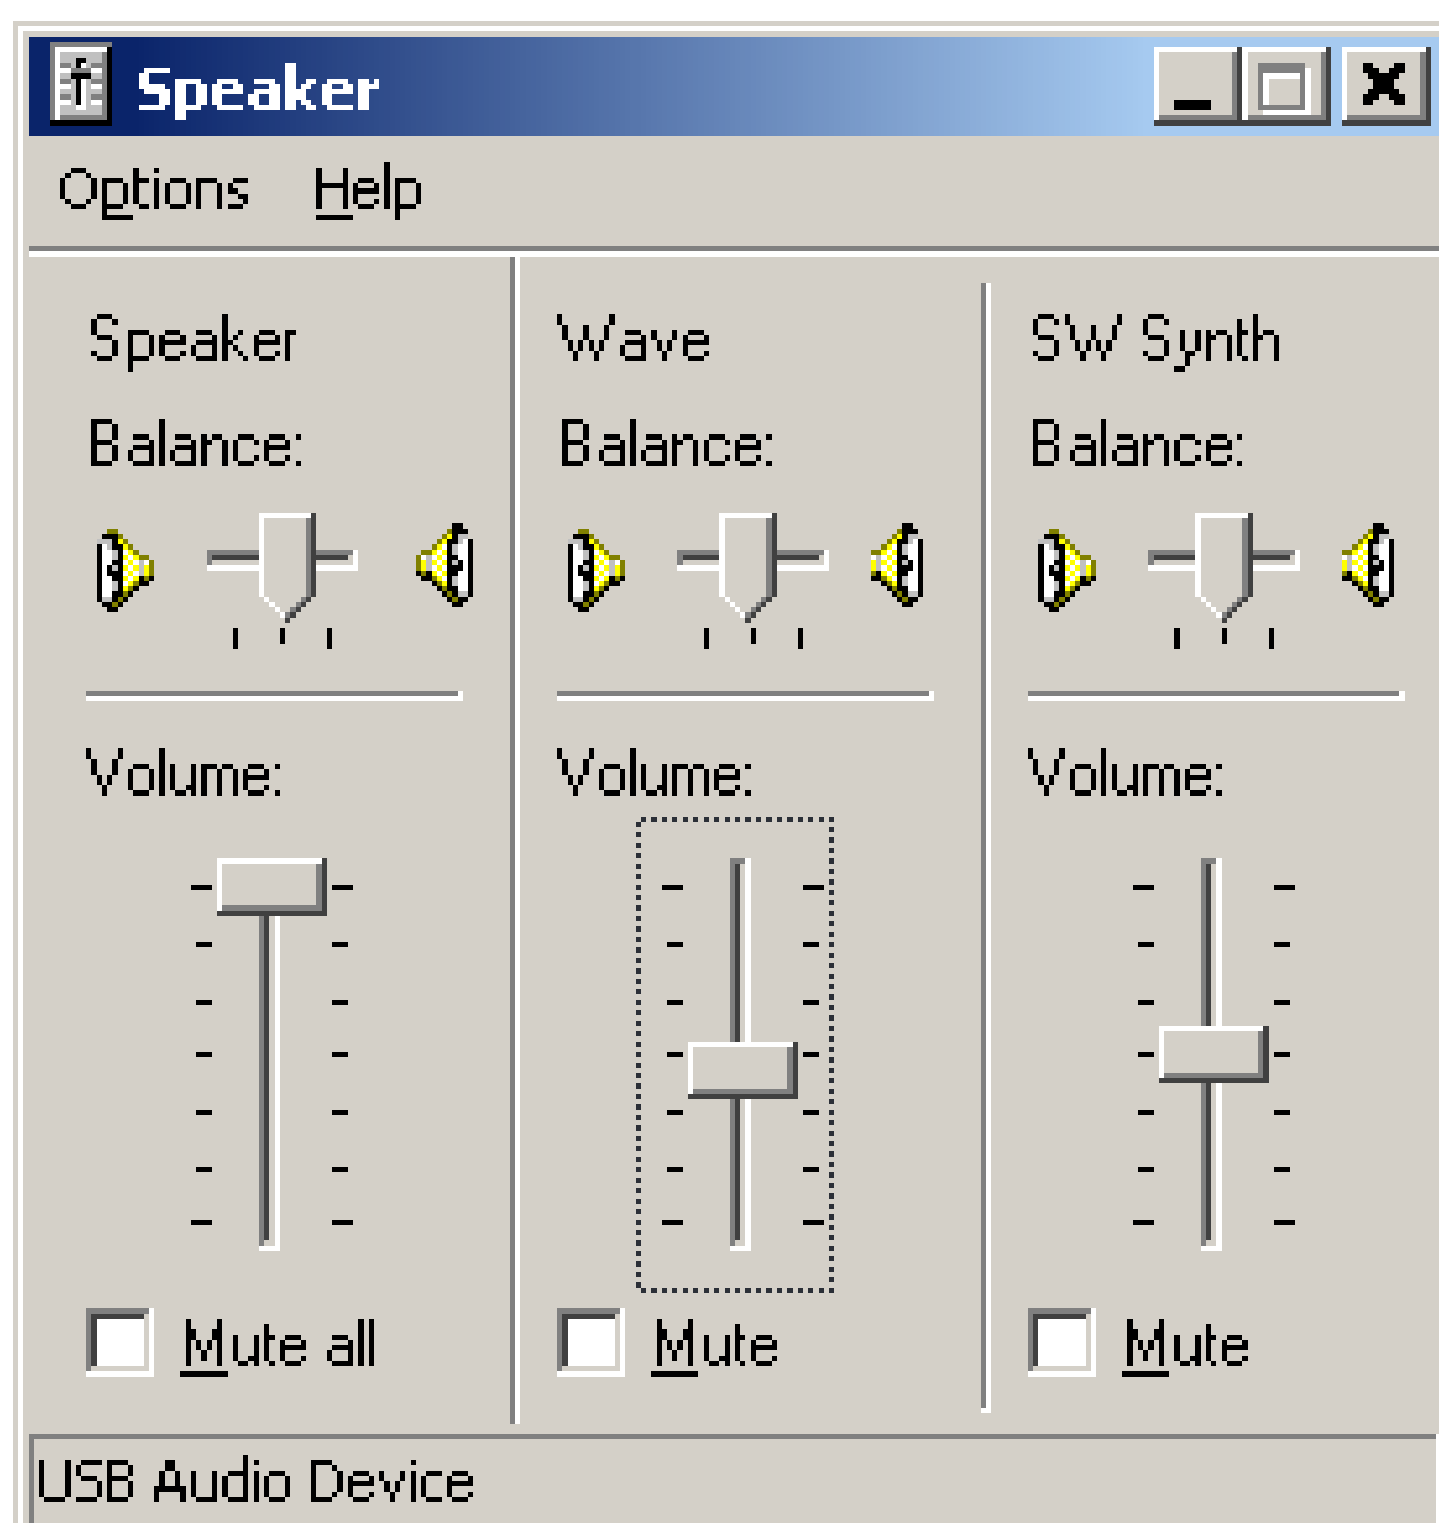

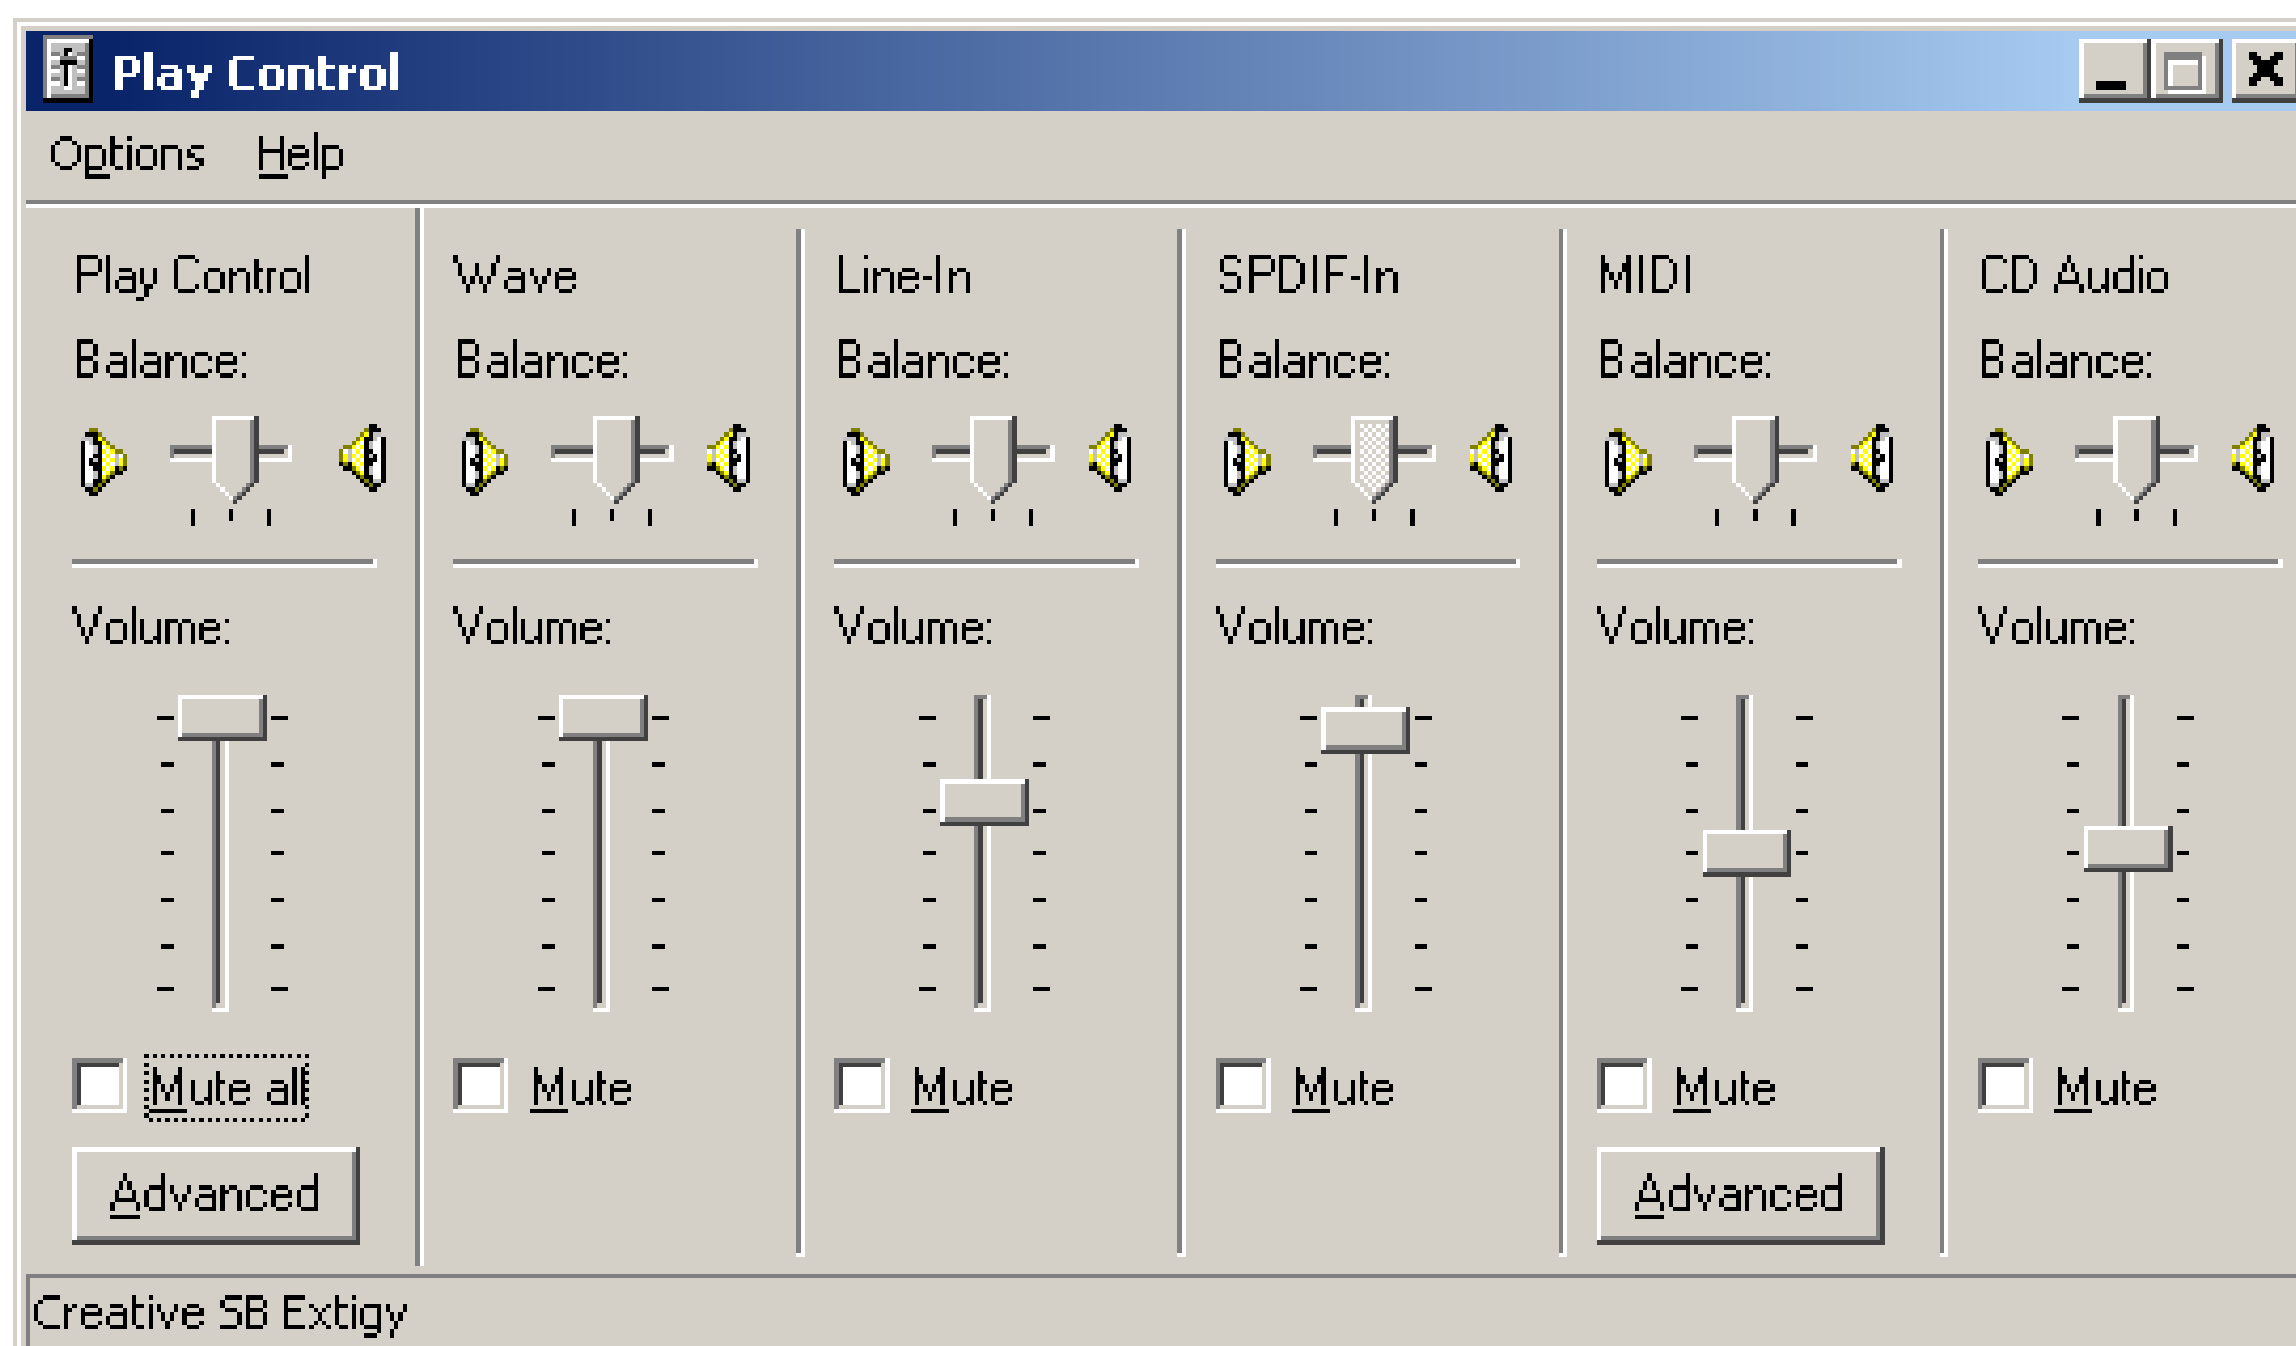

Note the level settings displayed to the right of the sound device name, these are of the form: -

[Master level, Wave output level]

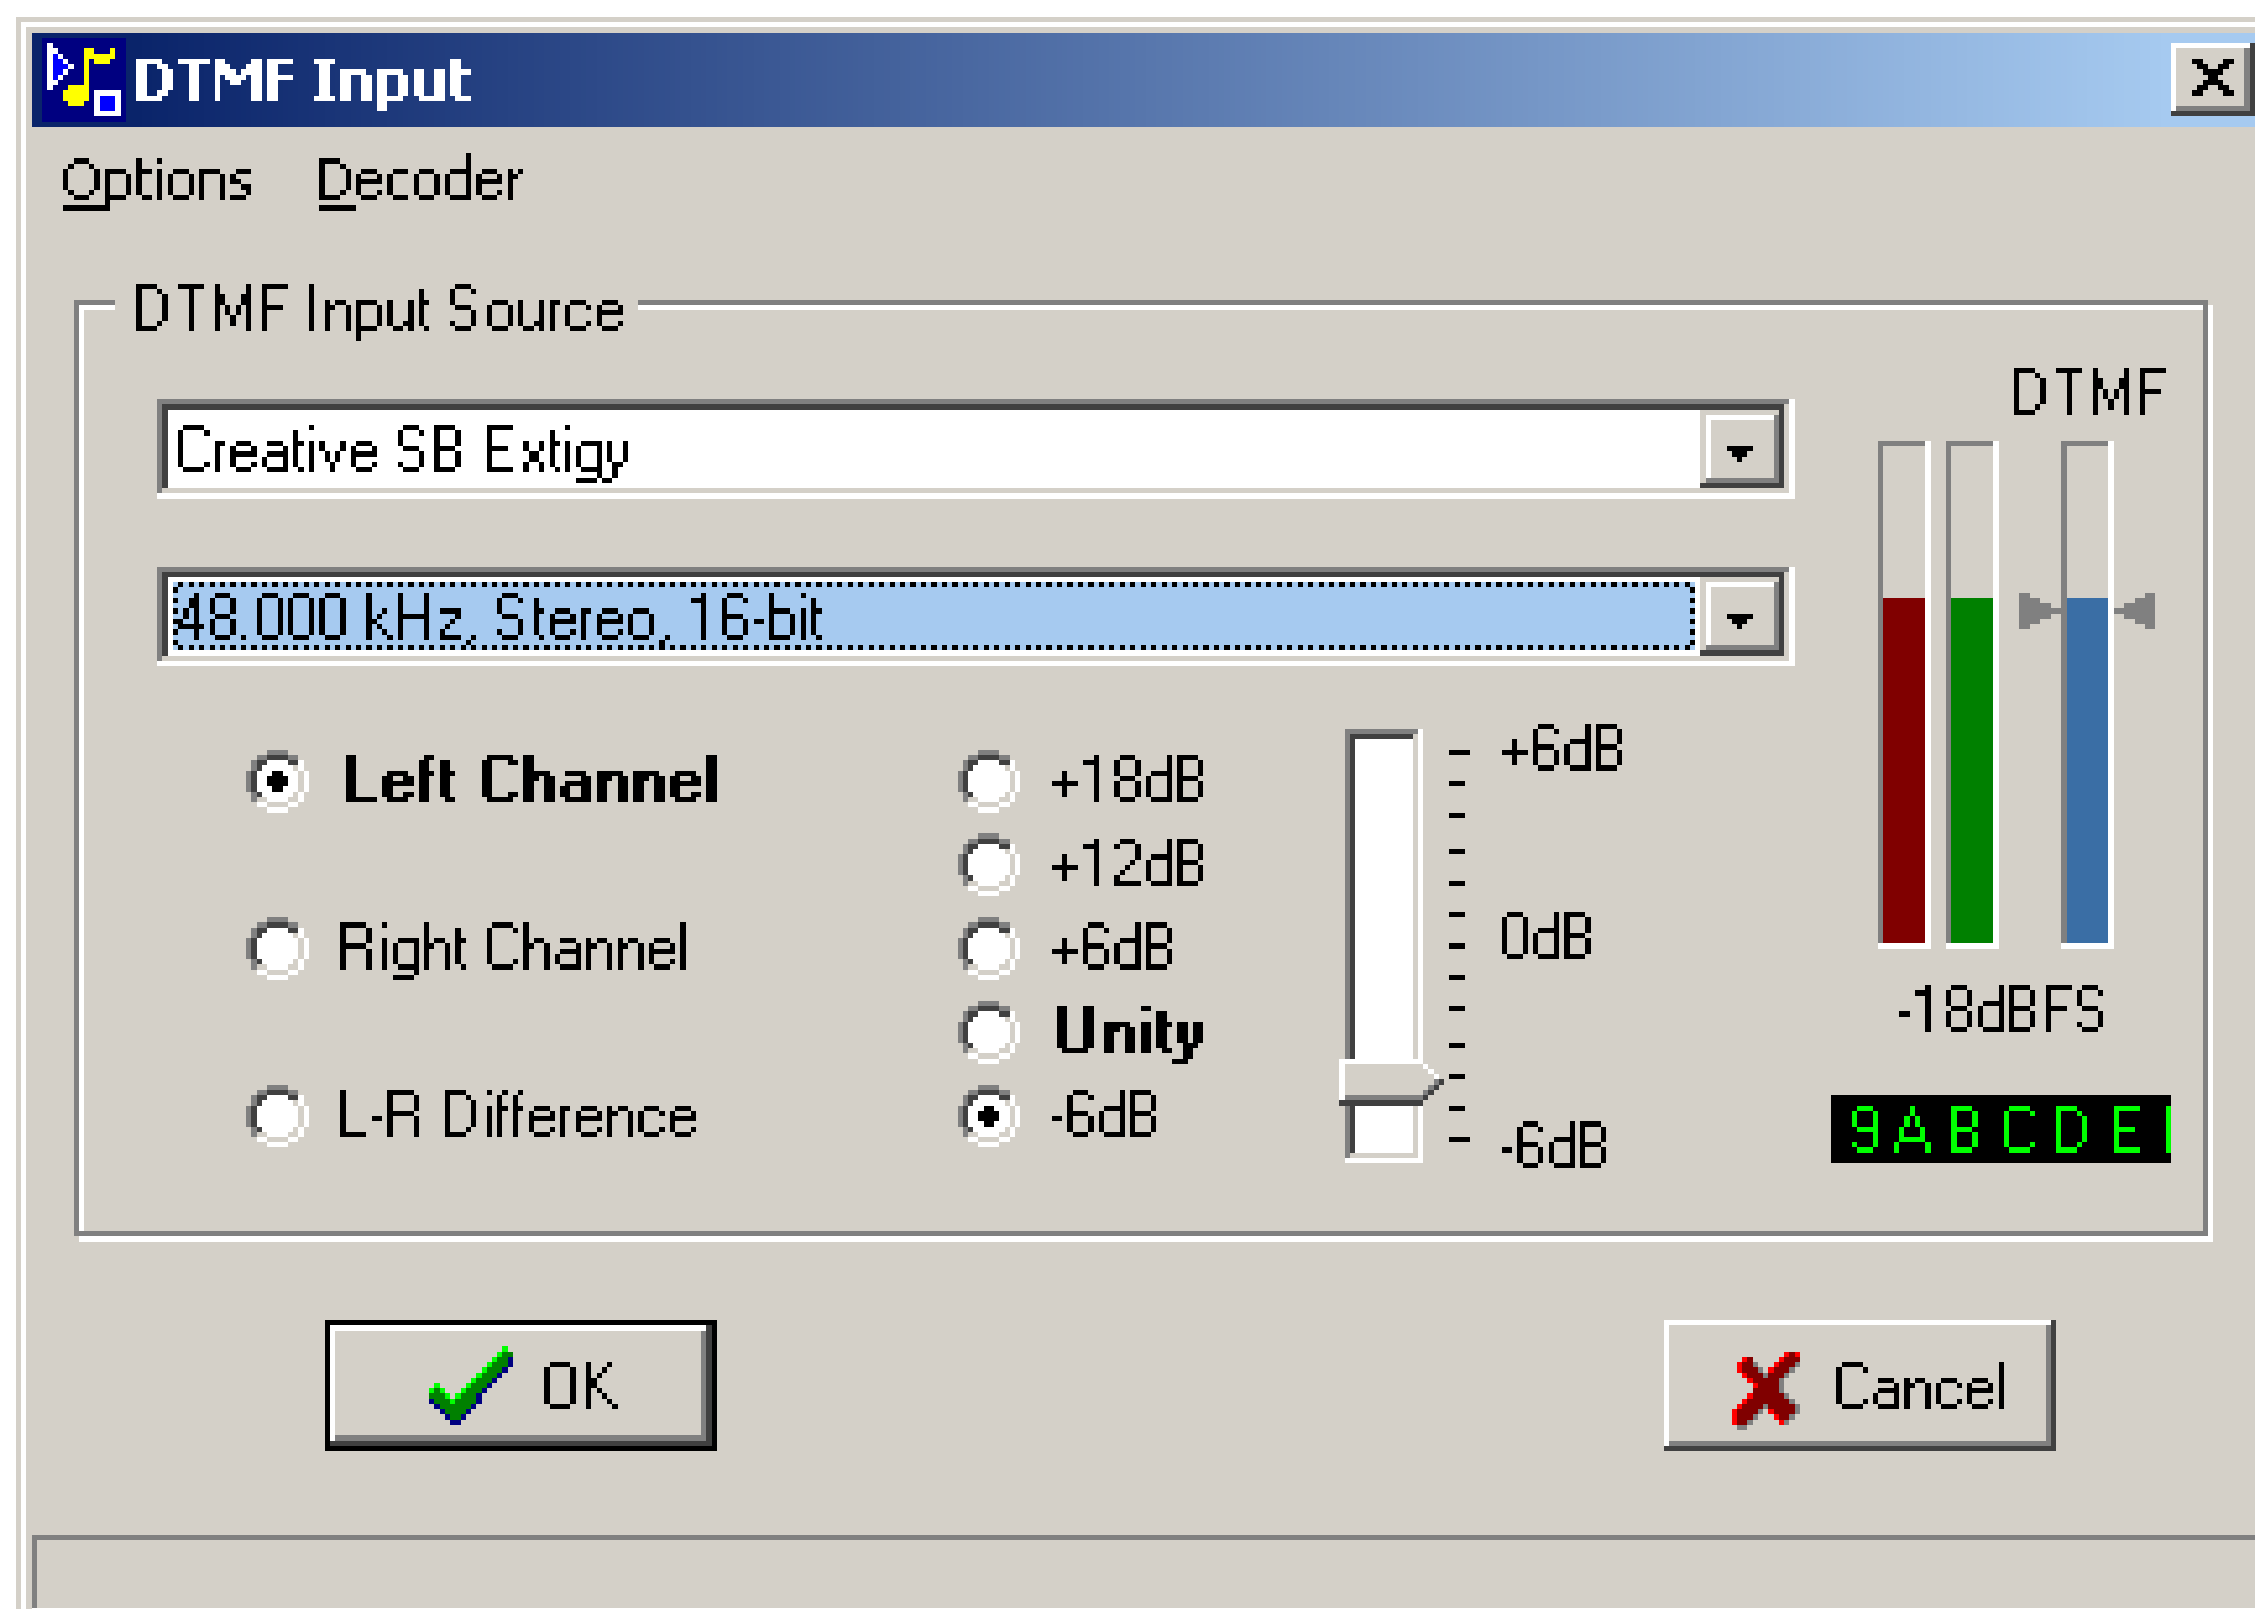

Levels are shown in dB (0dB is the maximum level), if a level is muted the word "Mute" is shown instead of the level value.

Typical control panels are shown below - note that not all sound card drivers support all options.

DTMF Decoder

SpotOn can decode external DTMF tones (0..F) from a selected audio input and use them to trigger buttons via Midi notes 100..115 on channel 16.

The analogue DTMF source should be connected to an audio input channel and the channel selected from the upper drop-down menu. If the source entry is displayed in red text then it is already in use as an input for the SMPTE timecodereader and is not available.

The lower drop-down menu selects the sample rate and bit depth for the timecode signal - this is fixed at 48kHz and 16 bit.

The bargraphs on the right hand side of the window show the signal levels for left, right and filtered channels, immediately below is the decoded data scrolling right to left.

Coarse and fine gain adjustment are available to compensate for low level inputs, if possible the level should be set so that the right hand bargraph matches the markers (-18dBFS).

The DTMF can be decoded from the Left channel, Right channel or the difference between the two channels, the last option is a facility to use a balanced feed of DTMF with an unbalanced stereo input as might be found on a Laptop computer.

The default options are shown in bold text.

The DTMF tones decoded are translated to Midi Note On messages in the range 100..115 on

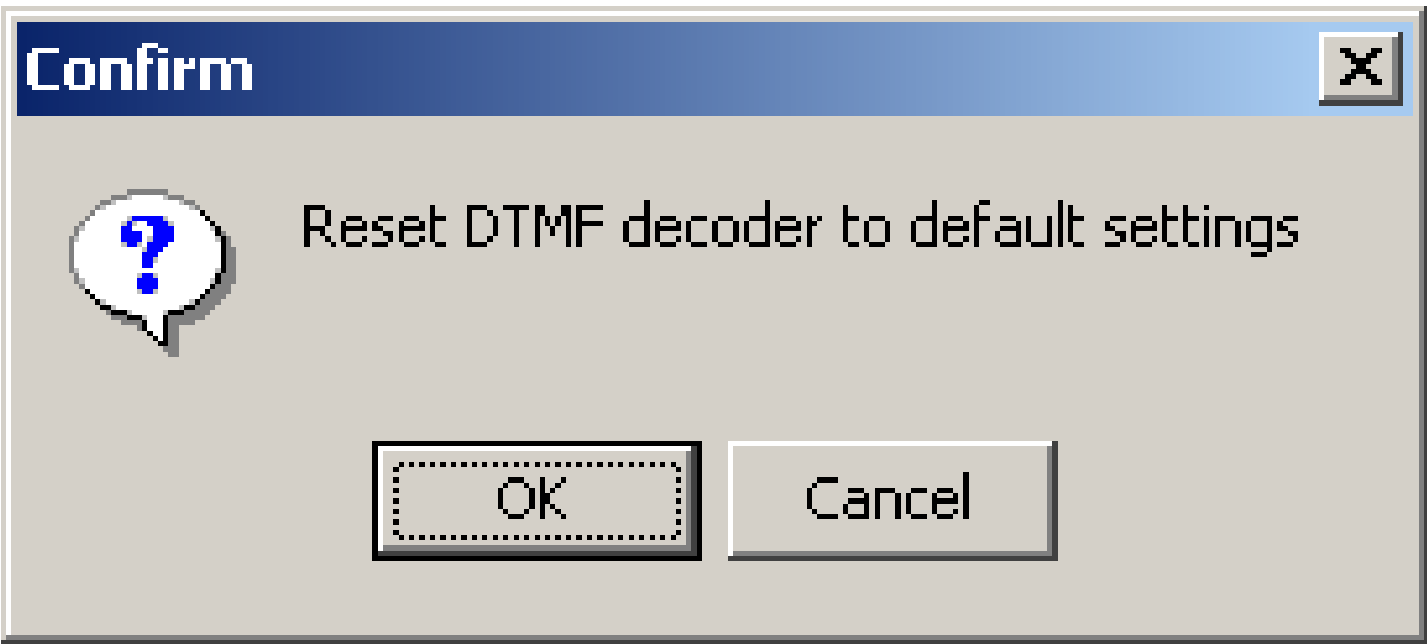

channel 16 for DTMF tones 0..F respectively where E=* and F=#.

Debug Update rate sets the refresh period of the debug display

Reset Decoder sets all the decoder parameters to their default values after clicking on OK in the confirmation dialog

The Debug option displays a live timestamped list of the incoming DTMF data along with analysis of the signal quality

The labels at the bottom of the screen show the decoder parameters, those with a '*' suffix

have right-click popup menus enabling the parameters can be changed live.

The Hold button a the bottom centre freezes the display for analysis, the Spacebar is the shortcut key for this button.

The Debug window is split into columns

Timestamp	25mS block decoding	
Tone Levels	Levels of the individual DTMF tones received	
Decoded Value	Decoded character 0..9, A..F	
Error	****	No Error
	bntot	Total of all the frequency components not above threshold - insufficient signal level
	tone1	Ratio of the level of tone 1 to the sum of all frequency components not above threshold - tone 1 not sufficiently distinct
	revtw	Higher tone level is greater than lower tone level and exceeds limit - channel has an excessive low frequency loss
	nortw	Higher tone level is less than lower tone level and exceeds limit - channel has an excessive high frequency loss
	tone3	Next largest tone after the two main tones is not suppressed sufficiently - possible ambiguity between tone 2 and tone 3
	hilo	Two tones detected are either both Lo tones or both Hi tones - there should be one Lo tone and one Hi tone
	2ndt1	Second harmonic of main tone 1 is larger than expected, so may not be a DTMF tone - only applicable when Wideband prefilter is used
	2ndt2	Second harmonic of main tone 2 is larger than expected, so may not be a DTMF tone - only applicable when Wideband prefilter is used
Twist	Measure of the relative values of the two main tones, shown as Normal Twist (nortw) when higher tone level is less than lower tone and Reverse Twist (revtw) when higher tone level is greater than lower tone level	
Tone3	Level of Tone 3 when compared with Tone 2 exceeds the preset limit	
Ratio	Ratio of levels of Tone 1 + Tone 2 to overall total is insufficient	

At timestamp 875mS the two tones detected correspond to DTMF frequencies 2 (tone 1 - highest level) and 7 (tone 2 - second highest level) and are shown in blue text.

The error is 'tone3' because the next largest signal shown in green text at DTMF frequency 5 (tone 3) is too close in level to DTMF frequency 7 (tone 2), the difference is -2.3dB, the relative level of tone 3 is shown in magenta coloured text as it exceeds the tone 3 limit of -18dB.

At timestamp 975mS the two tones detected correspond to DTMF frequencies 2 (tone 1) and 4 (tone 2), tone 2 is shown as normal in blue text but tone 1 is shown in magenta text which corresponds to the error '2ndt1' indicating the second harmonic of tone 1 exceeds the threshold.

The example below shows a high quality DTMF signal being decoded.

At timestamps 0, 25, & 50mS there is insufficient signal at the DTMF frequencies so the error is 'bntot', the next 3 entries correctly detect a '9', after two valid decodes the character is accepted as being good '****'. A similar sequence of events follows when decoding the next character 'A'.

	0	1	2	3	4	5	6	7	Error	Twist	Tone3	Ratio
	697Hz	770Hz	852Hz	941Hz	1209Hz	1336Hz	1477Hz	1633Hz		dB	dB	%
0000mS >	15,	5,	6,	3,	7,	4,	31,	9	bntot	6.7	-3.9	58
0025mS >	17,	4,	2,	6,	4,	7,	10,	5	bntot	-4.1	-3.1	48
0050mS >	4,	6,	160,	14,	11,	5,	101,	4	bntot	-4.0	-17.2	85
0075mS >	3,	12,	332,	13,	5,	11,	329,	9 = 9		-0.1	-27.9	93
0100mS >	10,	9,	374,	9,	4,	10,	313,	7 = 9 ****		-1.5	-29.8	93
0125mS >	13,	7,	333,	17,	8,	6,	277,	8 = 9		-1.6	-24.4	91
0150mS >	12,	23,	38,	7,	4,	2,	54,	5	bntot	3.0	-4.3	63
0175mS >	50,	22,	13,	9,	6,	9,	14,	30	bntot	-4.5	-2.6	52
0200mS >	287,	13,	11,	11,	9,	4,	22,	166 = A		-4.8	-17.6	87
0225mS >	300,	11,	13,	18,	6,	3,	20,	260 = A ****		-1.3	-22.4	89
0250mS >	231,	18,	6,	9,	13,	2,	7,	297 = A		2.2	-22.2	90
0275mS >	107,	13,	13,	7,	4,	3,	13,	207	bntot	5.7	-18.1	86

The Decoder menu sets the individual parameters of the decoder

Decoder

PreFilter (Wide)

Twist Limit (-12dB)

Tone 3 Threshold (-12dB)

Harmonic (-30dB)

The narrowband PreFilter selects only the DTMF tone spectrum range whereas the wideband filter includes the second harmonics of the DTMF tones

Twist is a measure of the relative amplitudes of the two most significant tones (tone 1 and tone 2)

Tone 3 threshold sets the limit for the next largest frequency component after the two most significant tones

With the Wideband prefilter selected a further check on the validity of the DTMF tones can be made by testing the level of the second harmonic of the primary tones.

In the SpotOn\TestFiles folder are a selection of DTMF wav files: -

- | | |
|-------------------------|---|
| DTMF?_48_A_M18.wav | Single pulse of DTMF '0'.. DTMF 'F' at 48kHz 16 bit mono at -18dBFS |
| DTMF_48_TestToneSeq.wav | Sequence of DTMF characters at 48kHz 16 bit mono at -18dBFS |
| DTMF_48_TestTones.wav | Sequence of DTMF tones 0..7 and then all tones simultaneously at 48kHz 16 bit mono at -34dBFS |

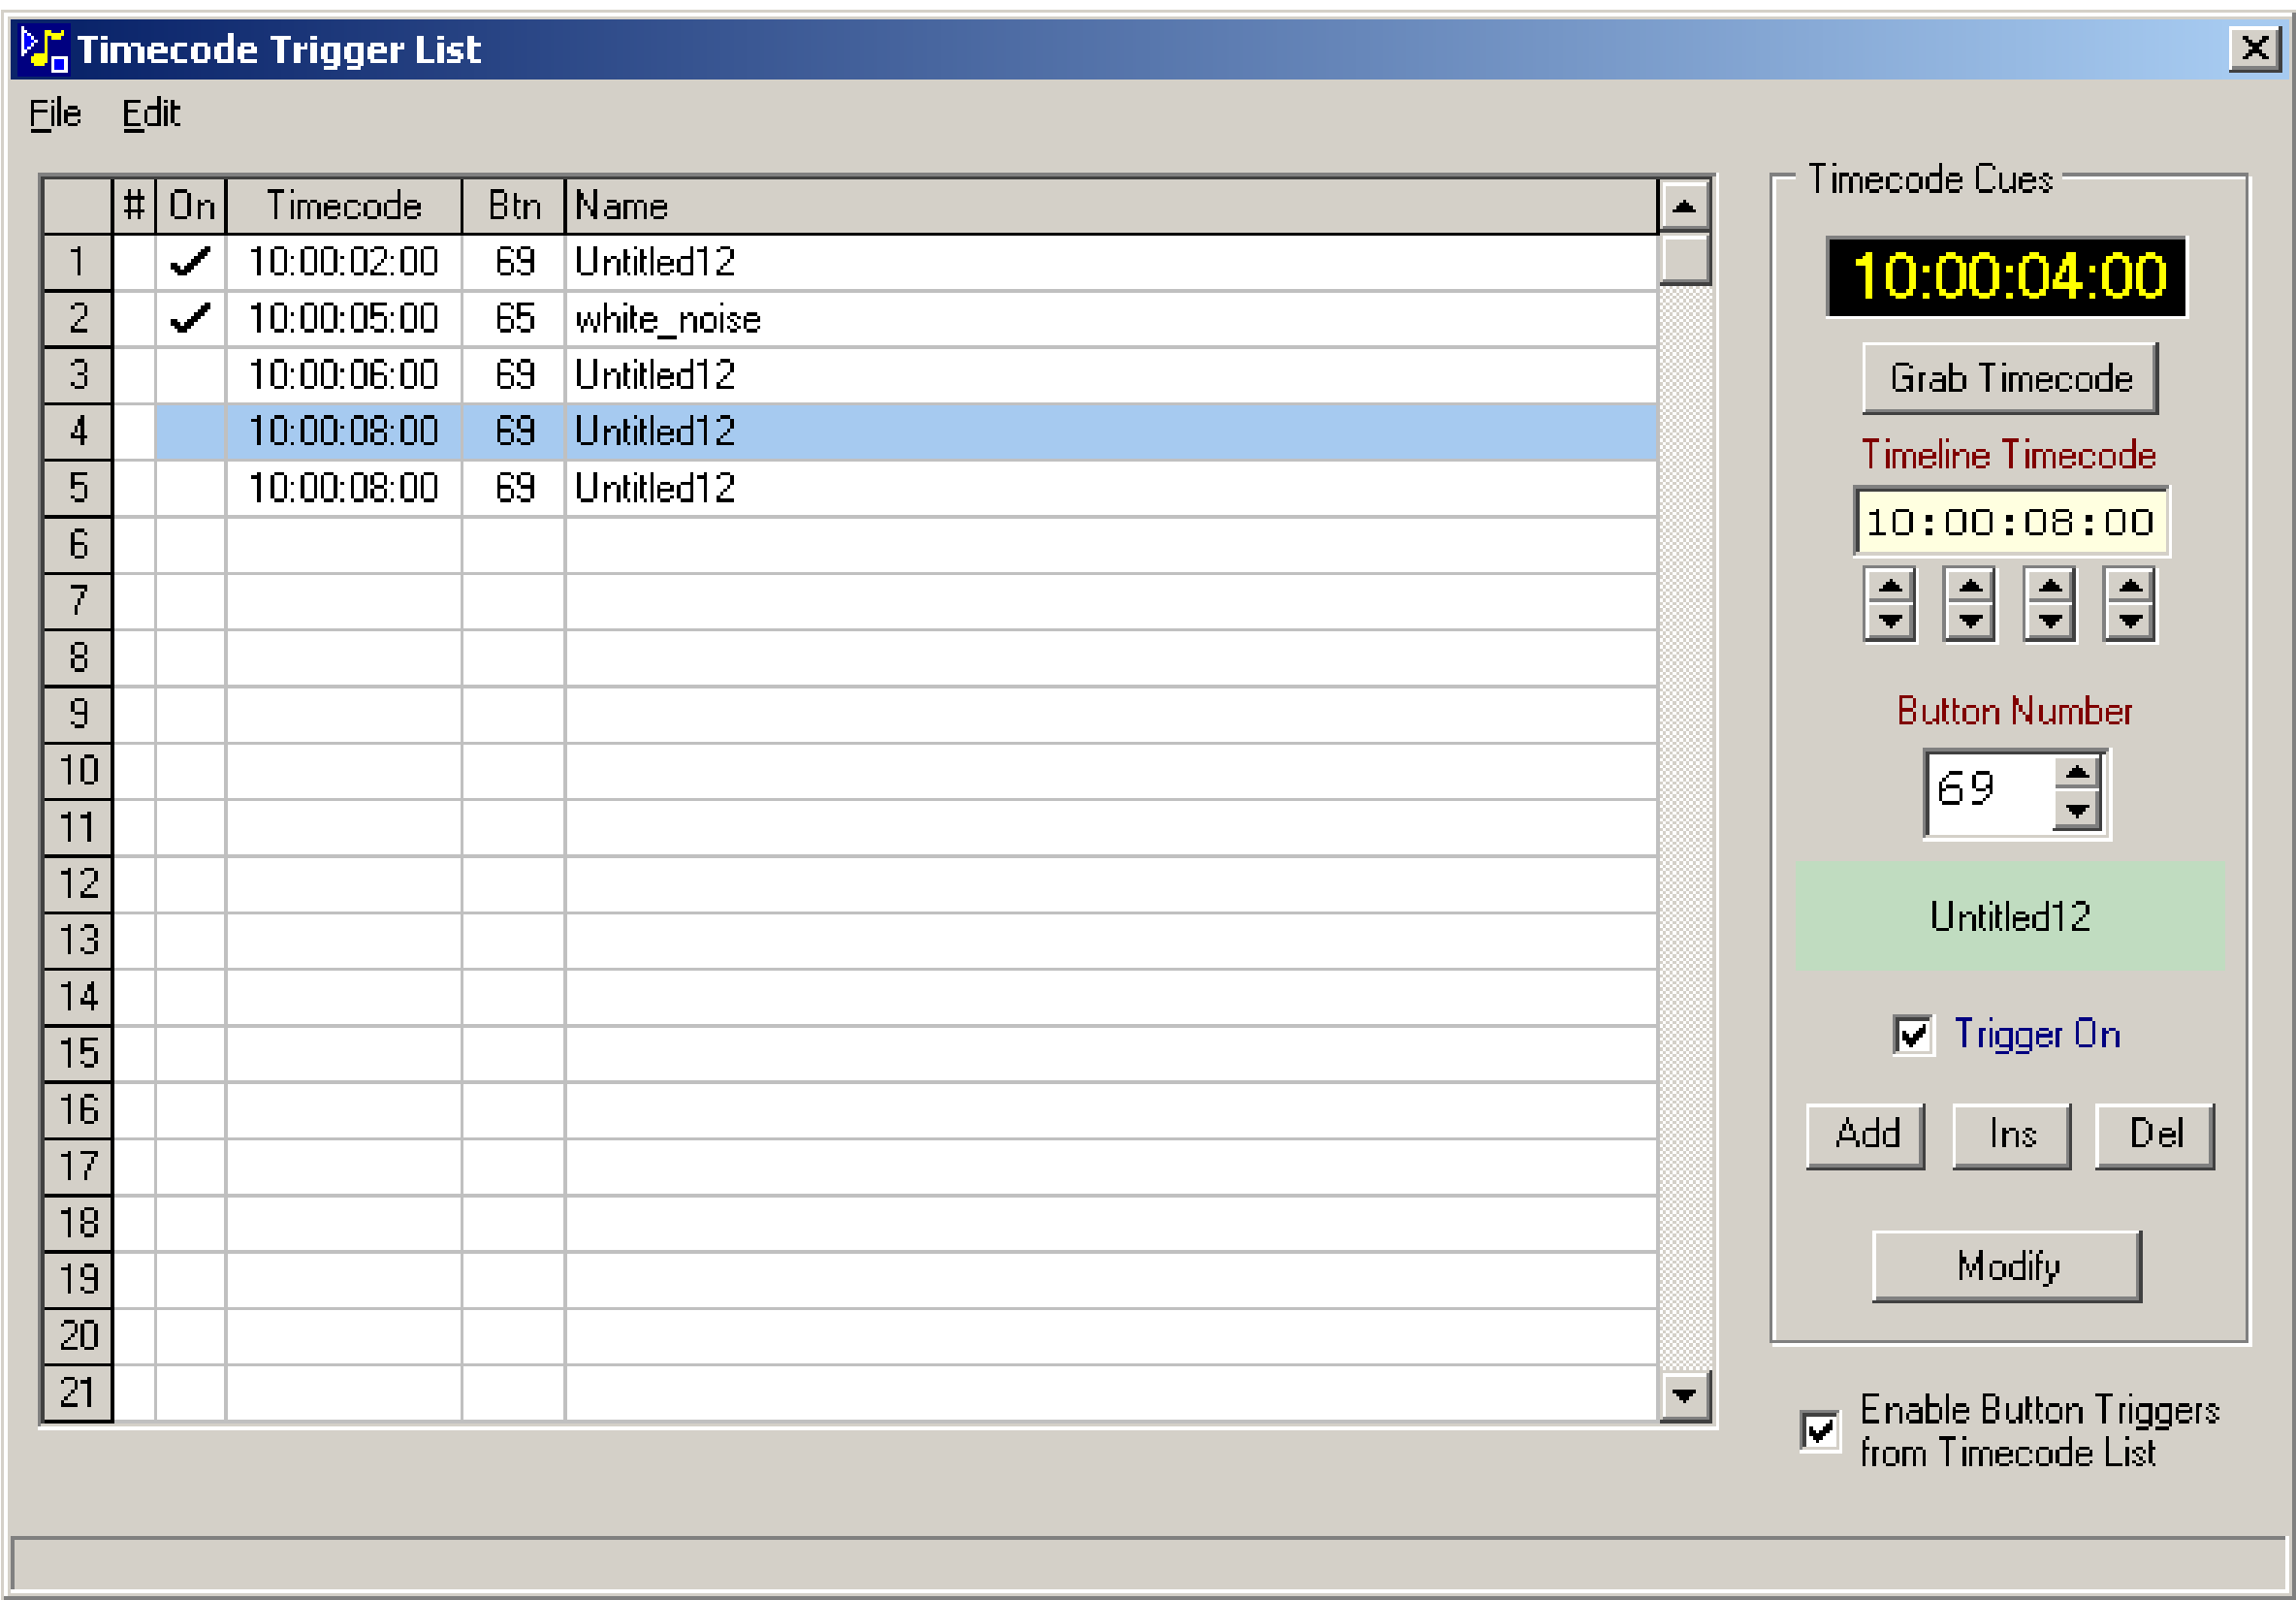

The DTMF decoder is enabled via the options menu selection Use DTMF Tone Trigger

Timecode Trigger List

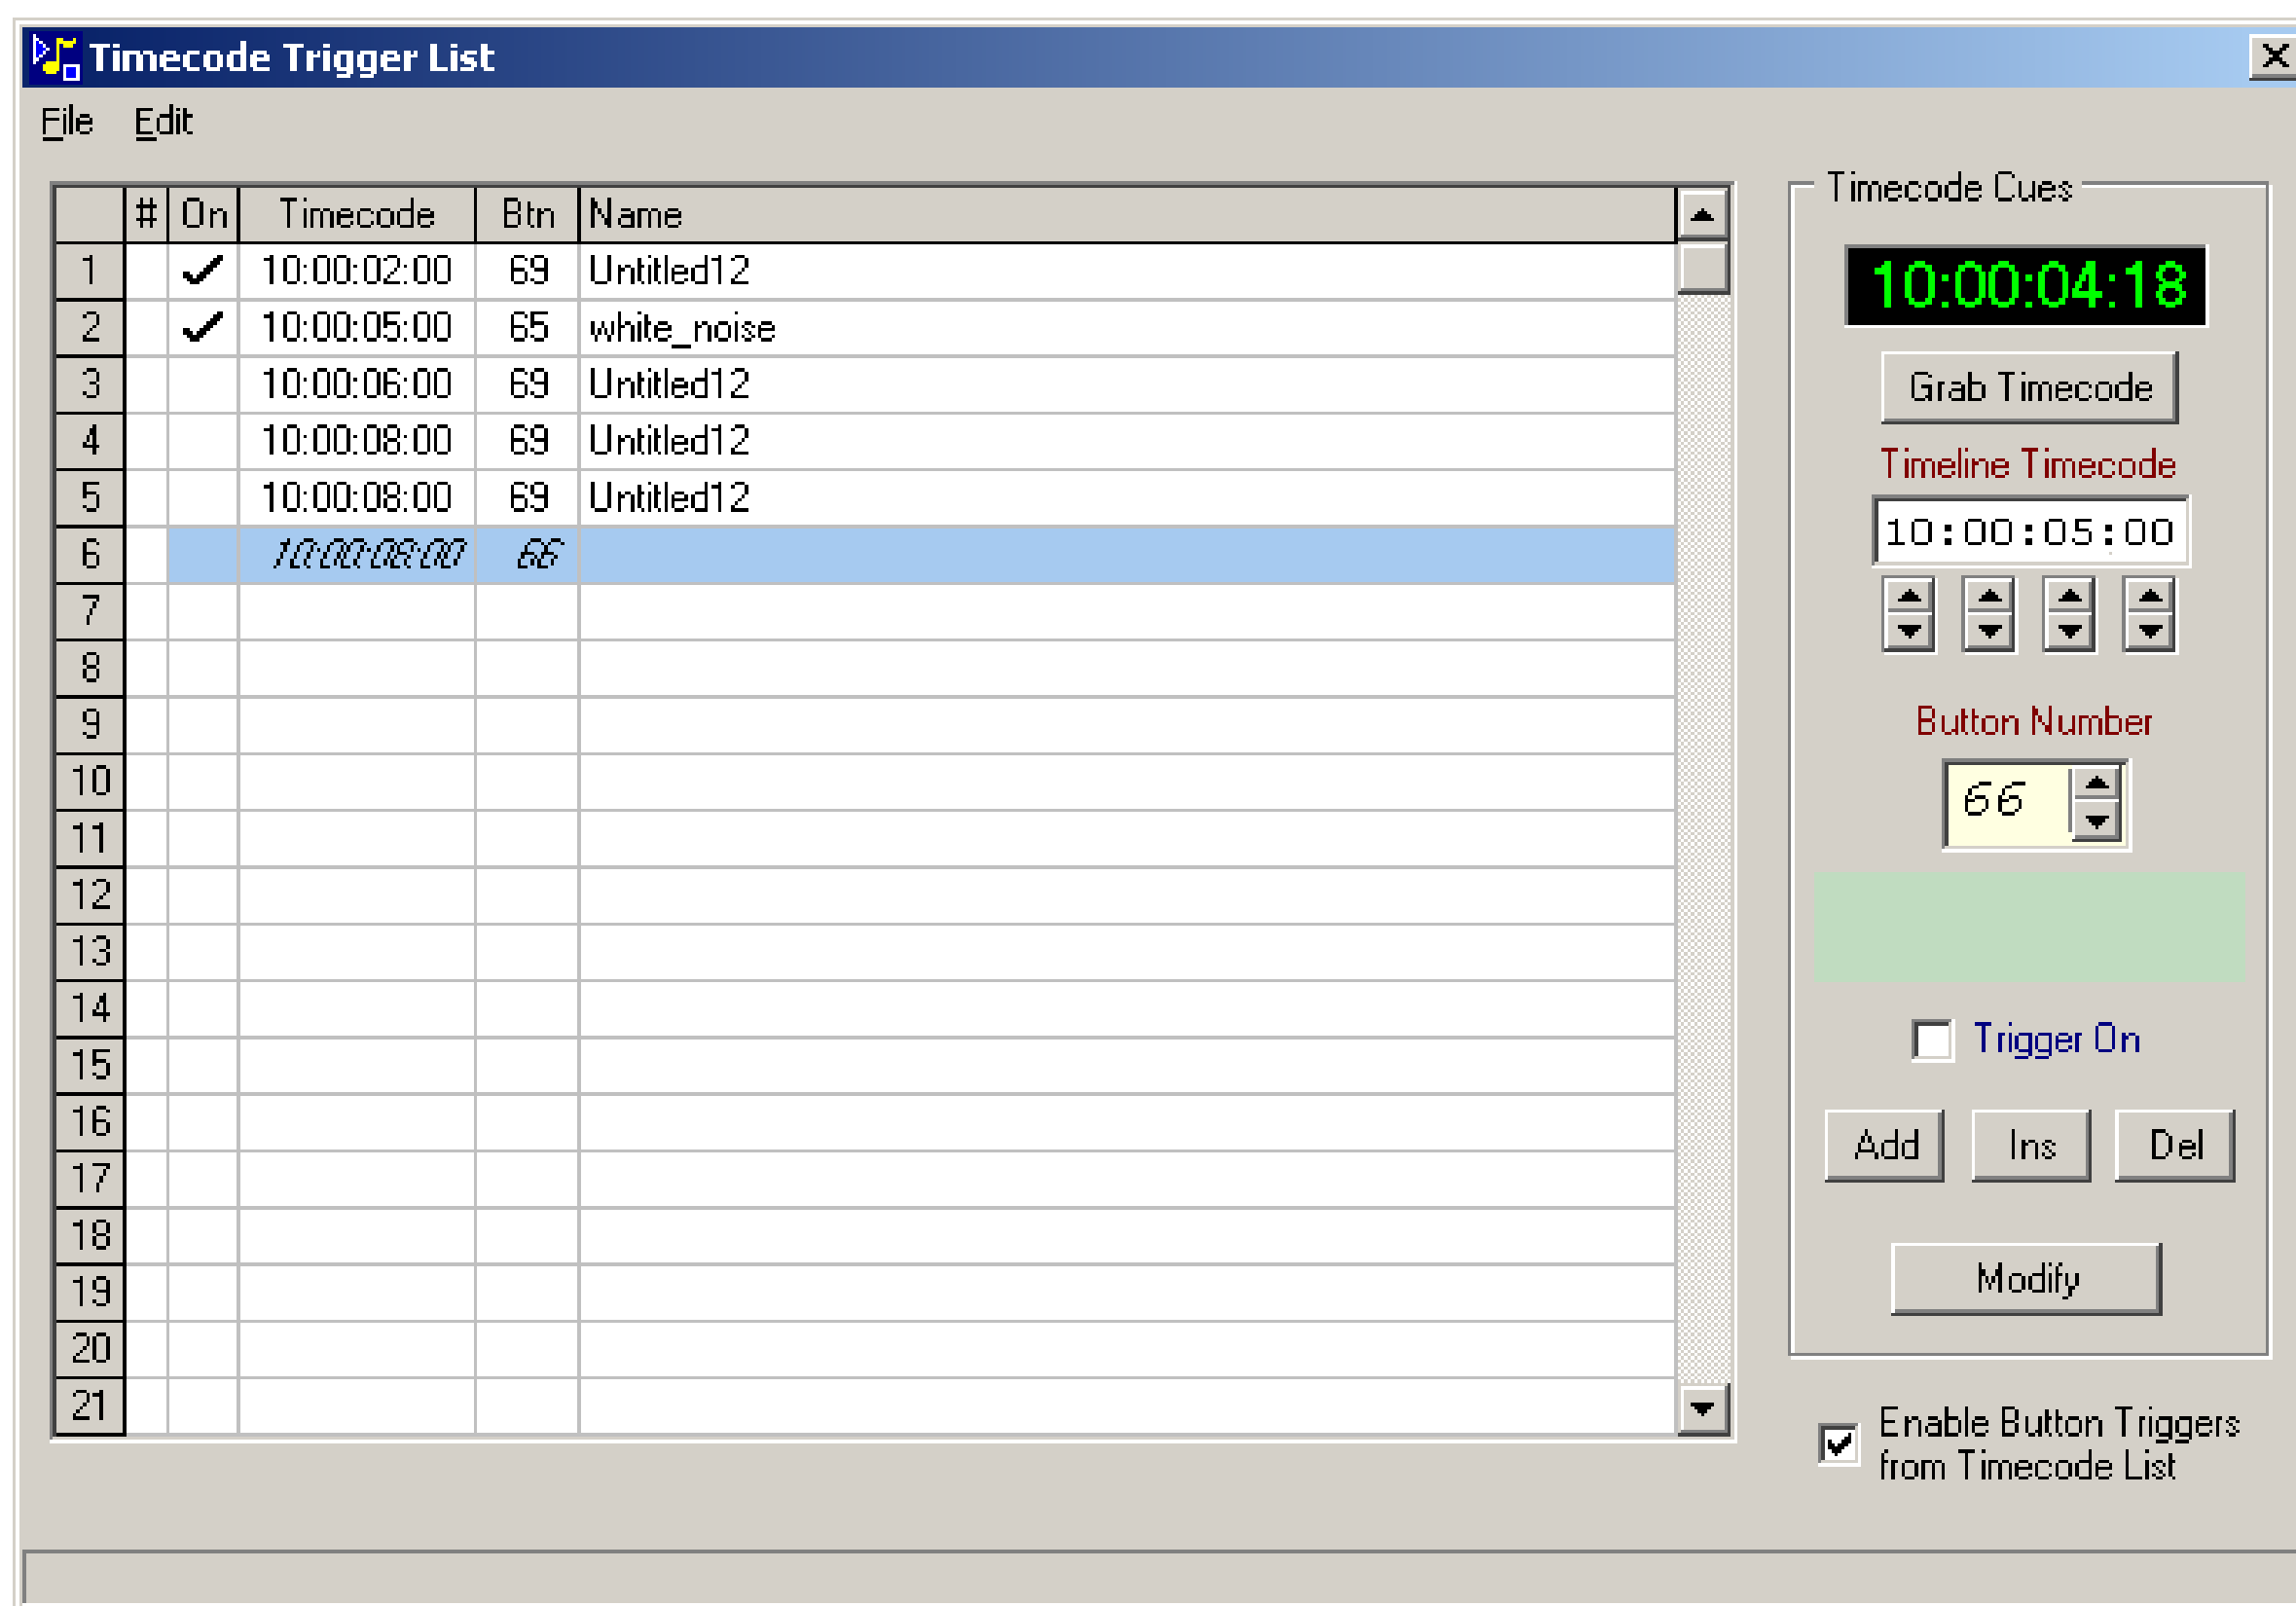

The Timecode Triggers dialog offers a list of timecode trigger points allocated to buttons, the list is formed of 6 columns.

The first column is the entry number followed in the next column (#) showing the state of the trigger, the third column (On) shows if the entry is enabled, clicking in the cells in the 'On' column will toggle the enabled state, this state is mimicked on the right hand edit panel as 'Trigger On'. The next three columns show cue point timecode, button number and button name respectively.

Clicking on the column headers will sort the list.

Button numbers can be entered by typing directly into the right hand Button Number section or by using the up/down nudge buttons. If the button selected is blank the number and the entry in the list will be shown in italic text as shown below in entry 6.

The timecode display in the upper right corner shows the SMPTE timecode being decoded from either an external source or directly from a button, the text will be yellow if no timecode is available.

The Mark Cue button will load the current timecode and add a new entry to the list, this can be used to make a first pass at setting the timecode cues.

The Add button will add a new entry to the end of the list, Del button will delete the selected entry and the Modify button will update the selected entry with the data in the right hand edit section.

The Insert button will insert a new entry above the selected line moving all higher numbered entries one line, if the list is full the last entry will be lost.

the State column show the current state of the cue - armed (green), playing (red) and elapsed (yellow).

Cues 1 and 2 are armed.

Cue 1 is playing and cue 2 armed.

	#	On	Timecode	Btn	Name
1		✓	10:00:02:00	69	Untitled12
2		✓	10:00:05:00	65	white_noise
3			10:00:06:00	69	Untitled12
4			10:00:08:00	69	Untitled12
5			10:00:08:00	69	Untitled12
6			10:00:08:00	66	
7					

Cue 1 has elapsed and cue 2 armed.

Items in the list can be selected by single clicks or using the standard Shift+click for a block of items.

	#	On	Timecode	Btn	Name
1			09:57:06:00	1	Sting 4 N
2			09:59:30:00	10	Round 2
3			09:59:30:00	7	Bed 5 main N95%
4			09:59:58:00	11	Round 3
5			09:59:58:00	18	vote bed
6			10:00:20:00	22	Sudden Death
7			10:00:36:22	34	HeadtoHead N

or Ctrl+click for a non-contiguous block of items.

There is a right-click popup menu on the list

Clear Entry allows the selected entries to be deleted, Copy will temporarily copy the selected entries to the clipboard.

Paste will paste the entries from the clipboard over the list starting at the currently selected row, Insert will move the selected entry and all higher numbered entries toward the end of the list and insert the entries from the clipboard into the blank lines created.

Compact List removes any blank lines and sorts the list into timecode order and finally Clear List will delete all entries.

There are two main menu sections File and Edit.

Load from EDL	Load timecodes from a section of an EDL file *.edl or *.txt
Load Timecode List	Load timecodes from disc file *.tcl
Save Timecode List As	Save timecode list to disc file *.tcl
Append to Timecode List	Load timecodes from disc and append to end of current list

Under the Edit menu are options to Undo or Redo changes

Timecode Triggers are enabled via the Options menu, this option is copied by the Enable Button Triggers checkbox in the lower right of the window.

Loading timecodes from an EDL (Edit Decision List) - an EDL contains four columns of timecode along with transition instructions, a typical EDL is shown below

Using the Load from EDL option the timecodes can be extracted and displayed as a simple list, the section of timecodes to be added to the Timecode Trigger list are selected by left-click dragging across the text. Any partial lines selected will be included in the example below lines 10 to 20 inclusive will be transferred.

Only one timecode column can be used and that is selected from the options immediately

below the listing, Recorder In is the default

EDL Timecode Viewer							
Select lines of timecode entries to transfer into Cue List by left-click dragging across text							
	Player In	Player Out	Recorder In	Recorder Out	Btn	Duration	
0001	00:00:00:00	00:02:24:00	09:57:06:00	09:59:30:00	001	00:02:24:00

There is no option for button numbers to appear in the standard EDL so the Dissolve time is used to indicate the 3 digit button number, below the button number 020 will be associated with Player In timecode 19:16:54:14

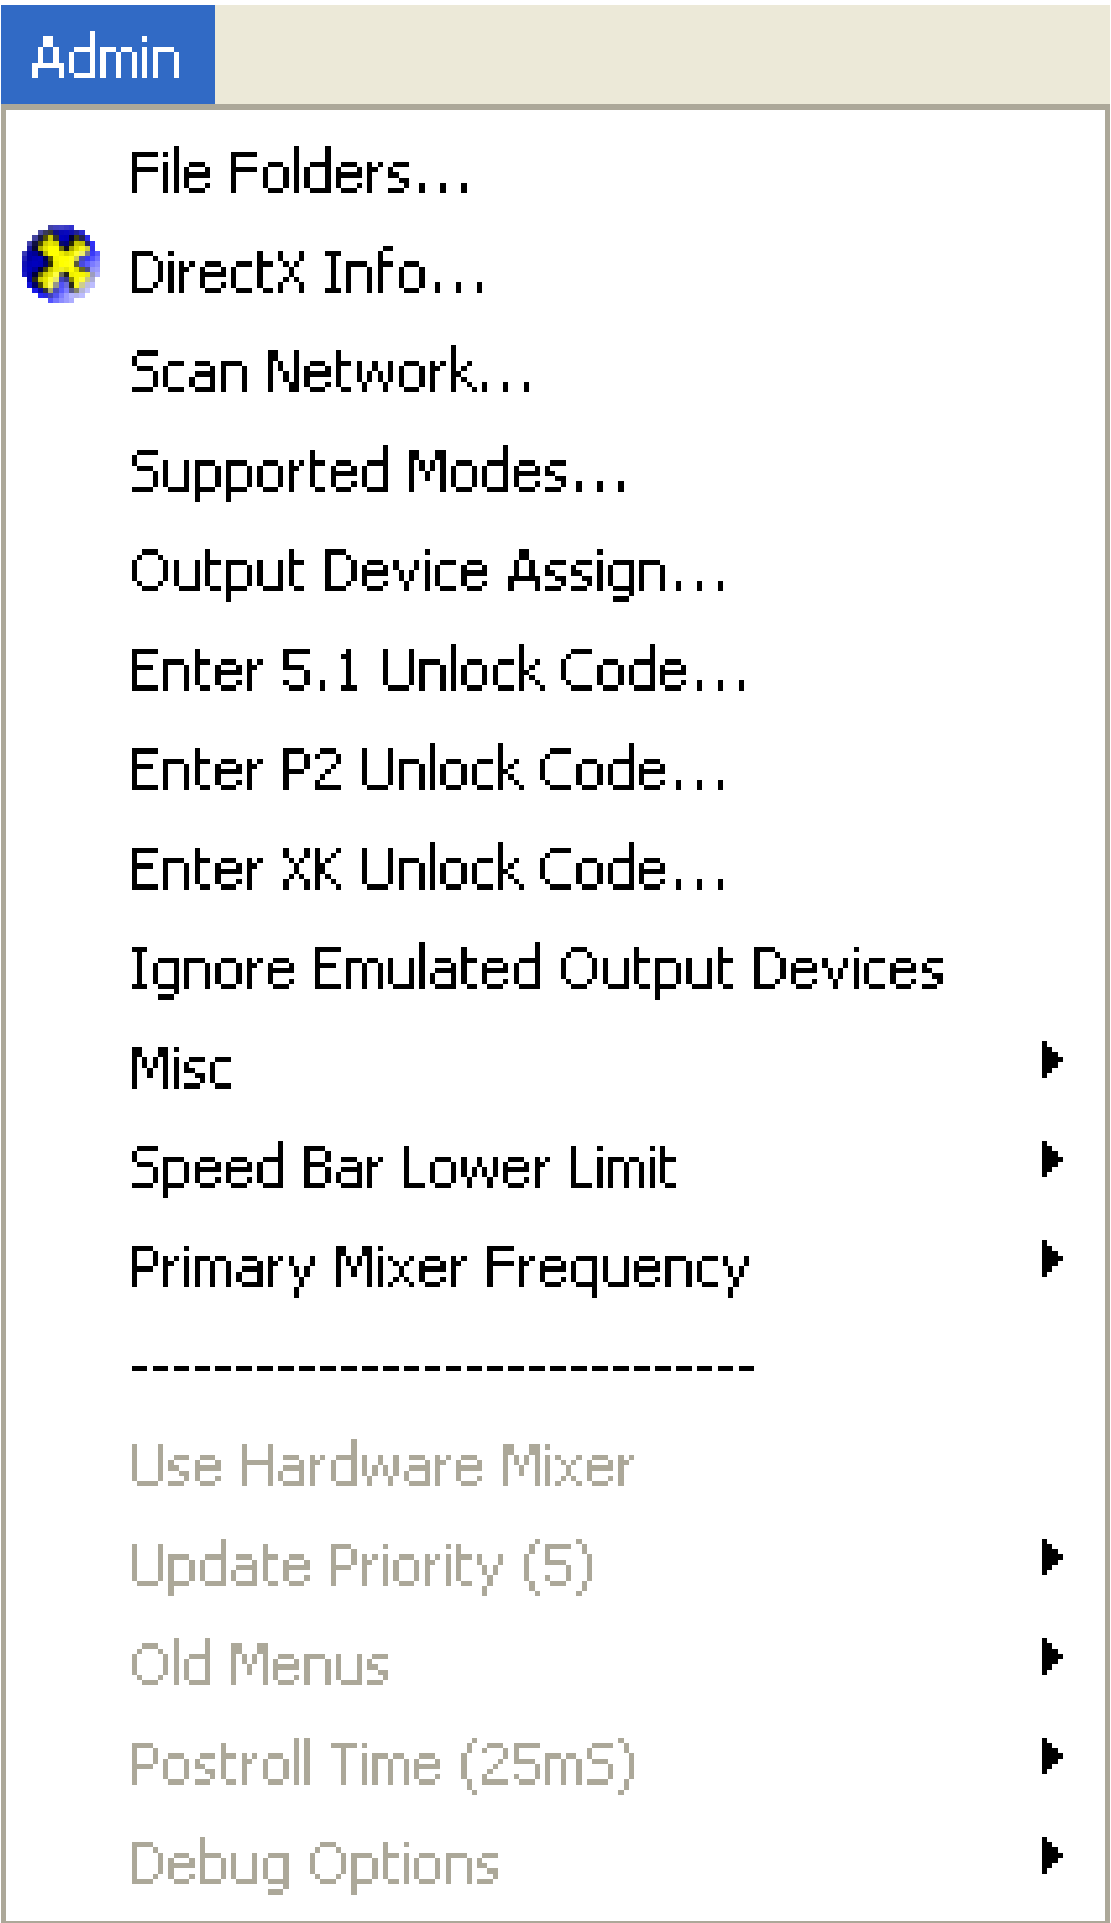

This can be seen in line 6 of the EDL Timecode Viewer above.

This interpretation of button numbers could be used if facilities to generate a dummy EDL is available, alternatively SpotOn can load simple text files based on the format:-

```
D 023 12:34:56:01
D 132 01:23:45:10
```

This could be produced directly in a text editor or extracted from a spreadsheet as a tab delimited file.

Admin Menu

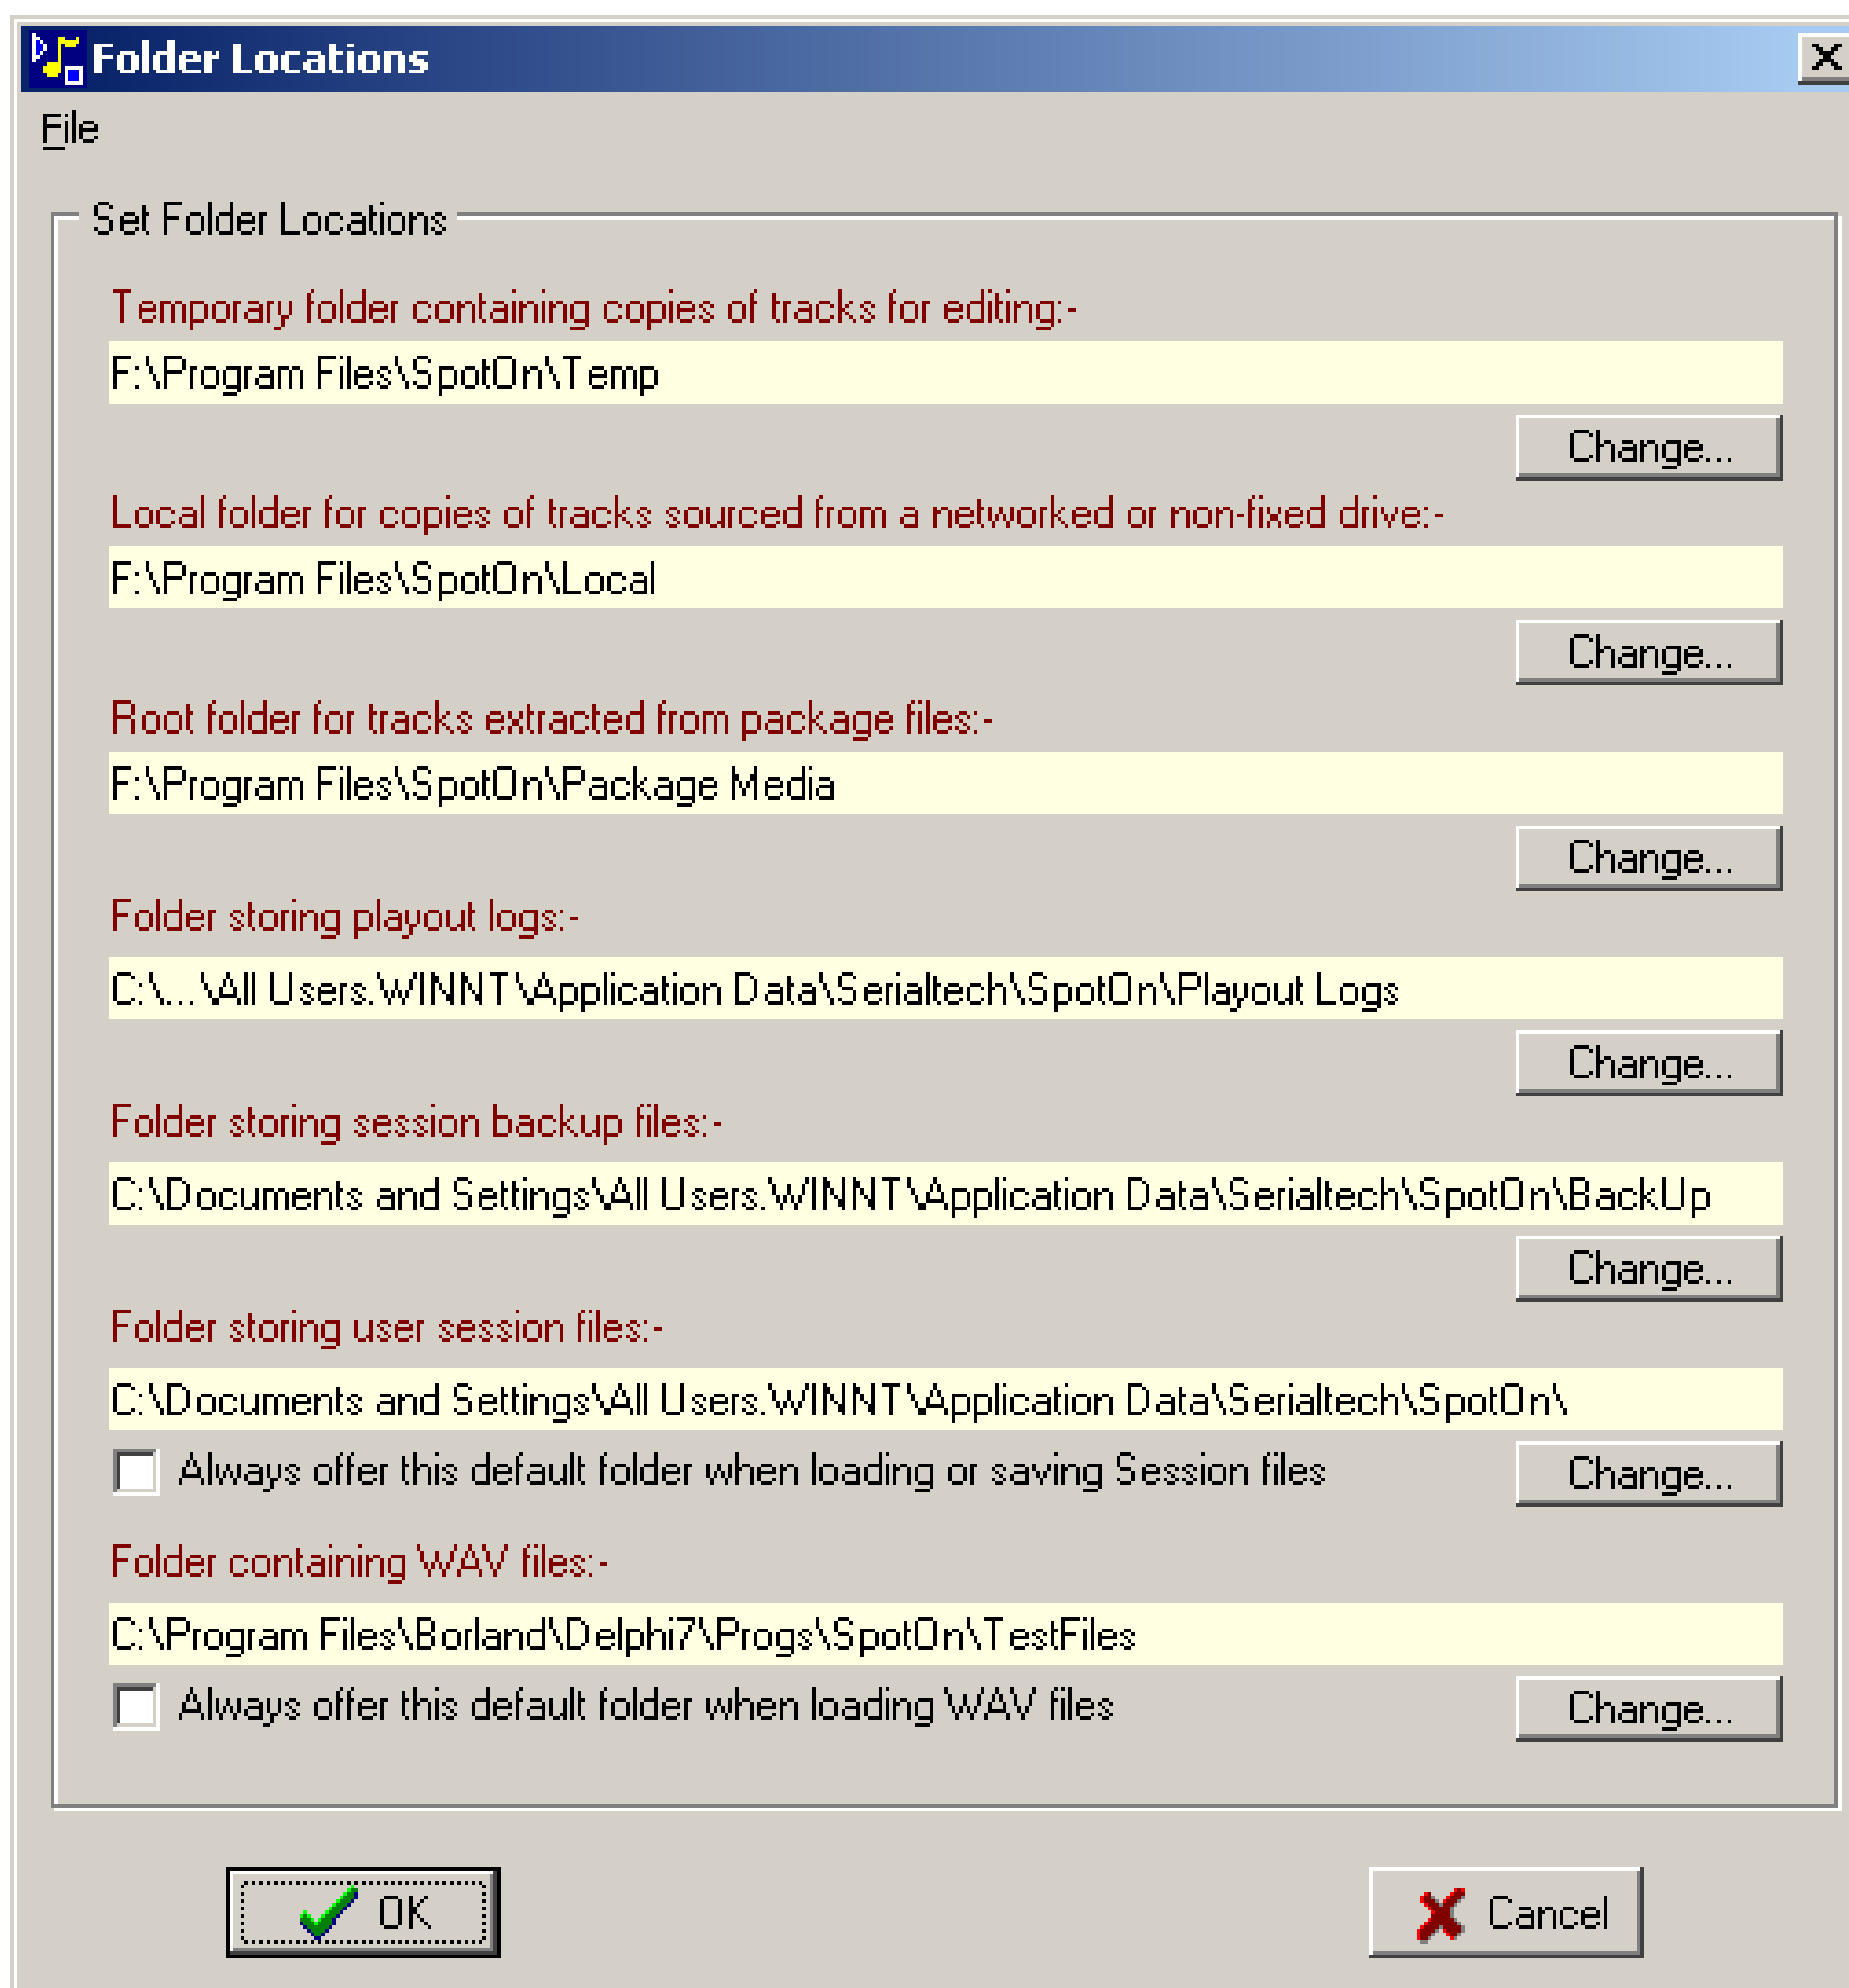

File Folders	Sets folder locations for application data
DirectX Info	Opens Microsoft DirectX diagnostic tool
Scan Network	Scan network for other SpotOn systems
Supported Modes	Analyse modes supported by audio output devices
Output Device Assign	Configures audio output patching
Enter 5.1 Unlock Code	Enable SpotOn for 5.1 surround sound operation
Enter P2 Unlock Code	Enter unlock code to enable SpotOn_P2
Enter Xk Unlock Code	Enter unlock code to enable SpotOn_Xk
Ignore Emulated Output Devices	Prevent SpotOn from opening Emulated Output Devices
Misc	Miscellaneous settings
Speed Bar Lower Limit	Define the lower limit of the speed change slider bar
Primary Mixer Frequency	Sets the Windows sound mixer sampling frequency

File Folders

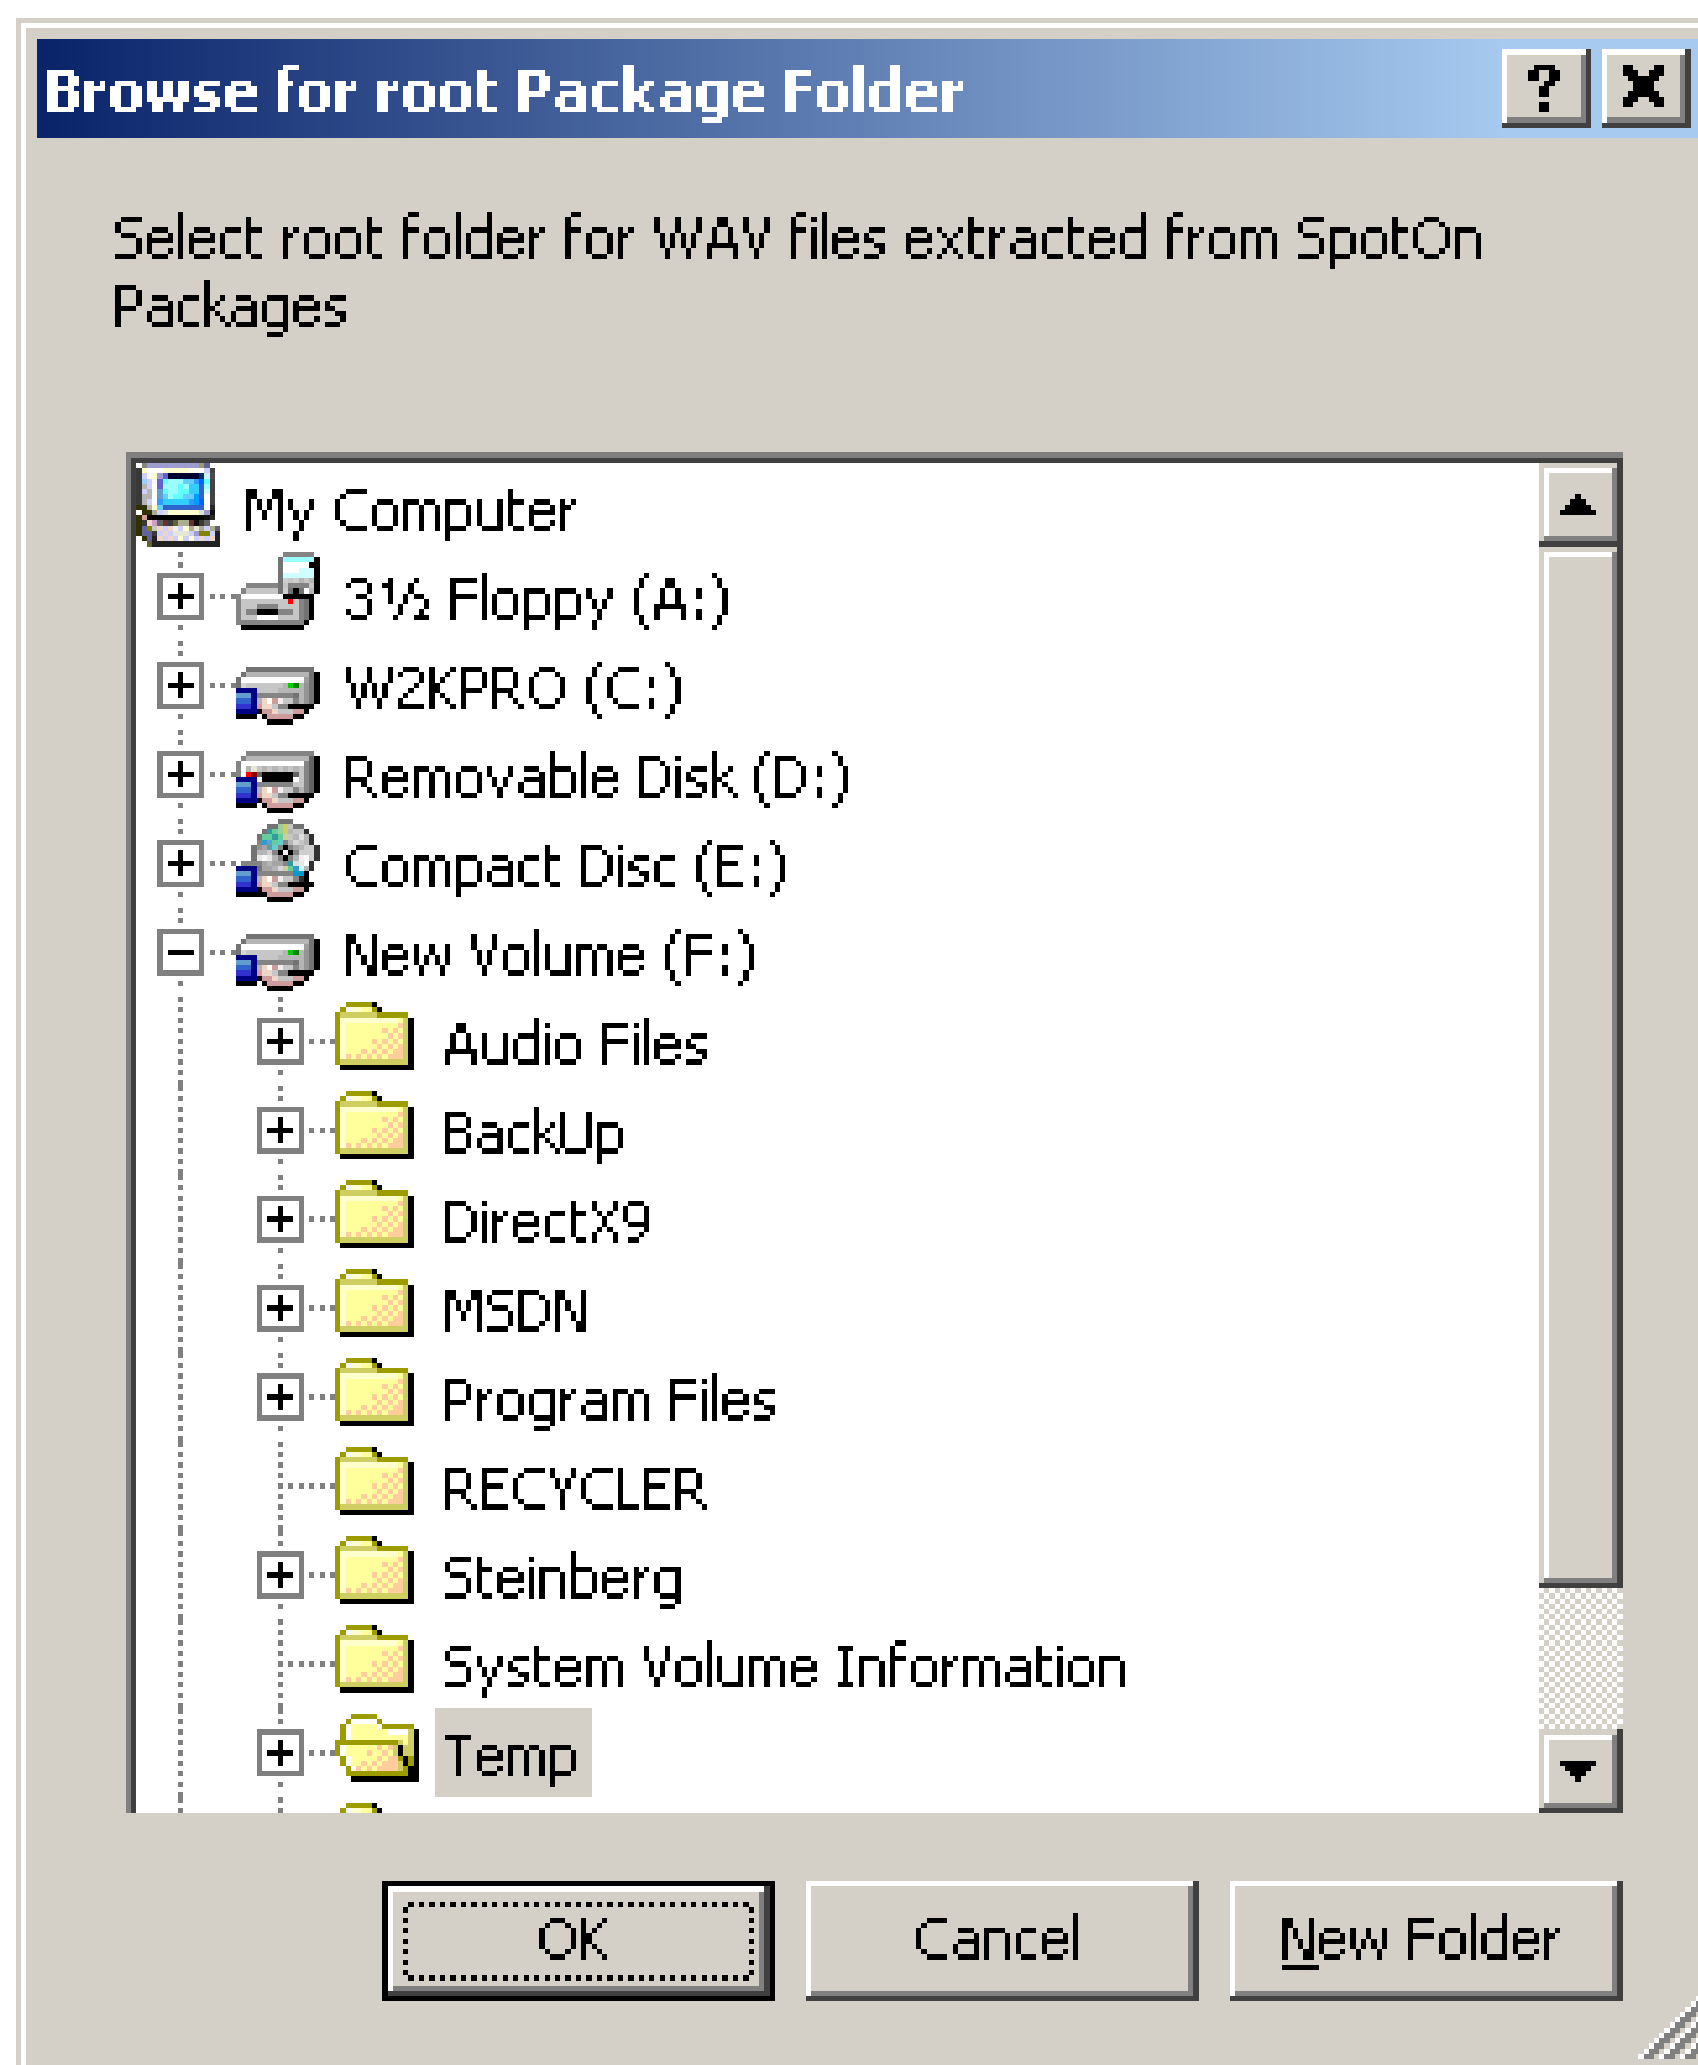

File Folders option displays a selection dialog box to define the locations of the folders used for: -

- a, temporary storage when tracks are copied prior to being edited by an external WAV file editor
- b, storage for tracks loaded from a network connection or a CD
- c, root folder in which new folders are created for files extracted from packages
- d, folder for playout logs containing a timestamped listing tracks played
- e, location of session backup files which can be used to recover from a computer failure
- default location for User session files
- f, if associated check box is ticked this location will be offered each time session is loaded/saved
- default folder for loading audio files
- g, if associated check box is ticked this location will be offered on every audio track load operation

These settings are also displayed in the Info|Statuslisting

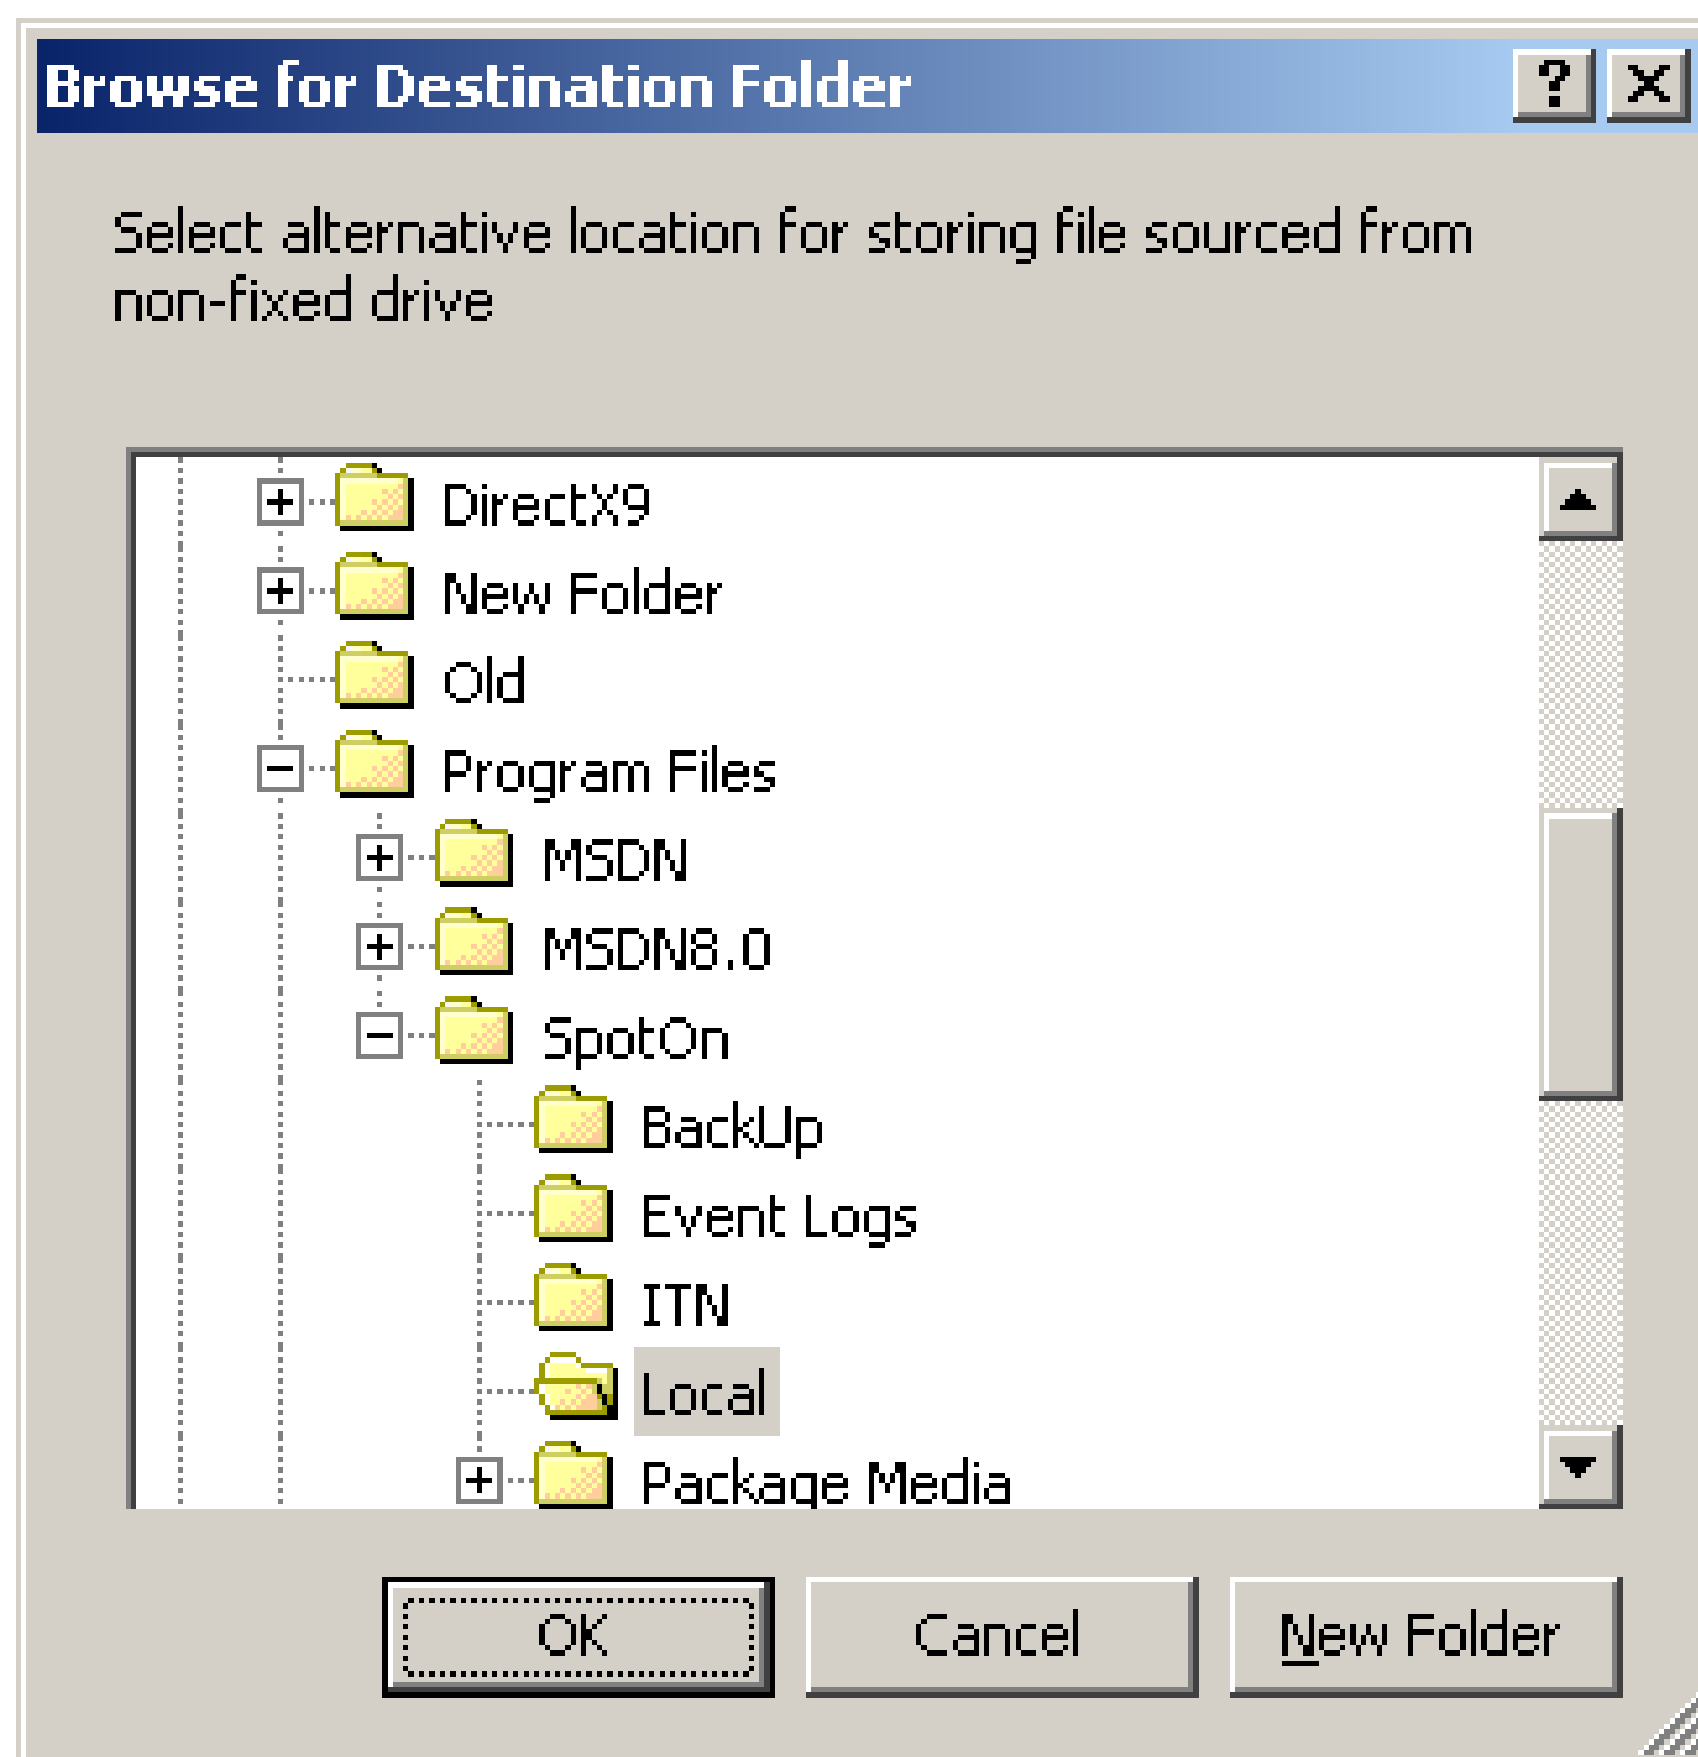

Clicking on the Change button will show a Folder Section dialog.

By default any files sourced from a network connection or a CD will be stored in the location defined in Folder Locations, however a dialog box will appear each time a remote file is loaded.

This gives the opportunity to save the file to a more appropriate - programme related - folder. If "Yes" is selected then a further folder selection dialog is shown.

Scan Network

In order to administer a network containing several SpotOn installations, it is useful to be able to scan through all of the installations currently running and list the version number along with other system parameters.

The window below shows the result of running the scan on a small network with two installations

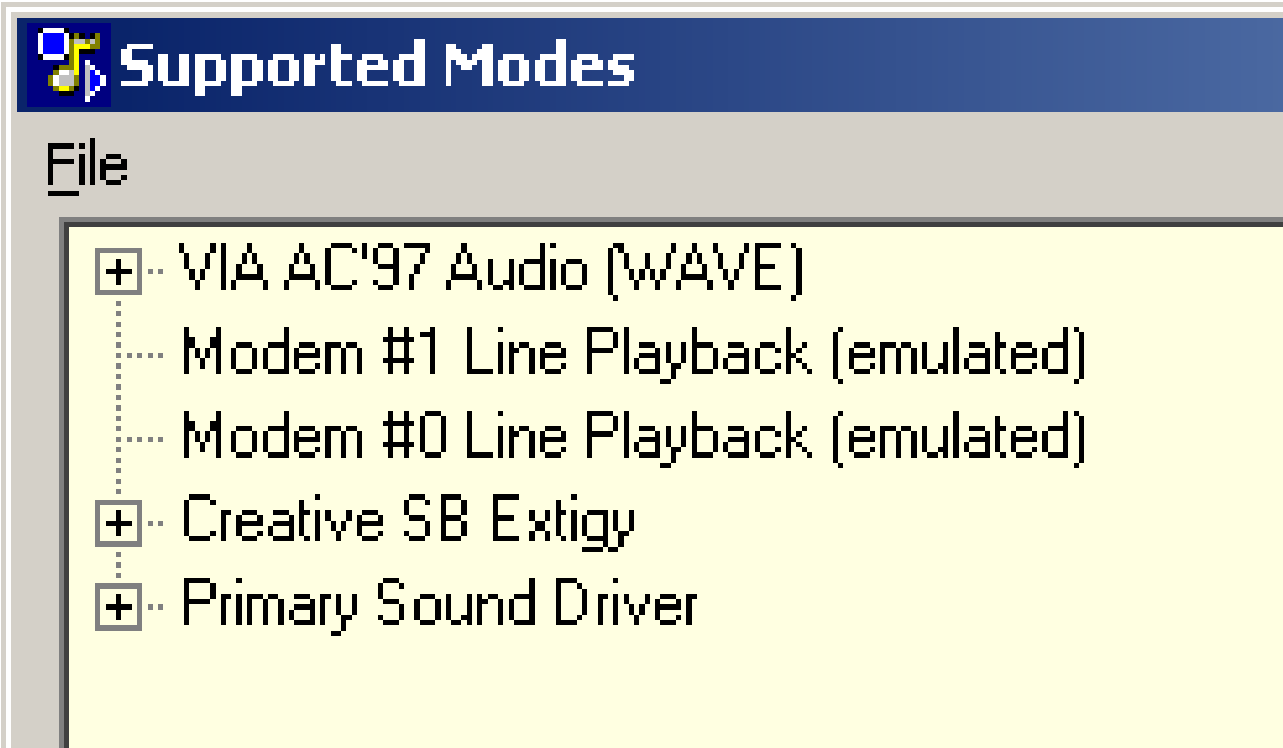

The addresses scanned are limited to the host's class C IP address space, which in the above example is 192.168.0.1 >> 192.168.0.254

Some Anti-Virus Firewall programs may prevent this from scan from working, ask your system administrator to grant SpotOn the appropriate access rights

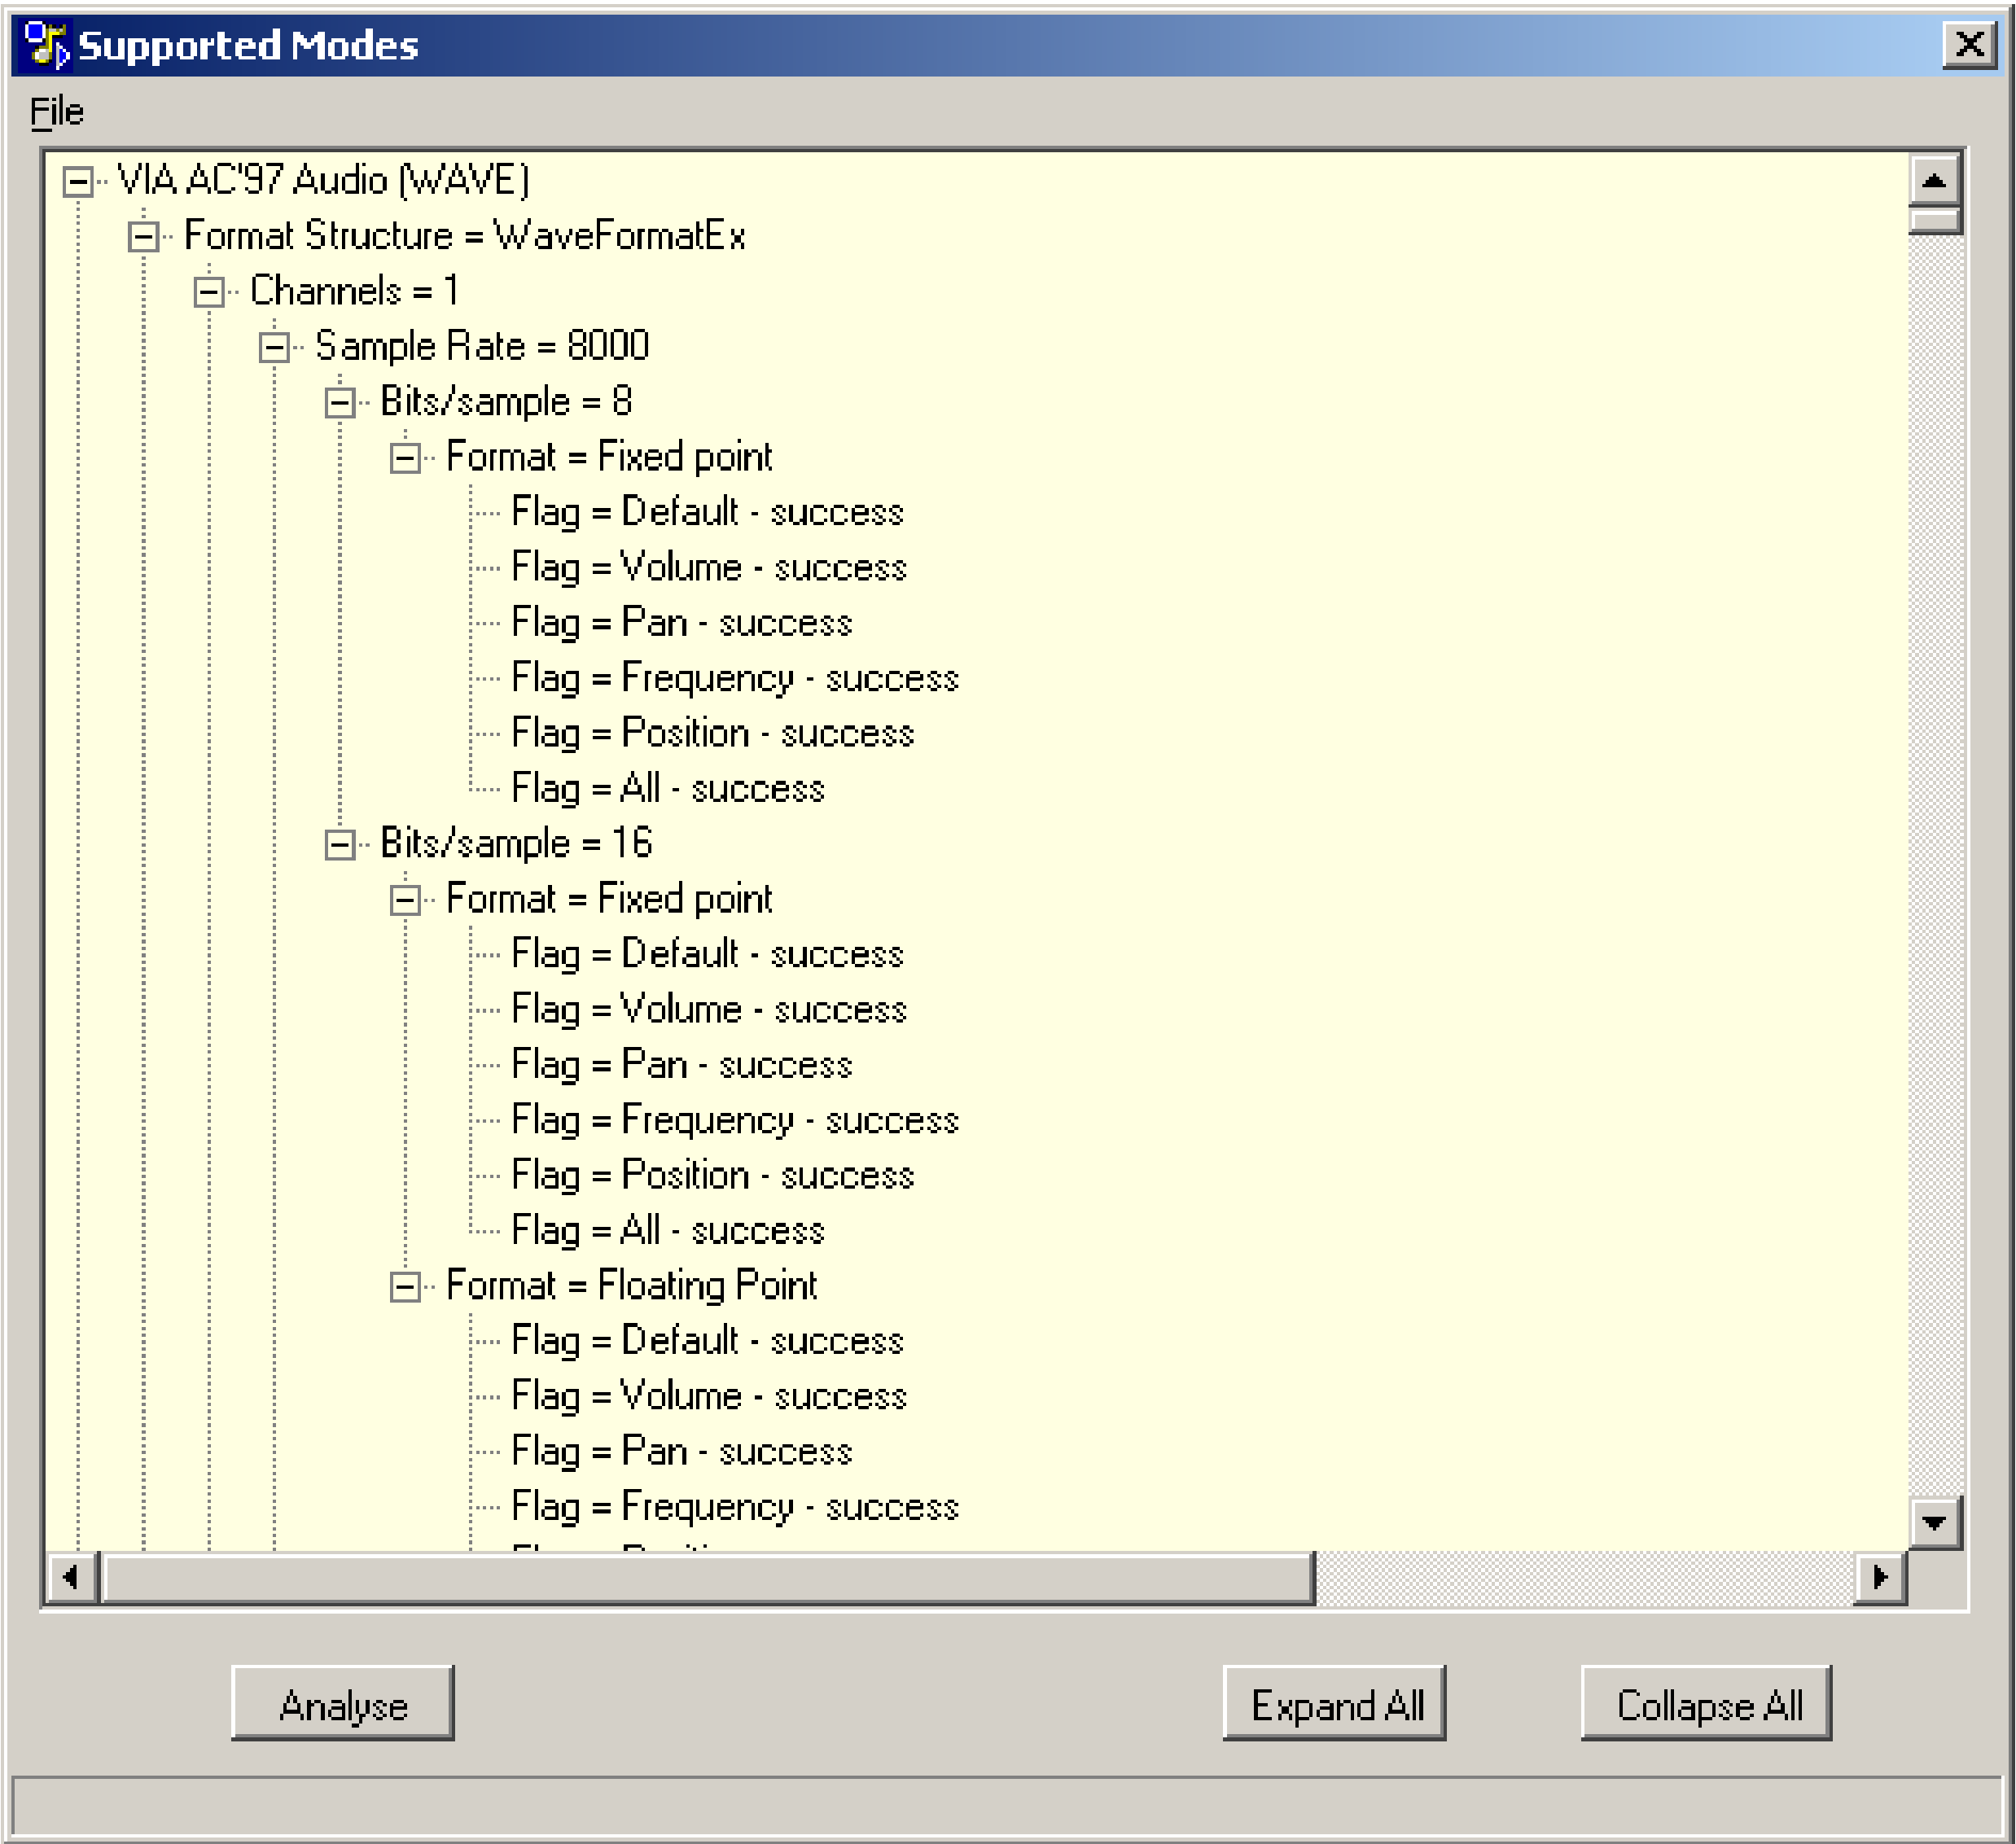

Supported Modes

As an aid to problem diagnosis the Supported Modes option scans all the available audio output devices and tries to set up a wide range of a WAV file formats (1680) on each output.

The results are displayed in a tree view

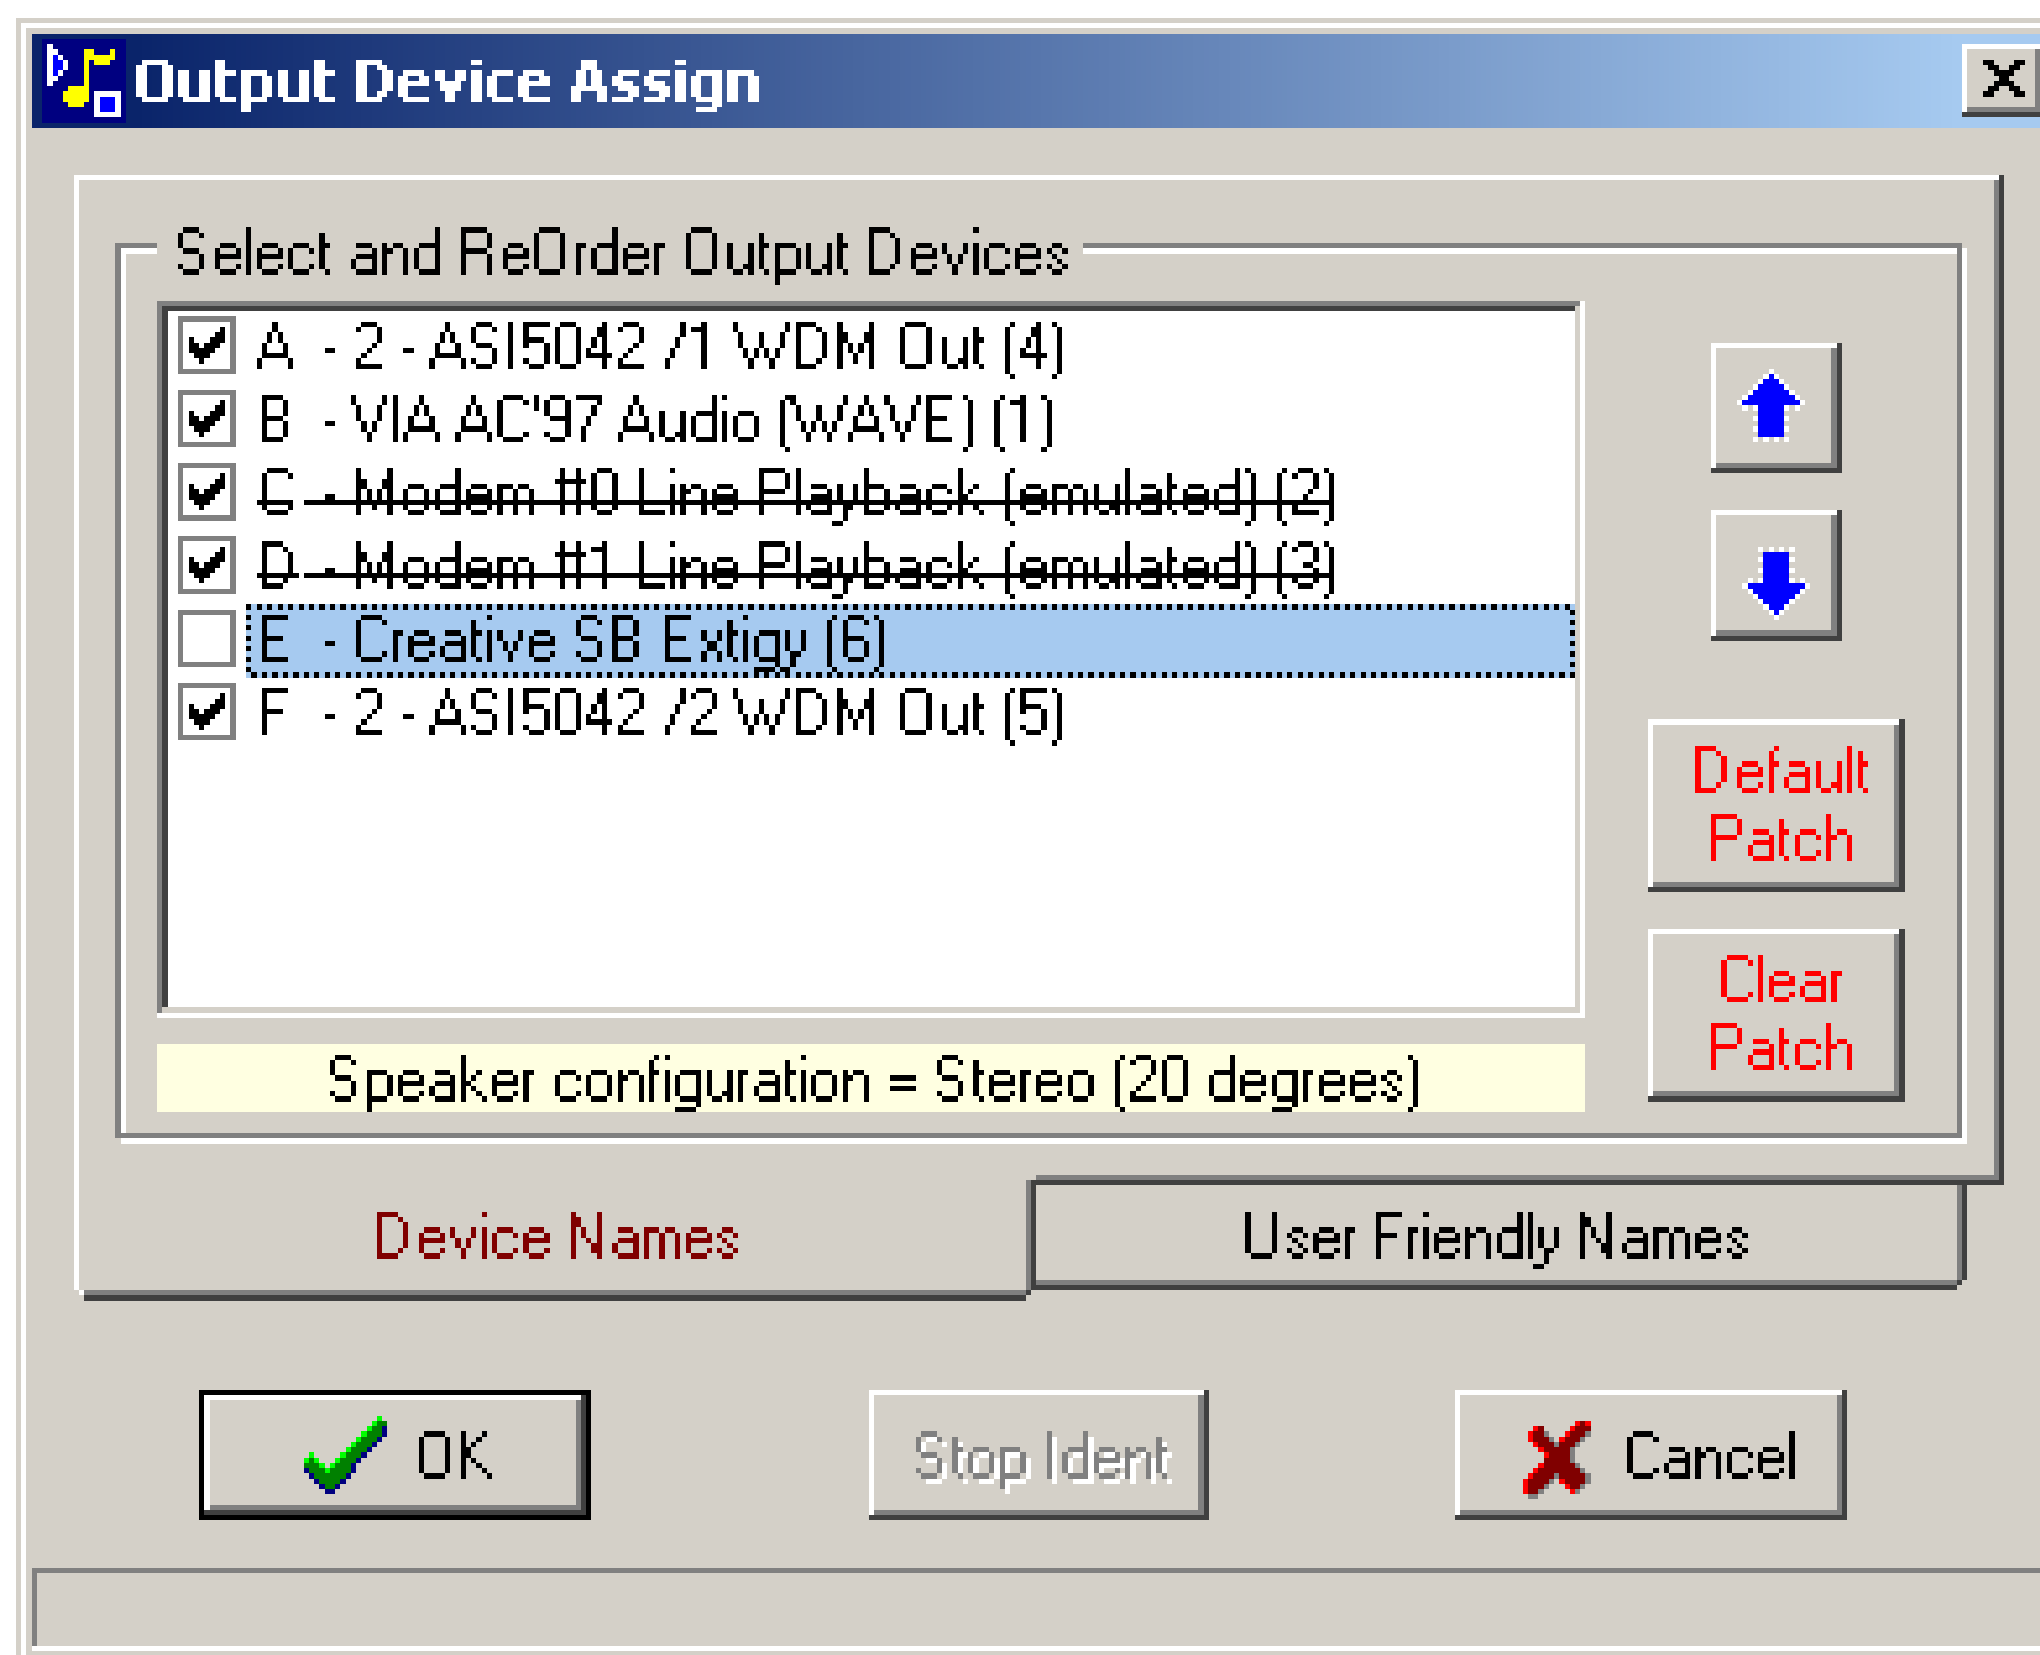

With the tree view fully expanded the individual format results can be seen.

The results can be saved to a text file via the File|Save As menu option.

Output Device Assign

See Output Device Assign page

Enter 5.1 Unlock Code

Before SpotOn can be used in 5.1 surround sound mode, an unlock code must be entered, the unlock code will be supplied when SpotOn upgrade is purchased.

If the unlock code supplied is of the form `"/multi6 /MCA1CF316F76107CE"` then the code should be entered without prefix `"/multi6 /MC"`

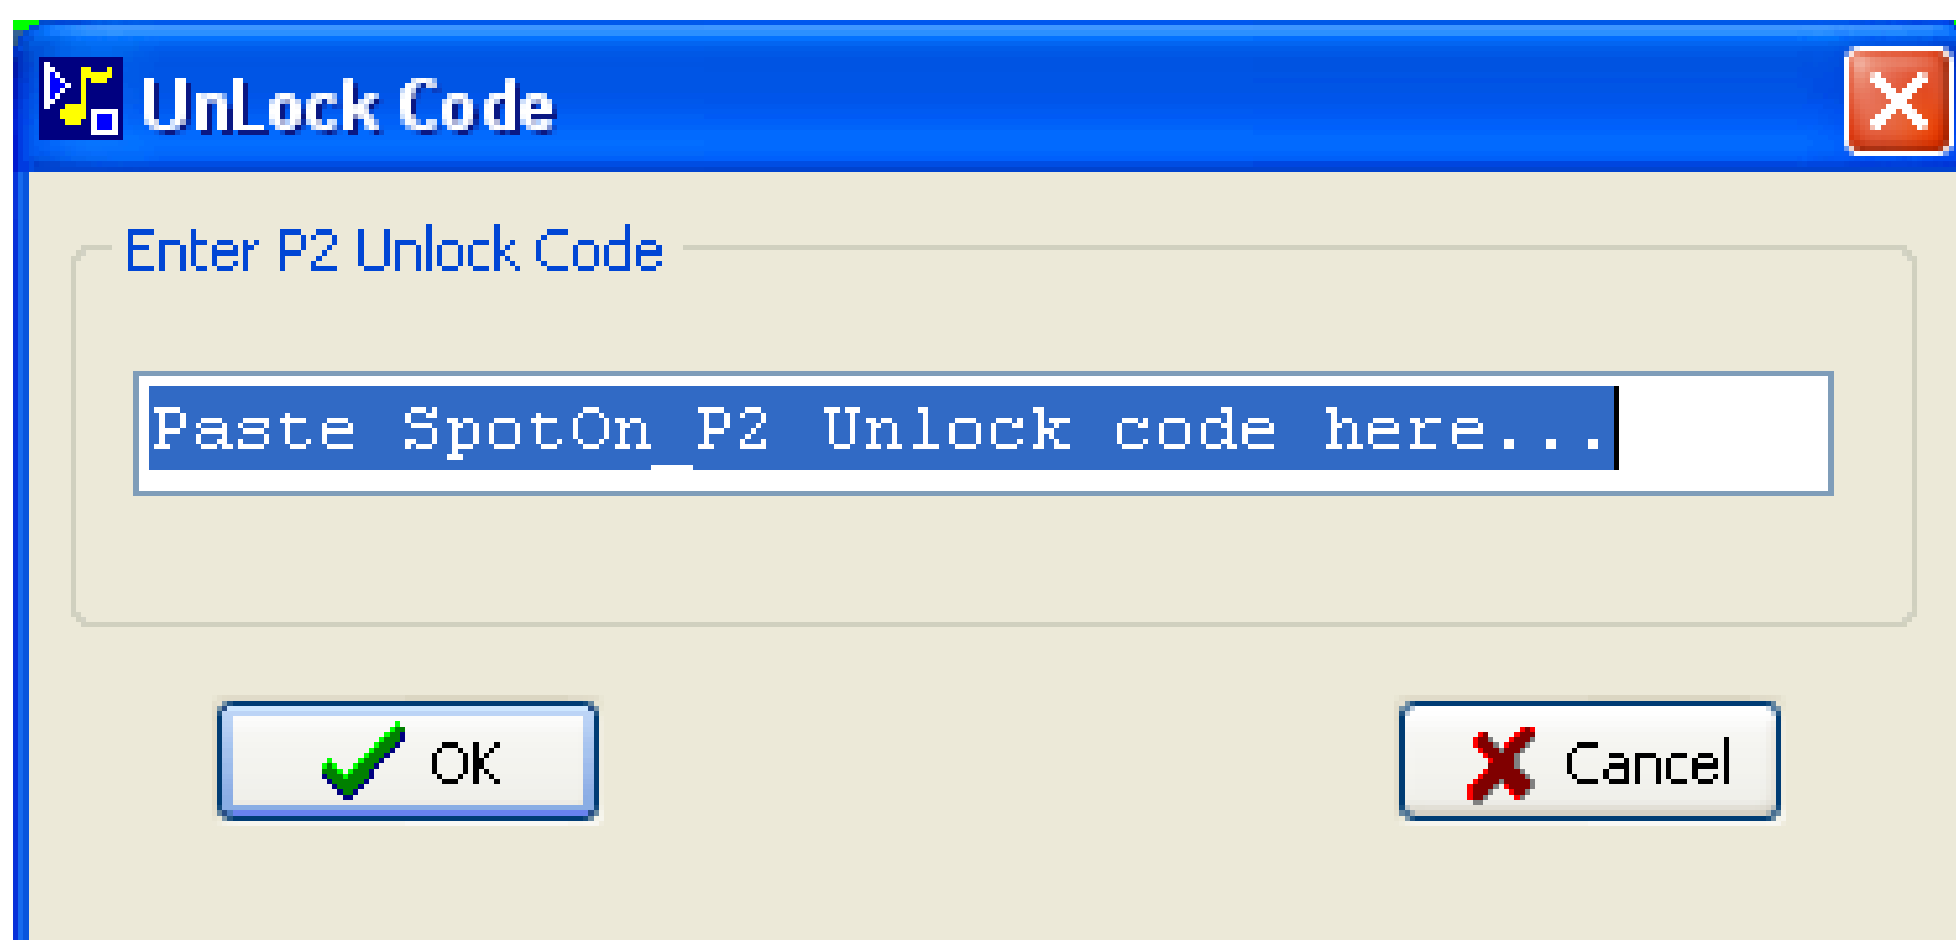

If the code entered was found to be invalid a warning dialog box is shown

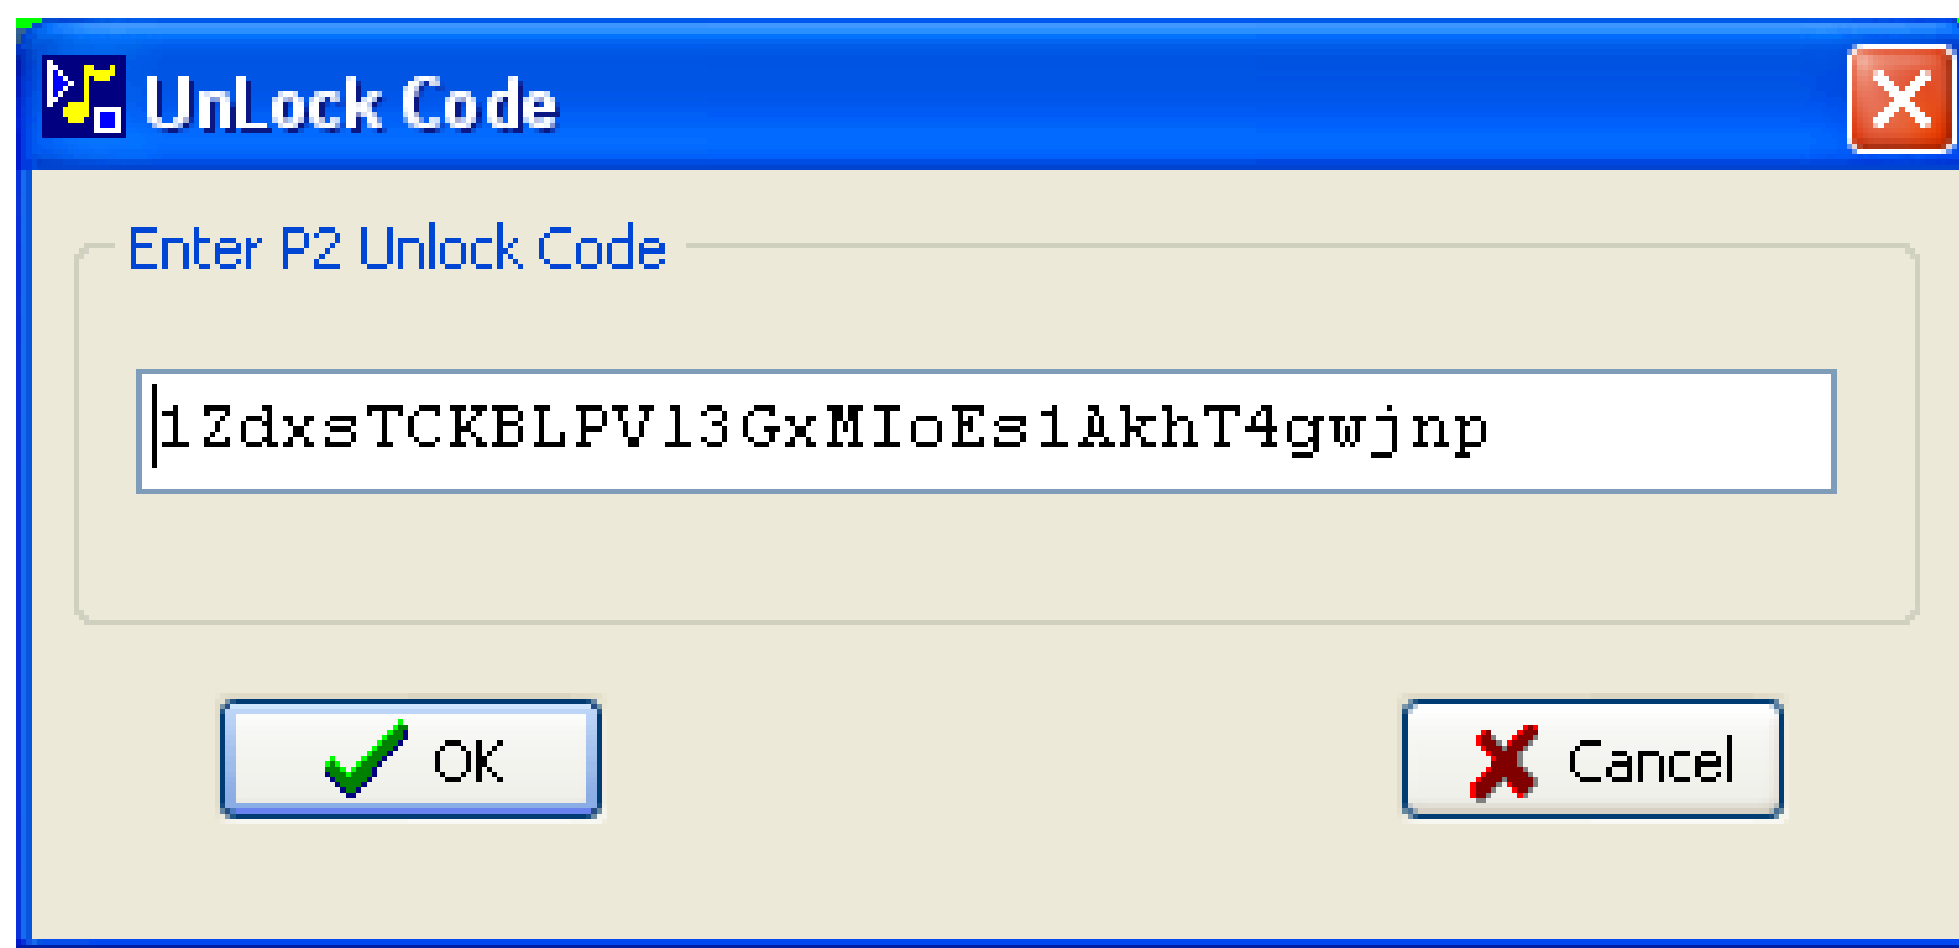

If the code was valid then a shortcut placed on the Windows desktop.

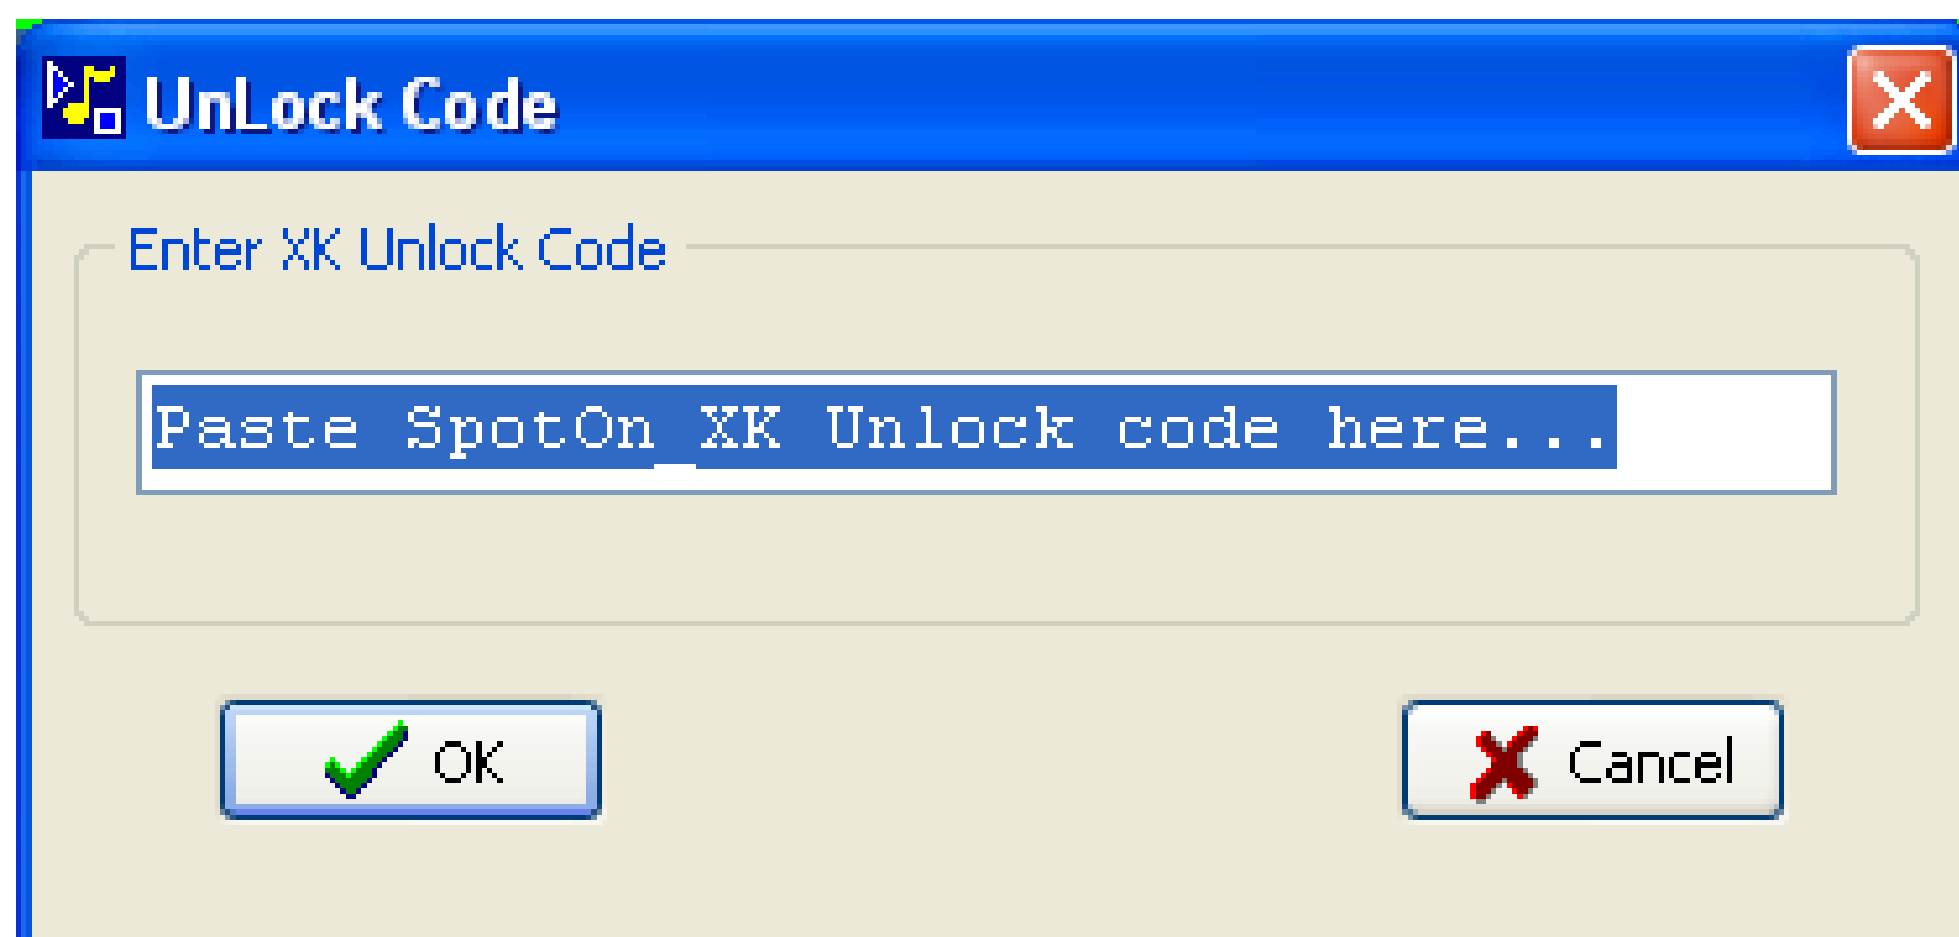

Enter P2 Unlock Code

The SpotOn_P2 utility is installed with SpotOn but not enabled, to enabled it enter the unlock code in one of the two formats shown below.

Enter XK Unlock Code

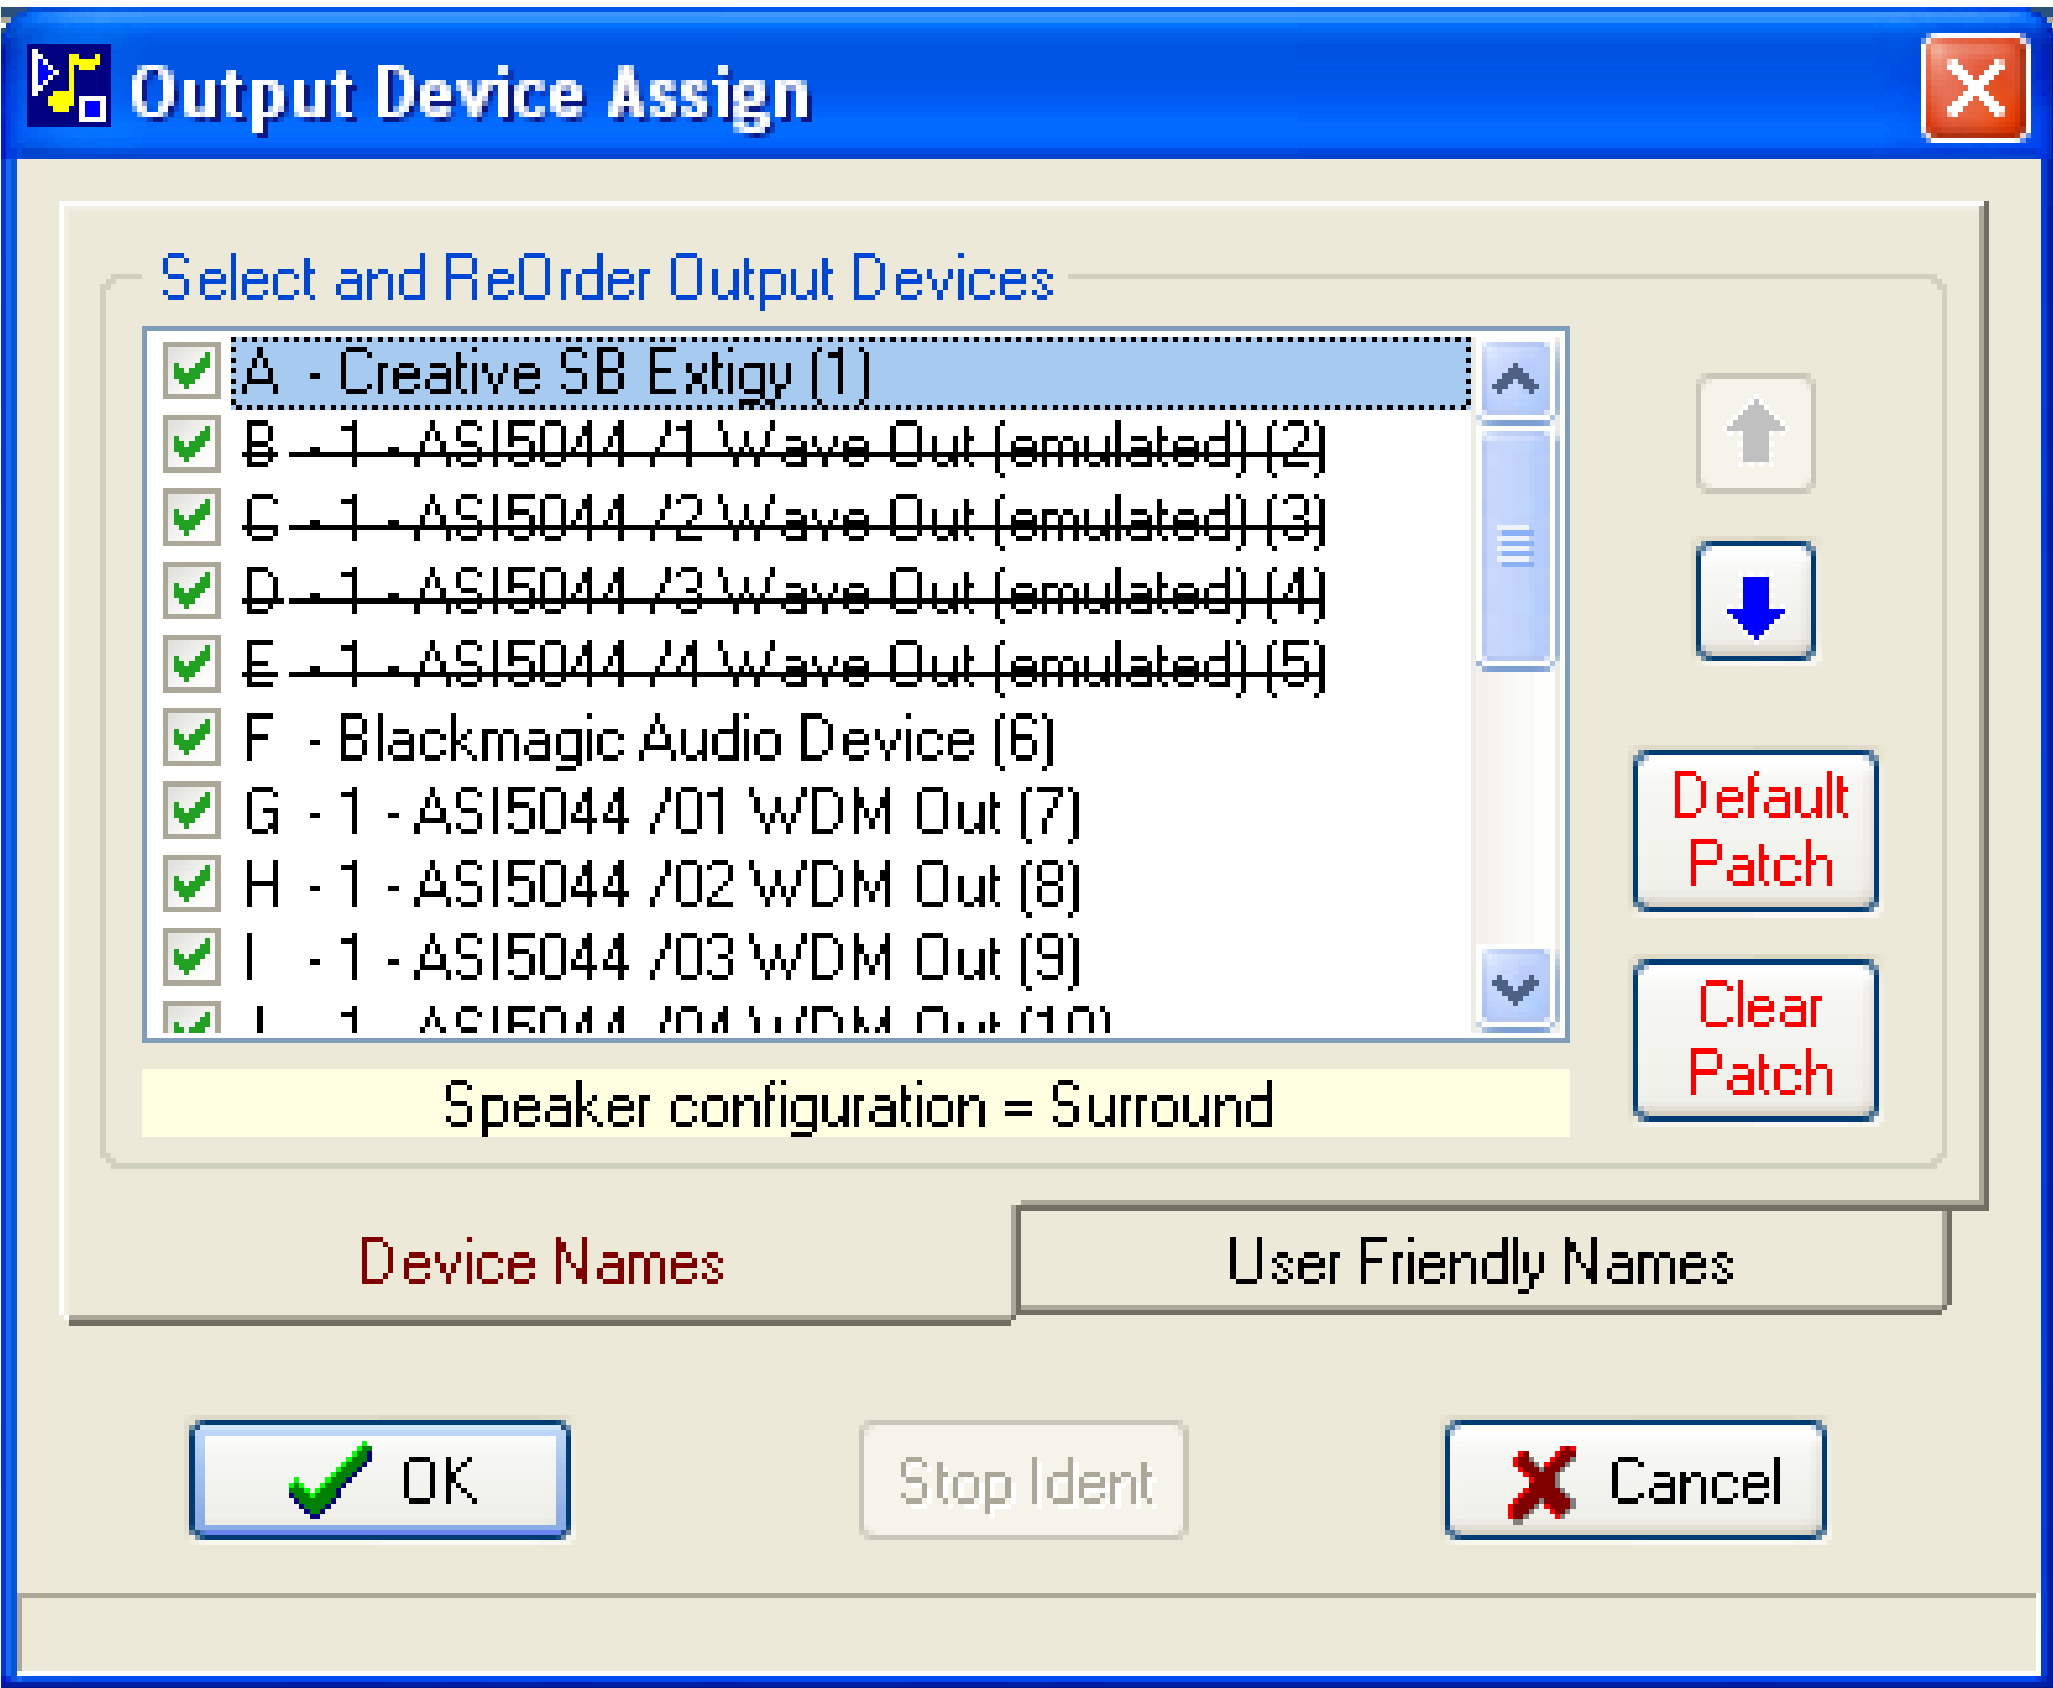

The SpotOn_Xk utility is installed with SpotOn but not enabled, to enabled it enter the unlock code in one of the two formats shown below.

Ignore Emulated Output Devices

With some sound card drivers a single output may be presented with more than one implementation, below an AudioScience ASI5044 card shows two entries "/1 Wave Out (Emulated)" and "/01 WDM Out" that refer to the same output device.

The WDM version is the one preferred for use with SpotOn, so to allow this to be used the "Emulated" version must be ignored by checking the Ignore Emulated Devices option.

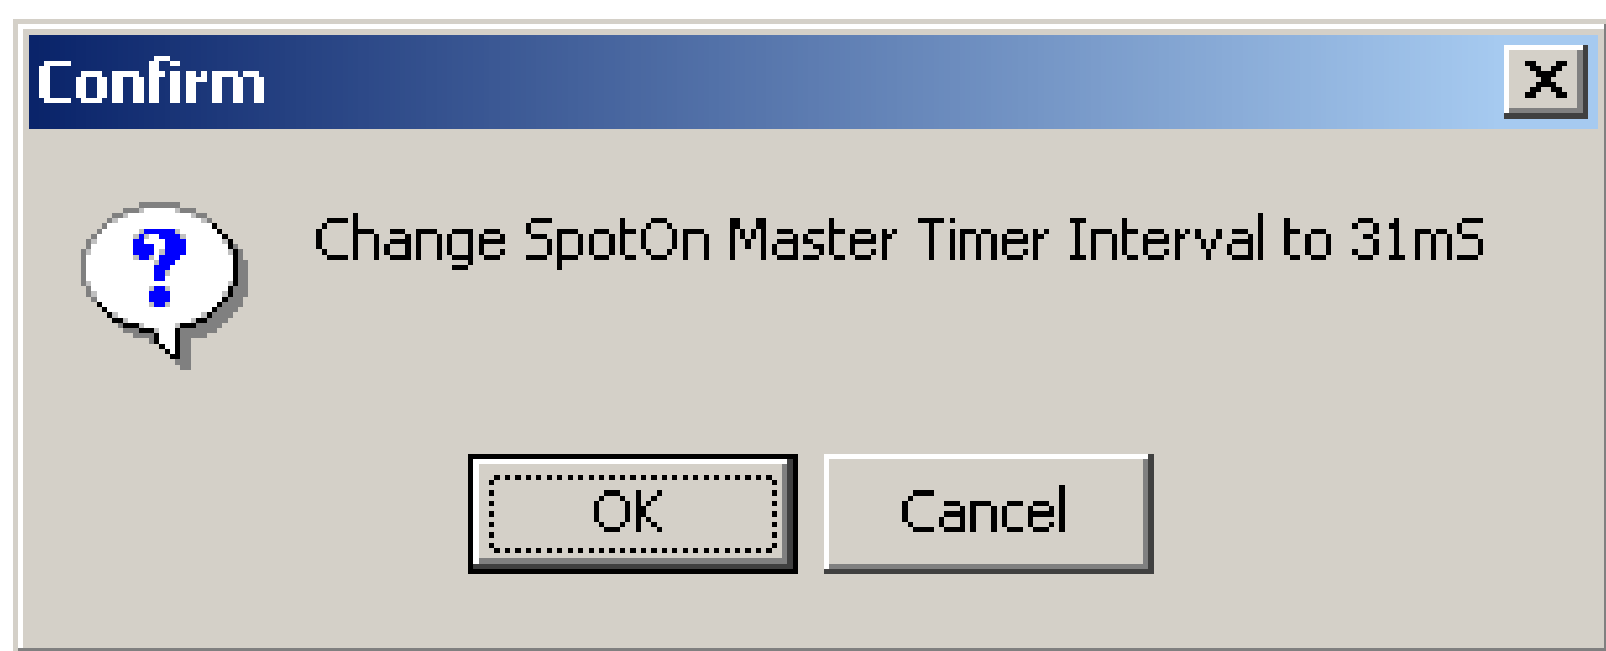

Misc

Misc - Timer Adjust

Due to the variation in performance of the Windows timing routines it may be necessary to adjust the base timer period in SpotOn this can either be 20mS or 31mS.

The menu item text shows the error, in the example below timer is 3% too long a +/- 15% error is acceptable

If the option is chosen to change the timer period then the following confirmation dialog box will be shown

Misc - Cascade Links

In normal operation of Master/Slave links, the Play Slave link is only effective if the Master button has been triggered by a mouse click or external trigger.

The Play Slave link is not effective if the Master button has been played as a result of itself being a Play Slave.

For example if Btn 2 is a play slave of Btn 1 and Btn 3 is a play slave of Btn 2, playing Btn 1 will play Btn1 and the slave Btn 2, the play slave on Btn 3 will not automatically be triggered.

When the Cascade Links option is checked the play slave action can itself be triggered from another play slave, so in the case above, playing button 1 will cause buttons 1, 2 & 3 to play.

There is a trap to fall into with Cascaded Links, it is now possible to set up an infinite loop where a Master button ends up being triggered by itself via various Master/Play Slave links. Playing such a link could lock up SpotOn and require Task Manager to close it down, so to avoid this a limit of 32 cascaded links has been set.

Warning dialogs will appear when an infinite loop is detected.

Misc - Web Version Check

If Web Hyperlinks are enabled SpotOn will attempt to check each week for new updates, if a new version is ready for download then a message dialog similar to the one shown below will appear.

If Admin mode is enabled and an update is not available then a message will be shown indicating the current and latest versions

Force GPI Poll Check

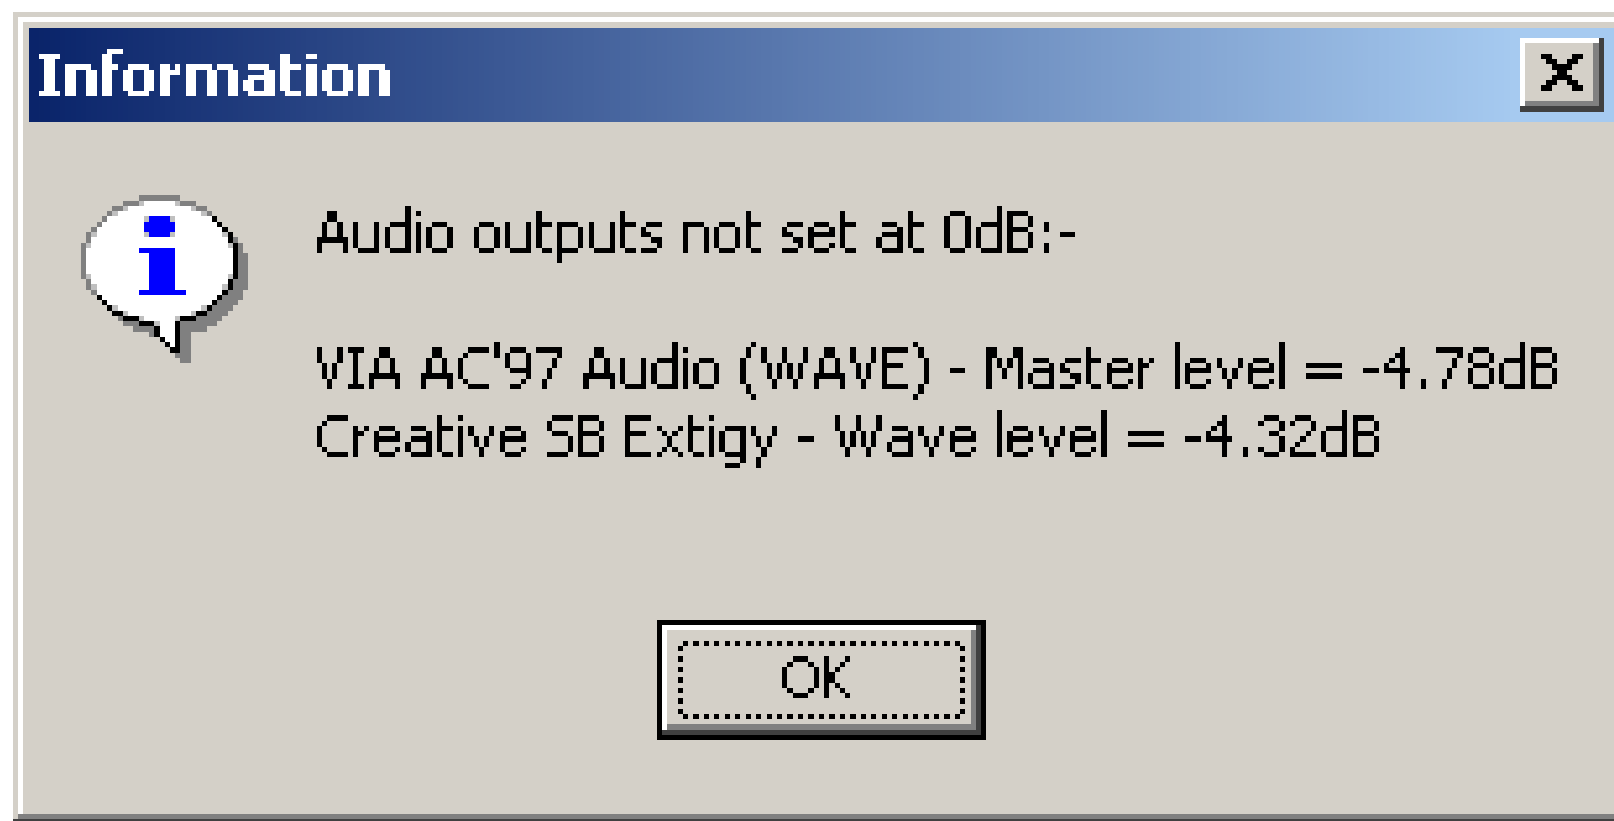

Only present as a debug aid, SpotOn continuously poll GPI devices and if a device is disconnected whilst SpotOn is running it can cause problems by modulating the audio output with a 50Hz square wave.

With this option unchecked, as soon as the device is detected as being disconnected it is removed from the polling list and so the disturbance is minimised. However, this is then sensitive to a poor connection to the GPI device which may be briefly unplugged in which case the GPI would be disabled until reassigned.

Misc - Enable Web Hyperlinks

In the situation where an WWW internet connection is not provided the help menu options that access the internet can be disabled

Misc - Volume Control Check

At startup SpotOn checks the settings of the Windows audio output levels, if any are not set to maximum (0dB) then a warning message is displayed, unchecking this option suppresses this warning dialog box.

Misc - Filter Midi Msgs

When Midi messages are being received very quickly SpotOn may not have time to implement all the actions, Filter Midi Msgs option was added to only act on the last messages for each channel/Note - intended for Debug use only.

Misc - File Access Time Logging

Indicates whether the Operating System keeps a record of when files were last accessed, when enabled this can slightly slow down file access speeds.

Speed Bar Lower Limit

The speed bar shown in the Audio Set Up dialog window has an upper limit of 400% (4x normal speed) and a lower limit set by the following menu option in the range 1%..25%

This setting also applies to the floating SpeedBars

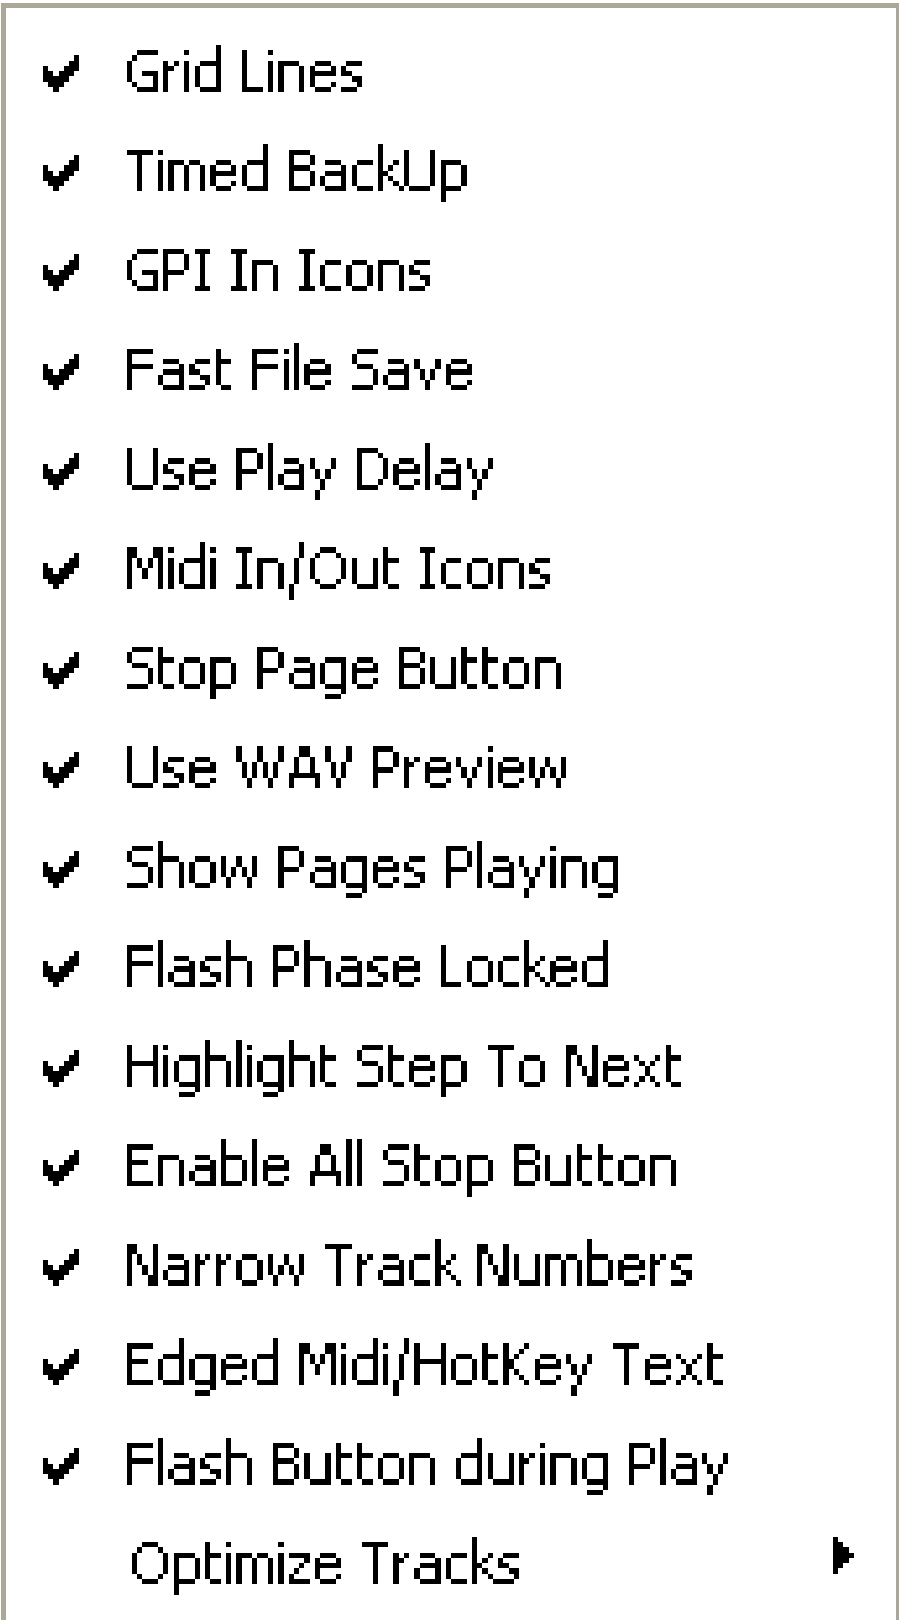

Primary Mixer Frequency

The audio tracks are mixed together to form the main output of SpotOn, as the tracks could have different sample rates they all have to be converted to a common rate before mixing, this rate can be either of the two standards 44100Hz or 48000Hz.

SpotOn will have to be restarted for this change to take effect.

Old Menus

Old Menus - Grid Lines

Under some circumstances it may be necessary to highlight the gaps between the buttons, this option adds a grid of white lines between the buttons

Old Menus - Timed BackUp

Backups of the current session are automatically made every 5 minutes and the last 16 files are retained - which equates to 80 minutes usage

Old Menus - GPI In Icons

By checking this option buttons that have GPIs assigned can be indicated by an extra button icon, a diamond on the left hand edge

Old Menus - Fast File Save

There are two methods of regularly saving system files in the background task routines, checking this item will cause SpotOn to use the "Fast" method instead of the "Threaded" method - intended for Debug use only.

Old Menus - Play Delay

Allow delayed play on Play Next and linked Slave buttons

Old Menus - Midi In/Out Icons

In order to easily see which buttons have Midi In or Out assignments this option adds the button icons shown below designating Midi In and Midi Out respectively

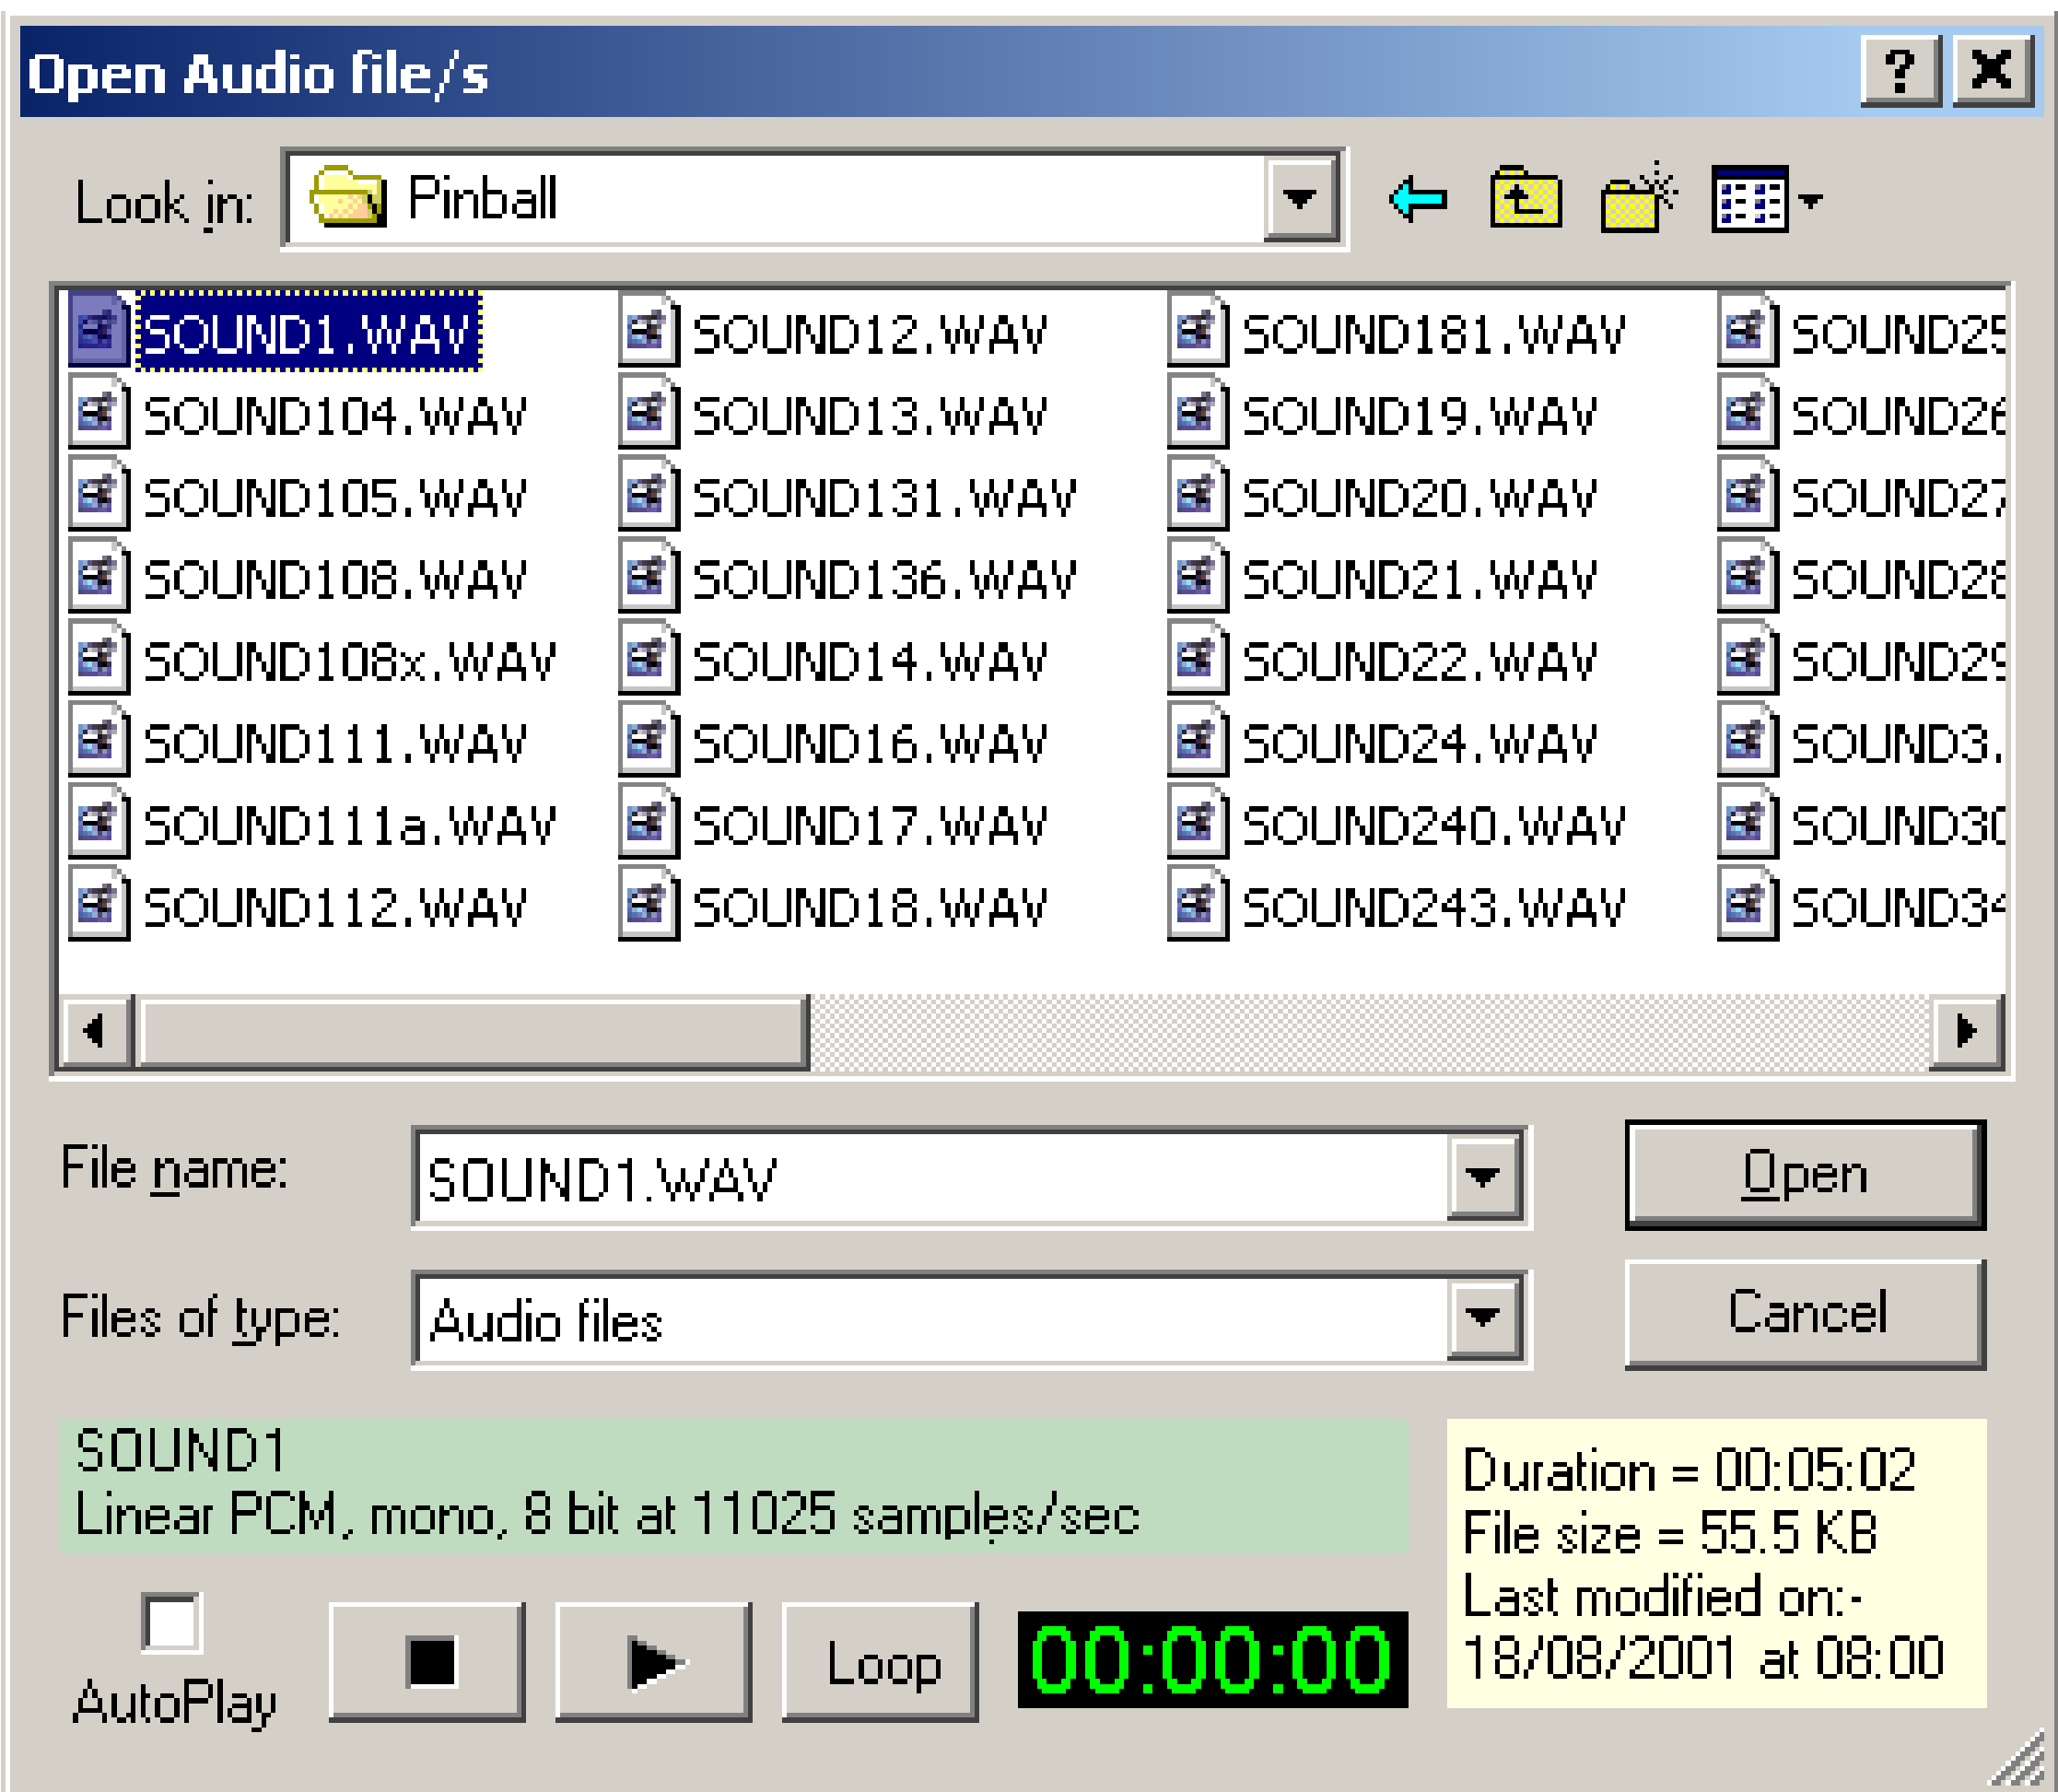

Old Menus - Stop Page Button

In addition to the All Stop button which stops all tracks on all pages, there is a Page Stop button which will stop all tracks on the current page, by default the page Stop button is hidden.

The All Stop button can be enabled/disabled via this menu

Old Menus - Use WAV Preview

Checking this option adds a track preview area to the "Load" file selector dialog

The track will be played out on the output assigned to the button about to be loaded at the default output level

Old Menus - Show Pages Playing

As an aid to know on which page tracks are being played, this option marks the page tabs in the upper left corner with a red triangle, this will flash if the Options|Flash Button During Play option is set.

Old Menus - Flash Phase Locked

Synchronize flashing of all button numbers

Old Menus - Highlight Step to Next

Step to Next mode shows the selected button with a white background to the track number

In some circumstances this may not be obvious on the screen so the Highlight Step to Next option adds extra highlighting in the corners of the button

Old Menus - Enable All Stop Button

This will disable/enable the All Stop button in the status bar

Old Menus - Narrow Track Numbers

The coloured background on the track numbers sometimes extends over the duration numbers, so hiding some or all of the modifier symbols.

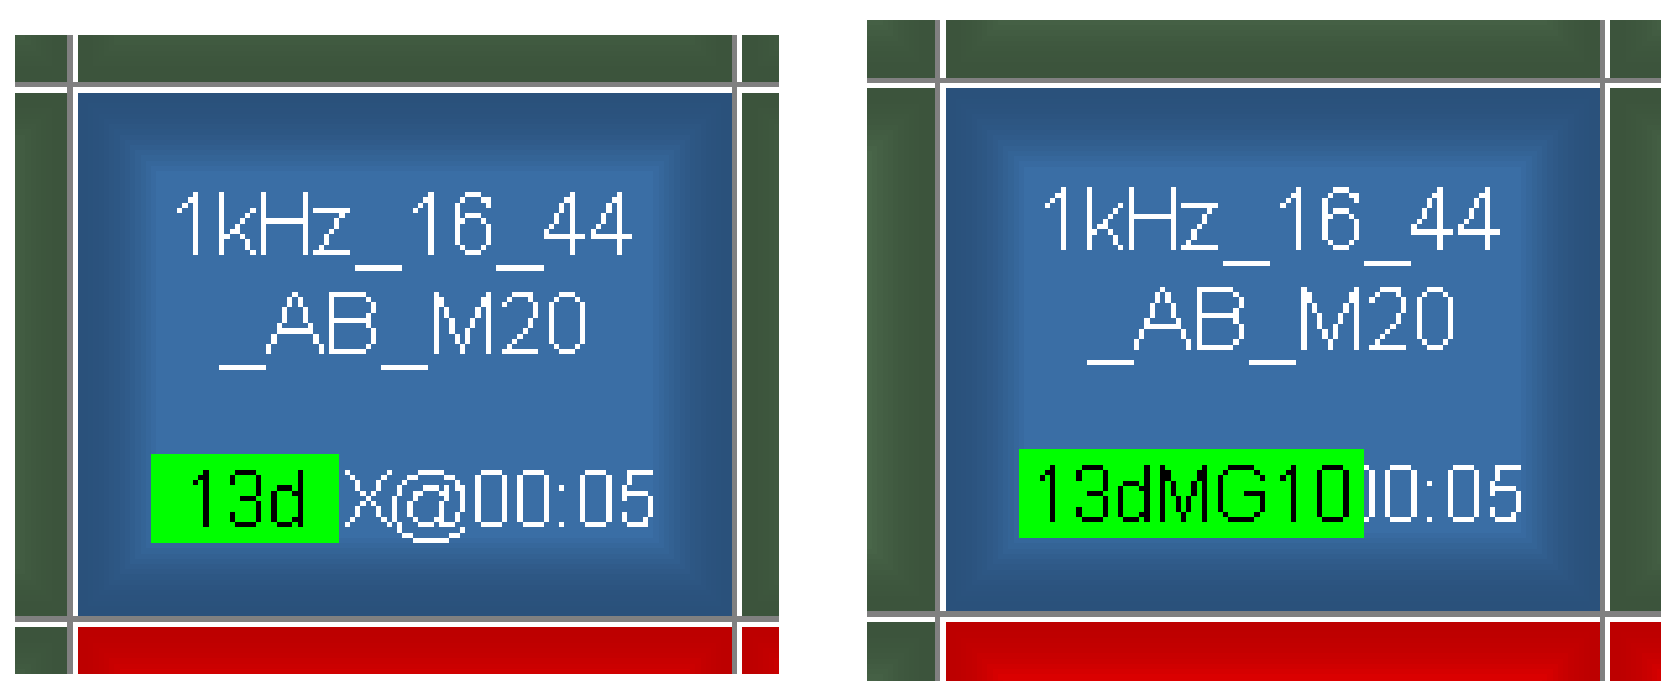

Links Off

Links On

In the situation above the switching on of the Master/Slave links causes the green text background to extend towards the right hand side of the button, this is to allow for indication of all the possible combinations of links. All buttons on a page have the text background set to the same width.

To reduce the instances of the track number hiding the duration modifiers the Narrow Track Numbers option can be checked, this will set the width of the background to be as wide as possible whilst avoiding overlapping the duration text except when absolutely necessary.

Links On

Links On

Old Menus - Edged Midi/HotKey Text

In order to improve visibility of the button Midi and HotKey text this option will add a drop shadow effect to the text

Old Menus - Flash Button During Play

Flash button number bright/dark red when playing

Old Menu - Optimize Tracks

Tracks can be optimized either globally covering all tracks on all pages, or just on the current page, so assigning the most frequently played tracks to hardware mixers.

Use Win XP Themes - enabled by default

Check the Use Win XP Themes menu item to enable the Windows "XP theme" look when running under Windows XP or above, SpotOn will have to be restarted for this to take effect.

XP themes disabled: -

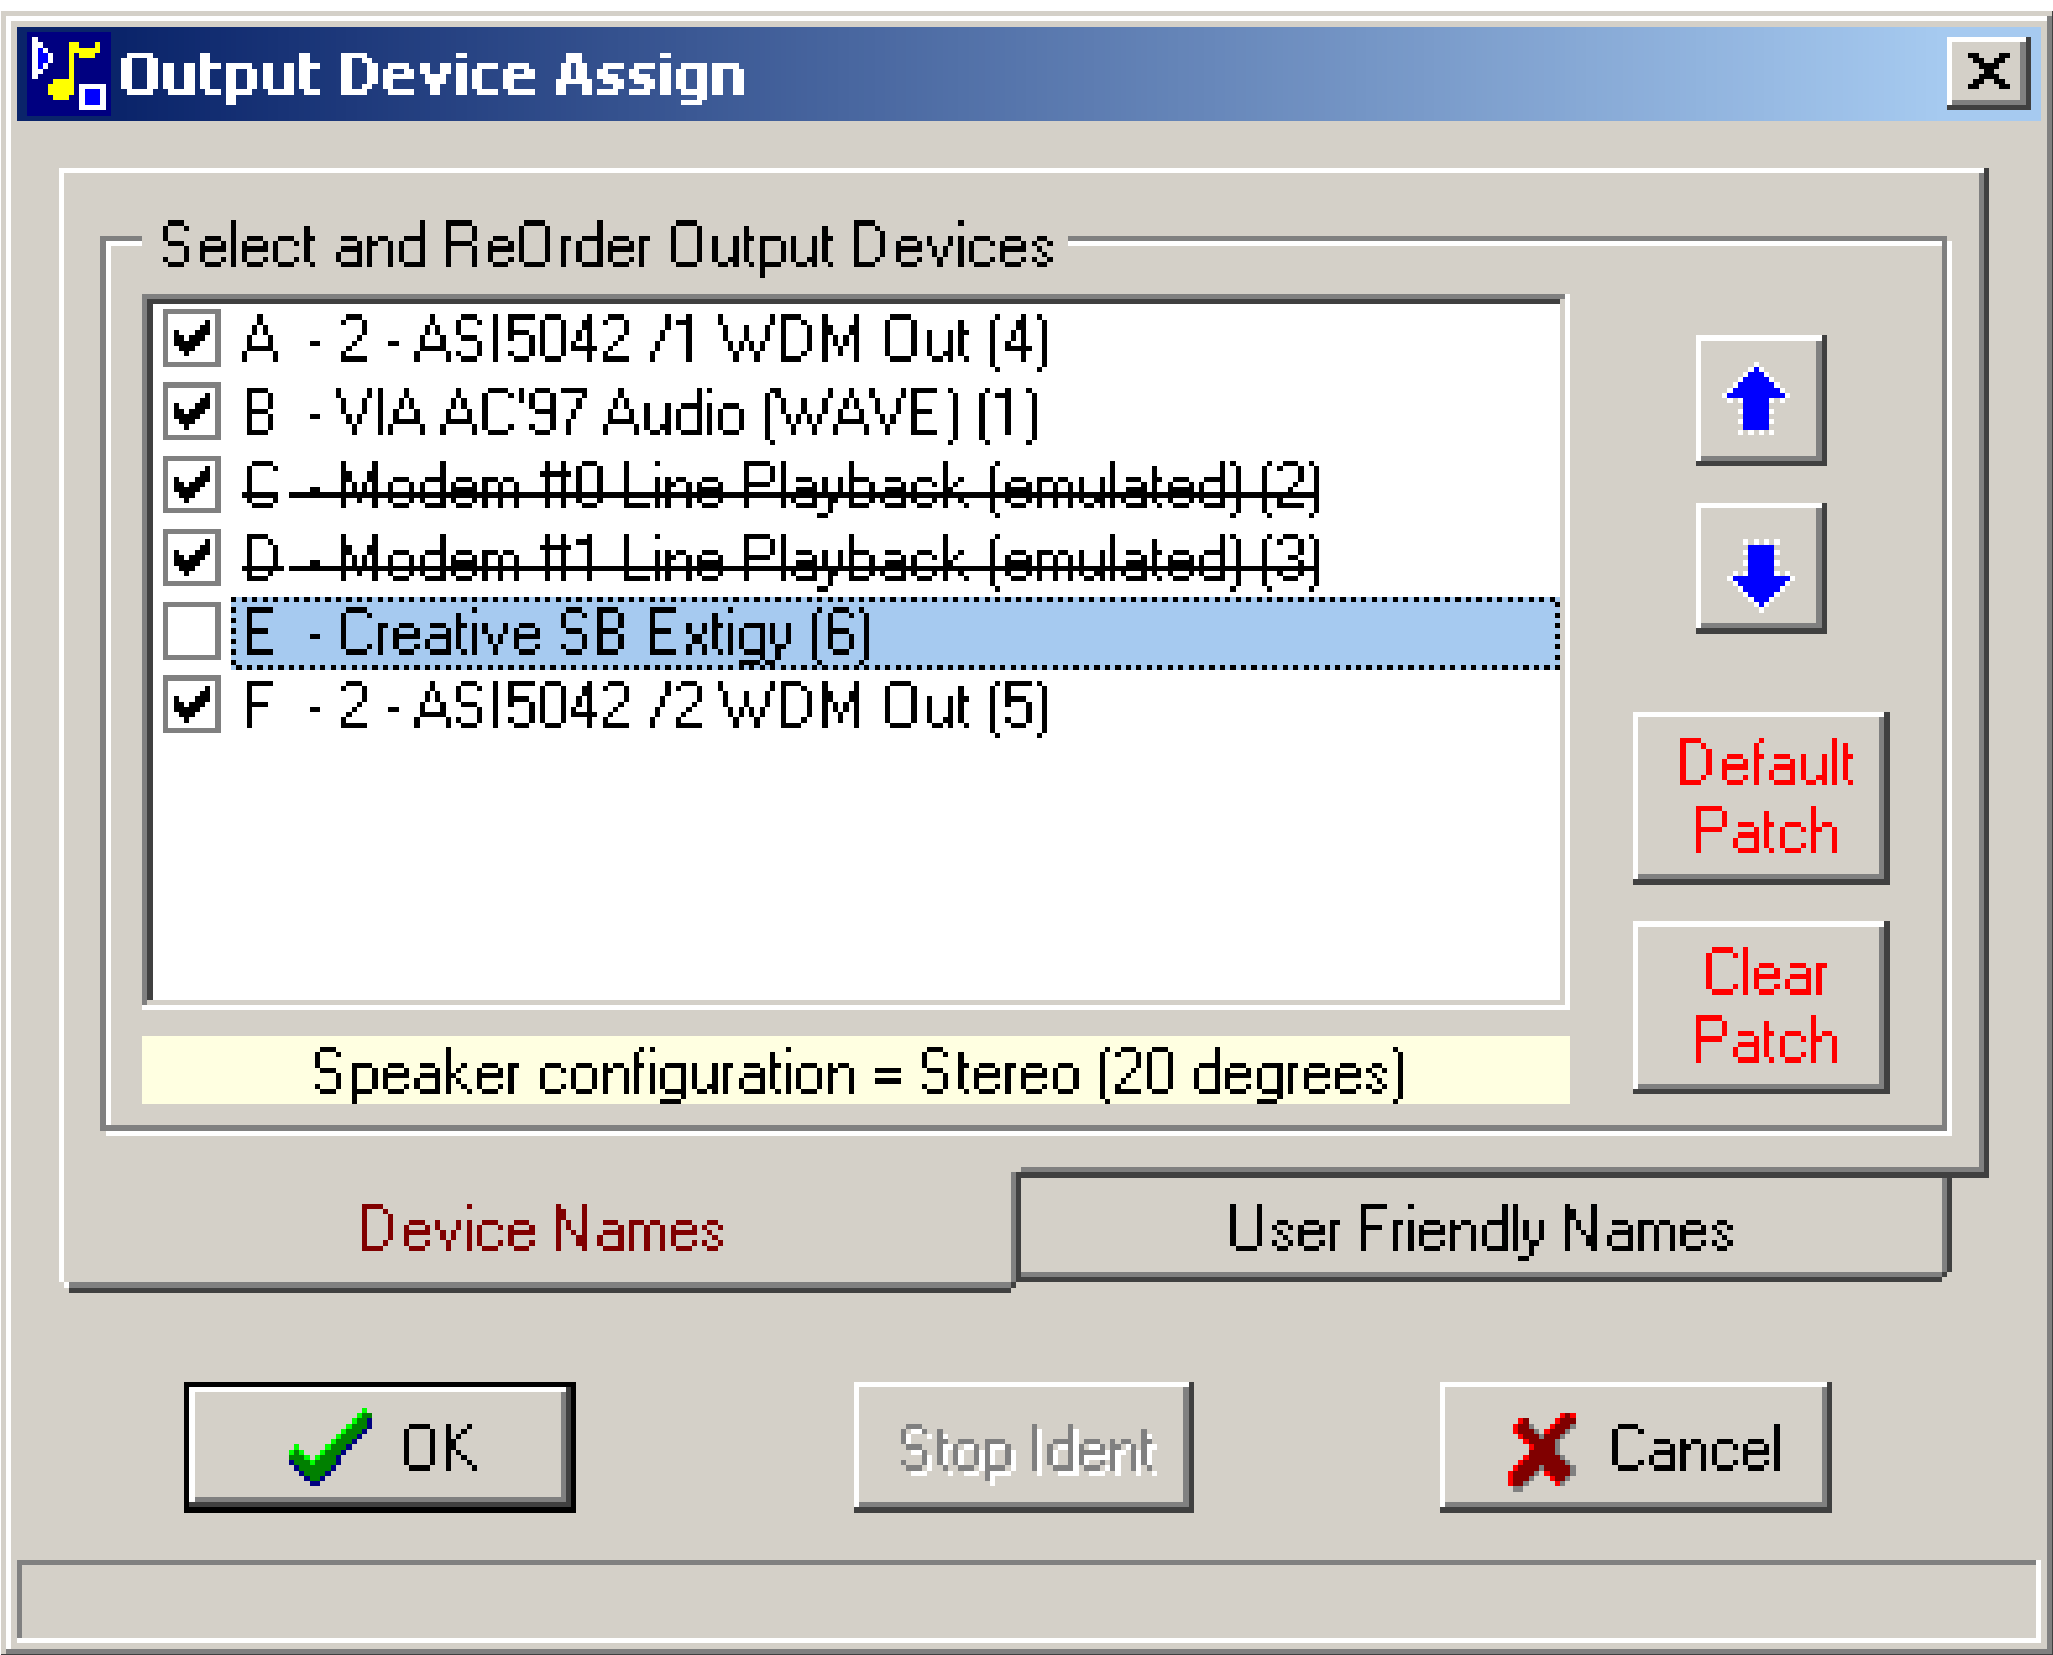

XP Themes enabled: -

Note: the actual representation will depend on the particular color scheme selected under WinXP themes, and consequentially the readability of some sections of the program may be reduced.

Output Device Assign

Output Device Assign - Clear Patch

When assigning outputs for the first time or after a change of output devices eg Multi-channel/Stereo, it is recommended that the Clear Patch button is used to clear any ambiguous settings in the SpotOn configuration file.

Clicking on Clear Patch will display the dialog box below

Choosing OK will close the Output Device Assign dialog and return to the main SpotOn screen.

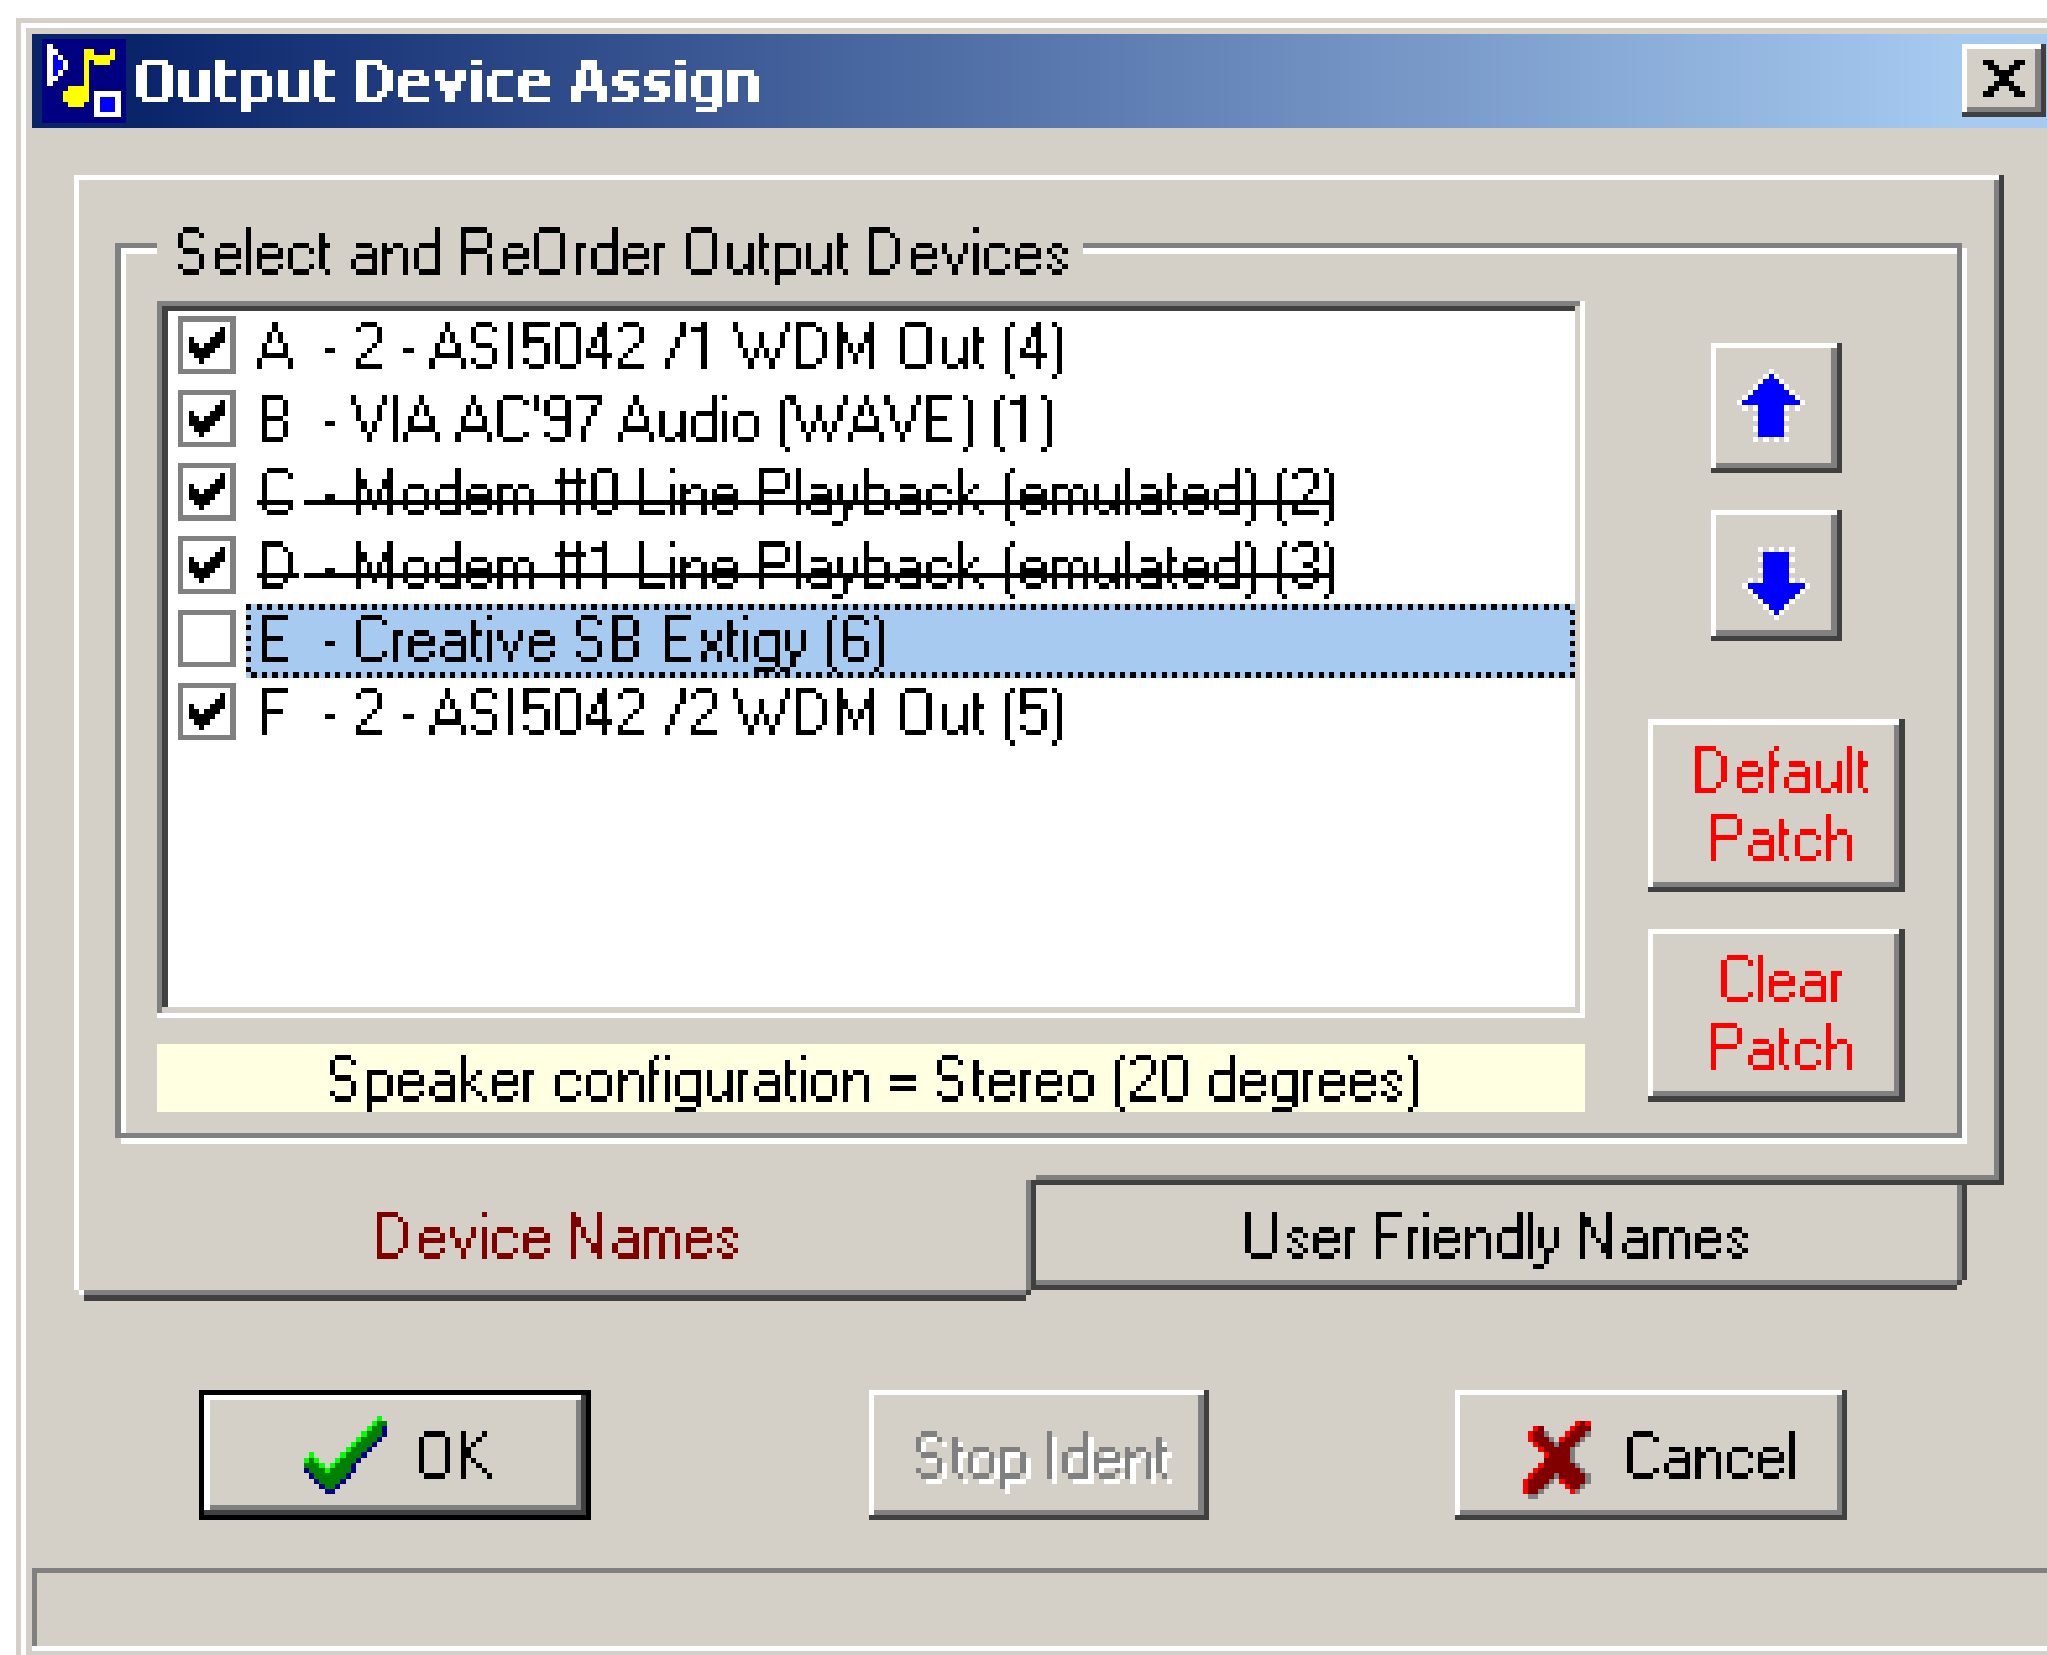

Output Device Assign - Default Patch

The Default Patch is saved on installation when the outputs have been initially configured. If necessary the Default Patch button will return the output device patch and masking to the installation settings.

Clicking on Default Patch will display the dialog box below

Output Device Assign - Masking

Some sound cards do not allow more than one application to access an output port simultaneously, in this case it is useful to force SpotOn to not use a specific output port so making it available for other applications.

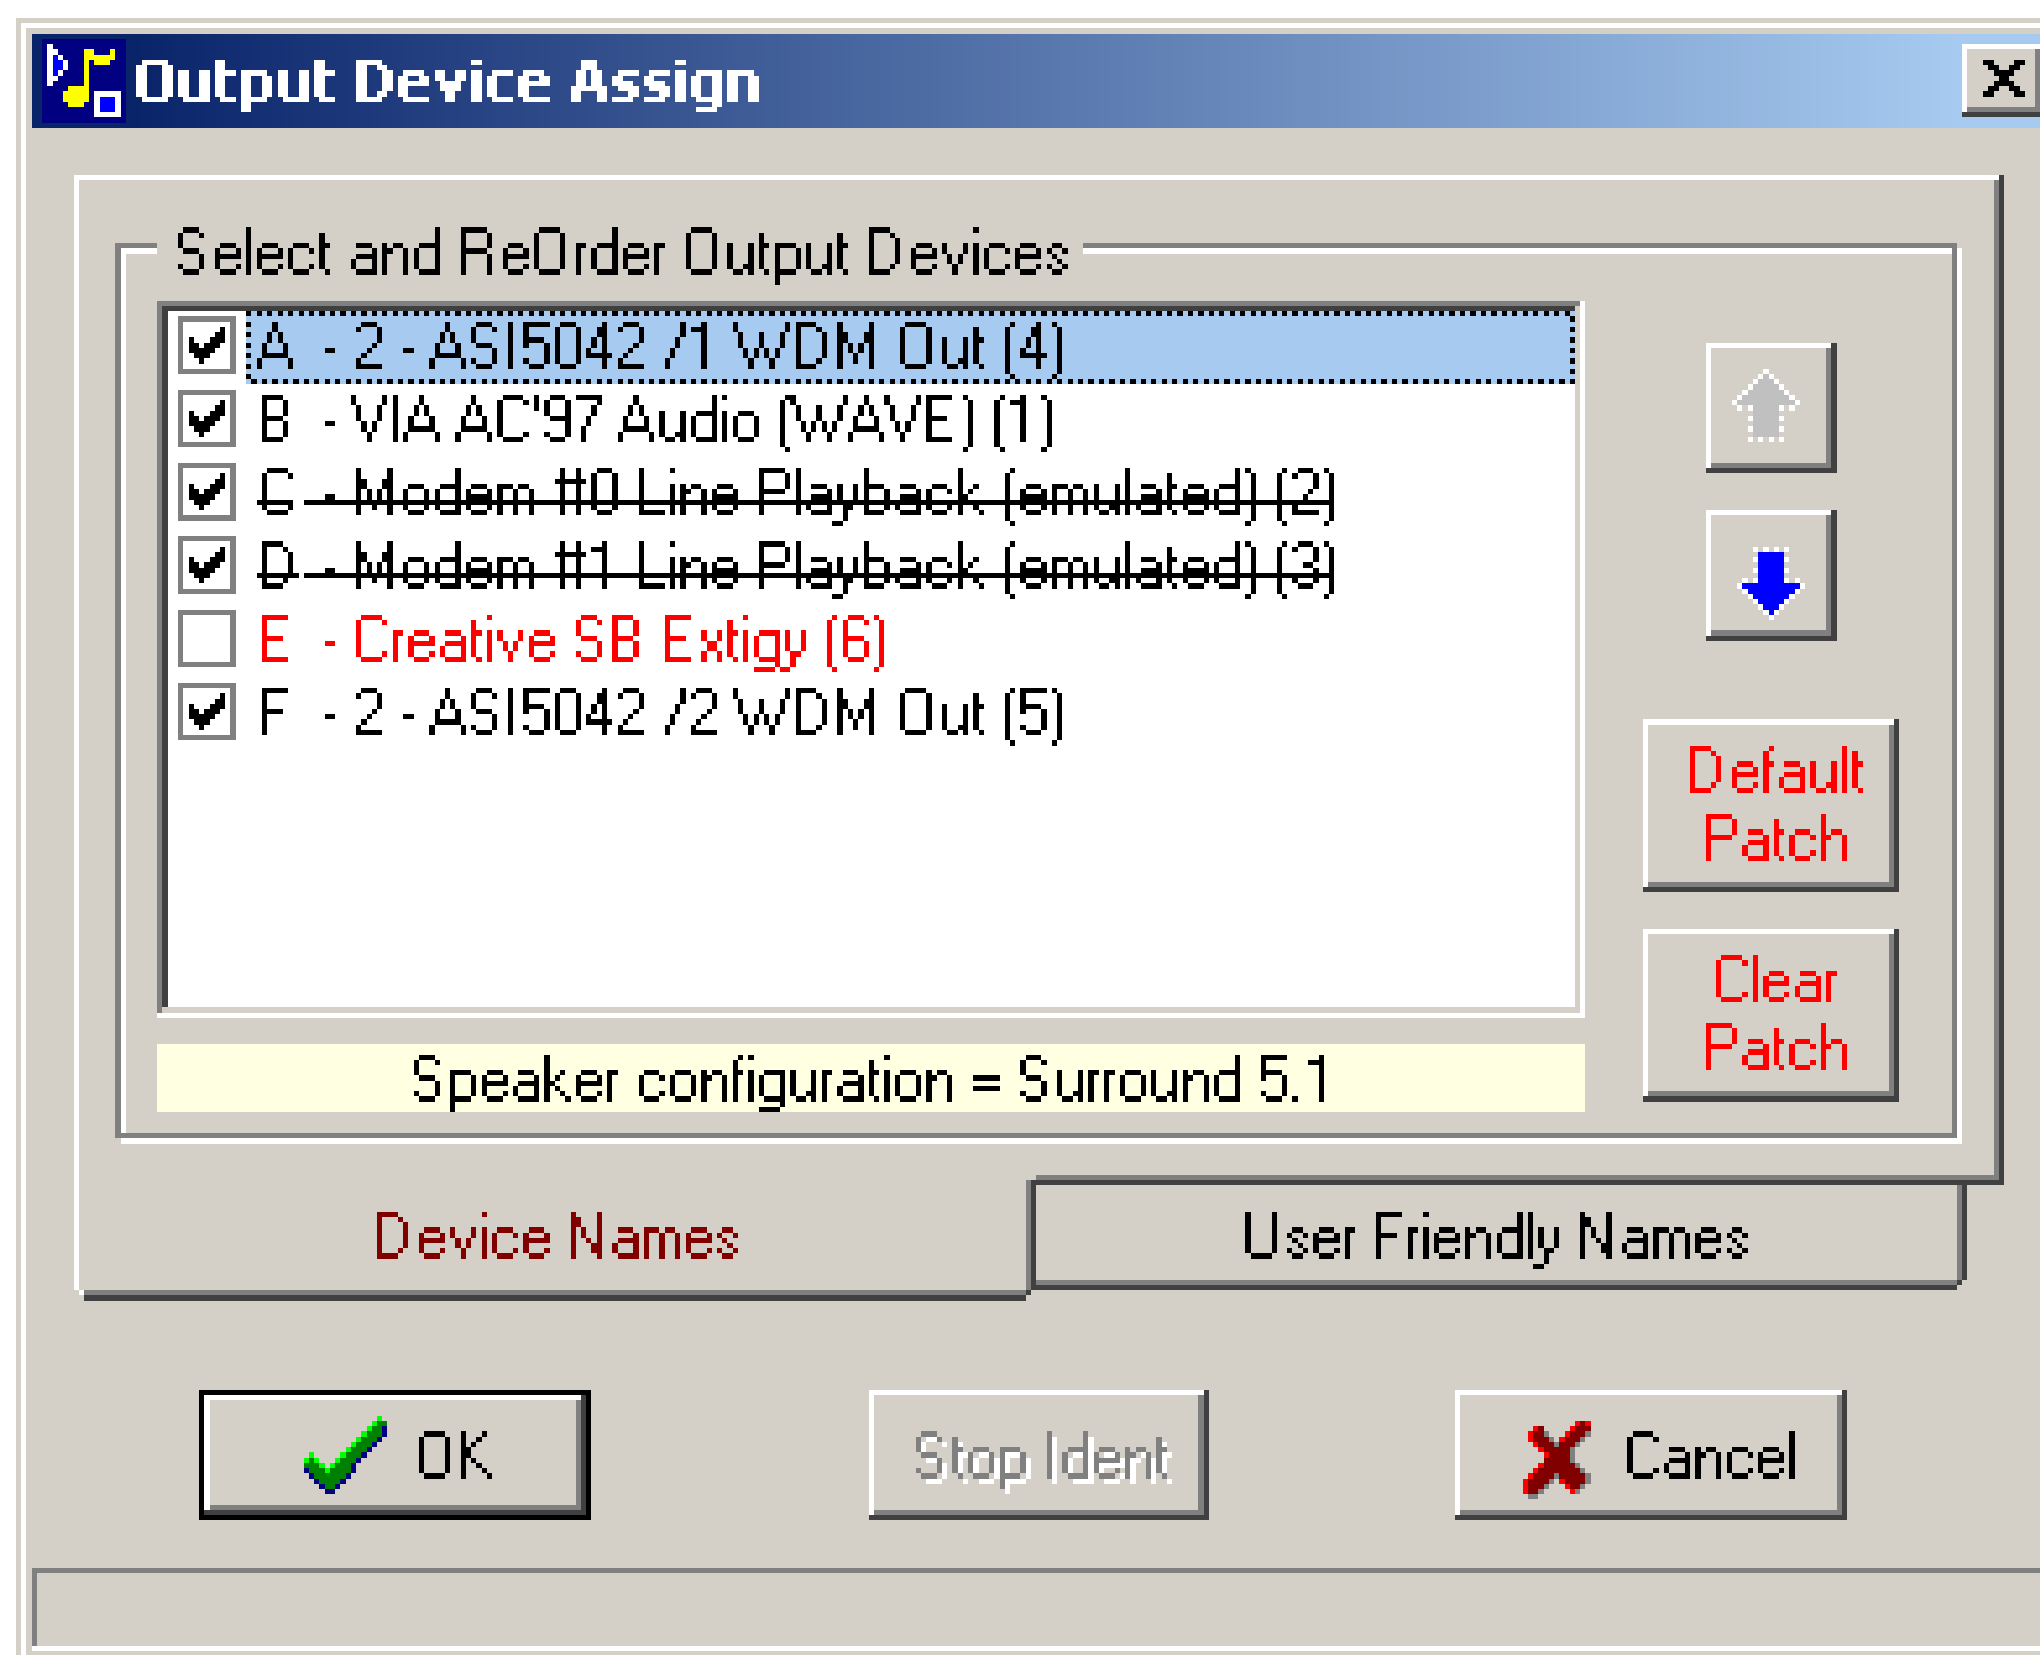

In the example above there are seven output ports listed A..F.

Items A, B and F are sound card outputs being used by SpotOn

Items C and D are not available because they are virtual outputs provided by two modems and not in fact real sound card ports.

The remaining item E has been unchecked and therefore will be masked out of ports used by SpotOn, the masking of ports will only take effect the next time SpotOn is restarted. If there are buttons using any port/s that are masked on restart then those buttons will be assigned to device designated as the Windows Preferred audio output device, designated by the subscript '(1)' in the device list. If the Windows preferred audio output device is also masked then the buttons concerned will not be loaded.

After a restart output E is shown in red text

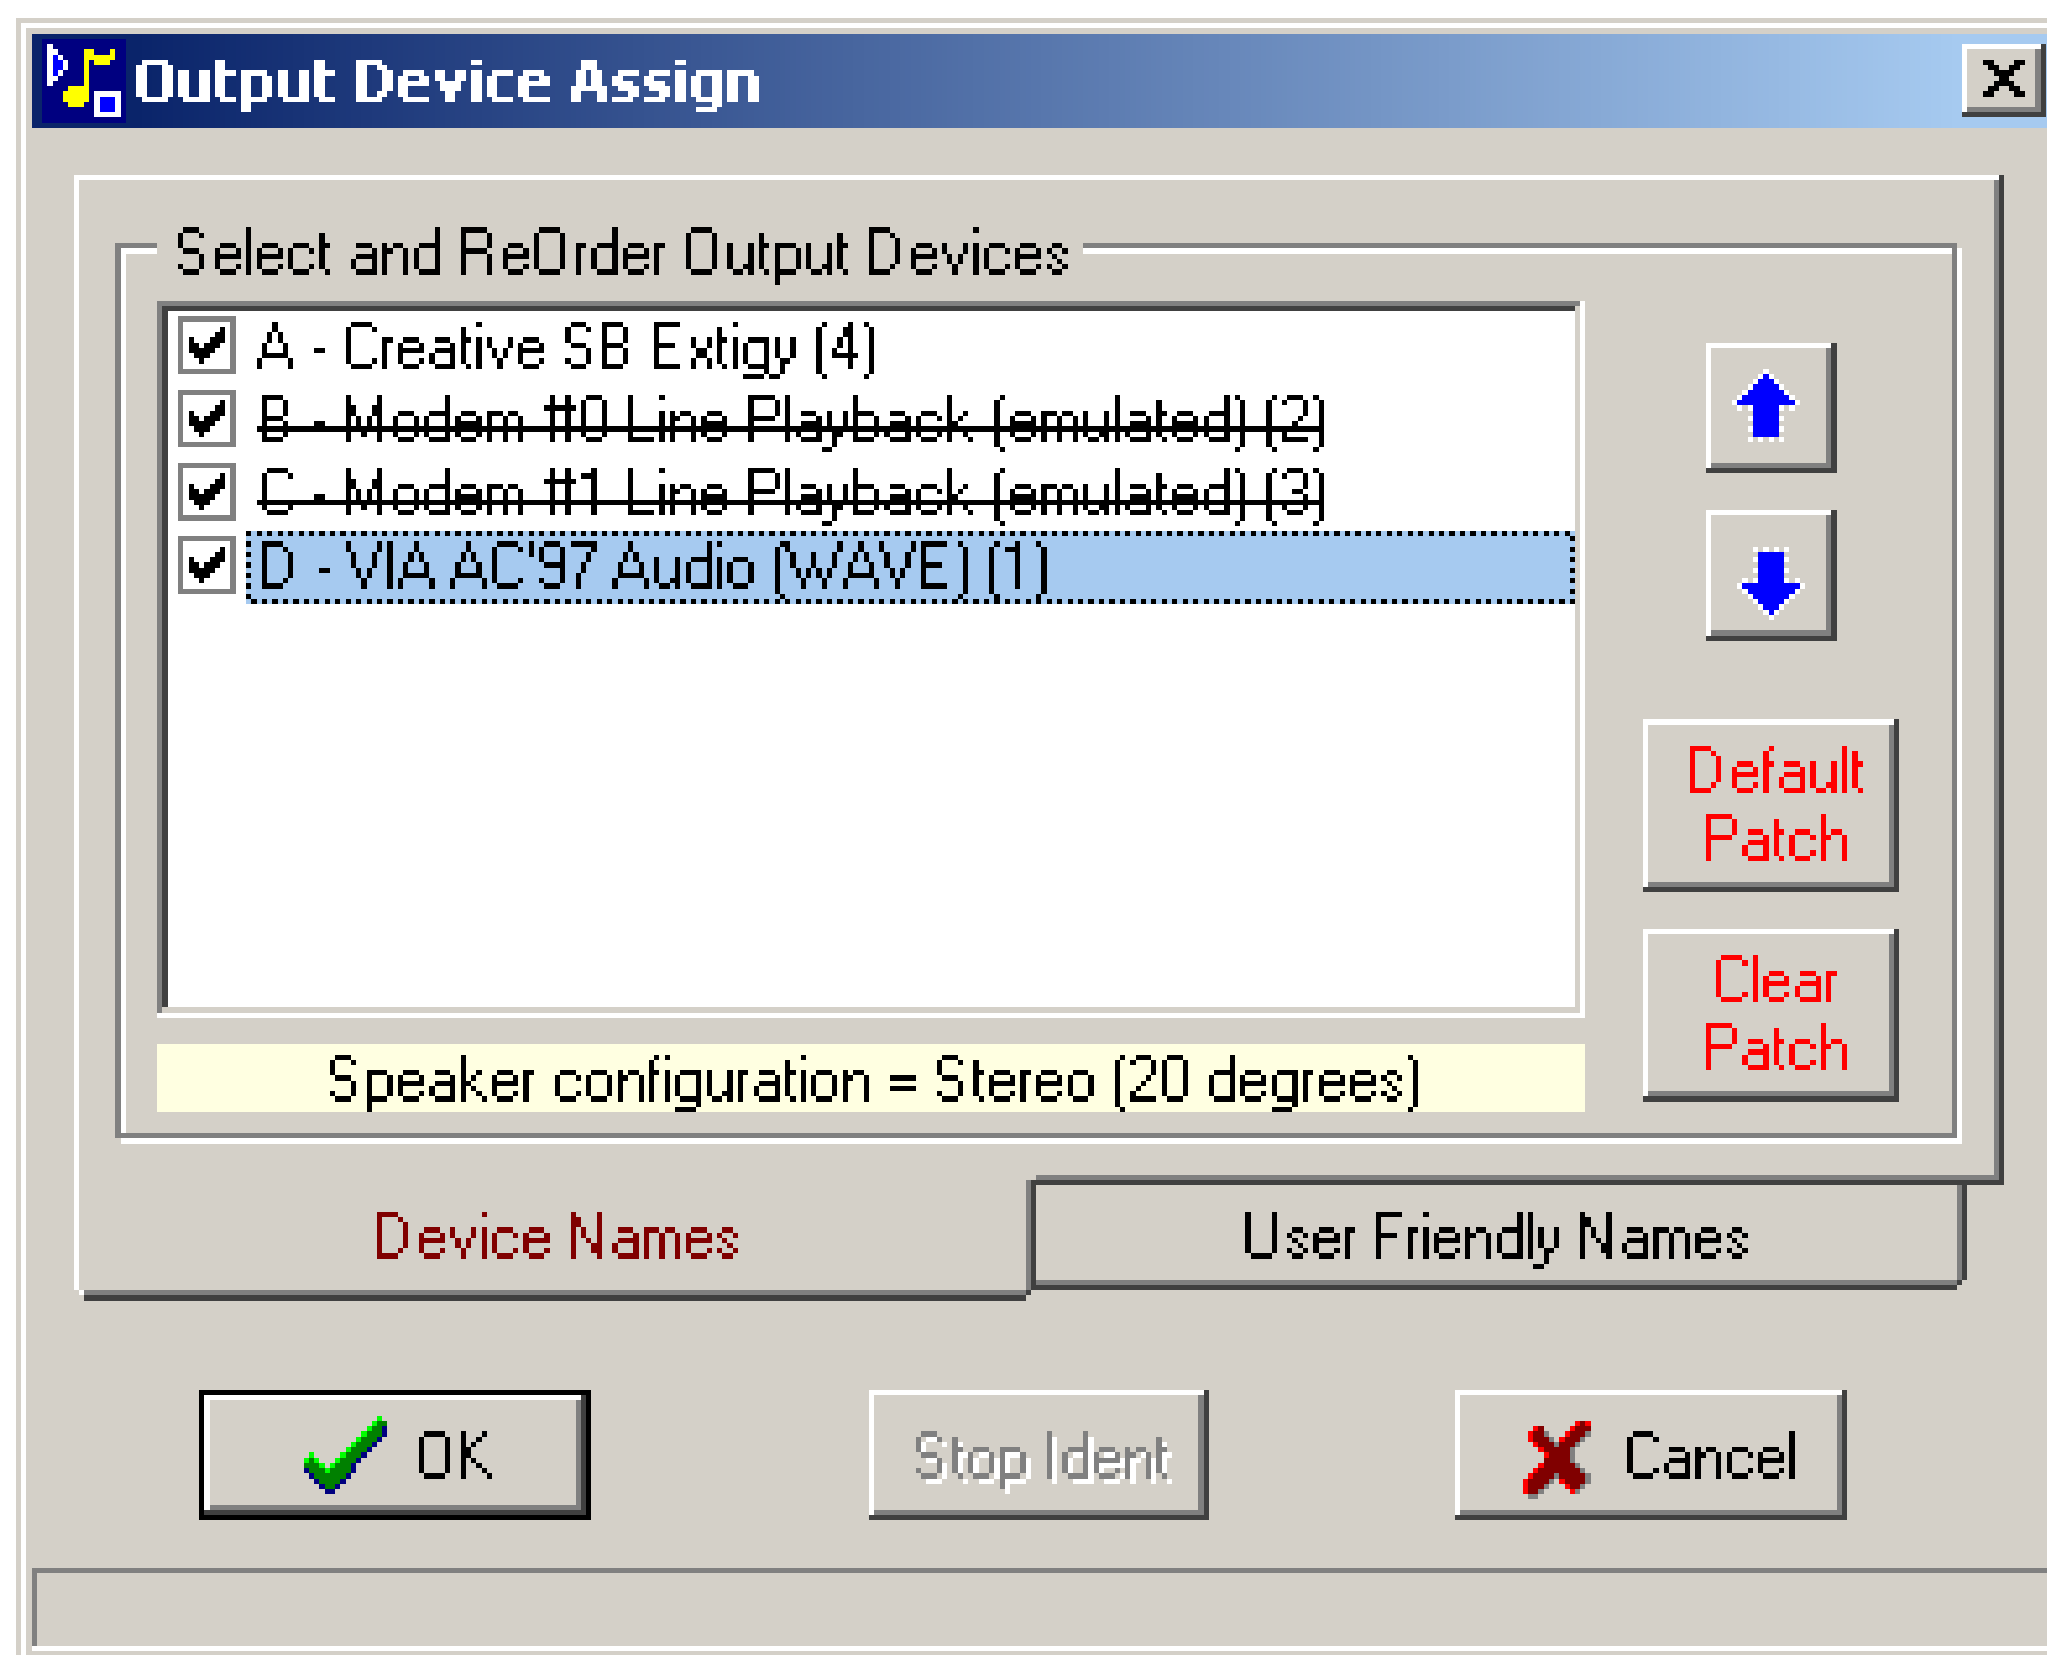

The example below shows the effect of masking outputs in the [Audio SetUp](#) dialog, where output E cannot be selected.

Output Device Assign - Order

The up, down and reset buttons on the right hand side of the window allows the ordering of the output devices.

If outputs currently known as A and D were to be the main options it would be useful to move them to the first two positions in the list so appearing as A and B

To do this first highlight the line describing output D

By clicking the up arrow twice the order now appears as

Reset Order button will restore the output device order to that which was found by the Windows OS.

Identically loaded computers may not always report the output devices in the same order, so this option is useful in making the computers 'look' the same to the user.

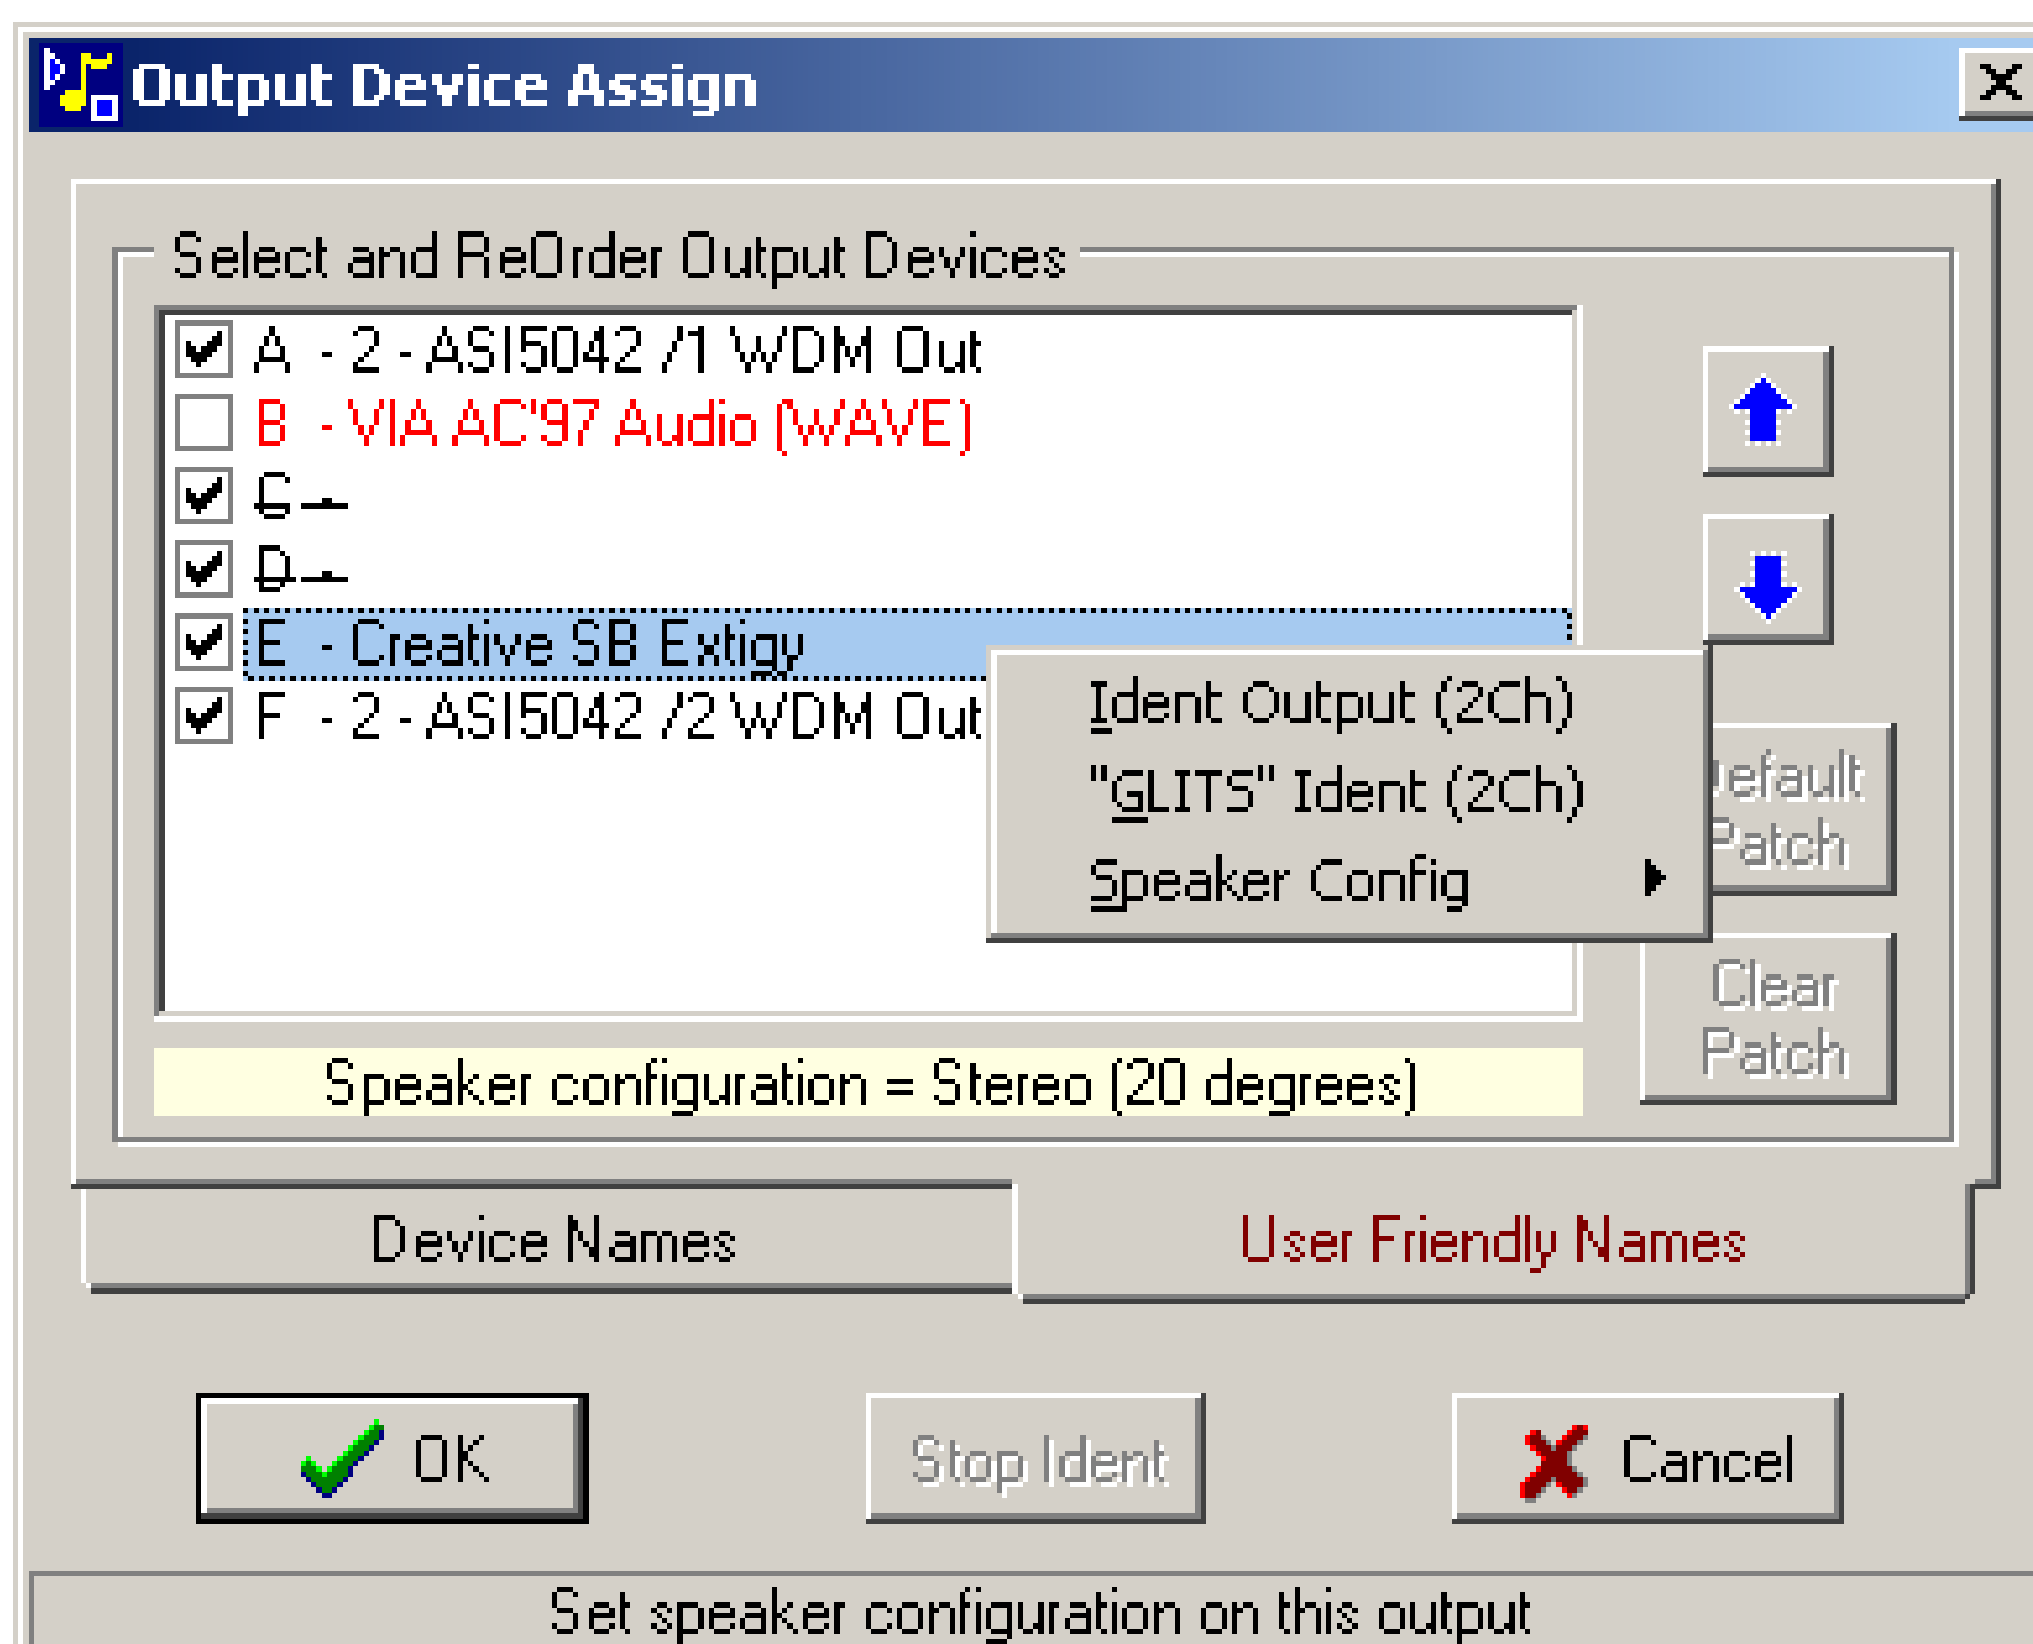

Exiting with OK produces a confirmation dialog box to warn that all buttons will be reloaded to in order to implement the change

Output Device Assign - Names

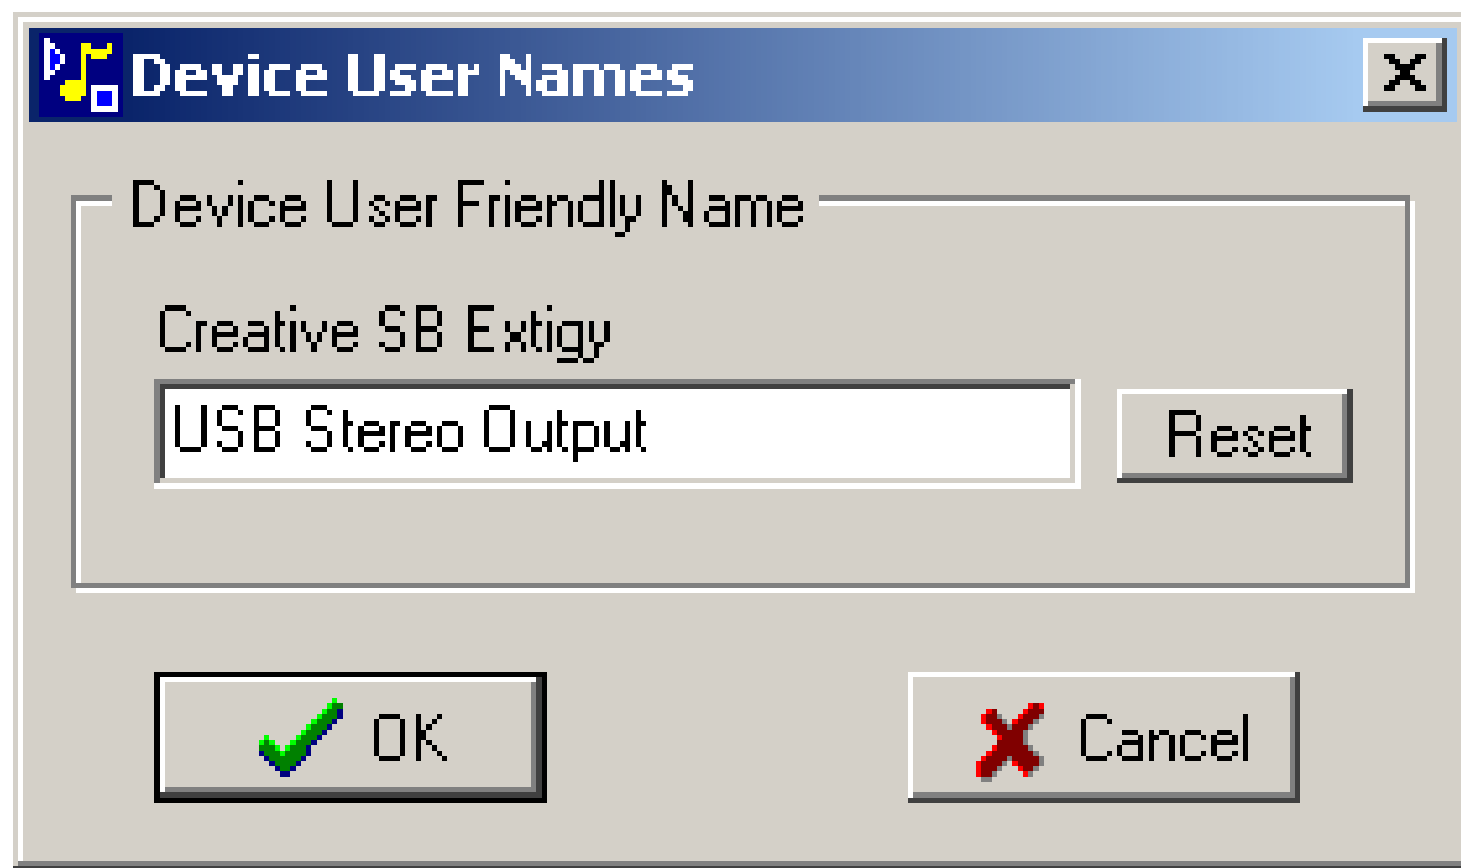

The names that appear alongside the output ports are those obtained from Windows, often more informative names are required, selecting the User Friendly Names tab show the alternative names defined - these initially default to the Windows name.

The new names are enabled via the Options|Display|Use Friendly Output Names menu item.

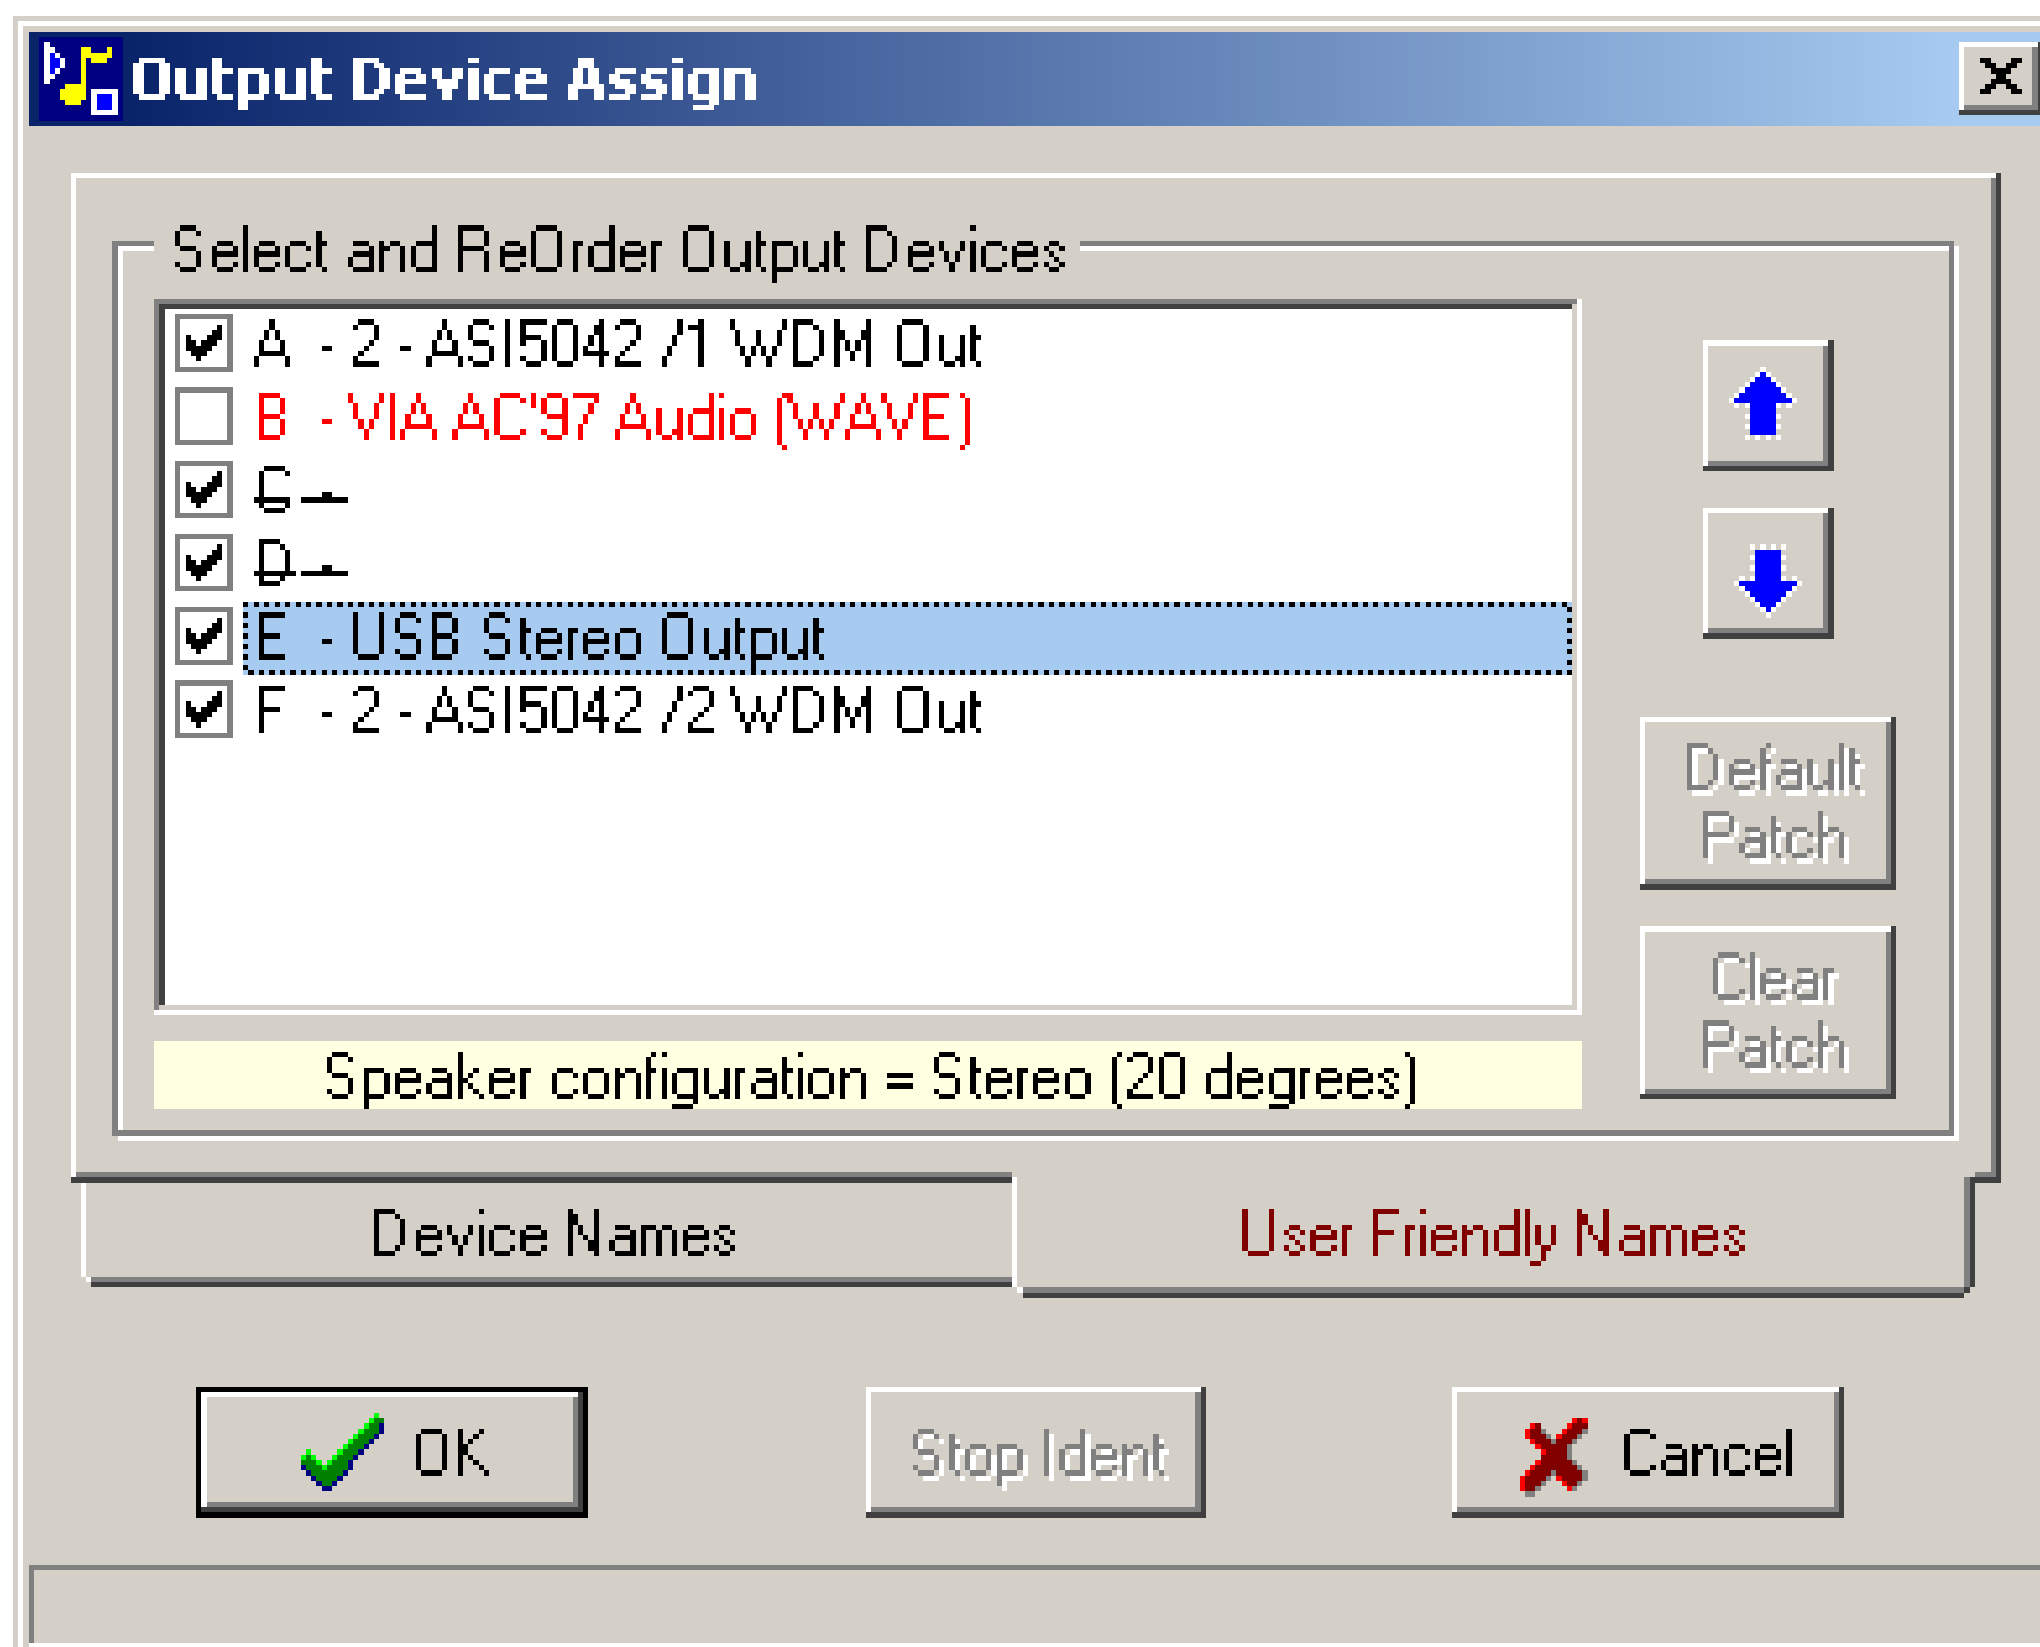

Right-click an entry and select Edit User Name, which displays the edit box below

Enter the new name

On closing the editor the name is up dated

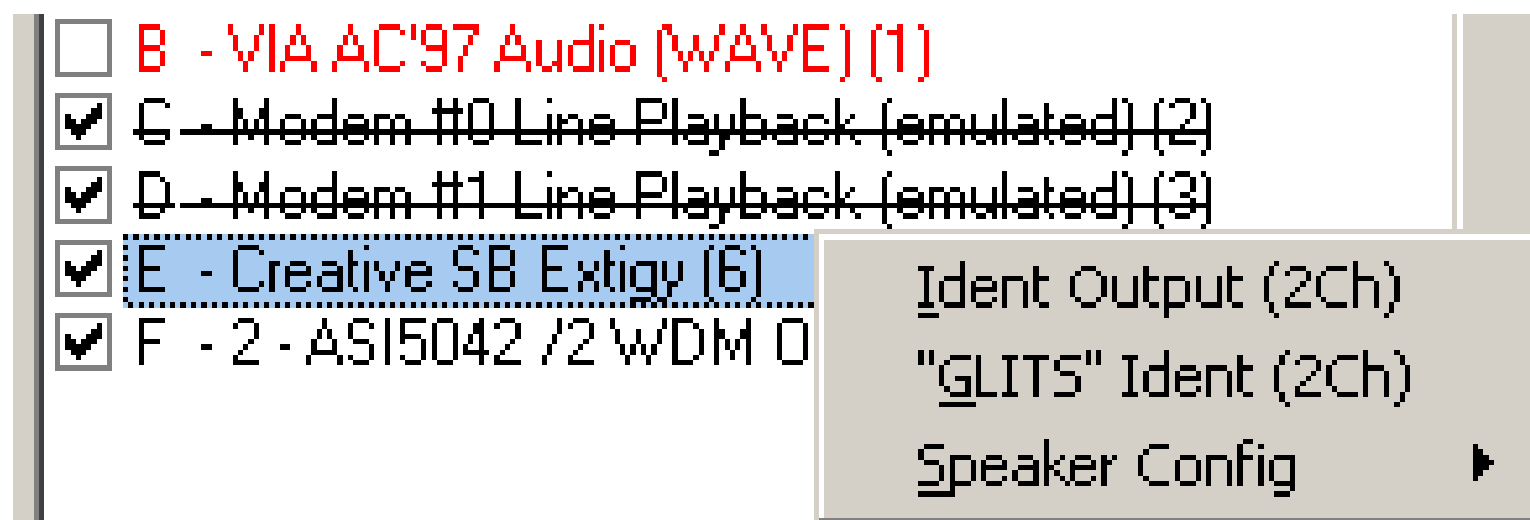

The User Friendly Names are only used in the button menu - option Audio|Output as below: -

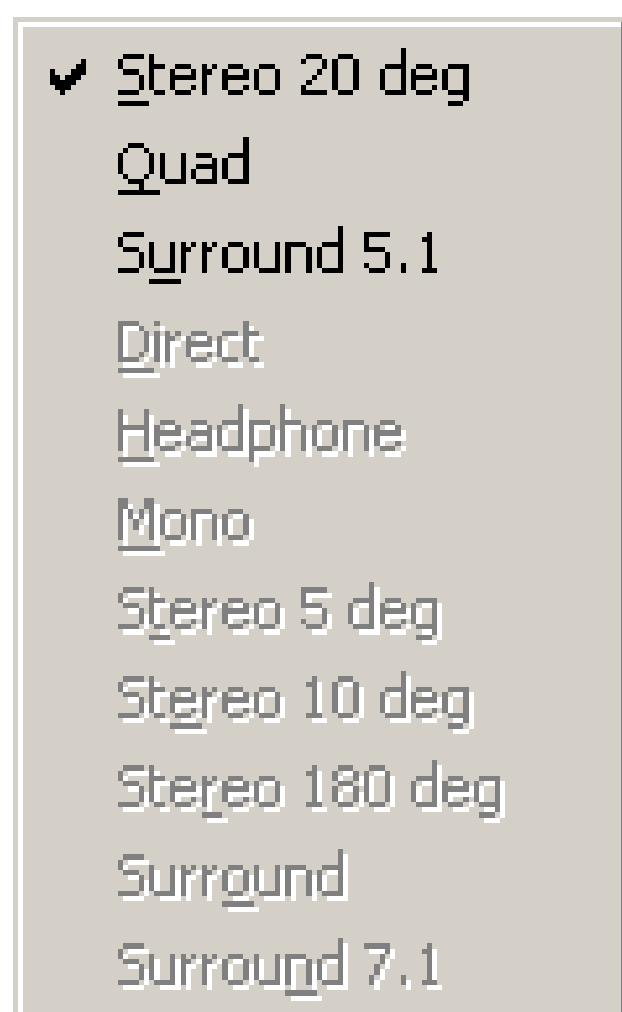

Output Device Assign - Mode

Under the list of output devices there is a panel showing the 'Speaker Configuration' of that output

To change the 'Speaker Configuration' right-click an entry and select the Speaker Config option.

The full list of modes is shown with the three most common modes enabled.

Check the appropriate option to change the mode of that output, in some cases it will also be necessary to use the manufacturers setup utility to change the hardware mode.

Output Device Assign - I dents

As SpotOn can operate in conventional 2 channel stereo and multi-channel modes, it may be useful to identify the individual output ports.

To identify output right-click the entry and select Ident option, this will start a voice ident loop spanning all output channels.

The "GLITS" test tone sequence is available for stereo sound configurations and is formed by interrupted 1kHz tone with one break on the left channel followed by two breaks on the right channel.

Similarly the "BLITS" test tone sequence is available for 5.1 surround sound configurations - see [BLITS](#) page for further details

Help Menu

About	Just displays an 'About Box'
Versions	Shows Versions page from help file
Contents	Opens this help file
Locate Menu Item	Search dialog for finding menu items
Remote Support	Utility to provide remote support of the SpotOn system
*Updates	Accesses SpotOn updates web page

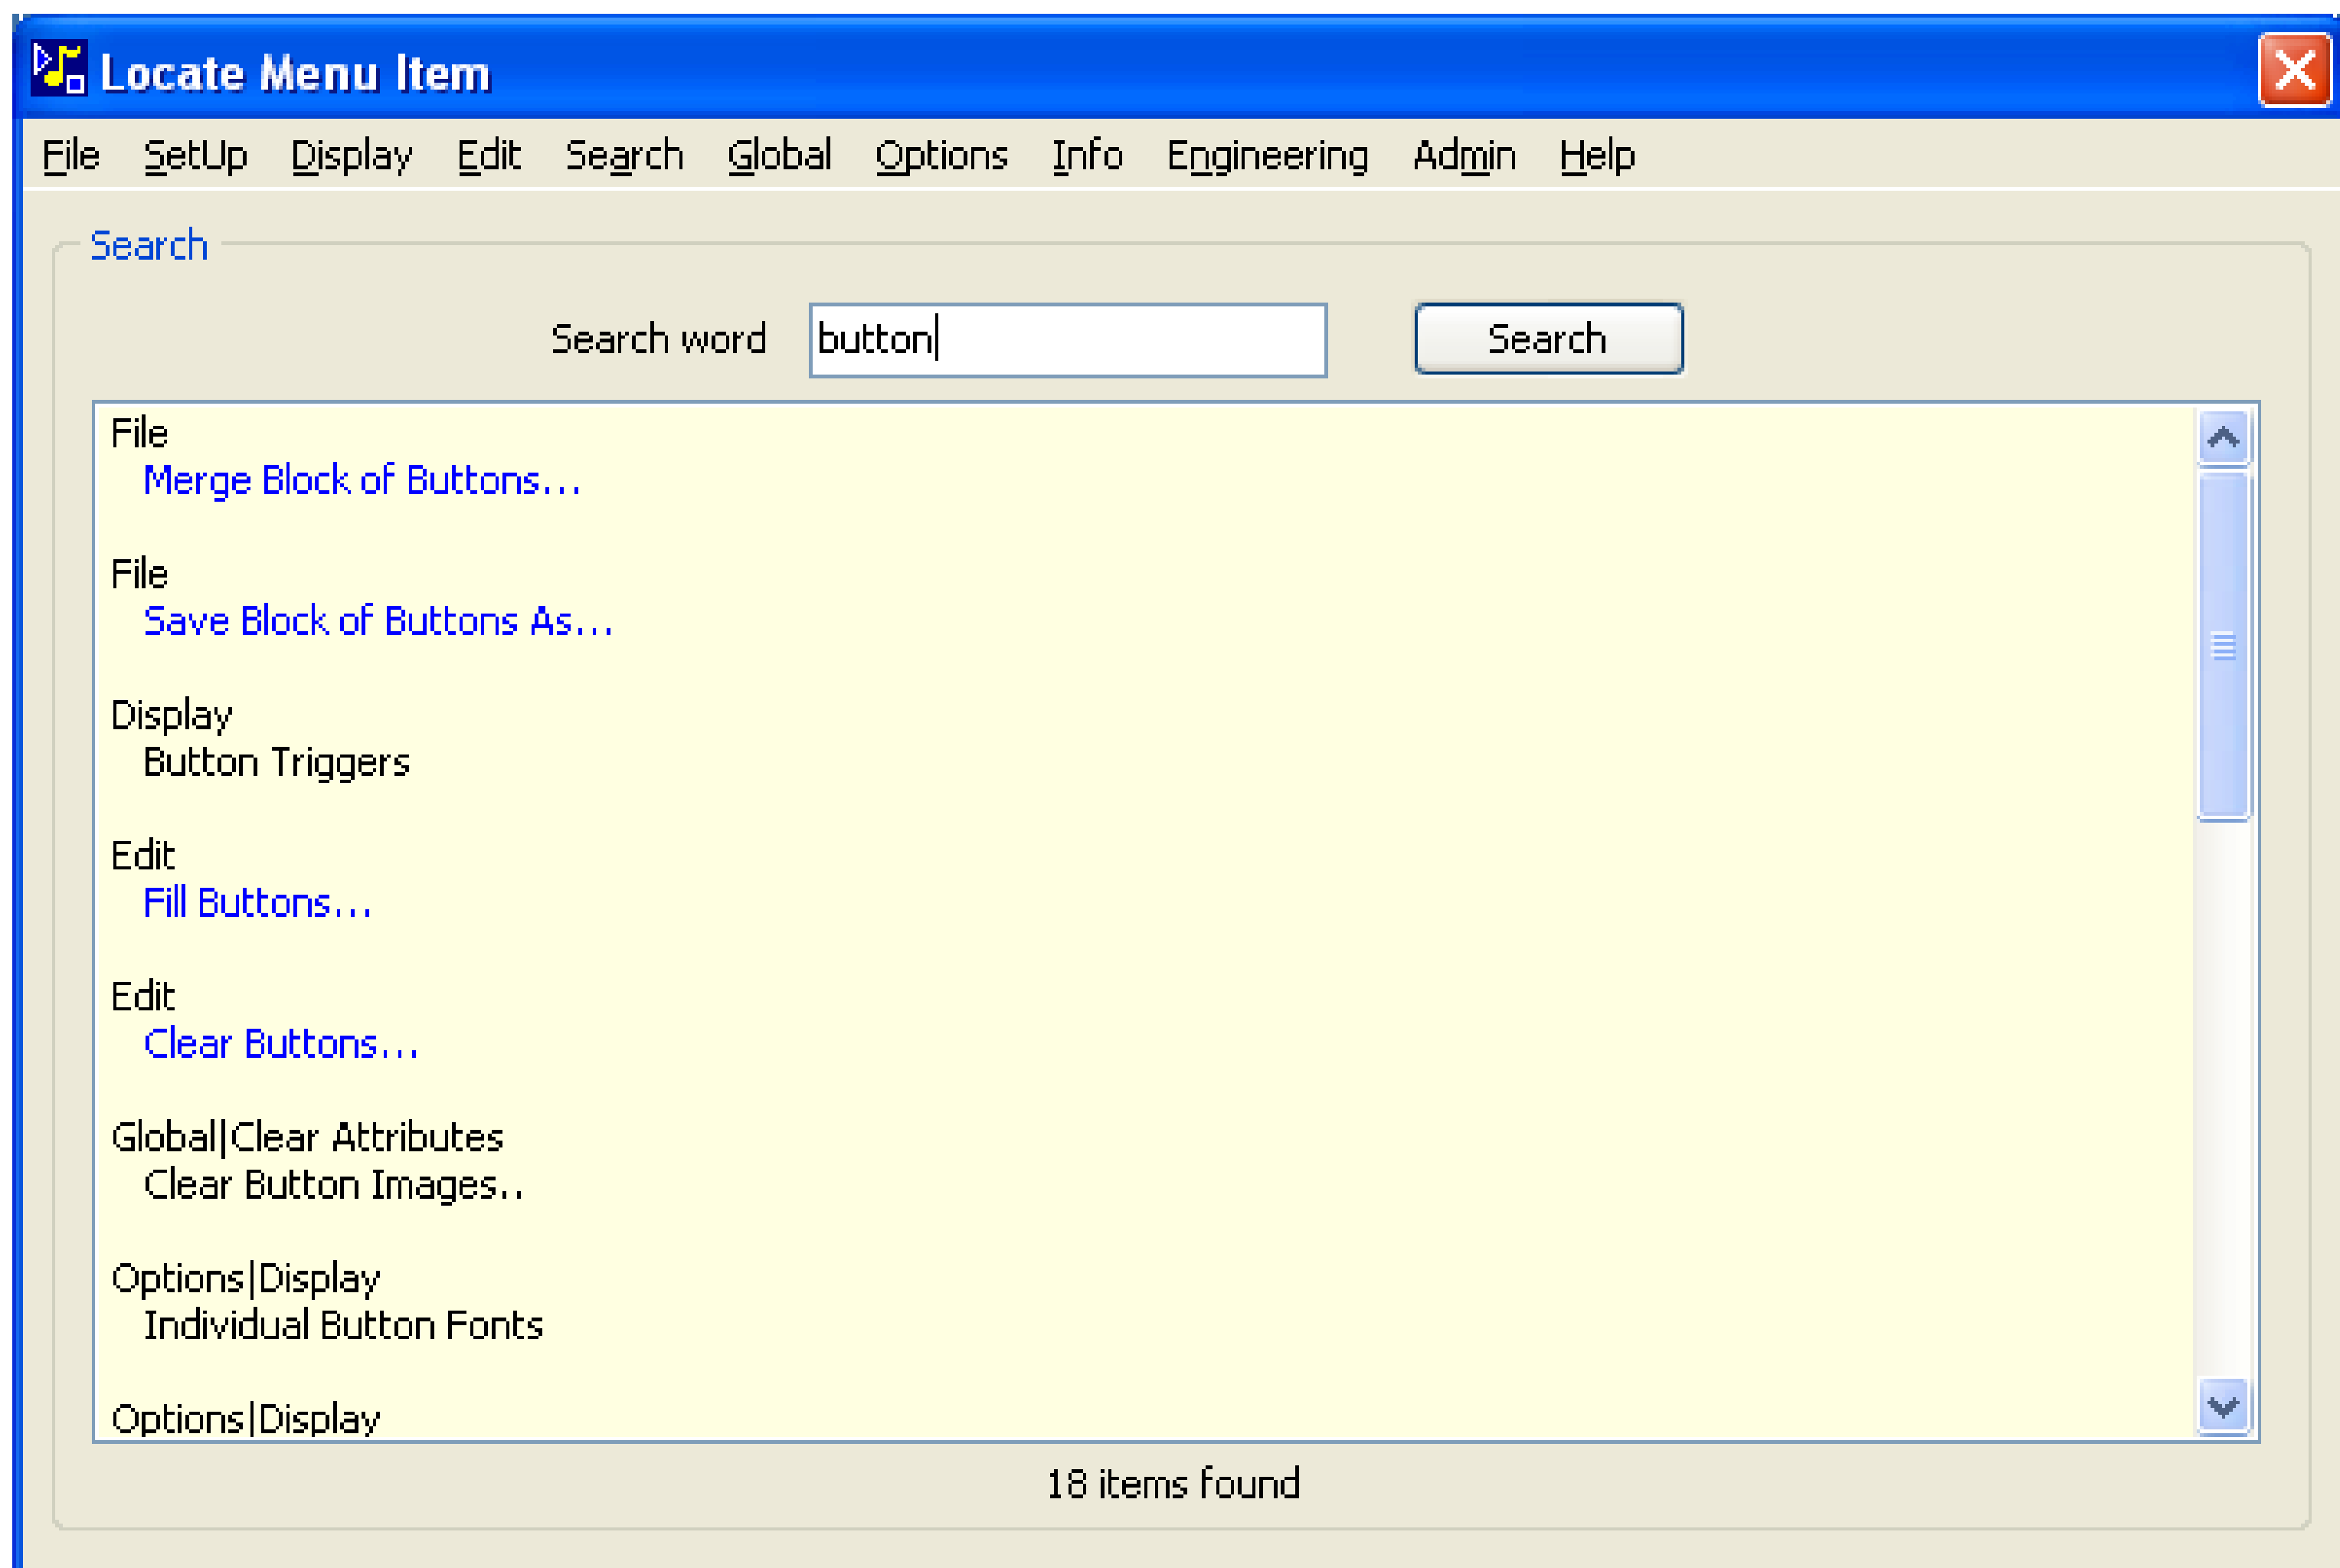

*Enabled via Admin menu

Locate Menu Item

The dialog below allows the menus to be searched for a keyword, the search term 'button' lists 18 items.

The results shown in blue text are hyperlinks to menu dialogs and can be clicked to open up the appropriate dialog box.

The format of the results includes the main menu item followed by a number of menu subitems eg Options | Display.

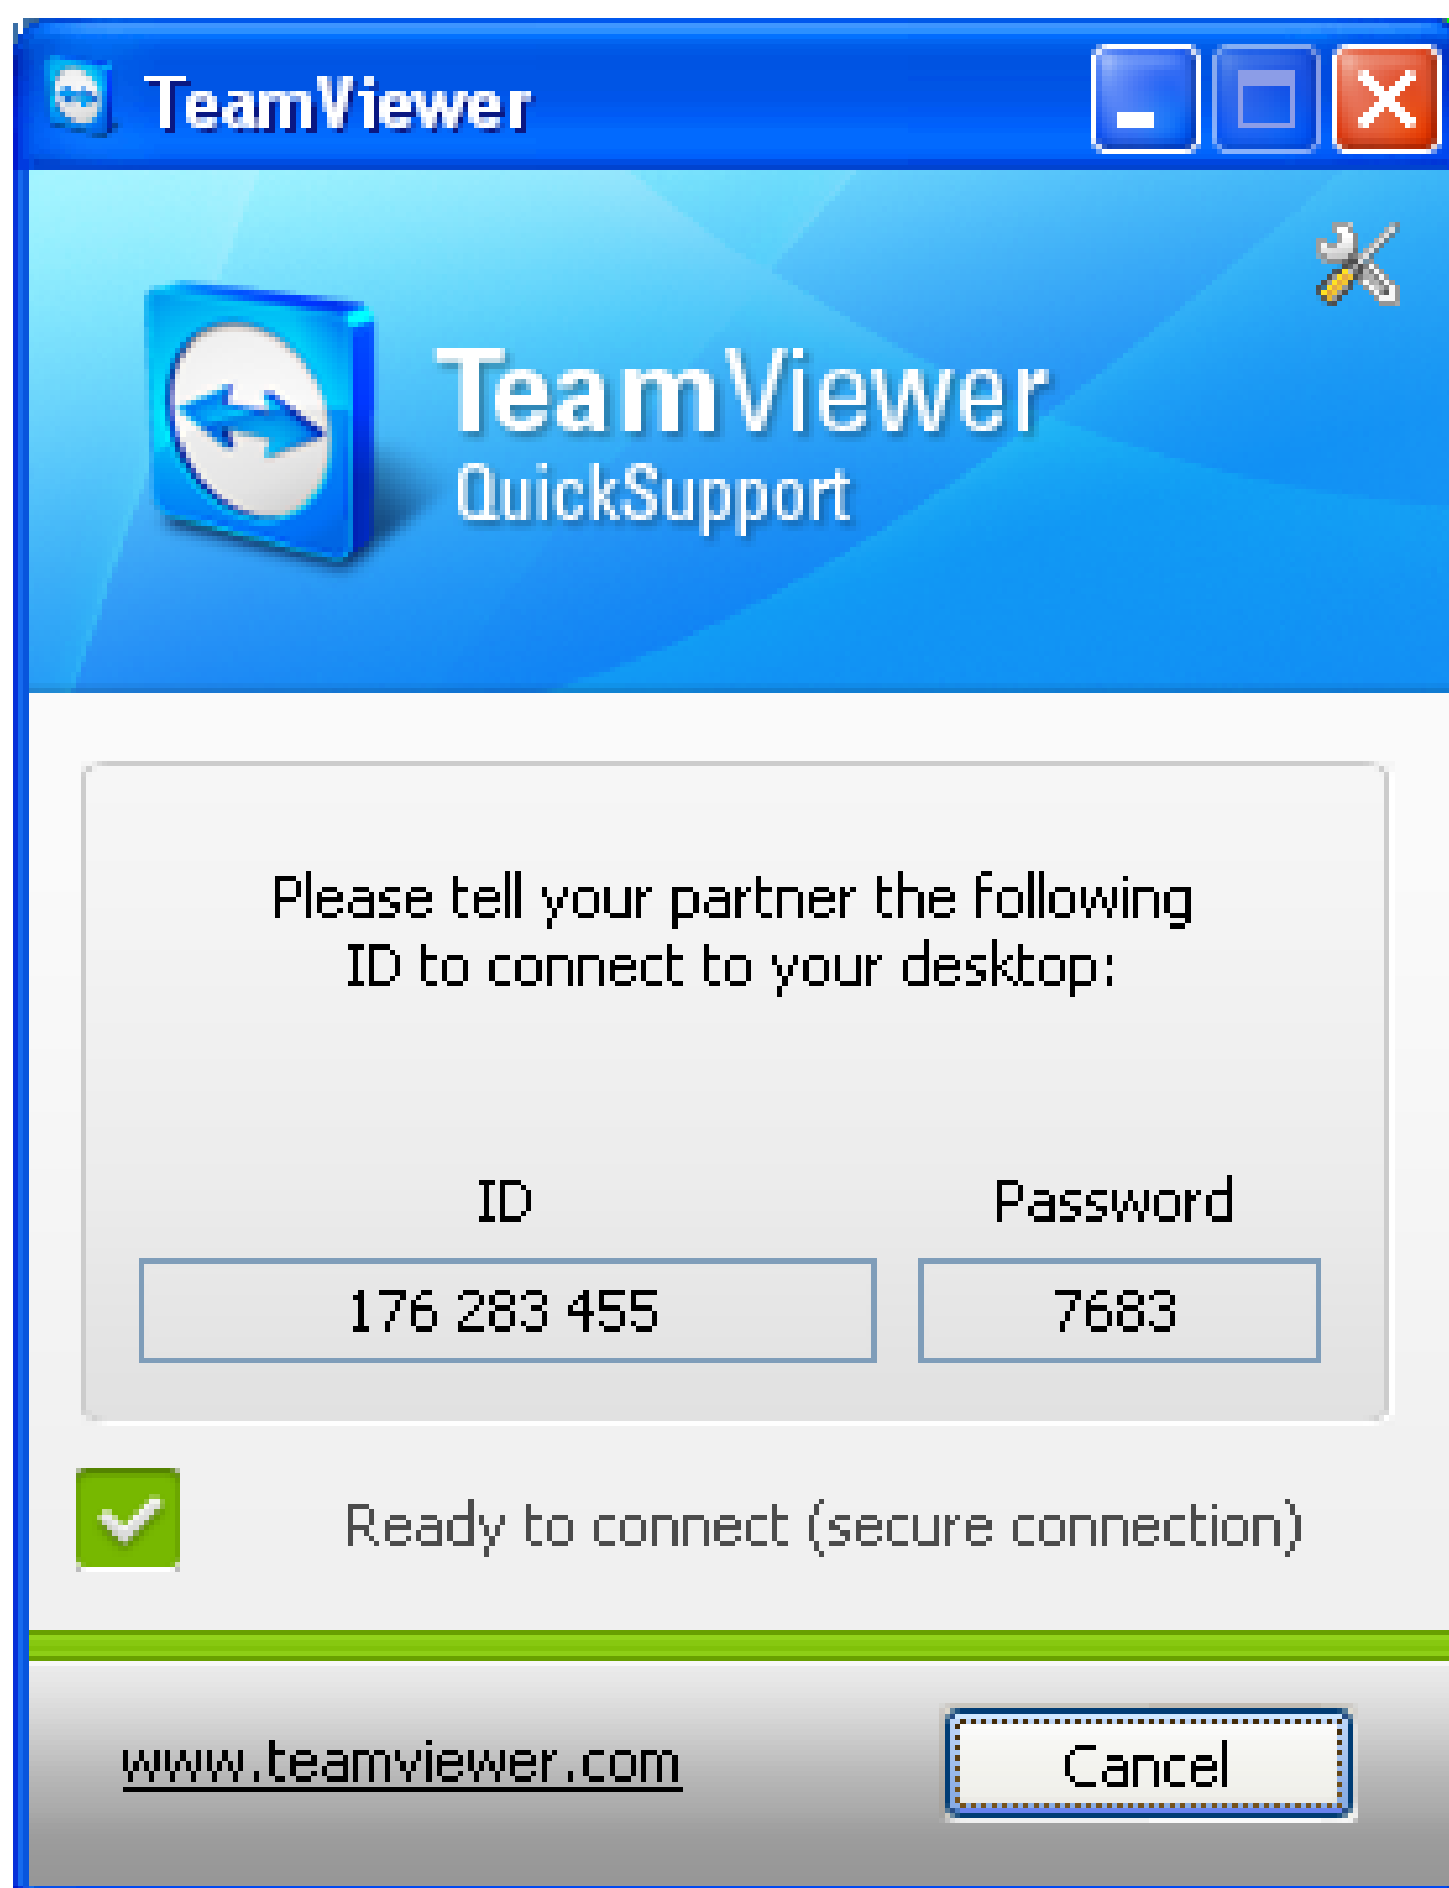

The menu bar shown at the top of the dialog is a copy of the main SpotOn menu and is live.

Remote Support

Remote support is available for SpotOn, prior arrangement with the supplier is required for this facility. The TeamViewer utility is used to provide remote access to the SpotOn computer.

A client application needs to be run on the local computer to allow access.

The ID and password displayed on the SpotOn computer should be passed on to the SpotOn supplier so that remote access can be initiated.

Button PopUp Menu

The items in the left hand column deal with the button as a whole, the items on the right cover the parameters of the track loaded into the button.

The Cut-to clipboard, Copy-to clipboard and Paste-from clipboard options allow tracks to be moved between buttons, Paste Colour will take the colour of the "Copied" button and paste it to a destination button enabling say, a set of buttons with similar sounds to have the same colour.

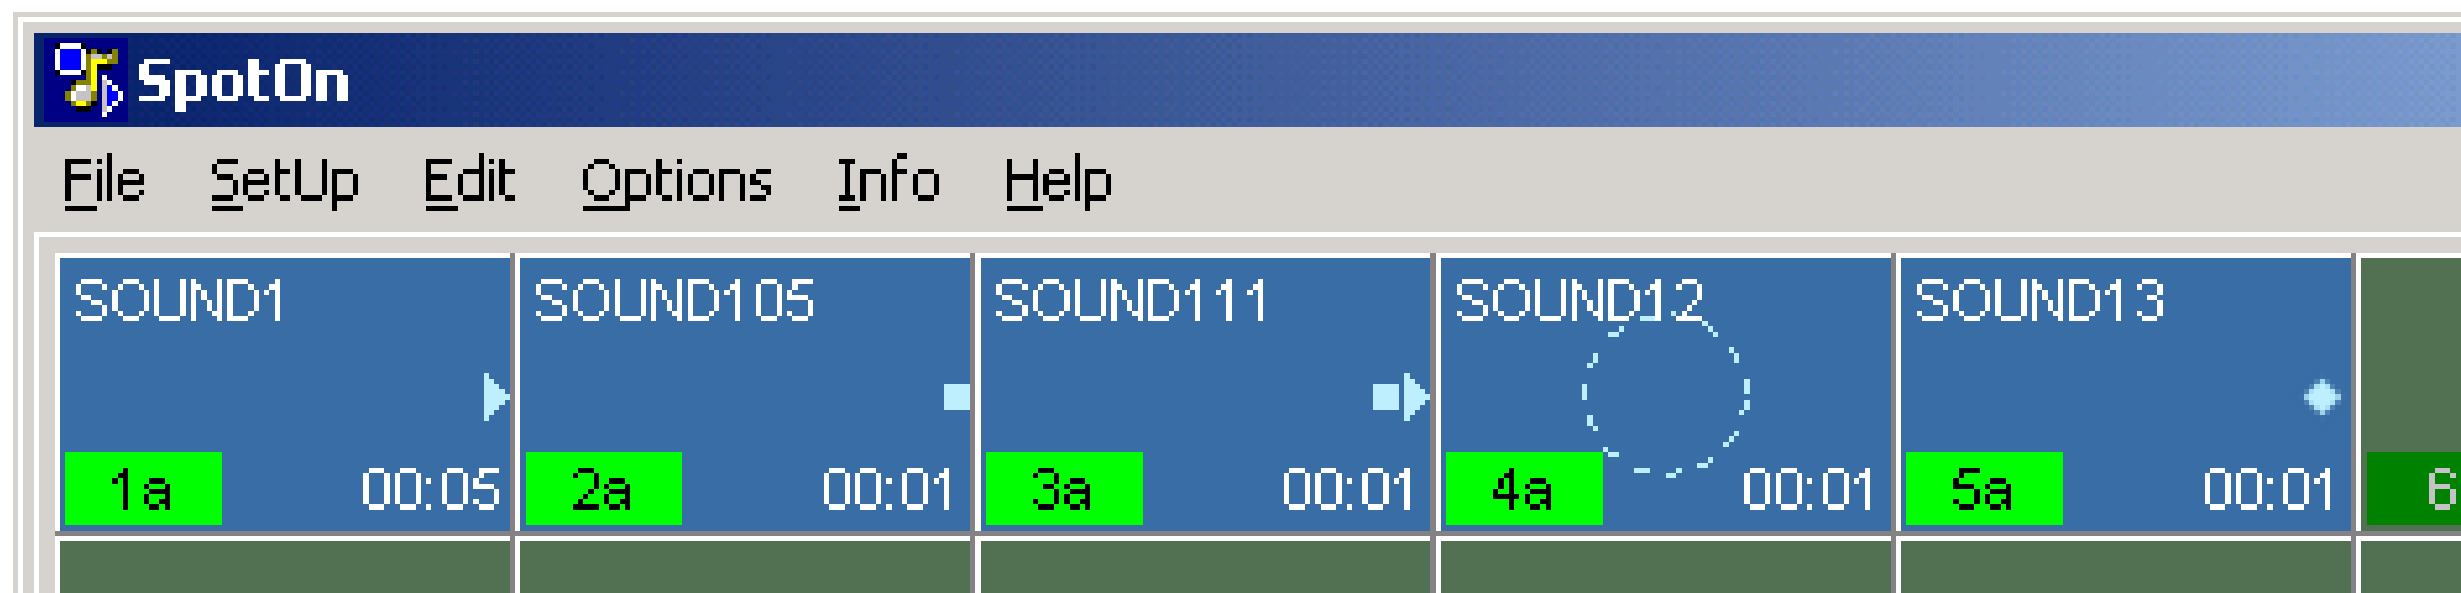

Swap will exchange the button "Copied" to the clipboard with the destination button.

Clear will remove all references to a track from a single button

Load and Browse display file selection dialogs for loading of tracks to buttons.

The first three items in the right hand column as options that can be checked or unchecked.

Loop	when checked will cause the track play command to start playing the track in a continuous loop see Loop+ for extended options
Stop All on Play	<p>if this option is checked when the track begins to play all other tracks being played will fade out using their individual fade times, this is indicated by a small square halfway up the right hand edge of the button.</p> <p>Alternatively tracks can be set to stop immediately without fades by muting the audio on this button (see Audio SetUp), in this case the square box icon is replaced by a square outline</p> <p>An advanced operation of Stop on Mouse Up is available by ctrl+clicking this option. When selected the track will play whilst the left mouse button is held down and stop when it is released, the mode is indicated by a white outlined red square on the right hand side of the button</p>
Play Next	checking this option will cause the track contained in the next highest button to play when this track reaches the end, this is indicated by a small right facing arrow halfway up the right hand edge of the button

When the track on button 1 reaches the end, Button 2 will begin to play

When button 2 plays any other tracks that may be playing will be stopped

When button 3 plays it will also stop any other tracks that are currently playing and will then play button 4 when the track on button 3 reaches the end.

Button 4 is set to loop continuously

Edit opens up the user defined WAV file editor, this editor is selected via SetUp|Editor menu

Midi see [Midi Assignment](#)

Audio see [Audio Setup](#)

Display see [Display Options](#)

For a full description of the popup menu options see [Button Menus](#) page

Button Menus

Right-clicking on an unassigned button will show the load menu

offering three options Load , Browse and File Search

Right-clicking an unassigned button that is displaying a 'File not Found' message will show one additional option Locate Filewhich allows the user to locate a WAV file that SpotOn cannot find.

If an assigned button is right-clicked then a more extensive set of options is available

- | | |
|---------------|--------------------|
| Cut | Loop |
| Copy | Stop All on Play |
| Paste | Play Next |
| Paste Color | Edit... |
| Paste Special | Midi... |
| Swap | Audio... |
| Clear ... | Display/HotKeys... |
| Load ... | Cancel |

Cut

Removes the track from the button and places it on the clipboard

Copy

Copies the track on the button to the clipboard

Paste

If the clipboard contains a track then it will be loaded onto the selected button

If there is a file that has been 'cut' or 'copied' to the Windows clipboard outside of SpotOn then that file will be available to paste onto the button

Instead of the specific operations of cut, copy and paste buttons can be moved and copied using a drag and drop method.

Shift drag/drop will move a button showing the cursor and similarly control drag/drop will copy a button with cursor

Drag/drop can be used across pages, the pages are changed by dragging the button over the page tabs at the bottom of the main window.

Paste Color

Pastes the only the color information from the clipboard track onto the selected button, used to set a group of buttons to the same color

Paste Special

Pastes one or more selected settings from the clipboard track onto the selected button, see Edit|Paste Special

Swap

Exchanges the track that has been previously copied to the clipboard with the track on the selected button.

Copying button 3 (track A) to the clipboard and then Swapping with button 12 (track B) will result in button 3 being loaded with track B and button 12 being loaded with track A

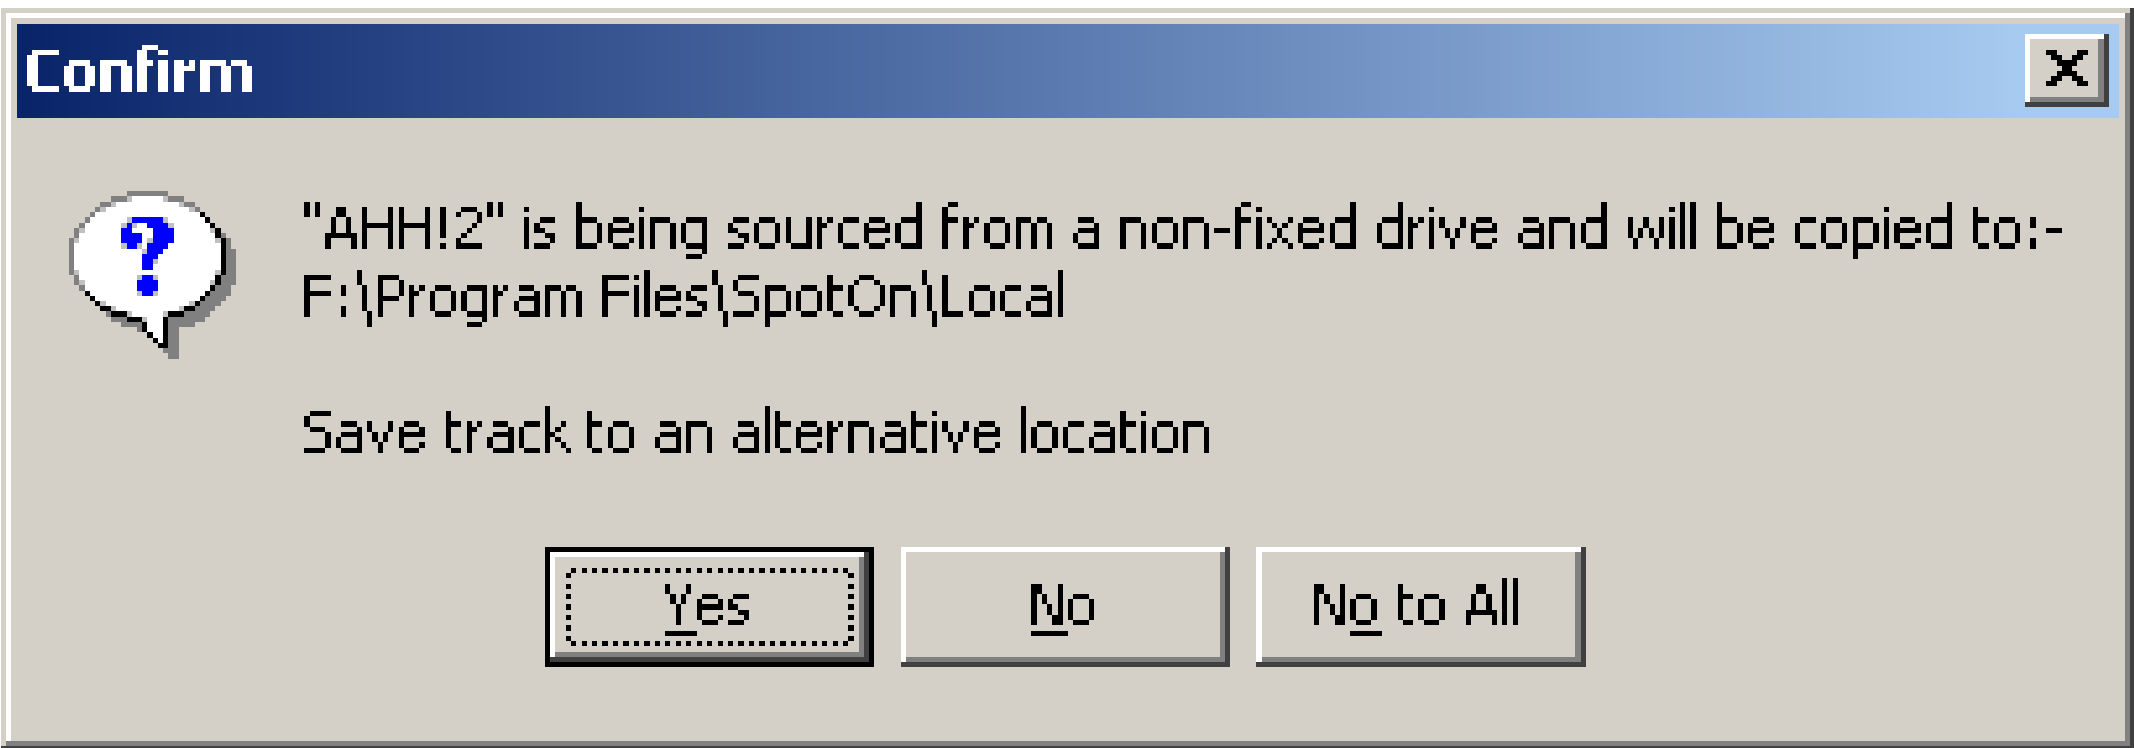

Clear

Clears the contents of the button, the original audio track is not deleted

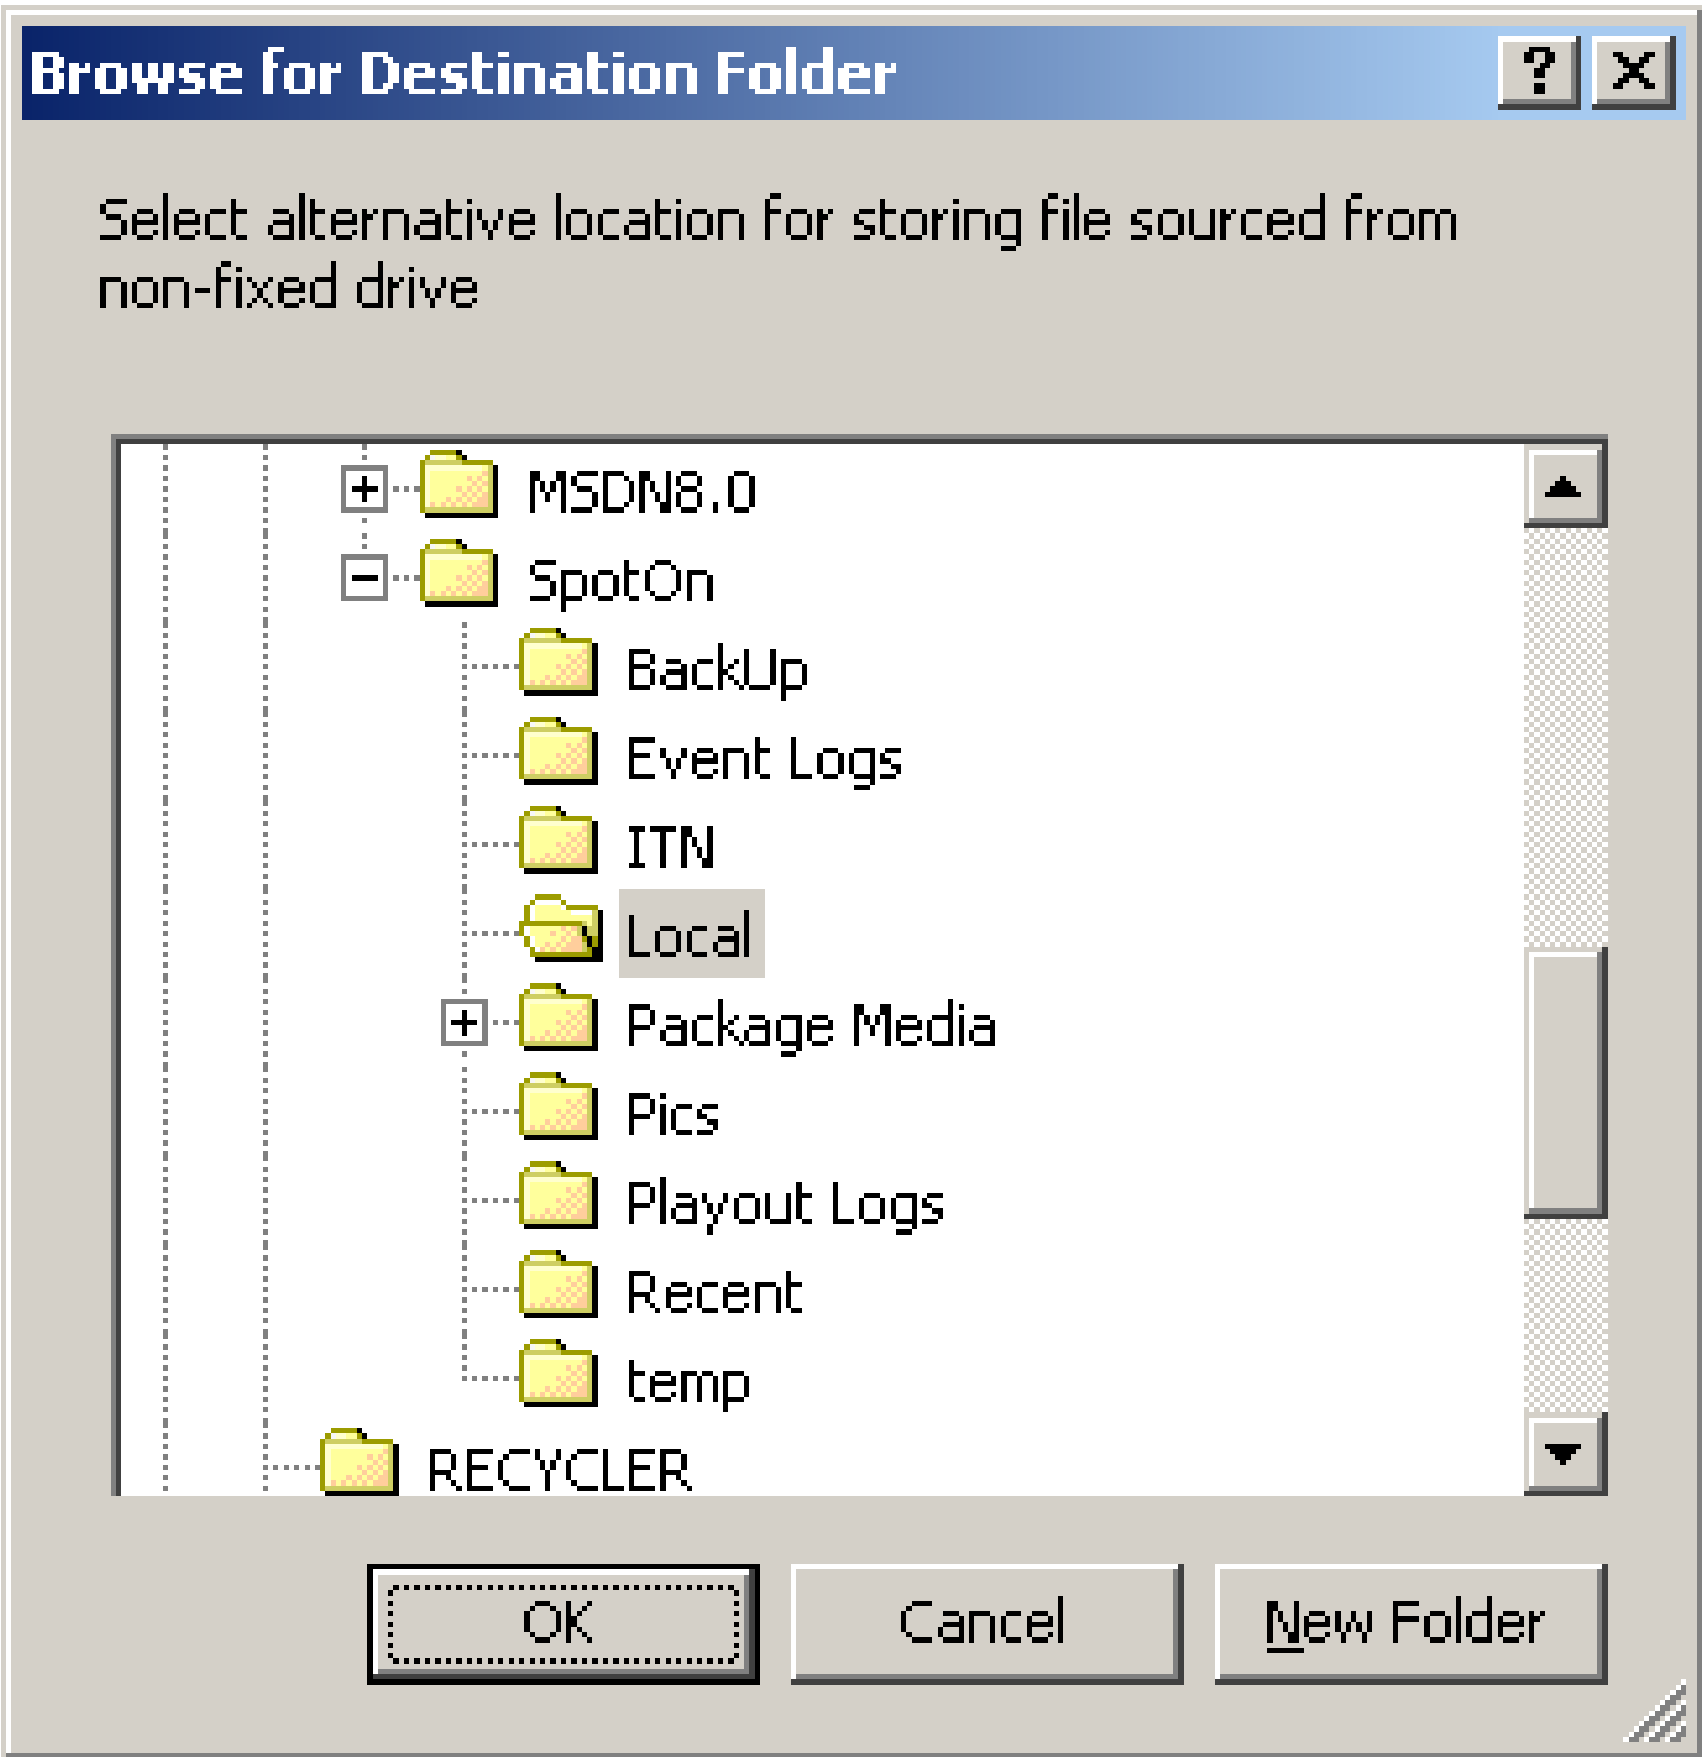

Load

This opens up a file select dialog as described in Getting Started in order to load one or more tracks onto buttons starting at the selected button.

If tracks are loaded in a compressed format eg MP3 or from a remote/networked disc, then a local uncompressed copy of the file will be made. The default location of this folder is set in the File Folders dialog, however each time a new local copy needs to be made the option to redirect the file to a more relevant folder is offered. the 'No To All' button will be shown when more than one file is selected for loading.

Clicking Yes will display a folder selection dialog

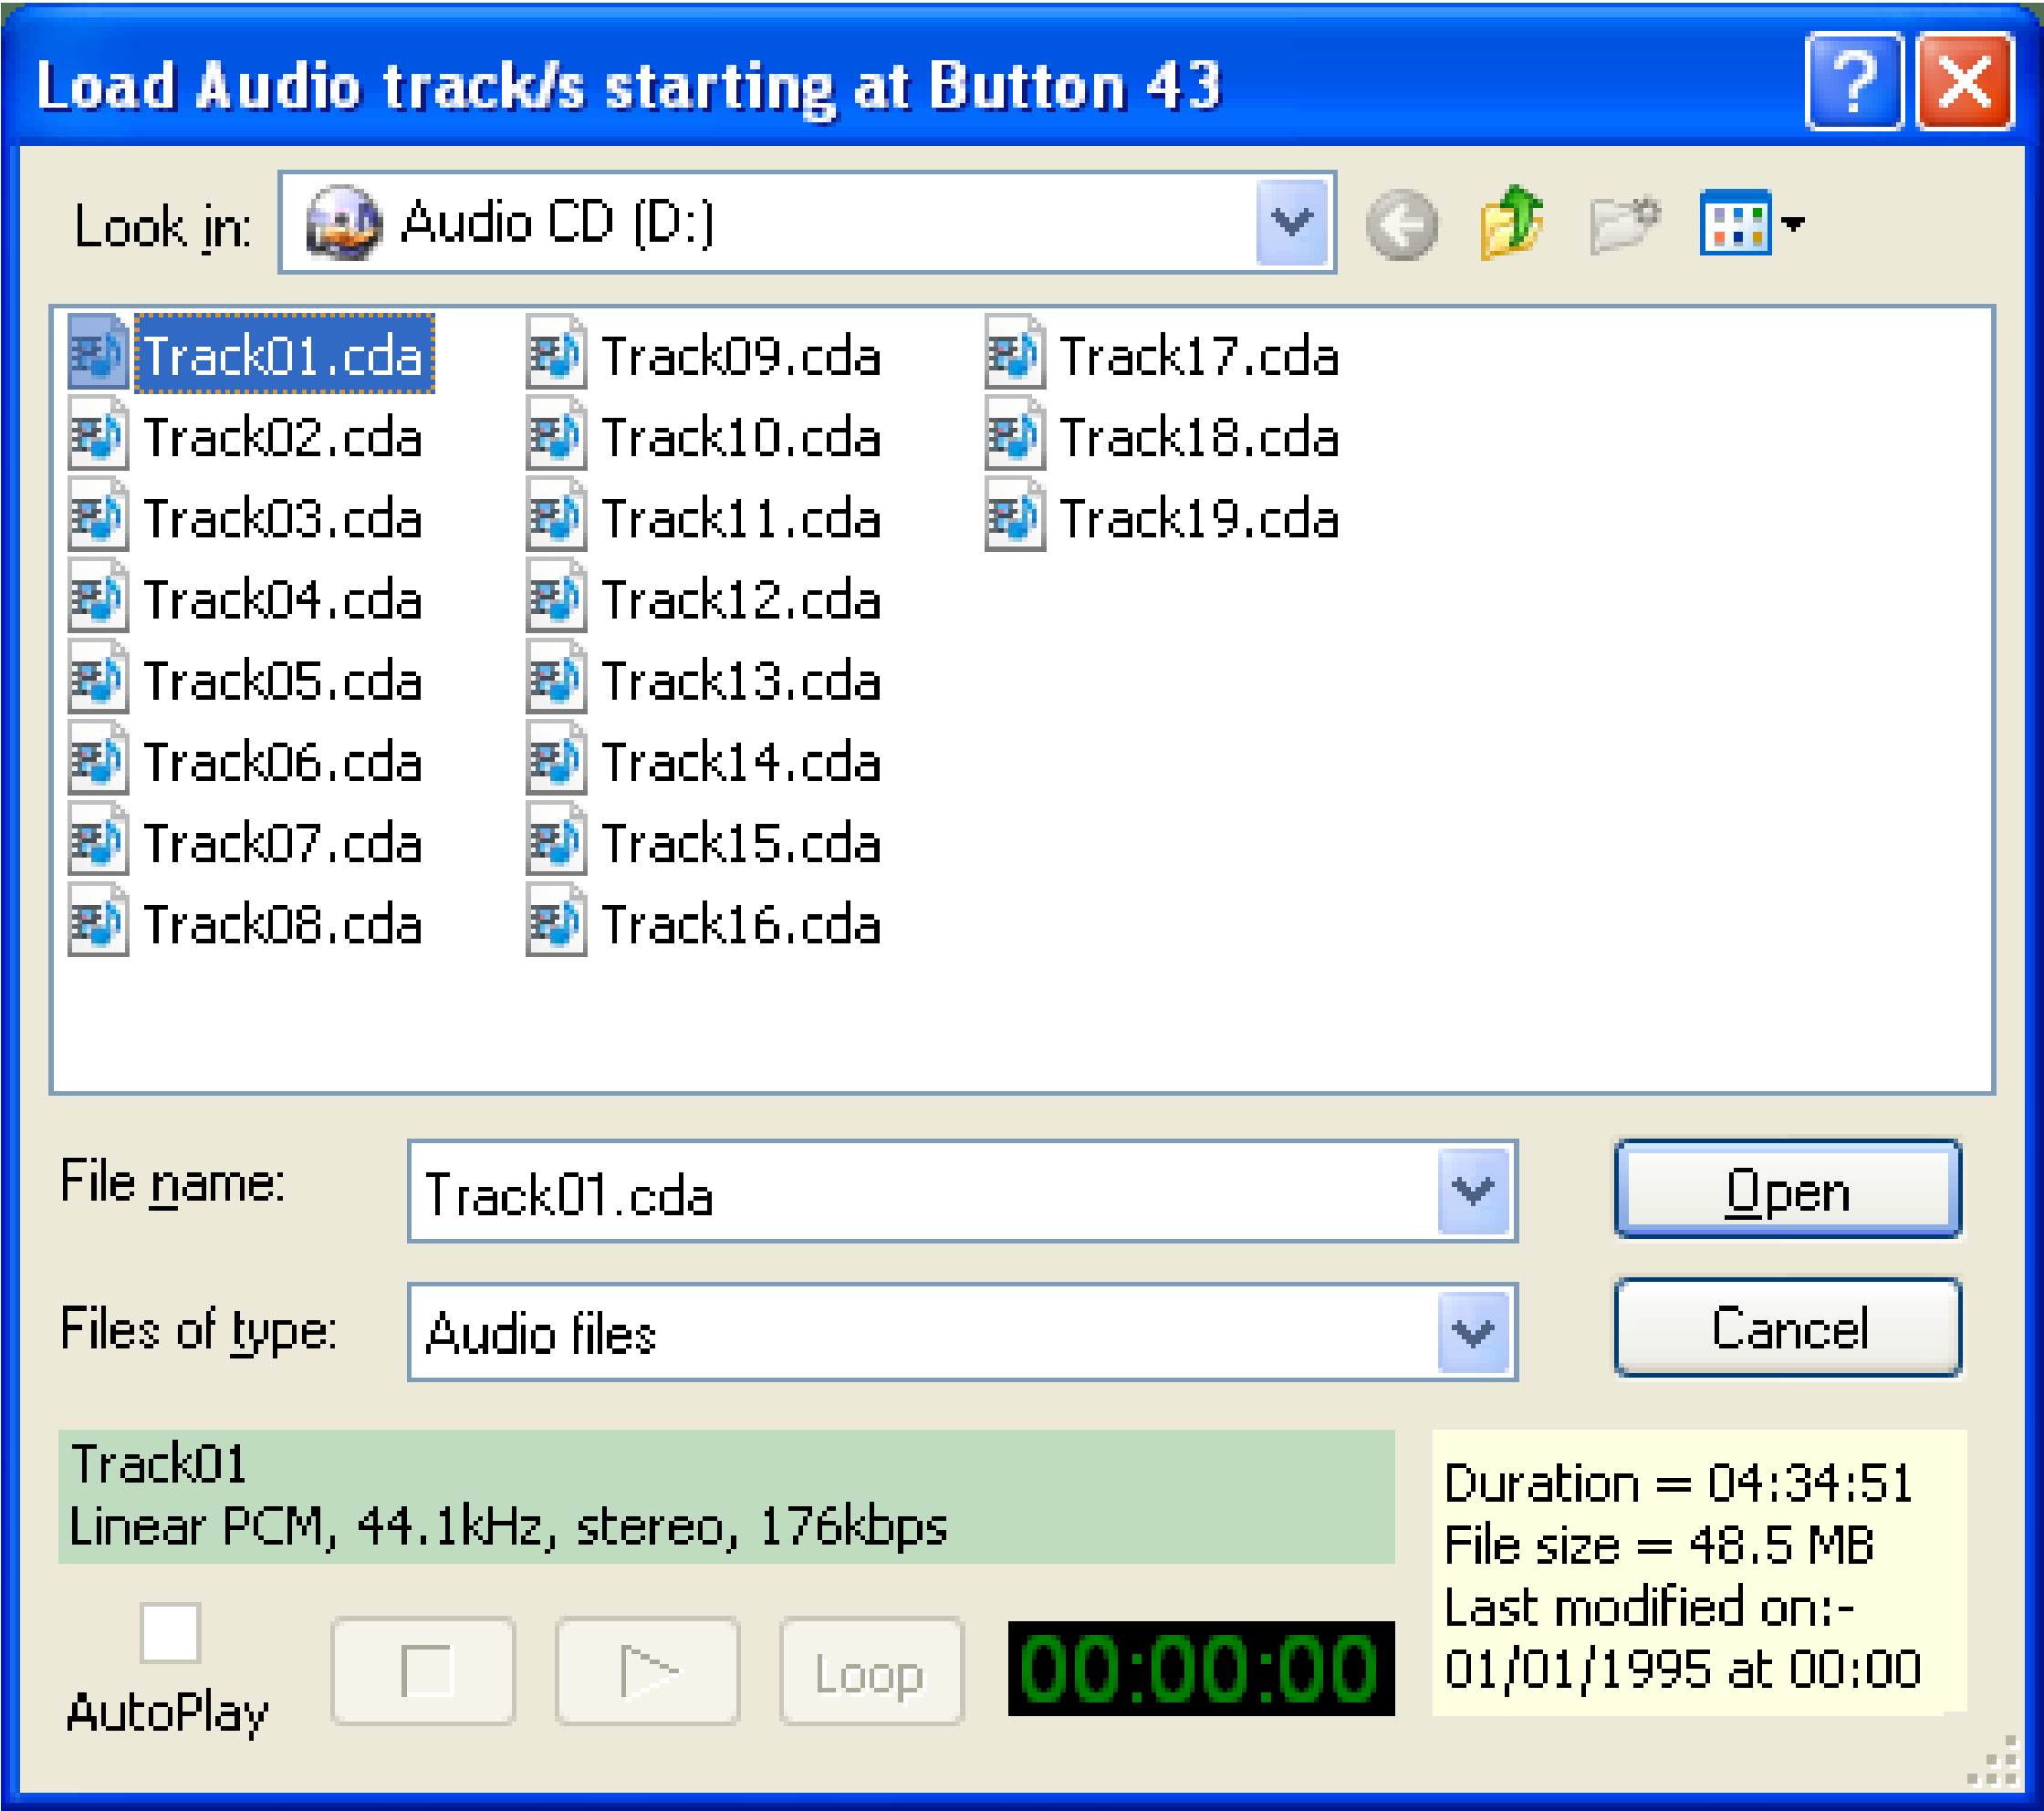

The destination folder selected can be saved for the duration of the session, that is until a new session is loaded, by selecting Yes in the dialog below

This facility is used where the files are to be saved in a nominated folder for a particular show rather than a general temporary folder.

Load - CD Track

It is possible to load a CD track directly onto a button, without having to use an intermediate CD ripper.

In SpotOn v0.96 and above an extended range of metadata is saved with the WAV files and inserted into the PlayOut logs.

The metadata for the CD track can be entered manually or looked up using an internet based database providing Web Links are enabled.

Clicking on 'Look up CD Details' starts the process of interrogating the remote database

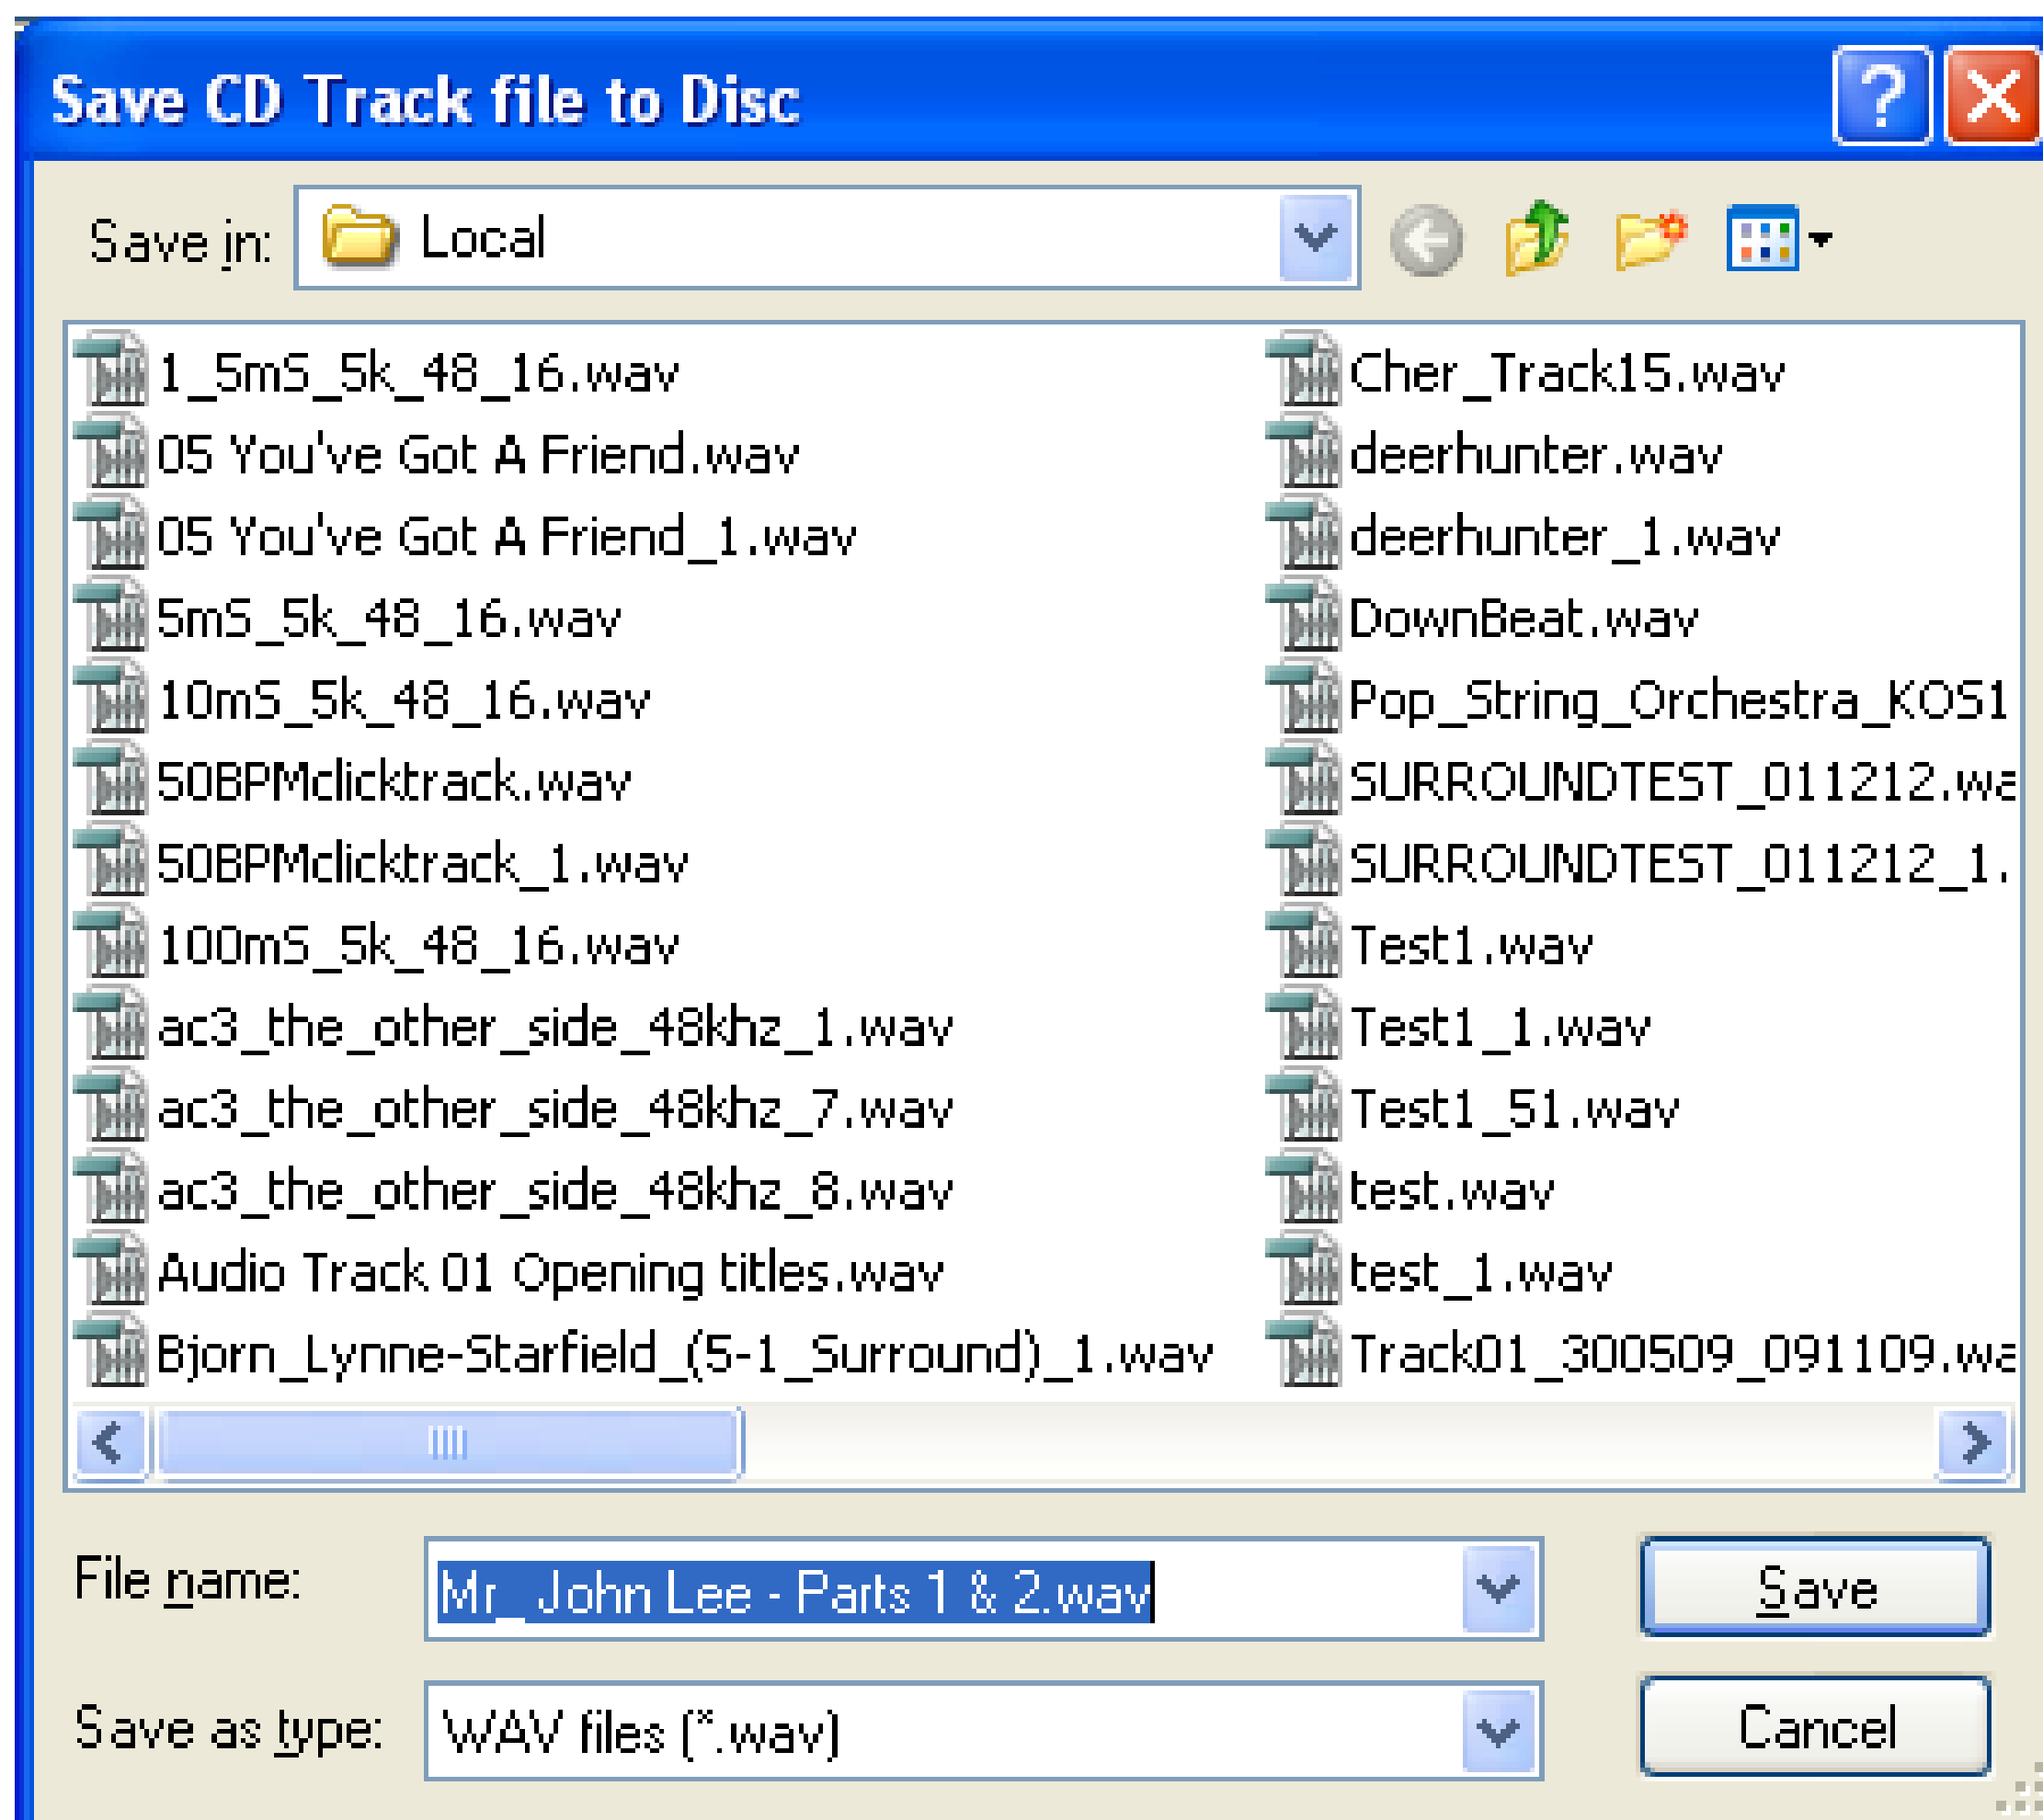

In the lower left corner of the window will be a progress counter, this will count up along with the data entry count in the centre of the status bar as the data is retrieved. The number in brackets (1) indicates the count through the multiple entries in the database.

A dialog box titled "CD MetaData - Track01.cda" with a blue title bar and a close button. The main area is labeled "MetaData" and contains several input fields: "Track" (dropdown menu with "Up! (Pop Version)"), "Artist" (dropdown menu with "Shania Twain"), "Album" (dropdown menu with "Up! (Red Disc) (CD1)"), "Genre" (dropdown menu with "Pop/Rock"), "Project" (text box), "Comments" (text area), "Supplier" (text box), "Source" (text box), "Software" (text box), "Engineer" (text box), and "Keywords" (text box with "(2002)"). Below these fields is a "Button Text" label and a text box. At the bottom, there are four buttons: "OK" (with a green checkmark), "Look up CD Details", "Auto Load CD Data" (with an unchecked checkbox), and "Cancel" (with a red X). The status bar at the bottom shows a green progress bar, the text "CD details complete", and the status "OffLine".

Sometimes the CD database has multiple entries for the same album/track, in which case the entries are shown in the drop down lists in each section

If the CD details lookup was successful then the filename of the extract track will be based on the CD track name

Alternatively if the CD details lookup failed or was cancelled then a default name will be used, the name is formatted from track number_DDMMYY_HHMMSS

If multiple CD tracks are being loaded then the 'Auto Load CD Details' checkbox can be selected

This will automatically look up the CD details and save the files without user intervention, the CD Metadata window is briefly held open during the process so the action can be interrupted.

Browse

This opens up a Windows Explorer dialog as described in Getting Started in order to load one or more tracks onto buttons starting at the selected button, The main advantage over the Load option above is that the Windows Explorer dialog stays open and files can be dragged from Explorer onto the SpotOn buttons

File Search

Runs a standalone utility SpotOnSearch which allows drives and folders to be scanned for audio files, the files can then be drag and dropped onto SpotOn

Loop

Checking this option sets the track when played to loop continuously between its marked In and Out points, by default the In and Out points are set to the start and end of the track, See Audio Settings for information on setting the In and Out points

The Loop+ (LoopPlus) extension was introduced in version 0.95, this allows the Loop modifier to be changed whilst the track is playing without automatically stopping the track. In previous versions of SpotOn the track was automatically stopped when the Loop modifier was changed.

As of version 0.95 the text in the button popup menu changes from Loop to Loop+ when the track is playing, if the Loop+ option is changed from unchecked to checked the track will continue playing in a loop.

If the track is playing and the Loop+ option is changed from checked to unchecked the track will continue playing in a loop until it is stopped and then the loop modified will be removed. This state is indicated by the loop graphic changing from dashed to a solid circle.

Stop All on Play

Checking this option will cause all other tracks currently playing to stop when this button is Played, the option is denoted by a block on the right hand edge of the button.

Normally all other buttons will stop using their fade out profiles, however if the button is also muted then the button icon is shown as a square outline and all other buttons will stop immediately.

Advanced versions of Stop All on Play are available by shift+click or ctrl+click on this option. When selected the menu item caption will change.

For Shift+Click

The Stop All on Play option becomes Stop Page on Play and the icon changes to a diamond, if the button is also muted then the button icon is shown as an outline and all buttons on the page will stop immediately.

For Ctrl+Click

When active this option will cause the track to play whilst the left mouse button is held down and stop when it is released, the mode is indicated by a white outlined red square on the right hand side of the button.

The left mouse button can be released without stopping the track if the Control key is held down as the left mouse button is released.

Note - the time between the left button of the mouse being pressed and released must be greater than the the default mouse click period.

Play Next

Checking this option will cause button N+1 to begin playing when button N reaches the Out point, if button N+1 is unassigned no other button will be played. The option is denoted by a triangle on the right hand edge of the button.

Both Play Next and Stop All options can be applied to the same button

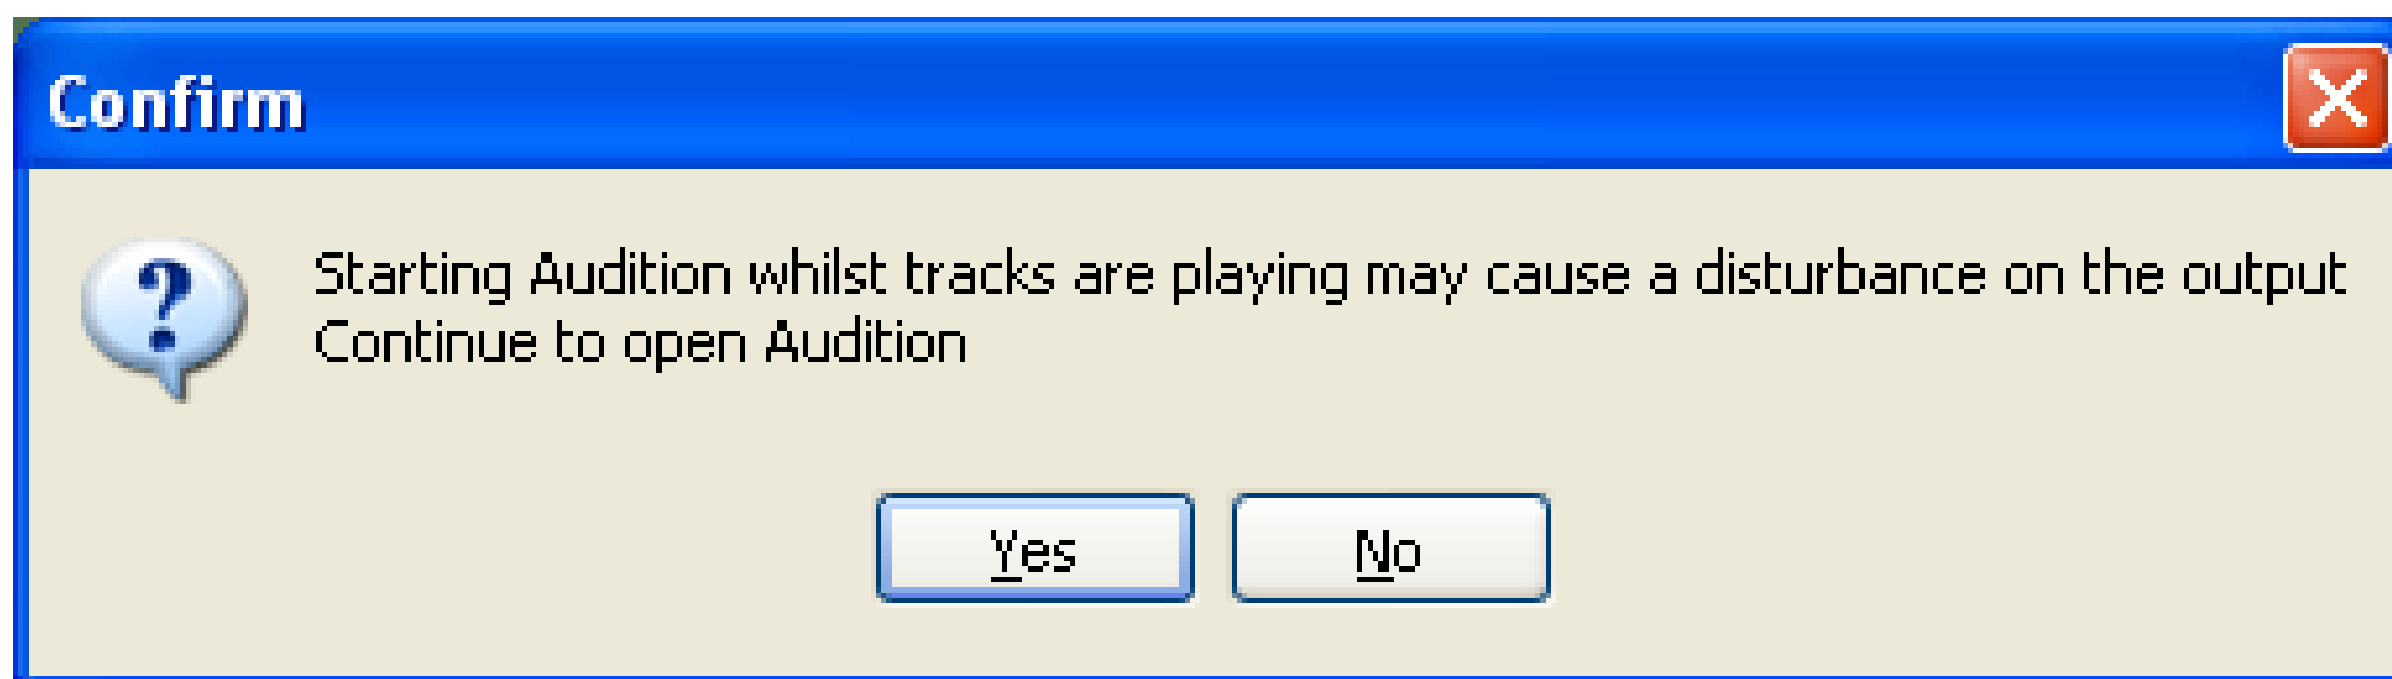

Edit

Opens up an external WAV file editor, so that the track audio data can be modified. The track data held by SpotOn is not automatically updated when the audio is saved by the external editor, the Global|Refresh Tracks menu option will update the button data.

In default mode SpotOn will first copy the audio file on the selected button as a file named "Copy_of_..." and then open this file in the chosen editor application. The user is then responsible for saving the edited file either under a new filename and manually loading it onto a button or replacing the original file name and selecting Global|Refresh Tracks.

In Advanced Editing the mode changes to open the audio file being used by SpotOn without first making a copy, the user is then responsible for saving the file and selecting Global|Refresh Tracks on completion of editing, the advantage of this mode is that saving and reloading the edited file is much faster.

When opening some audio editing applications there may be a disturbance on the SpotOn outputs, a warning prompt box is displayed if this is likely to occur.

Midi

Buttons can be played or stopped when defined Midi notes are received and similarly Midi notes can be transmitted when buttons are played, see Midi Assignmentfor details

Audio

Various aspects of the track audio can be modified - gain, pan, speed, fade times and trim points see Audio SetUp

Display/HotKeys

The display name and color of the selected button can be changed along with global settings for the button font styles, see Display Options

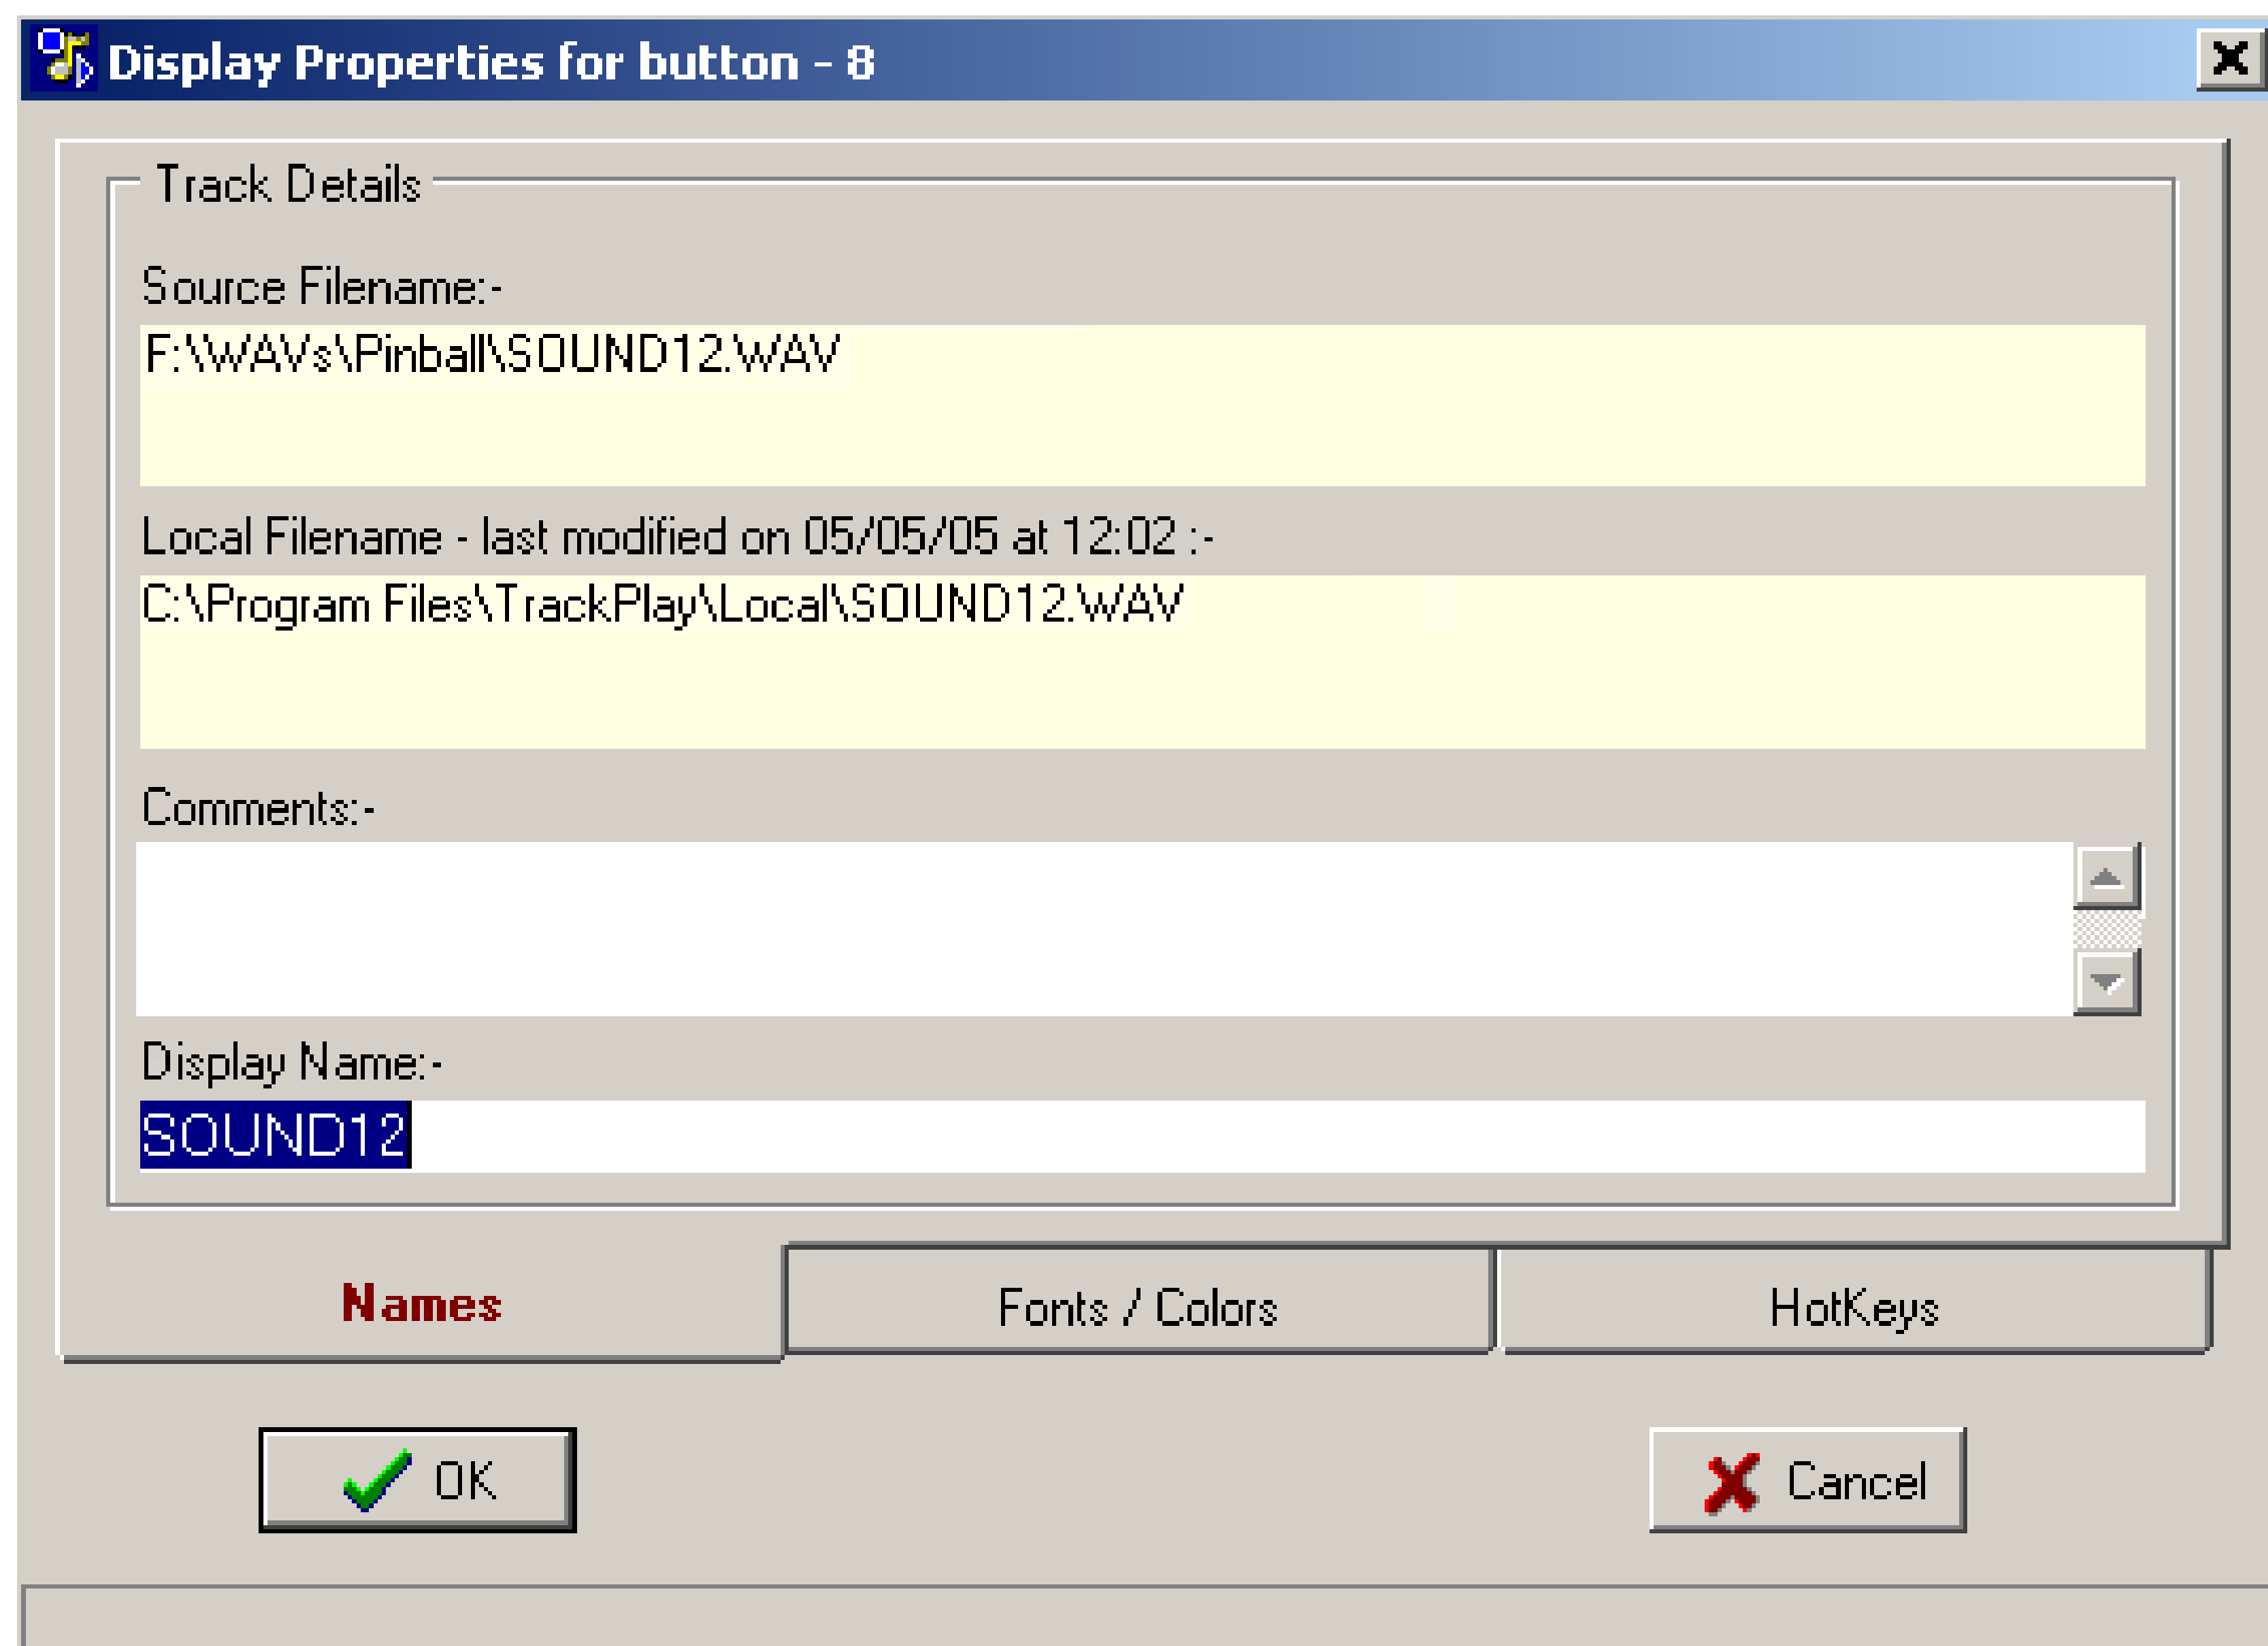

Cancel

Closes popup menu without performing any actions

Display Options

This menu item contains three sections the first for editing the displayed track name, the second for customising button appearance and finally assignment of HotKeys.

Names

Source Filename

The Source Filename label shows the full file path of the original file, if this file is on a fixed disc on the local machine then the Local Filename will be the same.

In the example above the source file was loaded from a CD mapped to drive F:, therefore SpotOn copied the file to a local directory.

If for any reason the source file could not be found when the dialog box opened then the filename will be shown in red text.

Local Filename

Right-clicking in the display area will reveal a popup menu

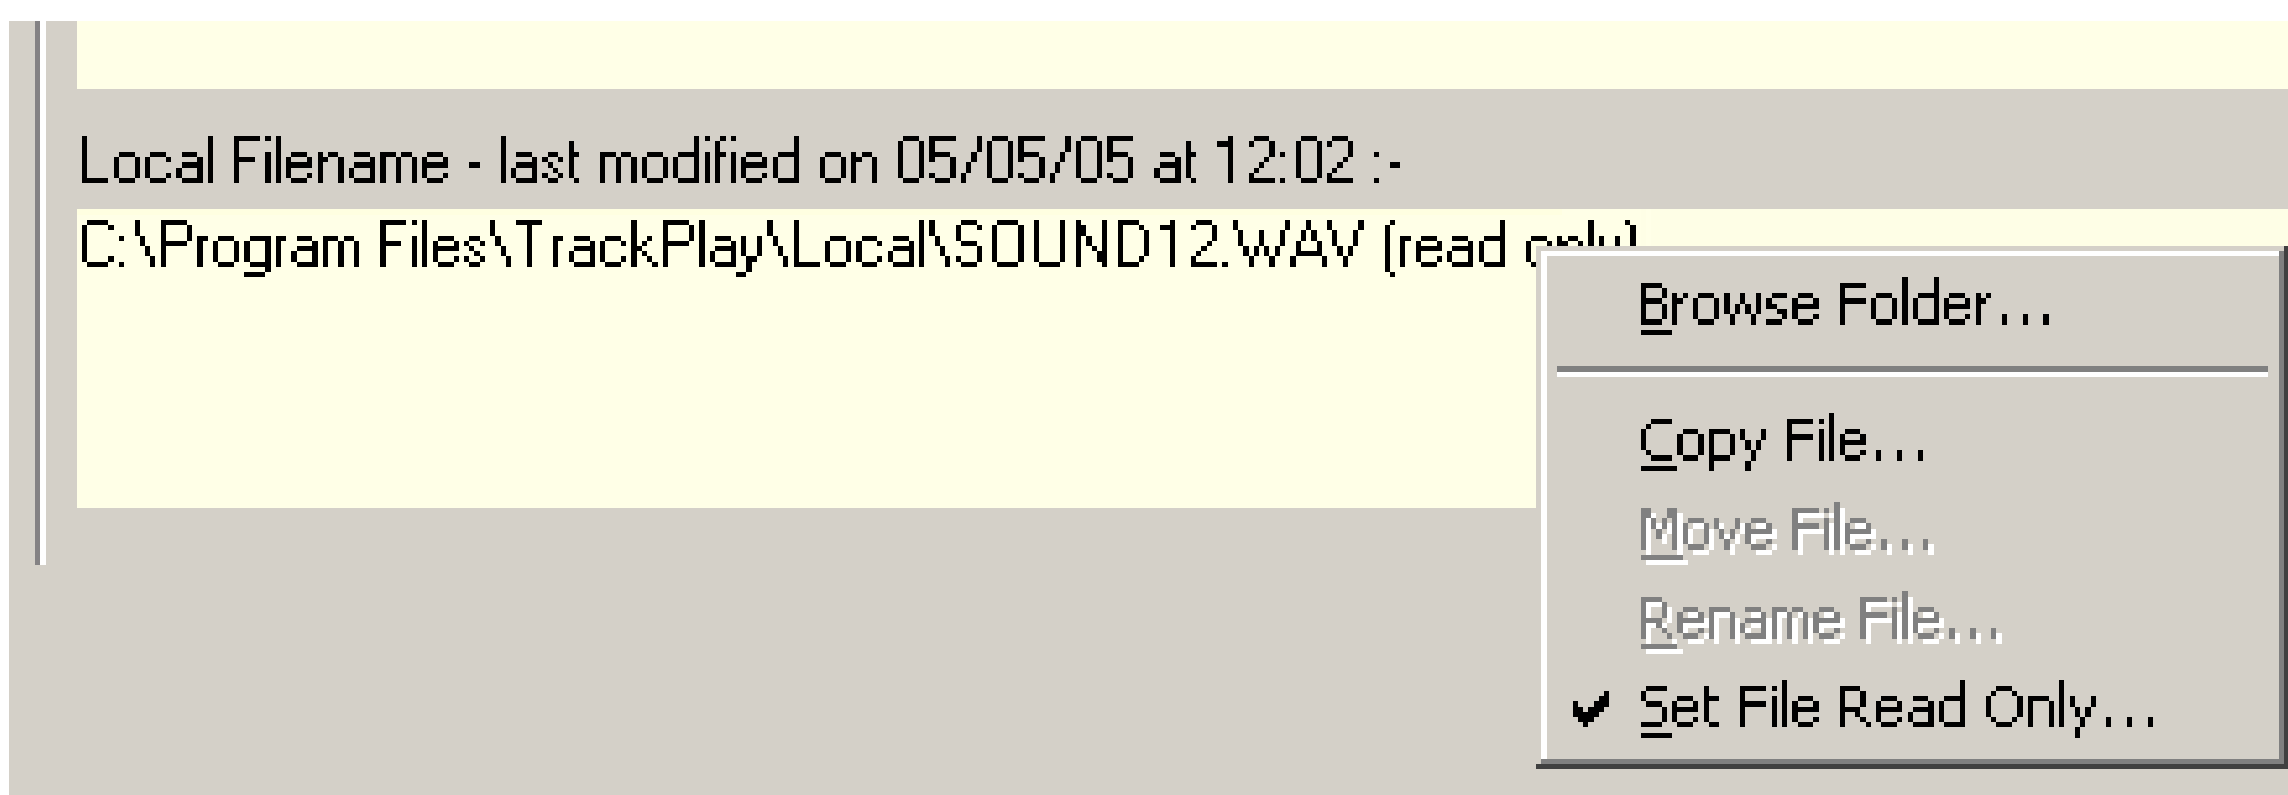

Browse Folder: -

Browse Folder will display a new Windows Explorer window showing the contents of the folder containing the current file, this may be useful if files from the same folder need to be loaded. To allow files to be drag and dropped from the Windows Explorer window the Display Options dialog is automatically closed by cancelling any changes.

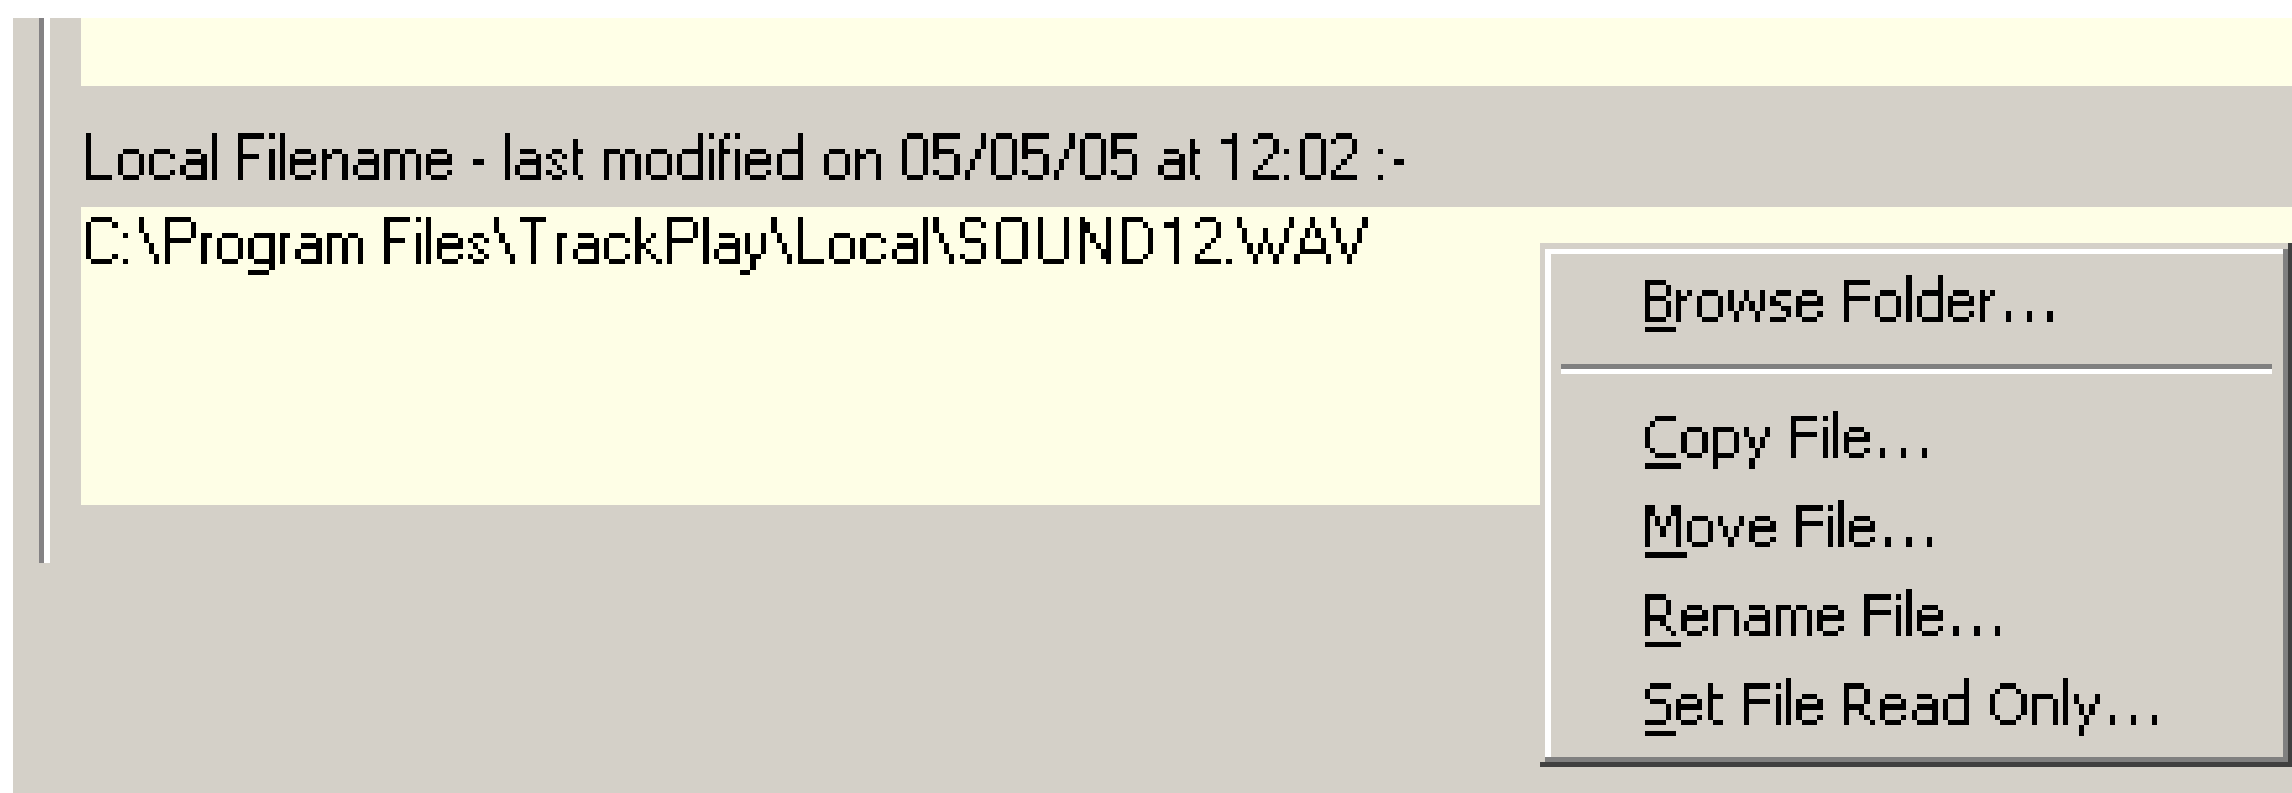

Read Only: -

If the file on the local machine needs to be write protected then check the Set File Read Only item, this will display a confirmation dialog box to set the access rights to the disc file.

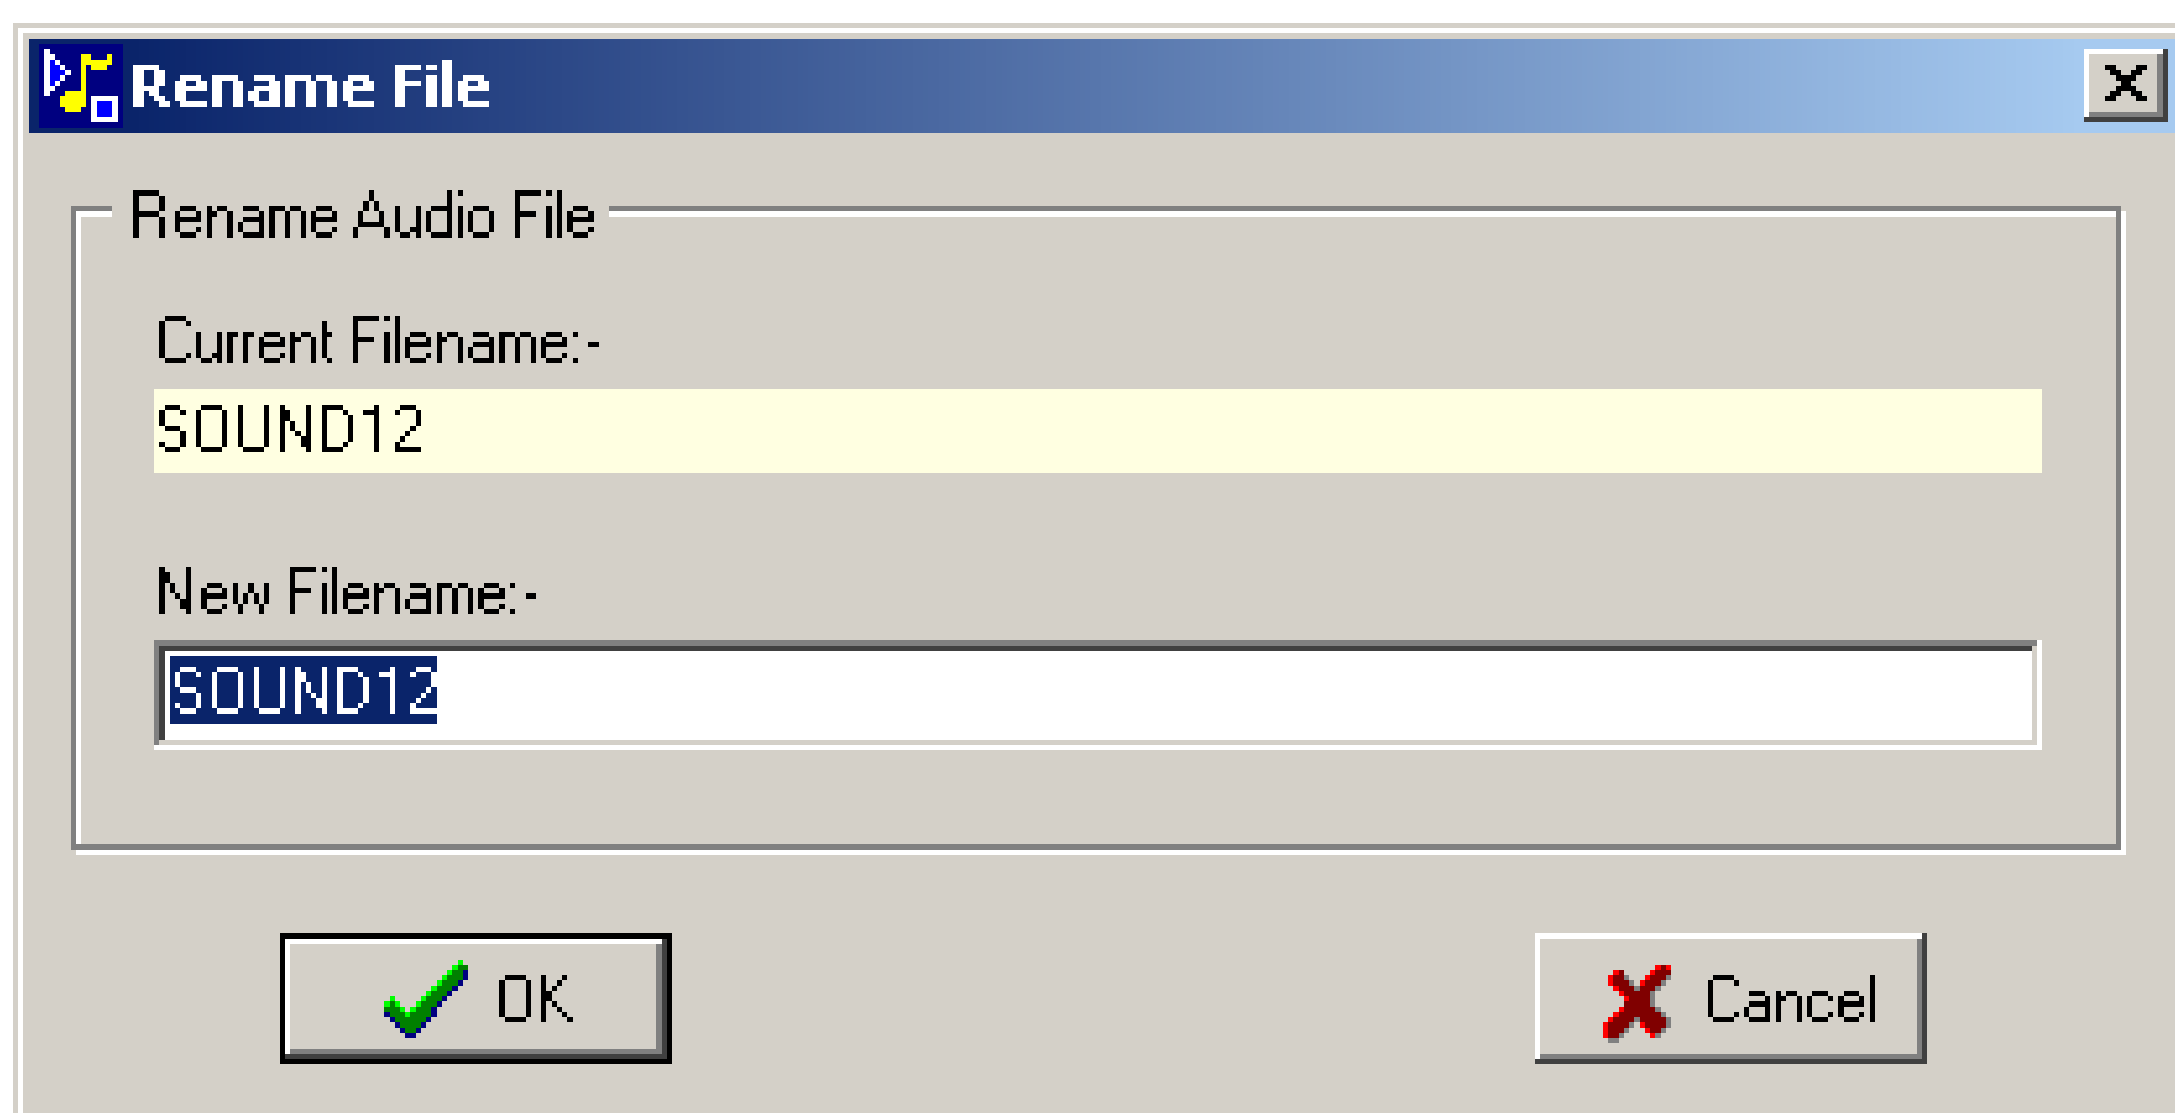

Rename File: -

If the file is not set to Read Only the local file can be renamed, this may be useful if the original filename was not descriptive and therefore difficult to locate.

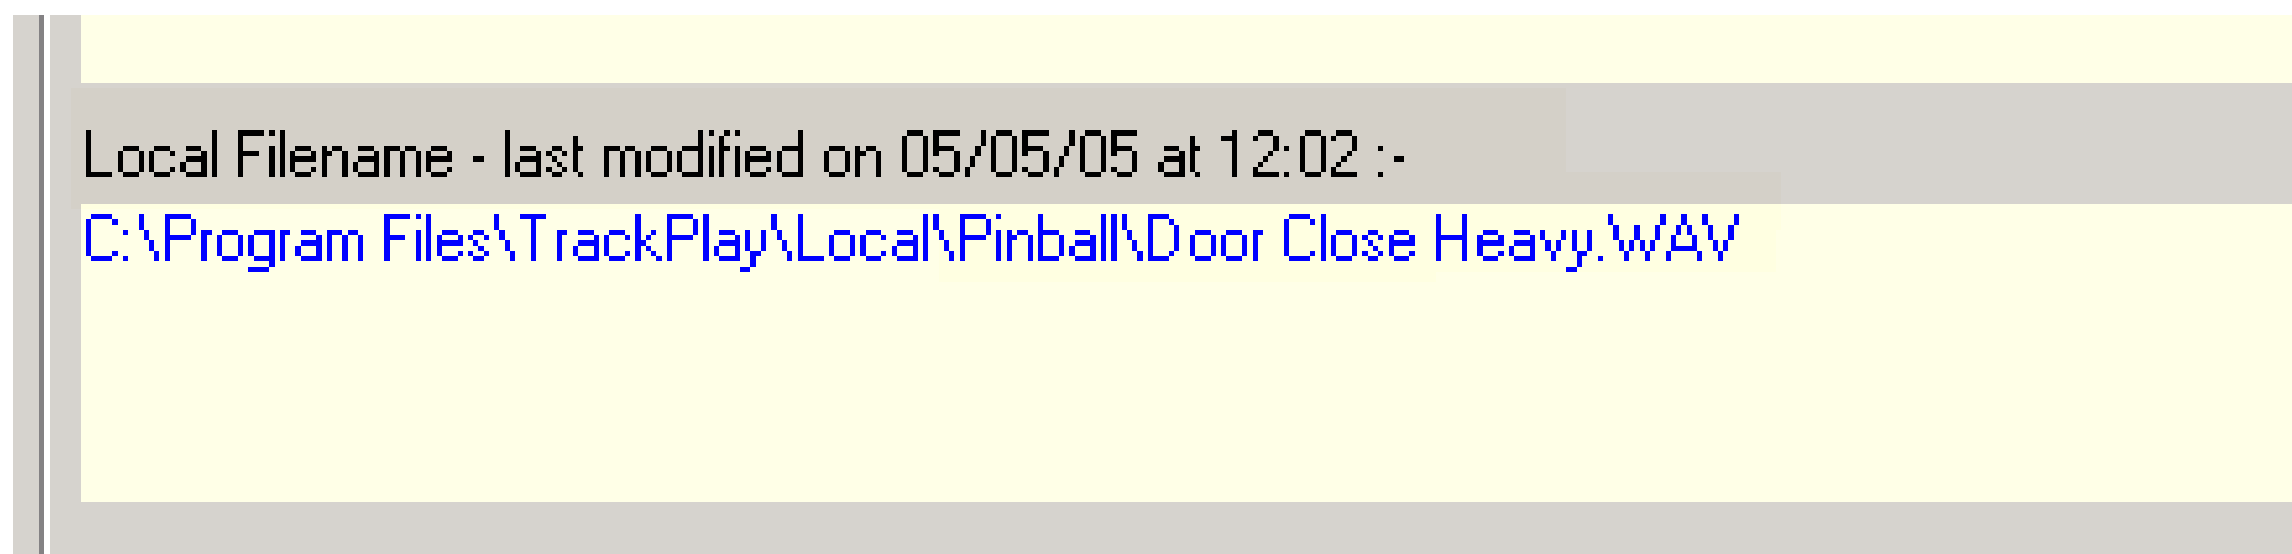

There are several consequences of renaming the file on the disk, the main two are that other SpotOn sessions referencing the file would no longer be able to find it, and similarly other separate applications that used the file would not function correctly.

Clicking on Rename File offers an edit dialog box allowing a new name to be entered.

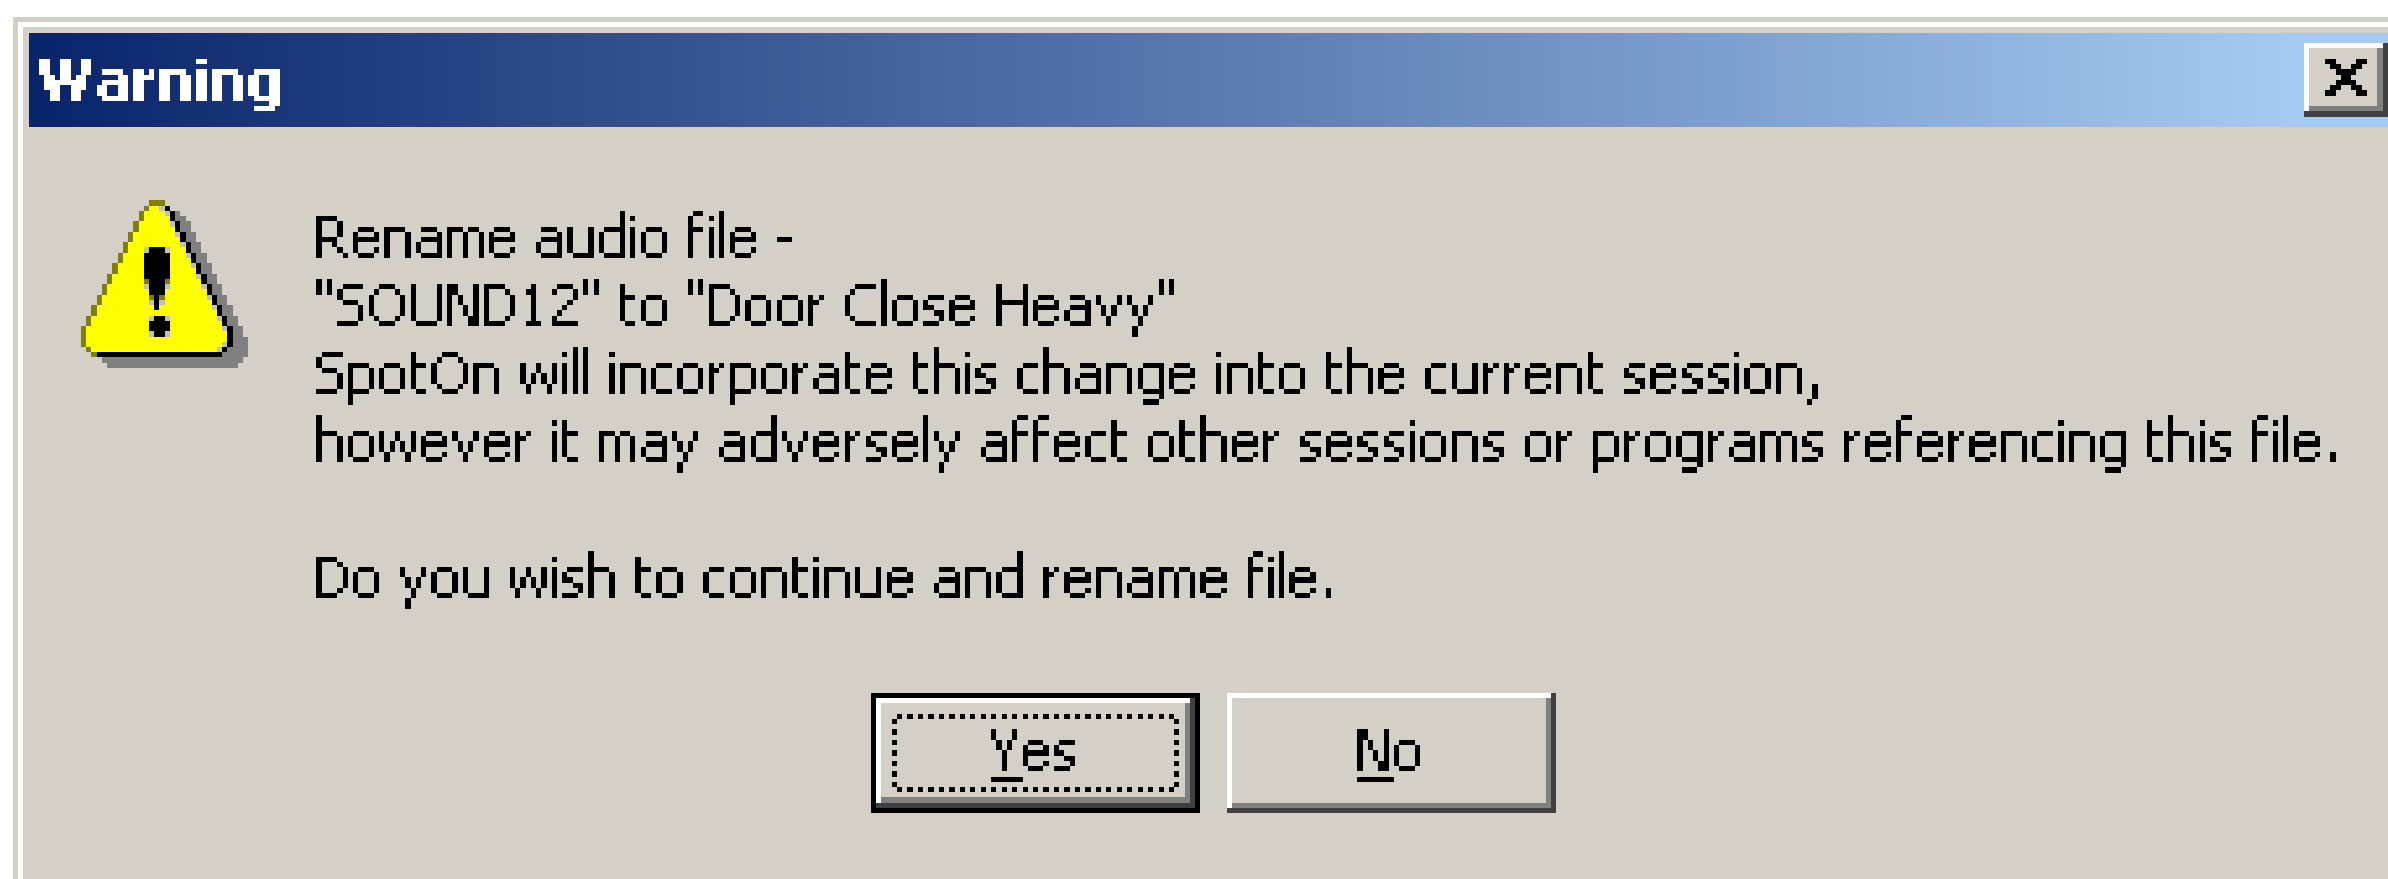

A prompt box will indicate if the filename already exists

On exiting with OK the new name will be shown in blue text in the Track Details page

On exiting the Display properties dialog, a further warning will be shown, clicking on Yes will then rename the file.

Move File: -

The difference between Rename File and Move File is that Rename File will only change the filename and not the file path, so the file will remain in the original folder.

However with Move File, both the file path and file name can be changed so that the file could be moved to a new folder under a new name.

Copy File :-

A copy of the existing file is made in a new location and the session modified to use the file in its new location.

The Read Only, Rename File, Copy File and Move File options are only enabled in Advanced Edit mode

Comments

A comments can be associated with each button, the initial entry is taken from the Comments Field in the WAV file otherwise it defaults to 'none'

Below is an example of a Wave file editor (Adobe Audition) showing the Text Fields embedded in the file, the Comments section upper right is the field that SpotOn imports.

The image shows a 'Wave Properties' dialog box with a blue title bar and a close button. It contains several tabs: 'Text Fields', 'Loop Info', 'Sampler', 'Misc', 'EBU Extensions', 'Cart', and 'File Info'. The 'Text Fields' tab is selected. Inside this tab, there is a 'Text Field Names' dropdown menu set to 'Standard RIFF'. Below this are several text input fields: 'Display Title' (containing '1KHz sinewave Tone'), 'Original Artist', 'Name', 'Genre', 'Key Words', 'Digitization Source', 'Original Medium', 'Engineers', 'Digitizer', 'Source Supplier', 'Copyright' (containing 'Markie Enterprises'), 'Software Package *', and 'Creation Date *' (containing '01/01/2004'). To the right of these fields are two large text areas: 'Comments' (containing 'Comments Field for any other information') and 'Subject'. At the bottom left, there is a checkbox labeled 'Fill * fields automatically'. At the bottom right, there are three buttons: 'OK', 'Cancel', and 'Help'.

Display name

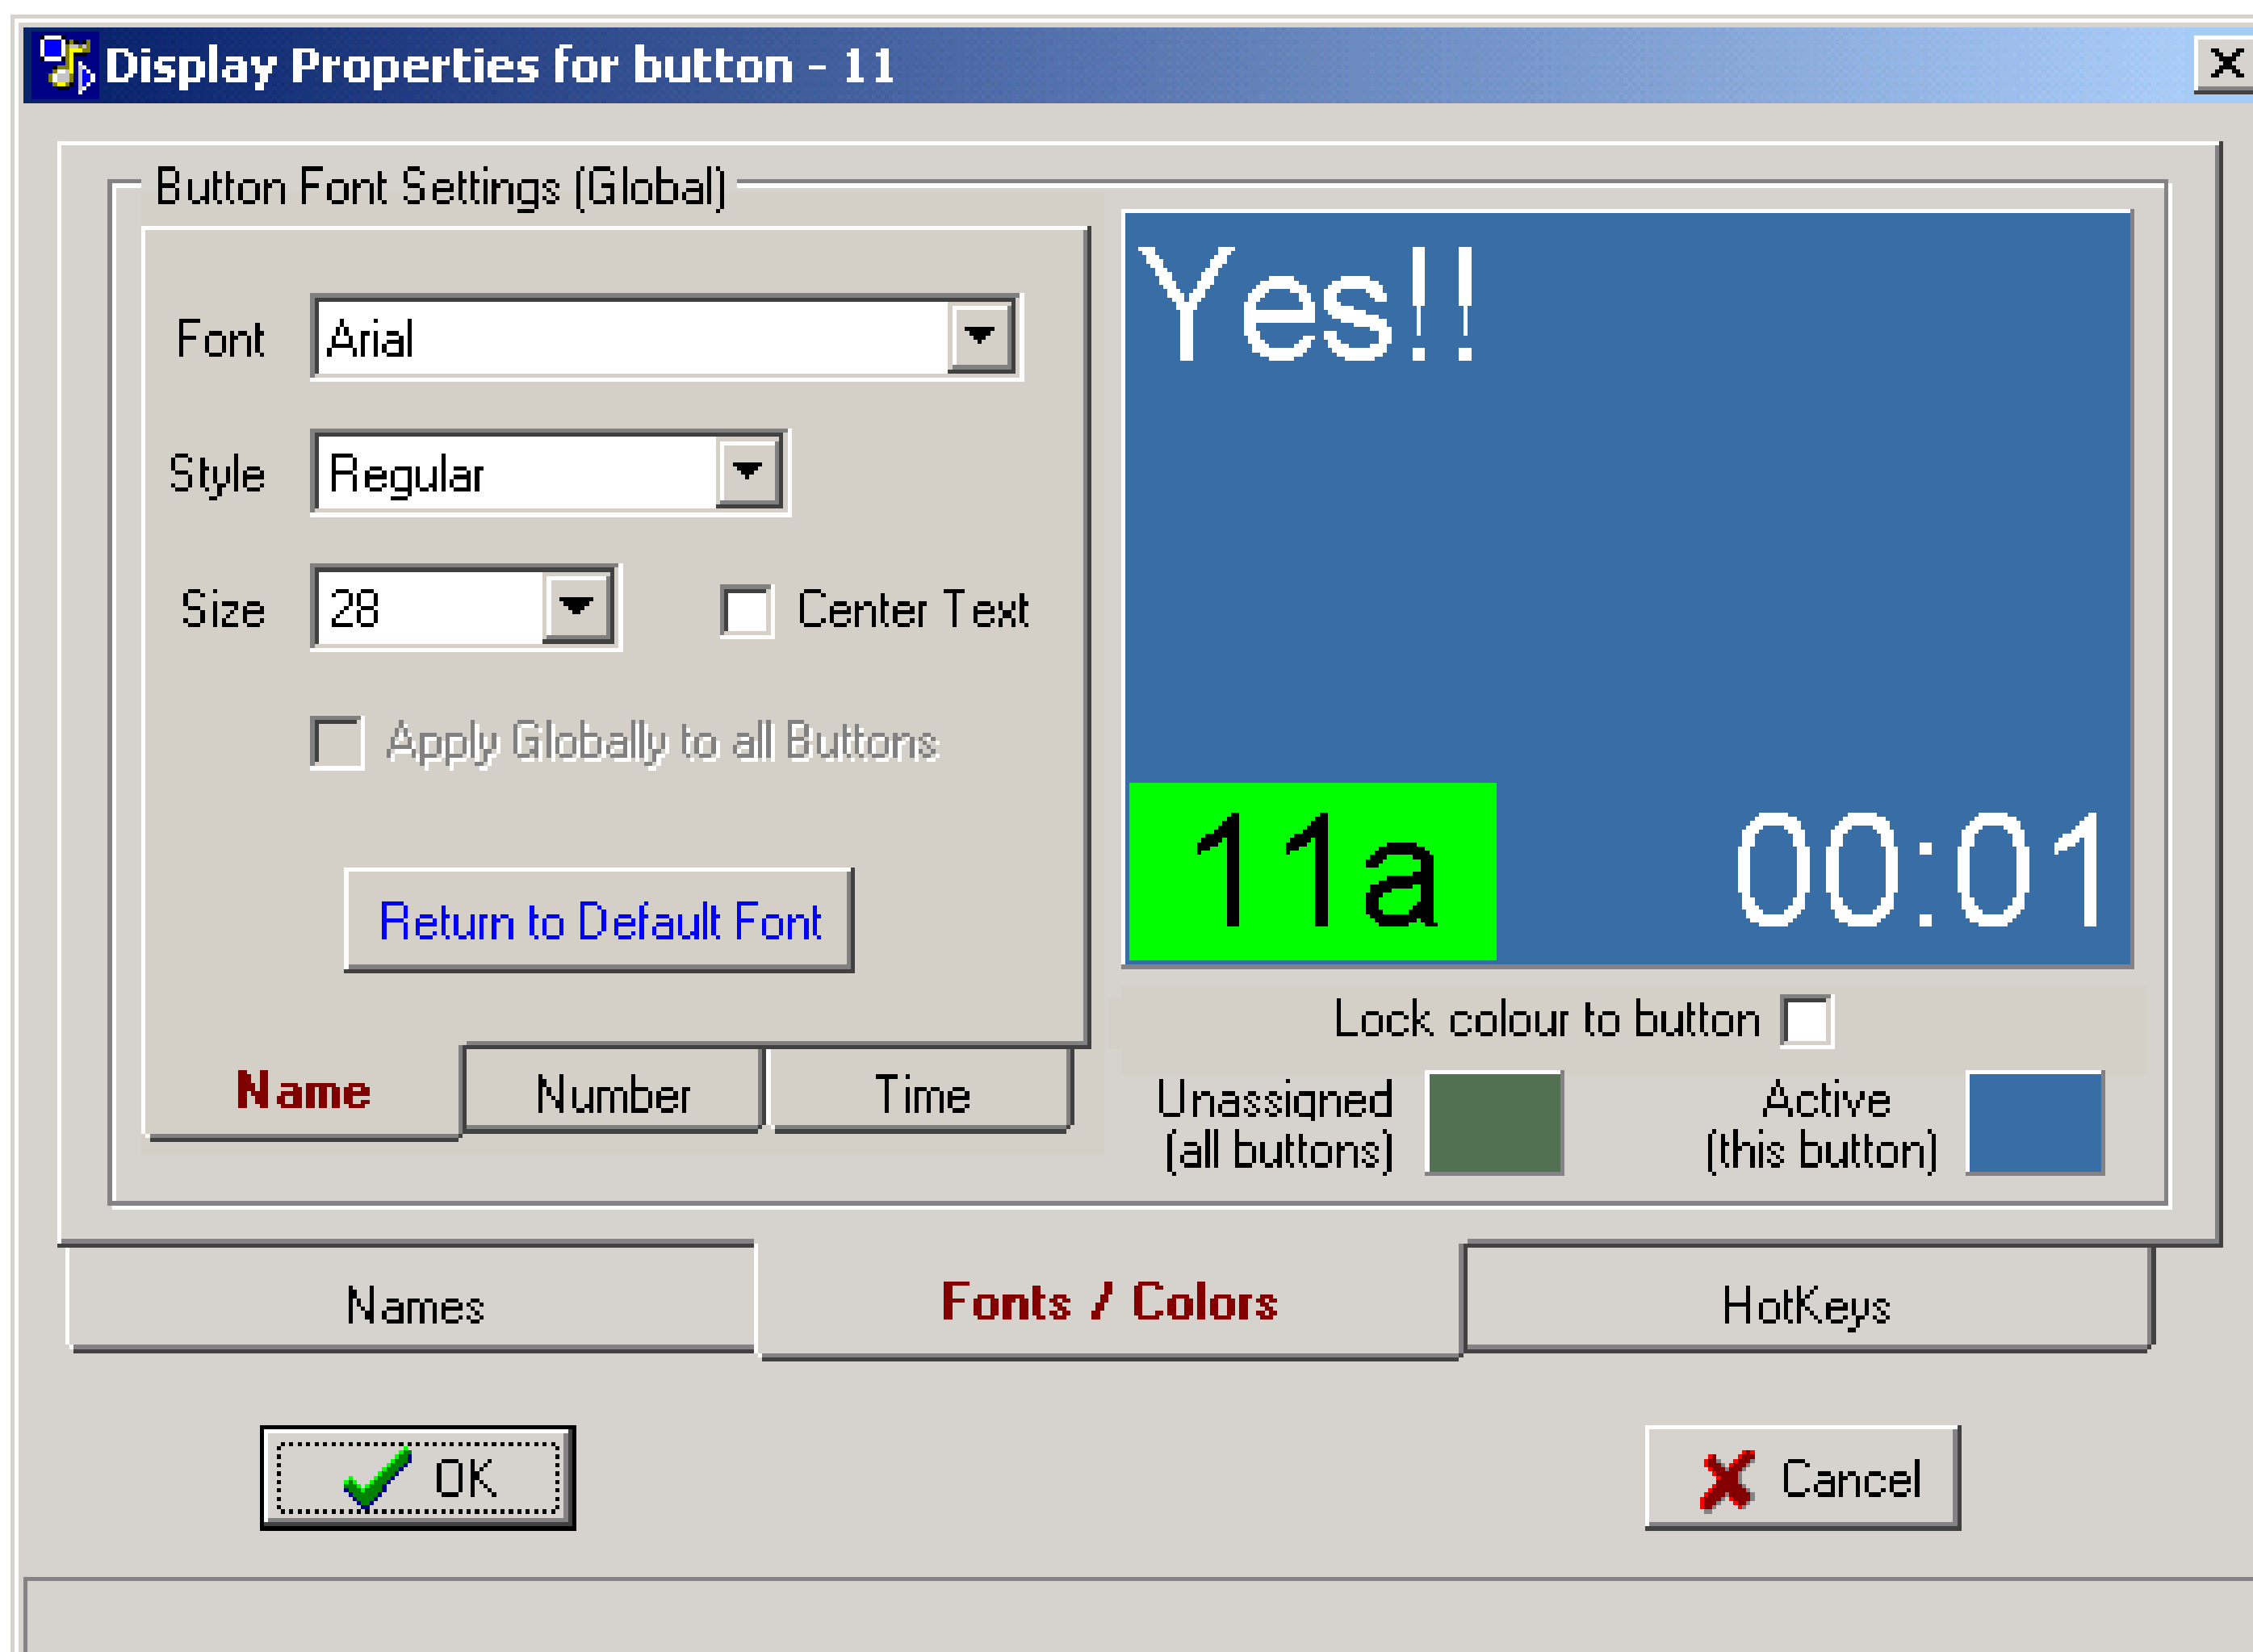

The displayed name defaults to the Display Title field shown in the dialog above, if this is not found embedded in the Wave file then the disc filename is used.

This text can be edited to something more applicable using the highlighted edit box below.

If a number of button names require editing then the Track Names menu option is more appropriate.

Font/Colors

The second tab shows the button and allows the font name, style and size to be set for each of the three items - track name, button number and time remaining. The font edit page can be selected via the tabs or by clicking the text in the button.

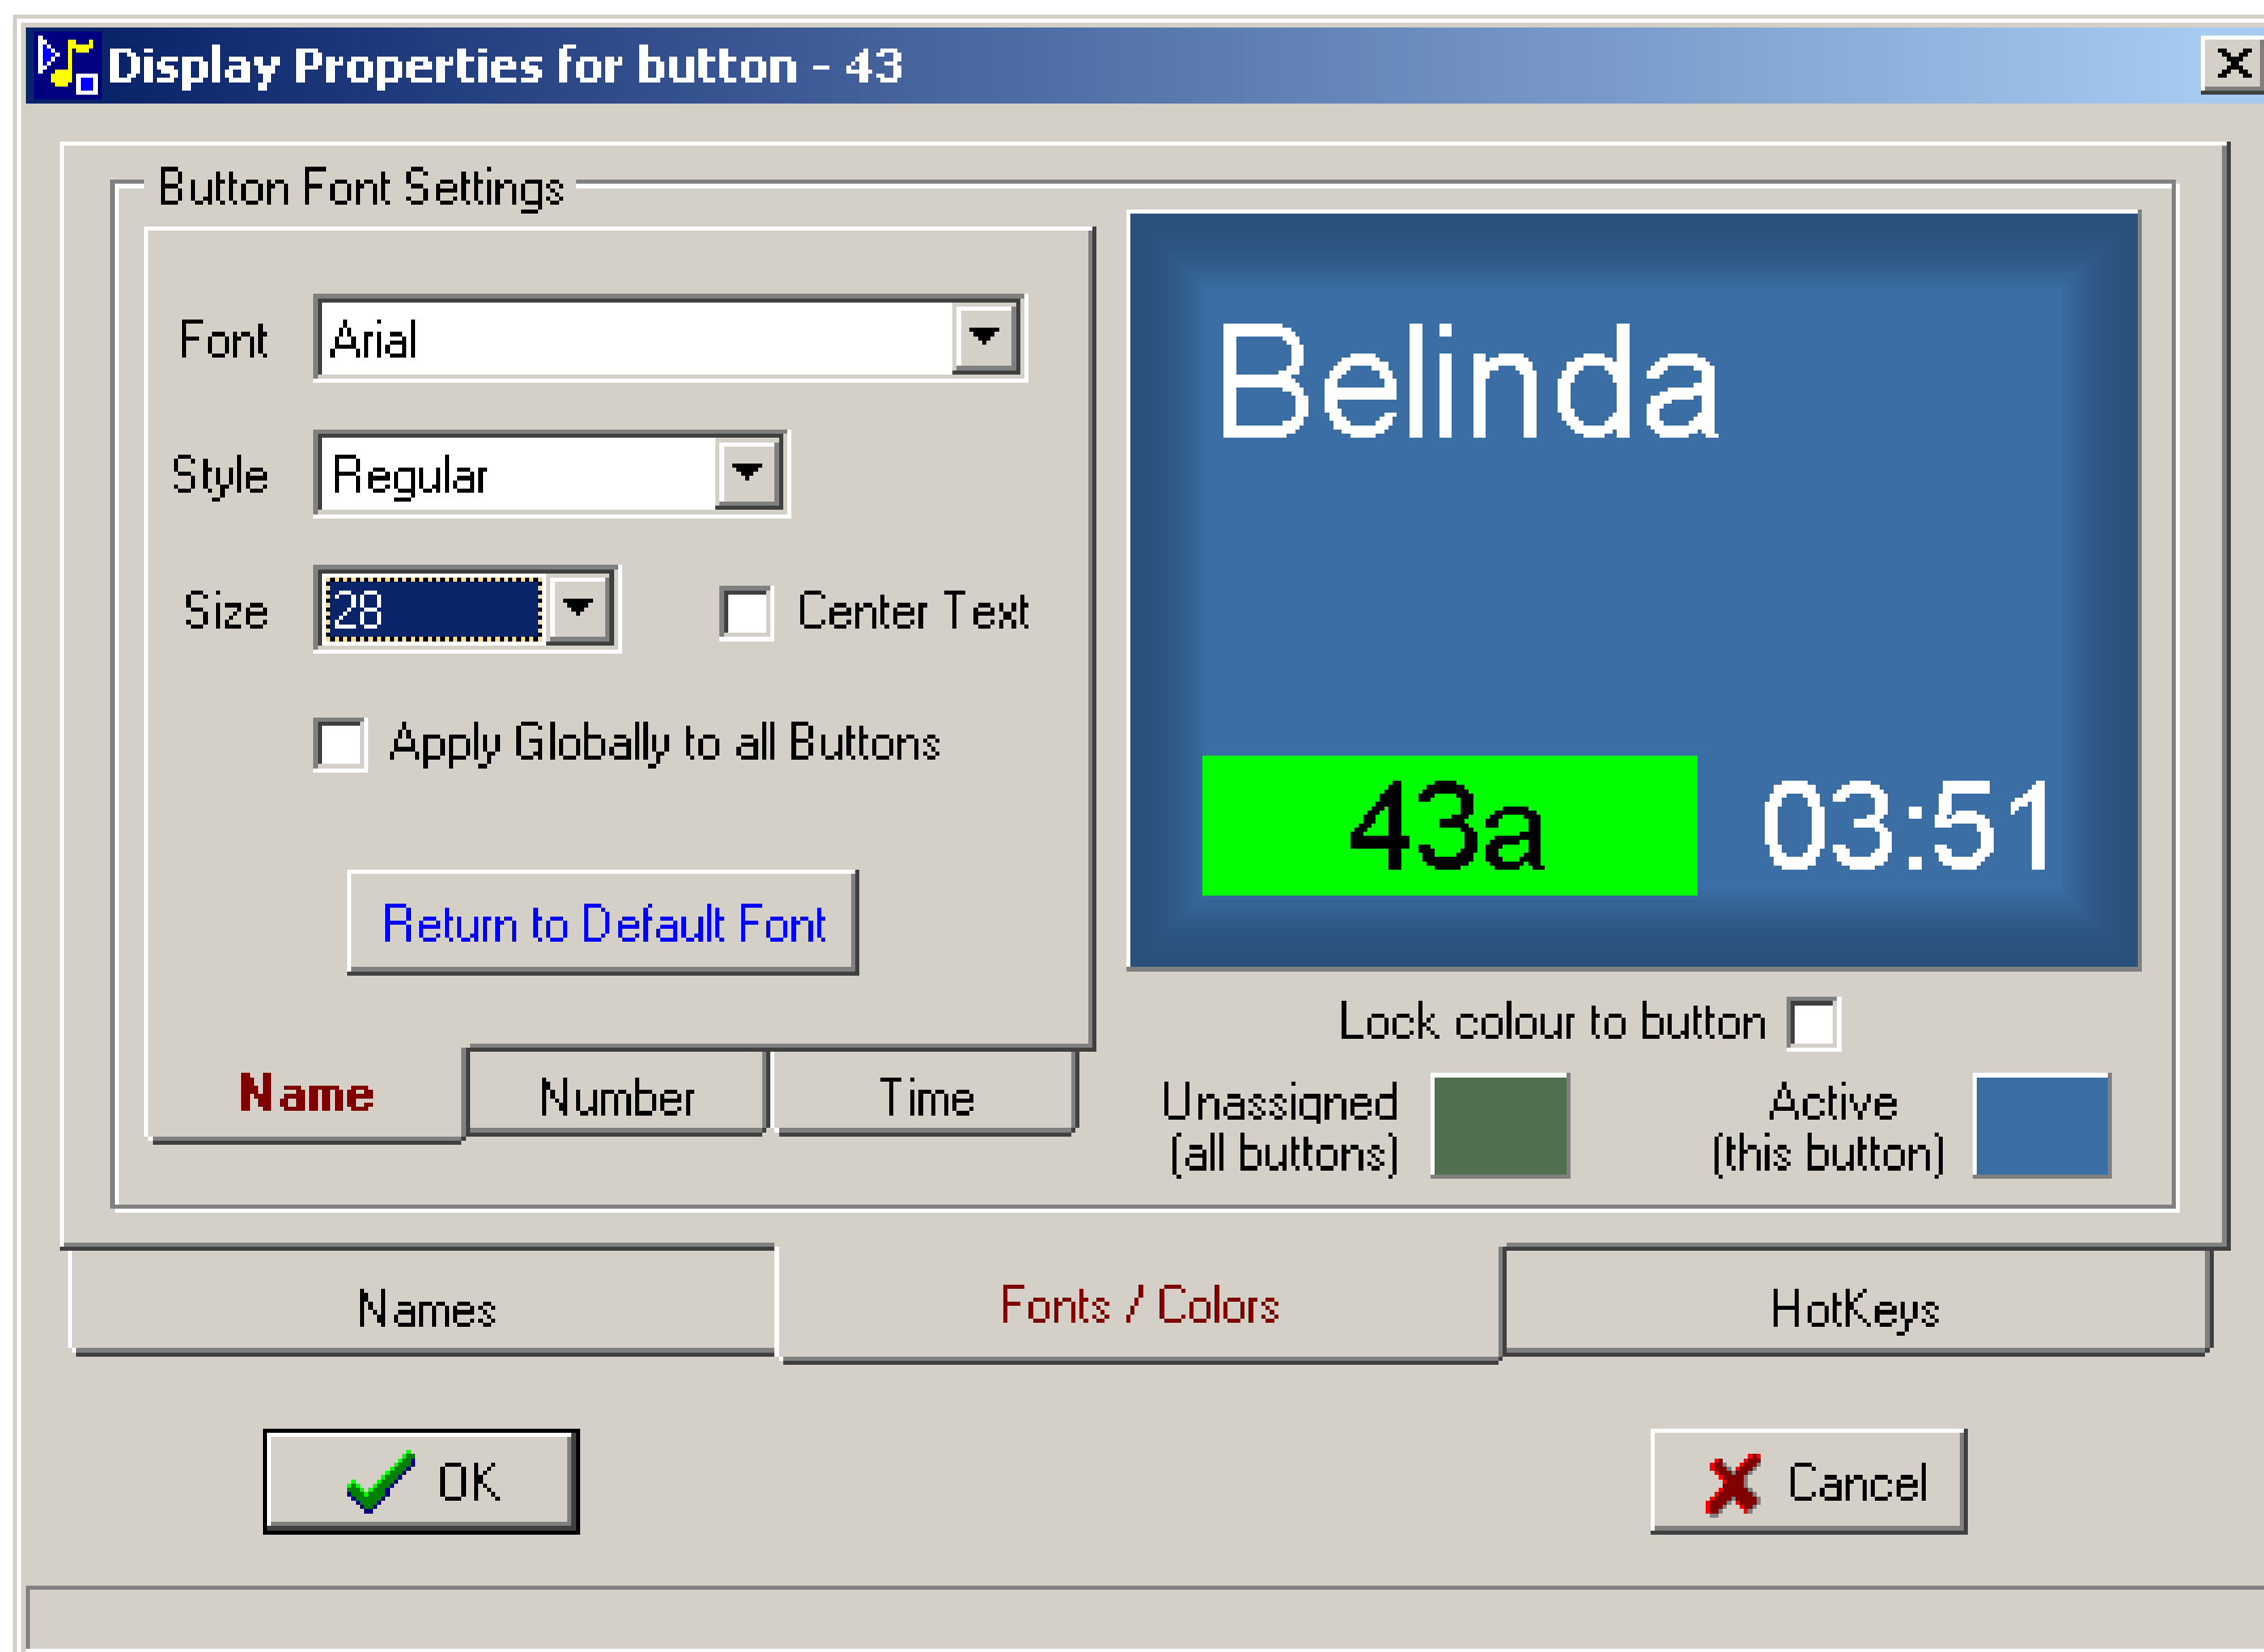

The fonts are set to AutoSize so that when the button size/aspect ratio changes the text stays approximately in the same proportion to the button. As a result of this bit mapped fonts should be avoided as they do not scale correctly.

When setting the font sizes remember that in certain circumstances the time remaining text in the lower right corner can have an additional two leading characters "X@" (track trimmed and speed changed).

In the example below buttons 42..45 currently use the same font for the trackname - the default font Arial 24pt.

In the Options|Display menu there is an option "Individual Button Fonts" to set the trackname fonts independently, when this option is selected the "Apply Globally to all Buttons" on the Display properties page is enabled.

By unchecking "Apply Globally to all Buttons" option the trackname font can be set for this button only - here set to Arial 28 pt.

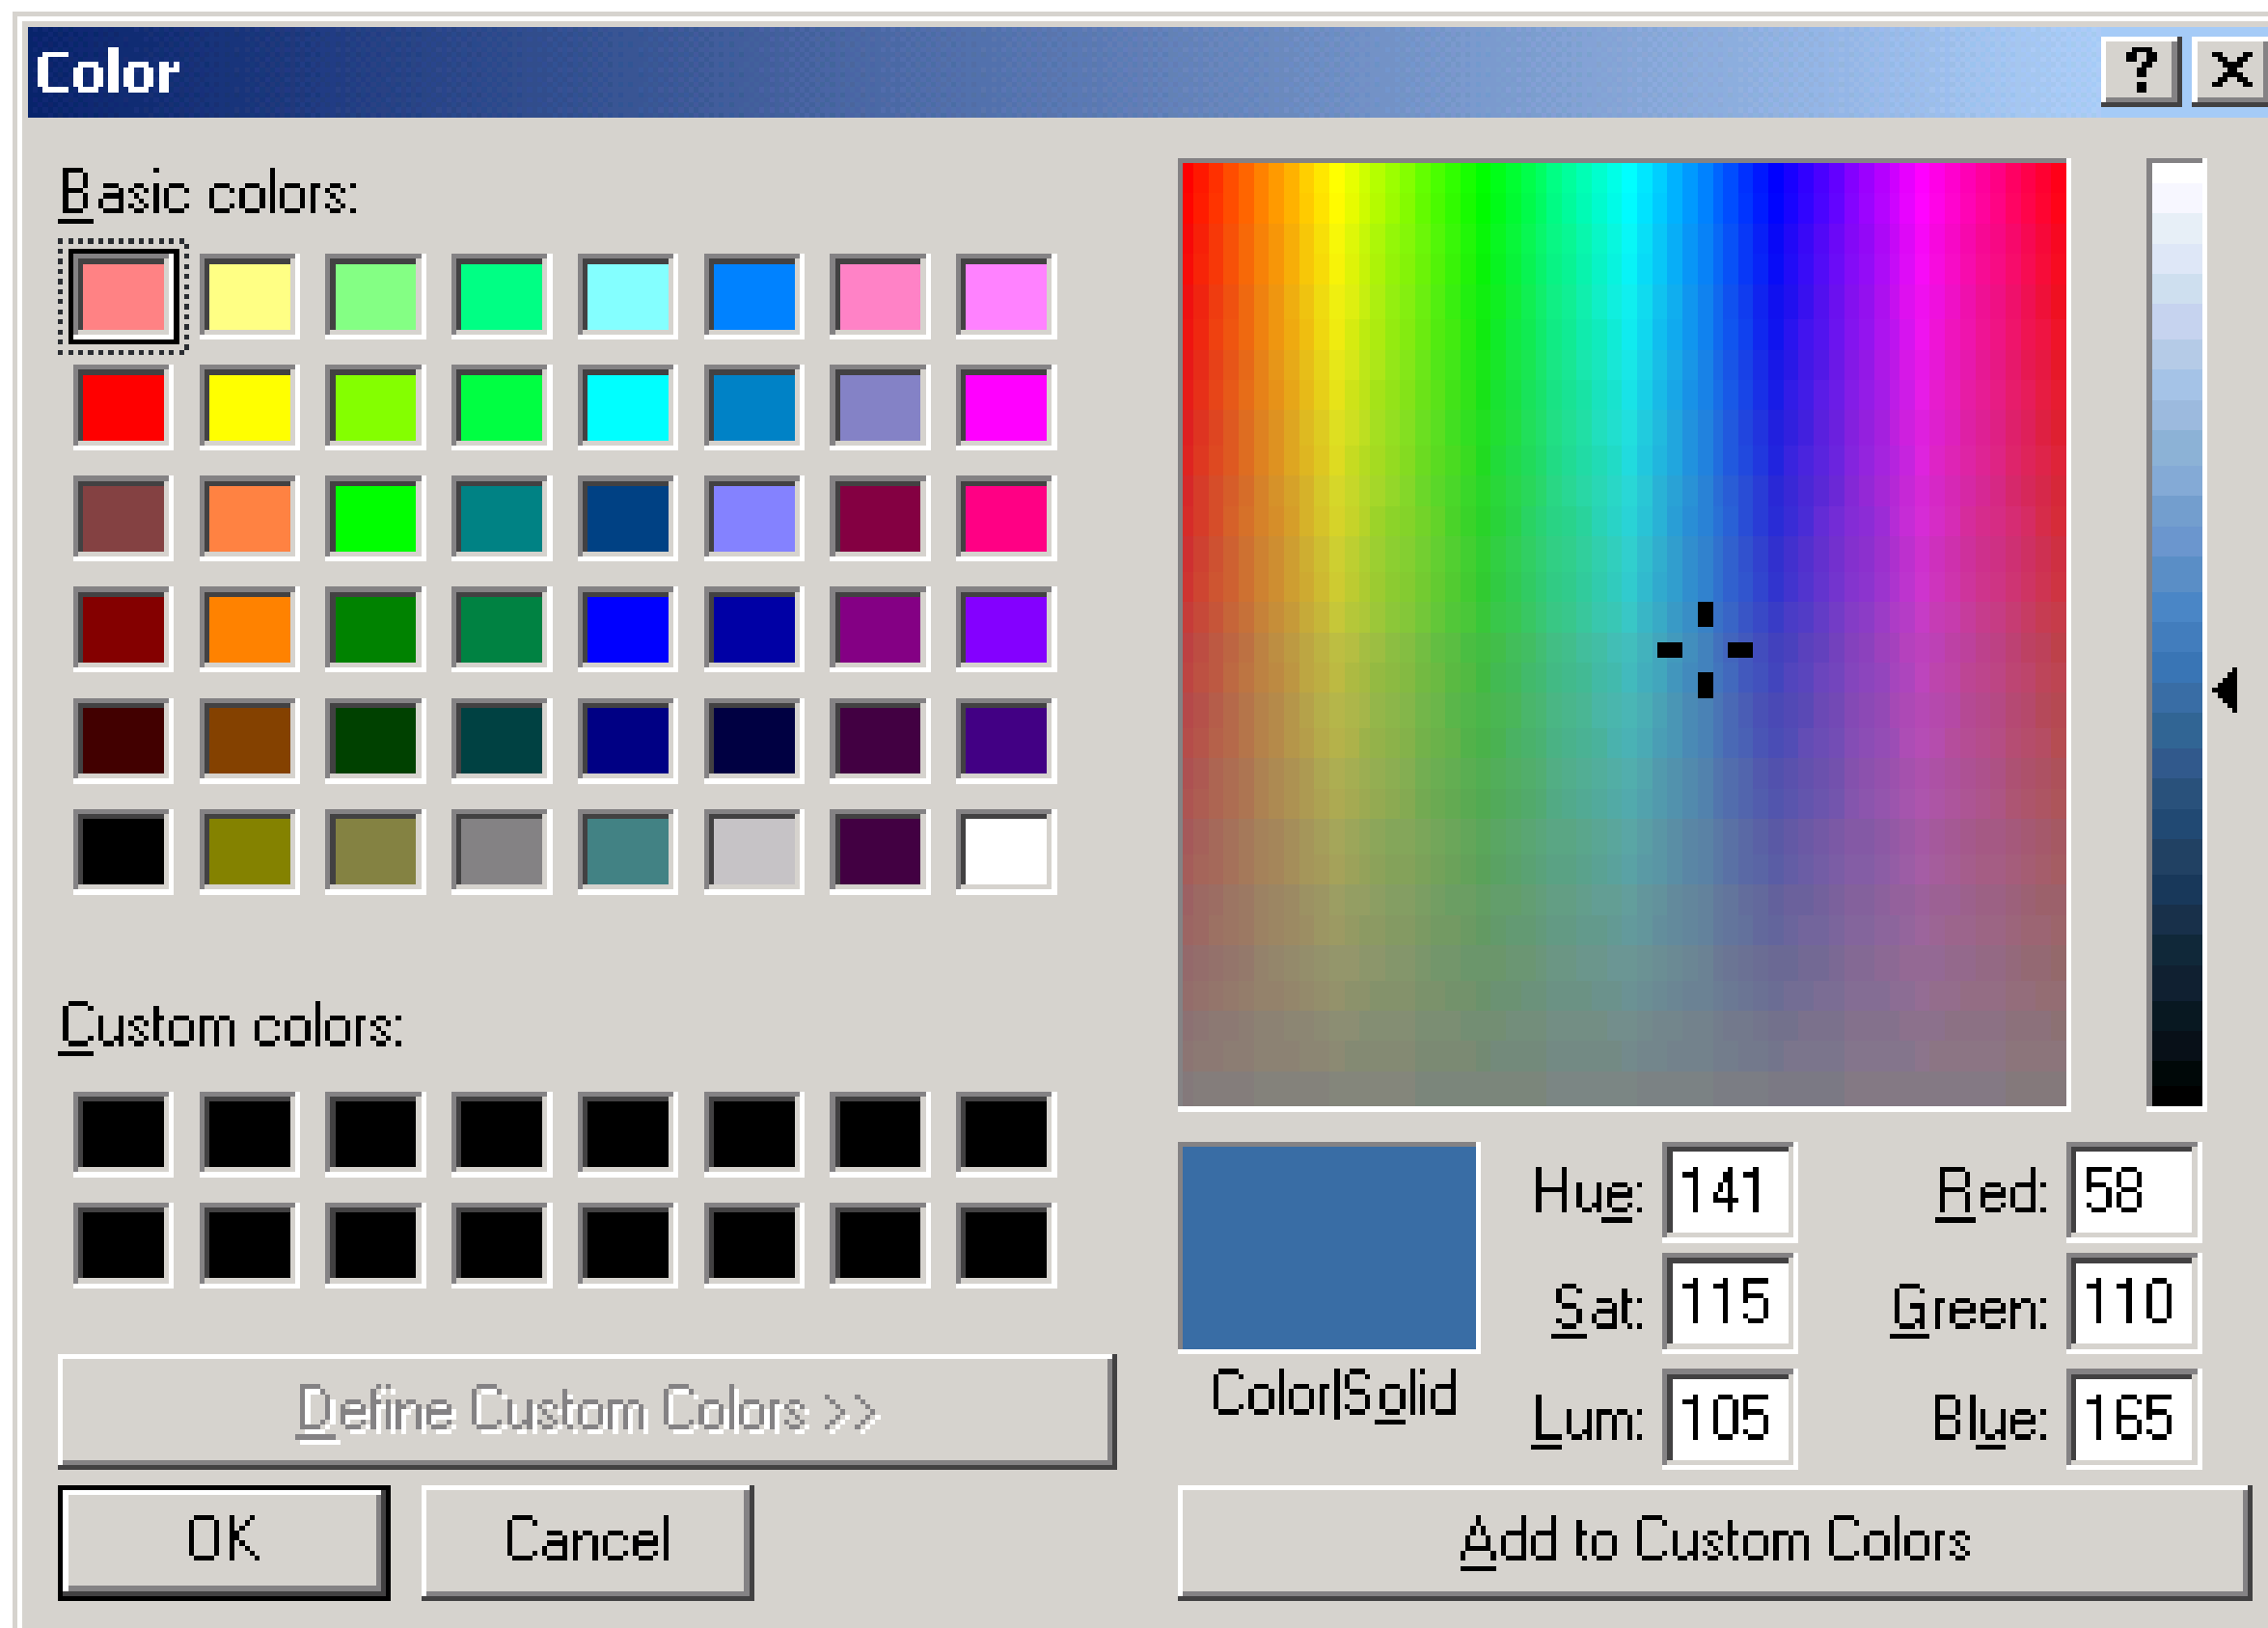

If button 44 is set to Arial 36 pt and button 45 set to Arial 36 pt italic the buttons will look as below, the individual fonts are saved in the Session files.

The Return to Default Font button does just that.

To change the background colour of the button right click the Active colour panel for a popup menu

Choosing Select Colour displays a full colour selector dialog

Similarly right-clicking the unassigned colour panel brings up a similar list of options

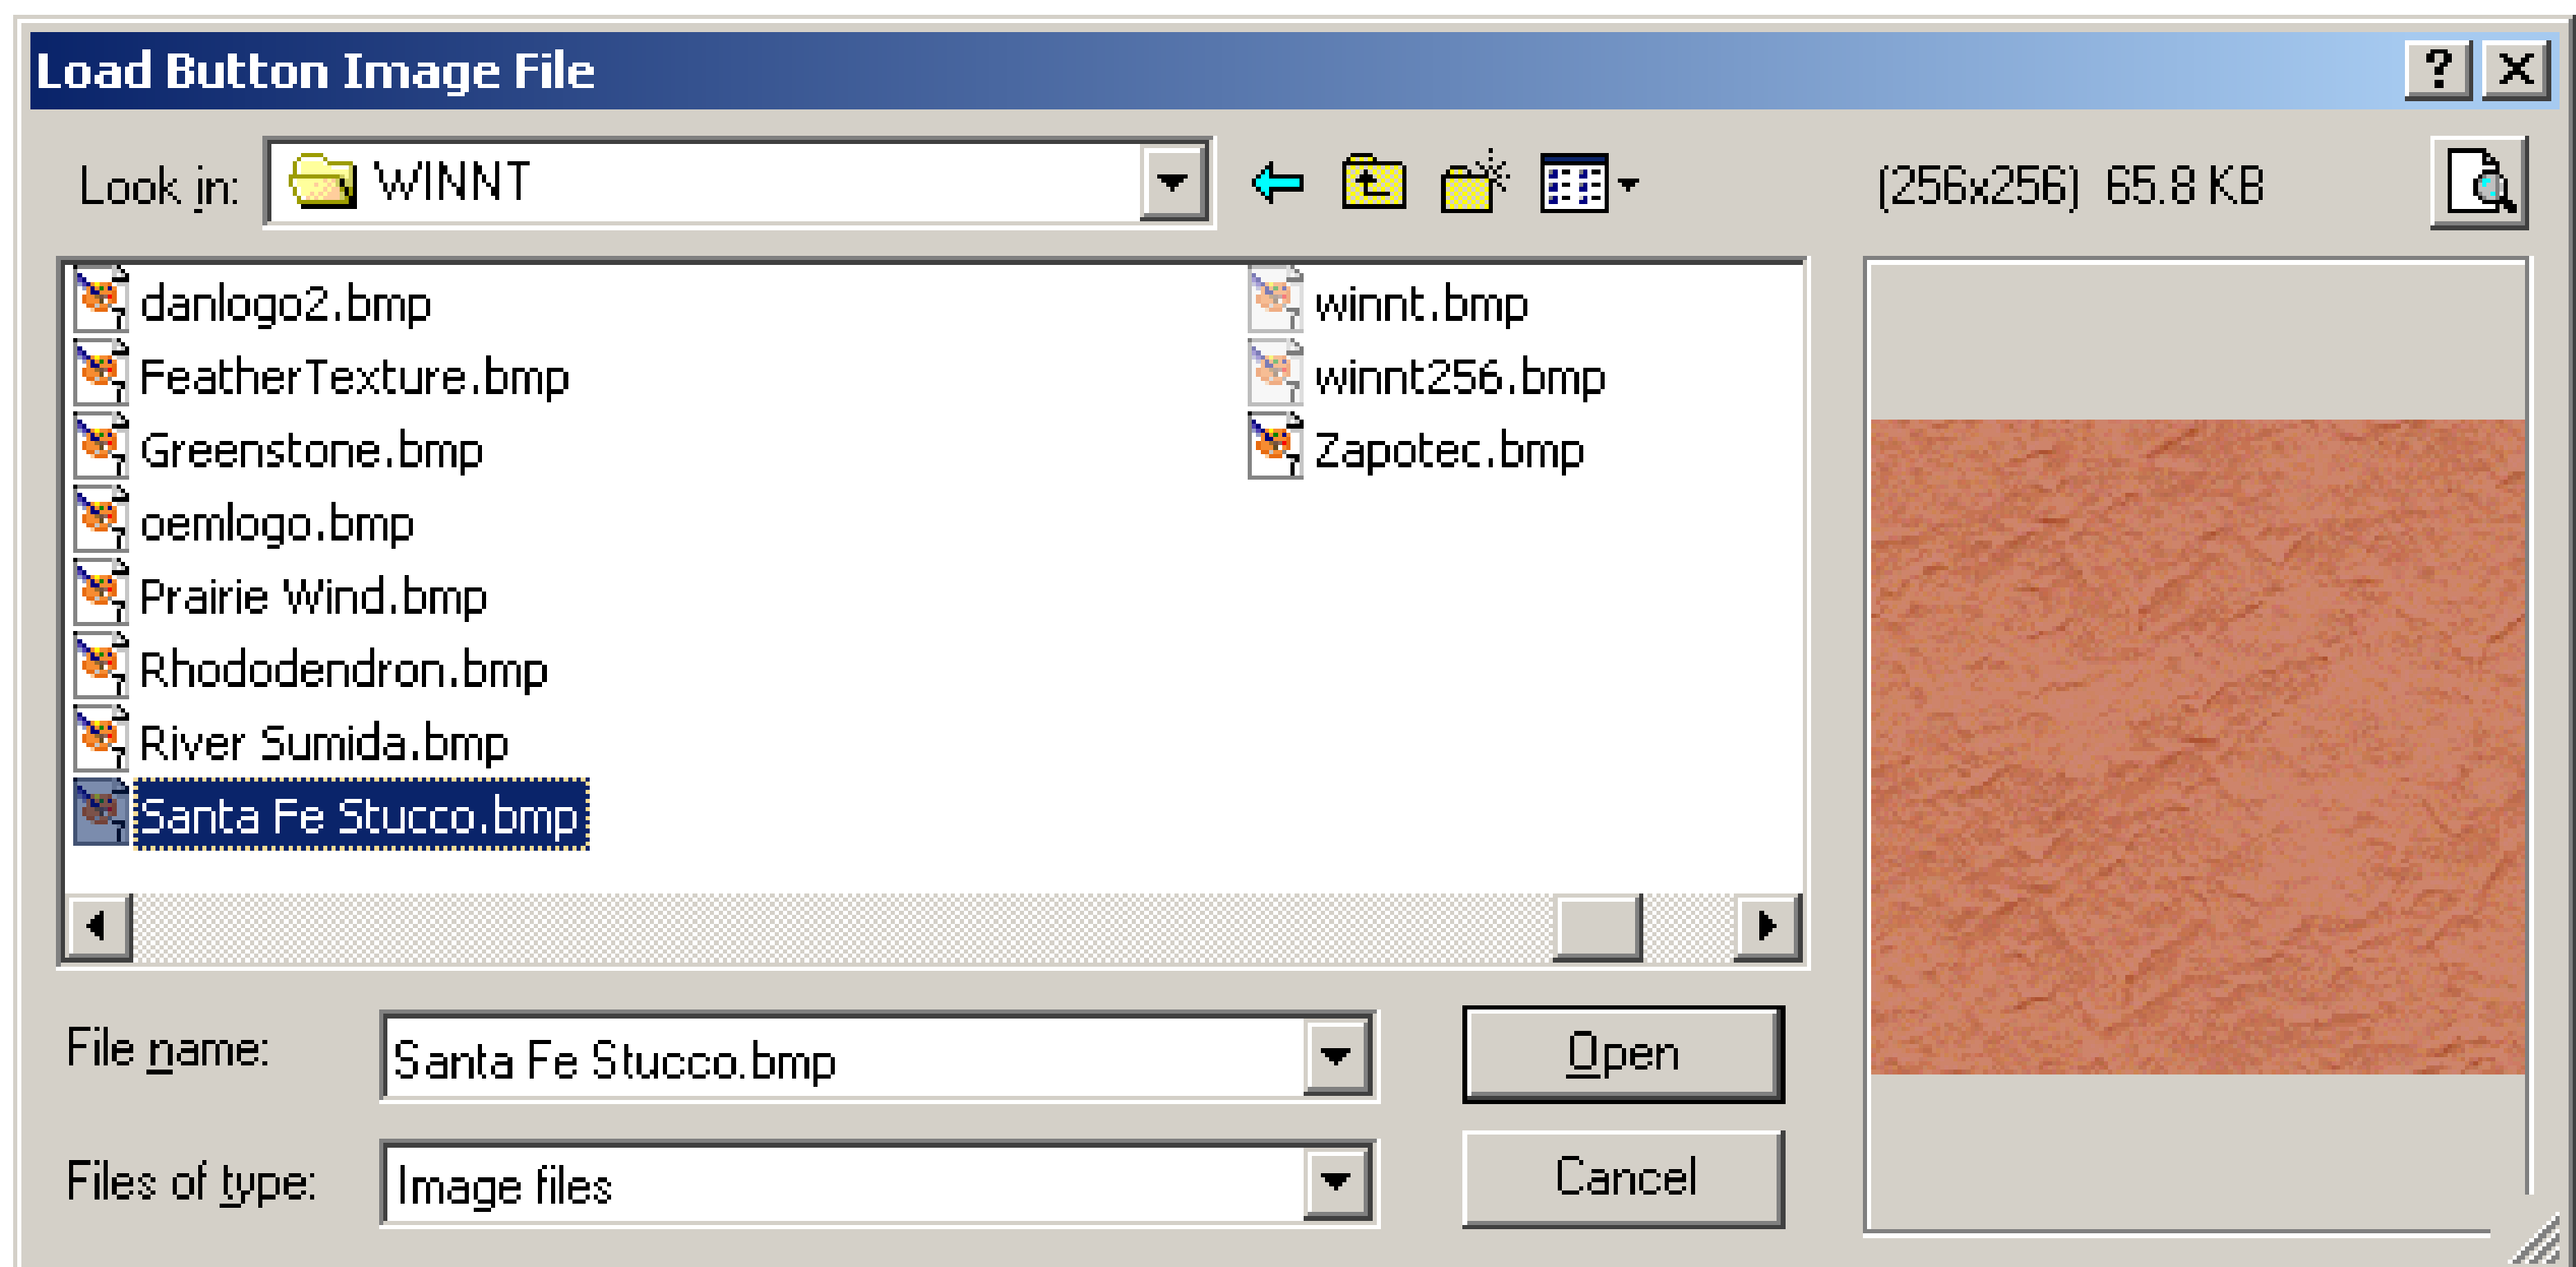

The colour of the button may be locked by checking the box below to avoid it being changed when the audio track is replaced

Right-clicking the button display will list a number of options

Button Colour - is an alternative route to the colour selection described above

Button Image - allows the file that is to supply the button image to be defined, at present the image types are restricted to Bitmap (*.bmp) and JPEG (*.jpg) with an uncompressed size less than 2.5MB

A selection of sample images can be found in the ..\Program Files\Serialtech\SpotOn\Bmps folder.

If an image file is already defined then clicking on Cancel in the file selection dialog will display an option to clear the image from the button.

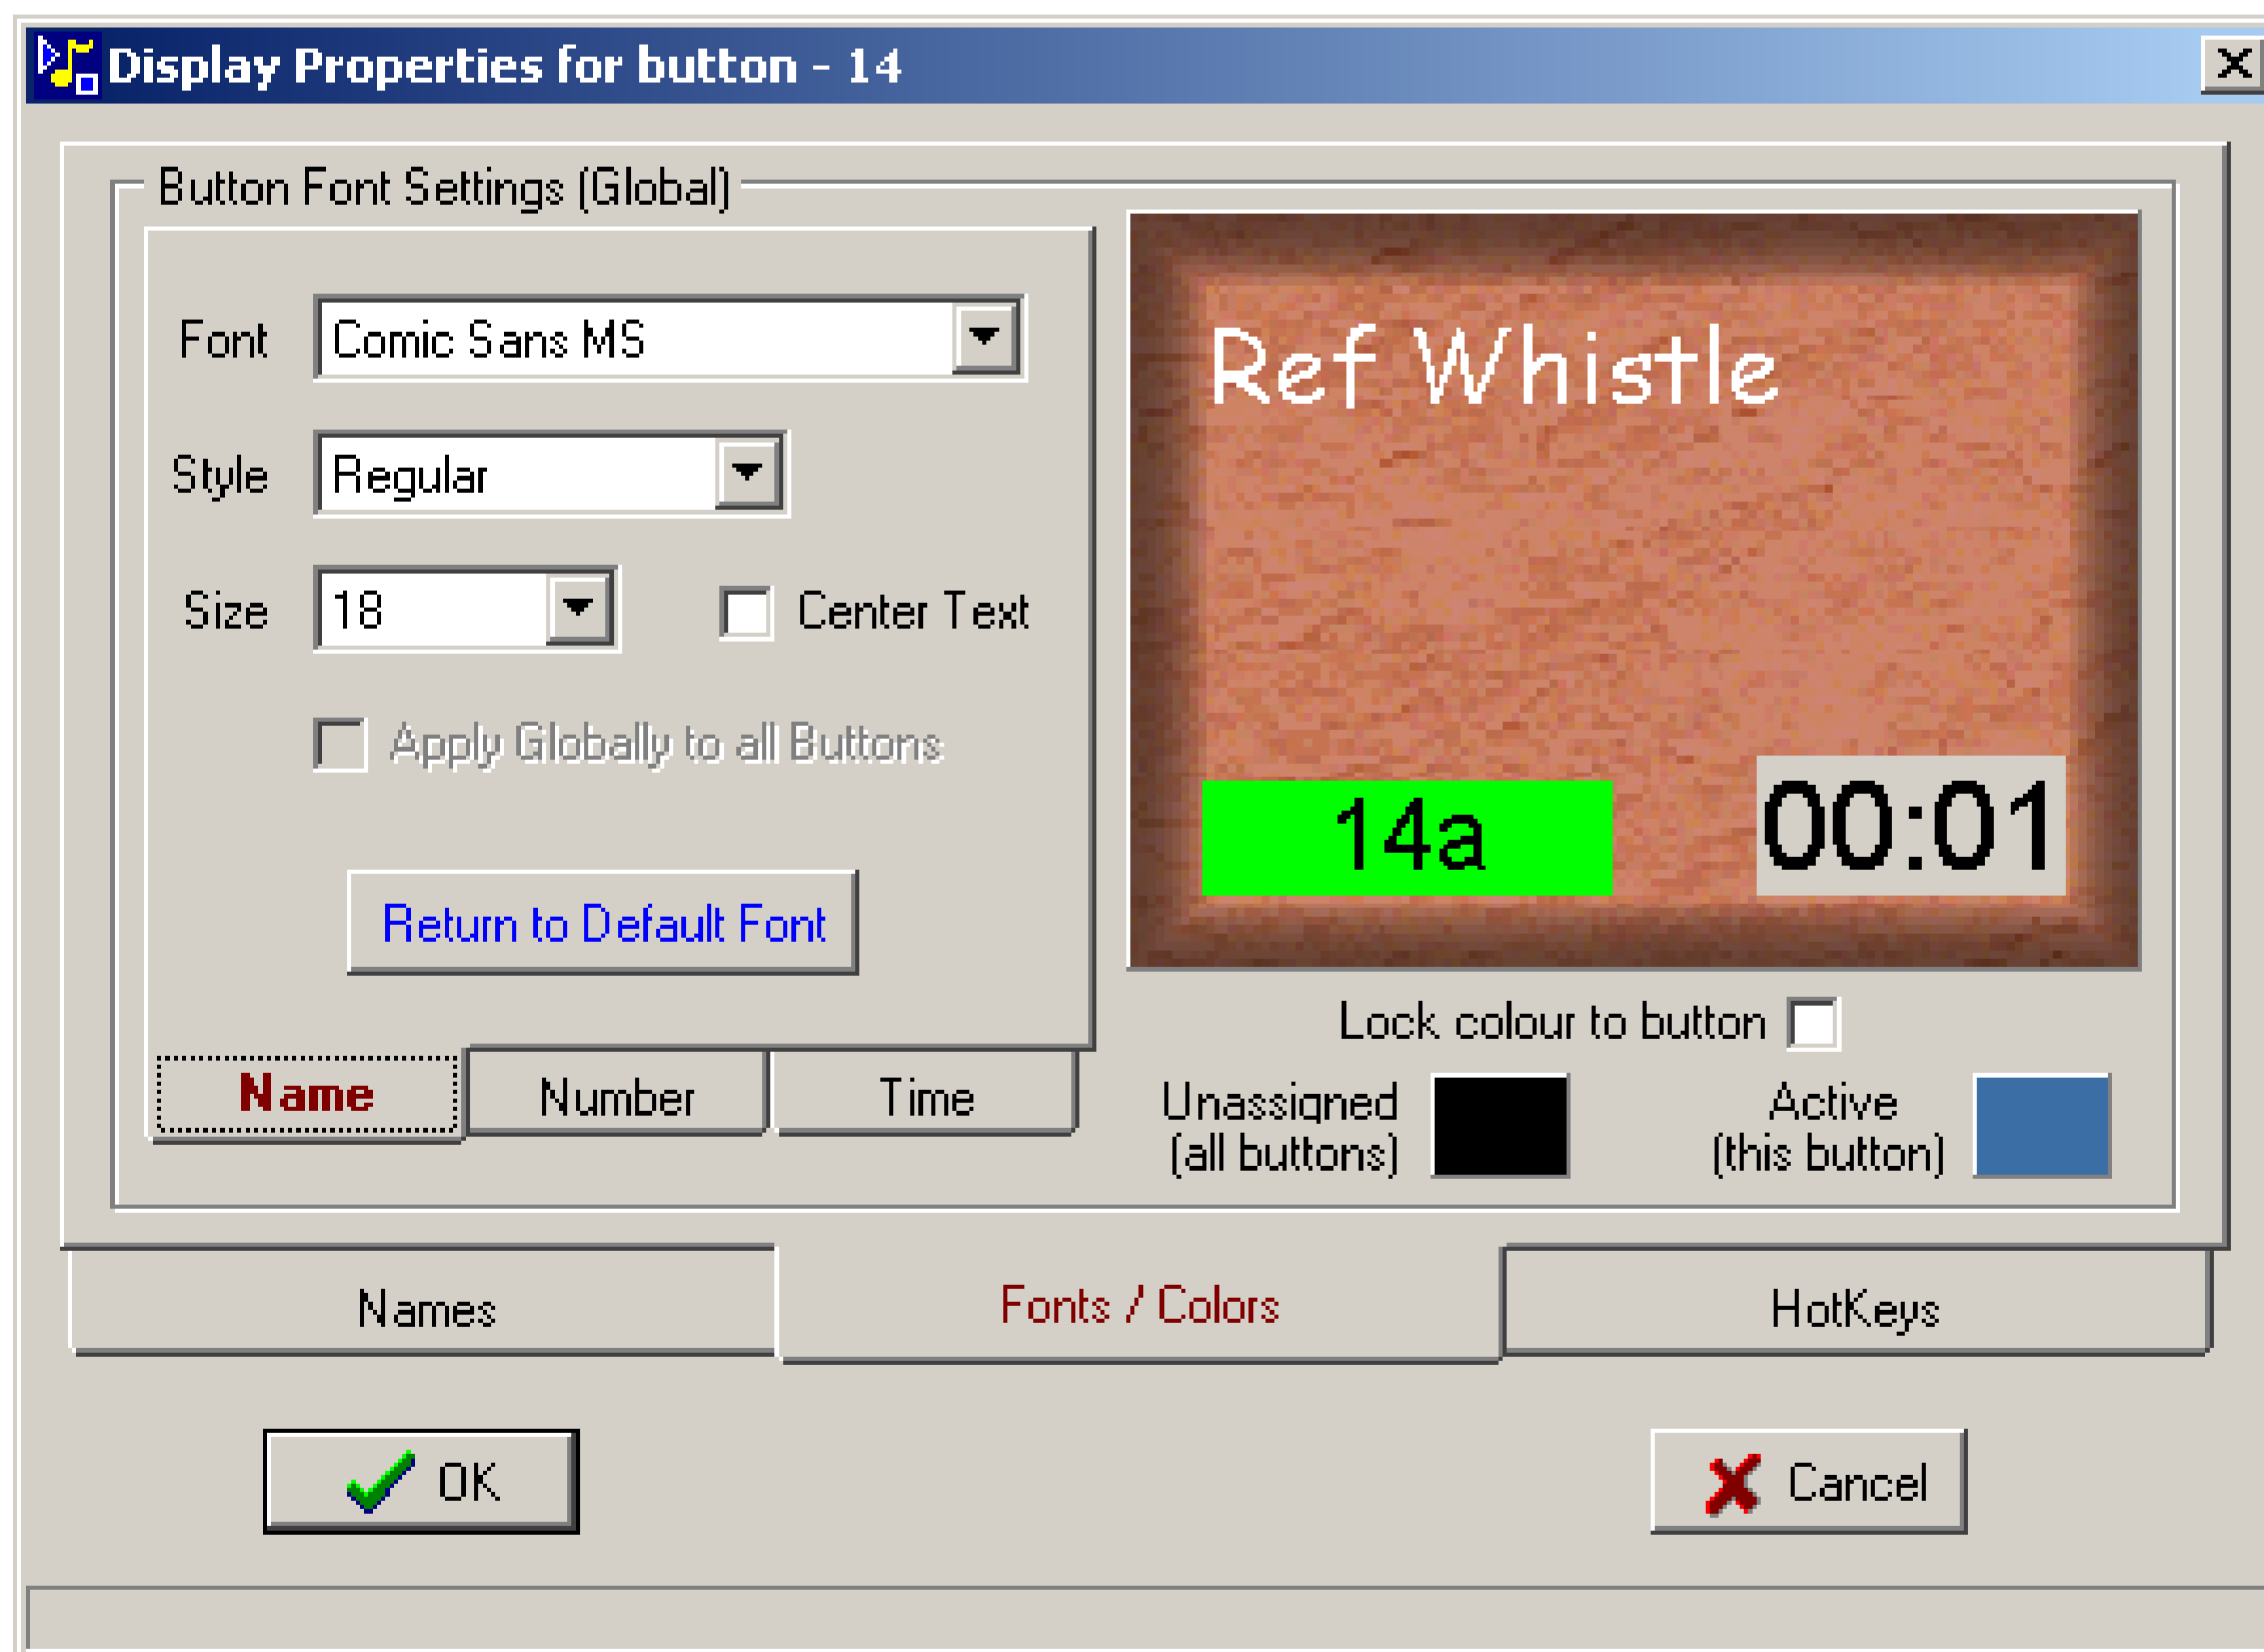

All button Images can be cleared via Global|Clear Button Images

If the menu item AutoLoad Button Images is checked then a dialog offering the option to associate the image with the button audio file is displayed, clicking OK will then set SpotOn to automatically load the same image each time that specific audio file is loaded.

Assigning a bitmap to button will result in a Properties display as below, note the Trackname text is white, the text can be either white or black the selection is normally made automatically dependent on the button colour to make sure the text is always readable.

When a bitmap is used as a background for a button the automatic choice of white or black text becomes very difficult, so the user can force the text colour by changing the basic button colour.

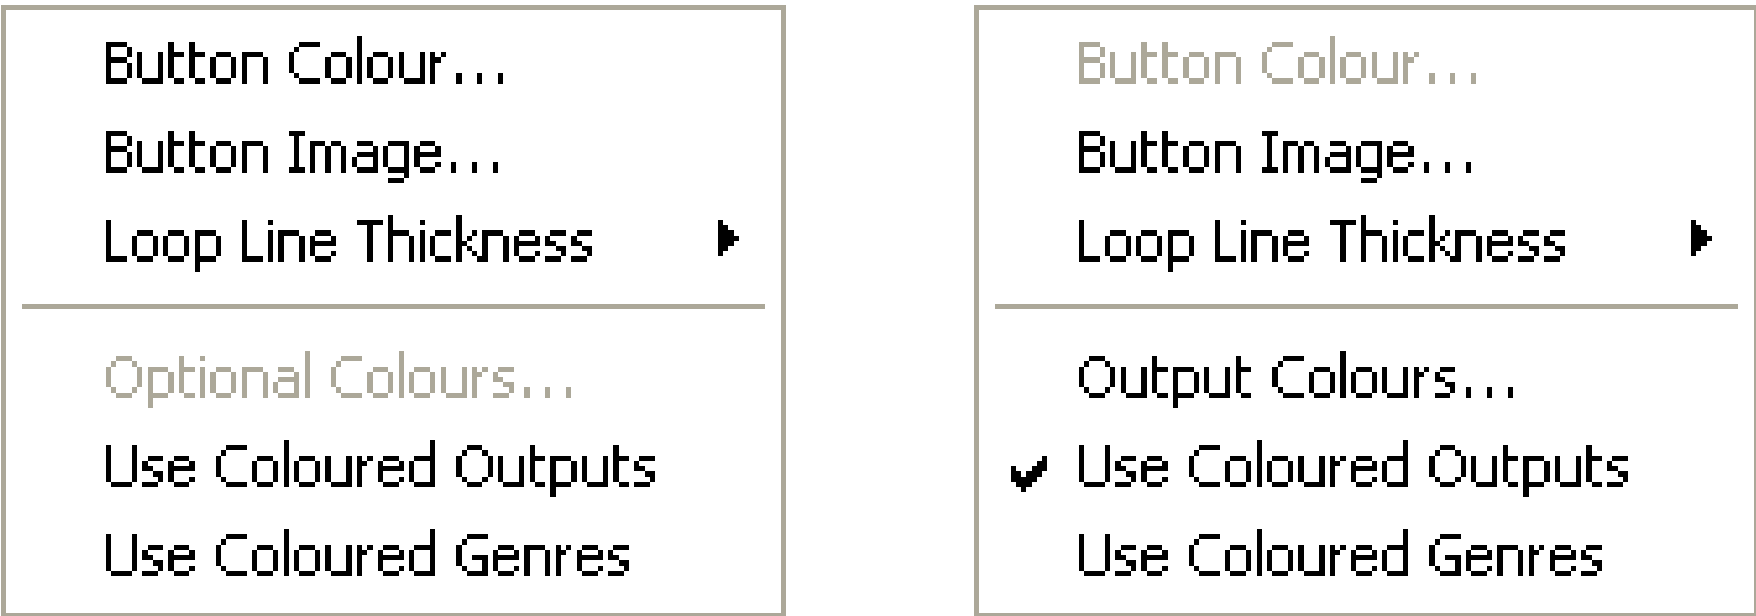

Selecting a white button background will give black text and similarly selecting a black button background gives white text, the image below shows the result of selection the button colour to white.

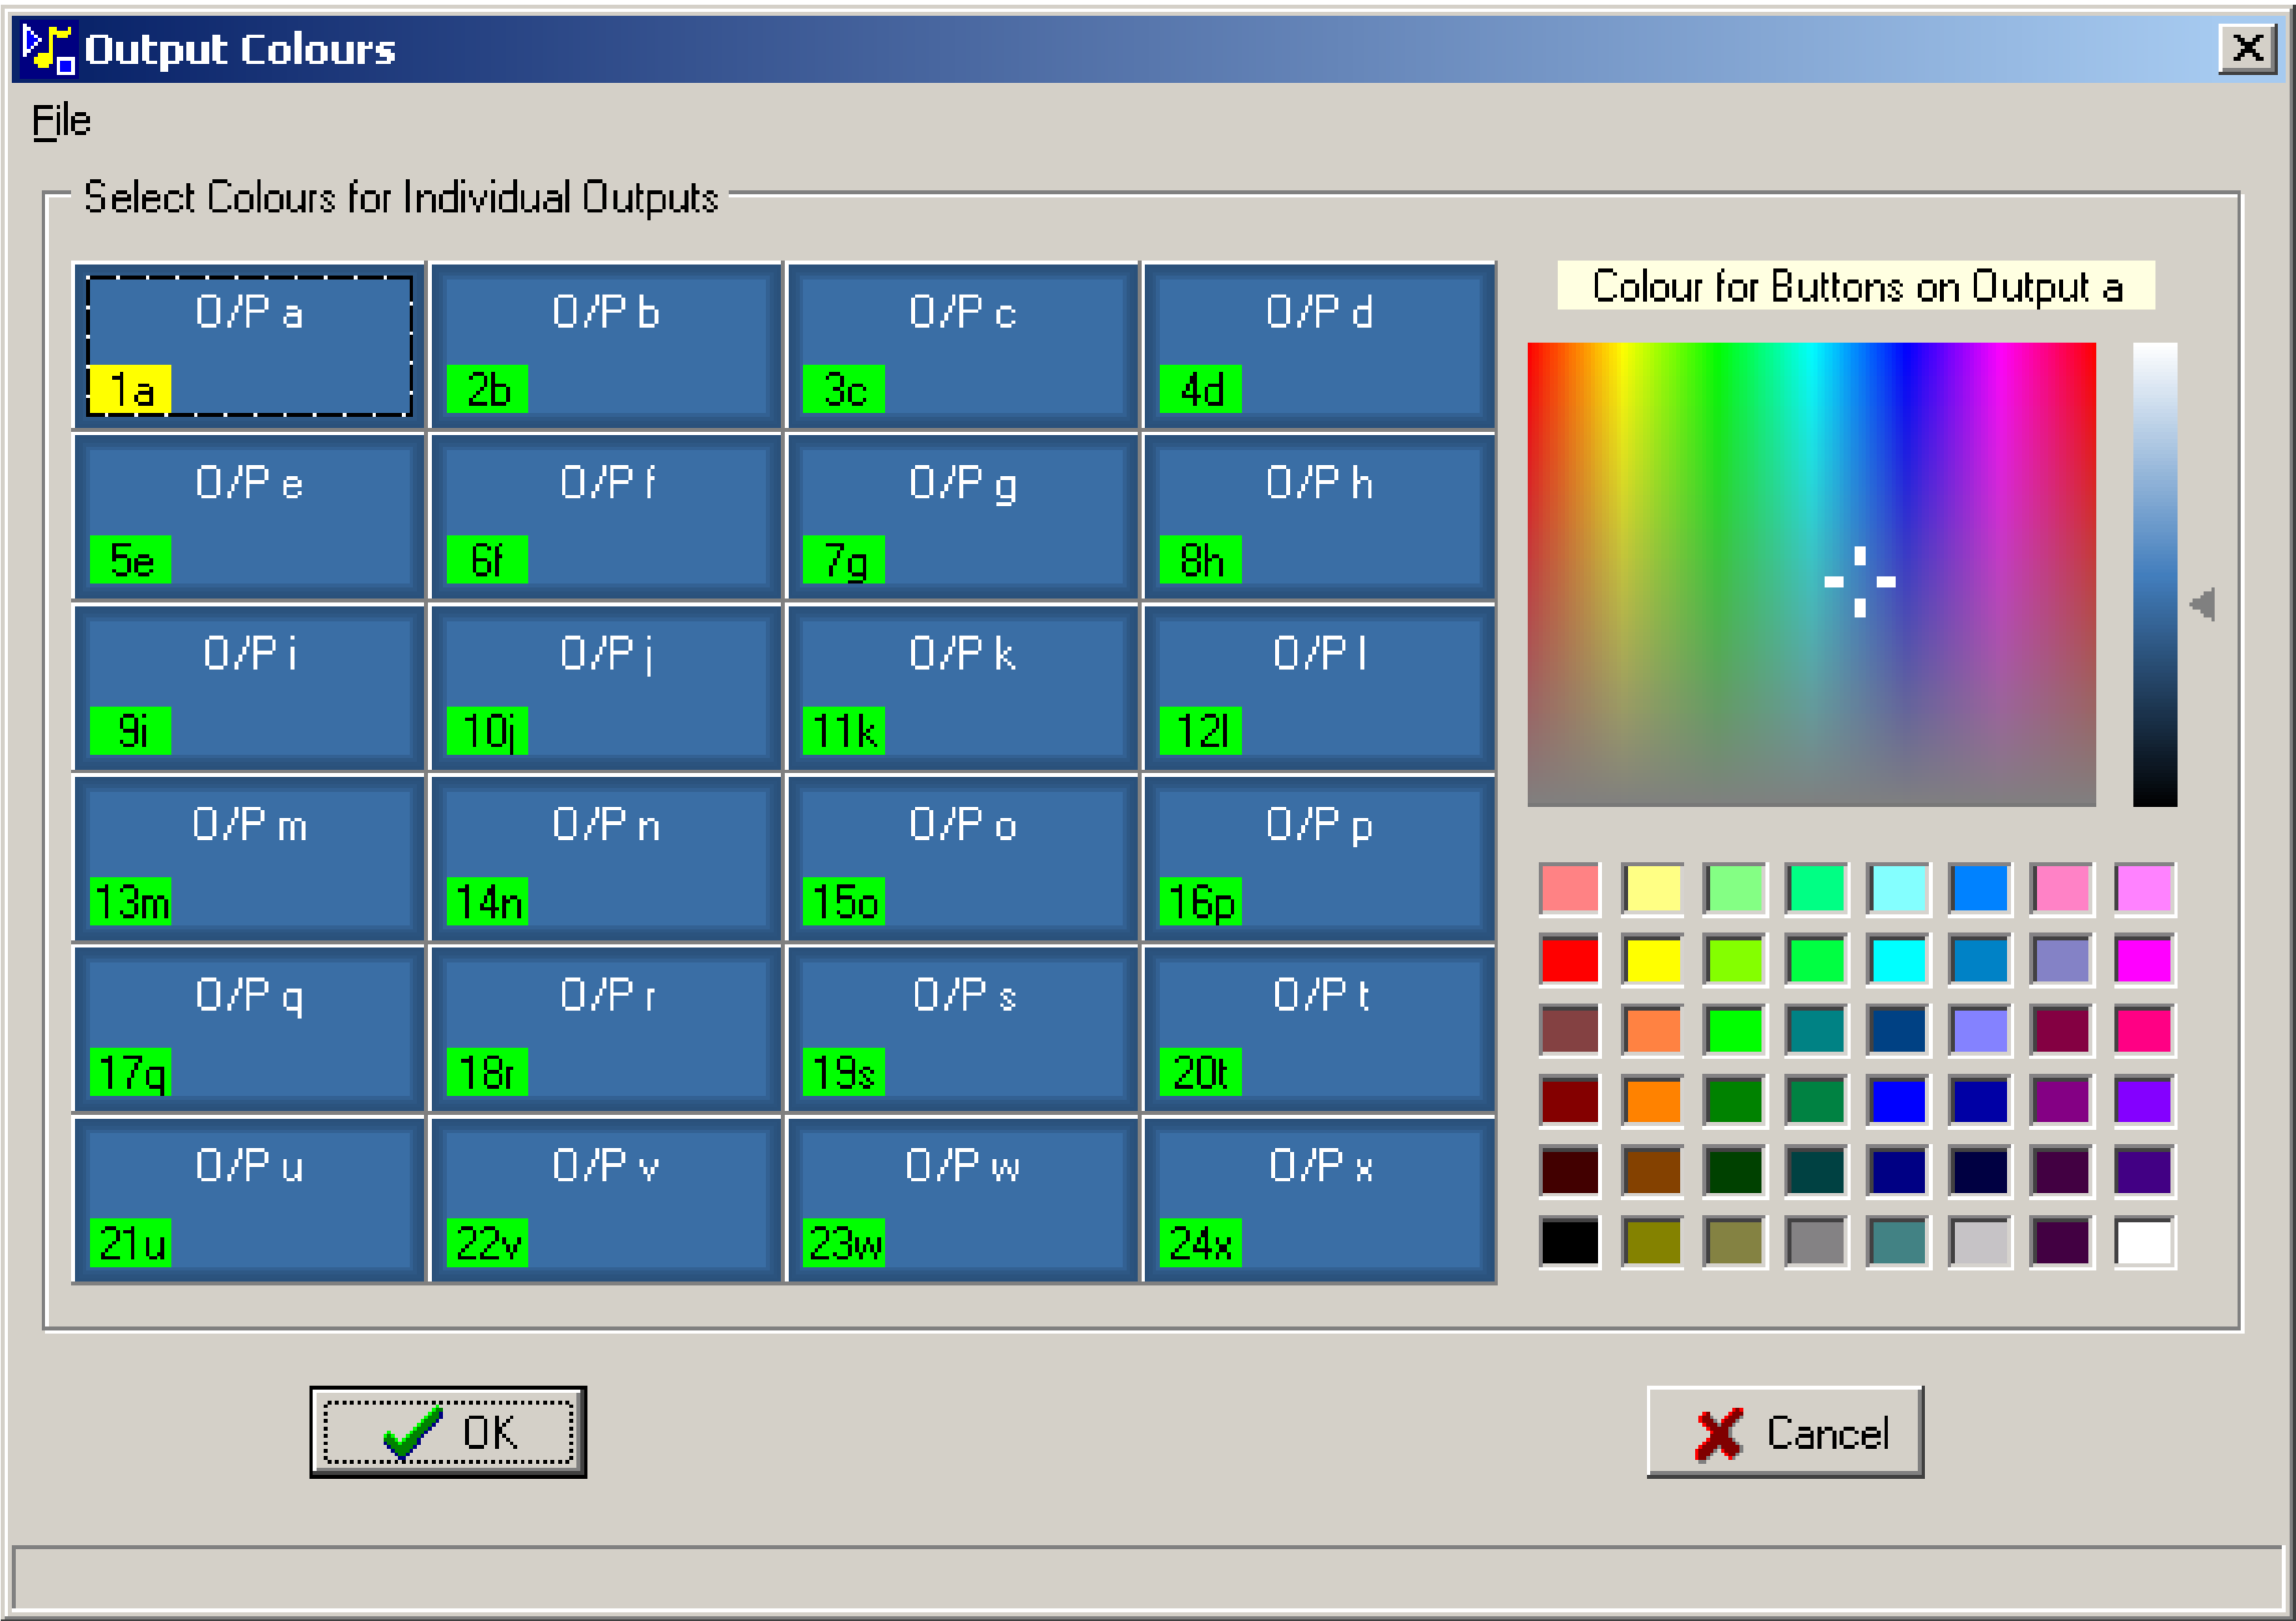

The button background colour used on button with bitmap images is independent of the original plain button colour.

Output Colours

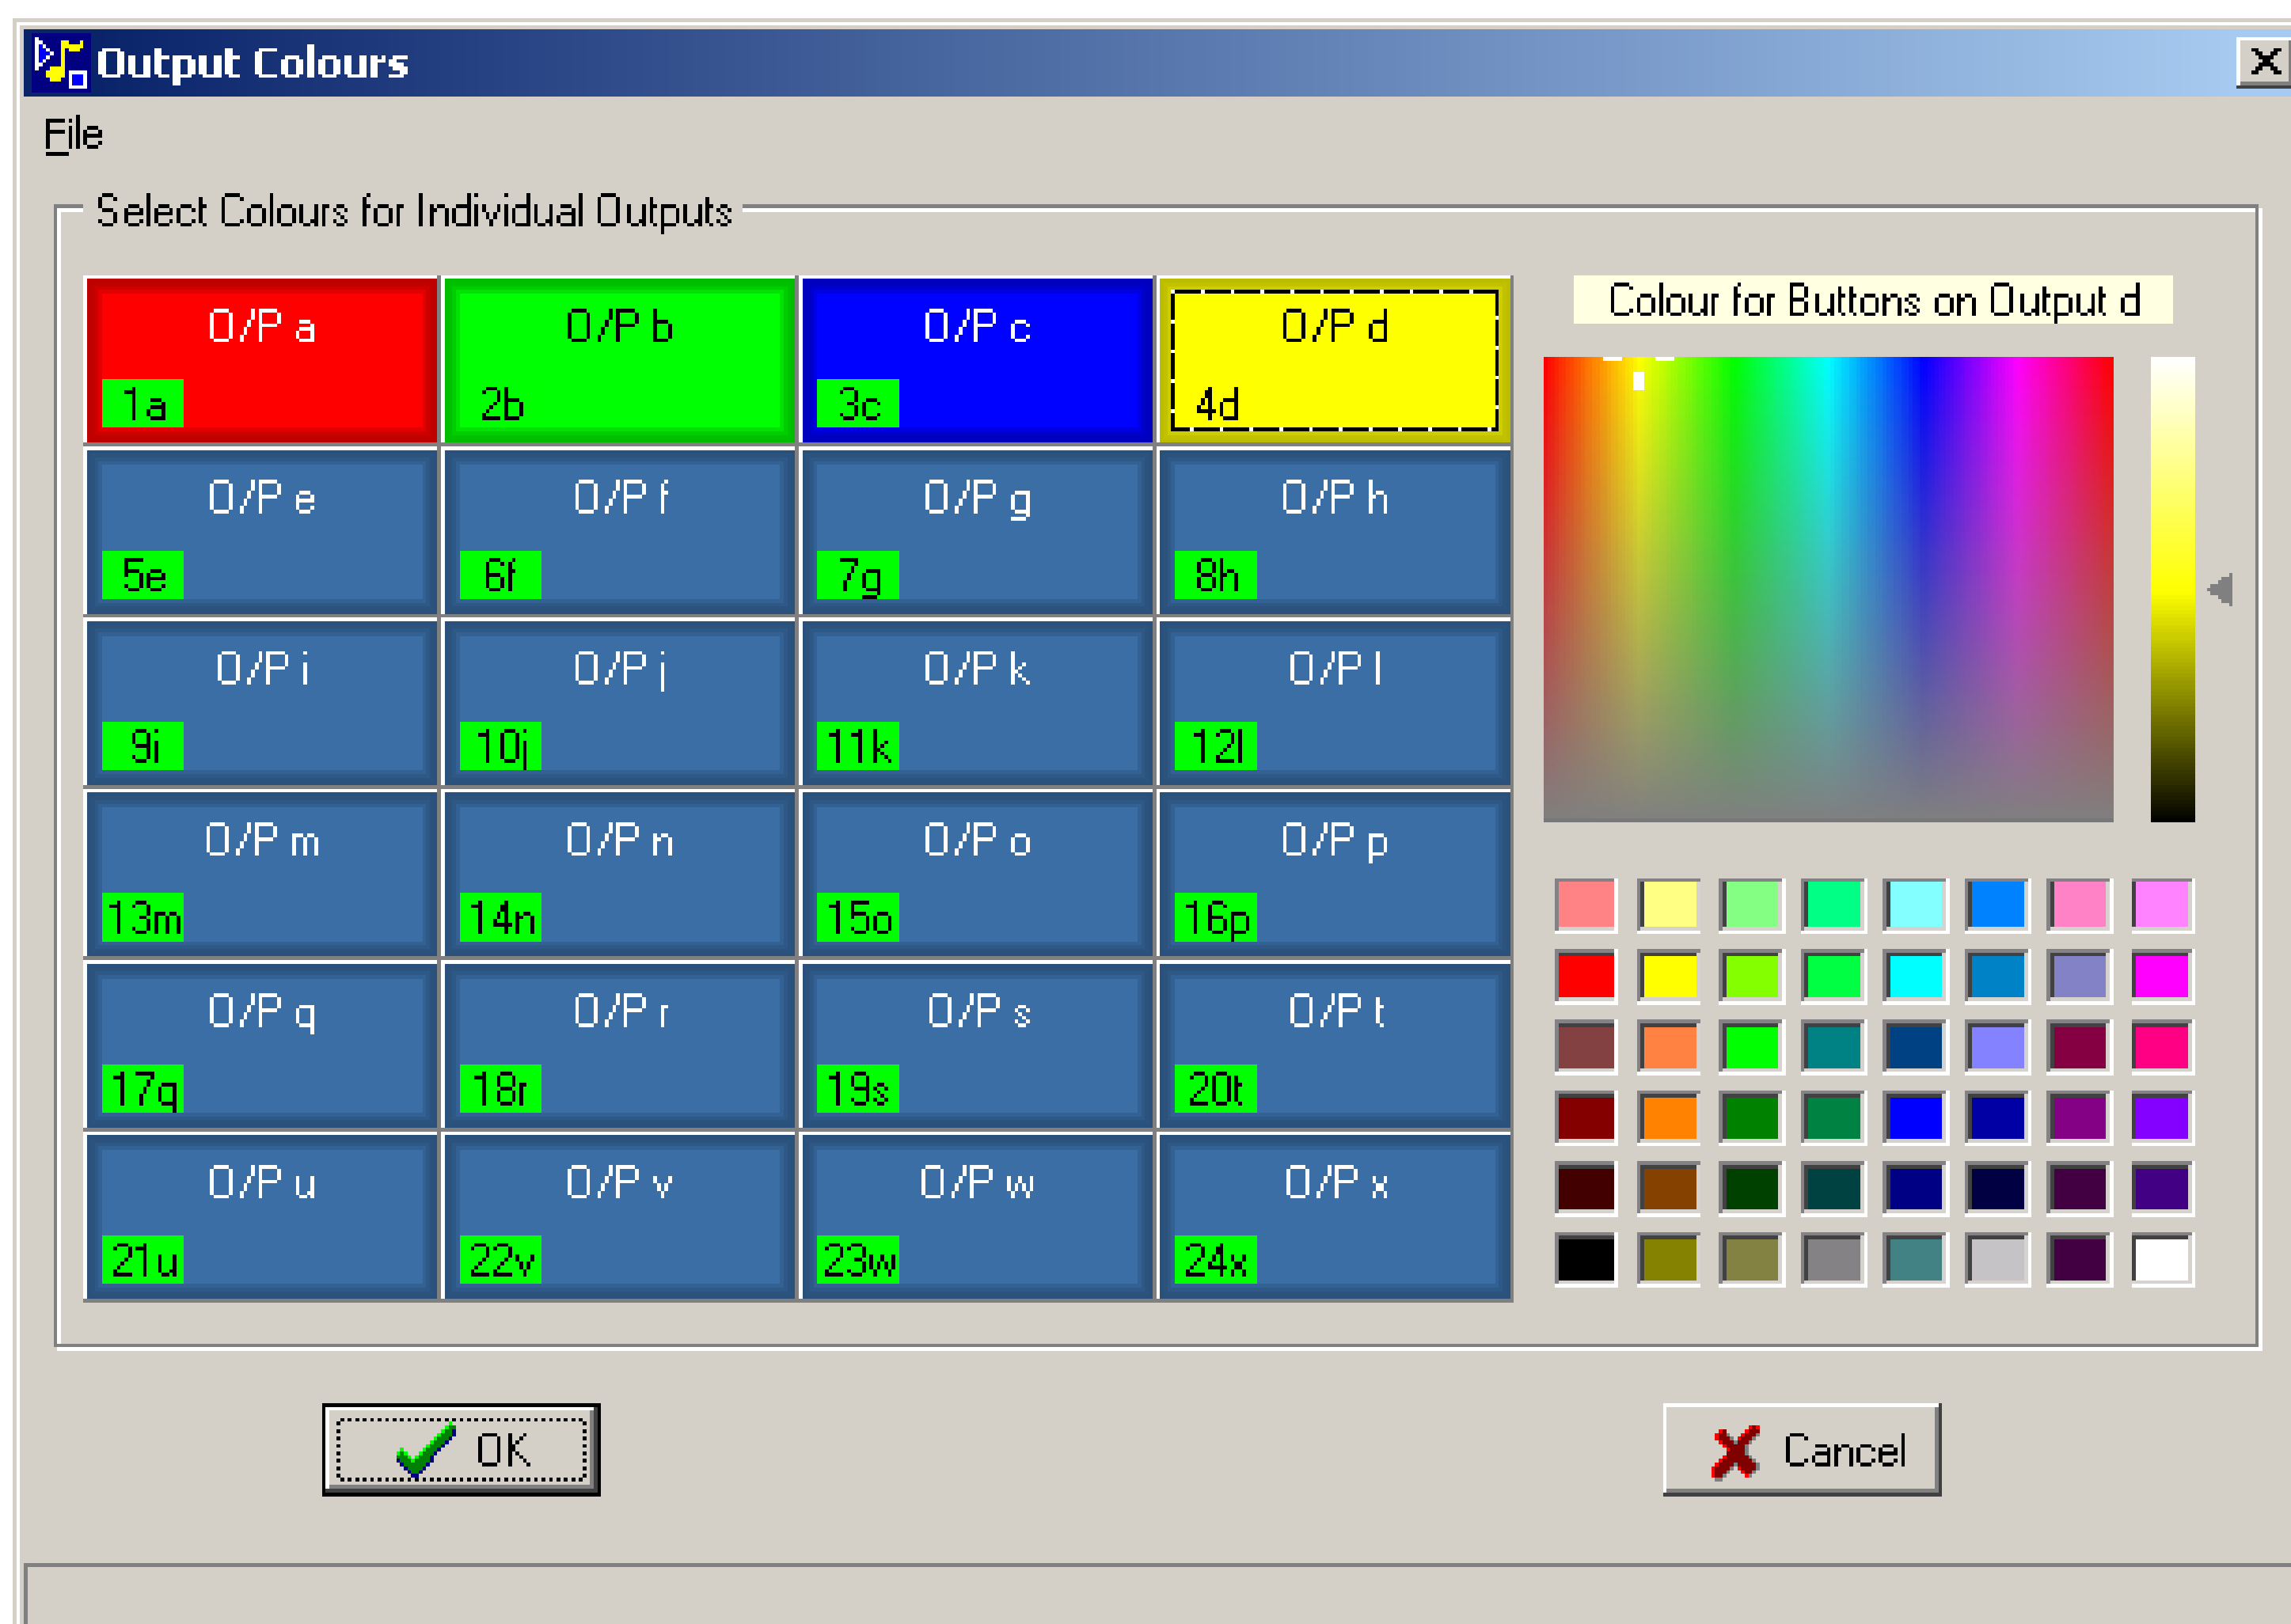

As well as colouring buttons on a per button basis it is also possible to colour the buttons on a per output basis, so all buttons on output 'a' would be one colour and all buttons on output 'b' another colour and so on.

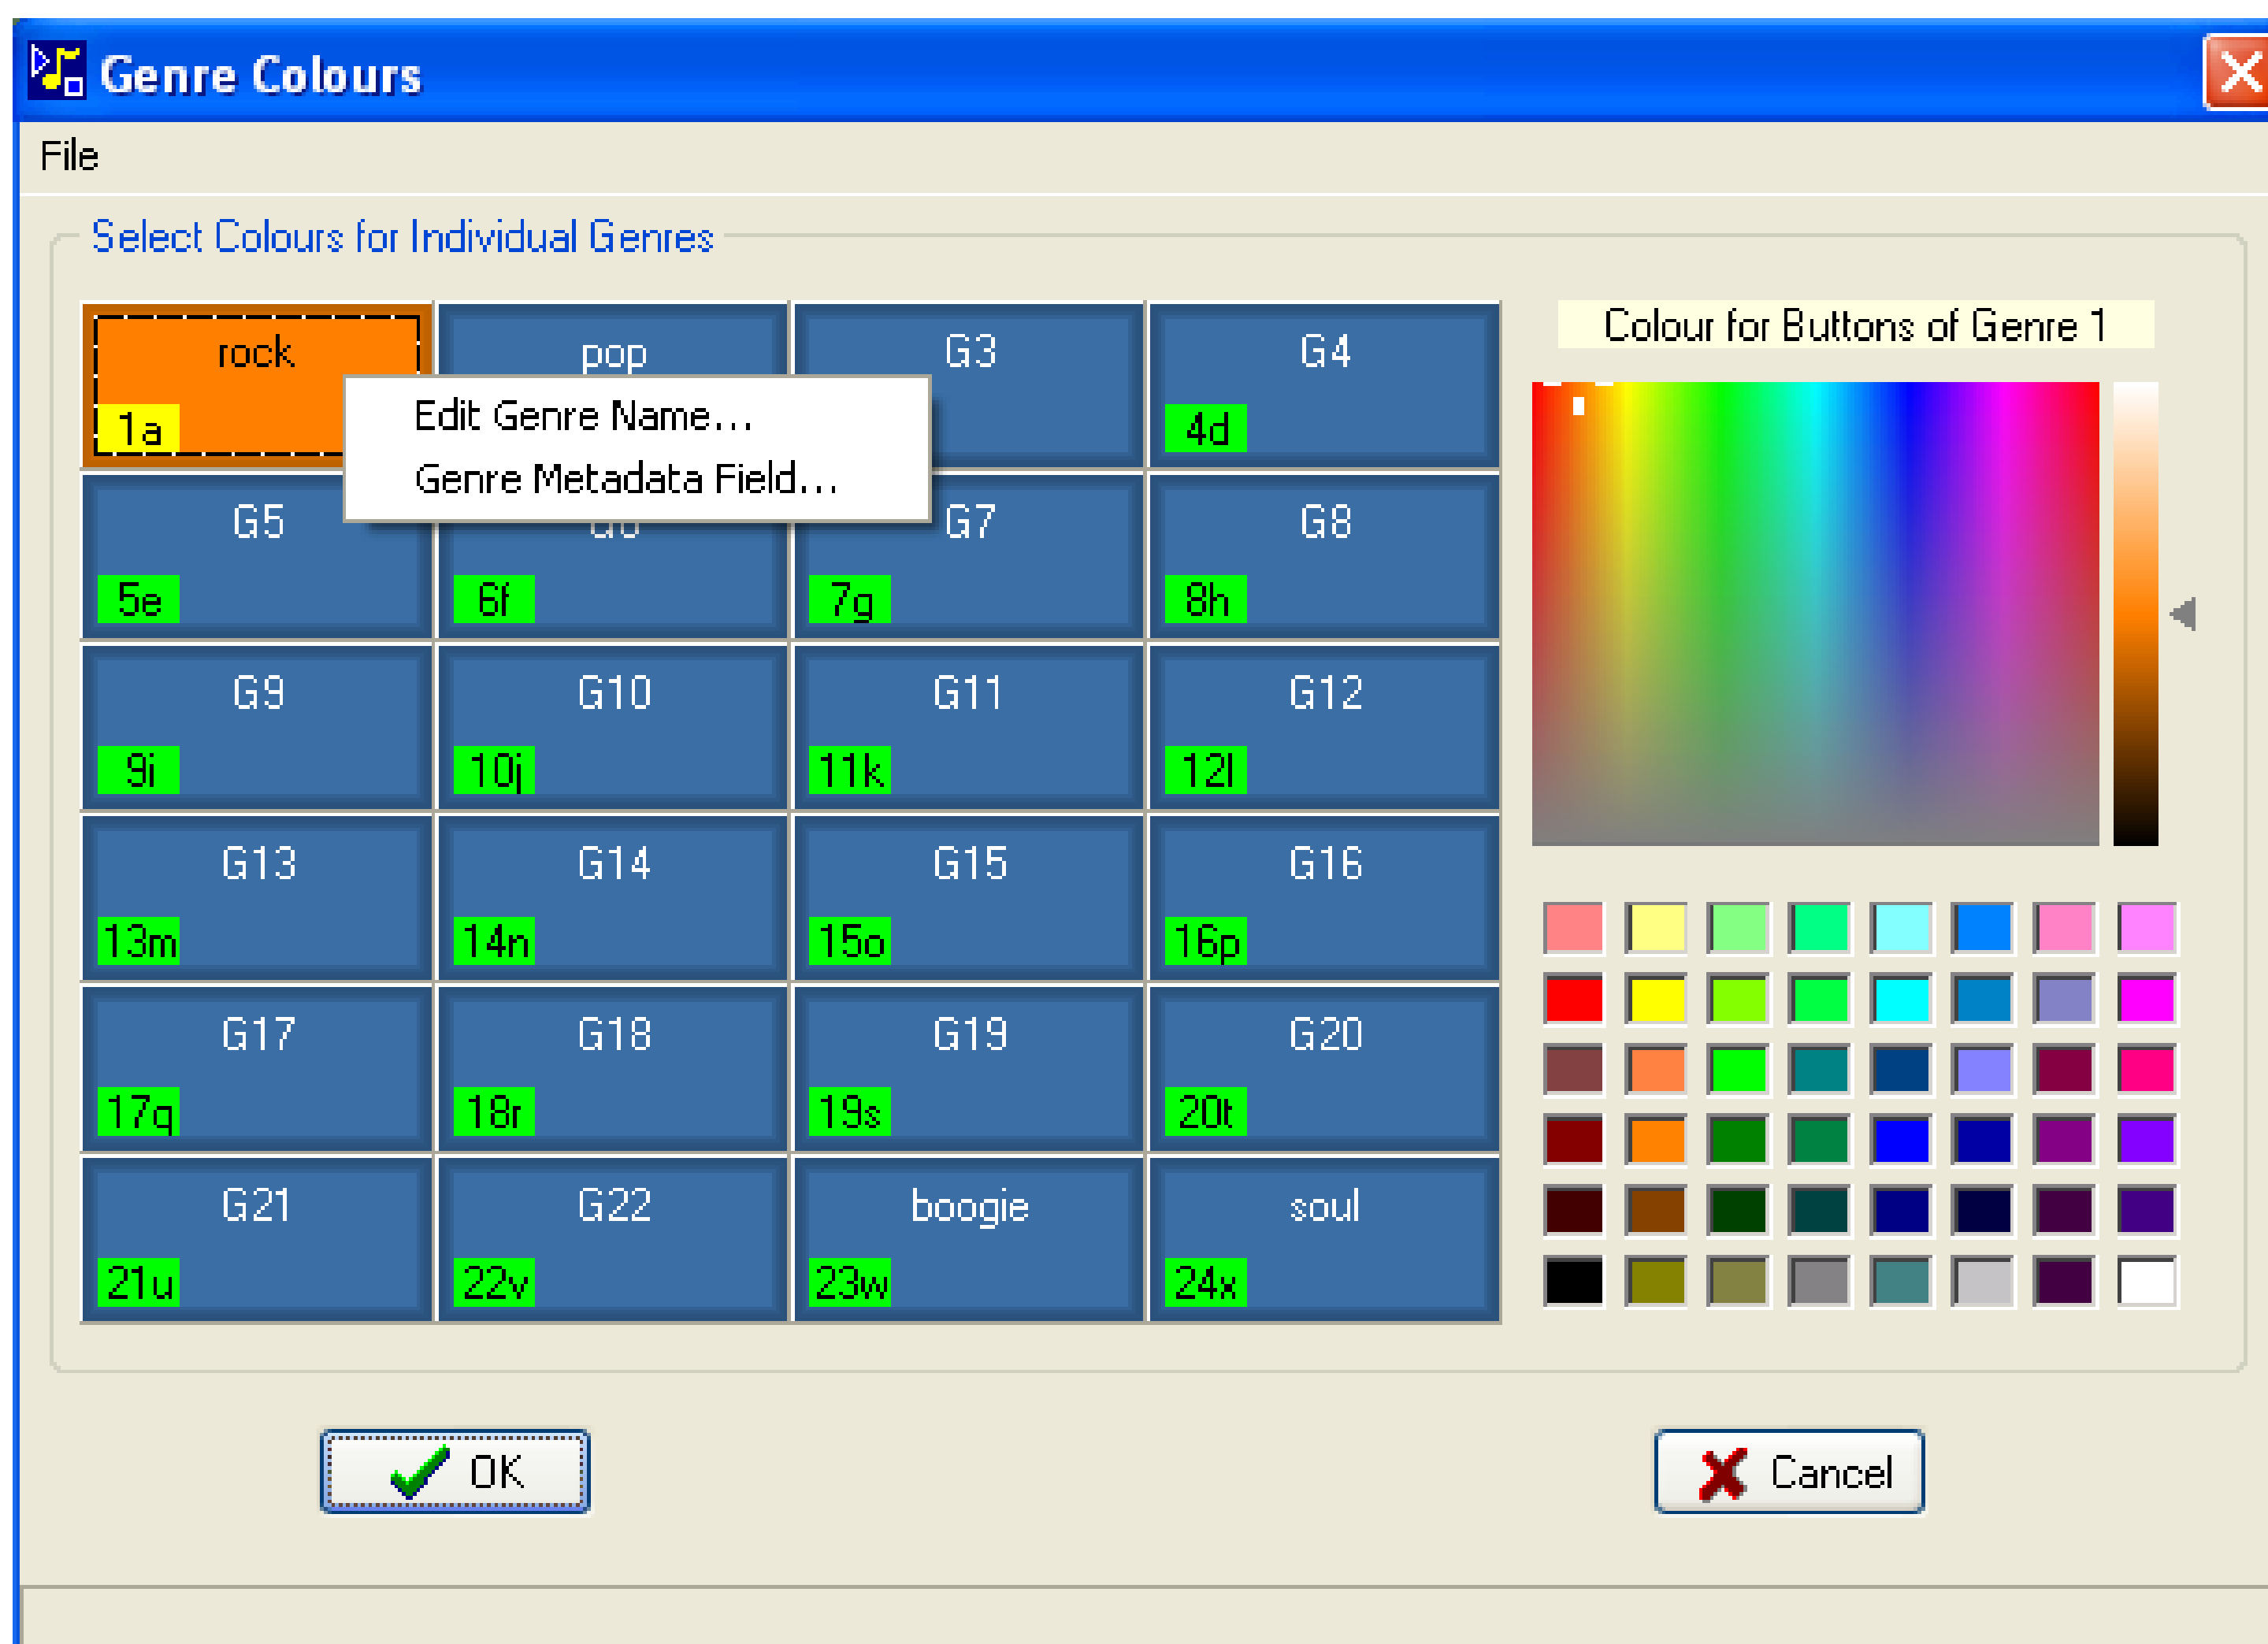

Selecting 'Use Output Colours' enables the 'Output Colours' option and when clicked opens up a further dialog window.

Select an output from the grid of buttons on the left and then paint a colour from the selectors on the right of the window.

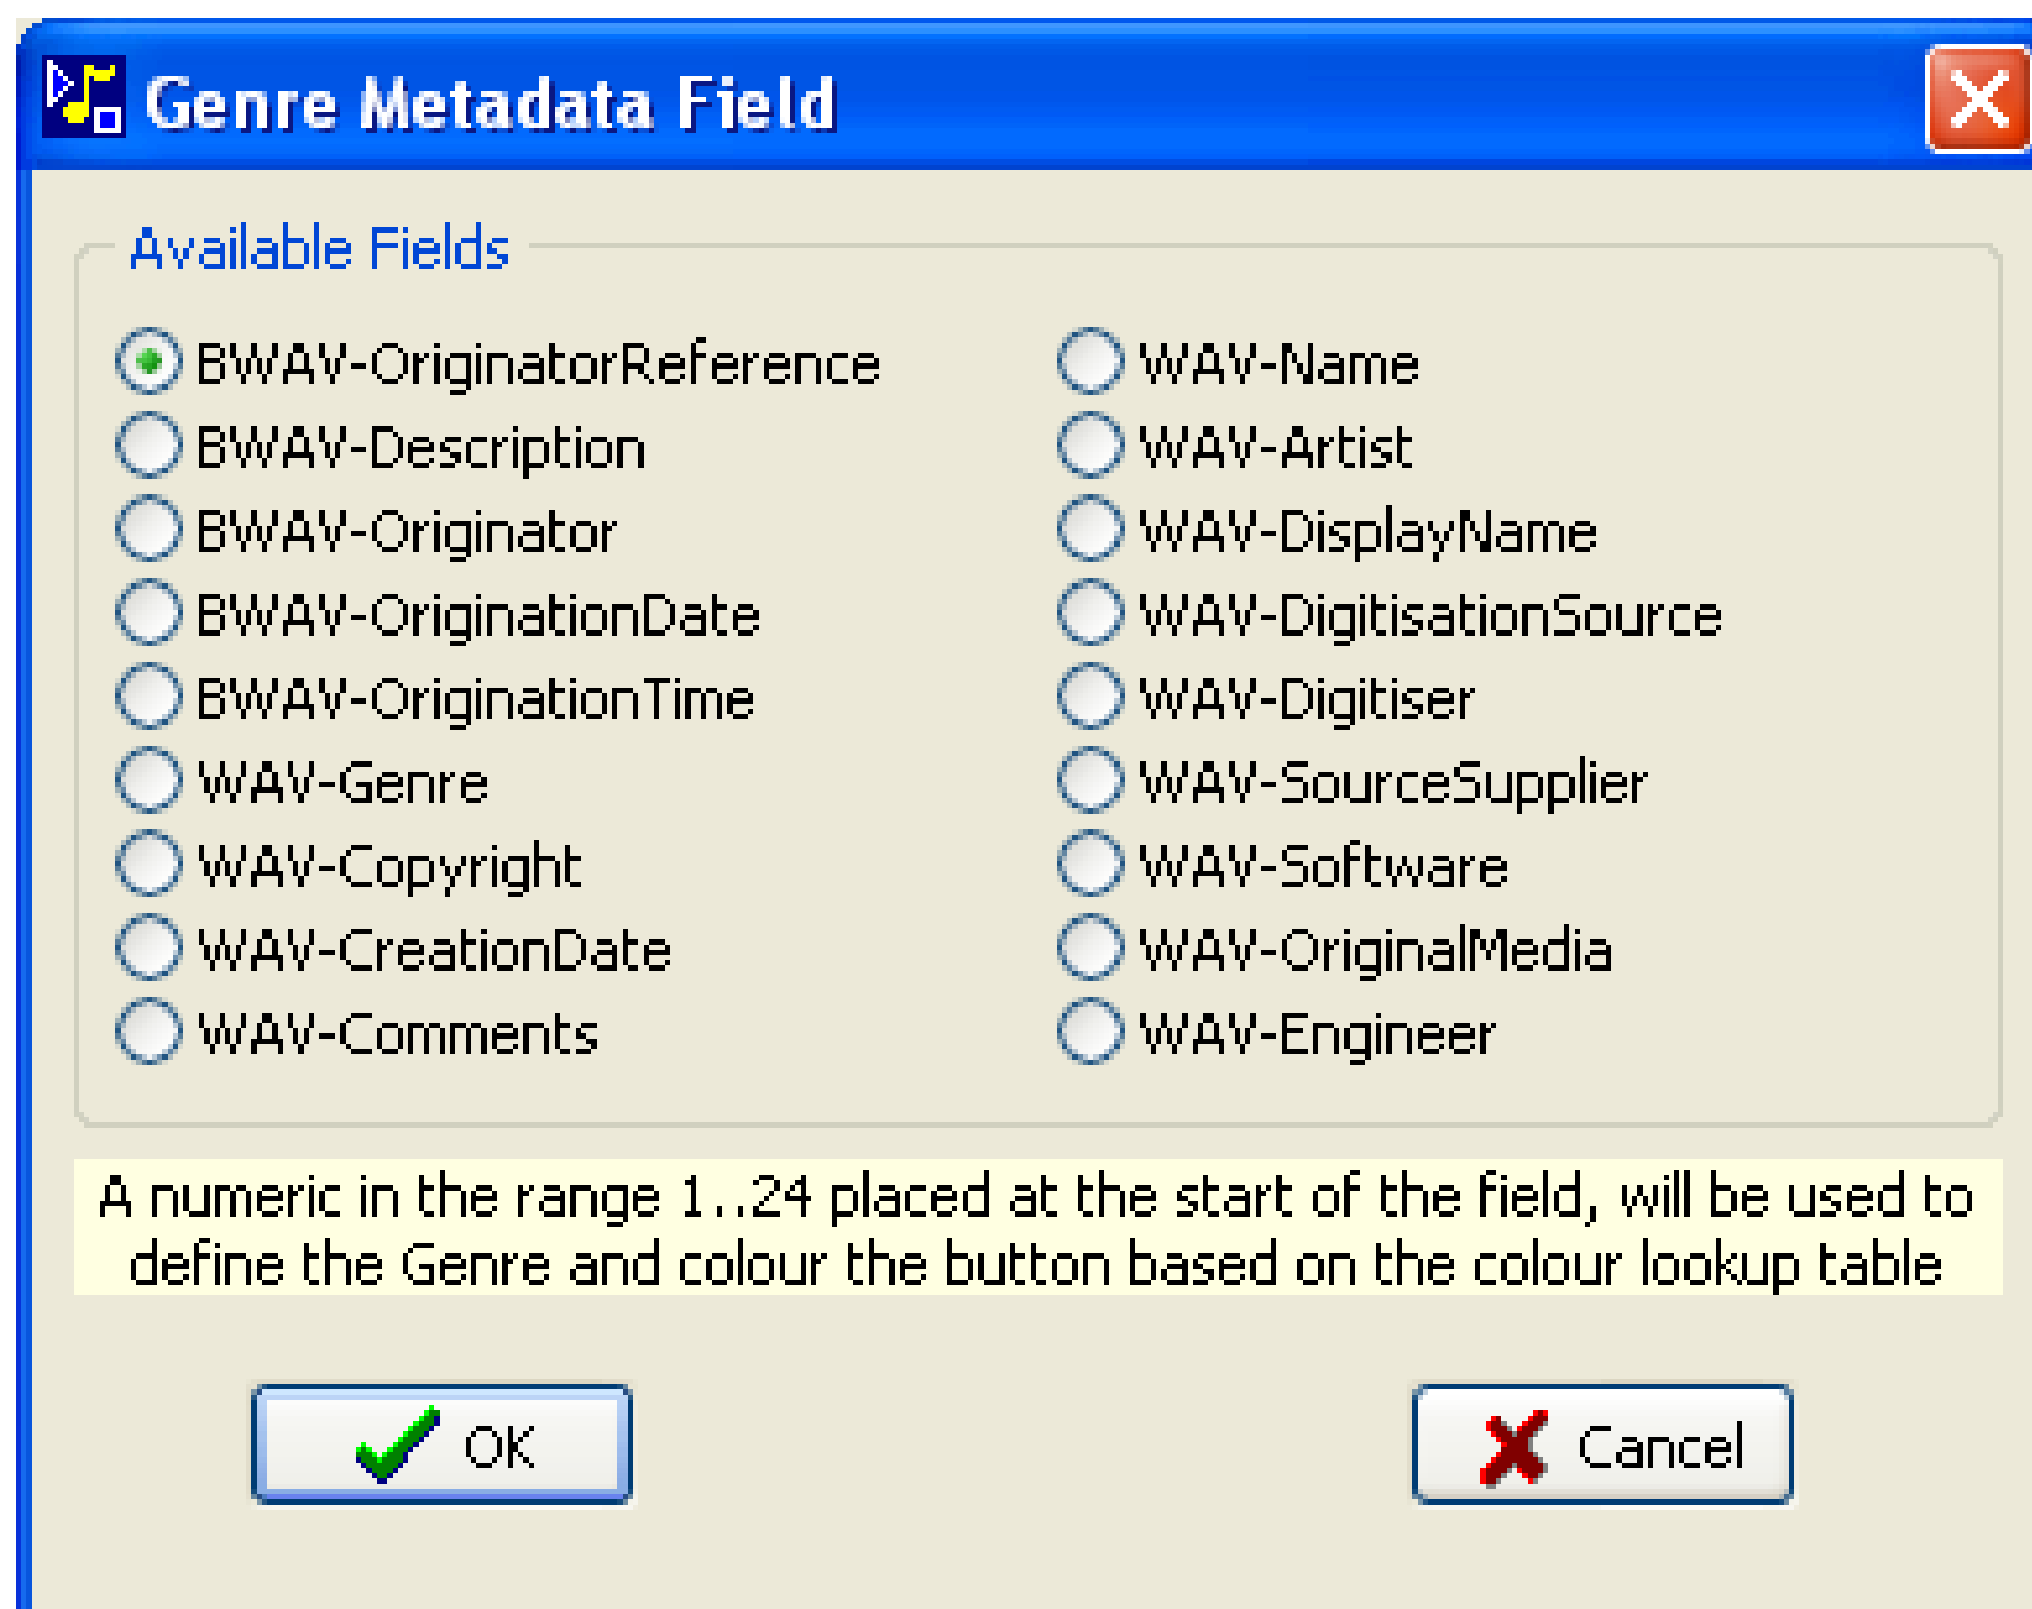

The option to colour buttons based on their genre is available by checking Use Coloured Genres, by default the genre is defined as a numeric 1..24 in the Originator Reference field of BWAV metadata.

Right-clicking any of the Genre buttons will allow the genre names to be edited.

The default metadata field for the Genre number is the Originator Reference field of BWAV metadata, the field can be changed via Genre Metadata Field in the popup menu

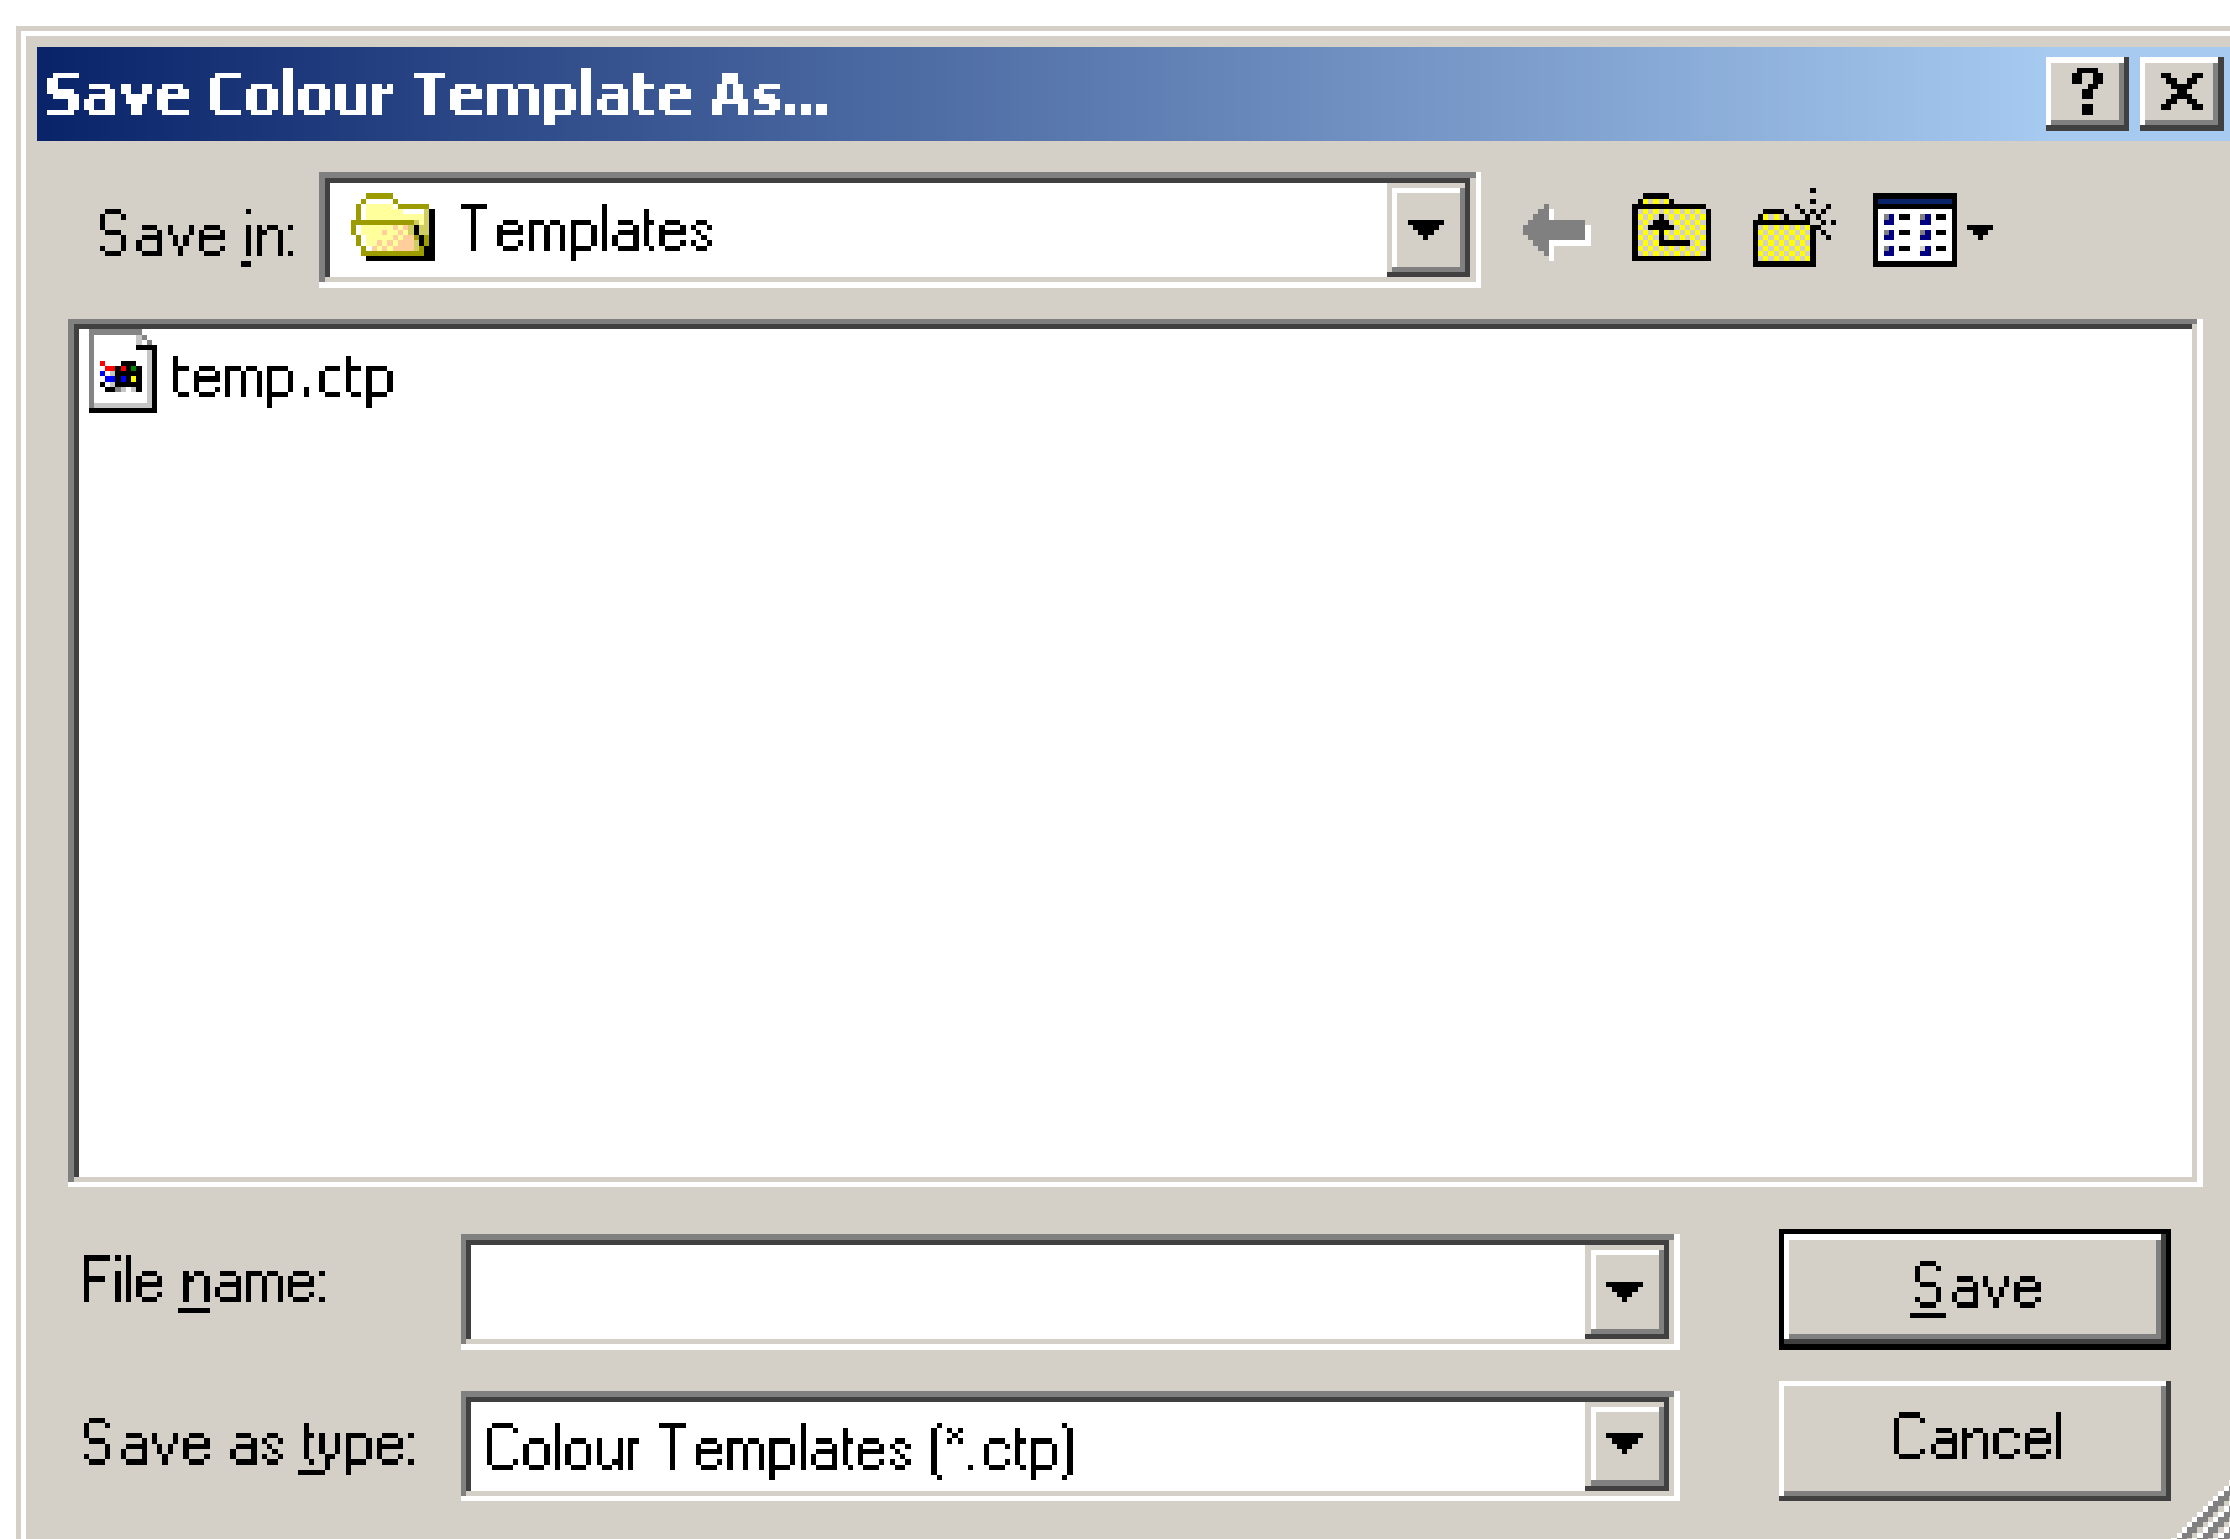

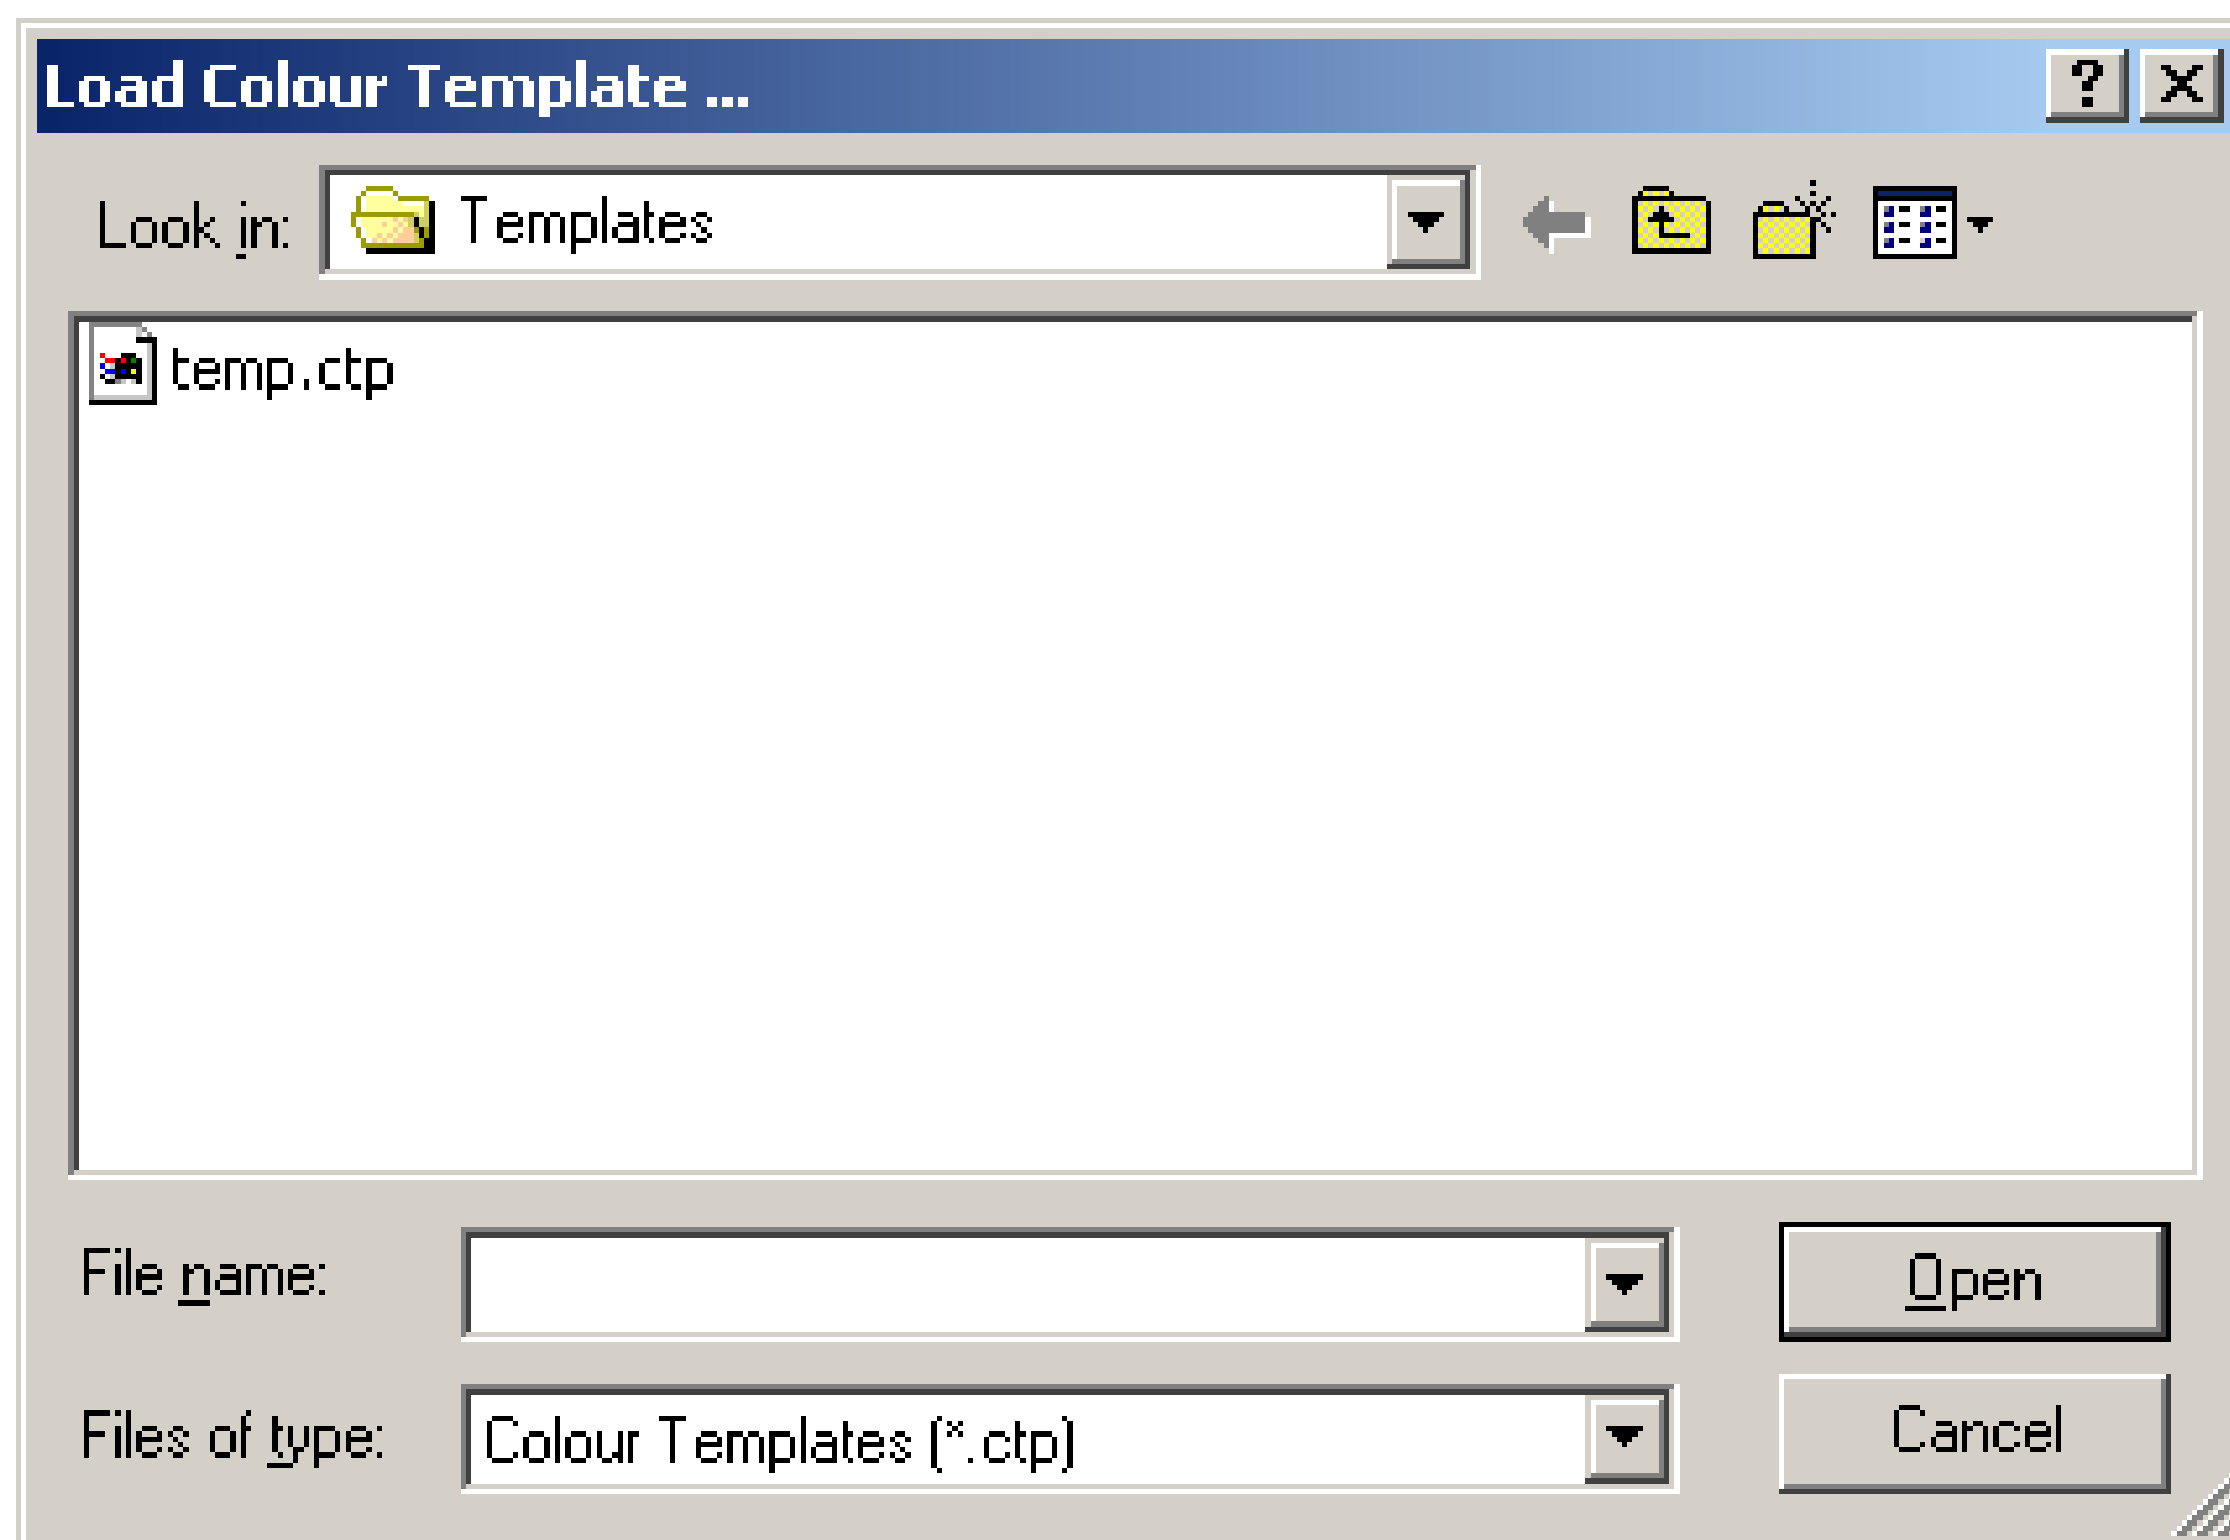

With Use Coloured Genres checked, the button colours are fixed and by the assigned genre/colour mapping, if the individual button colours need to be changed from the fixed genre colours then deselecting the Use Coloured Genres option and exiting the Properties dialog will show the dialog box below.

Selecting Yes will preset the button colours from the genre colours and then allow individual button colours to be changed. Selecting No will cause the buttons to revert to their original colours.

The set of output colours is saved in the session files along with the 'Use Coloured Outputs/Genres' option.

The File menu allows the colour template to be saved and recalled from disc

Also the colour template can be reset to the default colours

Loop Line Thickness - changes the thickness of the ellipse drawn on the button to indicate looped tracks, the value range is 1..4 with the default value being 1

HotKeys

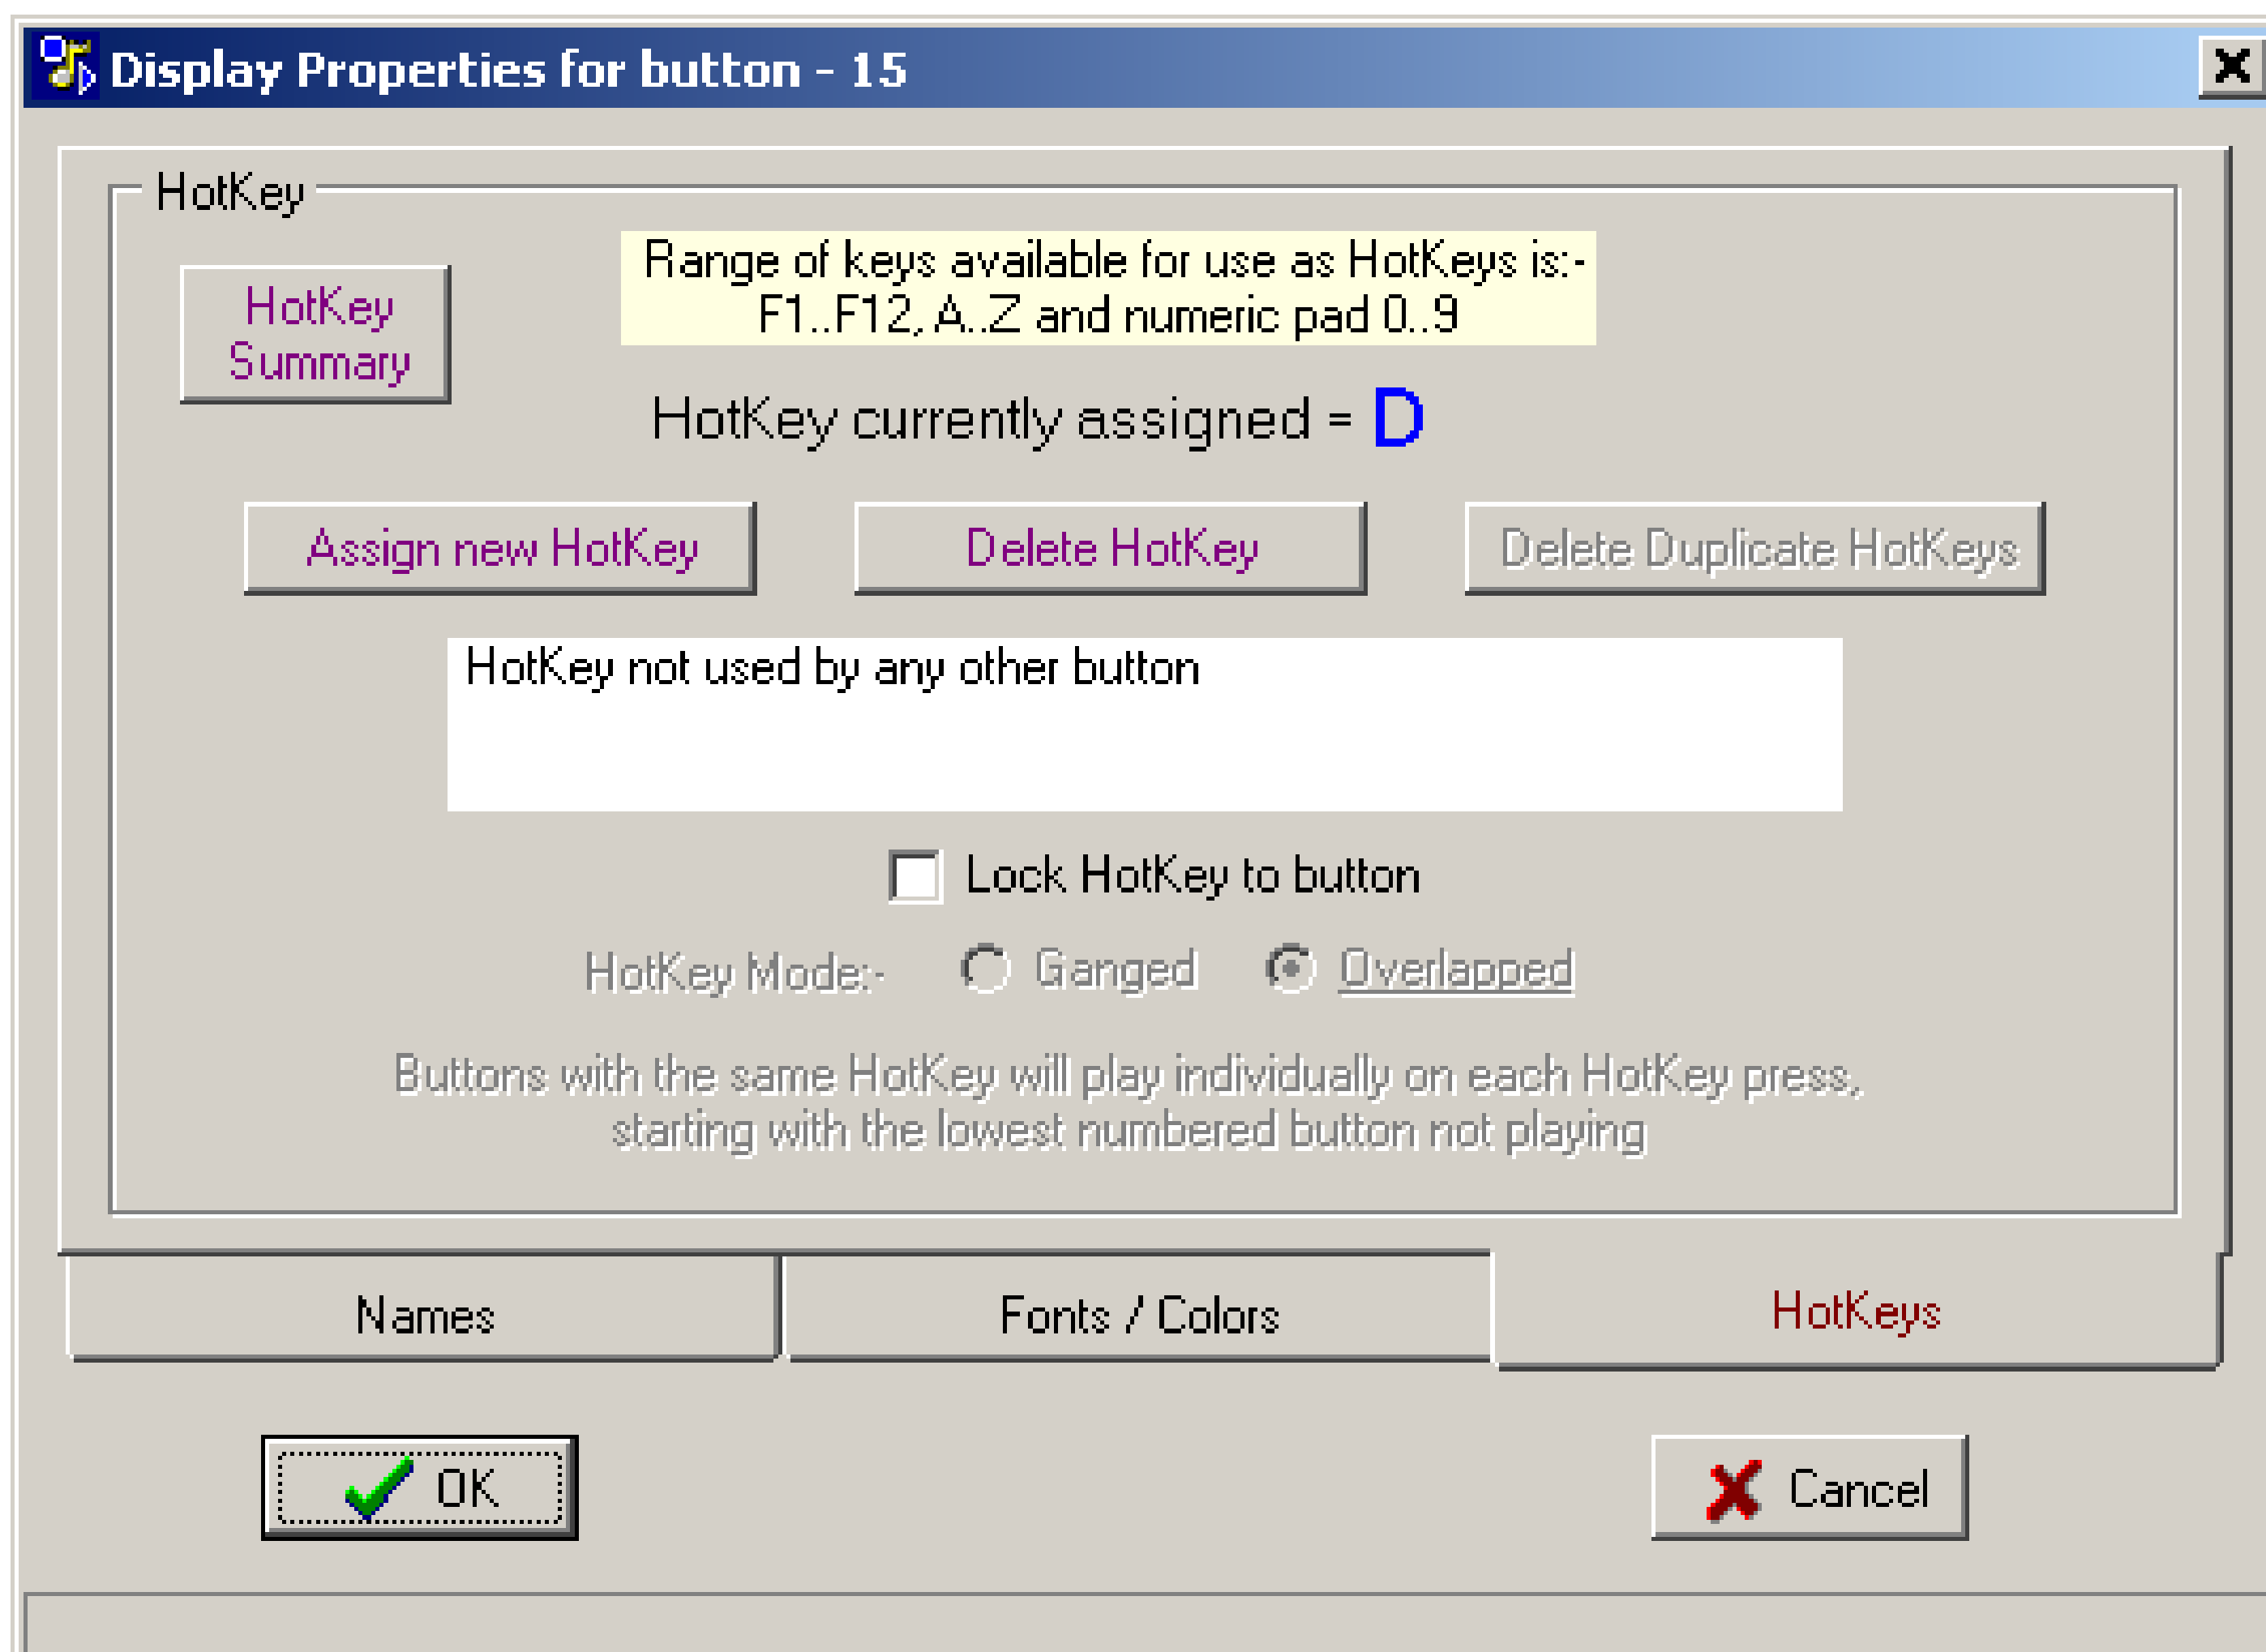

HotKeys can be freely assigned to buttons, the HotKeys available are restricted to F1..F12 and A..Z, along with the numeric pad numerals (assuming keyboard Num Lock is active). The HotKeys are not case sensitive and display in uppercase.

Click the Assign new HotKey button which brings up a further dialog box.

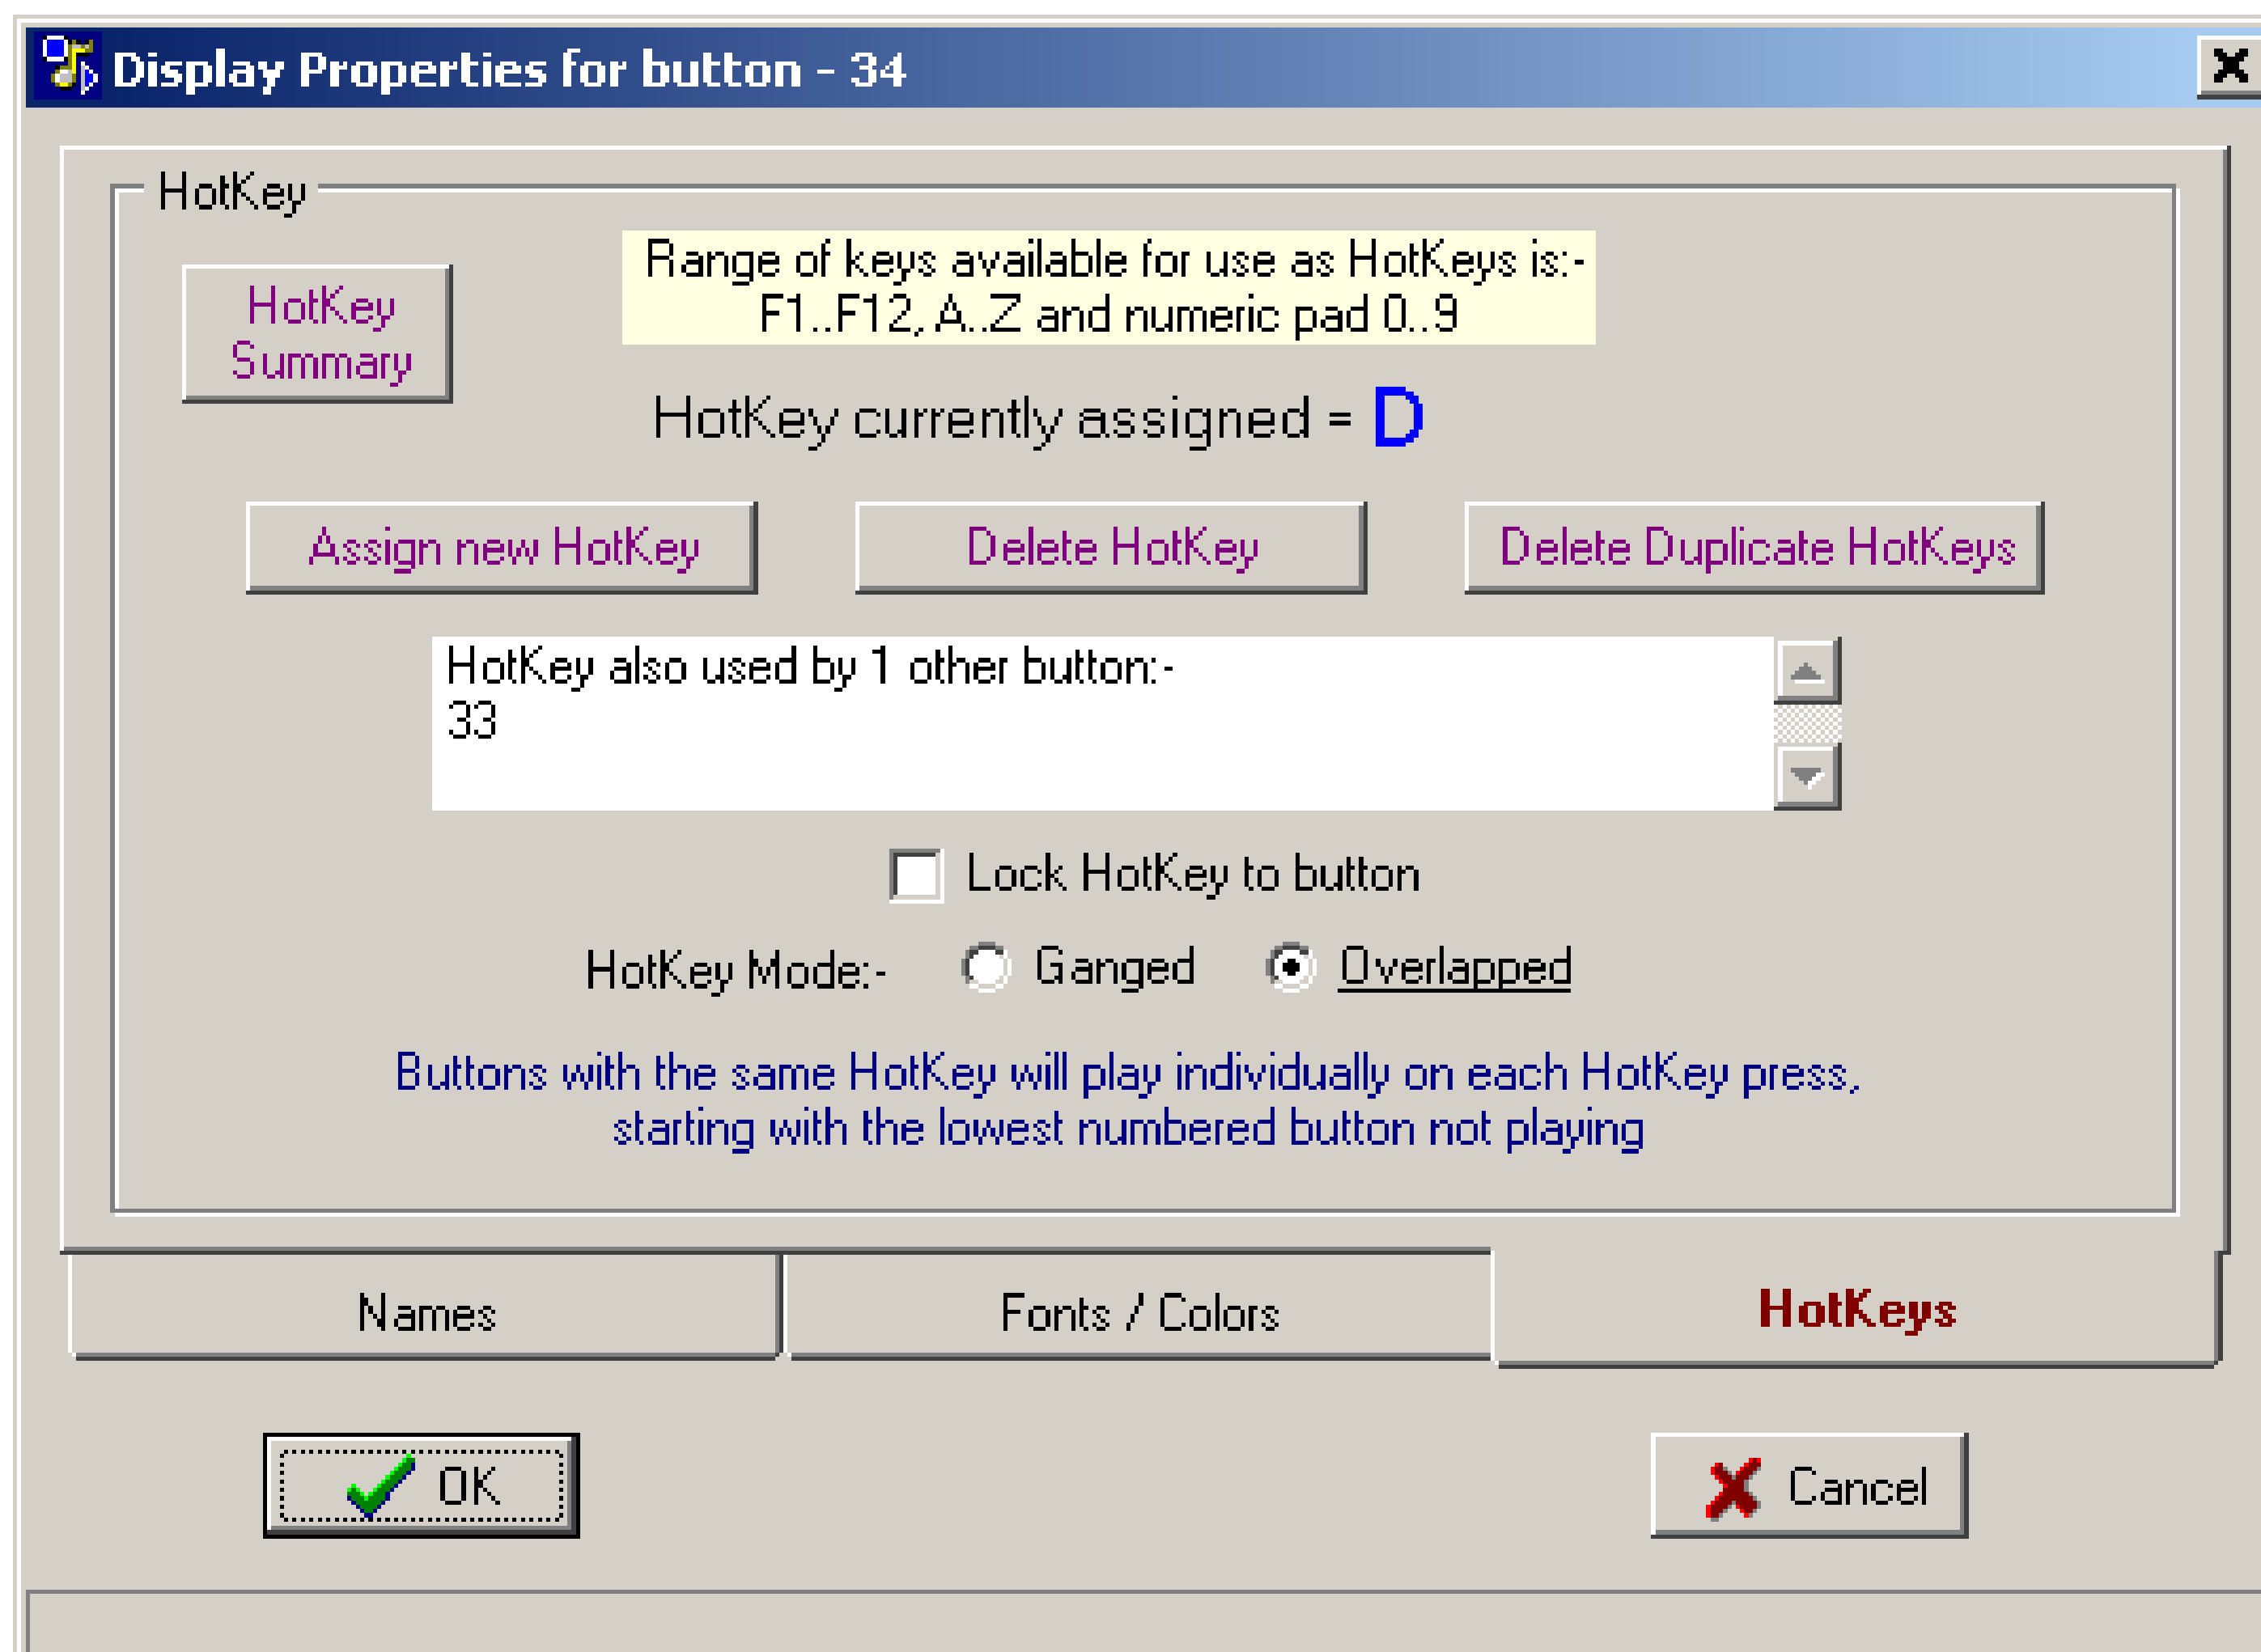

Note: the keyboard shortcut of Ctrl+right click will also bring up the HotKey selector from the main window, it will be positioned over the appropriate button and accept valid HotKeys or the Del (delete) key as an input. When assigning HotKeys with this method duplicate HotKeys are automatically deleted unless they are locked to a button.

Press the key required as the HotKey, if 'd' was hit the display will show that as the selected key (display is in uppercase)

HotKey selection can be deleted using the Delete HotKey button

If other buttons also have the same HotKey then they will be listed, below button 33 is shown to also to be assigned the "D" HotKey

Any other buttons that have the same HotKey can have their non-locked HotKeys assignment deleted by clicking the "Delete Duplicate HotKey" button as shown below

If Hotkey Paged mode is selected then the list of buttons using the same hotkey will be modified to show button numbers on other pages in brackets eg 34,35,[12],[124], in

addition a 'L' suffix will be added to the number if it has the HotKey locked to the button.

The HotKey can be locked to the button so that if the button is loaded with a new track - directly or via pasting - the Hotkey selection remains.

When more than one button is assigned to the same hotkey as in the example above there are two modes of behaviour - Ganged and Overlapped, see Advanced Operationfor further details

Click the appropriate button to toggle between Ganged and Overlapped modes

In order to select a hotkey it may be useful to see the hotkey allocation across all buttons, the HotKey Summary button will show the hotkeys sorted in Alphabetical, Qwerty or Numeric sequence.

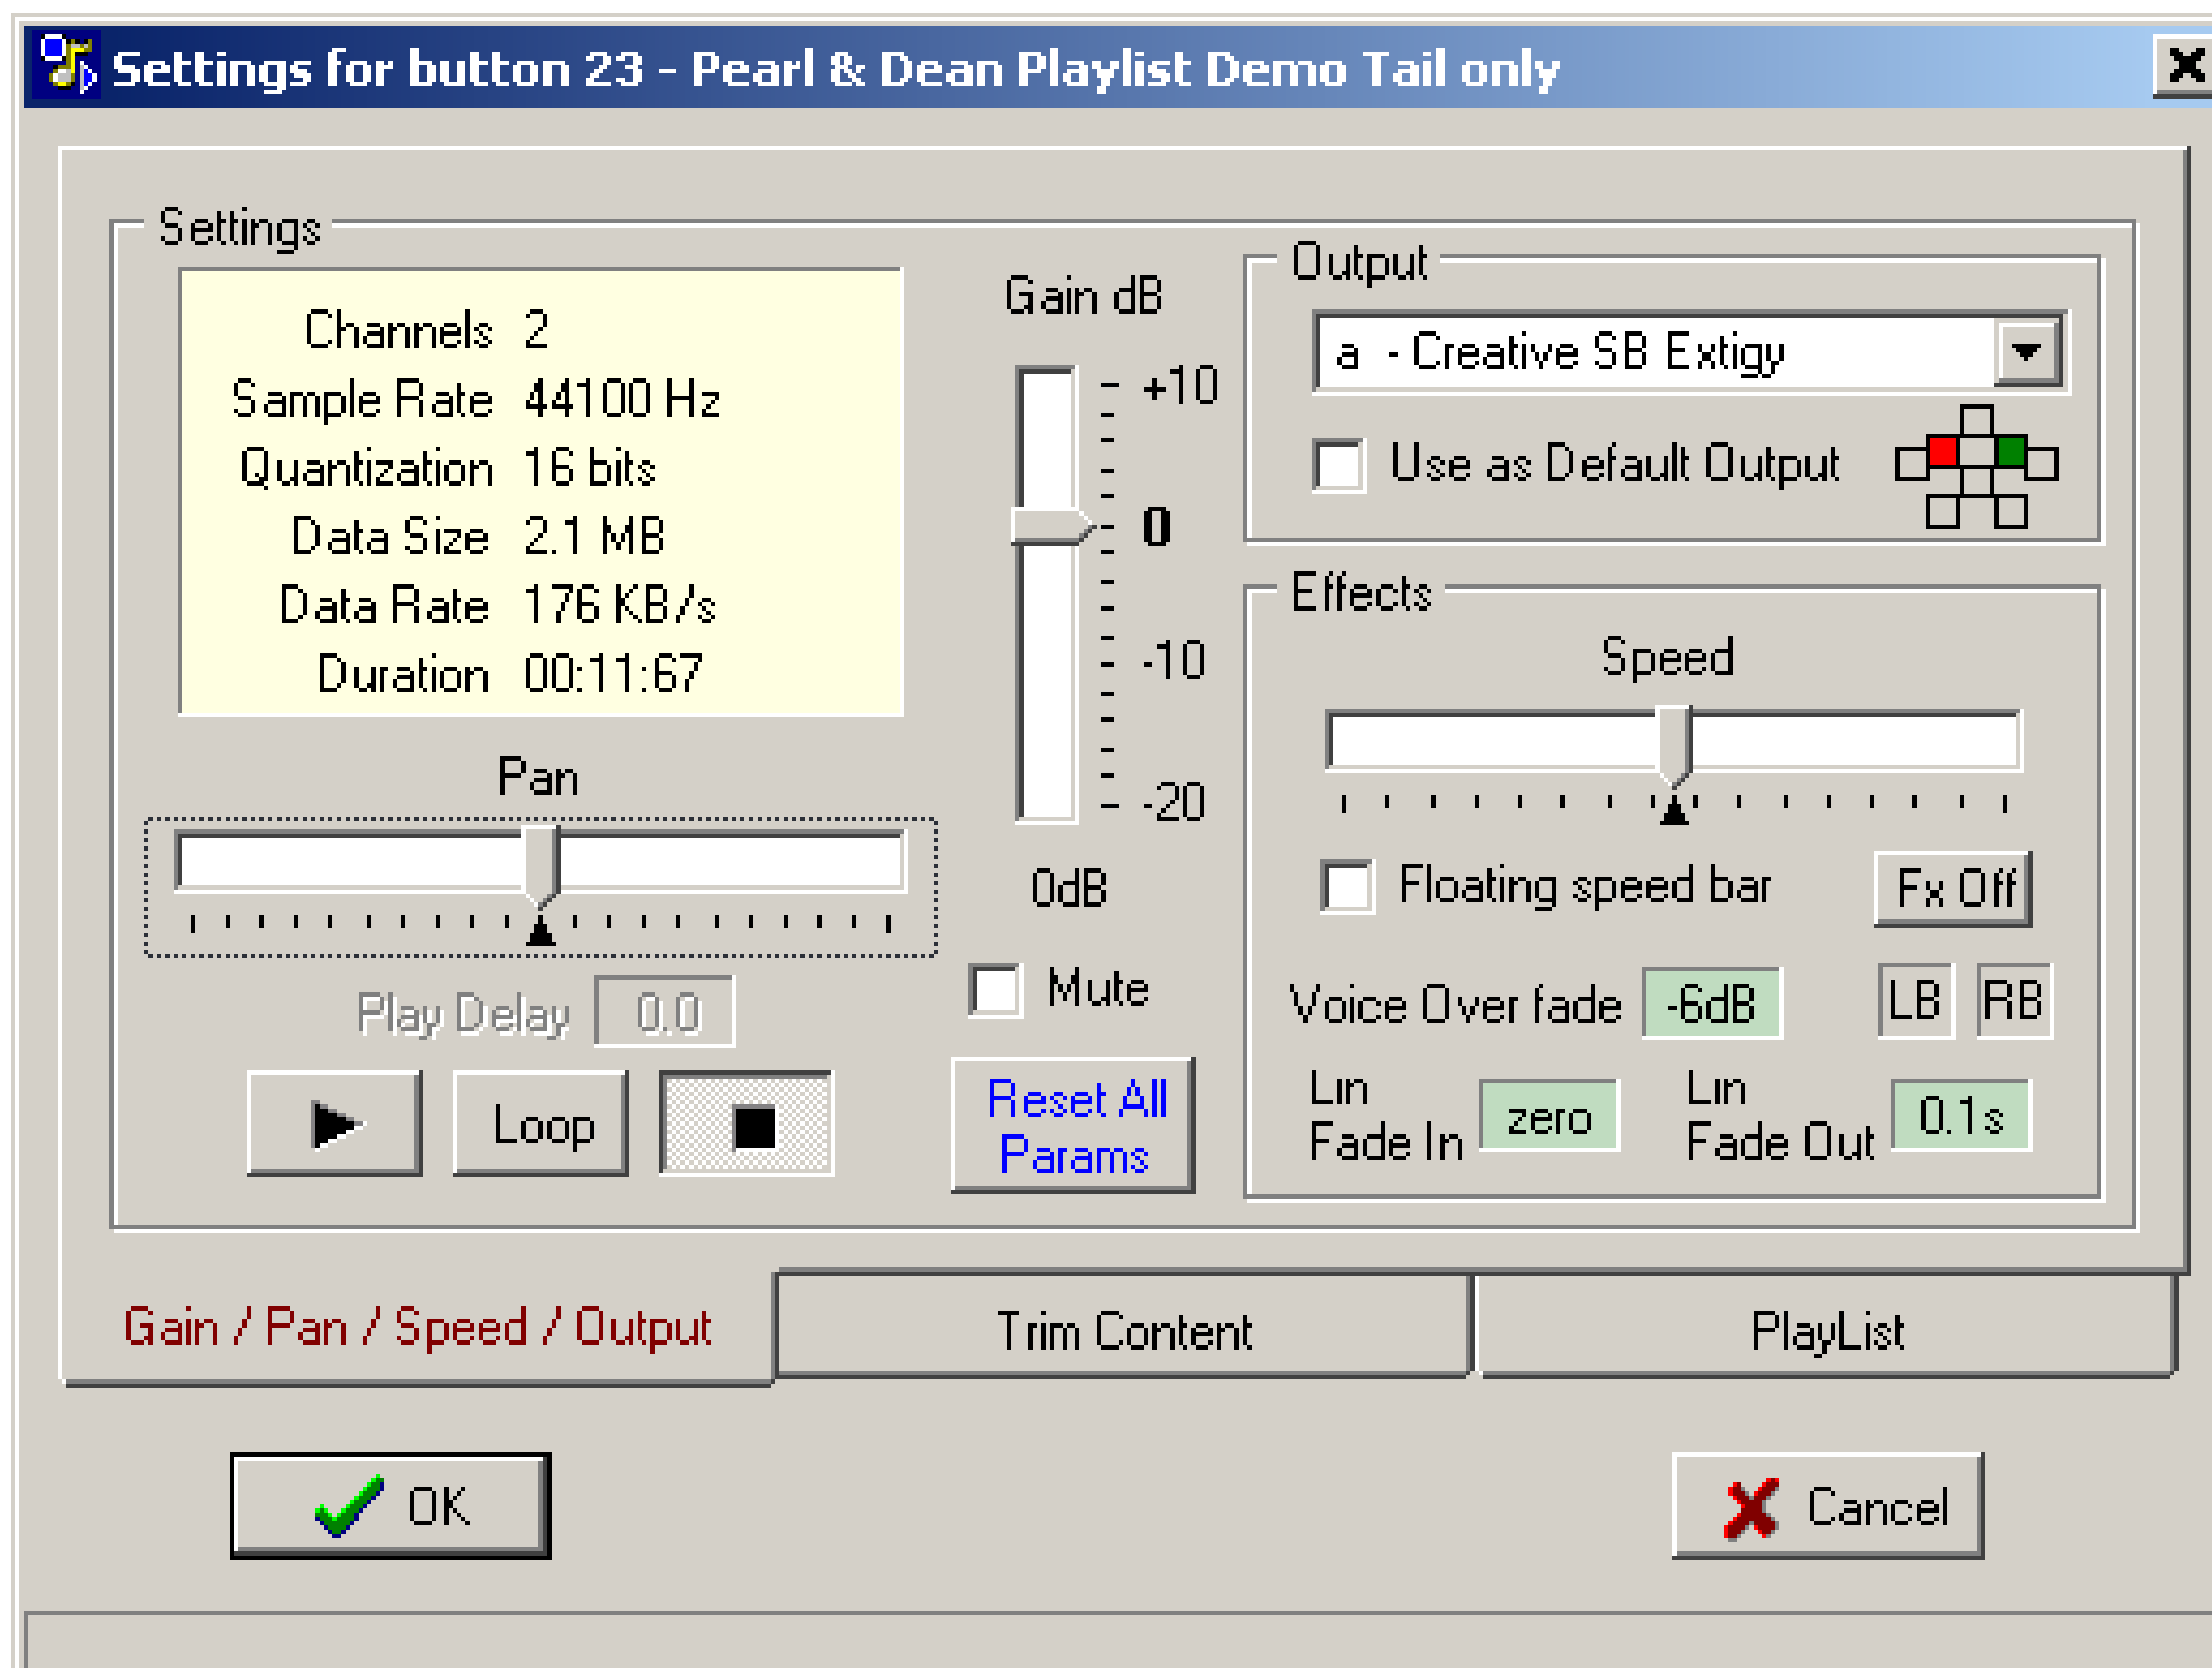

If the HotKeys are currently disabled then the message below will be shown at the bottom of the dialog box.

Misc

All HotKeys can be deleted from the Globalmain menu item

HotKeys can be enabled/disabled globally via the Optionsmain menu item

Audio SetUp

This section provides a way of controlling the way the track is played out and is split into three tabbed pages - Gain, Trim and PlayList

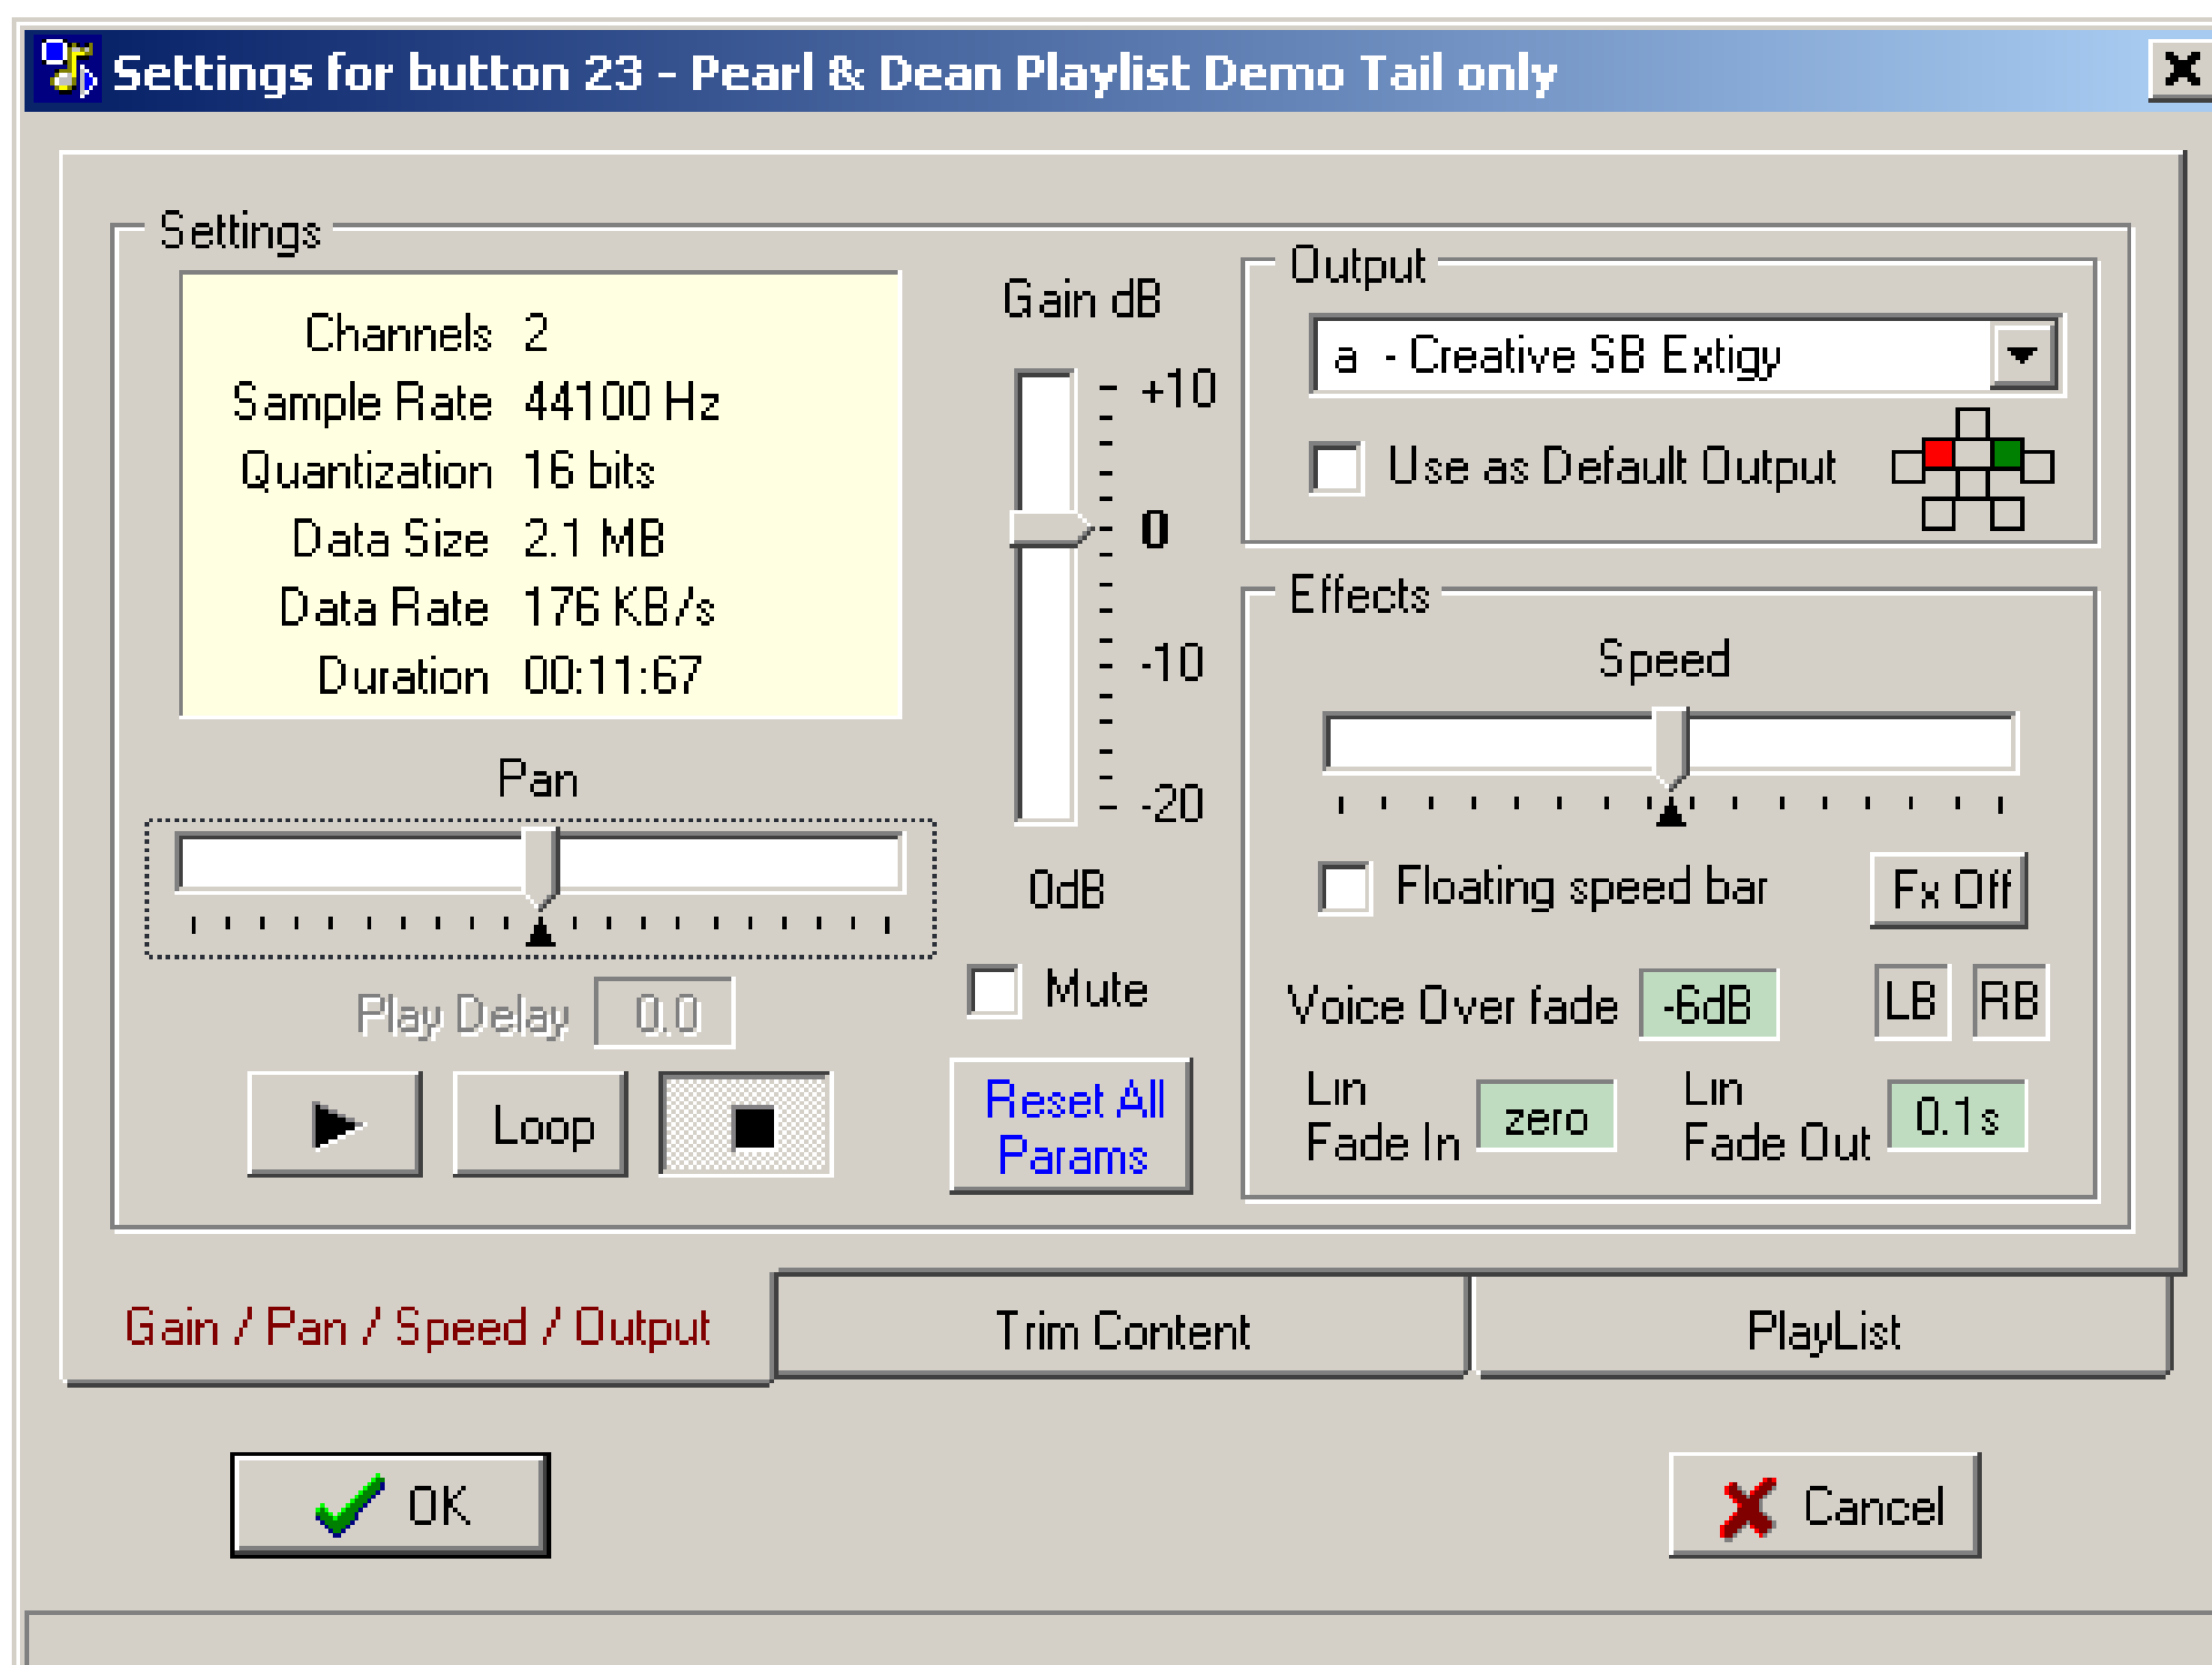

[Gain/Pan/Speed/Output](#)

[Trim](#)

[PlayList](#)

Audio SetUp - Gain

Gain/Pan/Speed/Output

The first tab shows the details of the track in the information panel and which audio output port will be used for payout

Checking the Use as Default Output Device checkbox will set all subsequently loaded buttons to play out from this output, the default output is the Windows Primary Sound Driver. See below for information about setting the Preferred Driver

The set of coloured boxes to the right of the checkbox indicates/controls the positioning of the audio channels in a multichannel environment.

The basic parameters of Pan, Gain and Speed (25%..400%) can be set along with the fade in and out times. Clicking on the parameter zero markers or double-clicking the parameter title will return the value to default setting.

MetaData can be embedded within audio files, SpotOn can decode BWAV and iXML data, if a track contains either of these formats of metadata it will be shown along side the number of channels in the summary panel.

Channels 1 (B'WF,XML)
Sample Rate 48000 Hz
Quantization 16 bits
Data Size 210 KB
Data Rate 96.0 KB/s
Duration 00:02:14

Output

The required output is selected from a drop down list

Here the entries for outputs 'b' and 'c' are unavailable as they are not real audio output devices.

Selecting output 'd' will change the display to that shown below

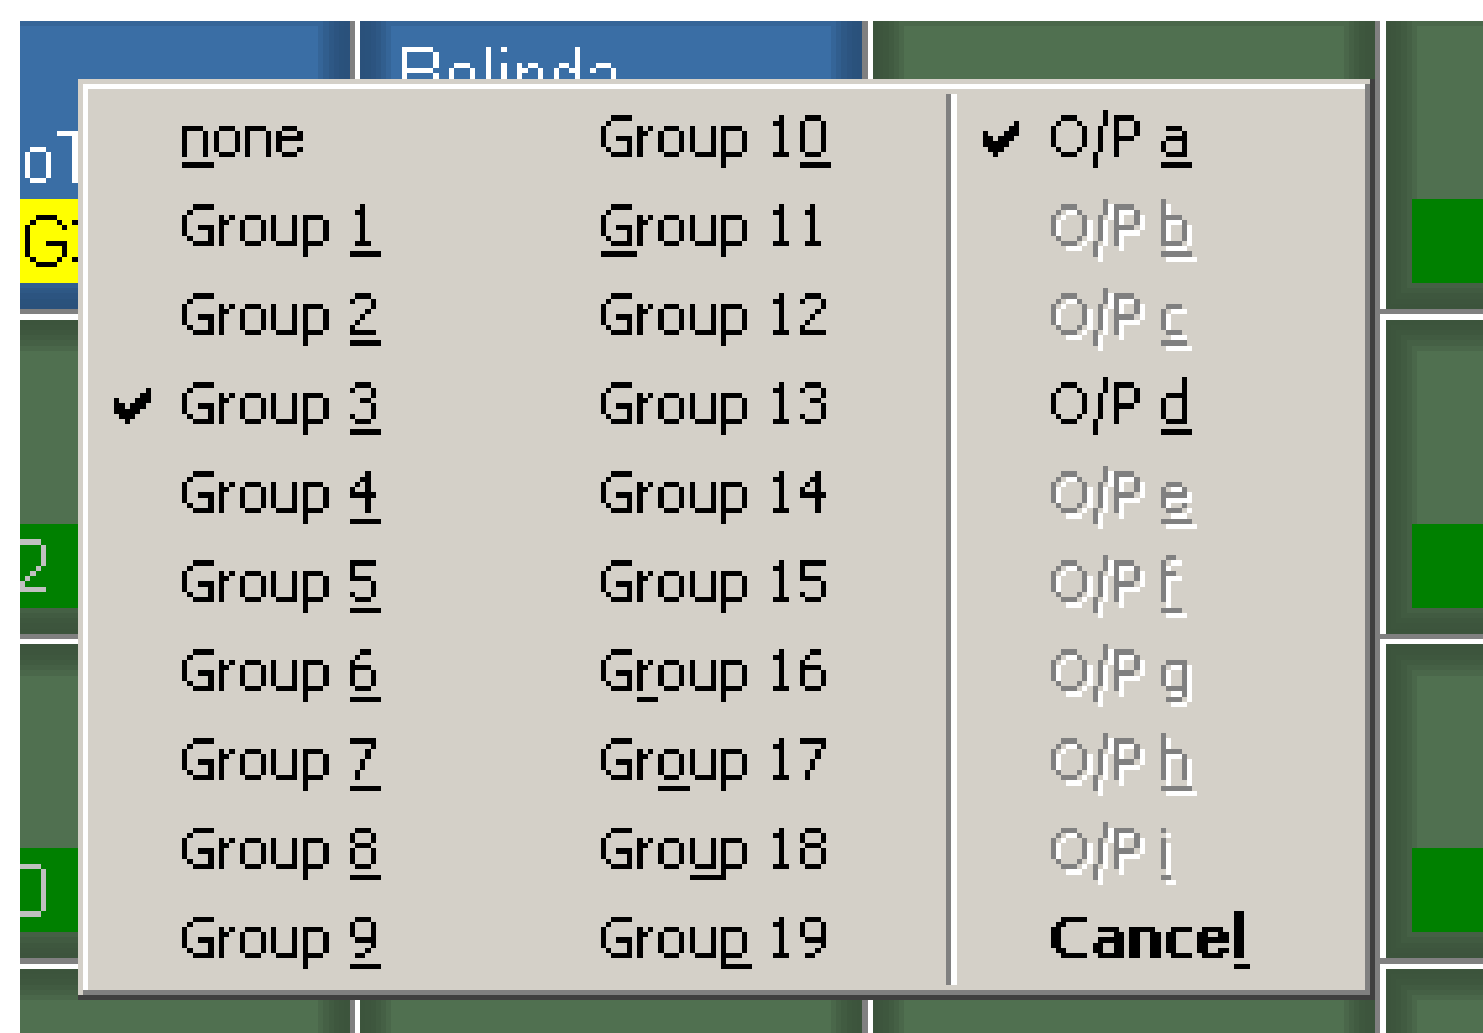

If any output devices have been masked out they will appear in red text, this would be the case when there are spare real outputs that are not to be used, for instance an on-board sound card is most likely to be masked.

Masked outputs cannot be selected, the masking is set up via the Output Device Assign dialog.

If the track is playing when the output selection is changed the prompt box shown below will appear

An alternative way to assign the output device is to shift+ctrl right-click a button, this will

display the Group/Output selection popup menu

The outputs can be assigned by checking the appropriate device on the right hand side of the menu.

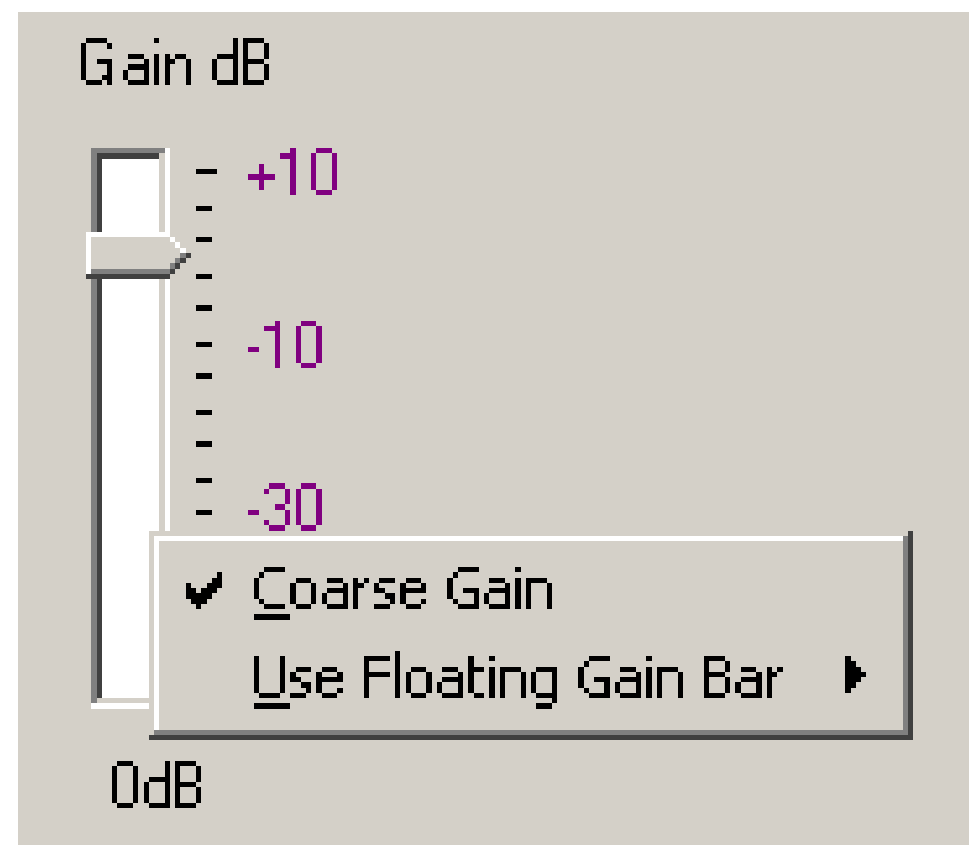

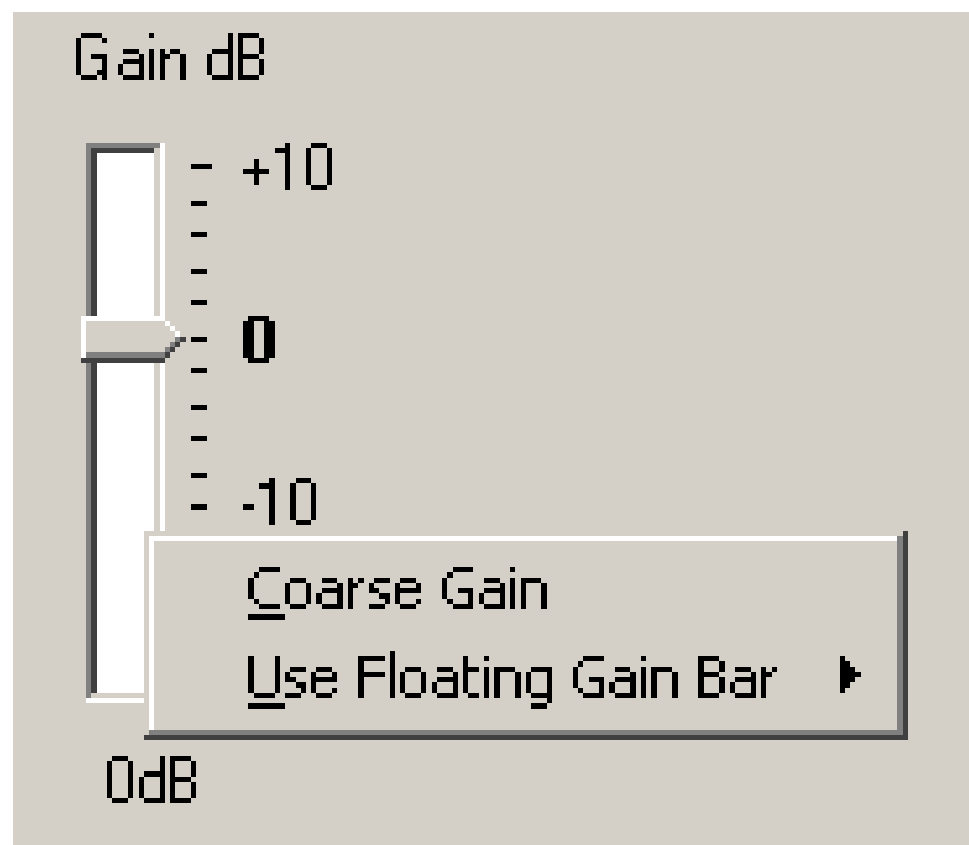

Gain

The range of gain can be changed via the Options|Gain Offset main menu item between [+10dB..-20dB] and [0dB..-30dB]

As shown above right the track can also be muted, this is achieved by right-clicking anywhere on the gain track bar and choosing Mute, UnMuting the track will return it to the original gain setting.

The muted track is indicated on the button by a line through the duration label

There is an option to view a wider gain range of 60dB, right-click the gain slider and check Coarse Gain, the gain display labels will change colour to purple.

If "Replay Gain" Metadata is present in the audio file it will be shown in this popup, clicking on Apply Replay Gain option will set the gain level accordingly - in this example to -6 dB.

Replay Gain is calculated to bring all track levels to the same loudness, the value is derived from psychoacoustic algorithm used to scan the track.

Also in this right click menu is an option to use a Floating Gain Bar

the Gain Bar has two scaling options: -

a, +/- 6dB relative to the preset gain bar

This floating gain bar allows trimming (+/-6dB) of the preset gain, the PST (preset) button at the bottom of the window will be active and coloured yellow when the gain has been moved away from the preset value, clicking the PST button will return the gain to the preset value.

b, -10dB..+10dB as absolute gain, effectively mimicking the top part of the preset gain bar

This floating gain bar allows absolute gain adjustment between -10dB..+10dB, the 0dB button at the bottom of the window will be active and coloured yellow when the gain has been moved away from the 0dB value, clicking the button will restore the gain to 0dB.

To distinguish between the two modes the top panel of the window is coloured yellow for +/-6dB relative and blue for -10dB..+10dB absolute.

The absolute gain setting is shown at the top of the window, upto four floating gain bars can be displayed simultaneously

Pan

The pan control can be moved left and right to position the audio within the stereo image, with a 6 channel 5.1 surround sound file loaded the pan control will rotate the whole sound image clockwise or anticlockwise as the Pan control is moved left and right respectively. With all other multichannel files the pan control is disabled.

AutoPan is a feature that allows the playing of one button (master) to modify the pan setting of another (slave) these Pan Masters and Slaves are setup in the Master/Slavelinks dialog.

A button must be set as a Pan Slave before the stages below can be completed.

As an example, move the pan control to the half right position

right-click the pan control slider

click on Mark Alternate Pan, this will then mark the position with a red pointer on the top of the pan control

now move the Pan control to full left

For 1 and 2 channel files the Pan value is show in percent left or right (0..100), with surround sound files the value is 0..180 indicating the angle of rotation.

Now there are the normal Pan setting of full left and an alternate setting of half right, the AutoPan feature will change the pan settings as follows: -

- | | |
|---------------------------------|--|
| 1, Start of Pan Master fade in | Slave Pan starts to change from full left towards half right |
| 2, End of Pan Master fade in | Slave Pan now half right |
| 3, Start of Pan Master fade out | Slave Pan starts to change from half right back to full left |
| 4, End of Pan Master fade out | Slave Pan now full left |

The profile of the Pan change is independent of the fade law selected on the master button.

Speed

The speed of an audio track can be varied between 25% and 400% of the original value providing the sound card can handle this range.

The speed value will appear in red when the sound card limits have been exceeded as shown above right.

The speed can be preset in this edit window or alternatively if speed changes are to be made live then the speed control can be displayed as a floating slide bar on the main window by checking the "Floating speed bar" box

The button on the left hand side of the window is colored yellow when the speed is non-standard and when clicked will reset to x1 speed

Upto four floating speed bars can be displayed simultaneously

If the speed variation is used the the Time Remaining value on the button will be prefixed with an '@' as shown in button 61 below

The floating speed bar can also be used to automatically slowdown a track to a stop, this is controlled by the button at the right hand of the speed bar 'x0'.

The 'x0' button is enabled when the track is playing and is shown with a blue background, clicking the 'x0' button will begin the slowdown and the button colour will change to red indicating that it is active.

The 'x1' button and scrollbar tab are still active during the slow down process and will cancel the slowdown if used.

The time taken to slow down is set by a a popup menu displayed by right-clicking the 'x0' button

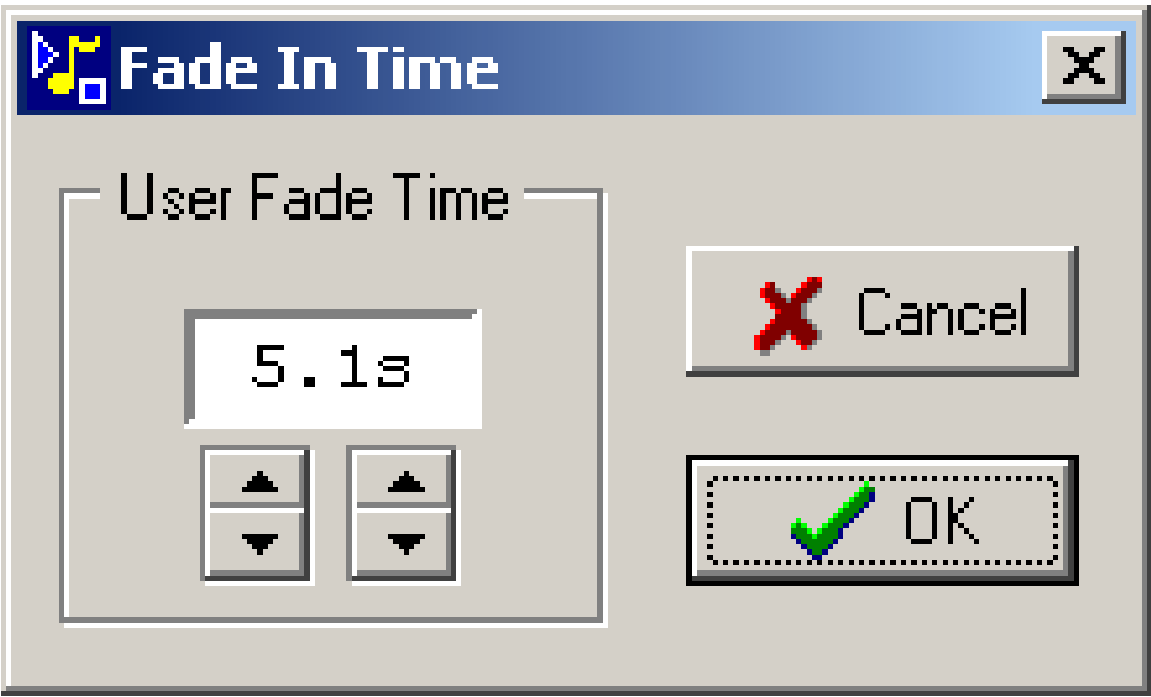

The default value is 2.0 seconds, the selected value is saved separately for each button.

Fades

Right-clicking the Fade In or Fade Out value brings up selection of fade times from zero to 5 seconds.

✓ zero	<u>1</u> .0s
<u>0</u> .1s	1.5 <u>s</u>
0. <u>2</u> s	2.0s
0. <u>3</u> s	2.5s
0. <u>4</u> s	3.0s
0. <u>5</u> s	3.5s
0. <u>6</u> s	4.0s
0. <u>7</u> s	4.5s
0. <u>8</u> s	5.0s
0. <u>9</u> s	<u>U</u> ser = 0.0s

The user value can be set as described below in the Play delay section.

Double-clicking the fade time display recalls the default values of zero for Fade In and either zero or 100mS for Fade Out, the default Fade Out time is set via menu Options|Default Fade Out Time .

Fade times can also be adjusted in the Trim window by dragging the Fade bars.

Linear and Logarithmic fade profiles are available for FadeIn and FadeOut by right-clicking the 'Lin Fade In/Out' text

Fade In

Fade Out

The default profile is logarithmic as shown in the right hand waveform above which has a linear vertical scale.

MicroFades are precision Fade profiles applied in real time and are consequentially smoother than the default profiles. These smooth profiles are available for all Fade Outs and Fade In durations that are less than 600mS, MicroFades are enabled globally via the Engineering menu

The MicroFades are set up as described previously but the Fade In has increased resolution, below are the Fade In popup menus for default and MicroFade modes.

Note on the right hand image MicroFades are enabled, the fade times are shown to 10mS resolution for times less than 700mS, the significance of 700mS is it is beyond the MicroFade limit for that track (697mS) which is 2 channel 16bit at 44.1kHz, the MicroFade limit changes depending on the track format.

The User Fade In duration can be set to 10mS resolution, the right hand up/down button uses 10mS steps up to a duration of 1.00s then reverts to 100mS steps.

The User value editor and FadeIn/FadeOut summary panels are shown in blue text when MicroFades are selected and the duration is less than the MicroFade limit.

There is no maximum limit on the Fade out so it will apply to all values, however the Microfade out will only be rendered when the track reaches its end point, if the track is stopped prematurely then the default fade out routine will be used.

Multi-Channel

The coloured boxes above represent the 8 possible outputs for an individual audio channel

In normal non-multichannel mode the images will be: -

When multichannel mode is selected a right click popup menu is available.

For mono sources this will allow routing of the channel to any of the 8 possible outputs.

front left front right front centre LFE effects rear left rear right front wide left front wide right default mono

The default setting for mono sources is front left and front right

For stereo sources this will allow routing of the channels to any of the 4 possible output combinations.

front L/R effects centre rear L/R front wide L/R default stereo

The default setting for stereo sources is front left and front right

The routing of the mono or stereo signals to different channels relies on the sound card driver being fully compatible with the Microsoft DirectSound API, some drivers including the M-Audio Delta 1010 series are not full compatible.

For Quad, 5.1 and 7.1 sources the assignments are fixed as shown below

quad
4 ch

5.1
6 ch

7.1
8 ch

If the Pan control is used with a 5.1 (6 channel) file loaded the source assignments will be shown without the Lfe channel, the diagram will rotate indicating the angle of pan.

Note that Pan is only available with 1, 2 and 6 channel files, however a 6 channel file can be built from a 1 or 2 channel file and loaded onto another button and then panned.

Play Delay

Play delay is a feature that provides a variable delay time between triggering a track to play and the track starting to play.

disabled

enabled

Right-clicking the delay panel shows a list of predefined delay times and a user value

✓ zero	<u>1</u> .0s
0. <u>1</u> s	1.5 <u>s</u>
0. <u>2</u> s	2.0s
0. <u>3</u> s	2.5s
0. <u>4</u> s	3.0s
0. <u>5</u> s	3.5s
0. <u>6</u> s	4.0s
0. <u>7</u> s	4.5s
0. <u>8</u> s	5.0s
0. <u>9</u> s	<u>U</u> ser = 10.0s

zero	<u>1</u> .0s
0. <u>1</u> s	1.5 <u>s</u>
0. <u>2</u> s	2.0s
0. <u>3</u> s	✓ 2.5s
0. <u>4</u> s	3.0s
0. <u>5</u> s	3.5s
0. <u>6</u> s	4.0s
0. <u>7</u> s	4.5s
0. <u>8</u> s	5.0s
0. <u>9</u> s	<u>U</u> ser = 10.0s

With 2.5 seconds selected the button will show two vertical lines

When Play Delay has been triggered the button track number will flash blue/red during the delay time before starting to Play.

The User defined setting for Play Delay can be entered by selecting the 'User' entry in the popup menu, this will show a dialog box allowing values to be set between 0.0s and 99.9s, the default value is 10.0s.

By using the up/down buttons a new value can be set

The right click popup menu will now show the new user value, which is saved separately for each button

zero	<u>1</u> .0s
<u>0</u> .1s	1.5 <u>s</u>
0. <u>2</u> s	2.0s
0. <u>3</u> s	2.5s
0. <u>4</u> s	3.0s
0. <u>5</u> s	3.5s
0. <u>6</u> s	4.0s
0. <u>7</u> s	4.5s
0. <u>8</u> s	5.0s
0. <u>9</u> s	✓ <u>U</u> ser = 12.3s

Voice Over

Voice Over mode is a special case of Master/Slave links where the gain of the Play Slave/s is reduced or increased under control of the Master track. The amount of gain adjustment is set by Voice Over fade value shown below

Voice Over fade

-6dB

LB

RB

Lin

Fade In

zero

Lin

Fade Out

0.1s

The adjustment can be selected by right-clicking on the entry panel, the default is -6dB

The user level can be set as described above for Play Delay

Voice over mode will only be come active when selected in the Master/Slave Links dialog and the Master button has both Fade In and Fade Out non-zero.

Channel Patching and Phase

The two panels to the right of the Voice Over fade setting control the real-time output processing of the Left and Right channels

Left-clicking the panels selects from one of four states of channel patching: -

No modification

Left channel routed to both Left and Right outputs
(Left To Both)

Right channel routed to both Left and Right outputs
(Right to Both)

With a Stereo track the Left and Right channels are summed and routed to both Left and Right outputs
(Mono M6)

With a 6 channel (5.1) track the Left channels are summed and routed to front Left and the Right channels summed and routed to front Right, other outputs are silence

Right-clicking the panels with a Stereo track loaded selects one of the four states of channel phase inversion: -

No modification

Left channel phase inverted

Right channel phase inverted

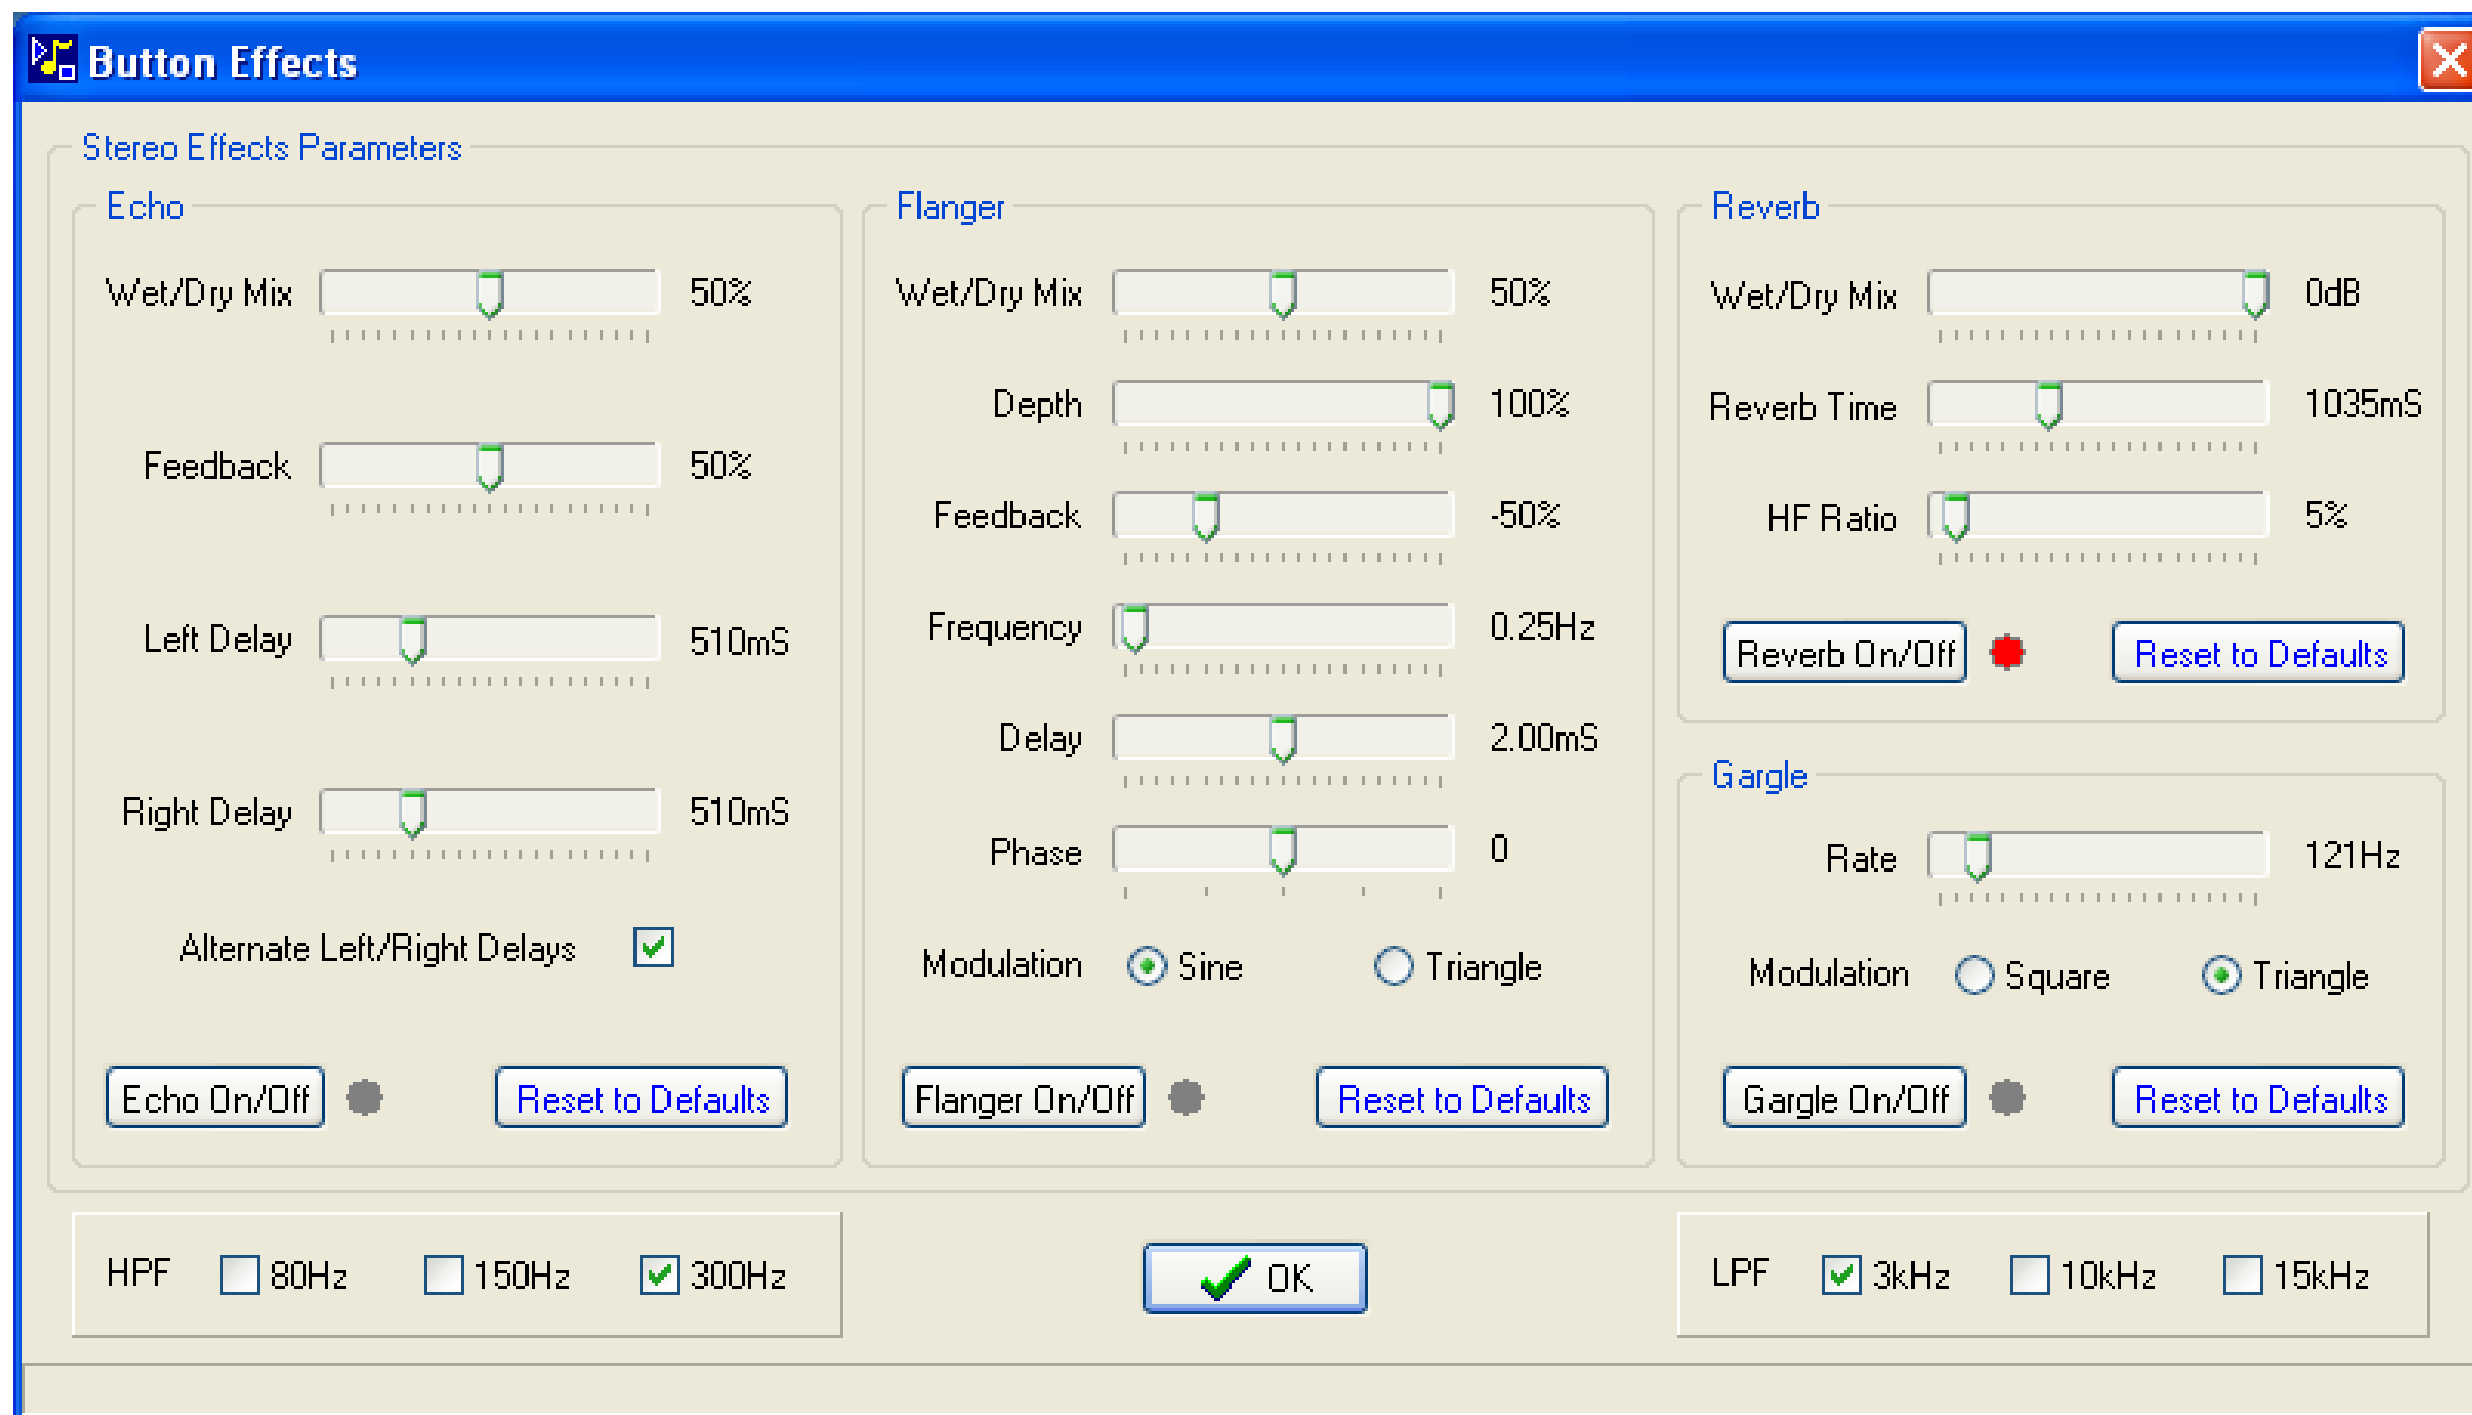

Both left and Right channels phase inverted

Channel patching and phase inversion functions cannot both be used at the same time.

Button Effects

An audio effect can be applied to the track, the effect can be either Echo, Flange, Reverberation or Gargle, the button on the right of the Effects section 'Fx Off/On' indicates whether any of the effects is active.

If an effect is active clicking the button will cancel the effect, if no effect is active clicking on the button will display the effect parameters

Only one effect can be active at any one time, the effects are enabled by clicking on the button in the lower left corner of the appropriate section

The 'LED' will show red when the effect is active.

The Effects can only be enabled/disabled when the track is stopped, so the effects On/Off buttons will automatically stop and start the track as necessary

If an effect is active the parameters can be modified live by clicking the Fx On button, this will display the Effect Parameter window shown above.

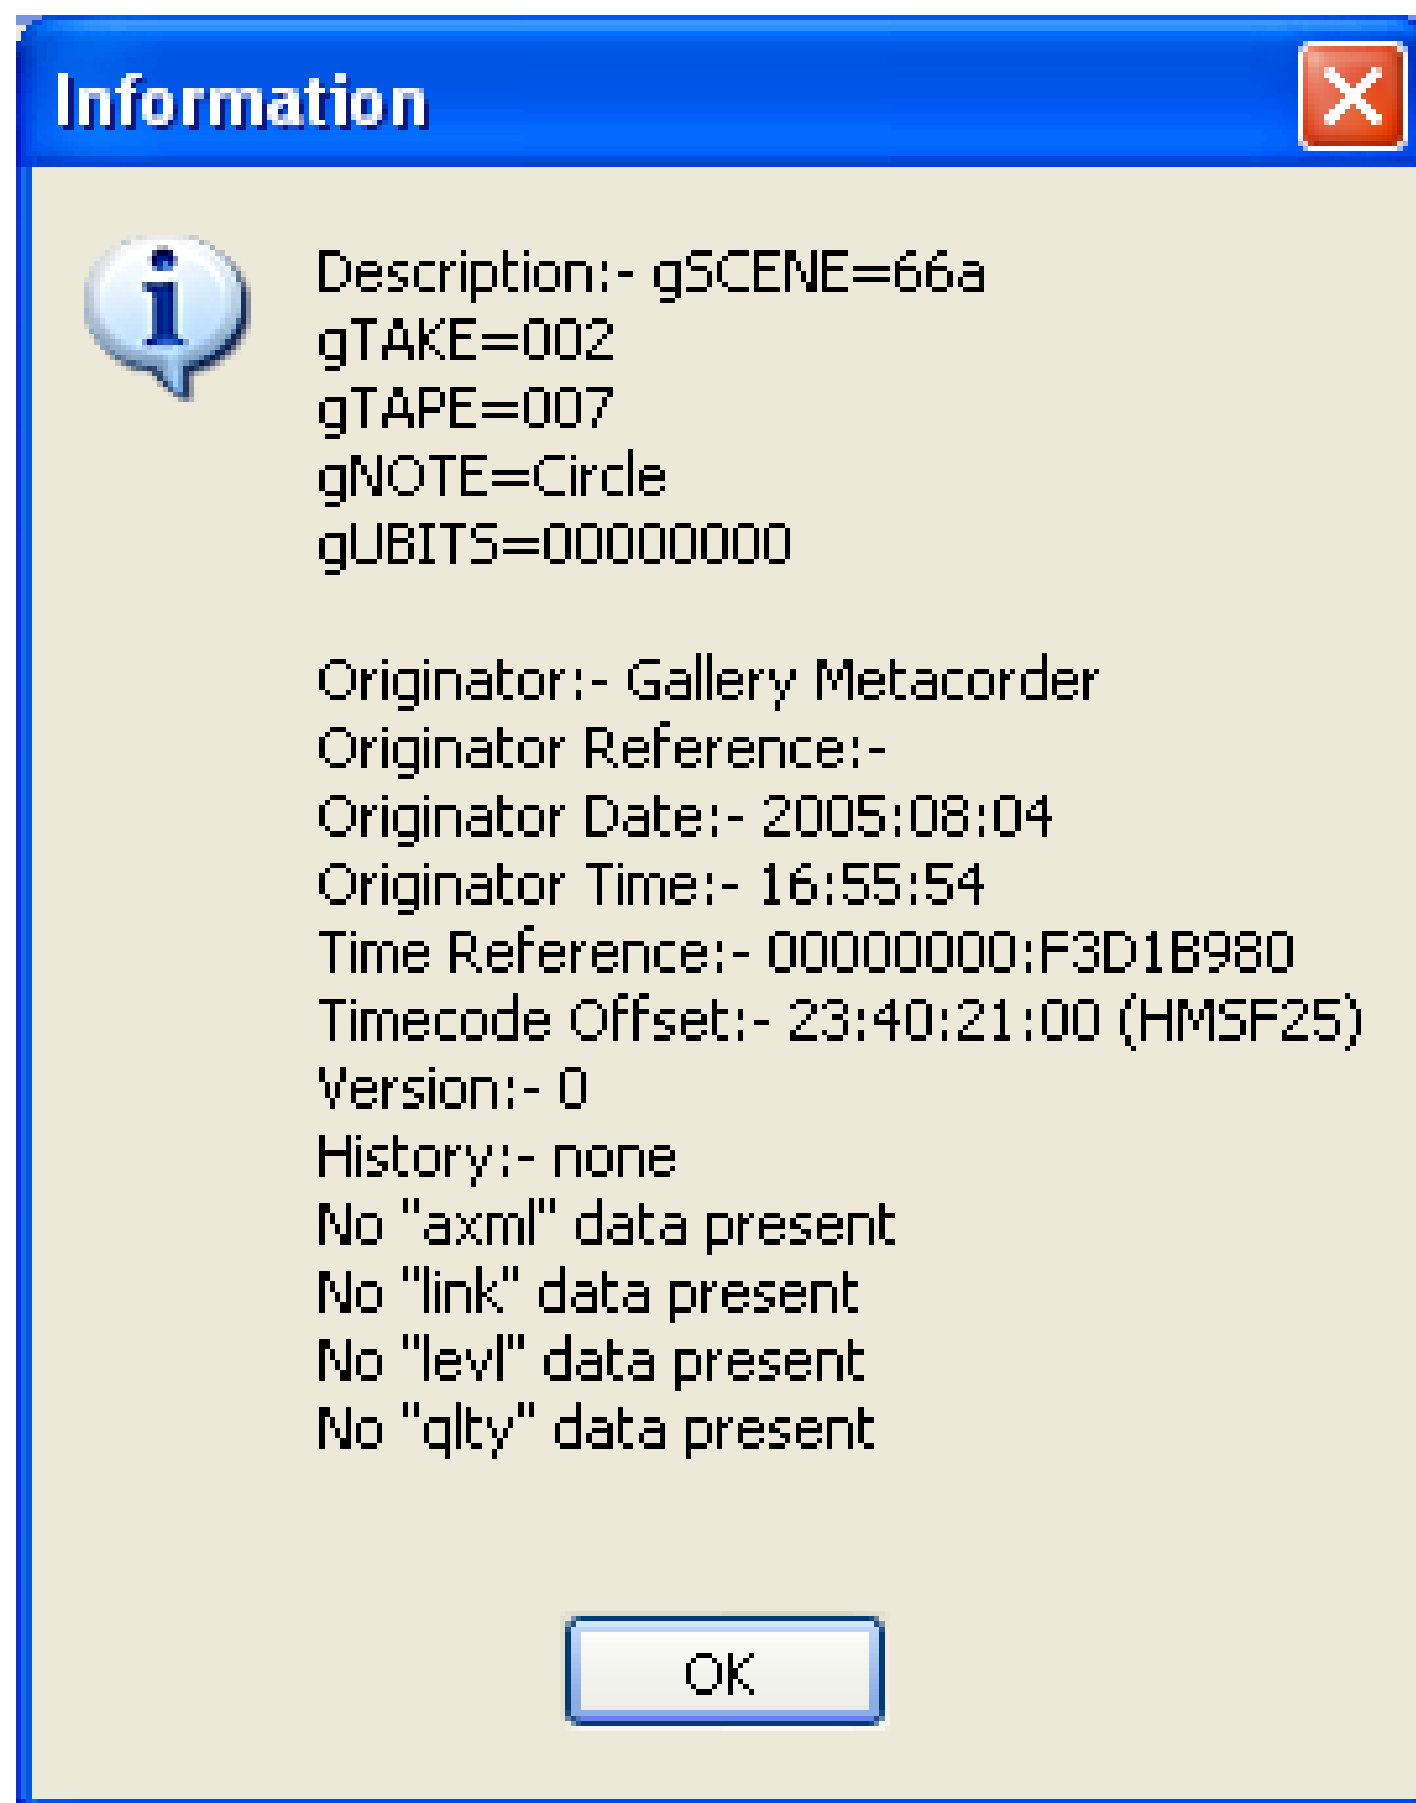

The effects are only available when SpotOn is operating in a 2 Channel Stereo mode.

The High Pass (HPF) and Low Pass (LPF) filters at the bottom of the display are live and do not require the track to be stopped to take effect.

MetaData

If metadata is present in the audio file then right-clicking on the summary panel will display the decoded data

Broadcast WAV (BWAV) data: -

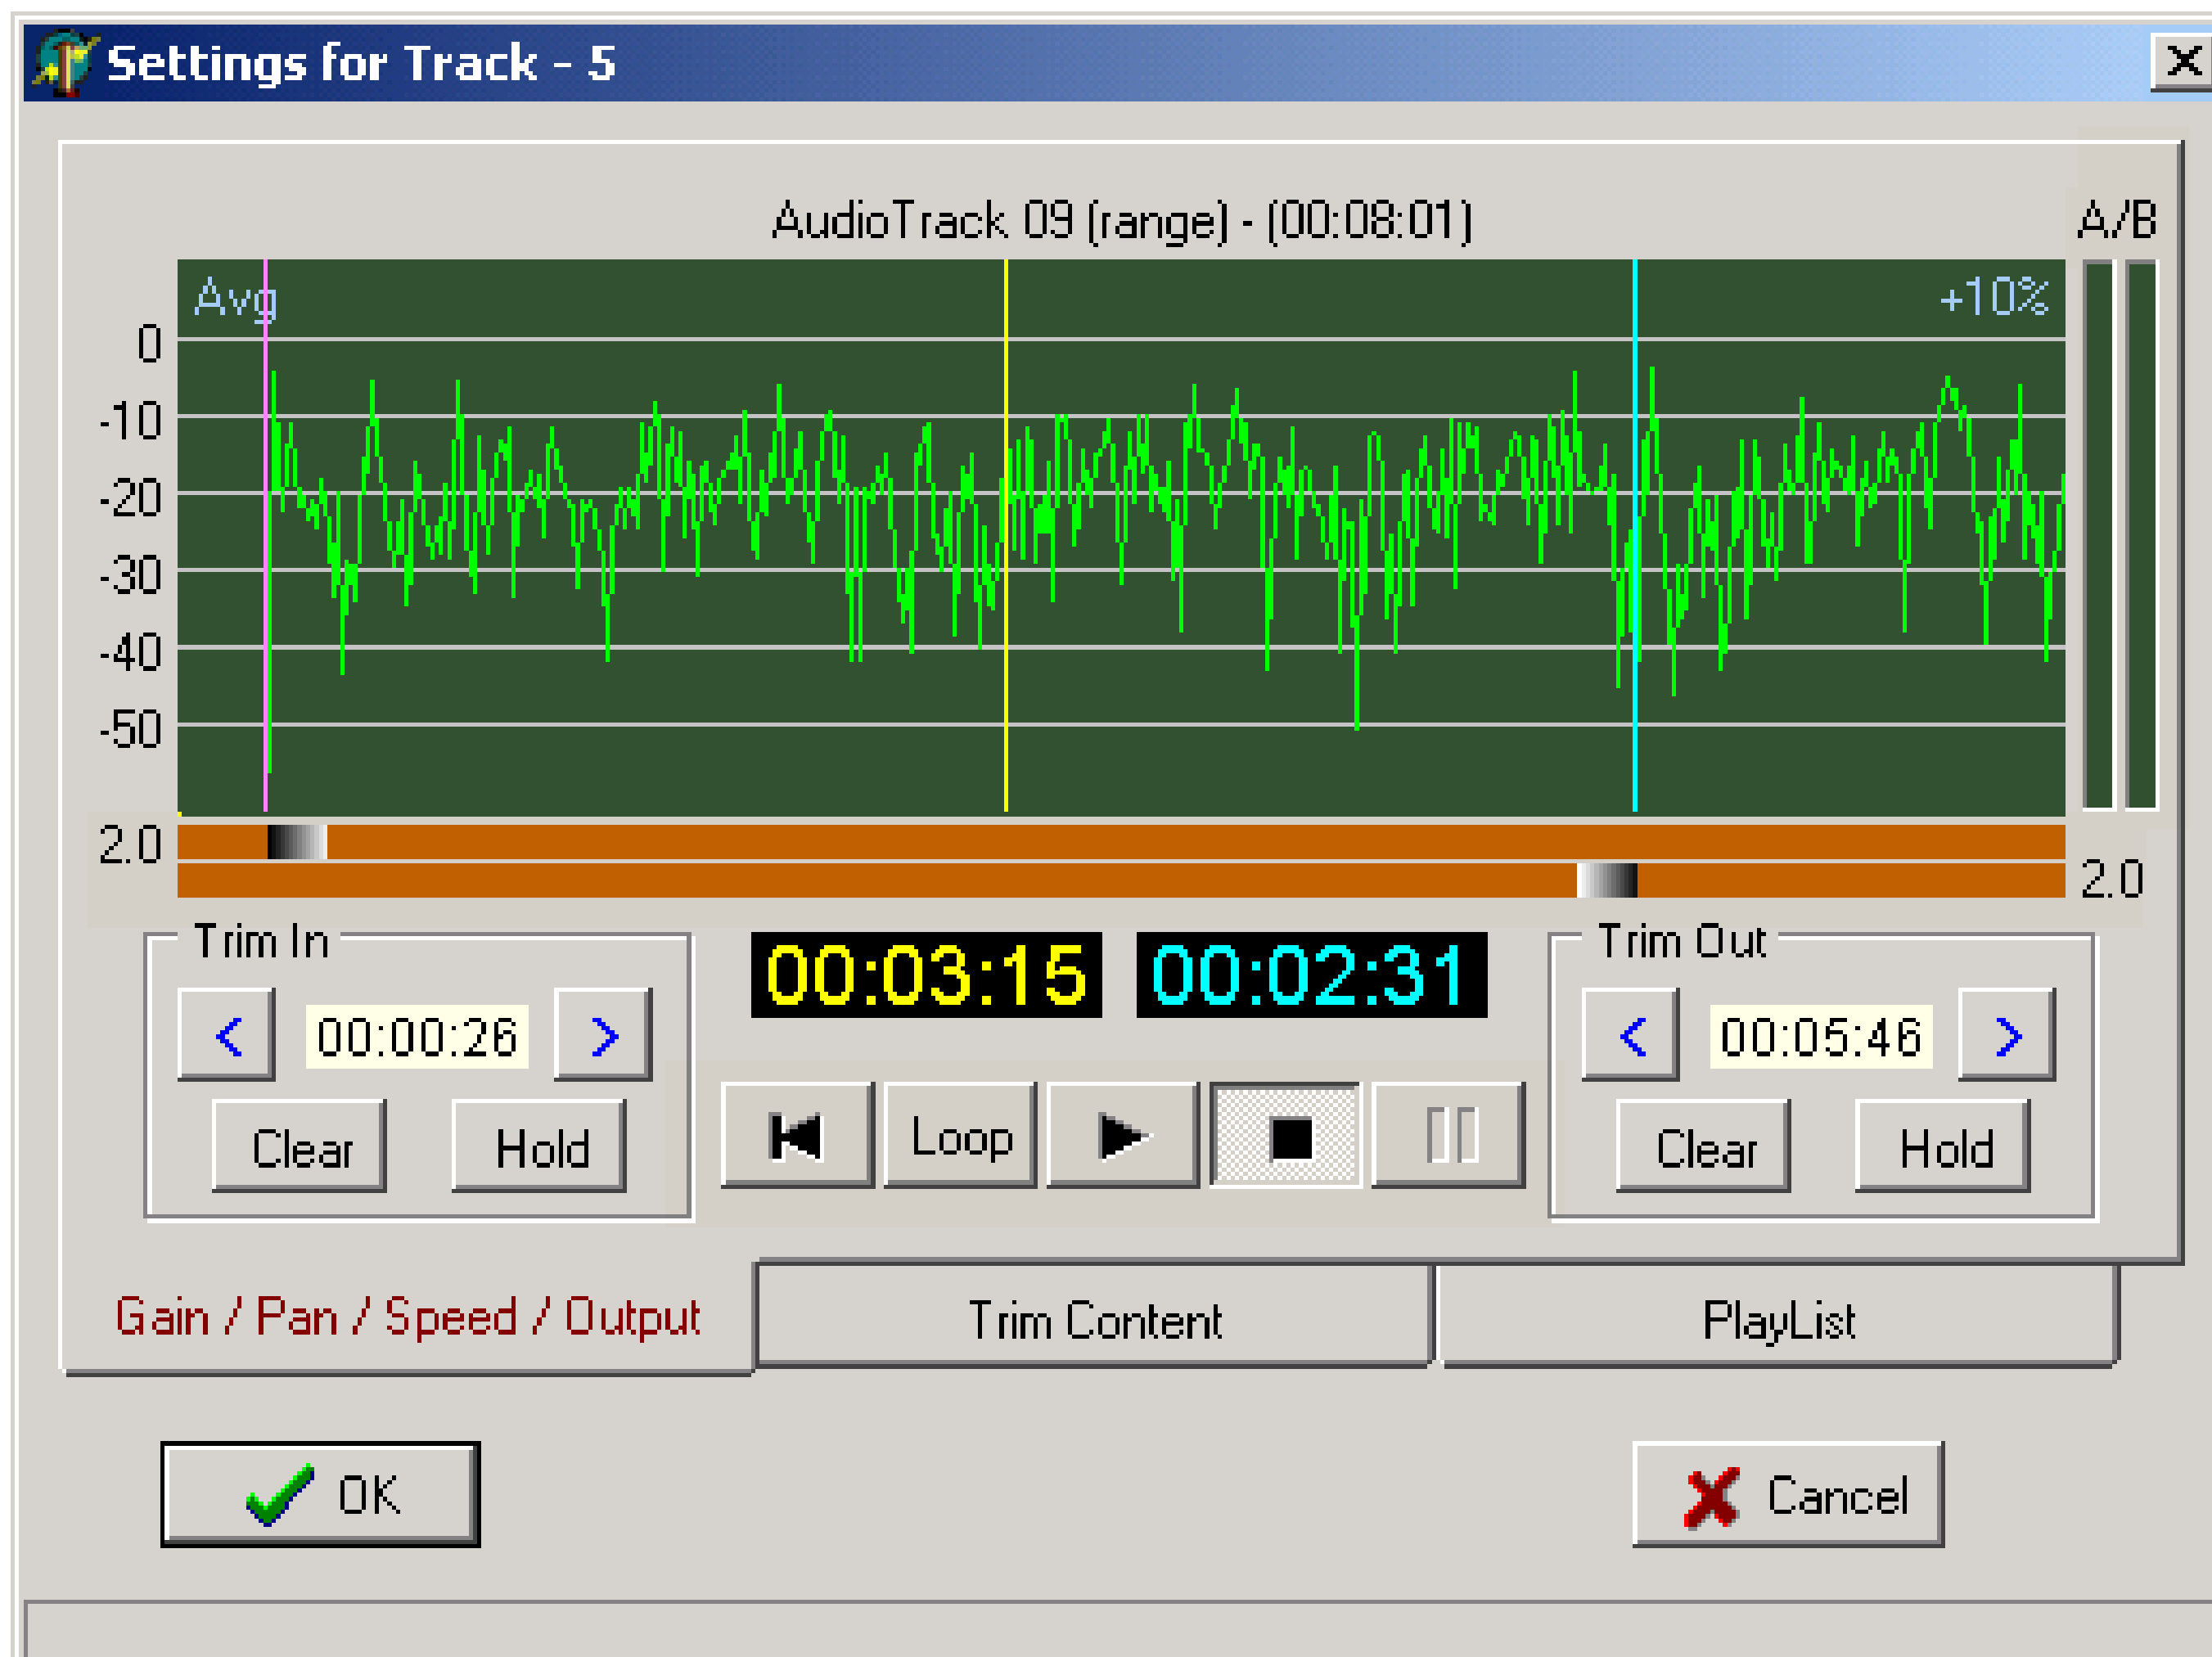

Institute of Broadcast Sound Extensible Markup Language (iXML) data: -

Audio SetUp -Trim

Trim Content

The content of the track is displayed in this tab as a time/amplitude waveform along with the trim in and out points.

Working down from the top of the window - first is the track name and its duration in mm:ss:ff(75).

Next is the complete audio waveform shown on a -60dB..+10dB scale, the legend top left shows it is an average value plot and the legend top right shows the current speed setting.

The waveform has three vertical lines drawn across it, the magenta line marks the Trim In point, the yellow line the current position in the playout of the track and the cyan line the Trim Out point.

The function of the Trim In point is to allow the track to be played from a position other than the start of the track, here the in point is 00:00:26(75) into the track, set to eliminate the period of silence at the beginning of the track

Similarly the Trim Out point stops the playout before the end of the track, here it is at 00:05:46(75).

The Trim points can be set by using the nudge buttons in the Trim In and Out sections or by using the mouse buttons in the waveform display area - left click sets in point, right click sets out point and centre click or shift+left click cues the track to that point.

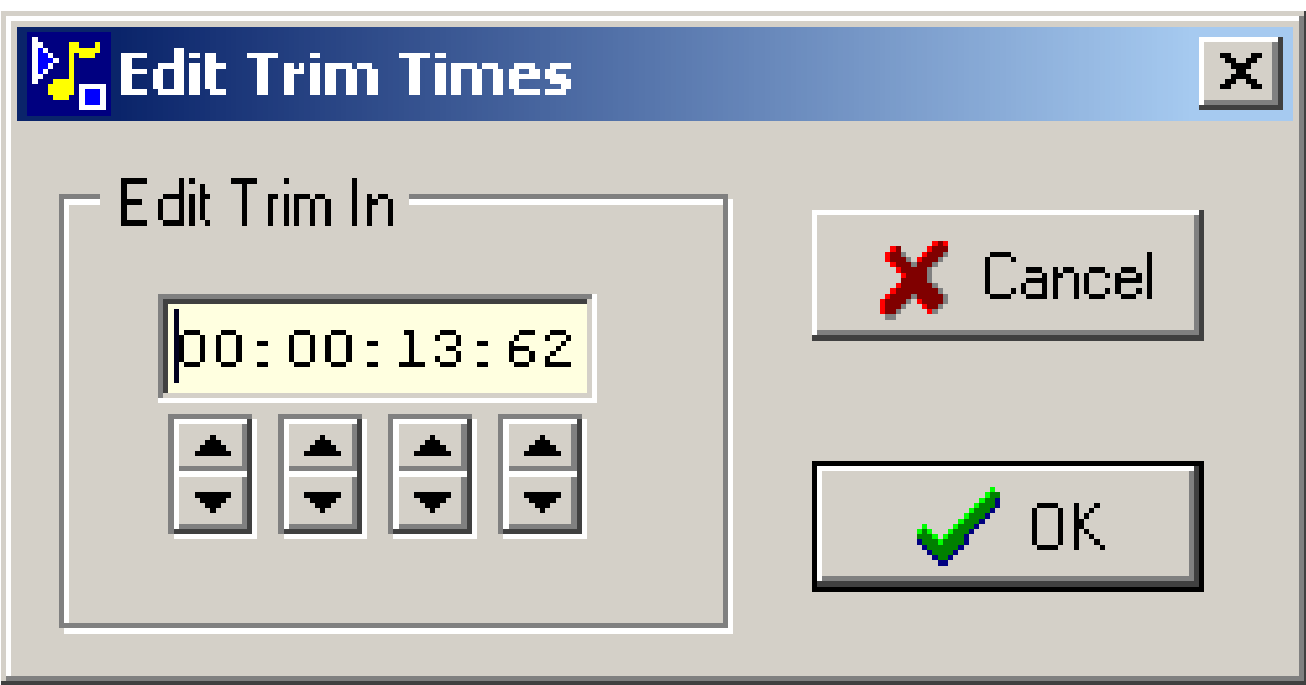

In the Trim In and Trim Out displays, left clicking the trim value will mark the current value as that trim point. The two clear buttons return the In and Out points to the start and end of the track respectively. Keyboard qwerty keys 'i' and 'o' can be used to mark the In and

Out points respectively.

Right-clicking on the trim In timecode display brings up a menu where the value can be entered numerically and also pasted to a local clipboard. The clipboard contents can be swapped between In and Out points so allowing a Play to In point function.

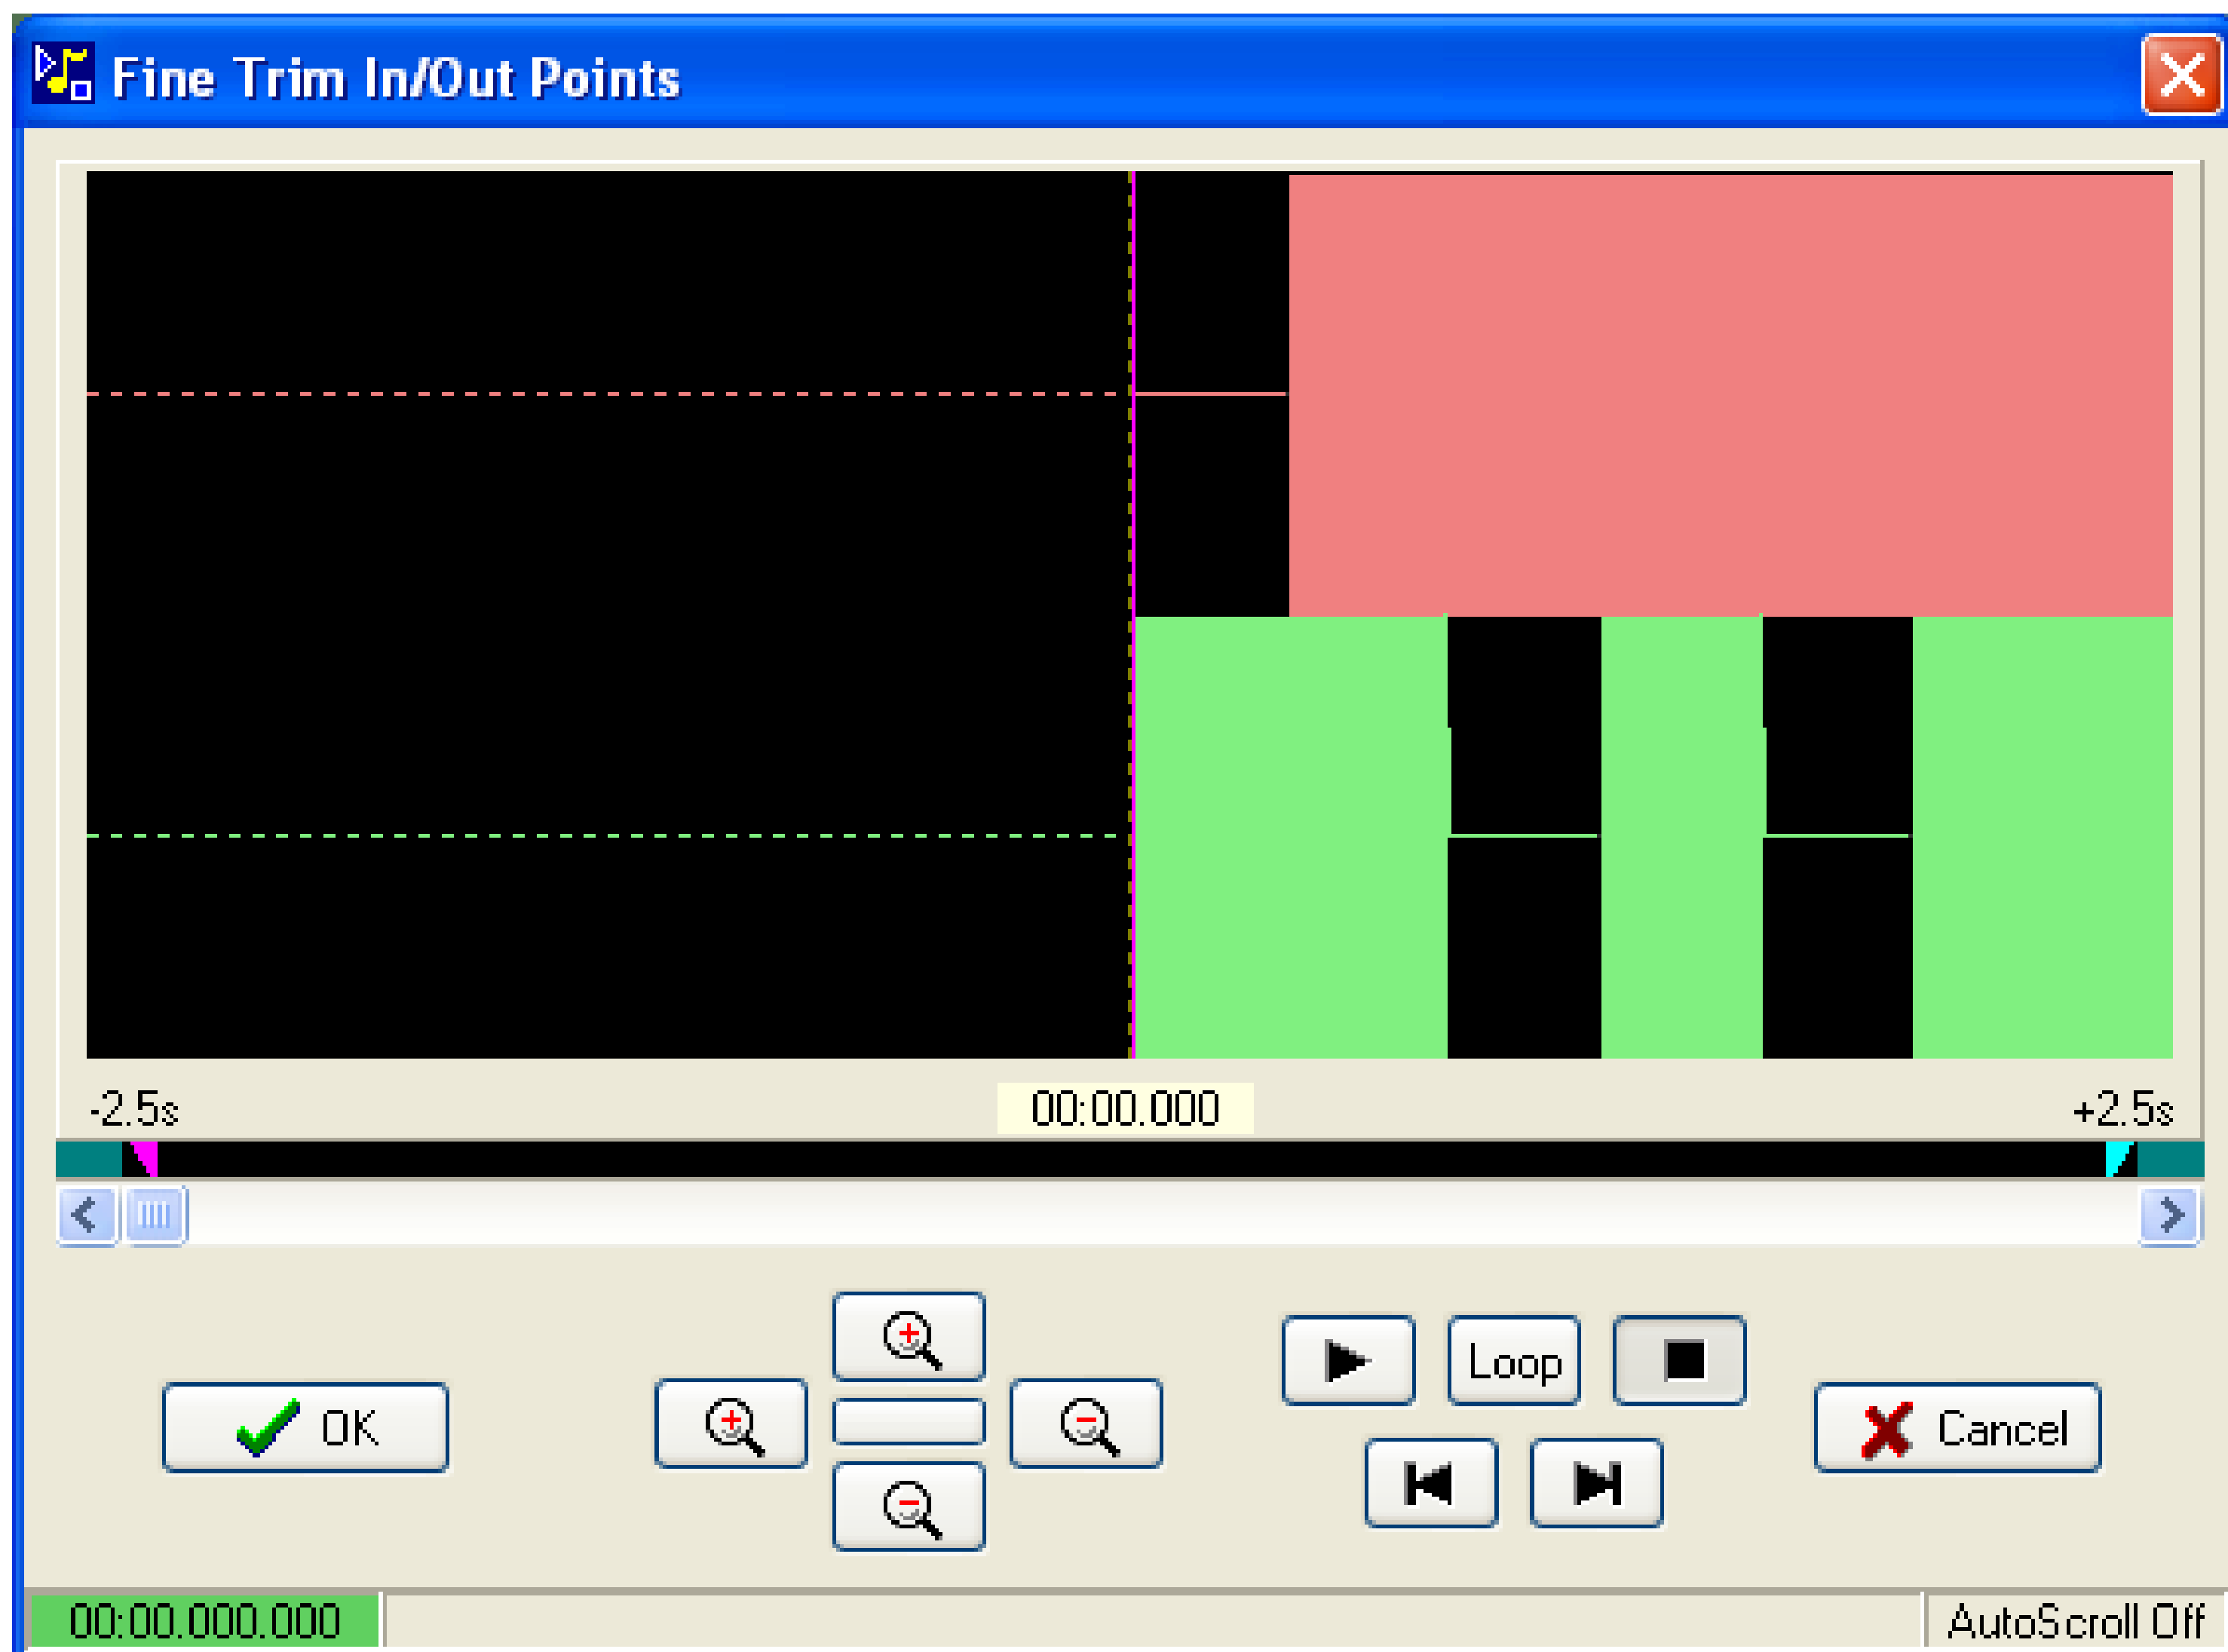

Selecting Edit Trim In displays a timecode editing dialog using the mm:ss:ff().

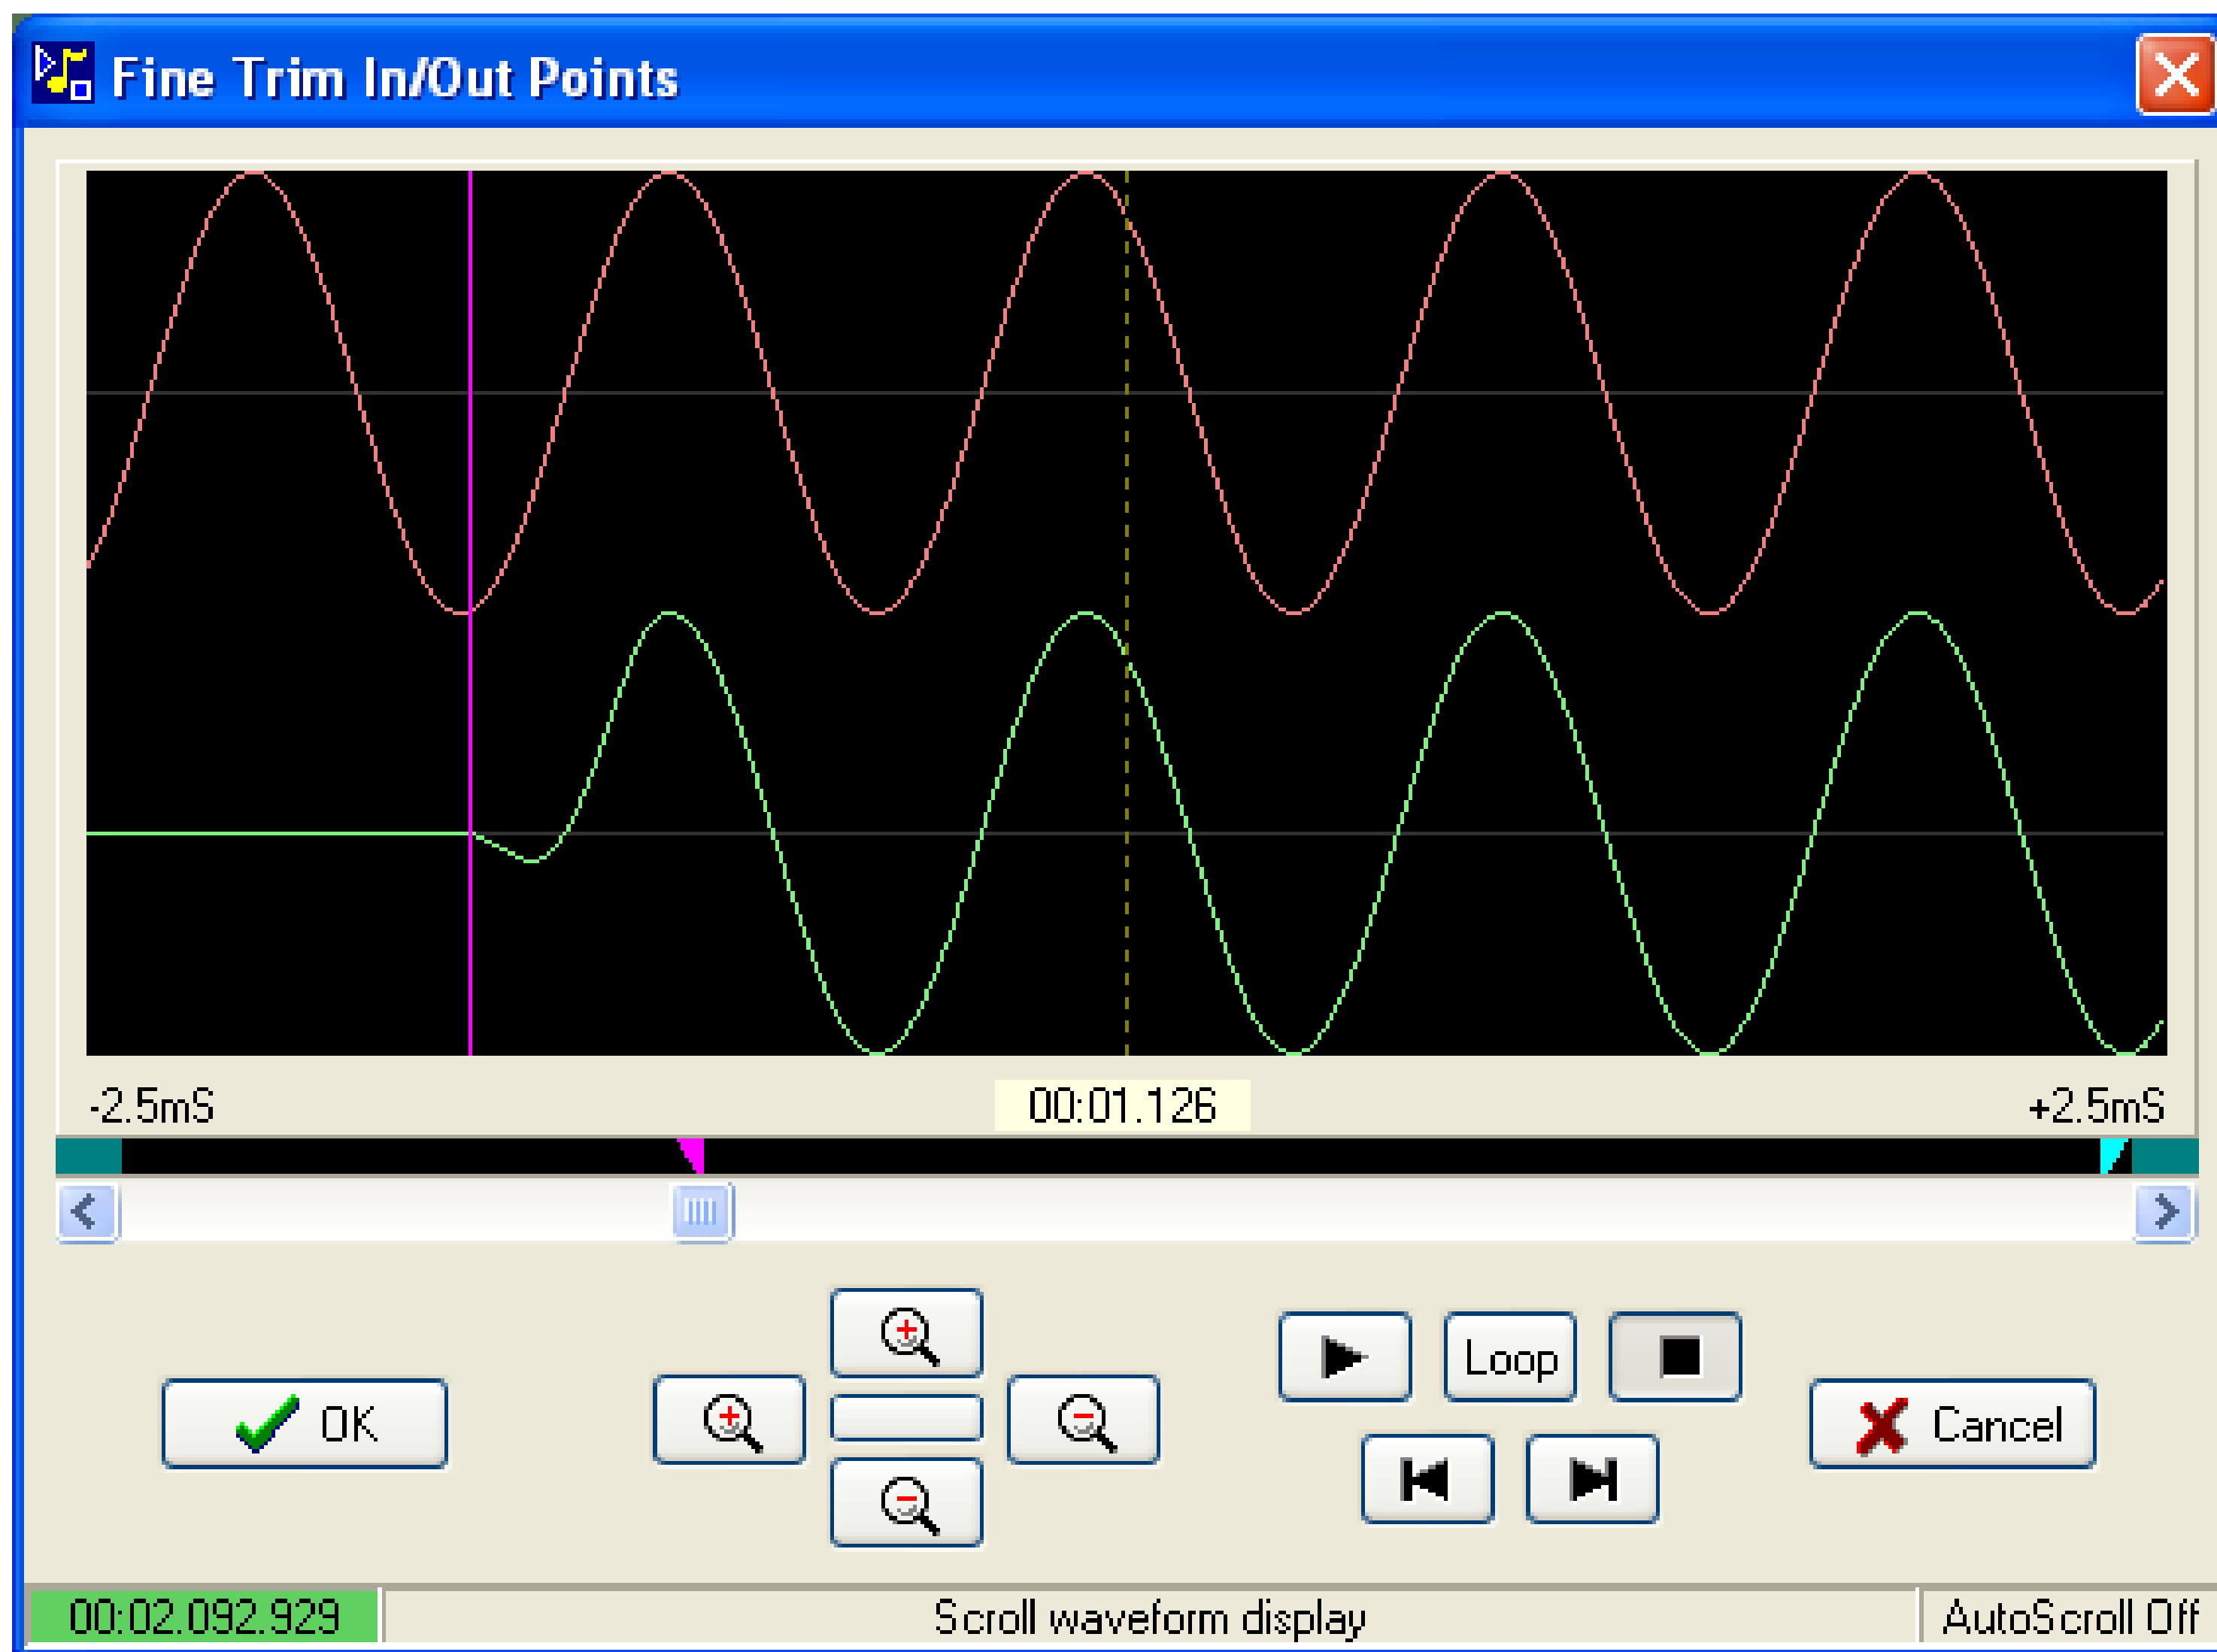

Using the Fine Trim In Point option the In Point can be precisely positioned with sample accuracy, below is an example using the 1kHz GLITS test signal.

Initially the In Point - shown by the vertical magenta line - will be set at the start of the waveform displayed with a 5 second horizontal axis.

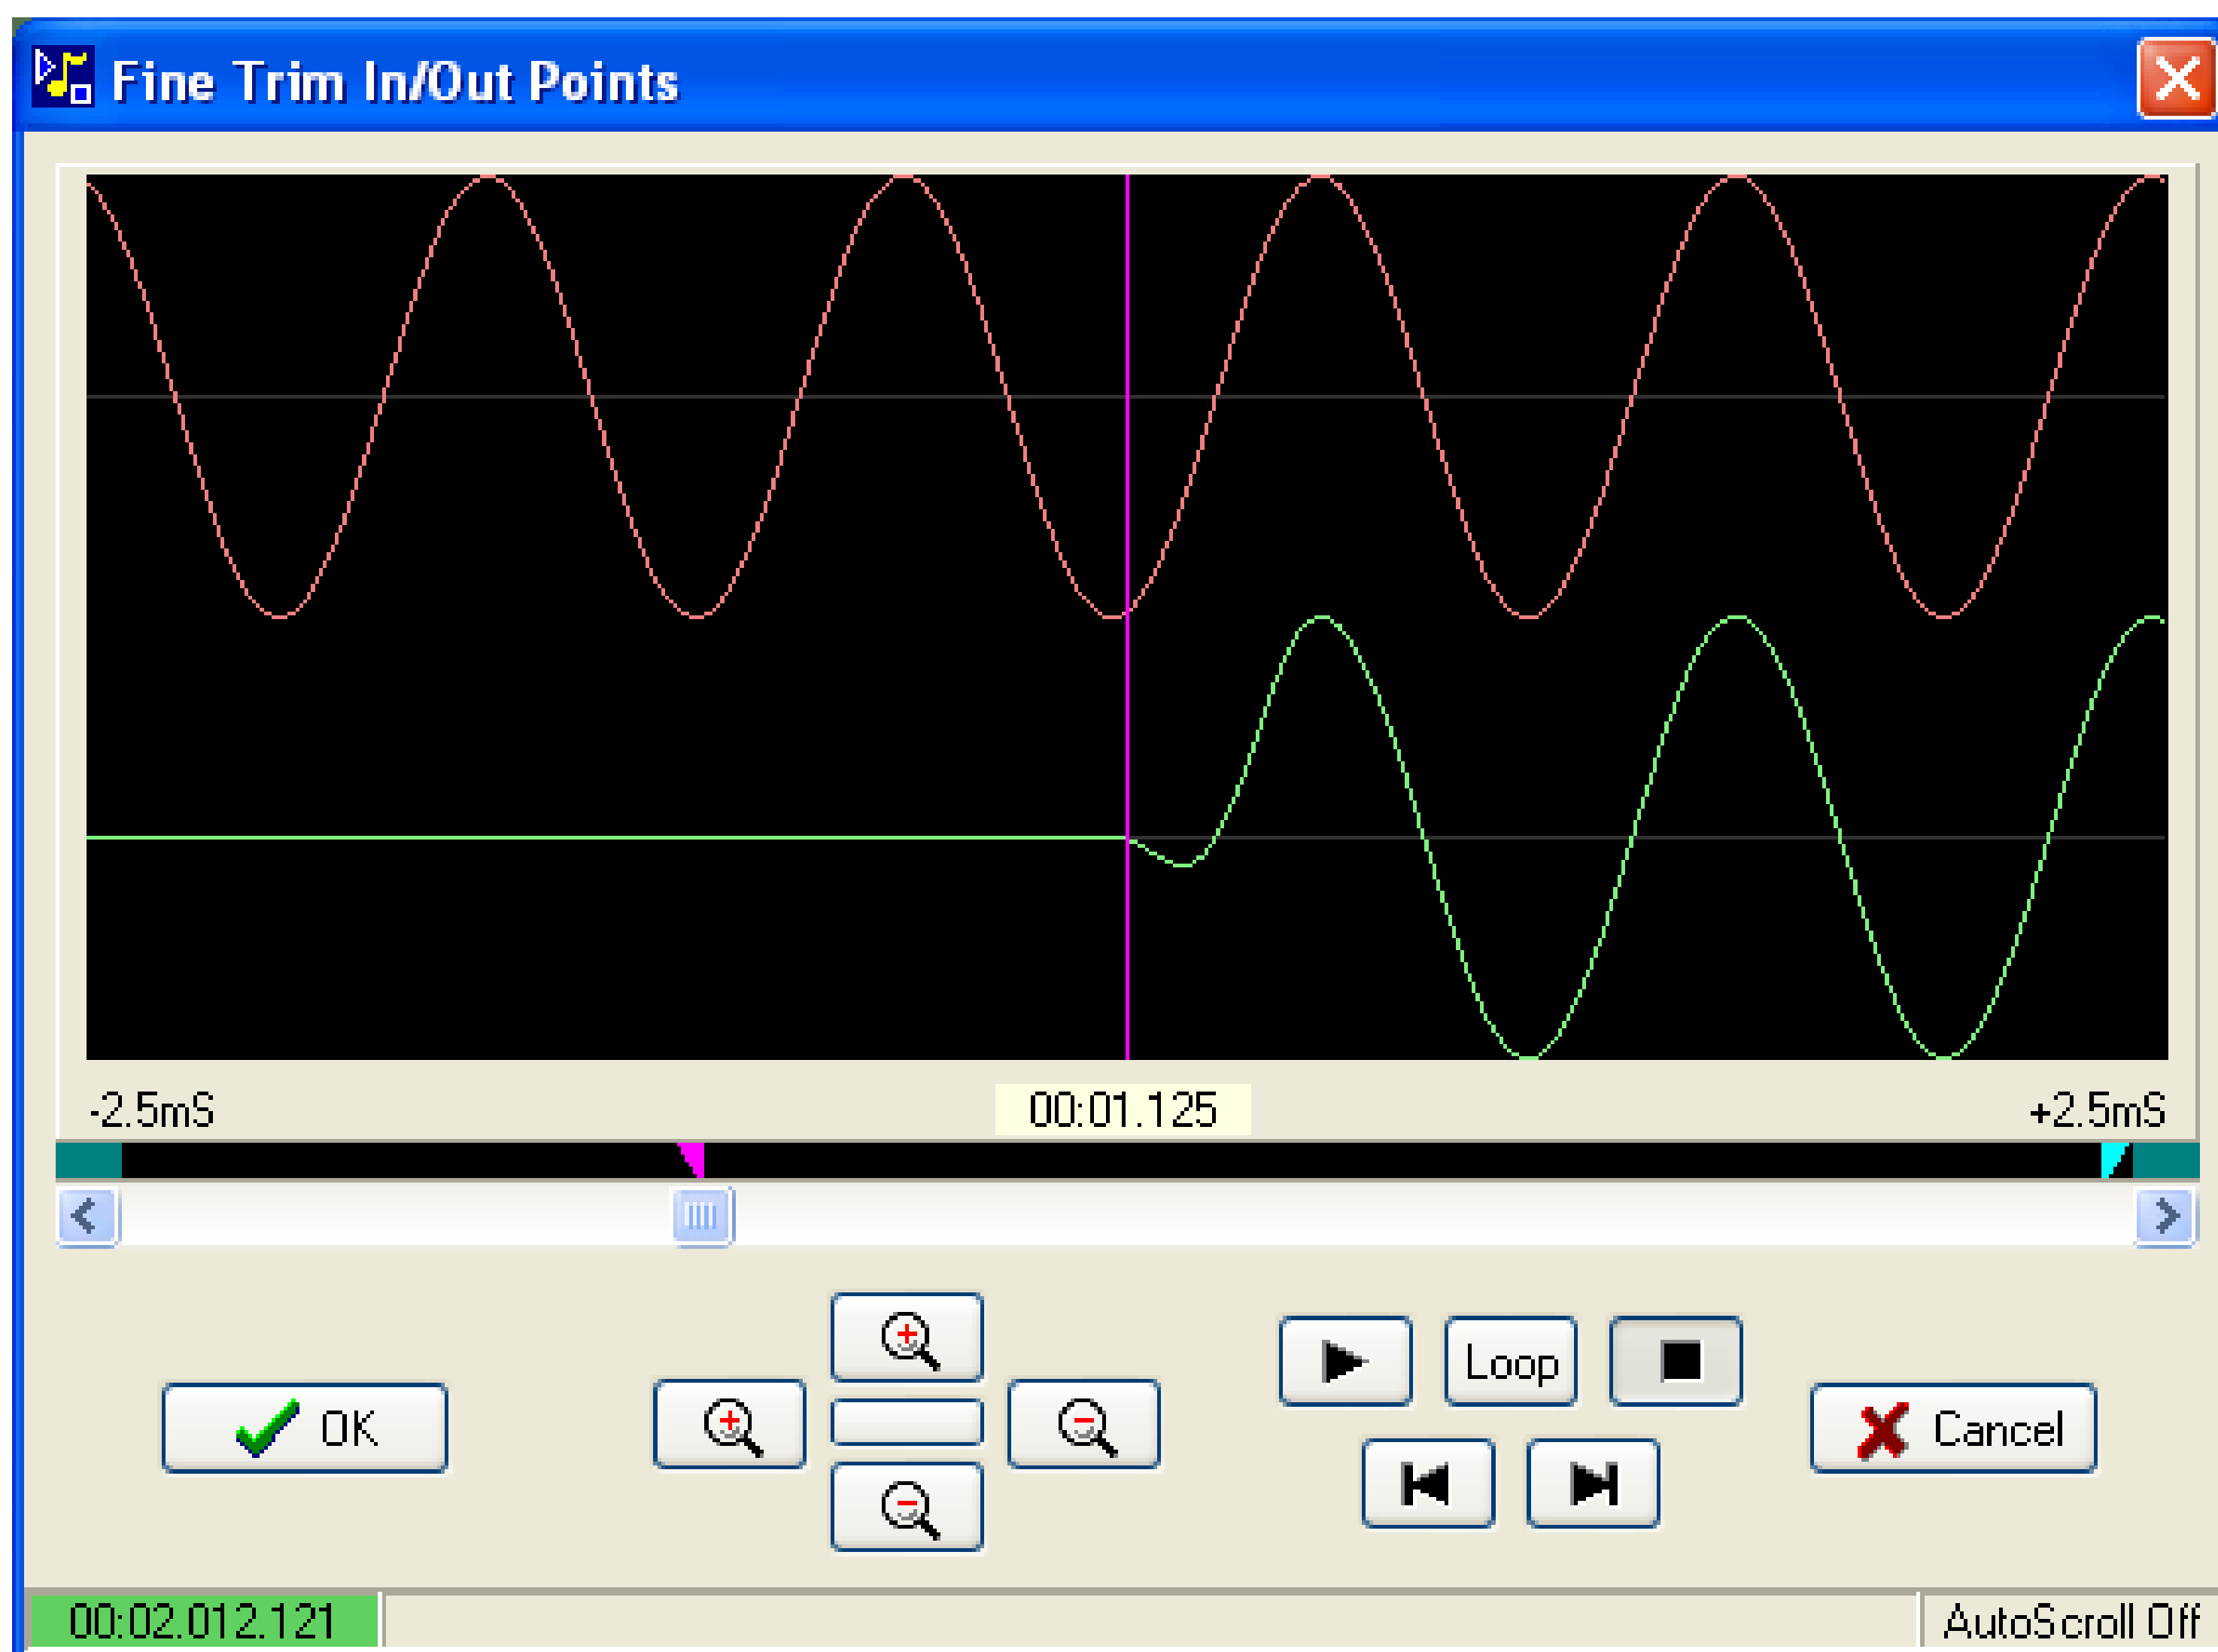

If the In Point was required to be at the beginning of the second burst on the right channel the waveform can be scrolled and zoomed to show 5mS of the waveform and the In Point positioned precisely.

Left clicking the mouse will move the In Point to the new position, similarly right-clicking will move the Out Point.

The waveform can be re-centred by clicking the Cue to In button.

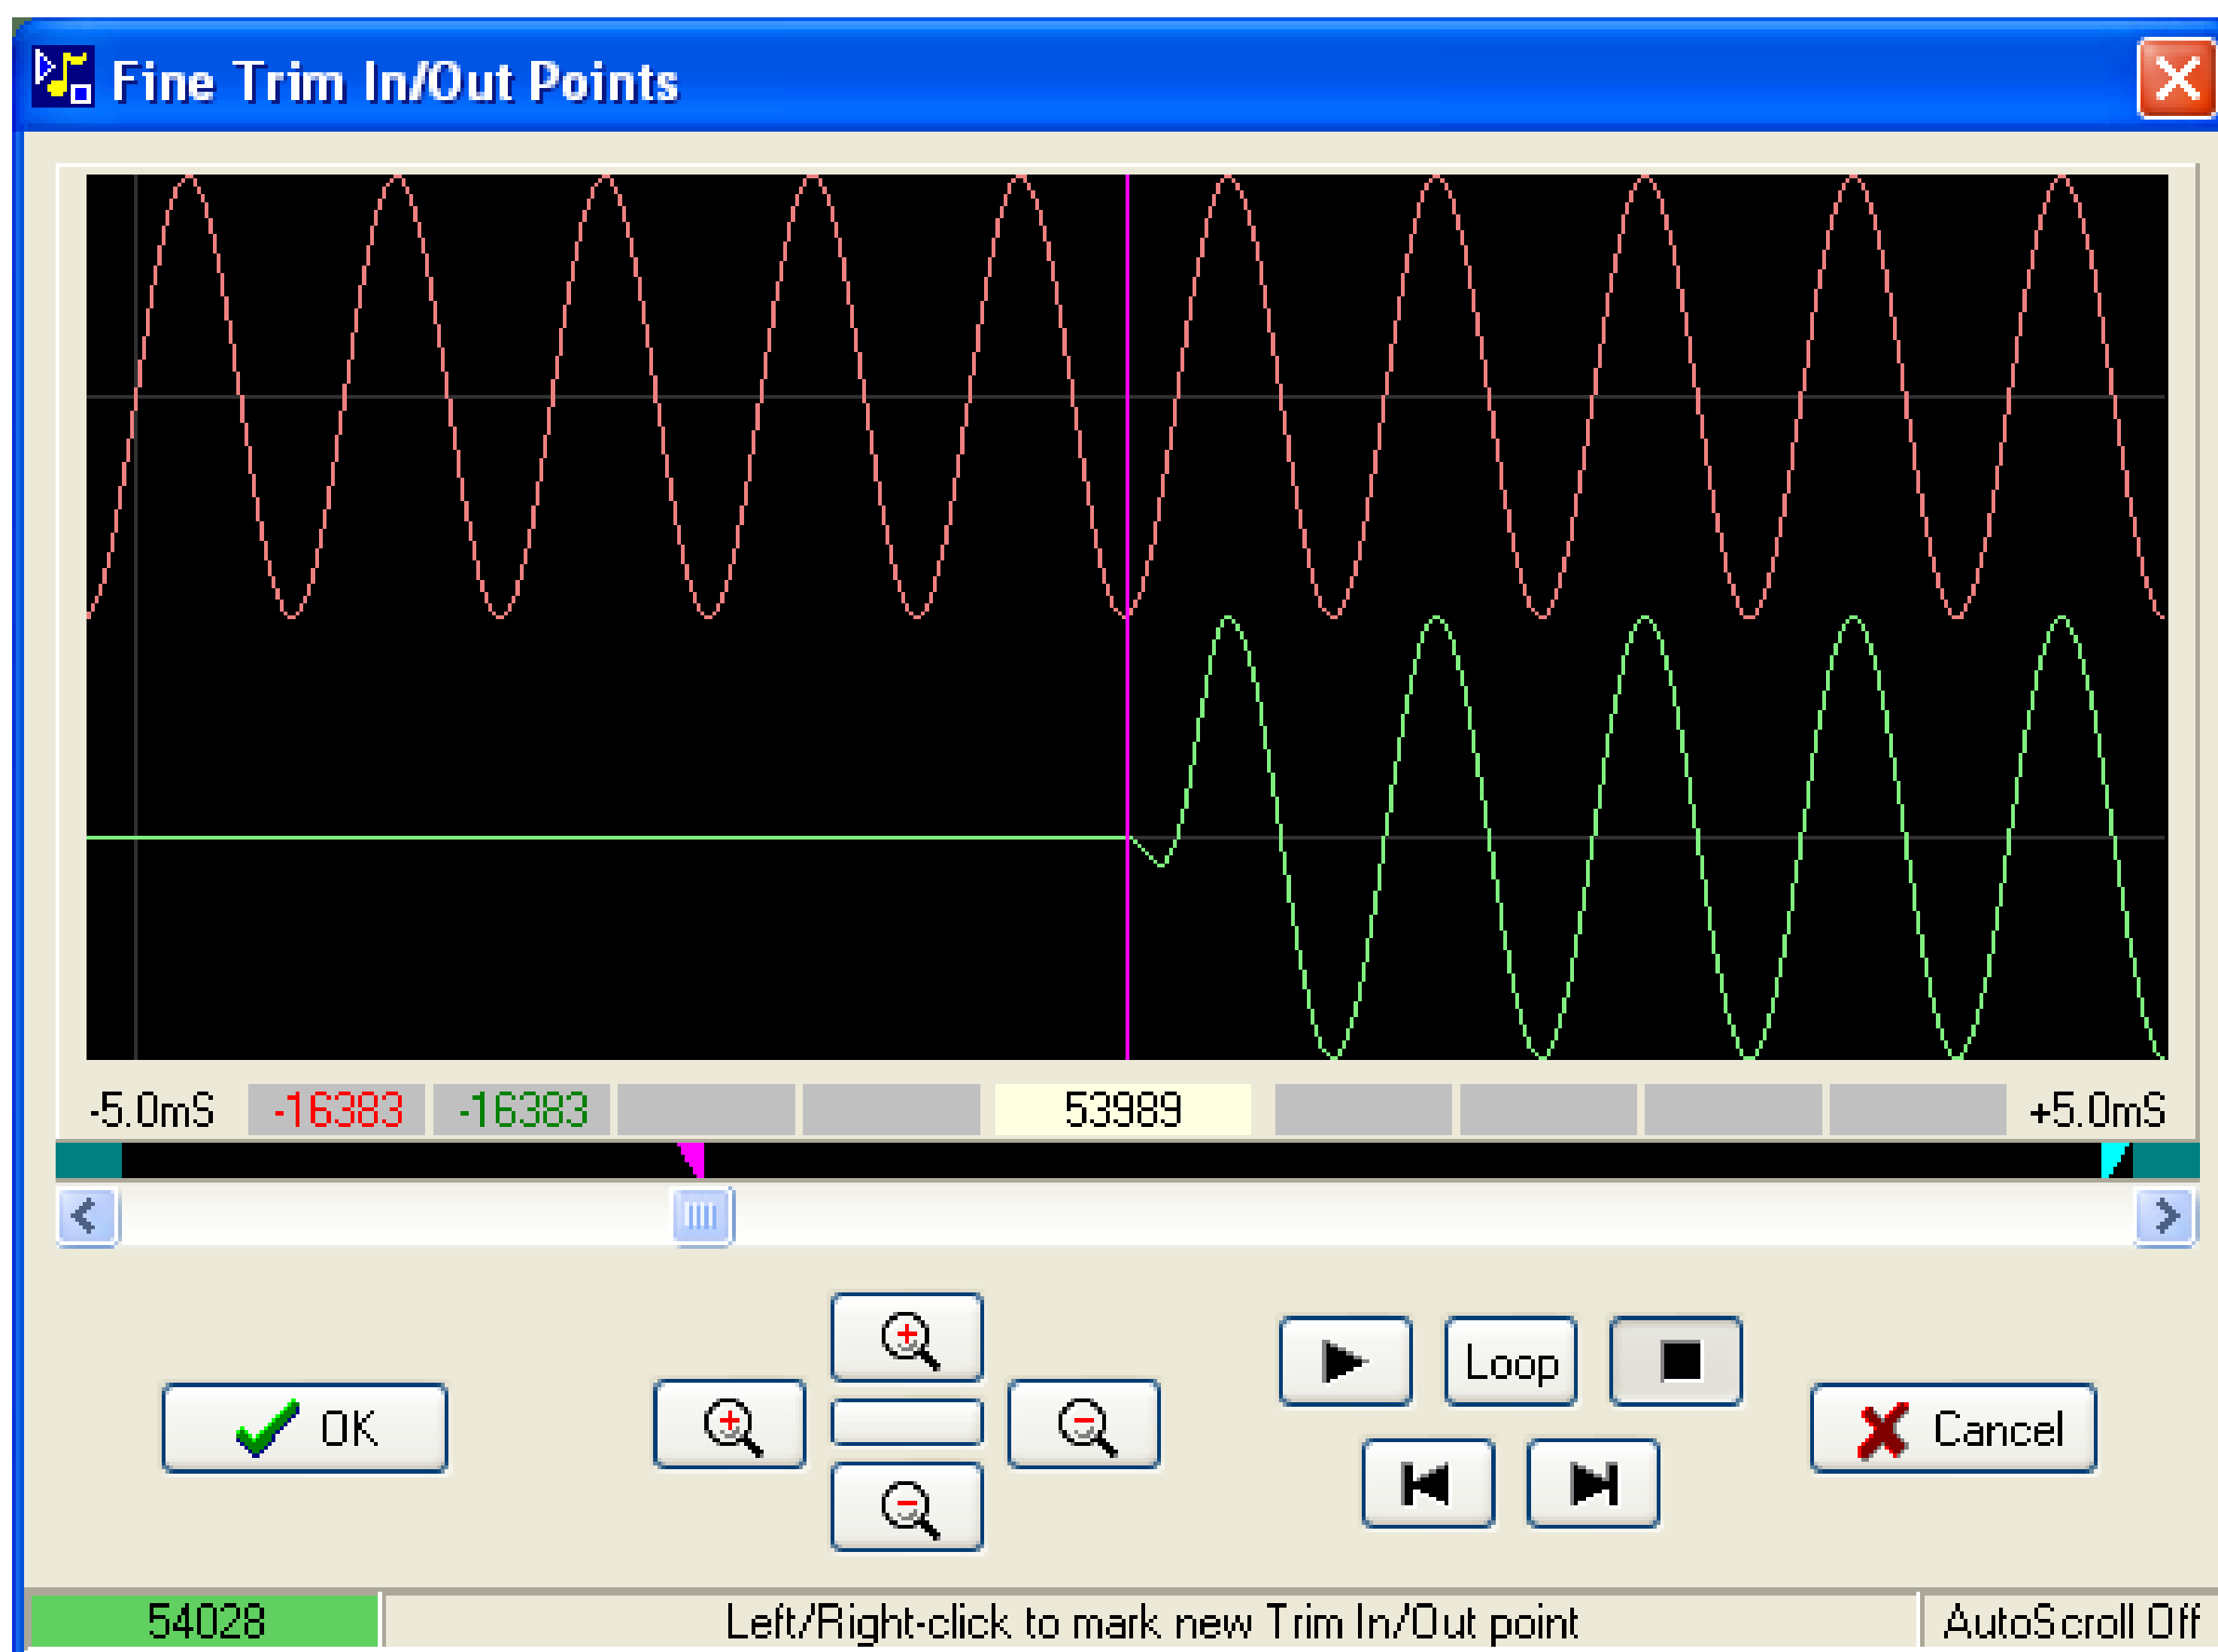

The position display 00:01.125 shown under the centre line is of the form minutes:seconds.milliseconds, alternative displays are available by right clicking the time display label

The samples option shows the sample number

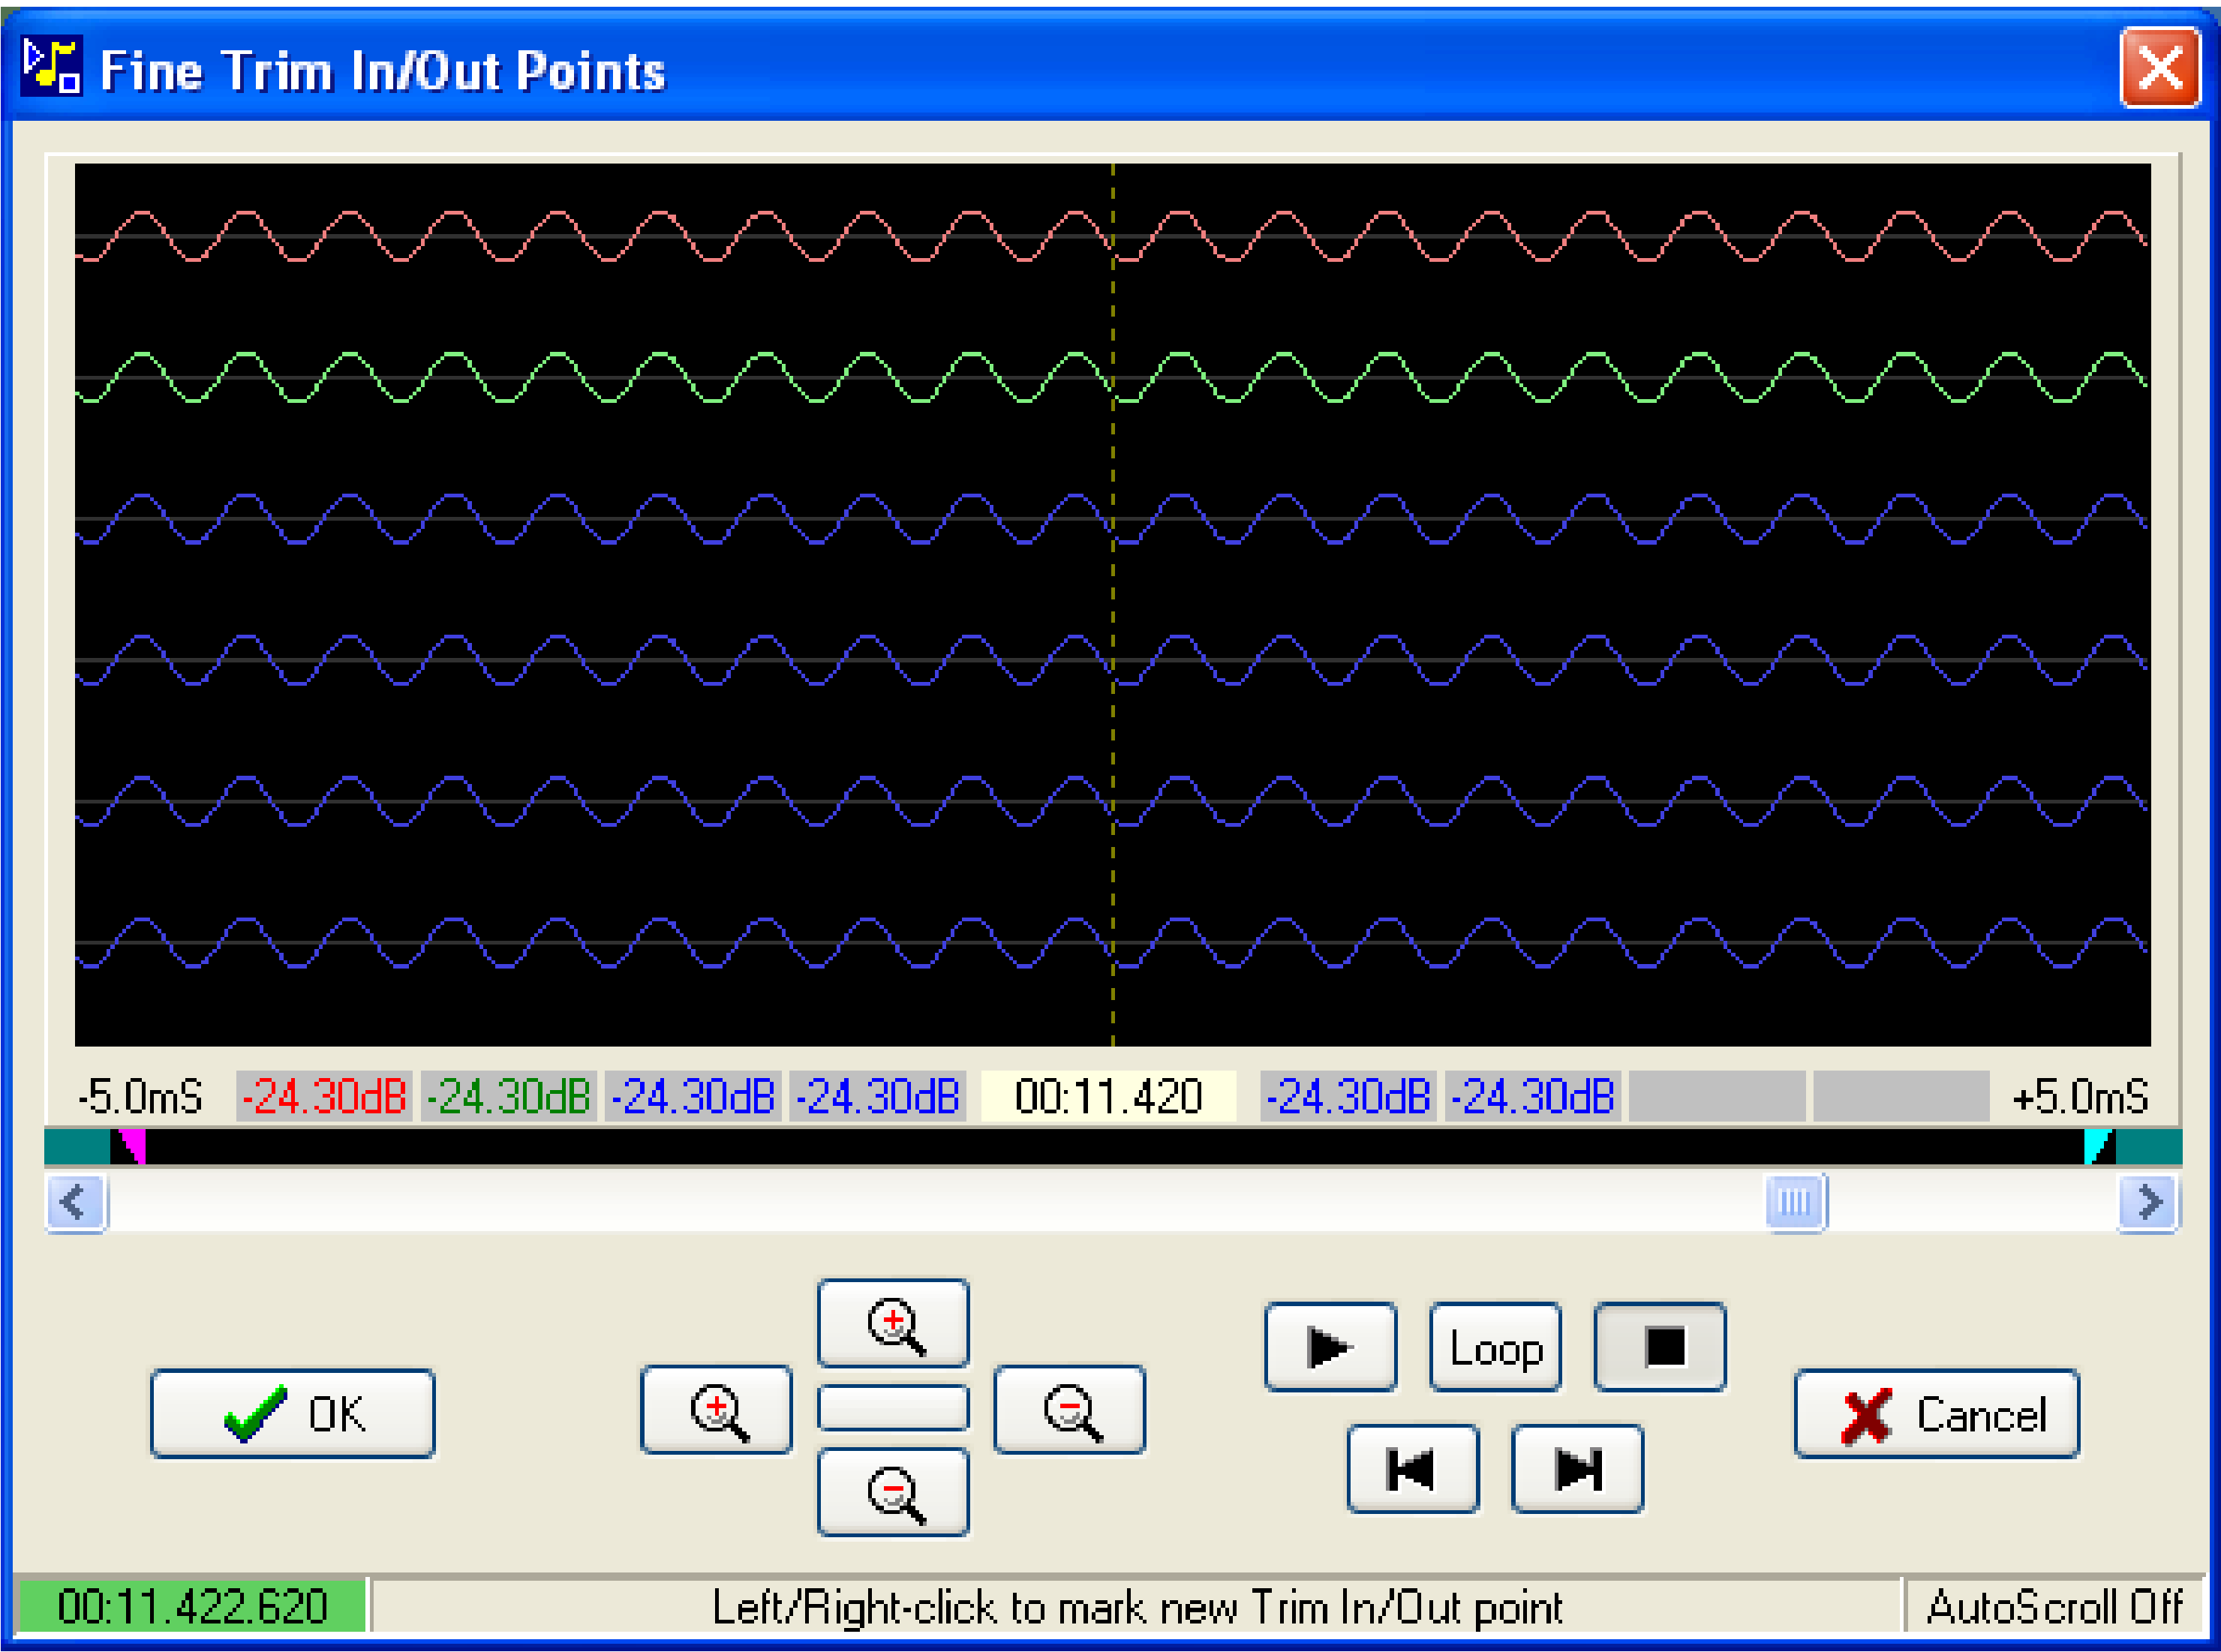

All time displays are reference to the start of the audio waveform irrespective of any Trim In Points that have been set.

At horizontal display widths of 10mS or less the Show Levels option is enabled and will display the levels for the tracks in absolute sample value.

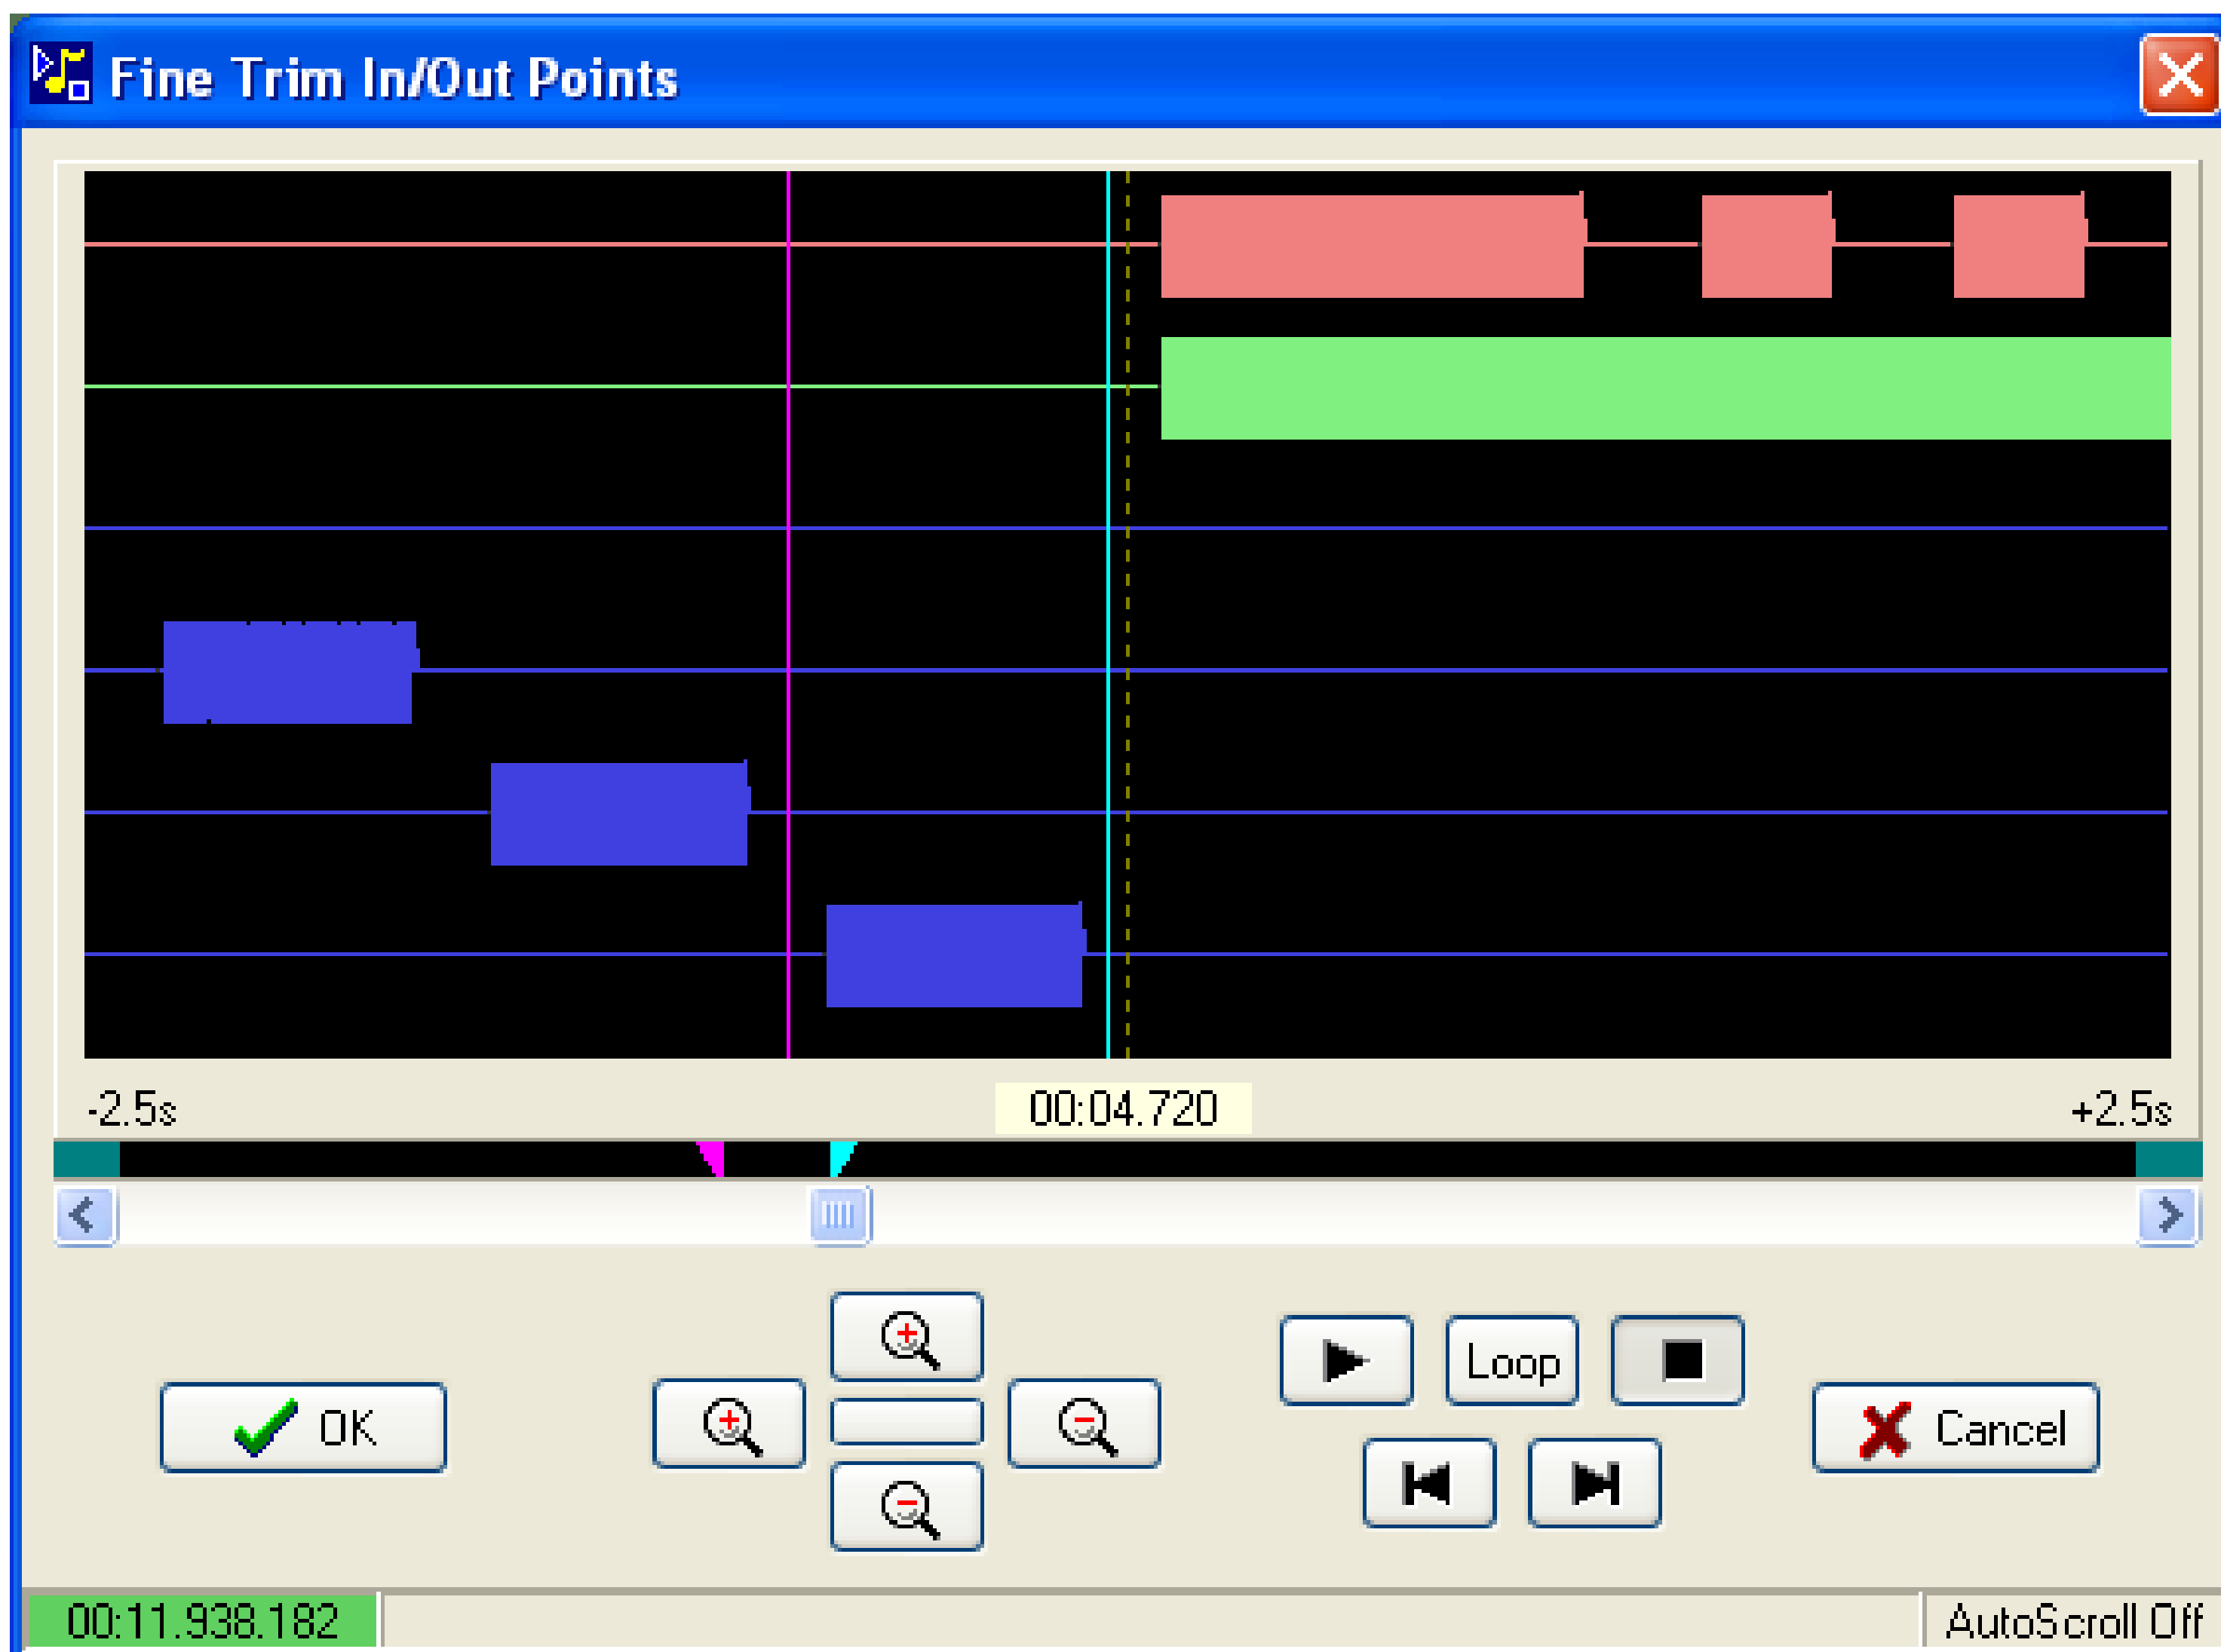

If the time display mode is set to M: S.mS then the levels are shown in dBFS

Multichannel (5.1) tracks are displayed as shown below.

Both Trim In and Trim Out points can be set in this dialog, the In and Out points are shown in magenta and cyan respectively.

The Trim In and Trim Out tabs move the In or Out point to the centre of the screen

In addition to left/right clicking on the waveform to position the In/Out points, the coloured triangles in the Marker Bar section below the waveform can be dragged to the approximate position.

If the In and Out points are too close to be separated they will be shown together as a blue triangle

The individual points can still be dragged, but this time by using Left drag for the In point and Right drag for the Out point.

The In and Out points can be cleared by clicking on the coloured sections at the left and right ends of the marker bar.

When the track is playing, a yellow vertical line is shown on the Marker Bar indicating the current position within the track.

Keyboard qwerty keys 'i' and 'o' can be used to mark the In and Out points respectively.

By default the waveform display is static, however it can be scrolled as the track is played by clicking on the AutoScroll On/Off panel on the lower right of the dialog box.

When AutoScroll is On and the track is playing the display can be frozen by pressing 'f' on the keyboard.

The display buttons shown below control the horizontal timebase (left and right buttons) and vertical gain (top and bottom buttons) of the the waveform, the unlabelled centre button clears the timebase and gain to the default values.

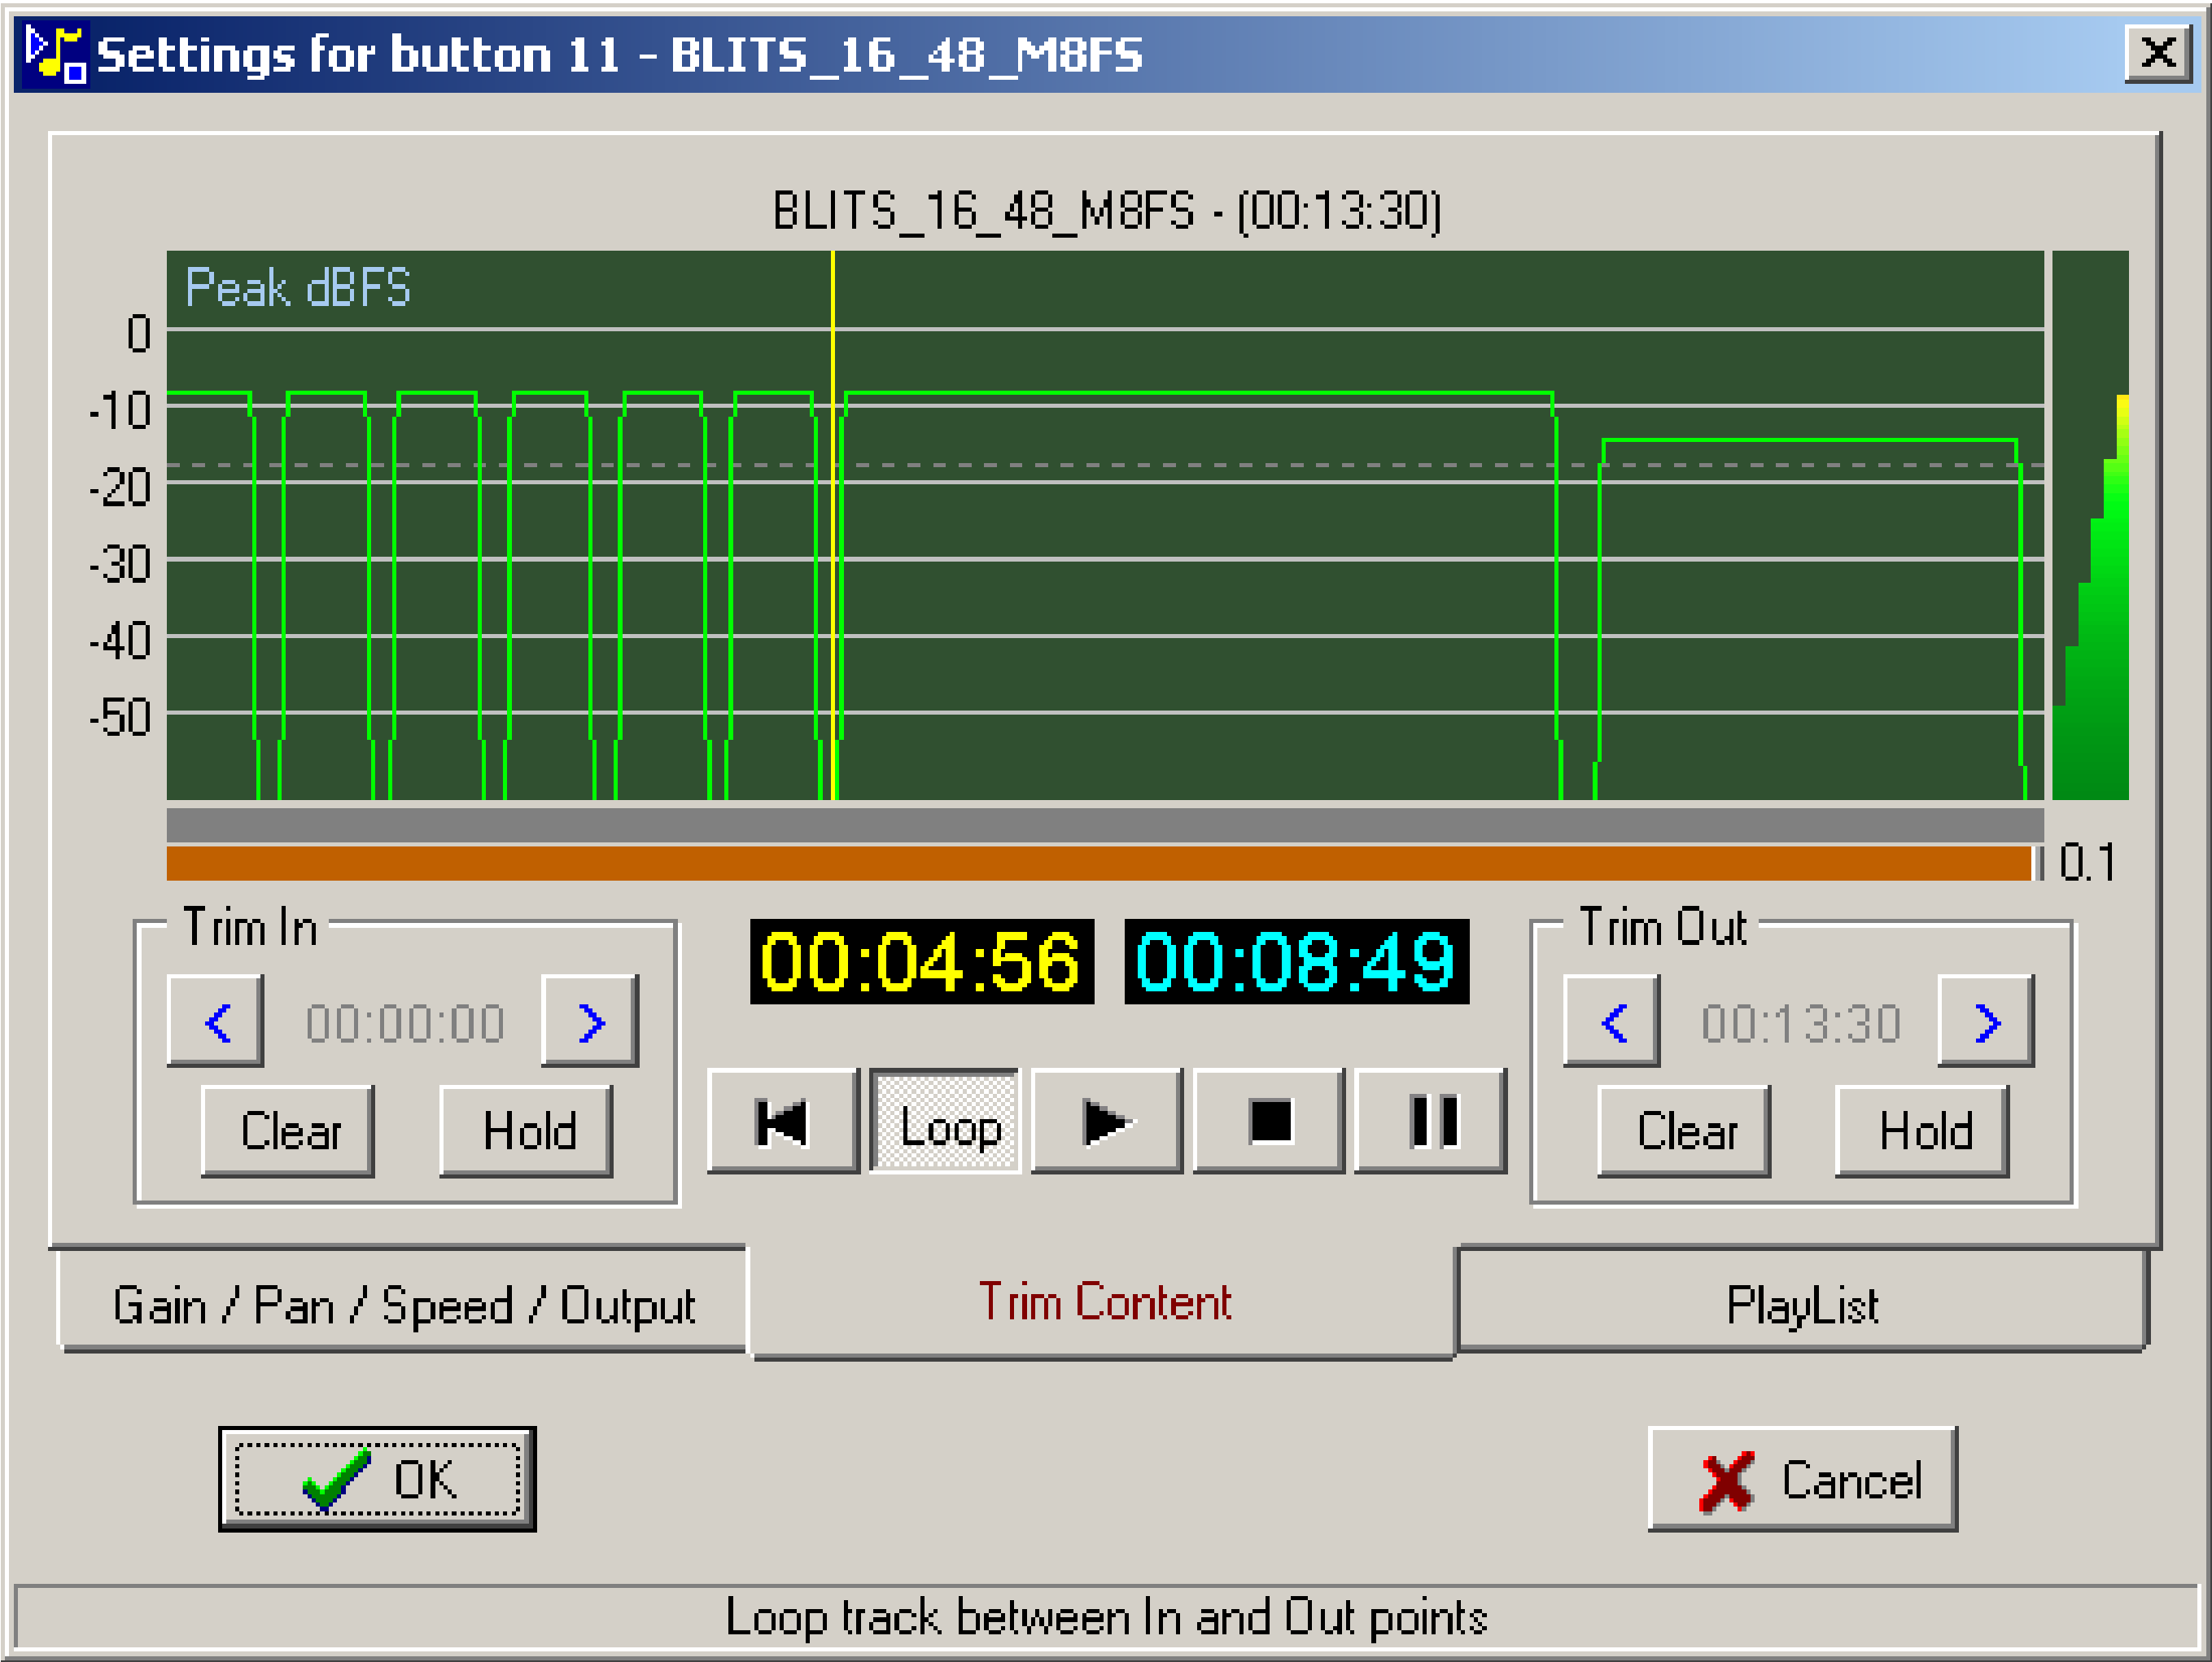

Level Meters

On the right hand side of the graph are peak reading level meters with the same range as the graph scale and attack and decay times similar to that of a PPM, the readings include modifications made by the Pan, Gain and Mute controls.

In the Stereo version of SpotOn there are two meters which can display either L/R or M/S signals the selection is made by right-clicking on the bargraphs, the selection is reset to A/B when the window is closed. The mode is shown by the text immediately above the bargraphs, this text will be red if the track is muted.

In the MultiChannel version of SpotOn there are six meters Left, Right, Center, LFE, Rear

Left and Rear Right

Option 3 changes the level meters to a PPM style of response with PPM6 representing 0dBFS

The fourth option in the popup menu is 'LED Style' which shows the bargraphs as a series of individual LEDs instead of a continuous bar, this option is saved with the session file.

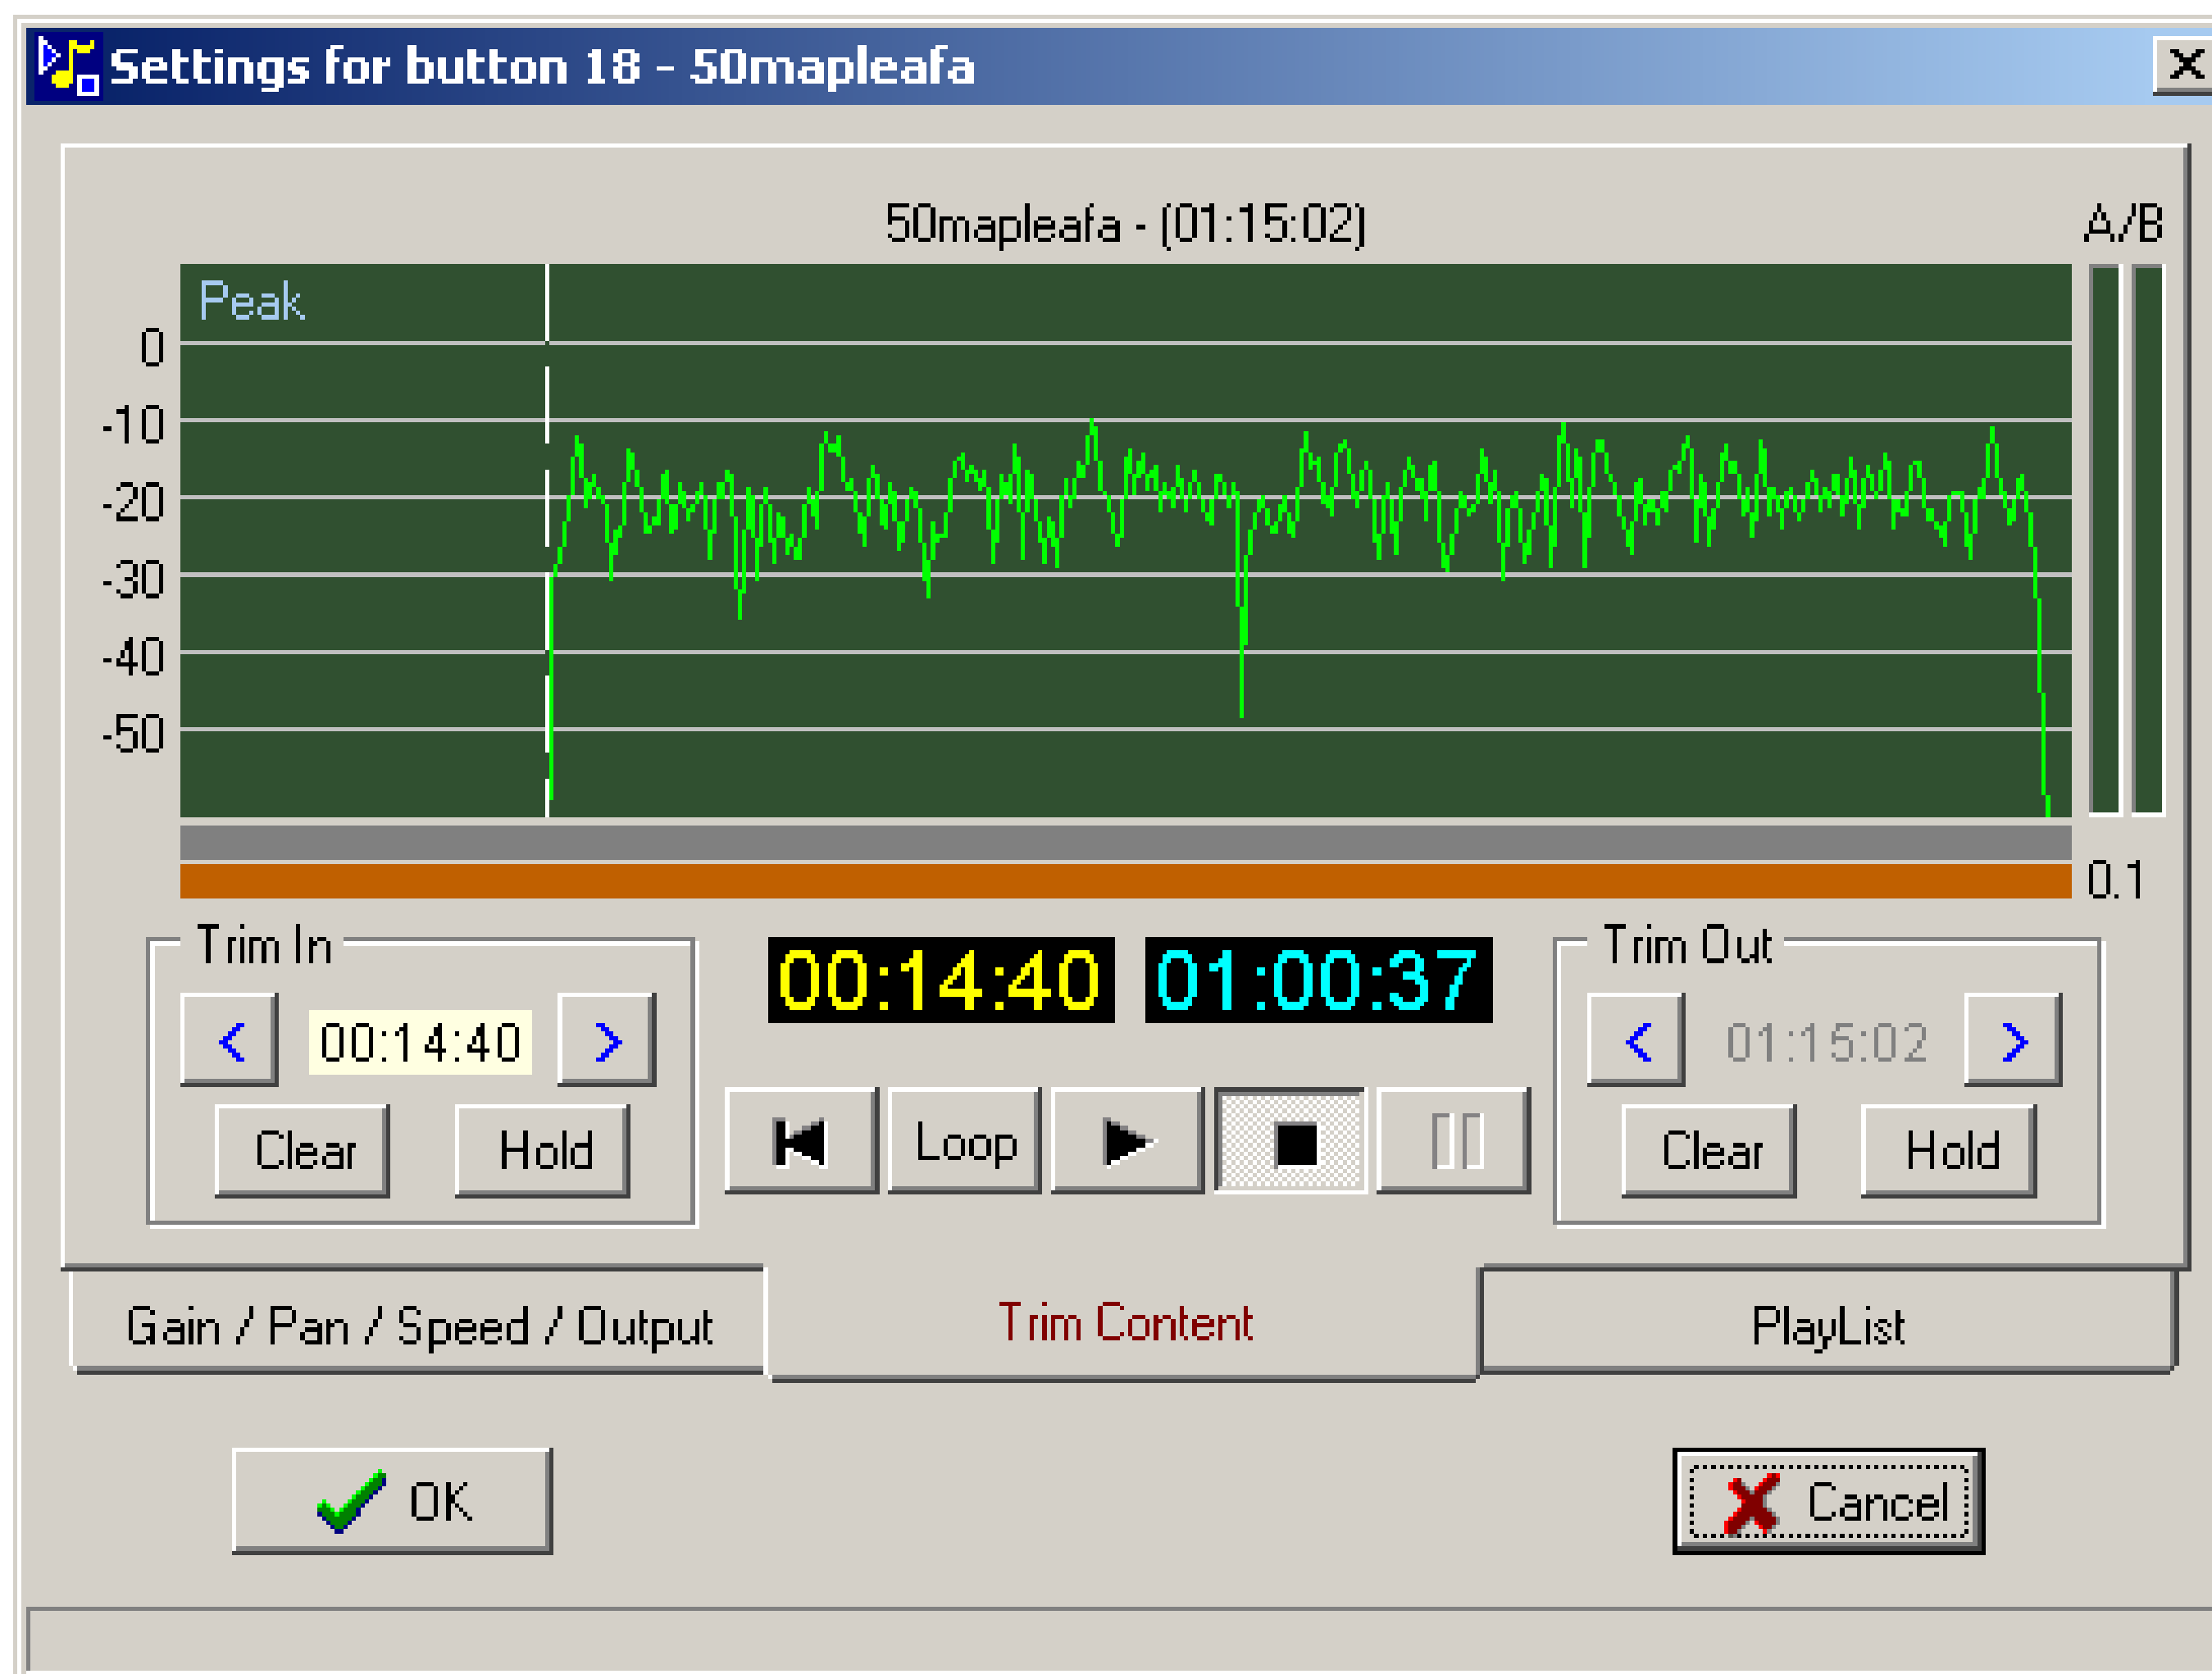

The final option in the Level Meters popup menu is Soft Cursor, when selected the yellow positional cursor on the waveform will track in quarter pixel steps allowing smoother and more accurate movement.

AutoTrim

The Find Audio Start item in the Trim In popup menu scans the audio waveform and marks the In point where the audio level exceeds a certain threshold, here it is -20dbFS. In the example shown below there is a long gap at the start of the audio before any modulation appears, this could be trimmed by trial and error or automatically by using the AutoTrim feature.

Below AutoTrim has positioned the Trim In point at the start of the audio modulation

Similarly The Trim Out menu has a Find Audio End option which locates the last audio modulation

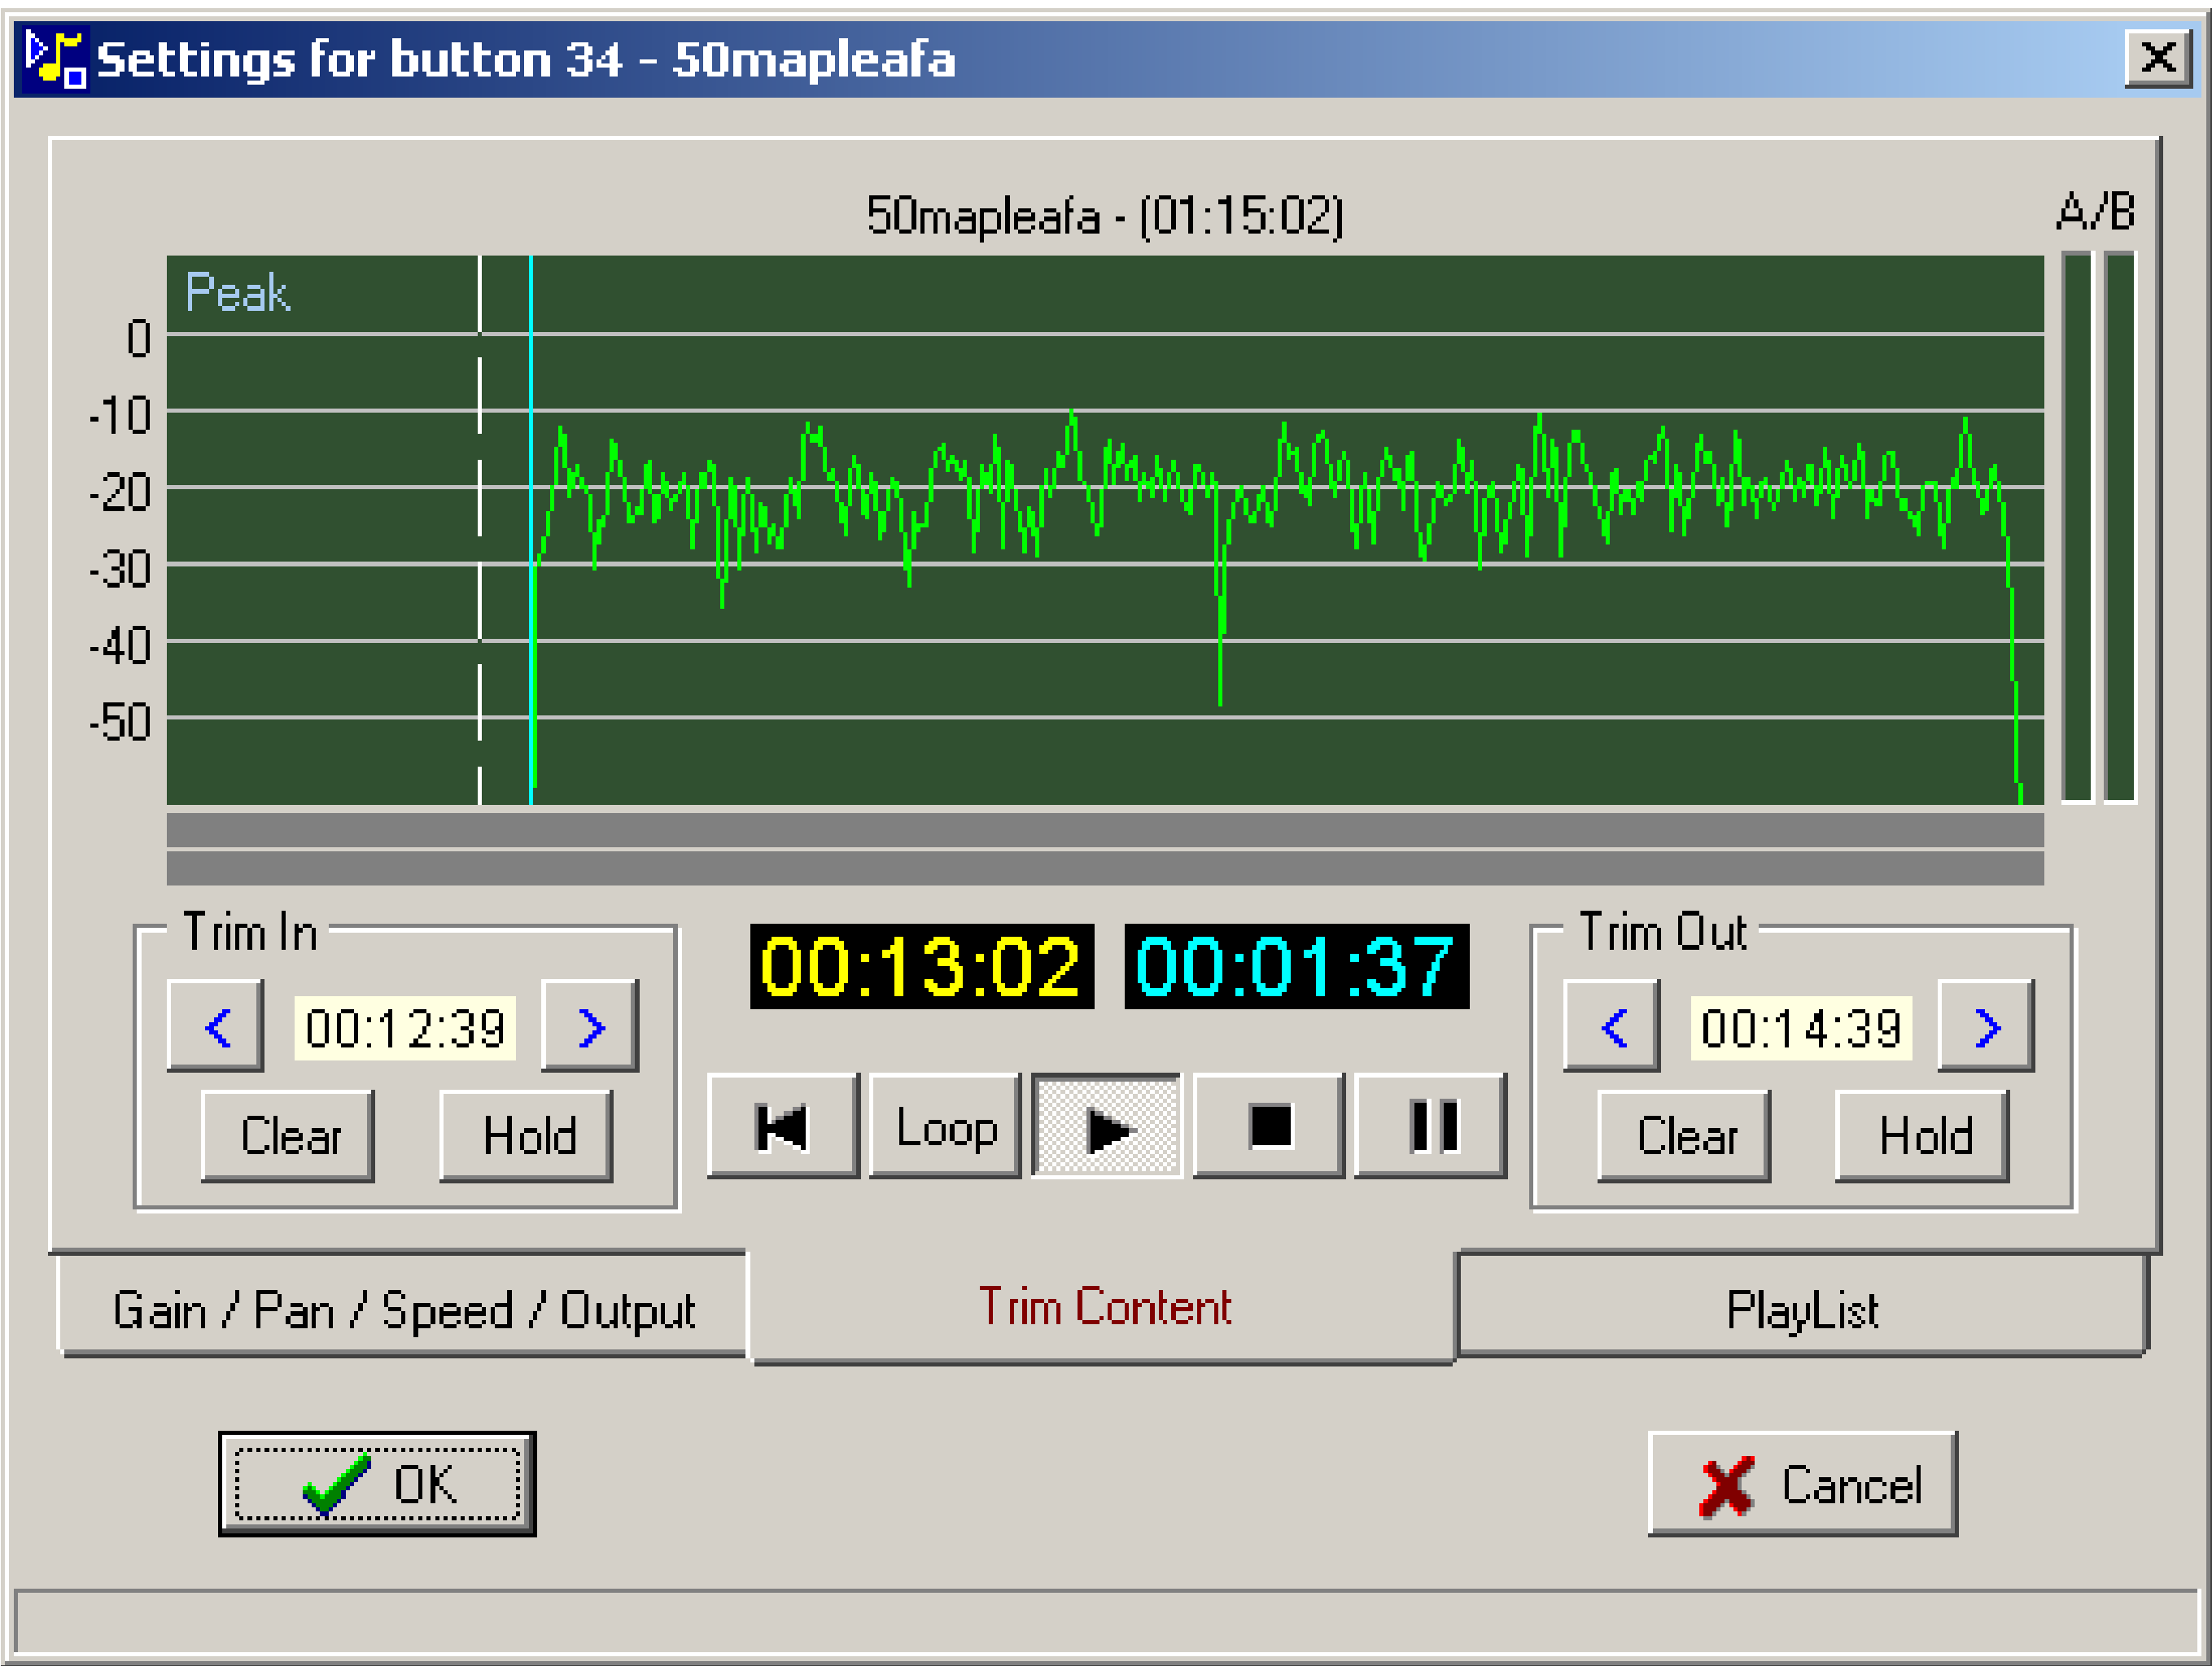

The Find Audio Start/End functions are combined in the "Top & Tail" Track option in the Trim In menu where AutoTrim trims both start and end of the track

Play to In Point

Play To In Point can be achieved by right-clicking the left hand (elapsed time) display which will show a list of rehearsal times, some may be greyed out if the InPoint is close to the start of the track.

Continuing with the example shown above the action of selecting a 2.0s In Point rehearsal will temporarily adjust the In and Out markers to surround the material to be rehearsed

The material up to the In Point can be reviewed and the In point adjusted by clicking on < and > in the Trim In section.

If Loop is selected instead of play then the section will be played repeatedly and the In Point adjustment will be heard directly, remember to deselect Loop otherwise it may be inherited by the button when the dialog is closed.

The Out point will return to the original value when the track is stopped or the dialog box closed.

The button display indicates whether Trim In '>' and Trim Out '<' are active, both ends of the track being trimmed is shown by an 'X' prefix.

Just below the waveform are two horizontal lines coloured brown with black/white transitions (Fade Bars), these represent a graphical display of the fade in and fade out timings where black is -40dB and white is 0dB gain. The fade times can be modified by dragging along the fade bars.

The -40dB level is the default for fades and can be set via Options|Gain Settings|Fade In/Out Depth

The two time code values show - in yellow the elapsed play time and in cyan the time remaining.

Rehearsal

Rehearsal of the last xx seconds of a clip can be achieved by right-clicking on the right hand (time remaining) display, this will show the following popup menu

Clicking on any item will cue the track to xx seconds before the Out Point and play until the end.

Entries in the popup menu will be disabled if the rehearsal time is greater than the track length.

Transport

The transport buttons control playout of the track, working from the left the button

functions are: -

Cue - to start of track or In point if defined

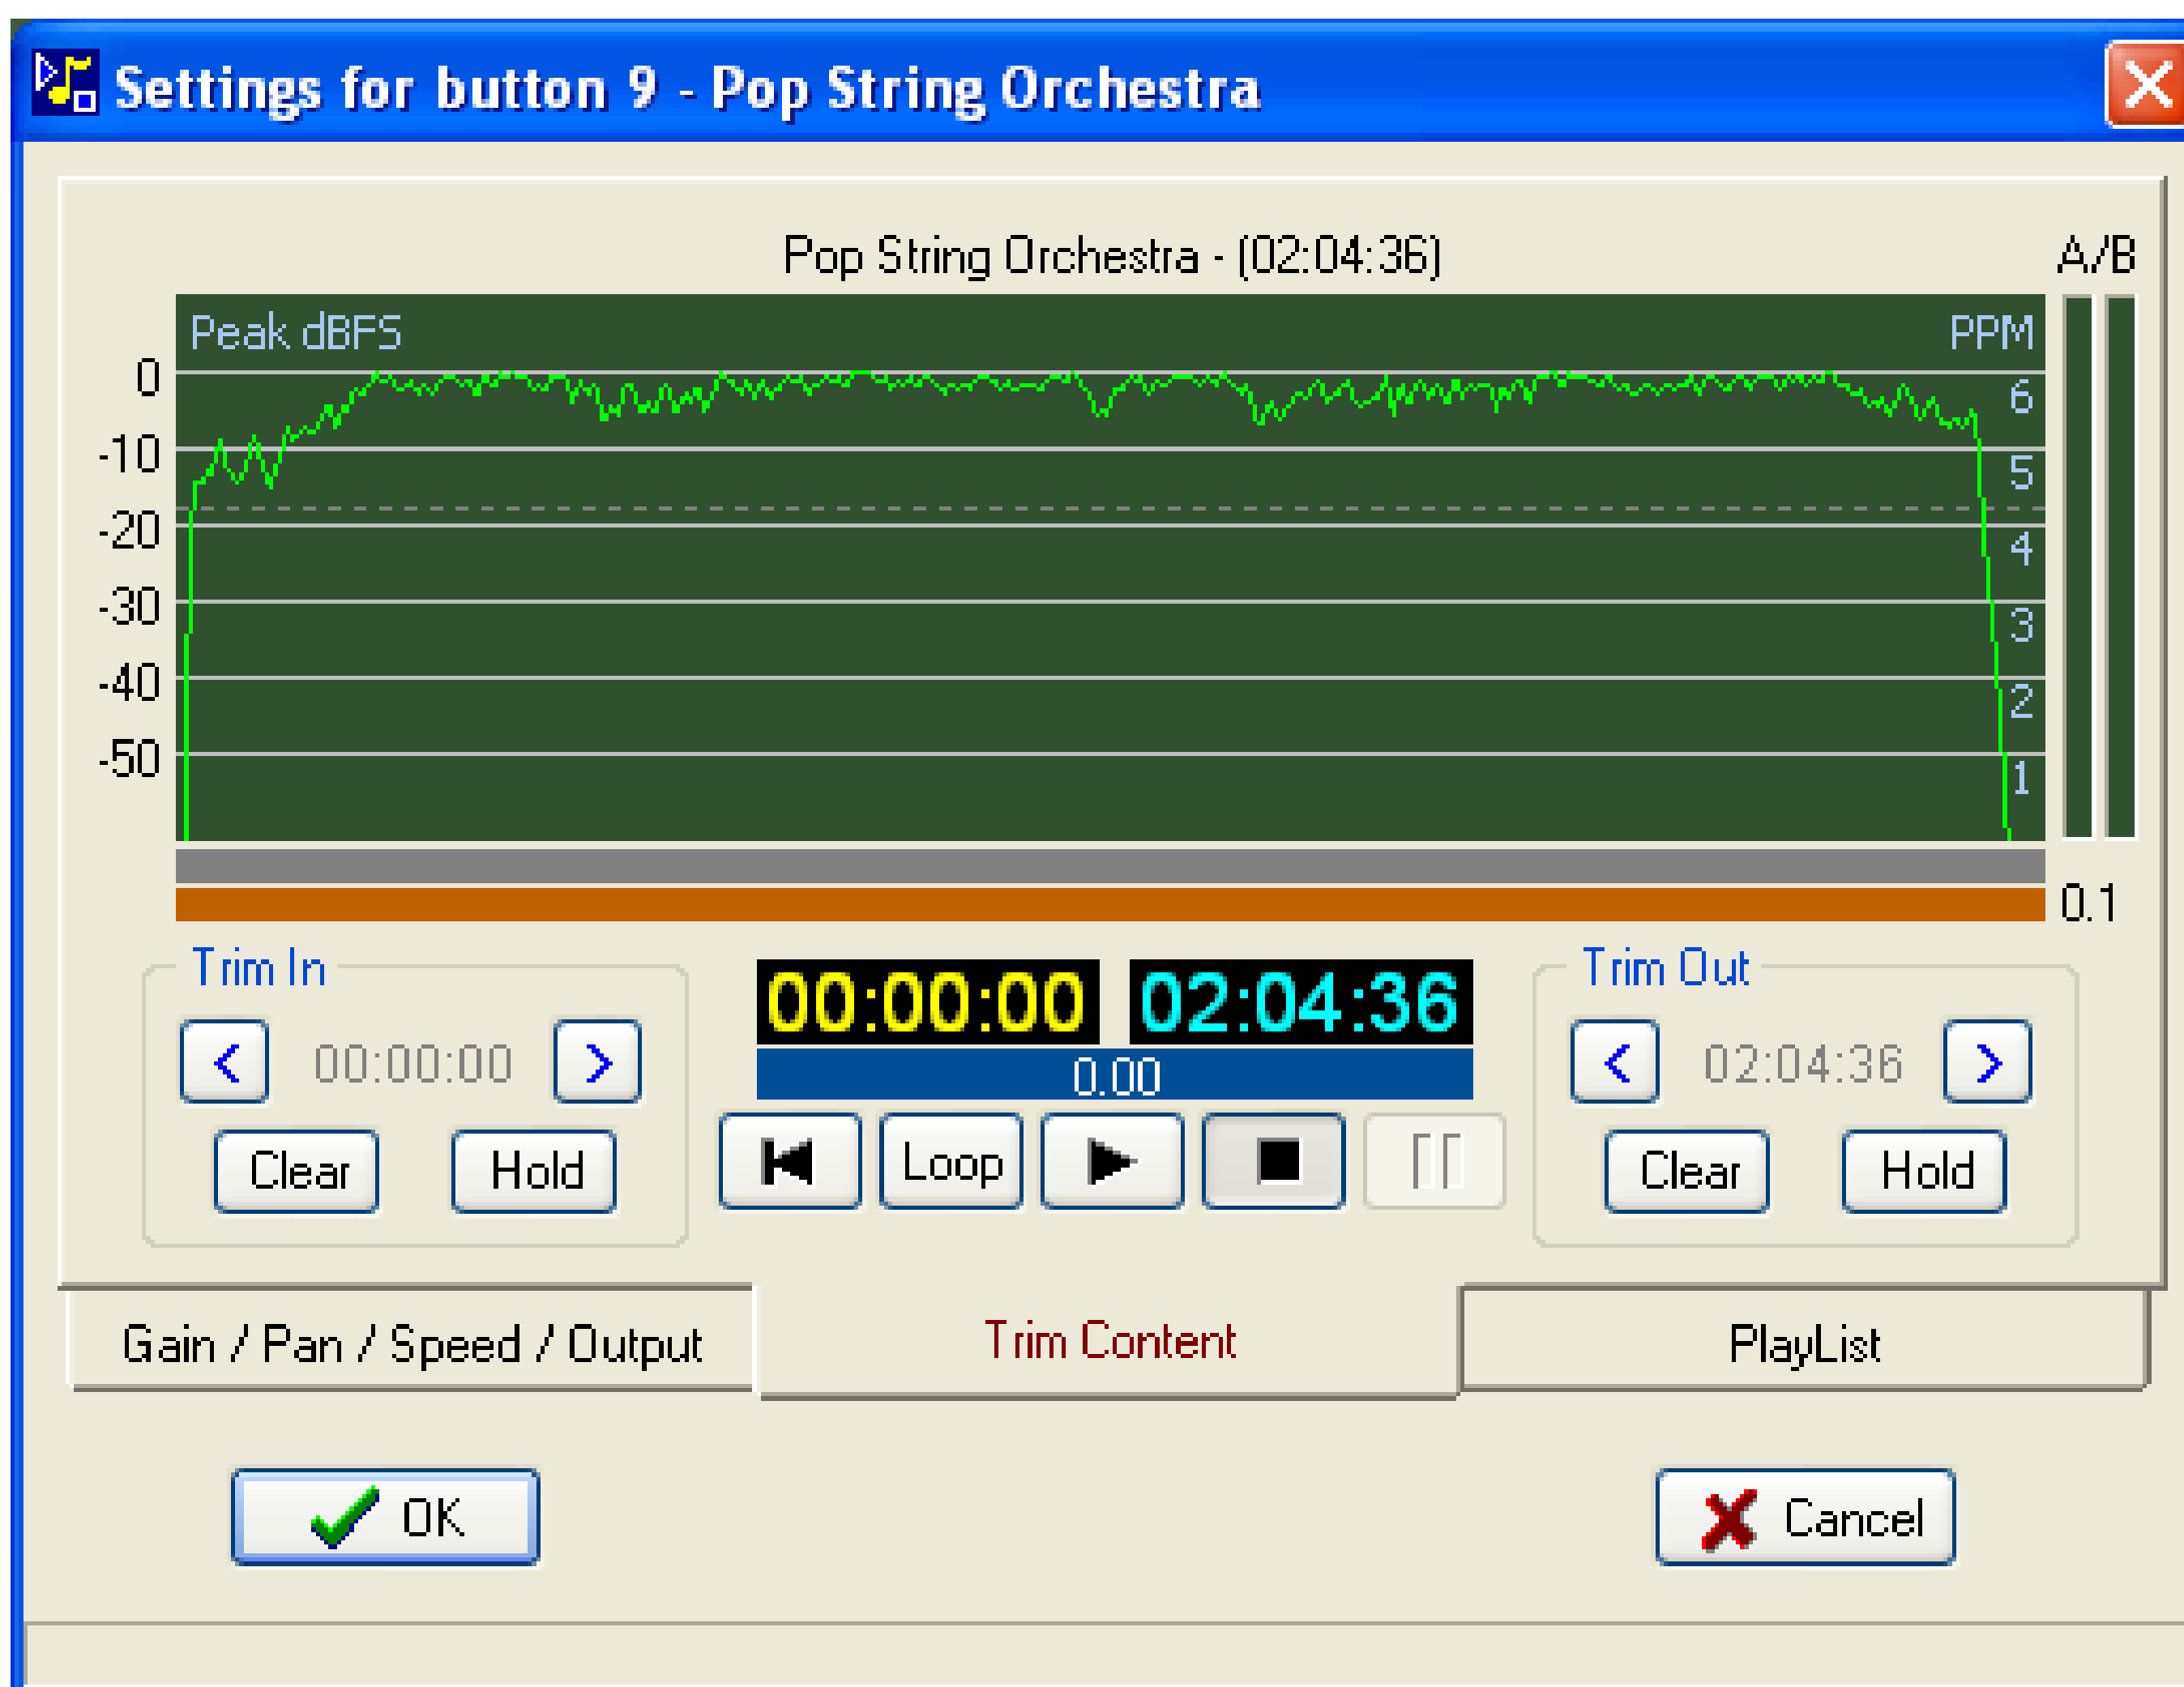

Loop - between start/in point and end/out point of track

Play - spacebar will play track from In Point

Stop - spacebar will stop and recue track to In Point

Pause - toggles Pause/Play
Note: Pause cannot be used if the track contains a Playlist

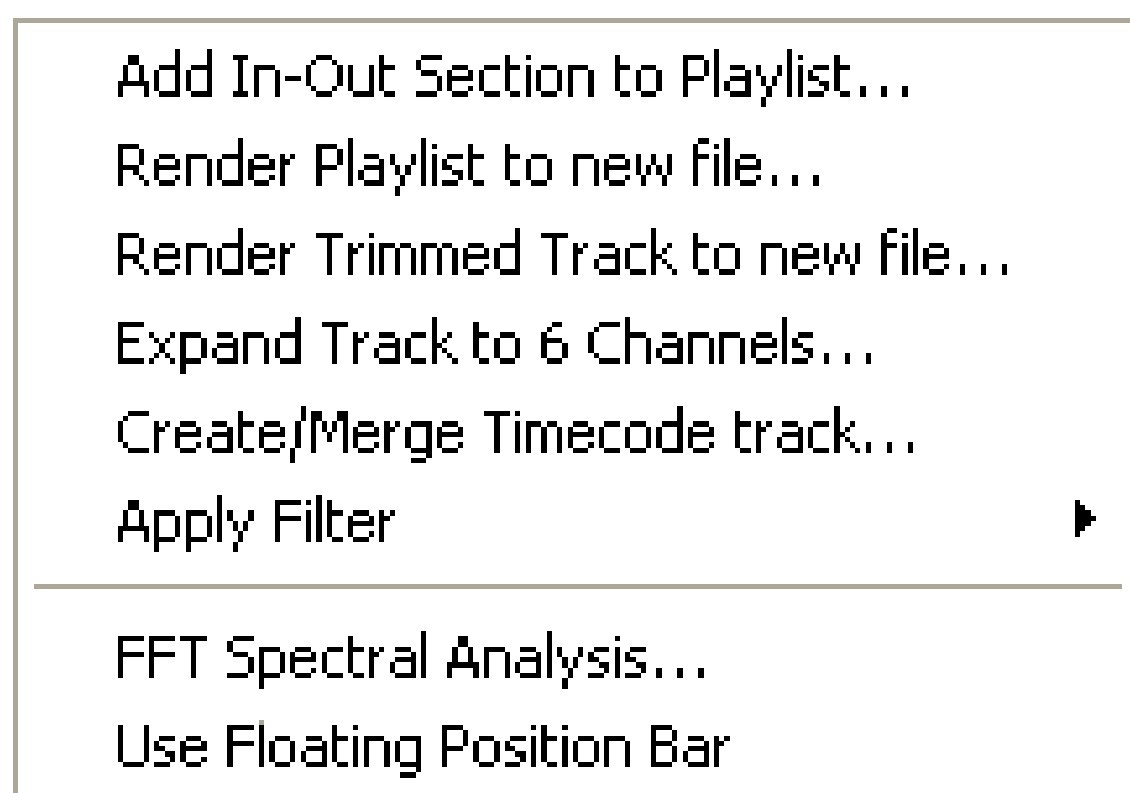

Timecode Chase

If Timecode Chase is active the current time offset error averaged over one second is shown in the blue panel above the transport controls.

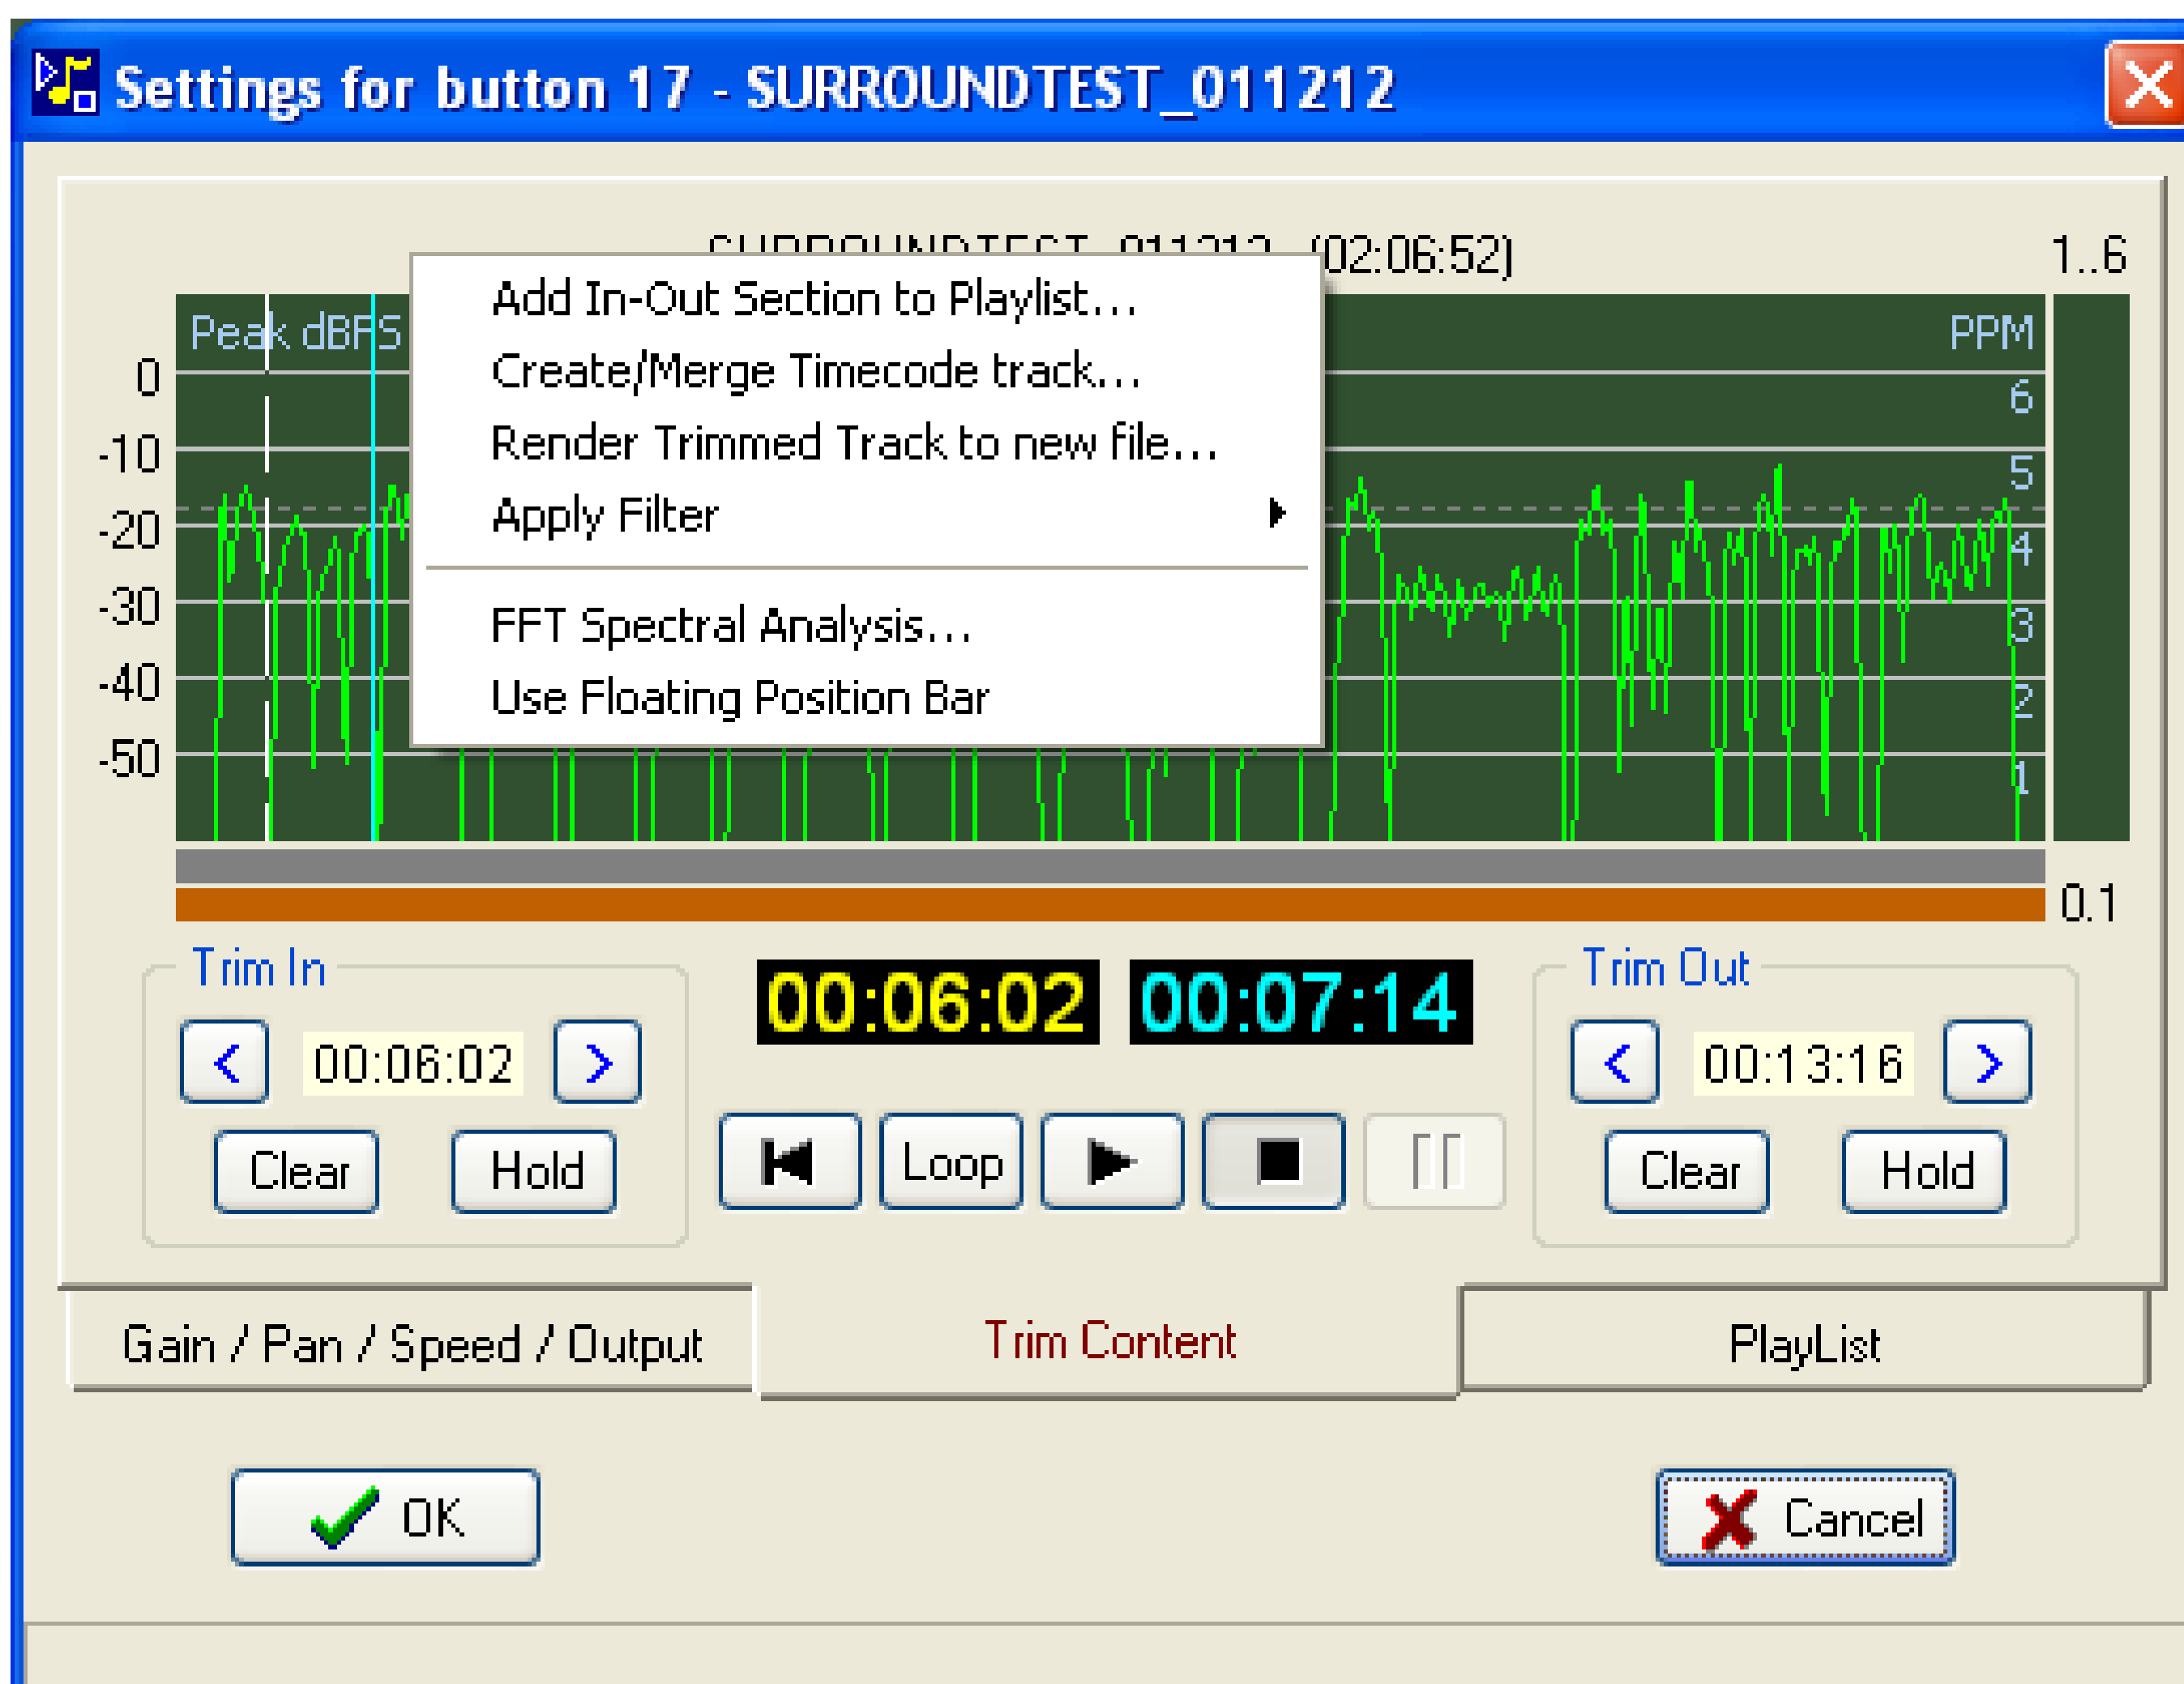

Clicking on this panel will force a resynchronisation of the track to the external timecode

Virtual Playlist Segments

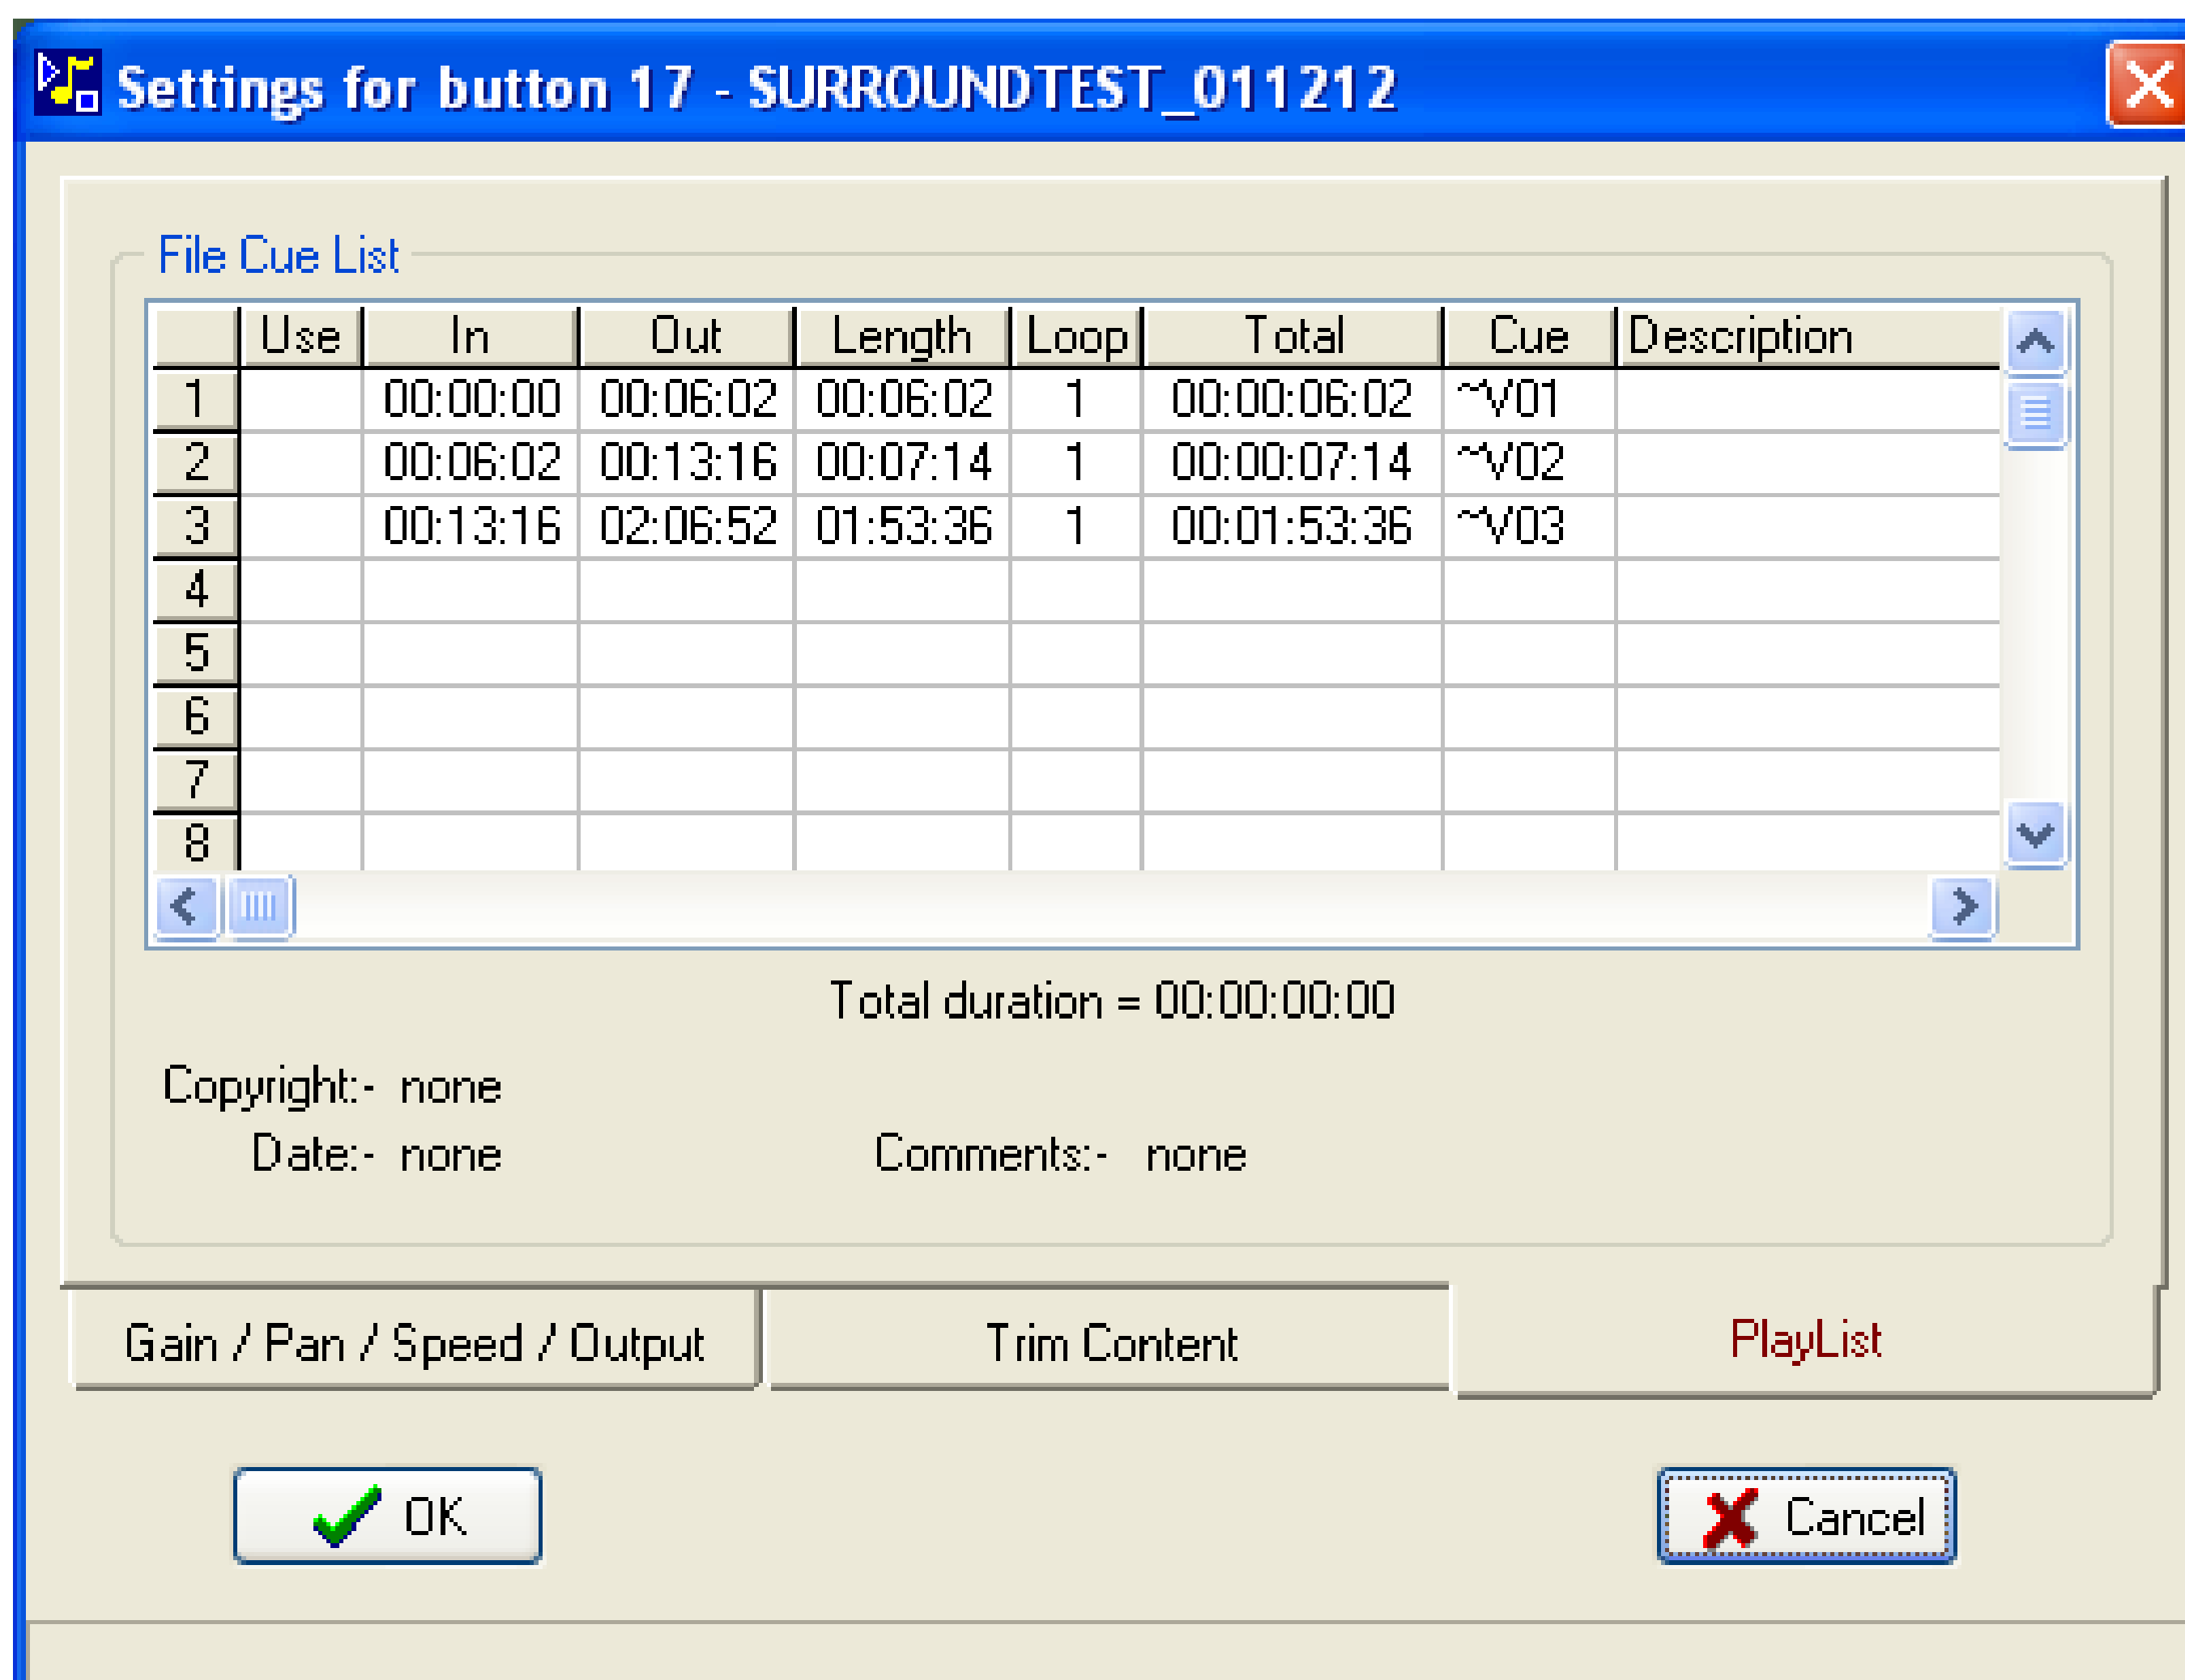

The menu item Add In-Out Section to Playlist will add three new (virtual) playlist segments comprising Start>In, In>Out and Out>End.

These playlist segments can be used just as any other, their intended use is to enable a quick method of removing a section of audio defined by the Trim In and Trim Out points

Moving to the PlayList tab will show the three new items

Checking segments 1 and 3 will cause the track to skip the Trim In..Trim Out section

Right-clicking on the In column entries will display further options

Some options are disabled when the Playlist is active

Delete All Virtual Segments will remove all playlist items added since the file was loaded, that is all items with names starting "~V"

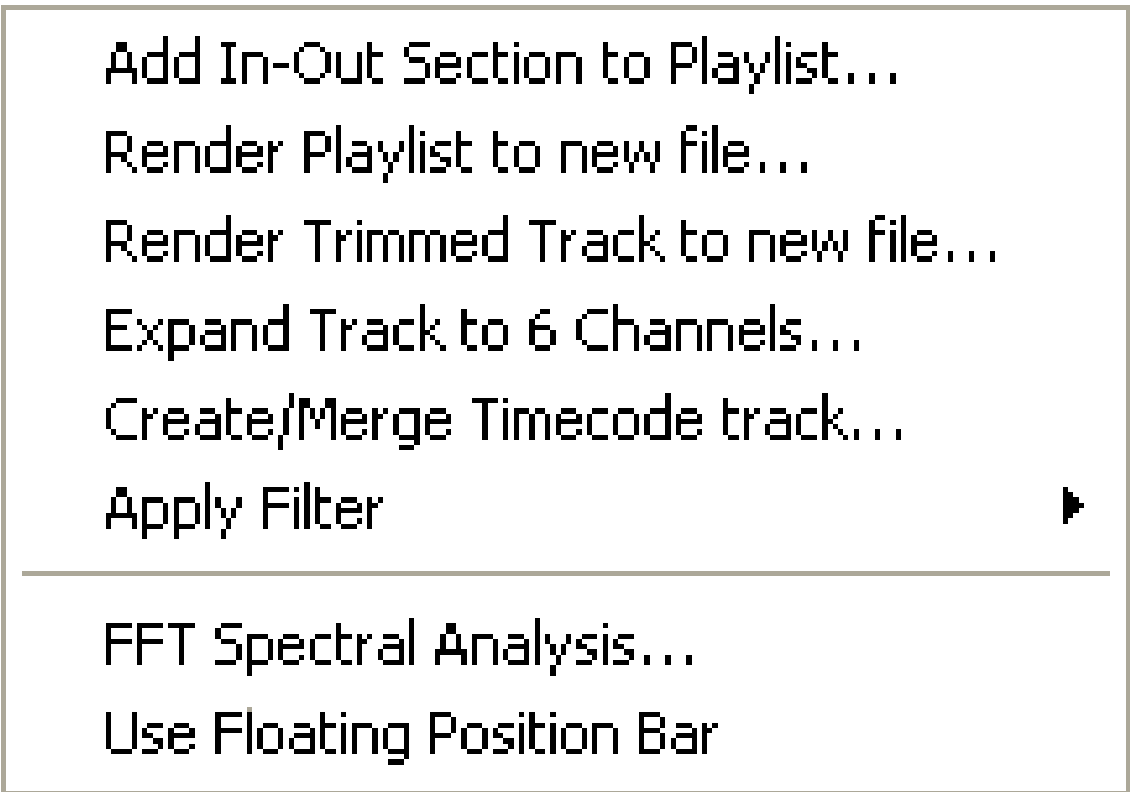

Cue to In will cue the track to the In Point of the selected playlist segment

Set Trim Points will reset the track Trim In and Trim Out points to match the selected Playlist segment so that the timing can be adjusted if necessary

Play from In Point will play the track from the In point of the selected Playlist segment.

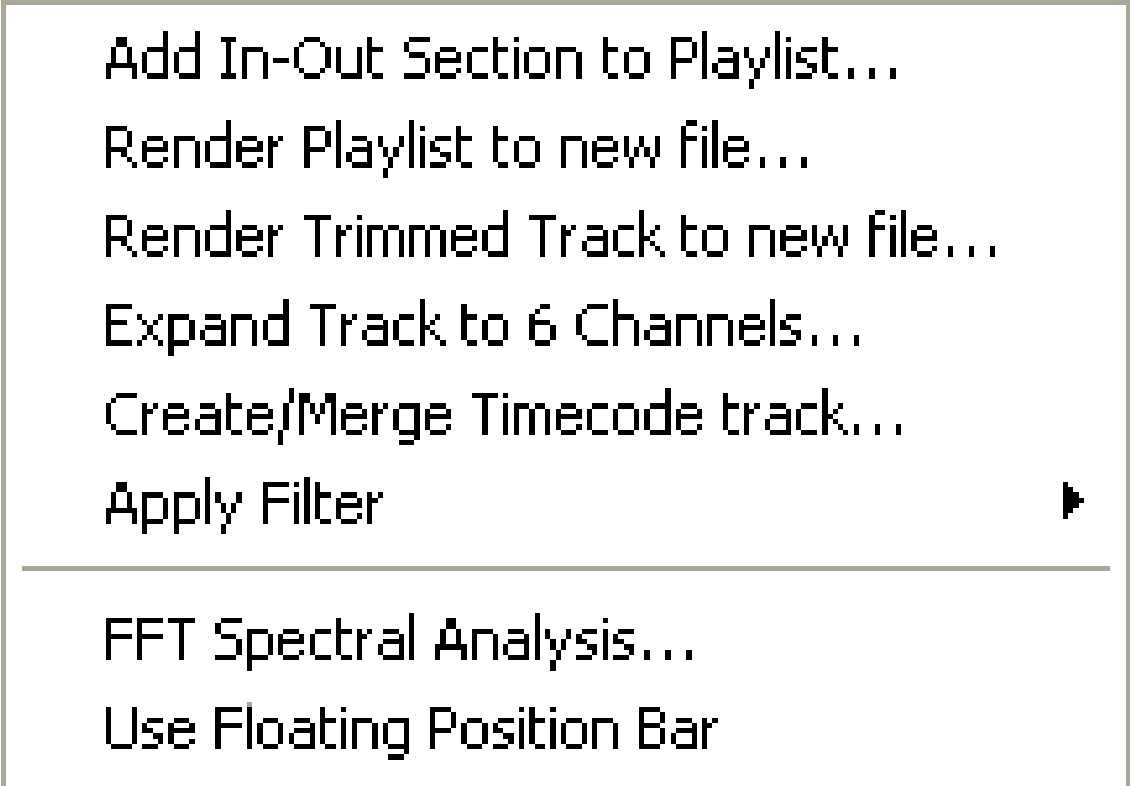

Render To New File

The right-click options in the Trim window include the option to Render Playlist to new file.

Choosing that option will display a setup dialog enabling selection of the track parameters to be rendered, the Mix Down options are inoperative in this mode.

Expand Track Channels

If the button track consists of either 1 or 2 channels and SpotOn is in MultiChannel mode, the Expand Track to 6 Channels option will create a new WAV file with the original audio data and at the same time increase the number of tracks to 6.

The reason for this option is to allow the 5.1 surround sound panning of mono and stereo tracks.

Mono and stereo tracks cannot be panned directly in 5.1 mode, however they can be converted to 5.1 tracks with this option and then panned +/- 180 degrees.

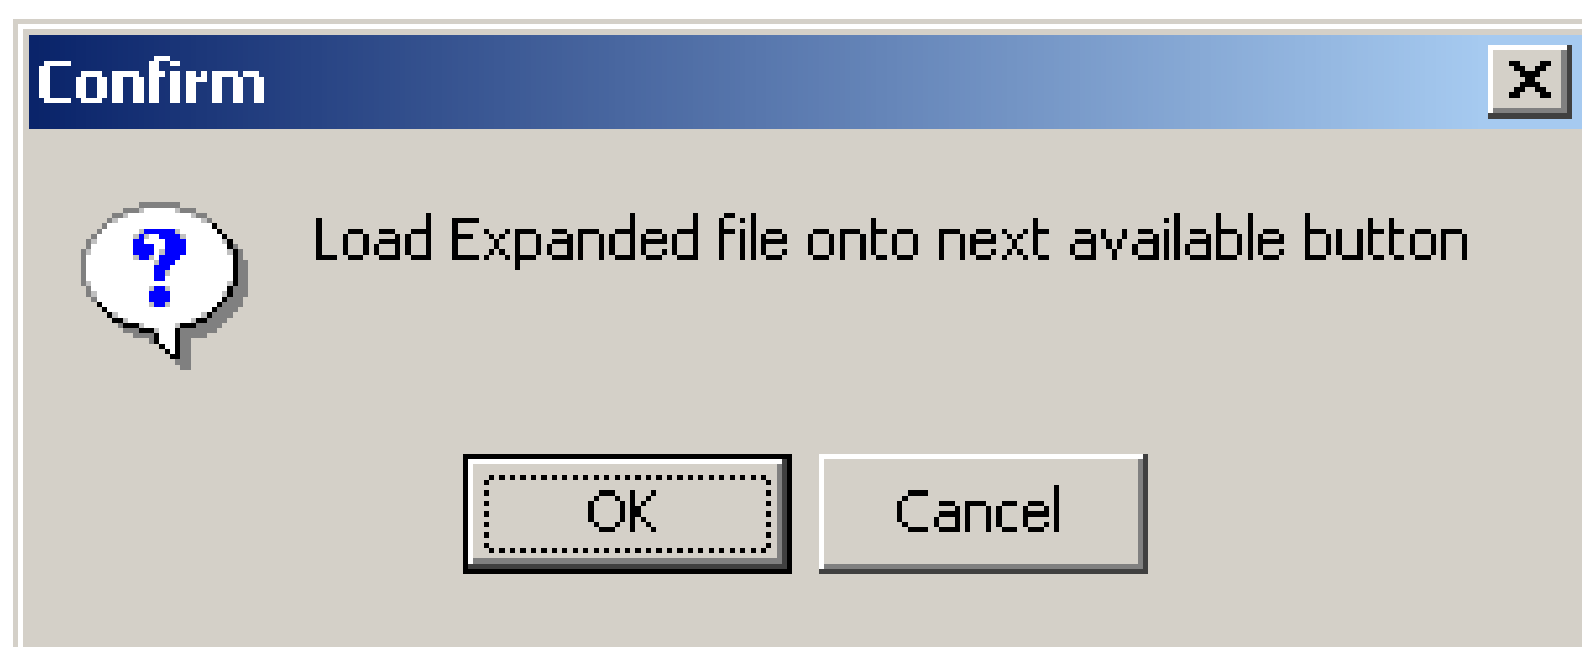

The default name of the expanded track is OriginalName_!6ch!.wav, the name and location can be changed in the dialog box below

If the file already exists then a warning prompt box will appear

The progress of the expand process is reported along with the option to cancel.

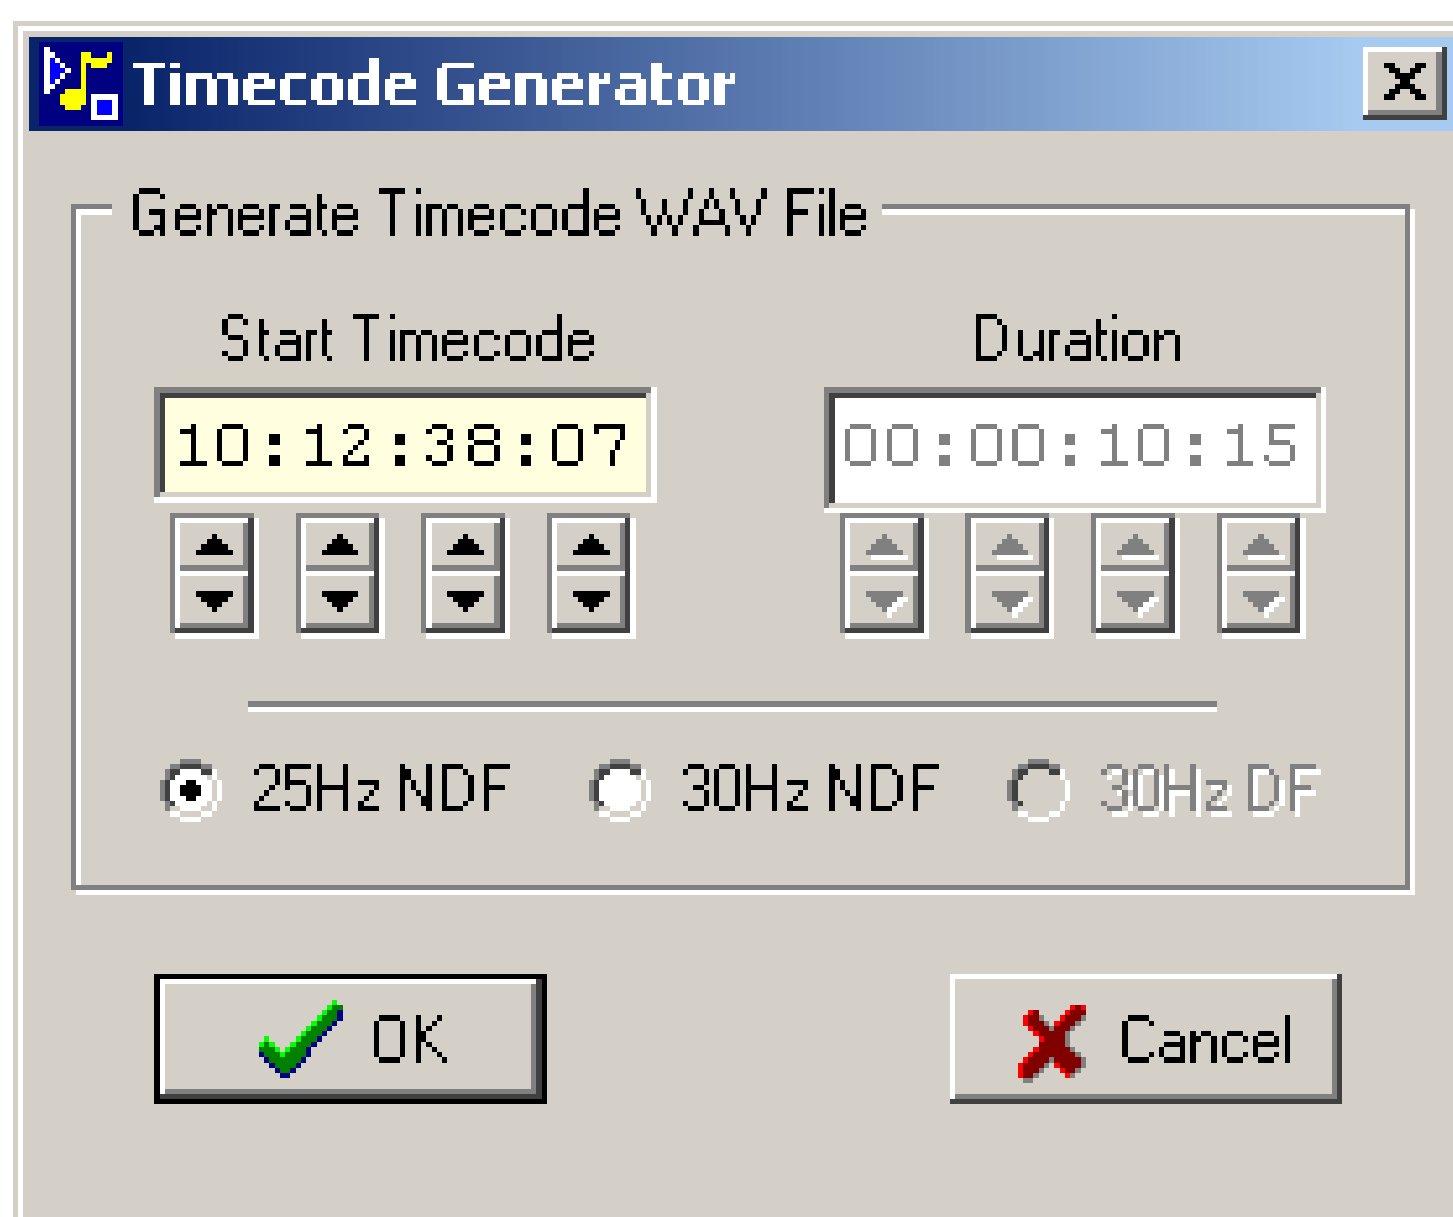

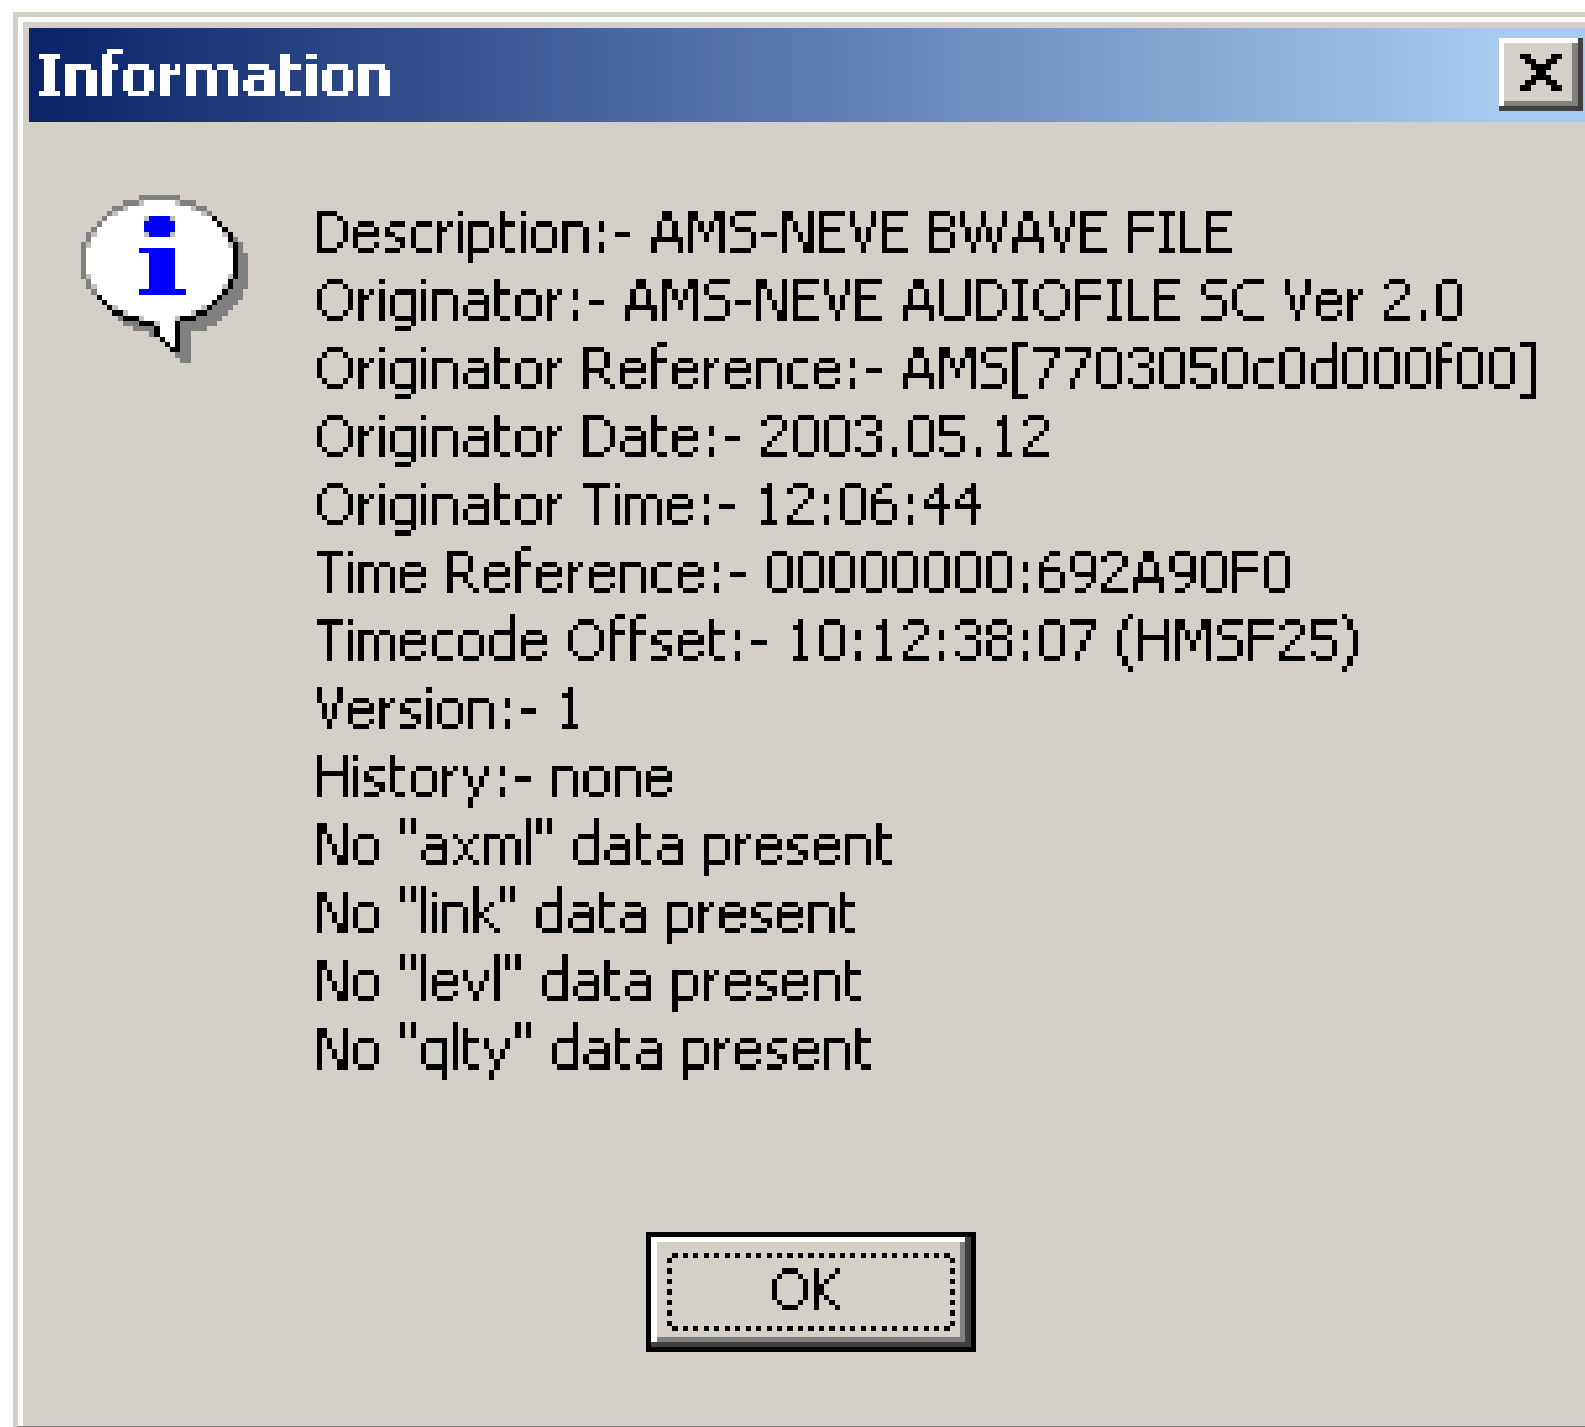

Finally the option to load the expanded track onto the next available button is offered, the button will be loaded when the main Audio dialog window is closed.

Create Timecode Tracks

An associated timecode track can be generated from a button track, most tracks do not have any form of timecode reference so a default timecode range starting at 00:00:00:00 will be shown.

In the case of a BWAV (Broadcast WAV) file there is a start timecode embedded within the metadata and this is used as the start value for the timecode file.

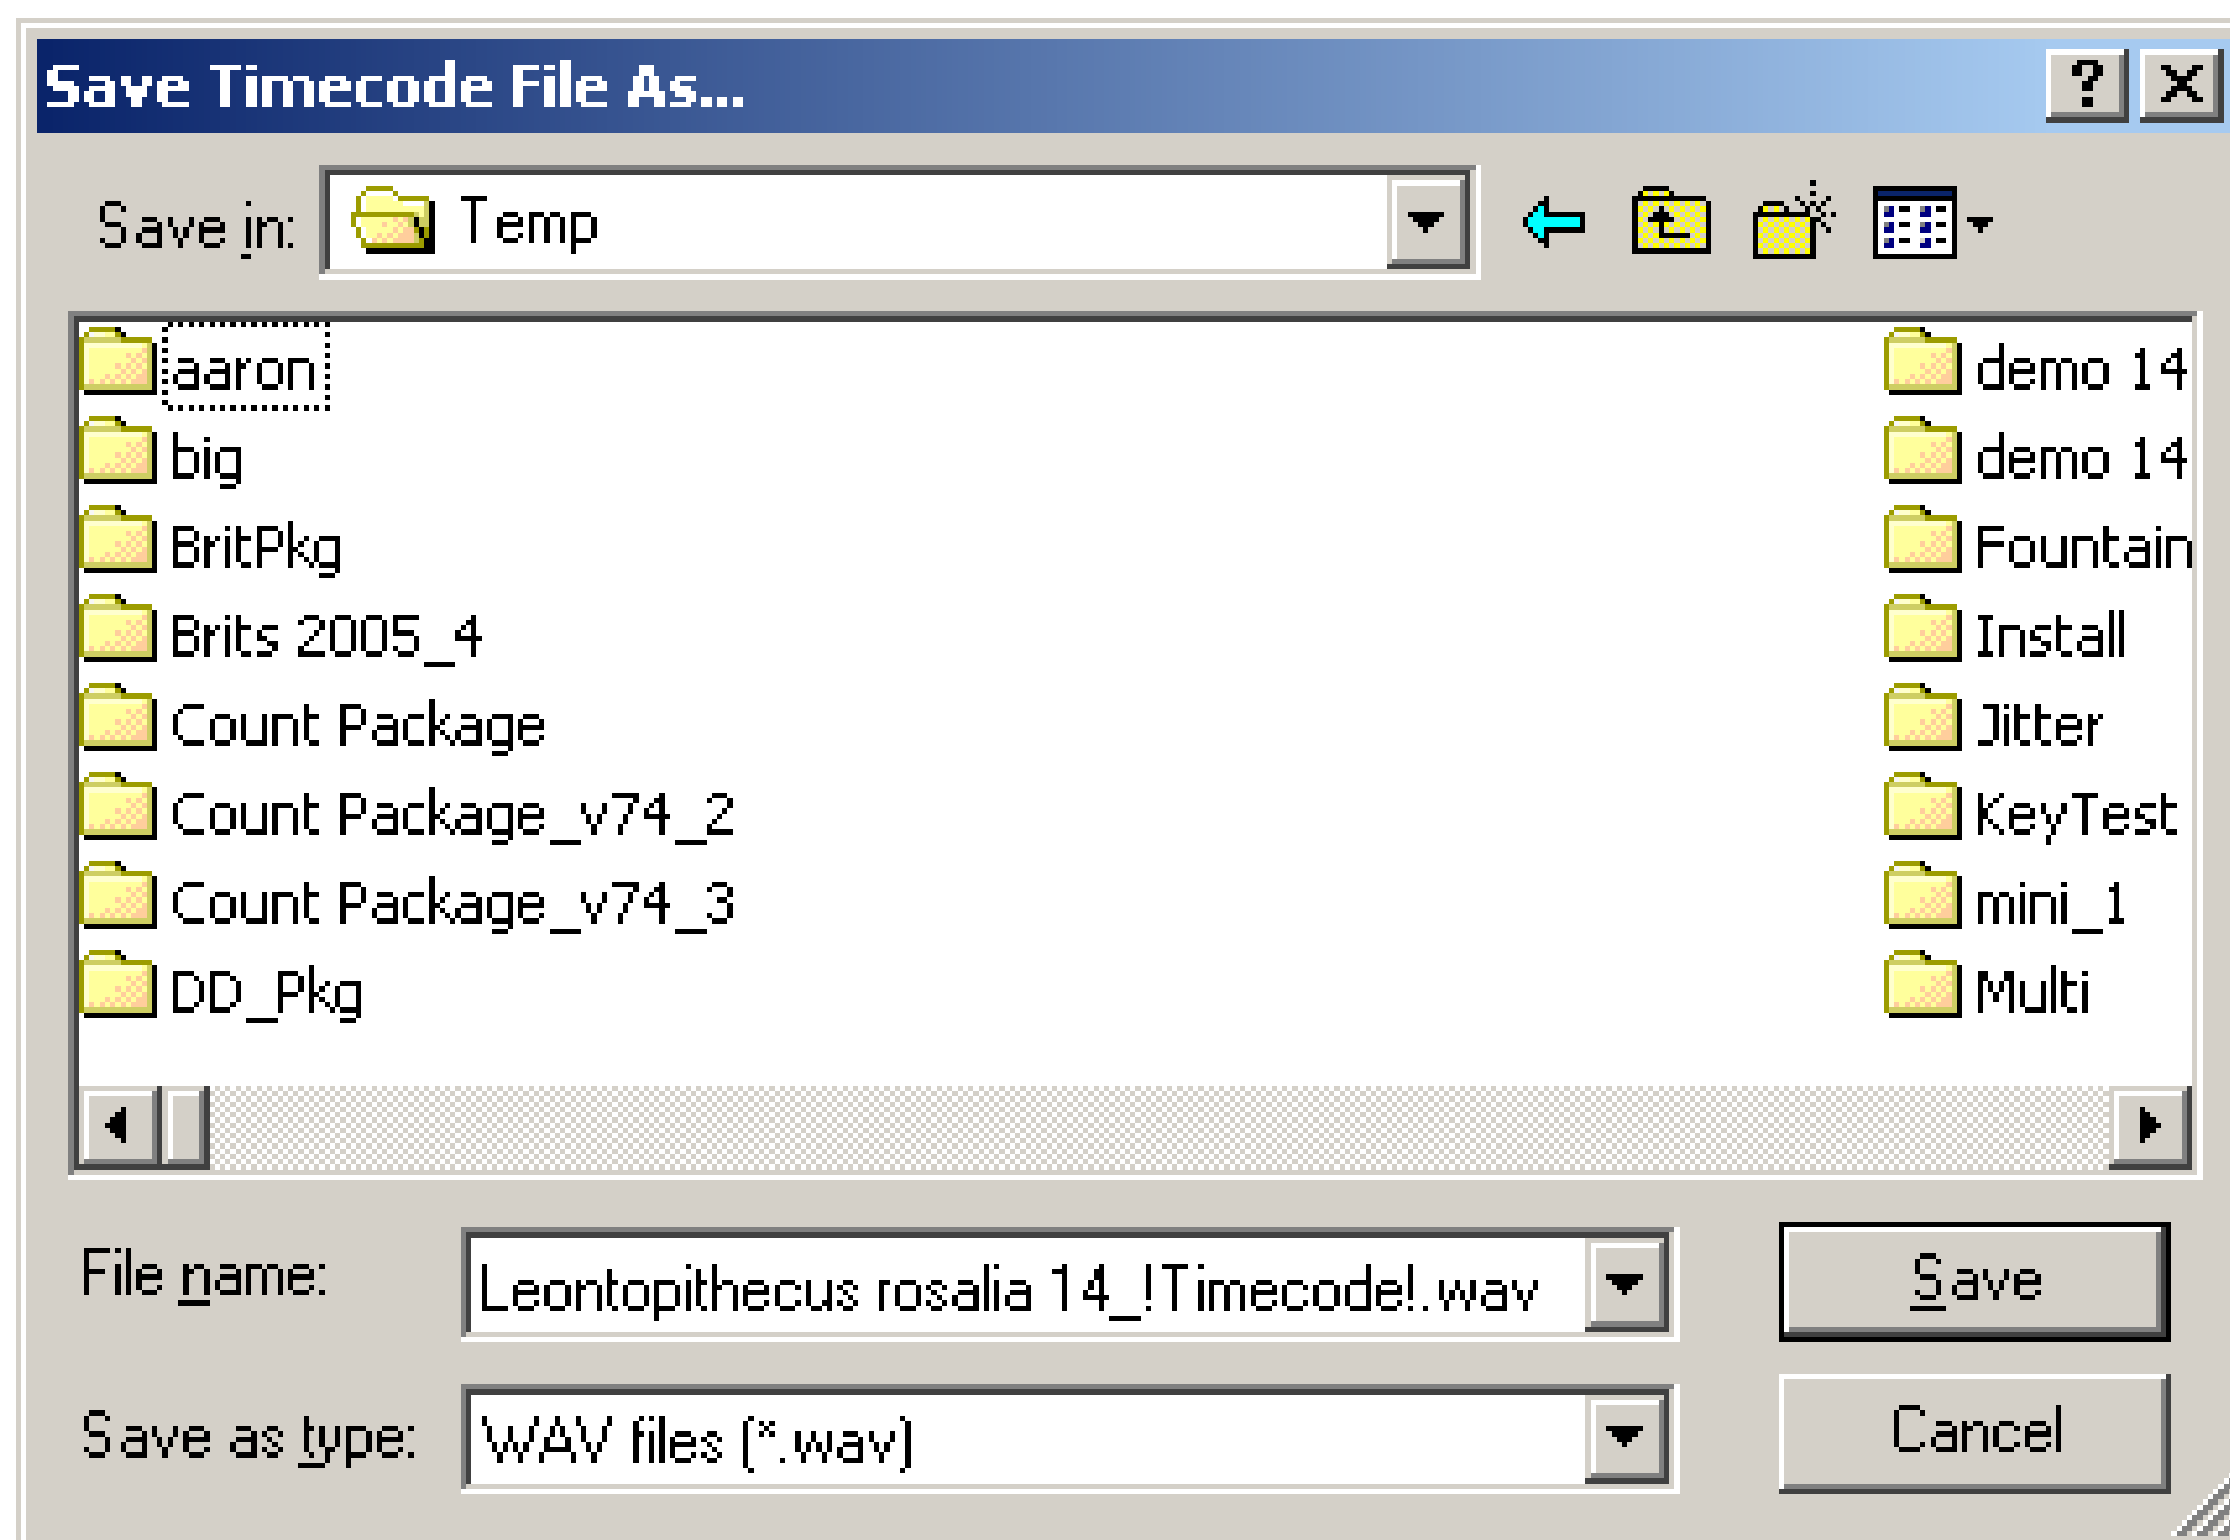

In both cases the duration is fixed by the length of the track.

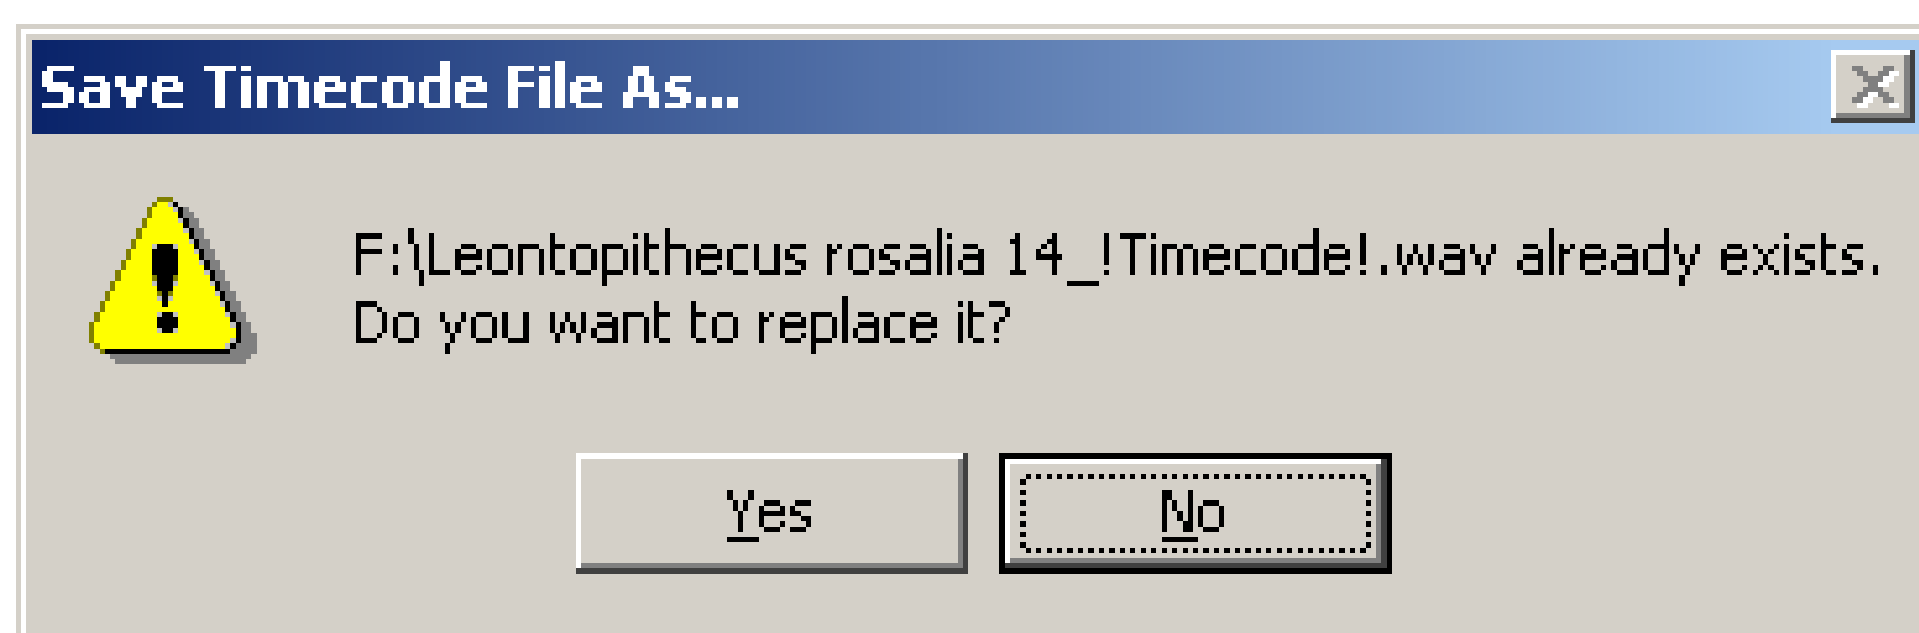

On clicking OK the default filename for the separate timecode track will be displayed, the name format is: -

TrackFilename_!Timecode!.wav

making it distinct from ordinary tracks

If the file name already exists and overwrite prompt box is shown.

The creation of the timecode file can take some time so a progress box is shown, the cancel button will abort the operation

After saving the timecode file, the next stage offers the option to merge the timecode file with the original audio track, this option is only available on the multichannel version of SpotOn.

The original stereo audio will be transferred to tracks 1/2 of a 6 channel WAV file and the timecode can be placed on any of the remaining 4 tracks

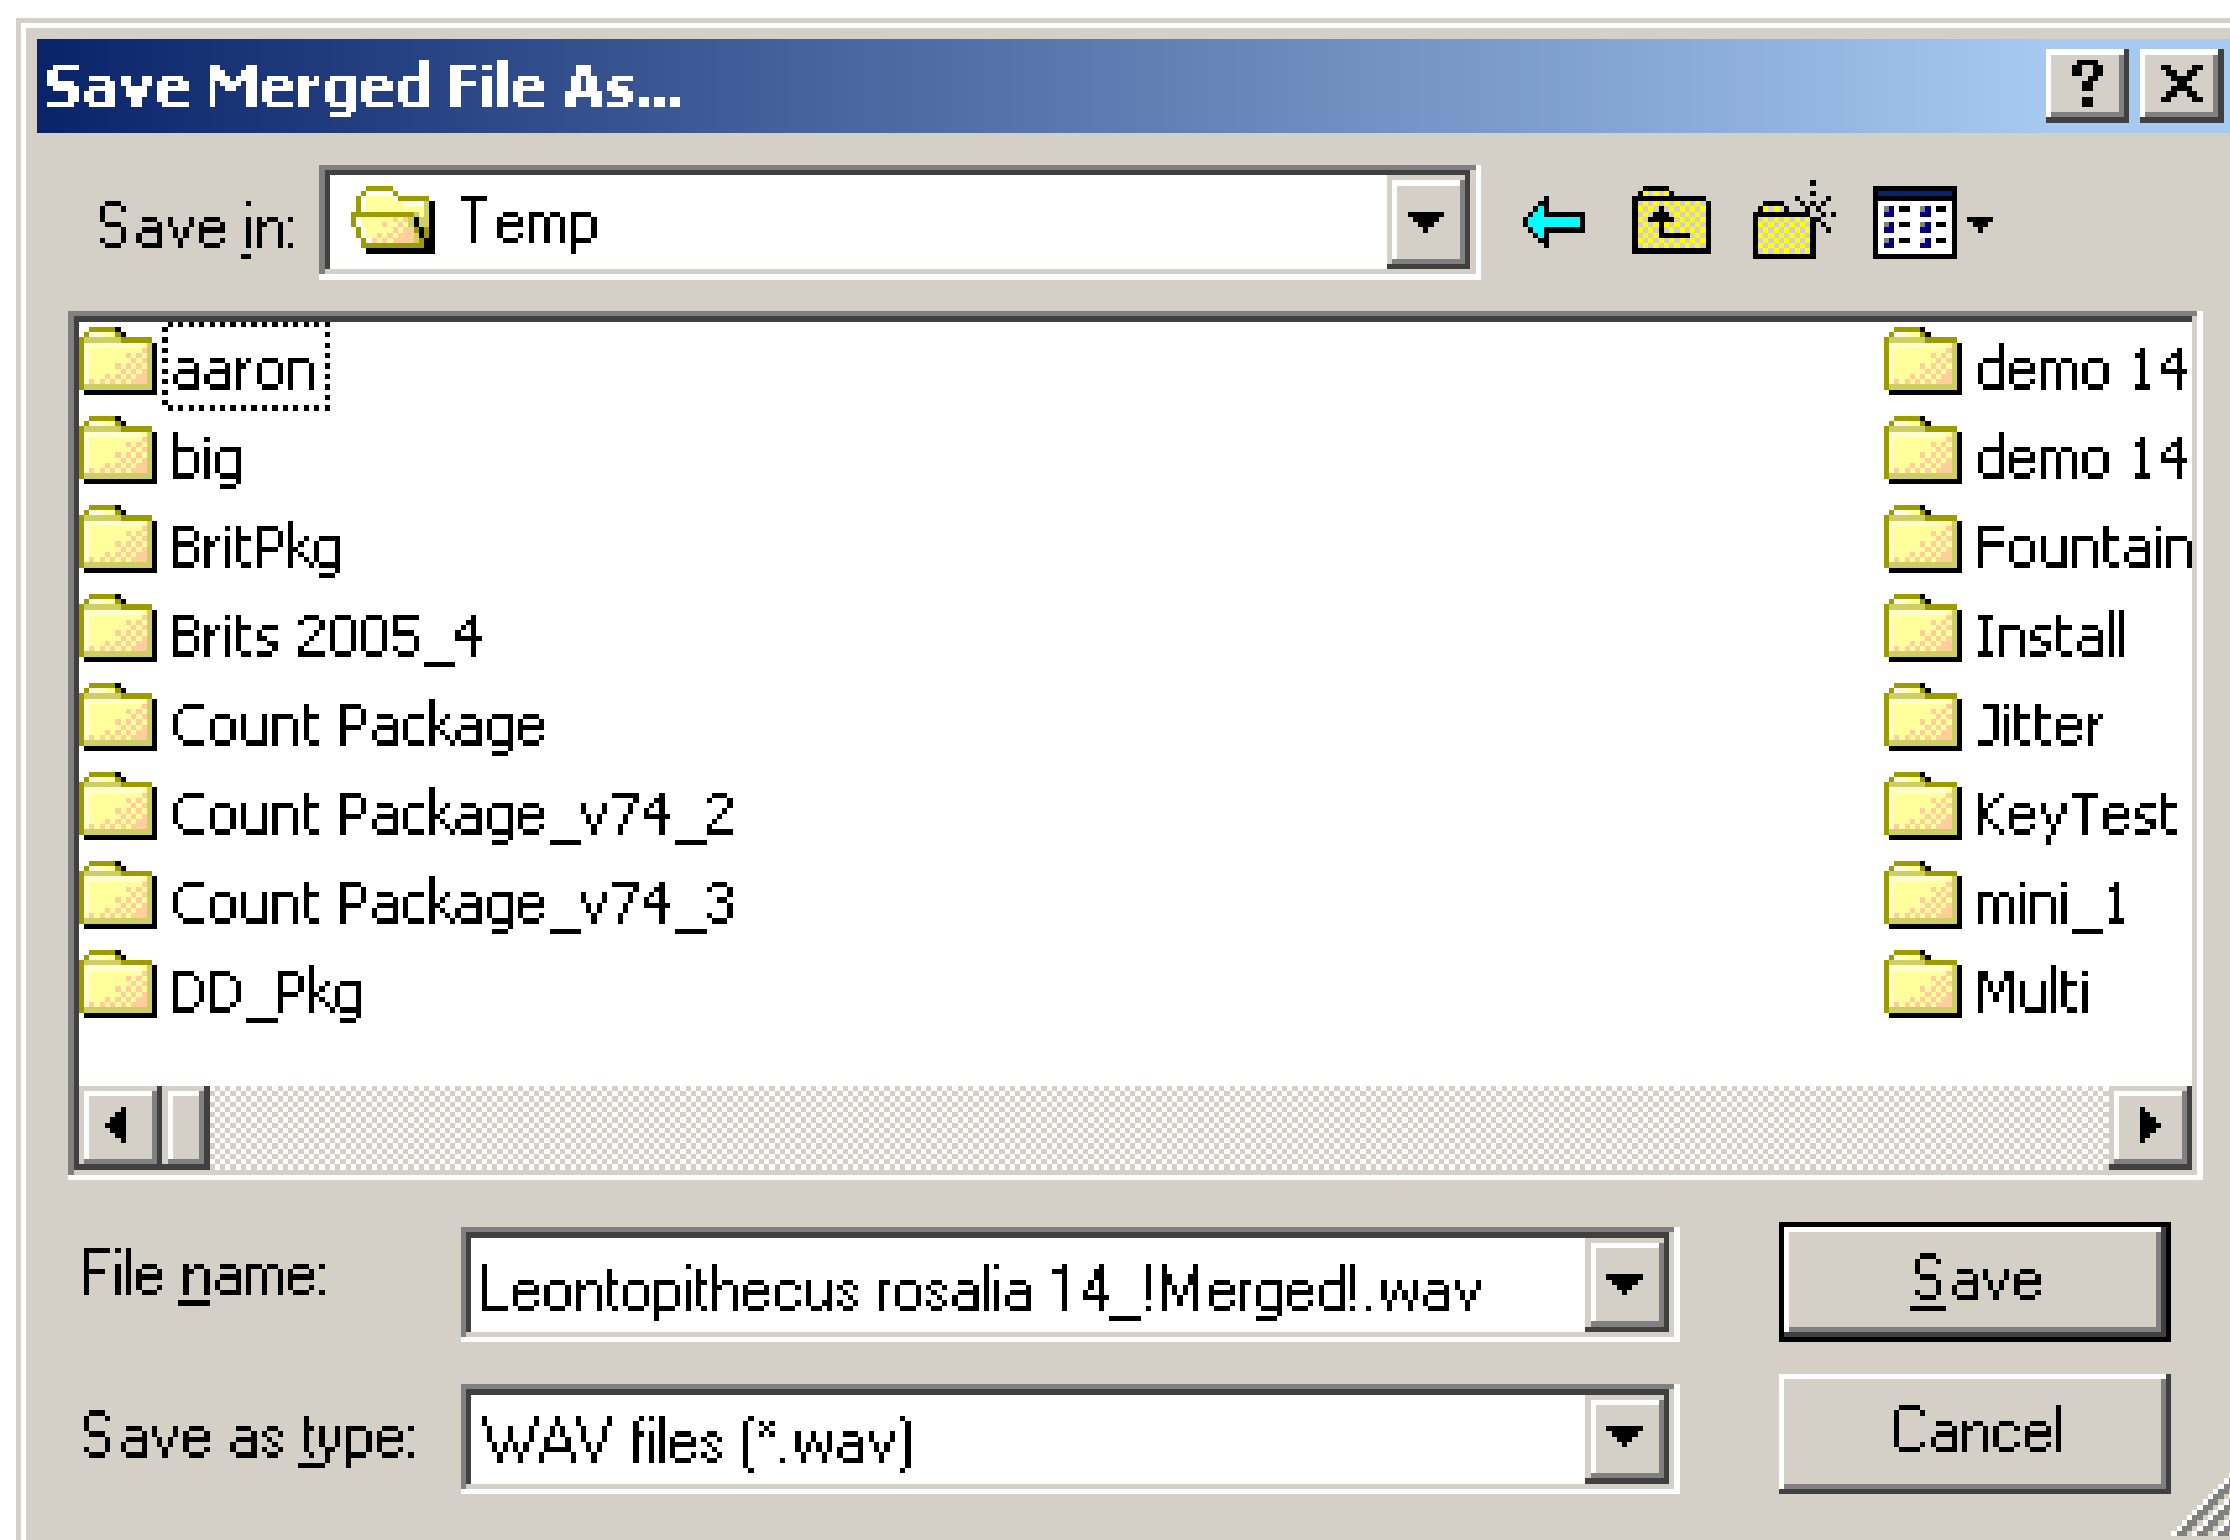

In the case of a 8 channel (7.1) version of SpotOn a 5.1 track can have timecode merged into either tracks 7 or 8

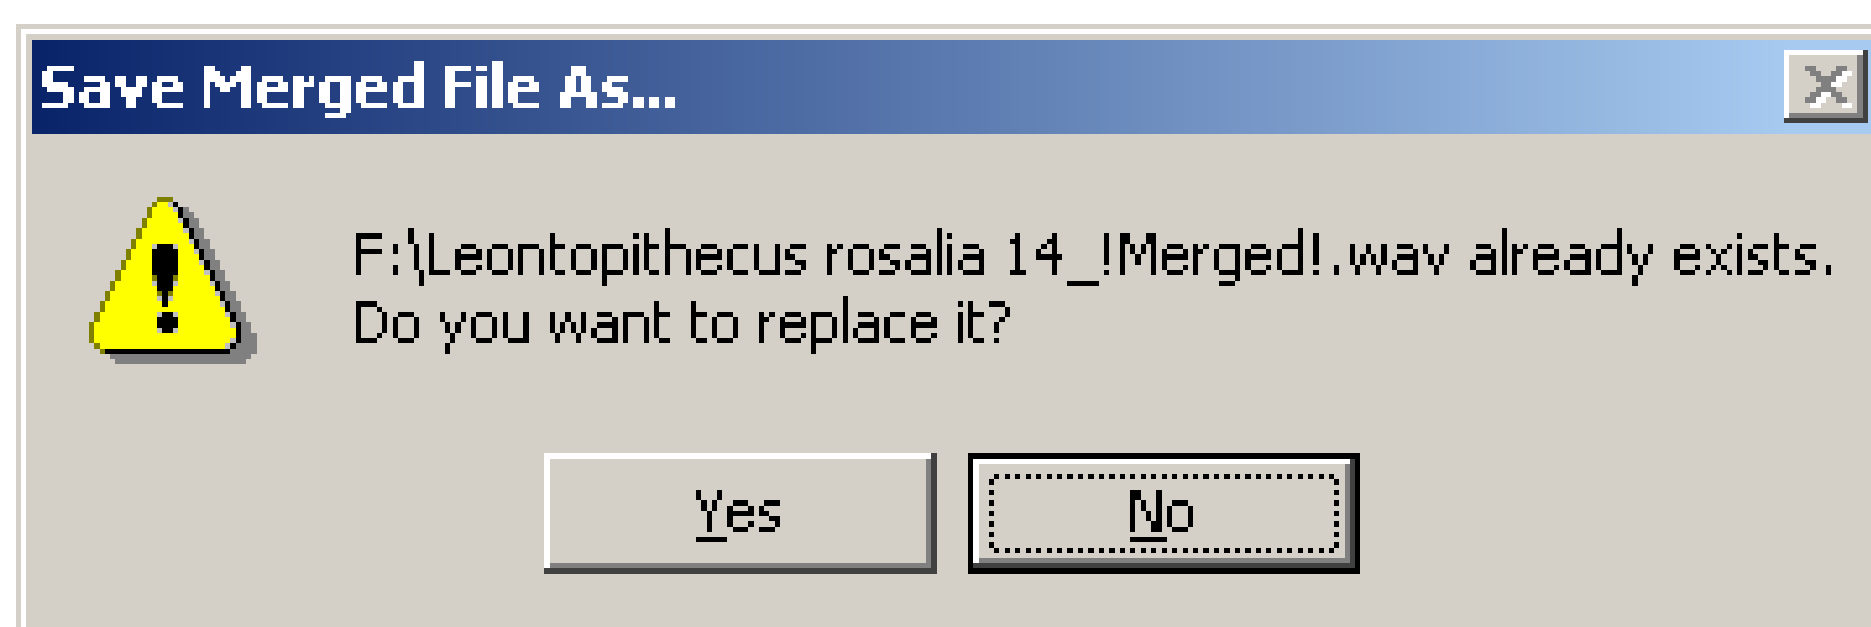

The default name for the merged file is: -

TrackFilename_!Merged!.wav

In the case of the file already existing the overwrite prompt dialog will appear

Finally the option to load the one or two files generated onto the next free button/s is shown

Render Trim

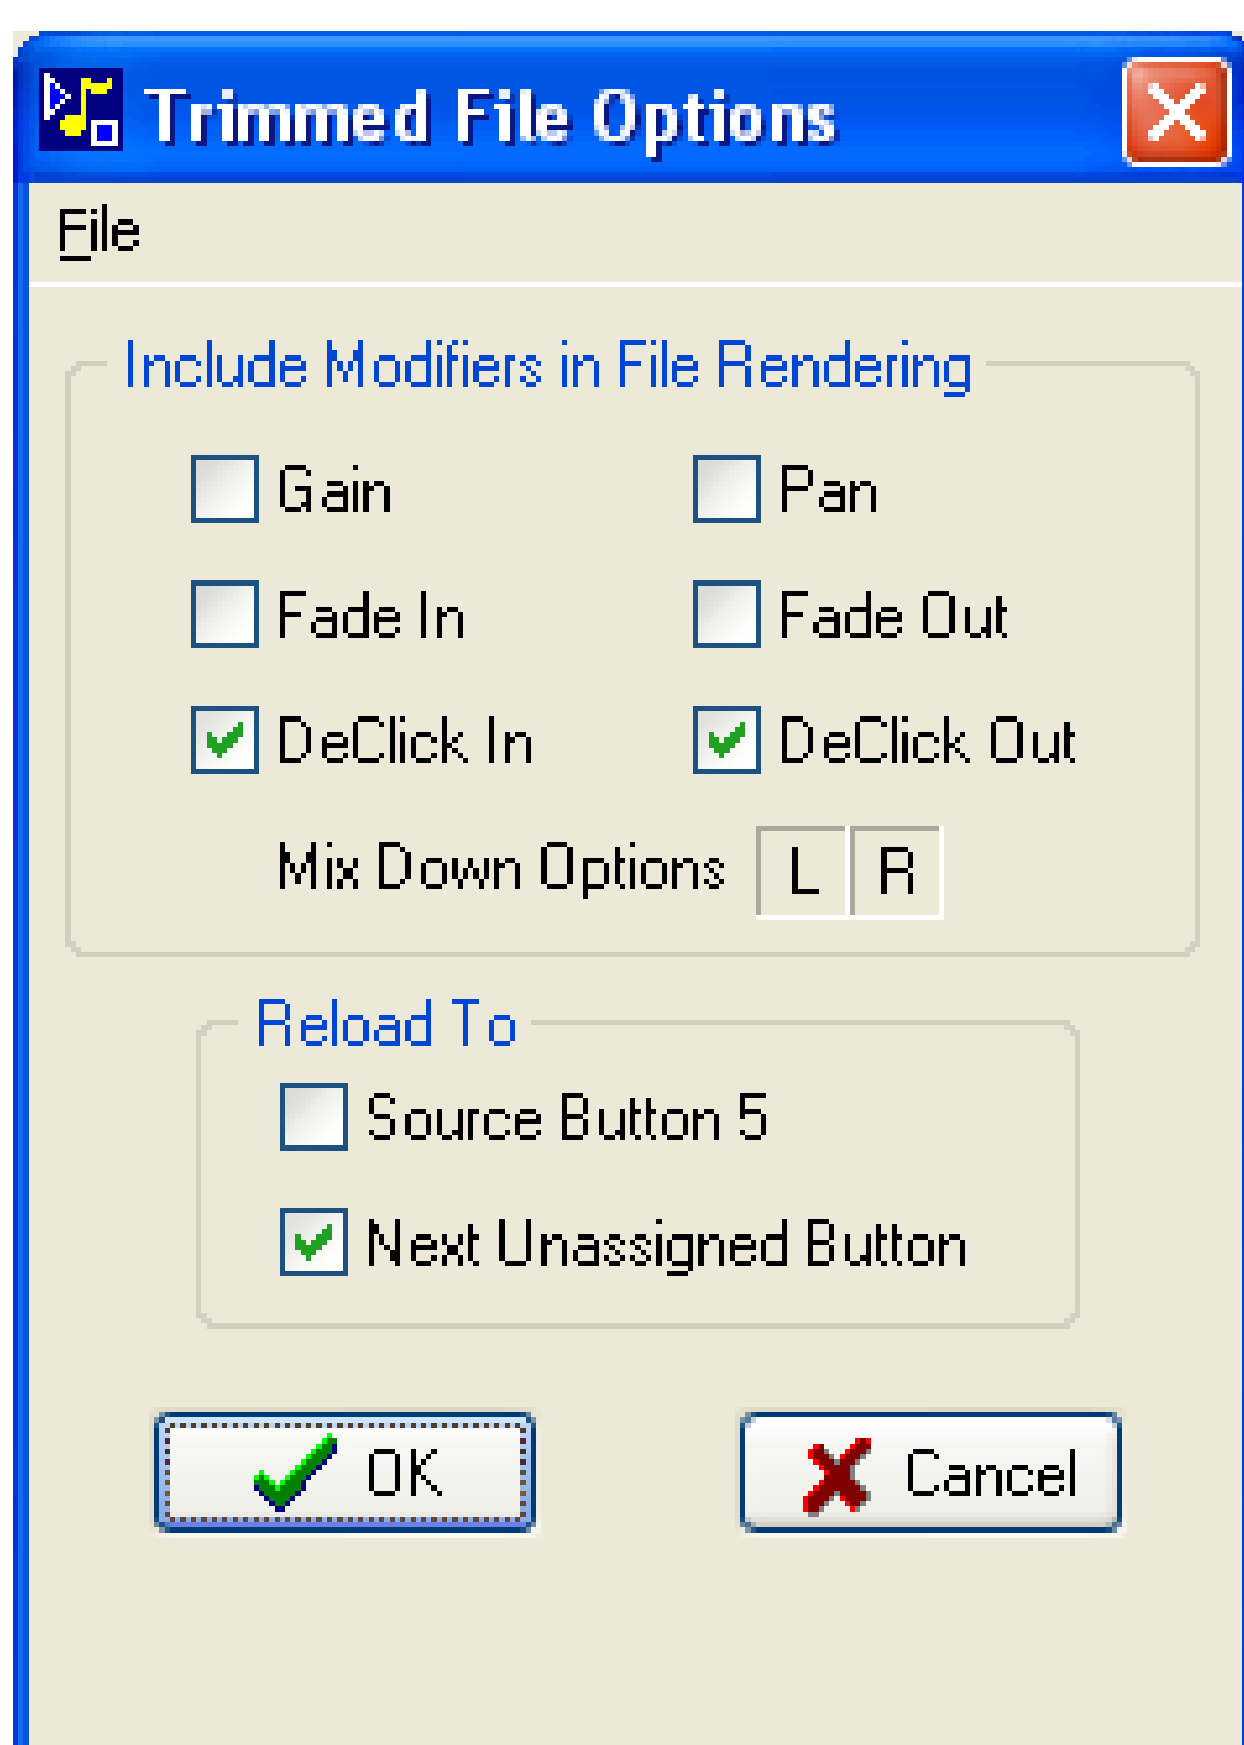

The trimmed audio track can be saved as a new file by right-clicking the Track name label at the top of the waveform window

Selecting 'Render Trimmed Track to new file' displays the dialog box below with options to include the Gain, Pan, Fade In and Fade Out modifiers in the new file which will be rendered from the original.

The DeClick In and DeClick Out options are checked by default these add 10mS fades at the start and end of the trimmed file to avoid sharp waveform transitions, these options can be unchecked if the start and end transients are to be preserved.

The Mix Down options are initially set to be that of the button settings but can be temporarily changed to the render the file.

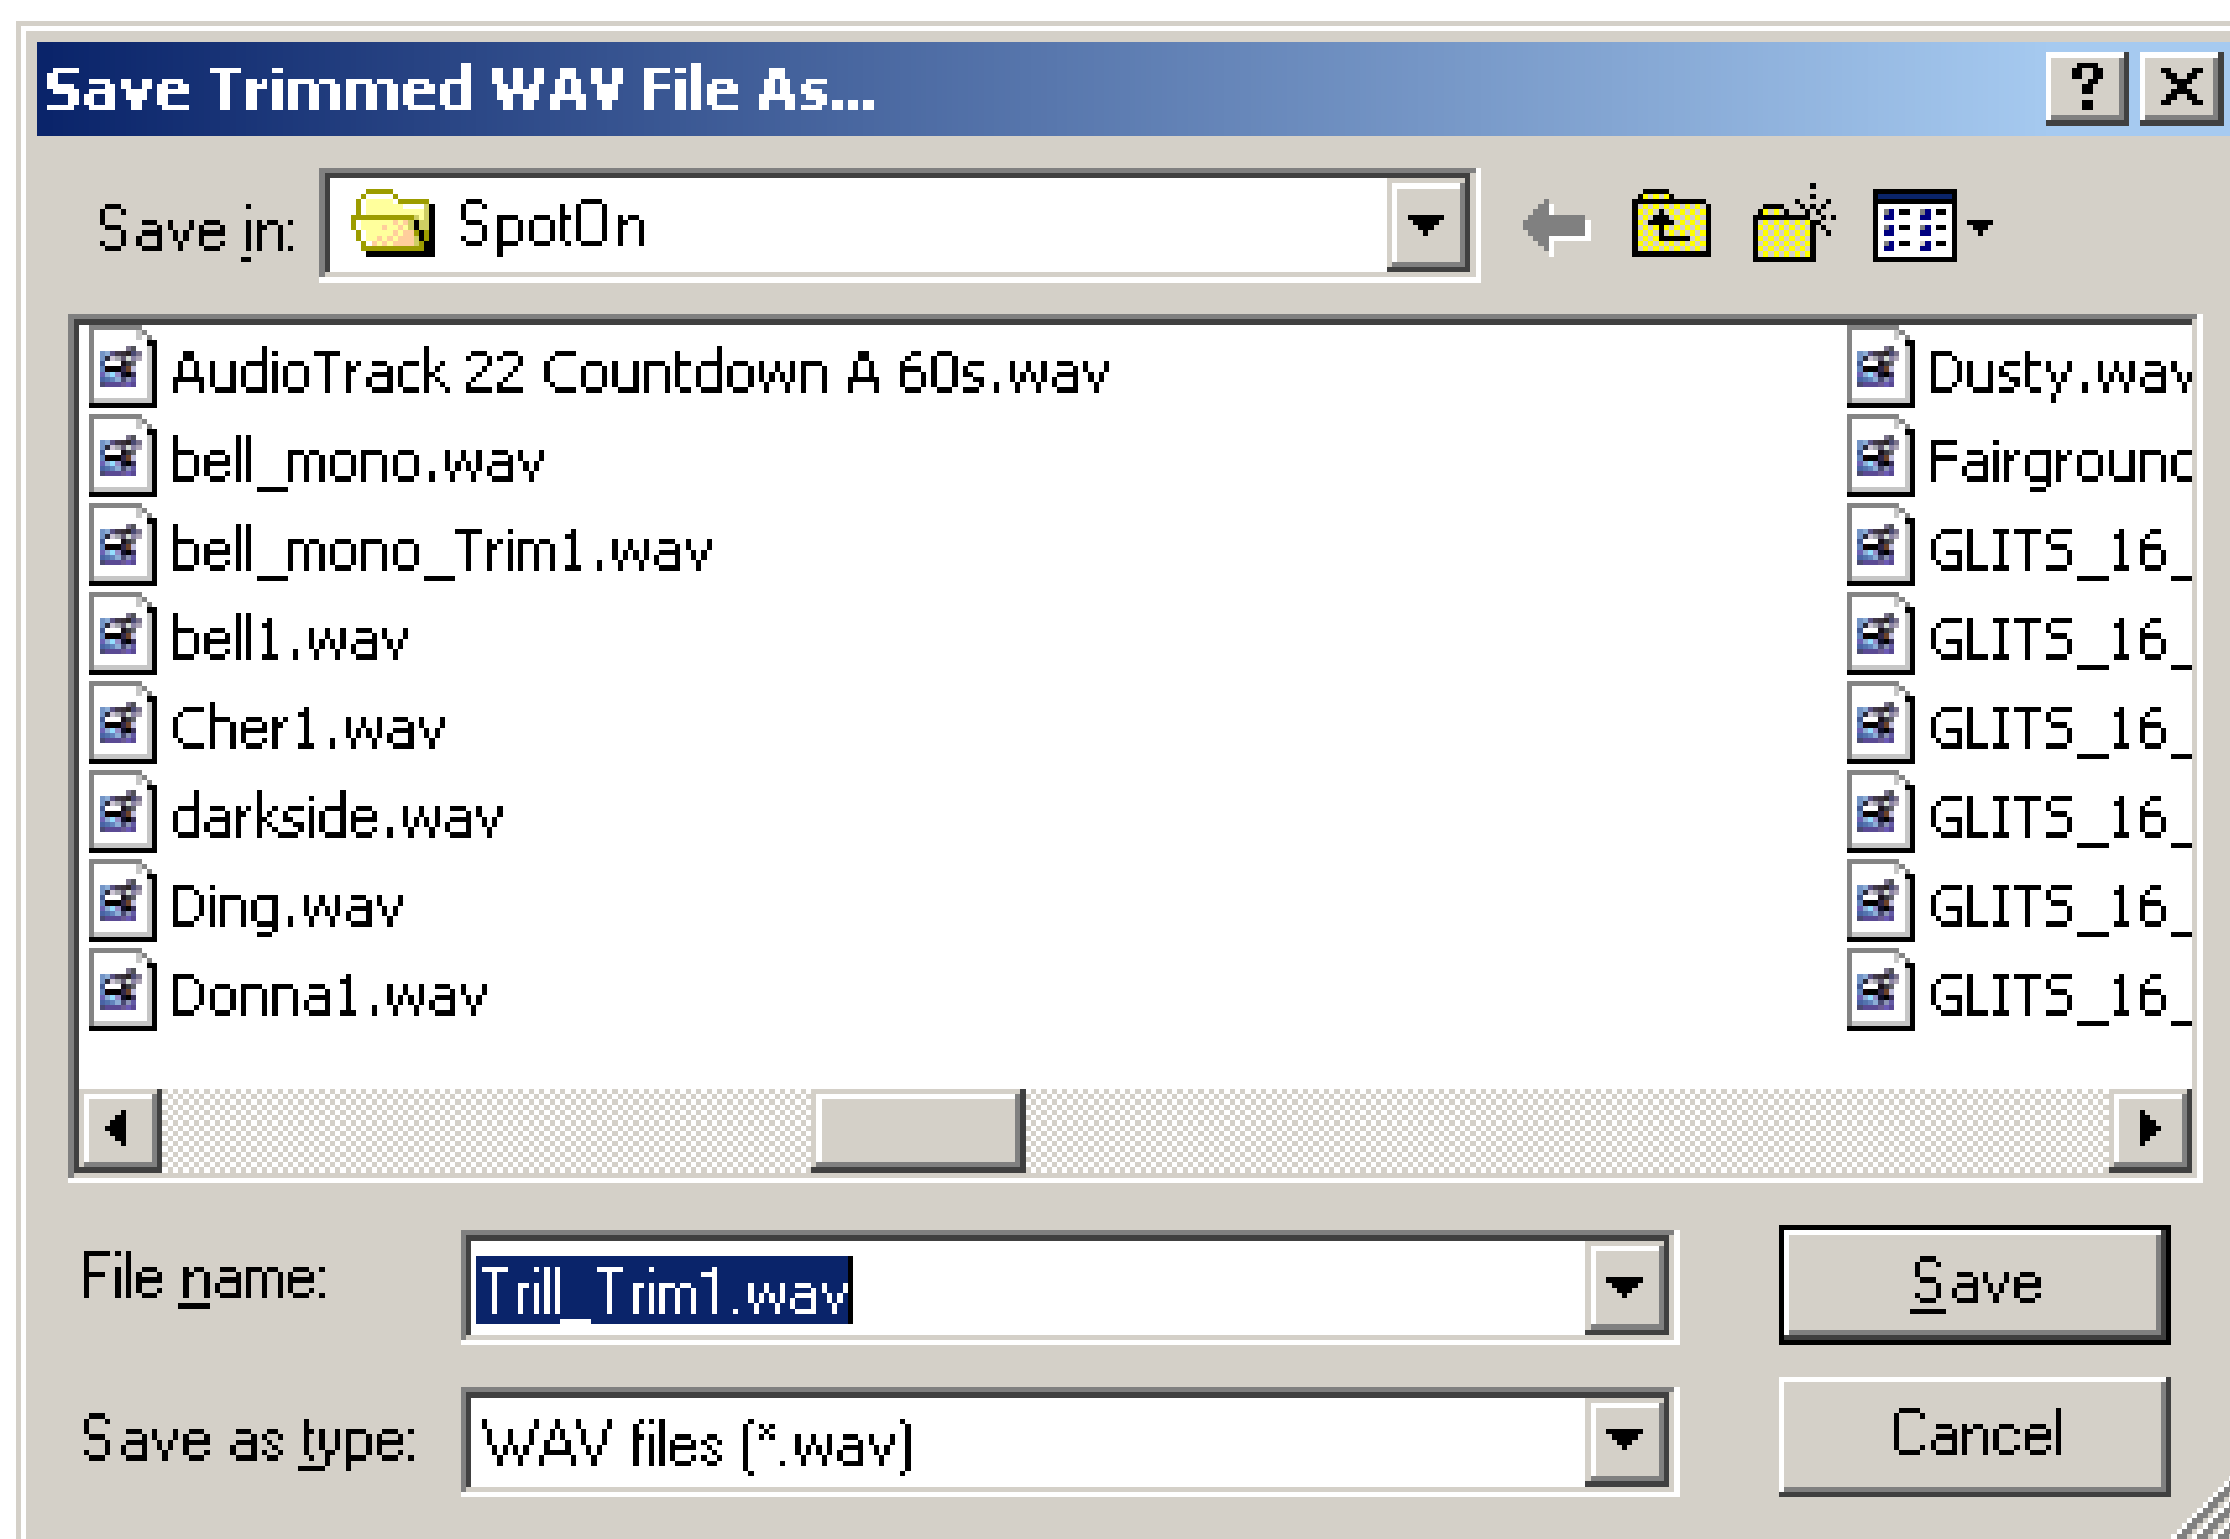

The button being edited can be reloaded with the new rendered file by checking Reload To Source Button, alternatively the file can be loaded onto the next unassigned button.

The default name for the rendered file is "OriginalFilename_Trim1.wav" and it will be saved in the same folder as the original file.

The filename and location of the rendered file can be changed from the default by opening up the File menu

Here a standard Windows file selector dialog is displayed

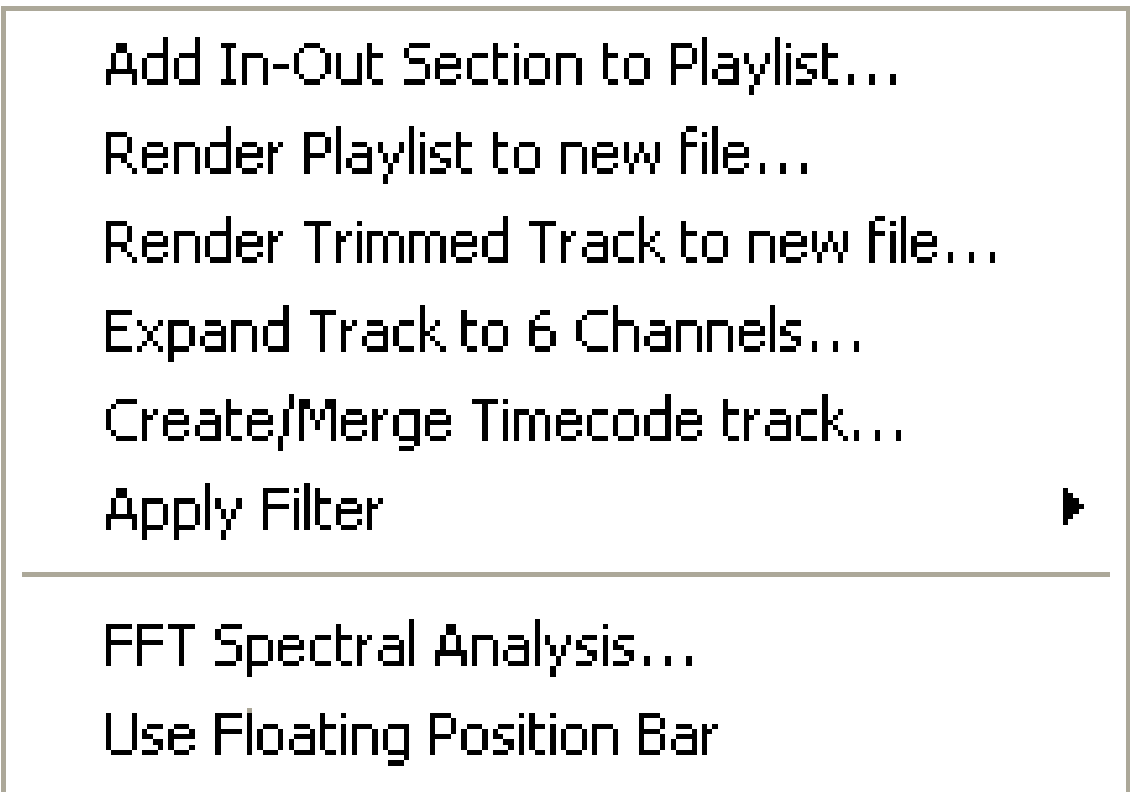

Enter a new filename and click Save to change the rendered filename or location.

The button will not be reloaded until the Audio Settings dialog is closed by clicking OK

RePatch MultiChannel Files

Some applications export multichannel (interleaved) WAV files with a non-standard track order, this dialog allows the ProTools channel ordering to be changed to the audio standard.

Filter Track Audio

Using the Apply Filter item one filter can be selected from the range

The filtered version of the track can then be saved as a new file, the default name is the original file name with "_!FxFilterX!" added as a suffix.

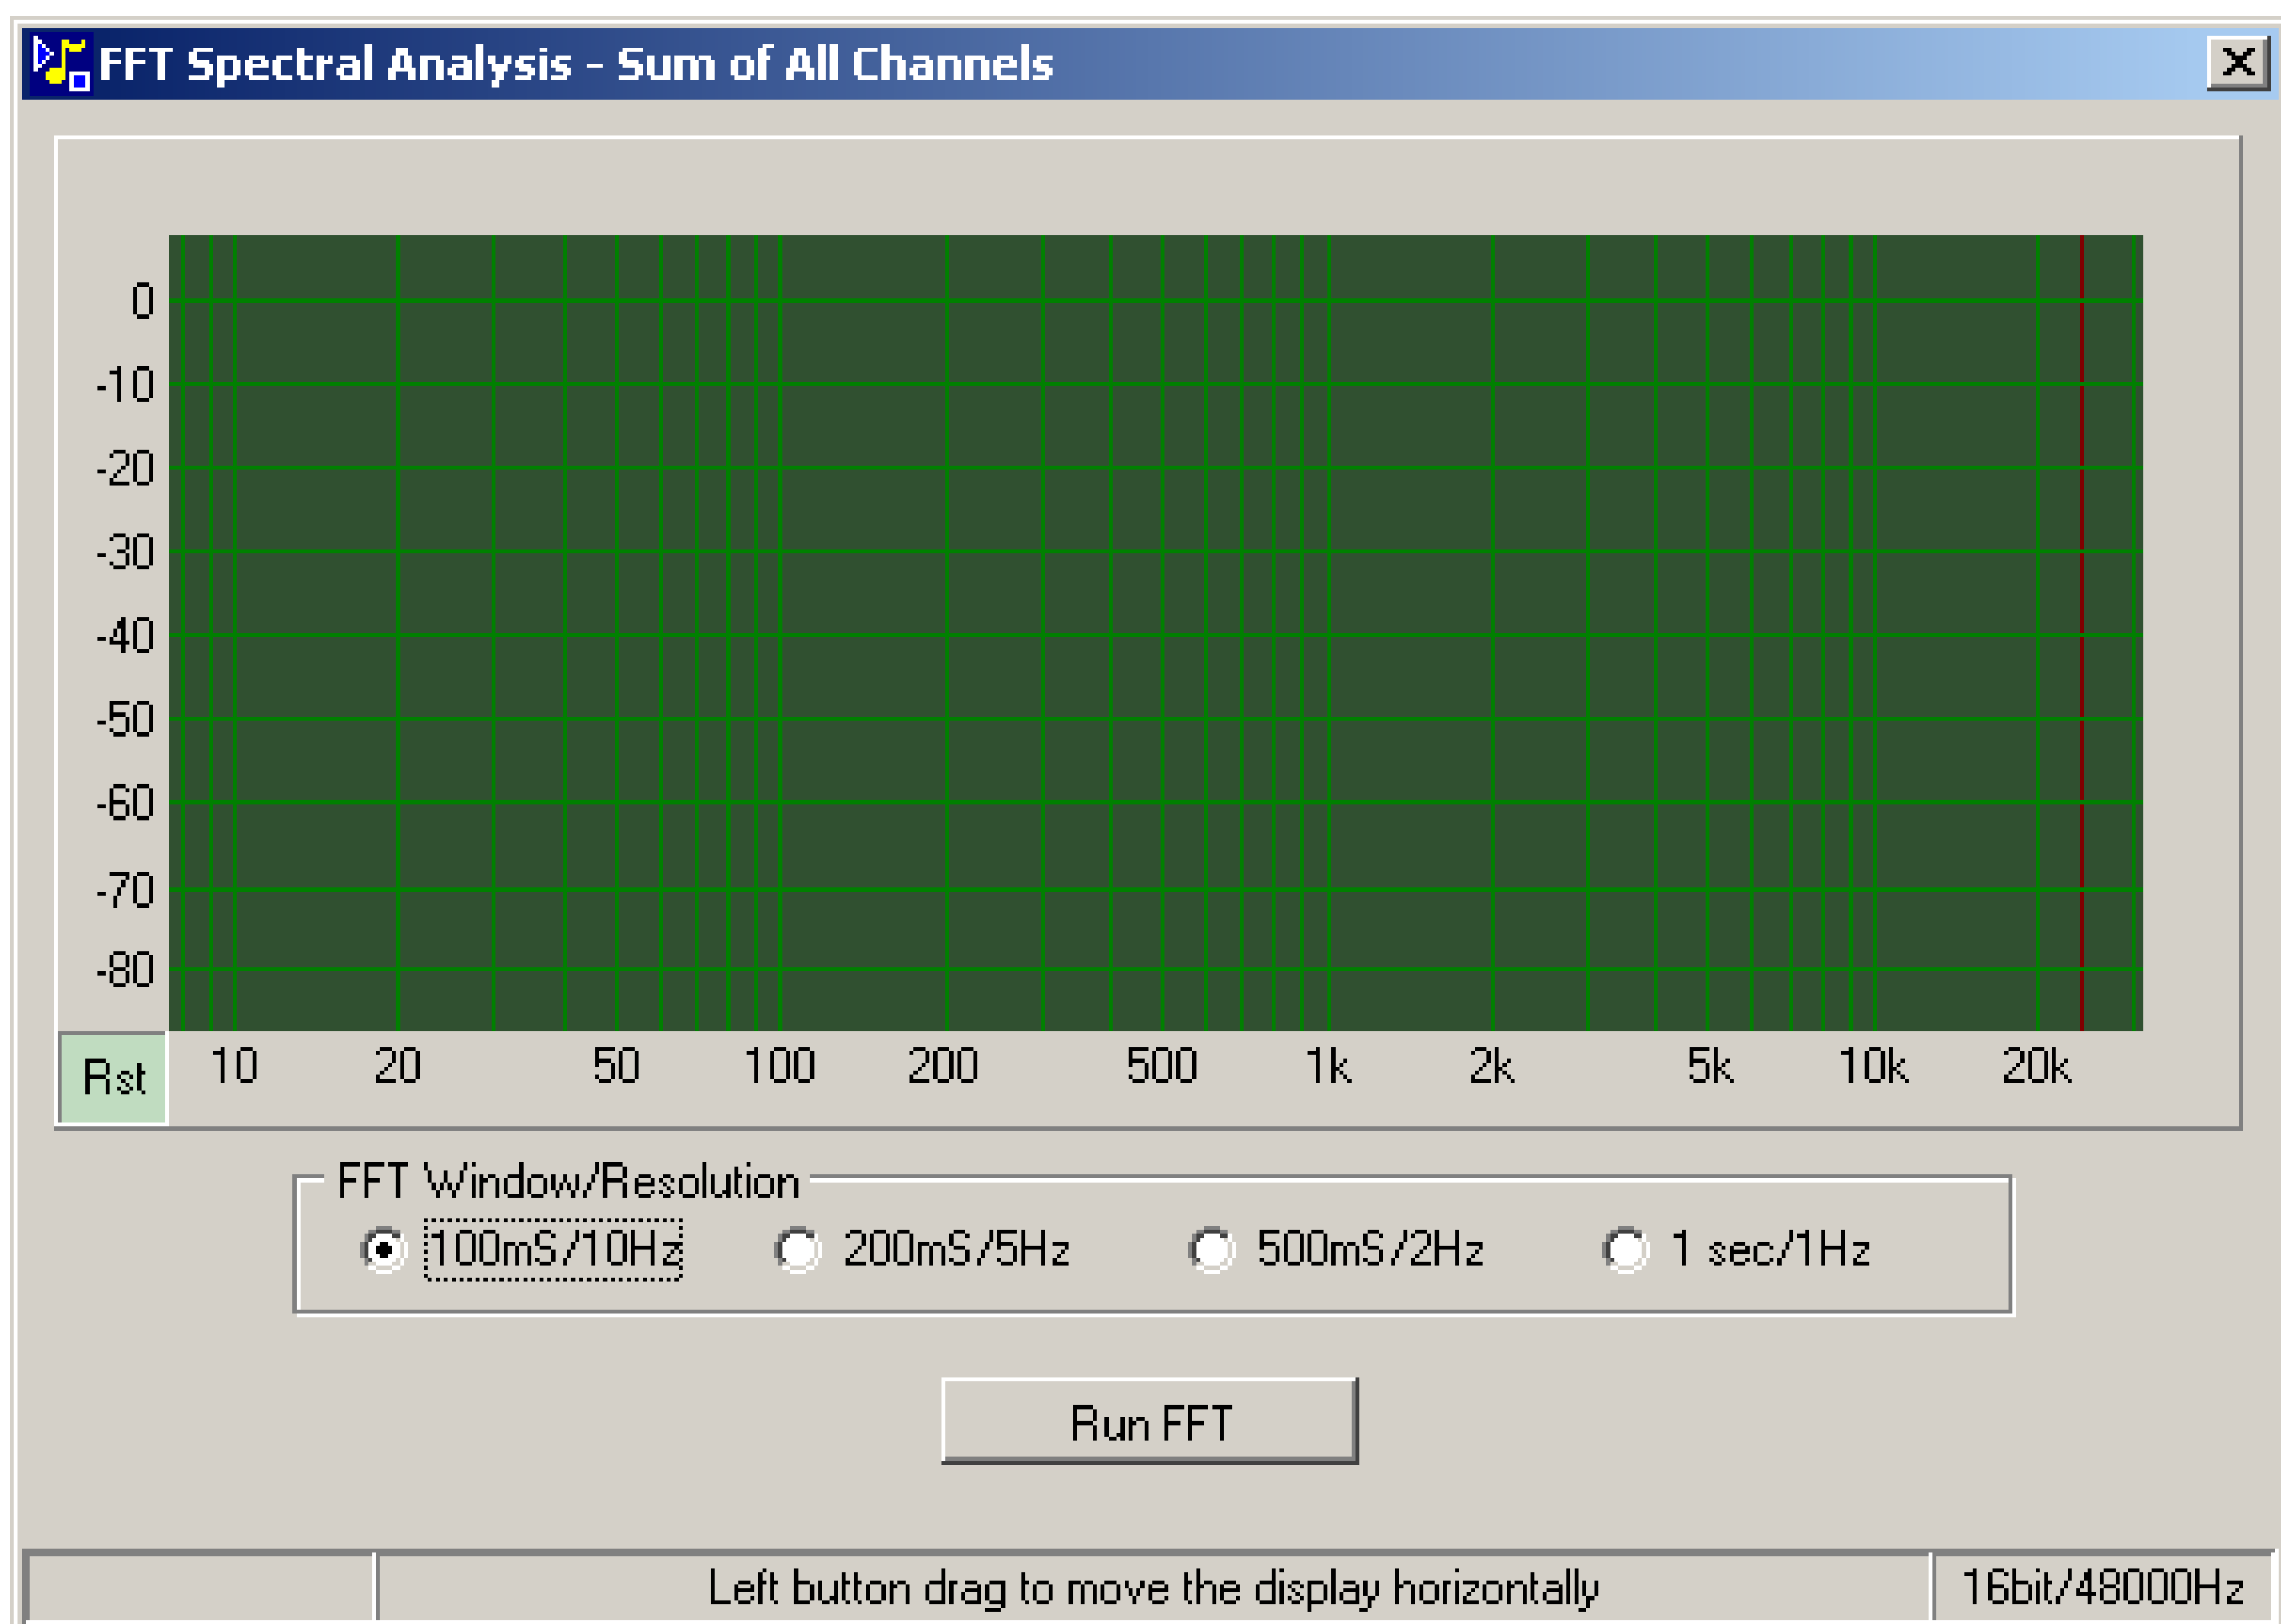

Applying the filters involves a large amount of mathematical calculations and in some cases the filter will take some considerable time to complete - approximately 3x real time. The filters are linear phase and have a 3dB passband ripple and 40dB stopband attenuation.

Spectrum (FFT) Analysis

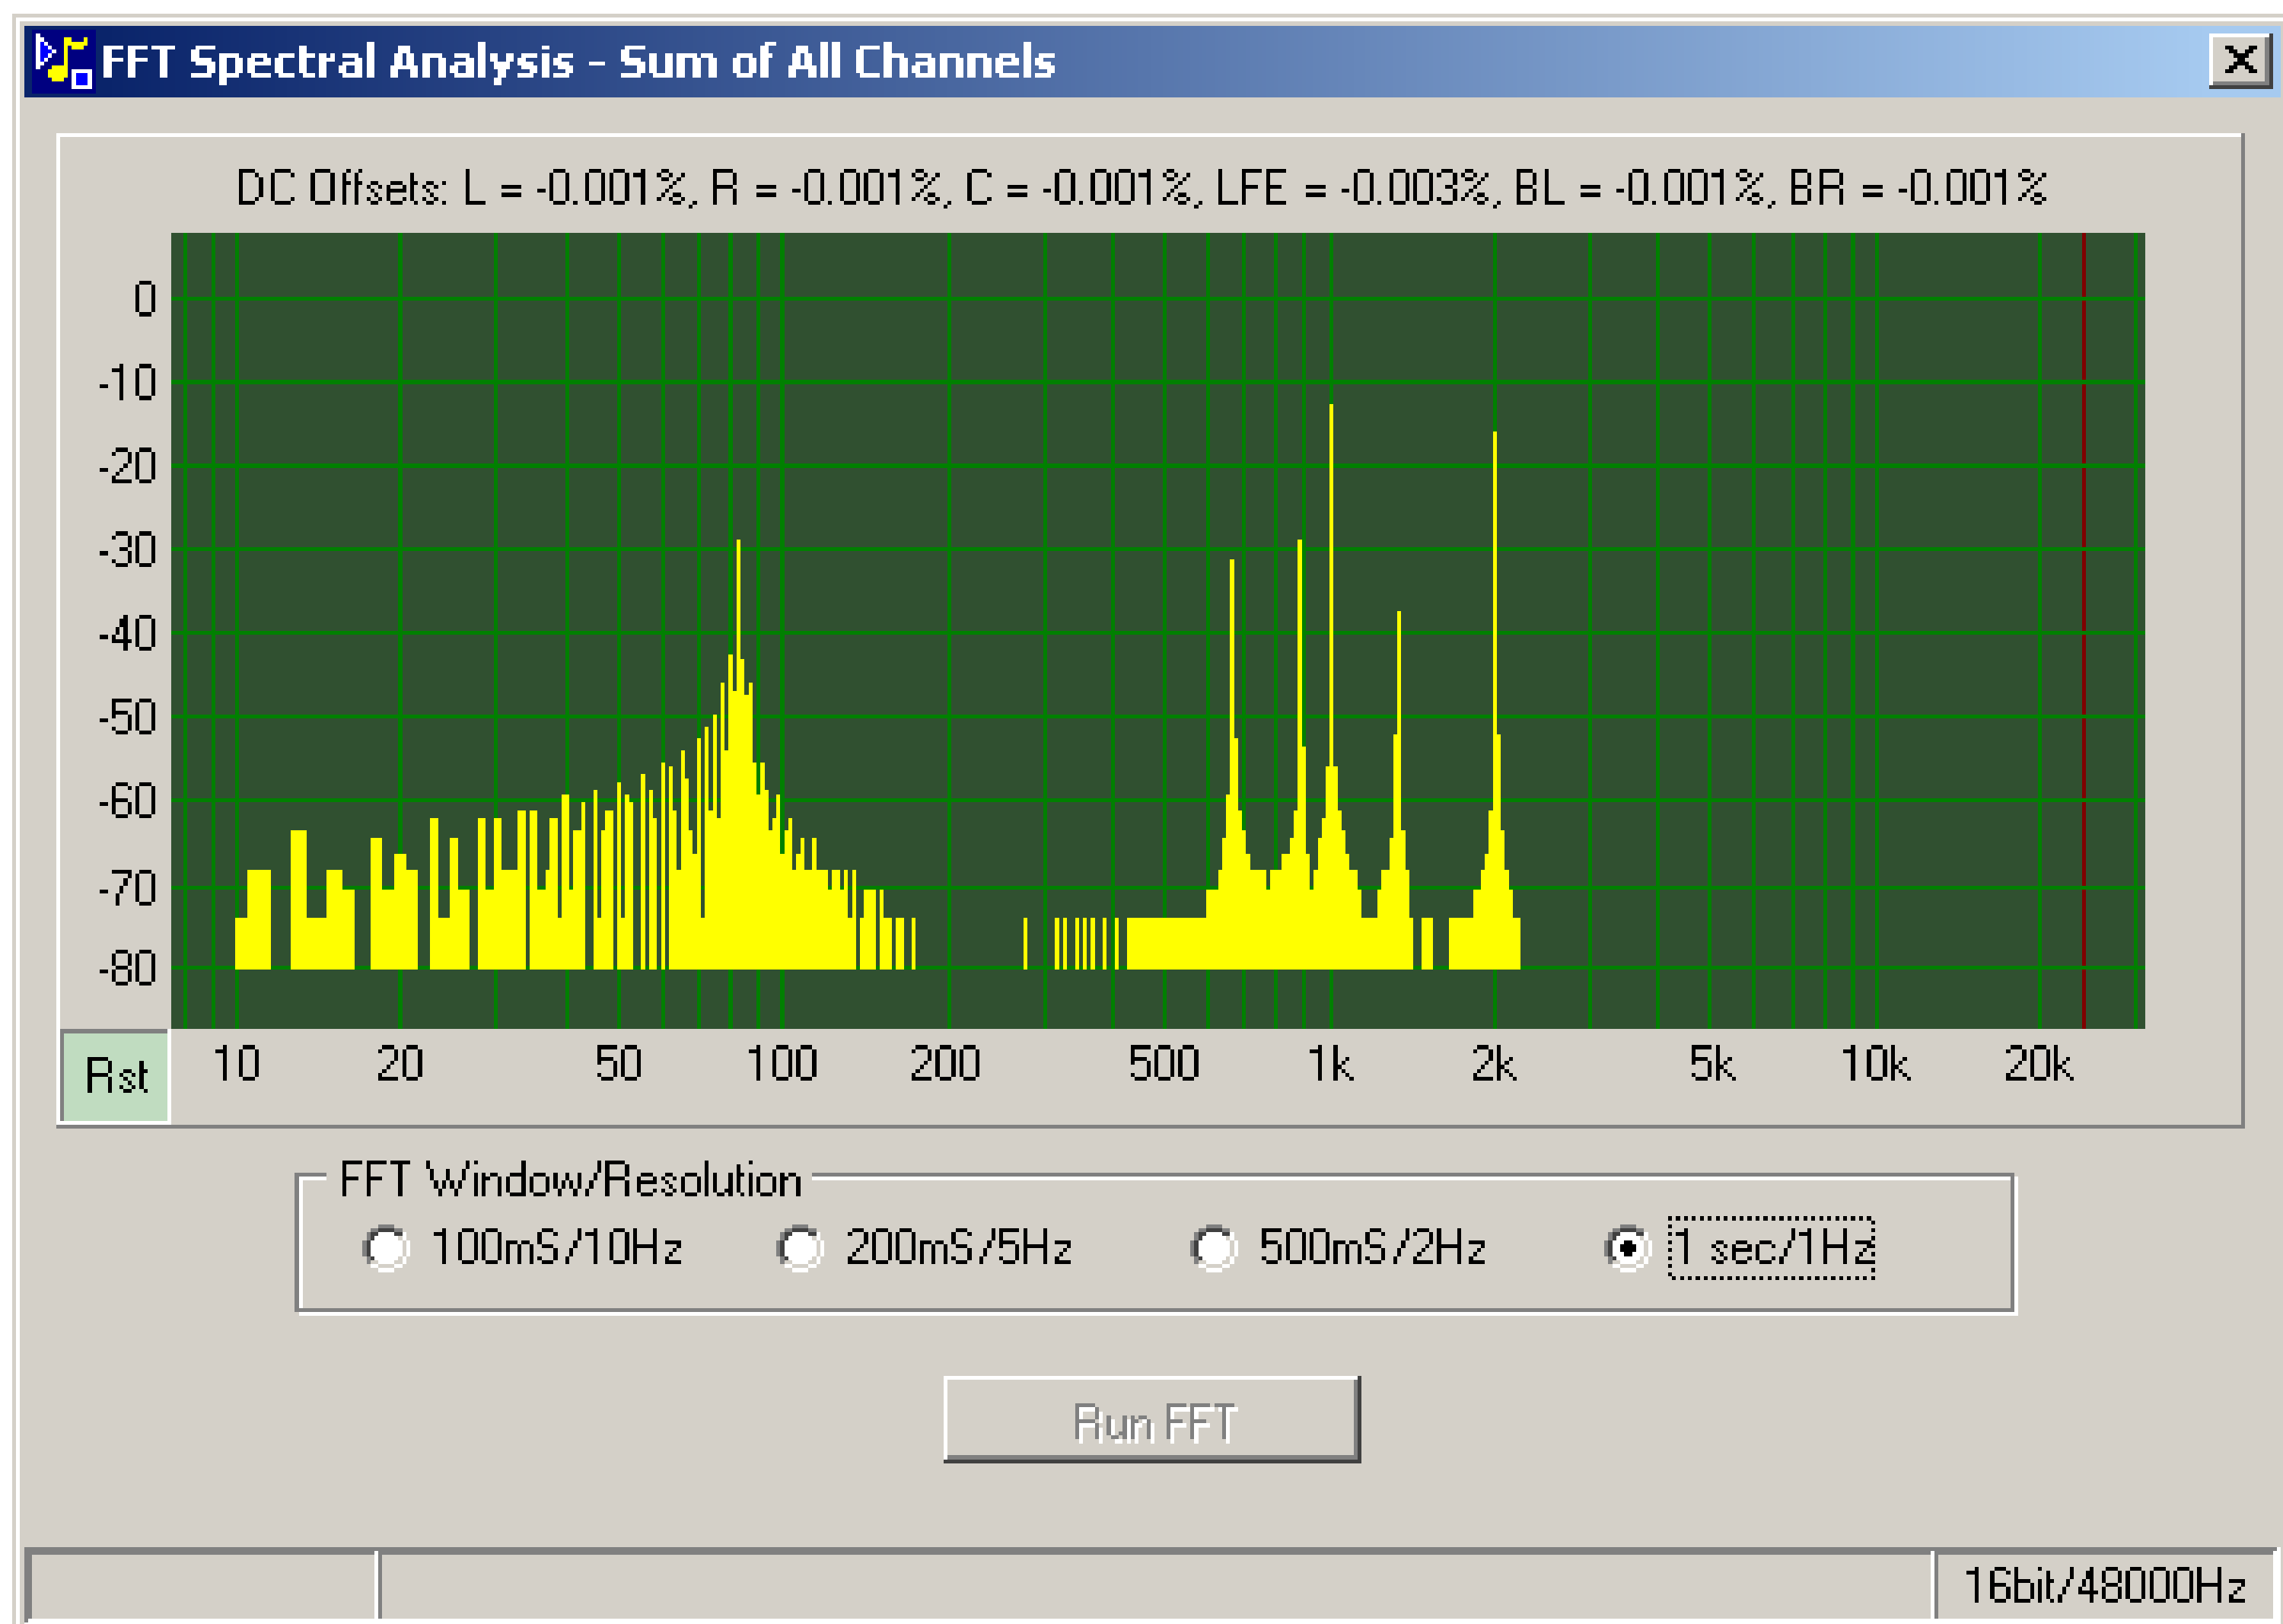

Selecting 'FFT analysis' from the title right-click menu opens up a new window displaying a blank spectrum plot

The FFT Window/Resolution options select the resolution of the display between 1Hz and 10Hz, the 1Hz setting will give the most accurate plot, click the Run FFT button to analyse the file.

The analysis takes some time to complete - approximately 5x normal speed eg a 20s stereo track is analysed in 4s.

The analysis of the 6 channel BLITS waveform is shown below, here the main frequencies of 82.5, 660, 880, 1000 1320 and 2000Hz can clearly be seen, the other spectrum lines are a result of the modulation of the main frequencies.

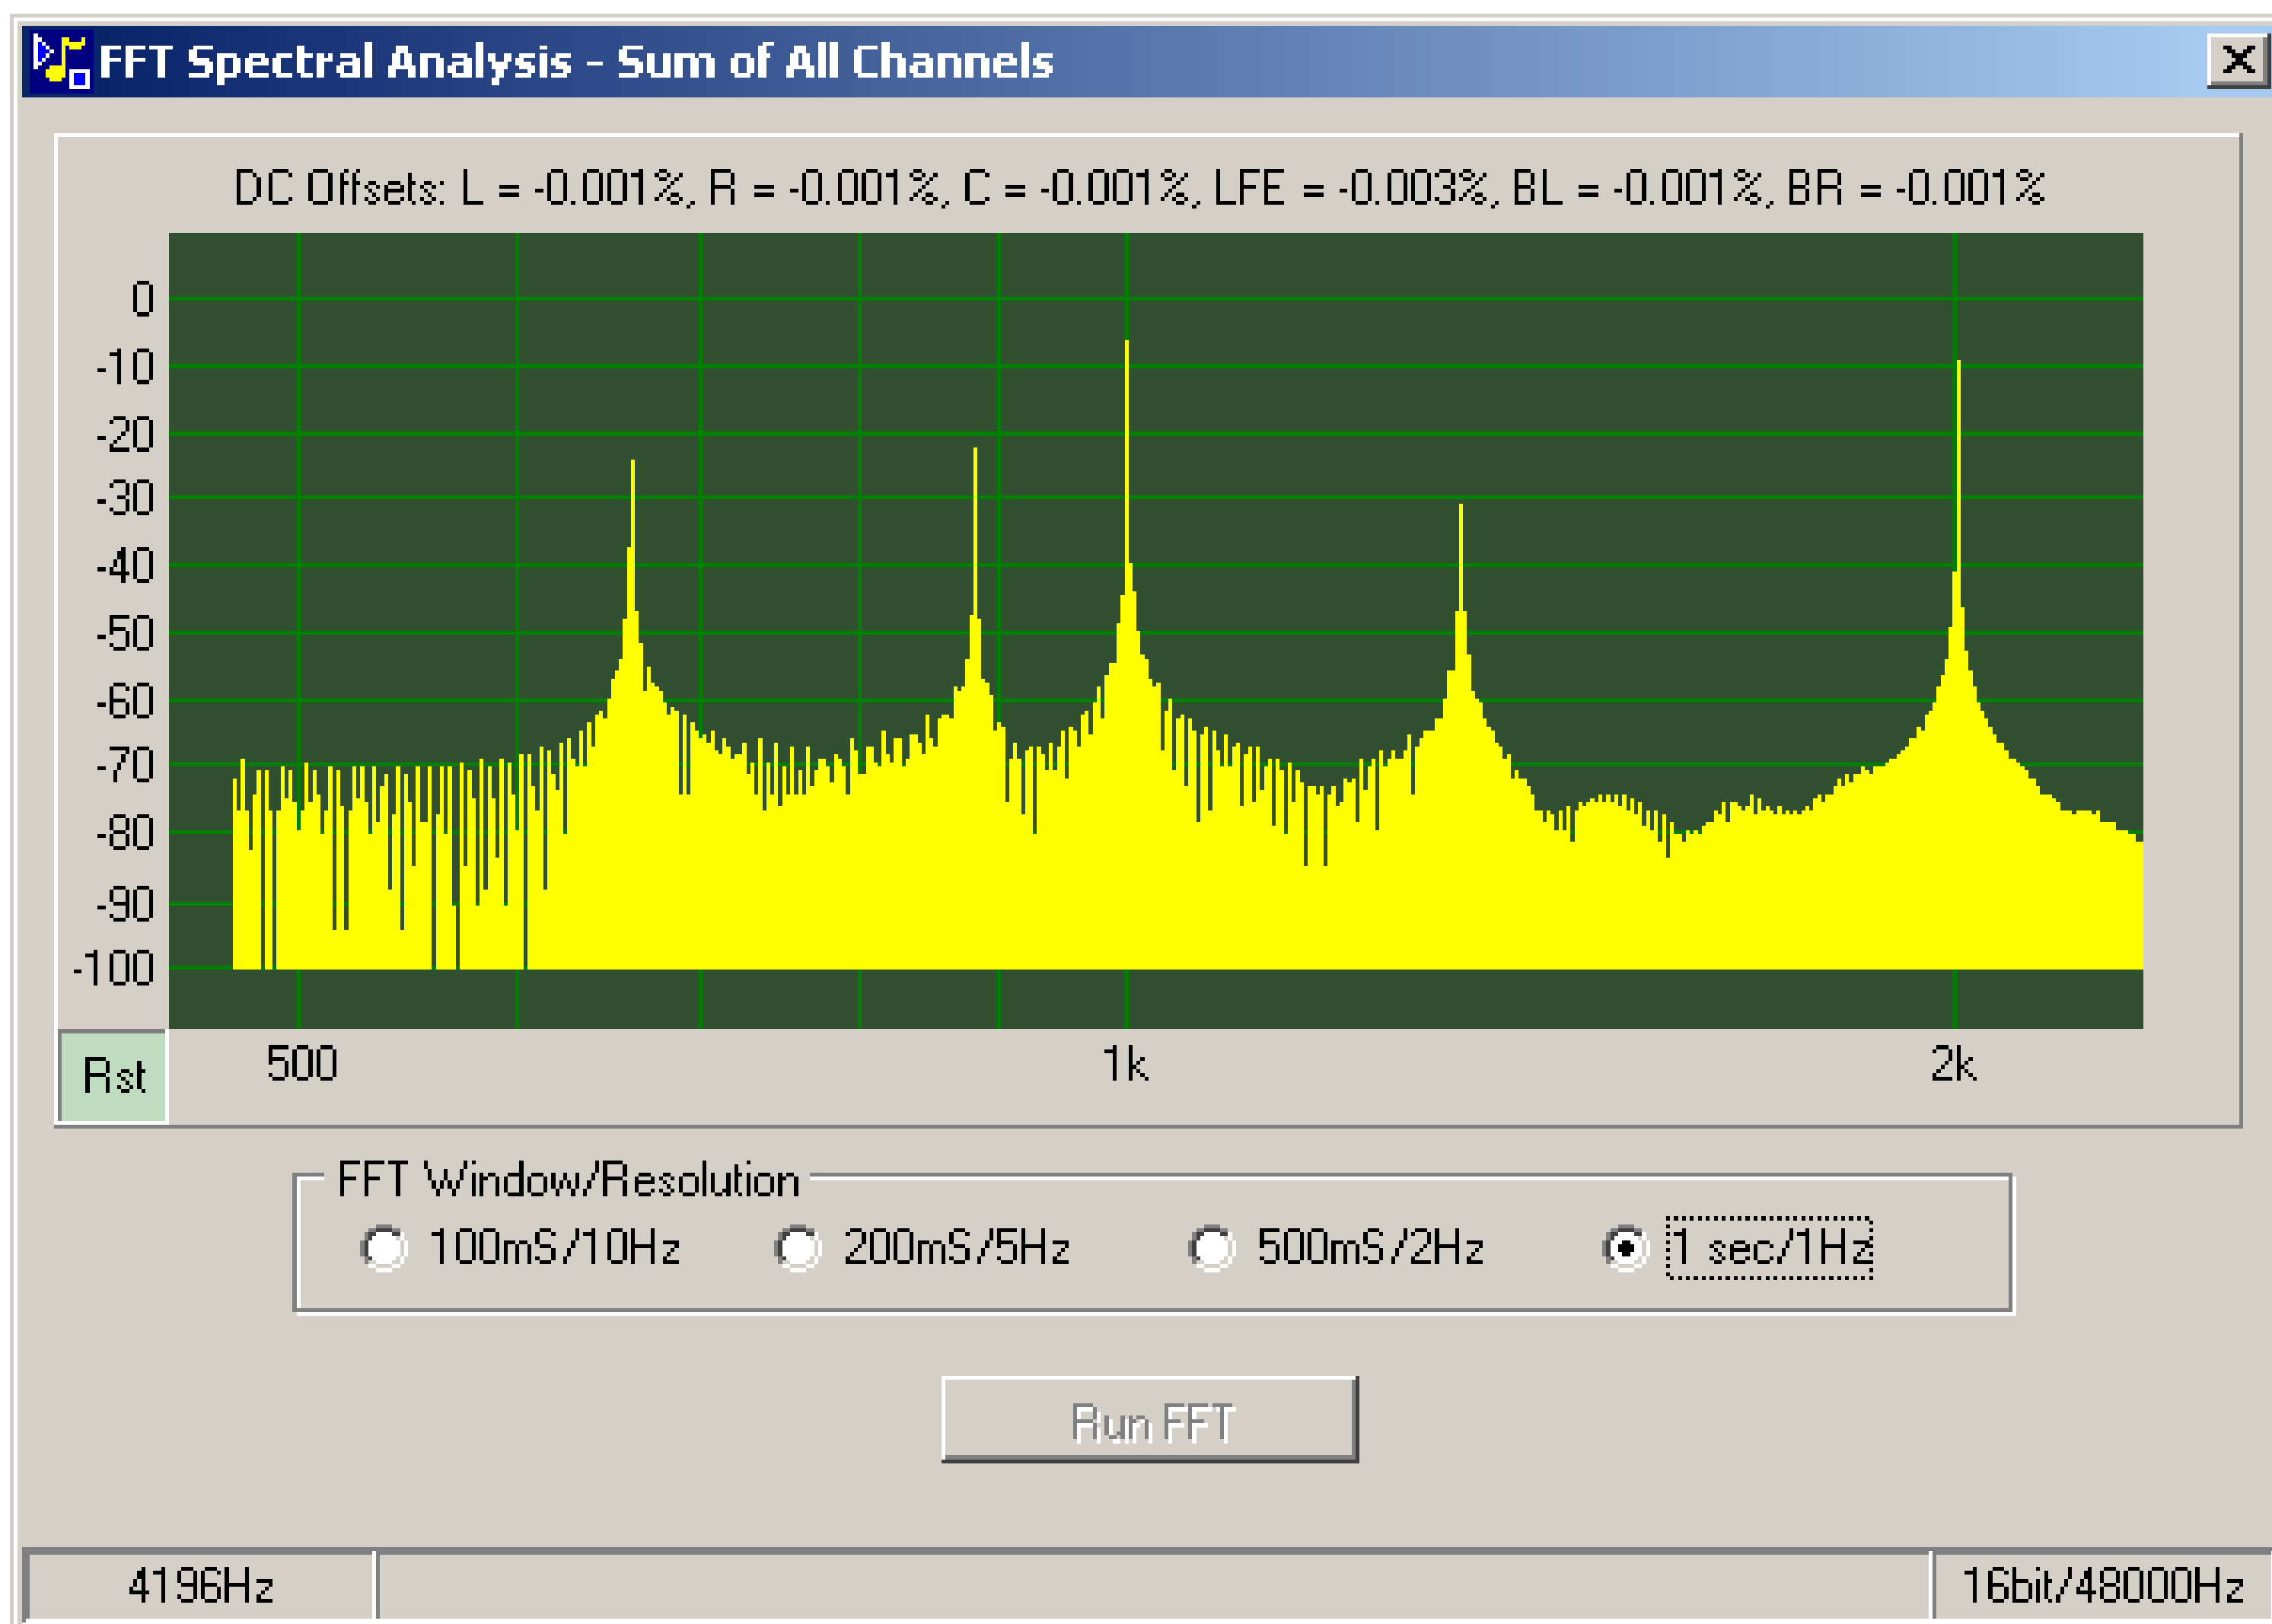

Above the spectral display is a listing of the DC components found on the channels shown as a percentage of peak level.

The horizontal scale runs from 10Hz to half sampling frequency - in this case 24kHz as indicated by the dark red line.

Both the Frequency and Amplitude scales can be changed by clicking on the scales, left-click expands the scale and right-click reduces the scale.

Expanding the horizontal frequency scale will move some of the spectrum out of view, so the plot can be moved sideways by left-click dragging on the spectrum display area. Below is an example of increasing the amplitude scale to be 0.. -100dB and expanding/positioning the frequency scale to show the detail between 500Hz and 2kHz.

The 'Rst' button at the bottom of the amplitude scale resets both the amplitude and frequency scales to their default values.

The peak values of the spectrum display may not be what is expected, this is due to the display being a measurement of power so the length of time a particular frequency exists is taken into account.

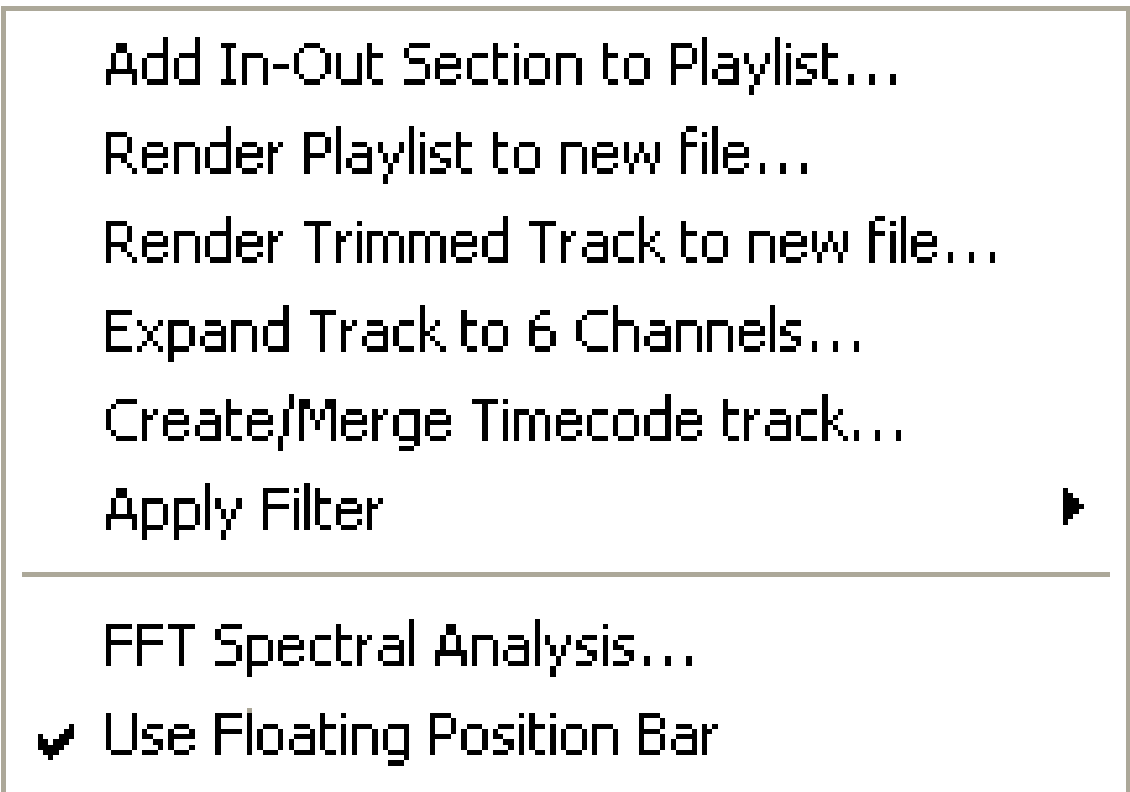

When the mouse is moved over the graph, the frequency corresponding to the mouse position is shown in the lower left panel of the status bar.

Floating Position Bar

The Use Floating Position Bar option allows ganged control of multiple buttons.

If the button selected is a Master button the ganged operation controls the Master and all Play slaves, if the button is not a Master then controls operate only on that single button.

The Floating Position bar will not control buttons that have an active PlayList, although deselected PlayList In Points can be used as cues.

Checking the option and the exiting the Audio Trim page by clicking OK will show a new Floating Position Bar - there is a limit of four Position Bars available.

Here button 1 has been assigned the Floating Position bar which as button 1 is a Master the Position bar will control buttons 1..4 and 11..13, only basic operations of Stop, Play and Cue are available.

Pressing Play on the Position Bar will start all controlled buttons playing and the scrollbar tab will move to show the position within the track, above it is shown positioned 01:08s from the start of the track or Trim InPoint.

If the Slave tracks are not the same length as the Master then they will stop before or after the Master track and the scroll bar will not be a true representation of their position.

While the Master track is stopped it can be cued by dragging the scroll bar tab, below it has been moved back to 00:50s

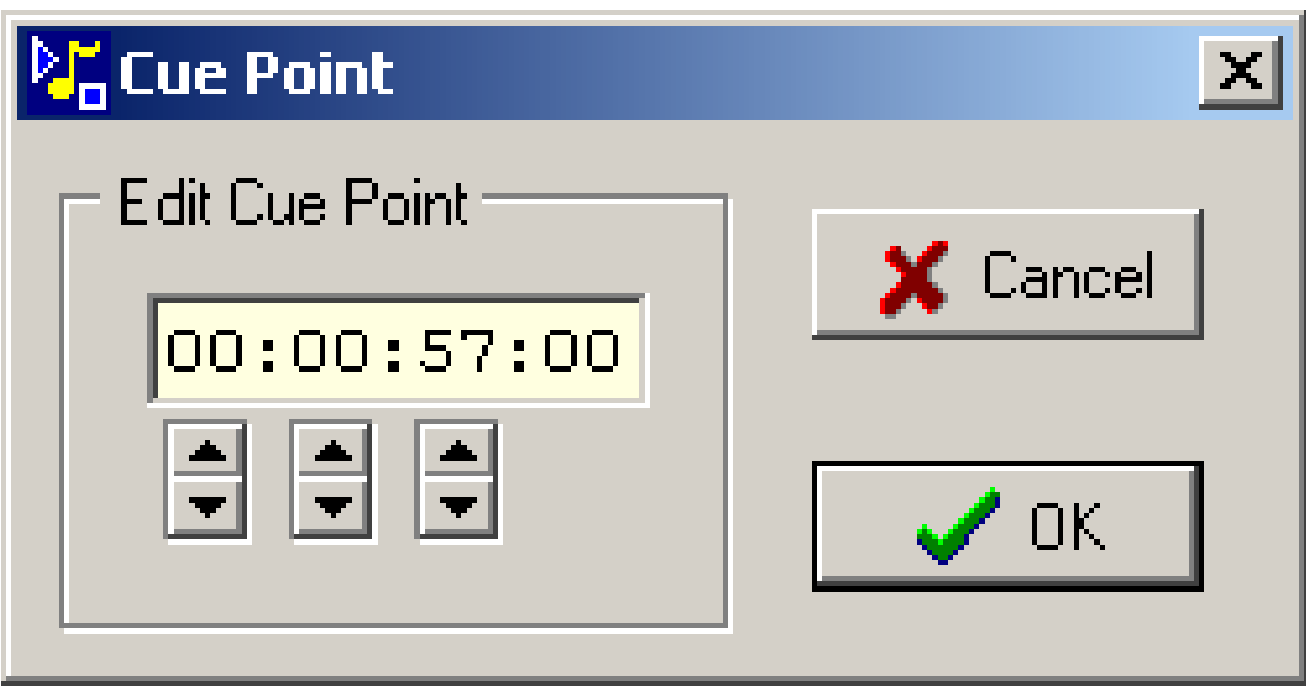

When Play is again pressed the tracks will play from their new start point.

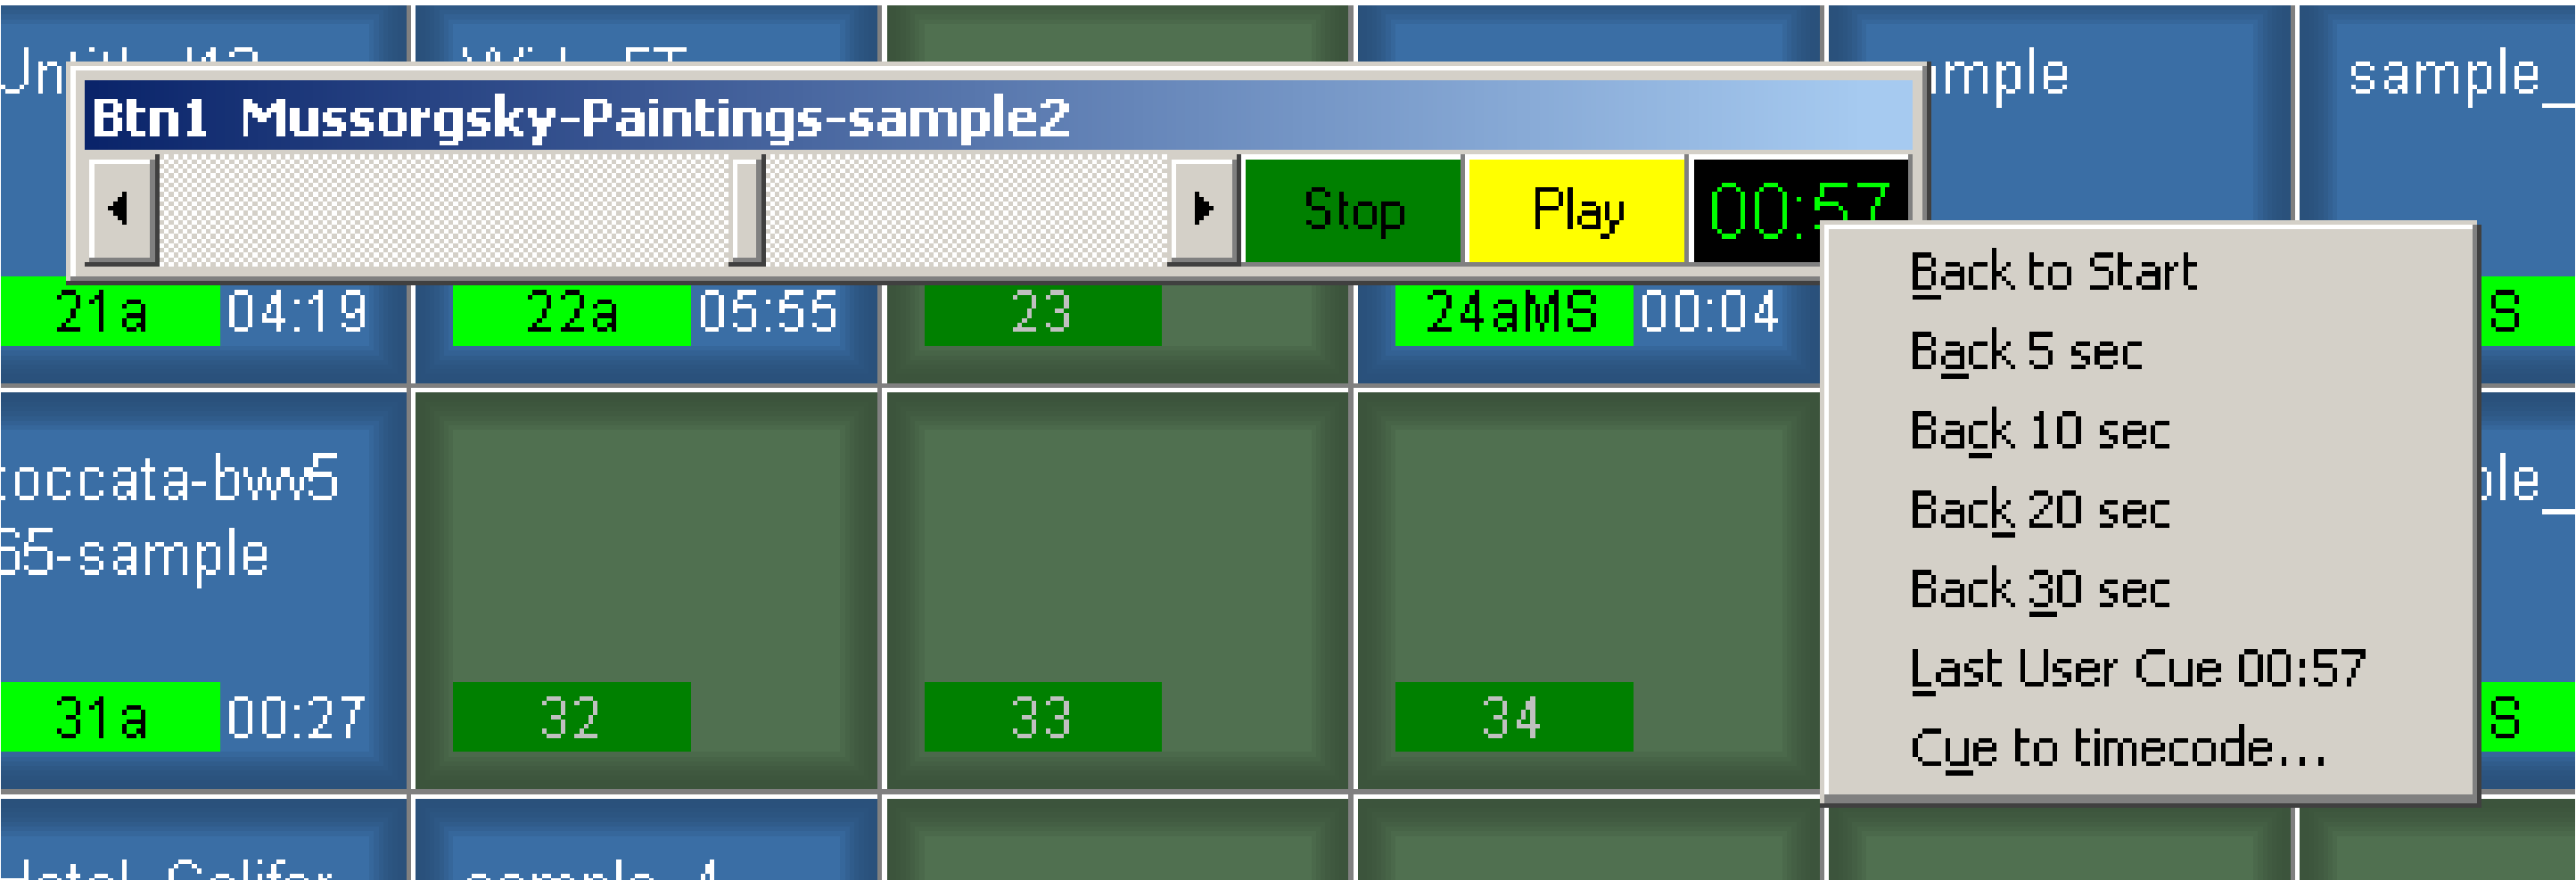

To assist in cueing a popup menu is available by right-clicking on the timecode readout

Here there is quick access to the start of the track and cue points at 5s, 10s, 20s and 30s before the point at which the track was stopped

Also any timecode value can be entered by clicking Cue to timecode.

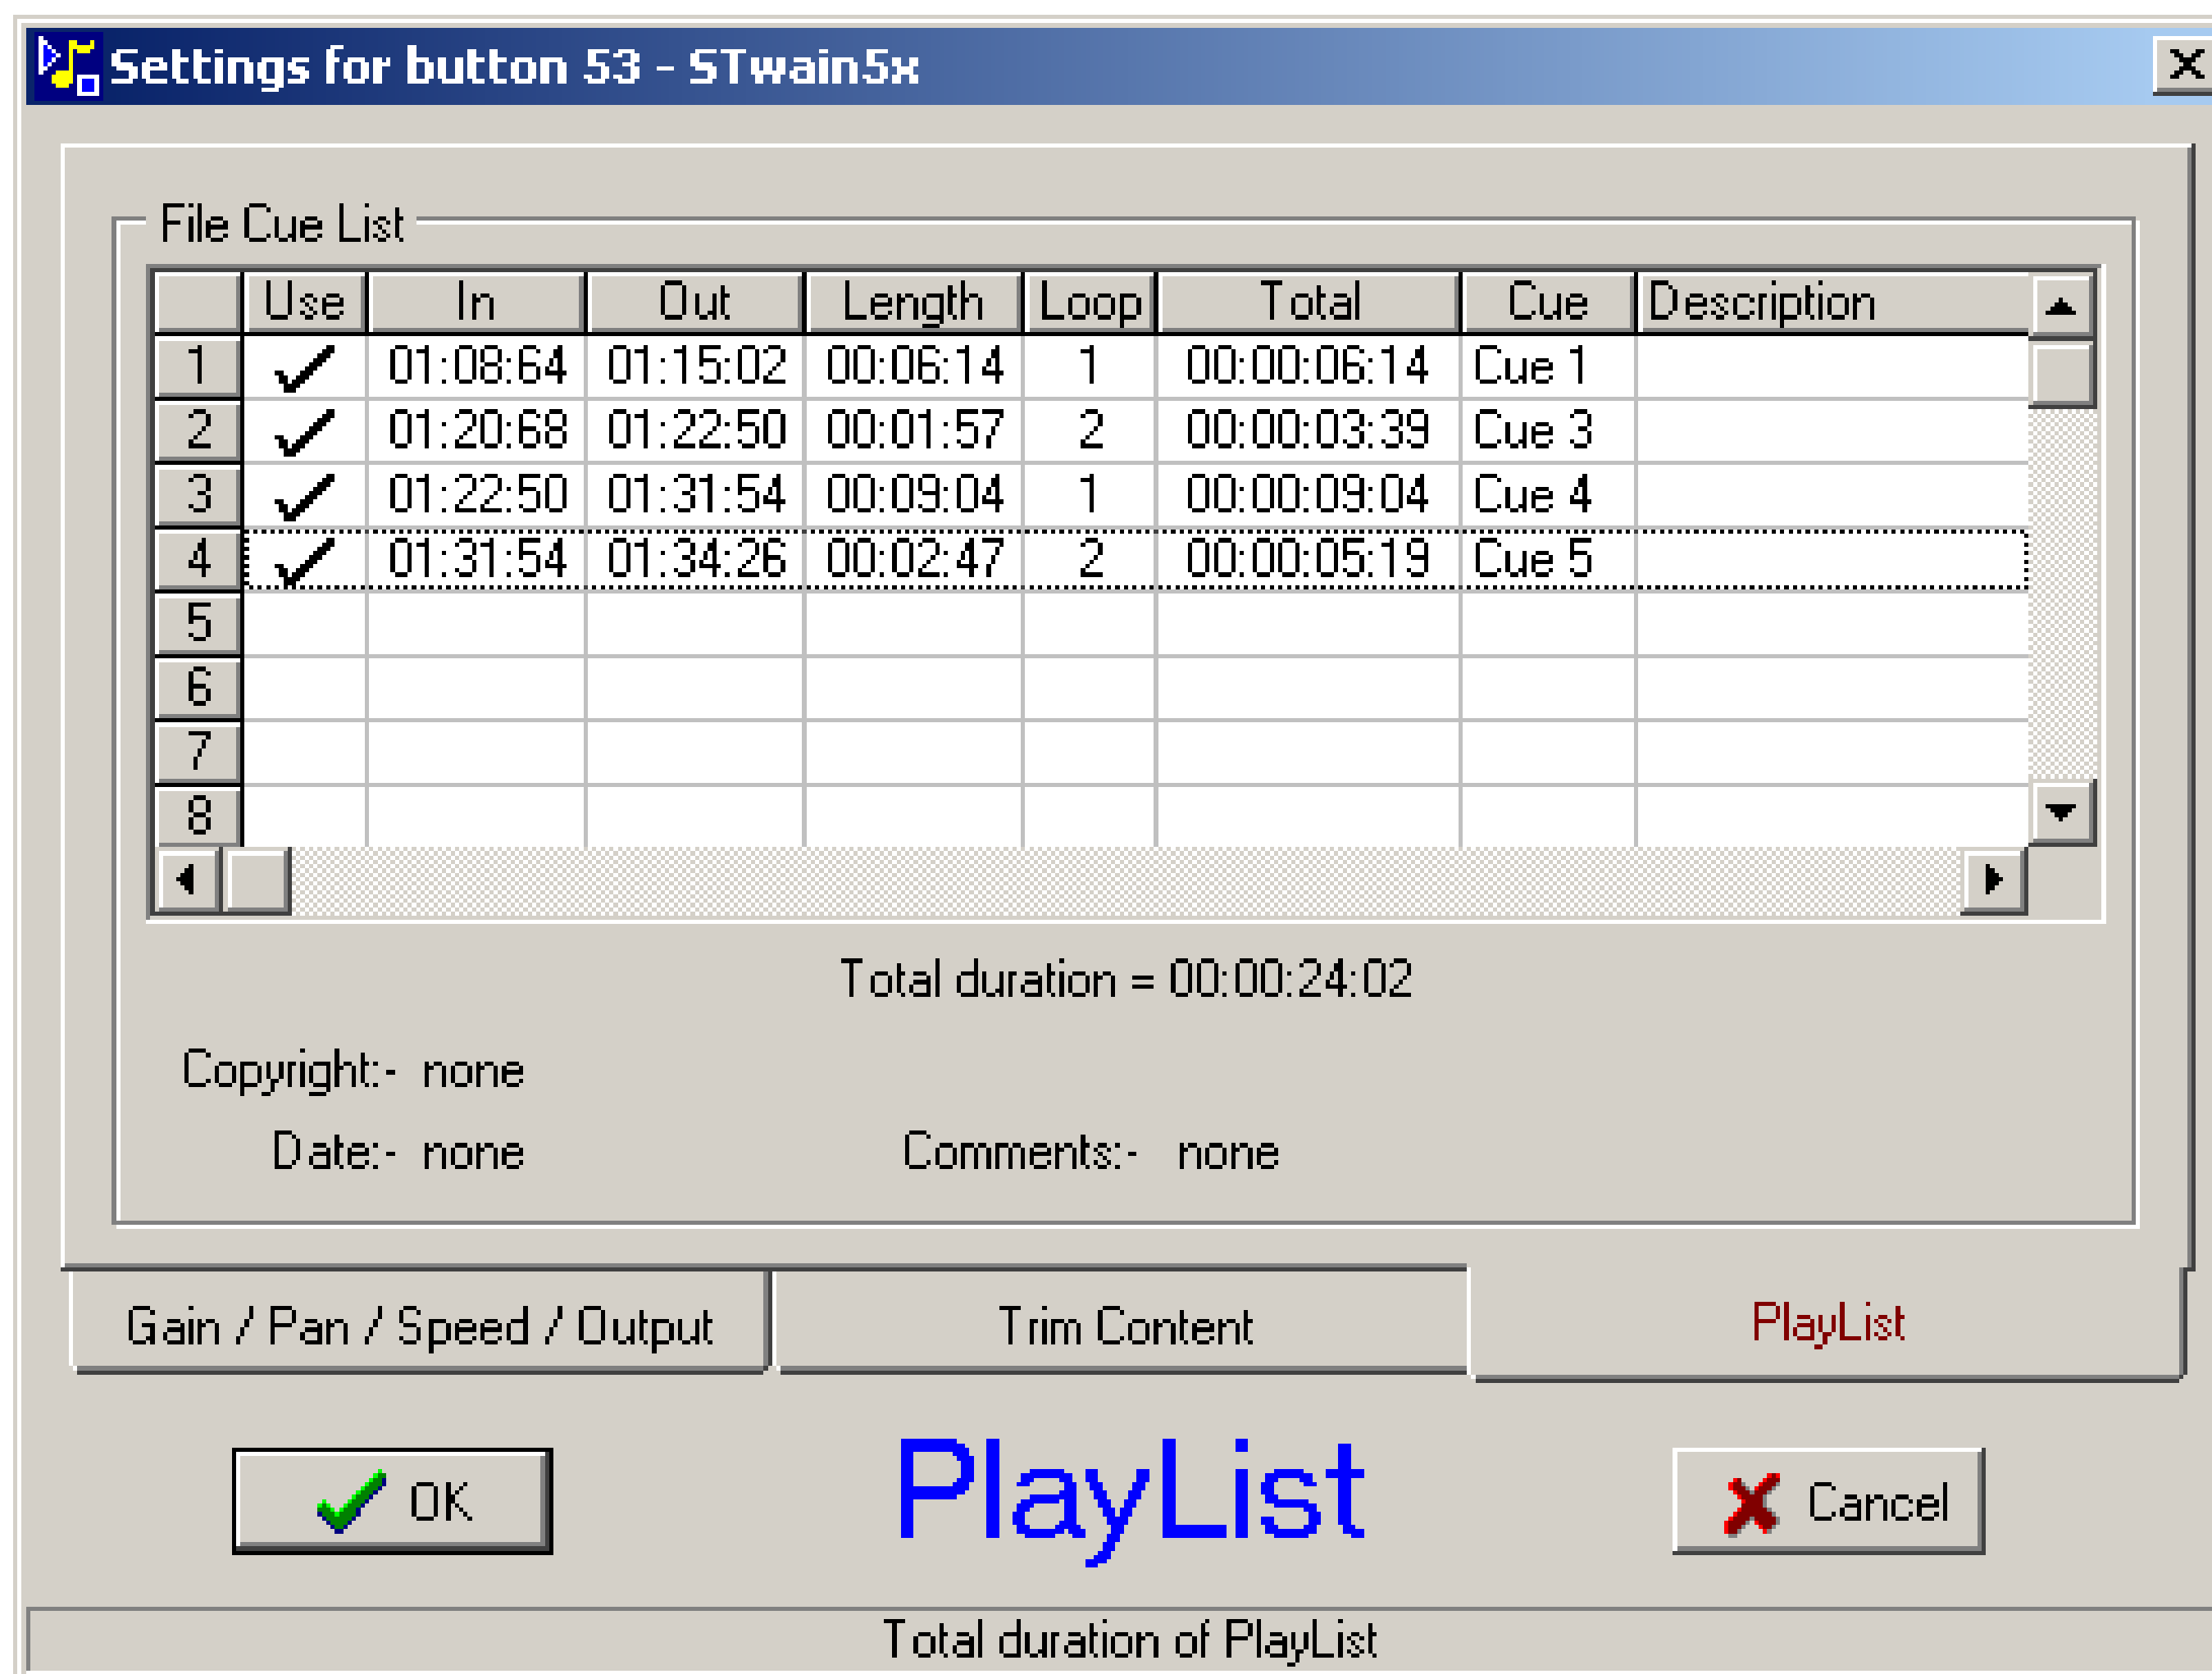

The last value entered into the timecode edit window will be saved as the Last User Cue point

The Play button is shown in white text on a red background when the track is cued up to the start, and in black text on yellow when cued at any other point.

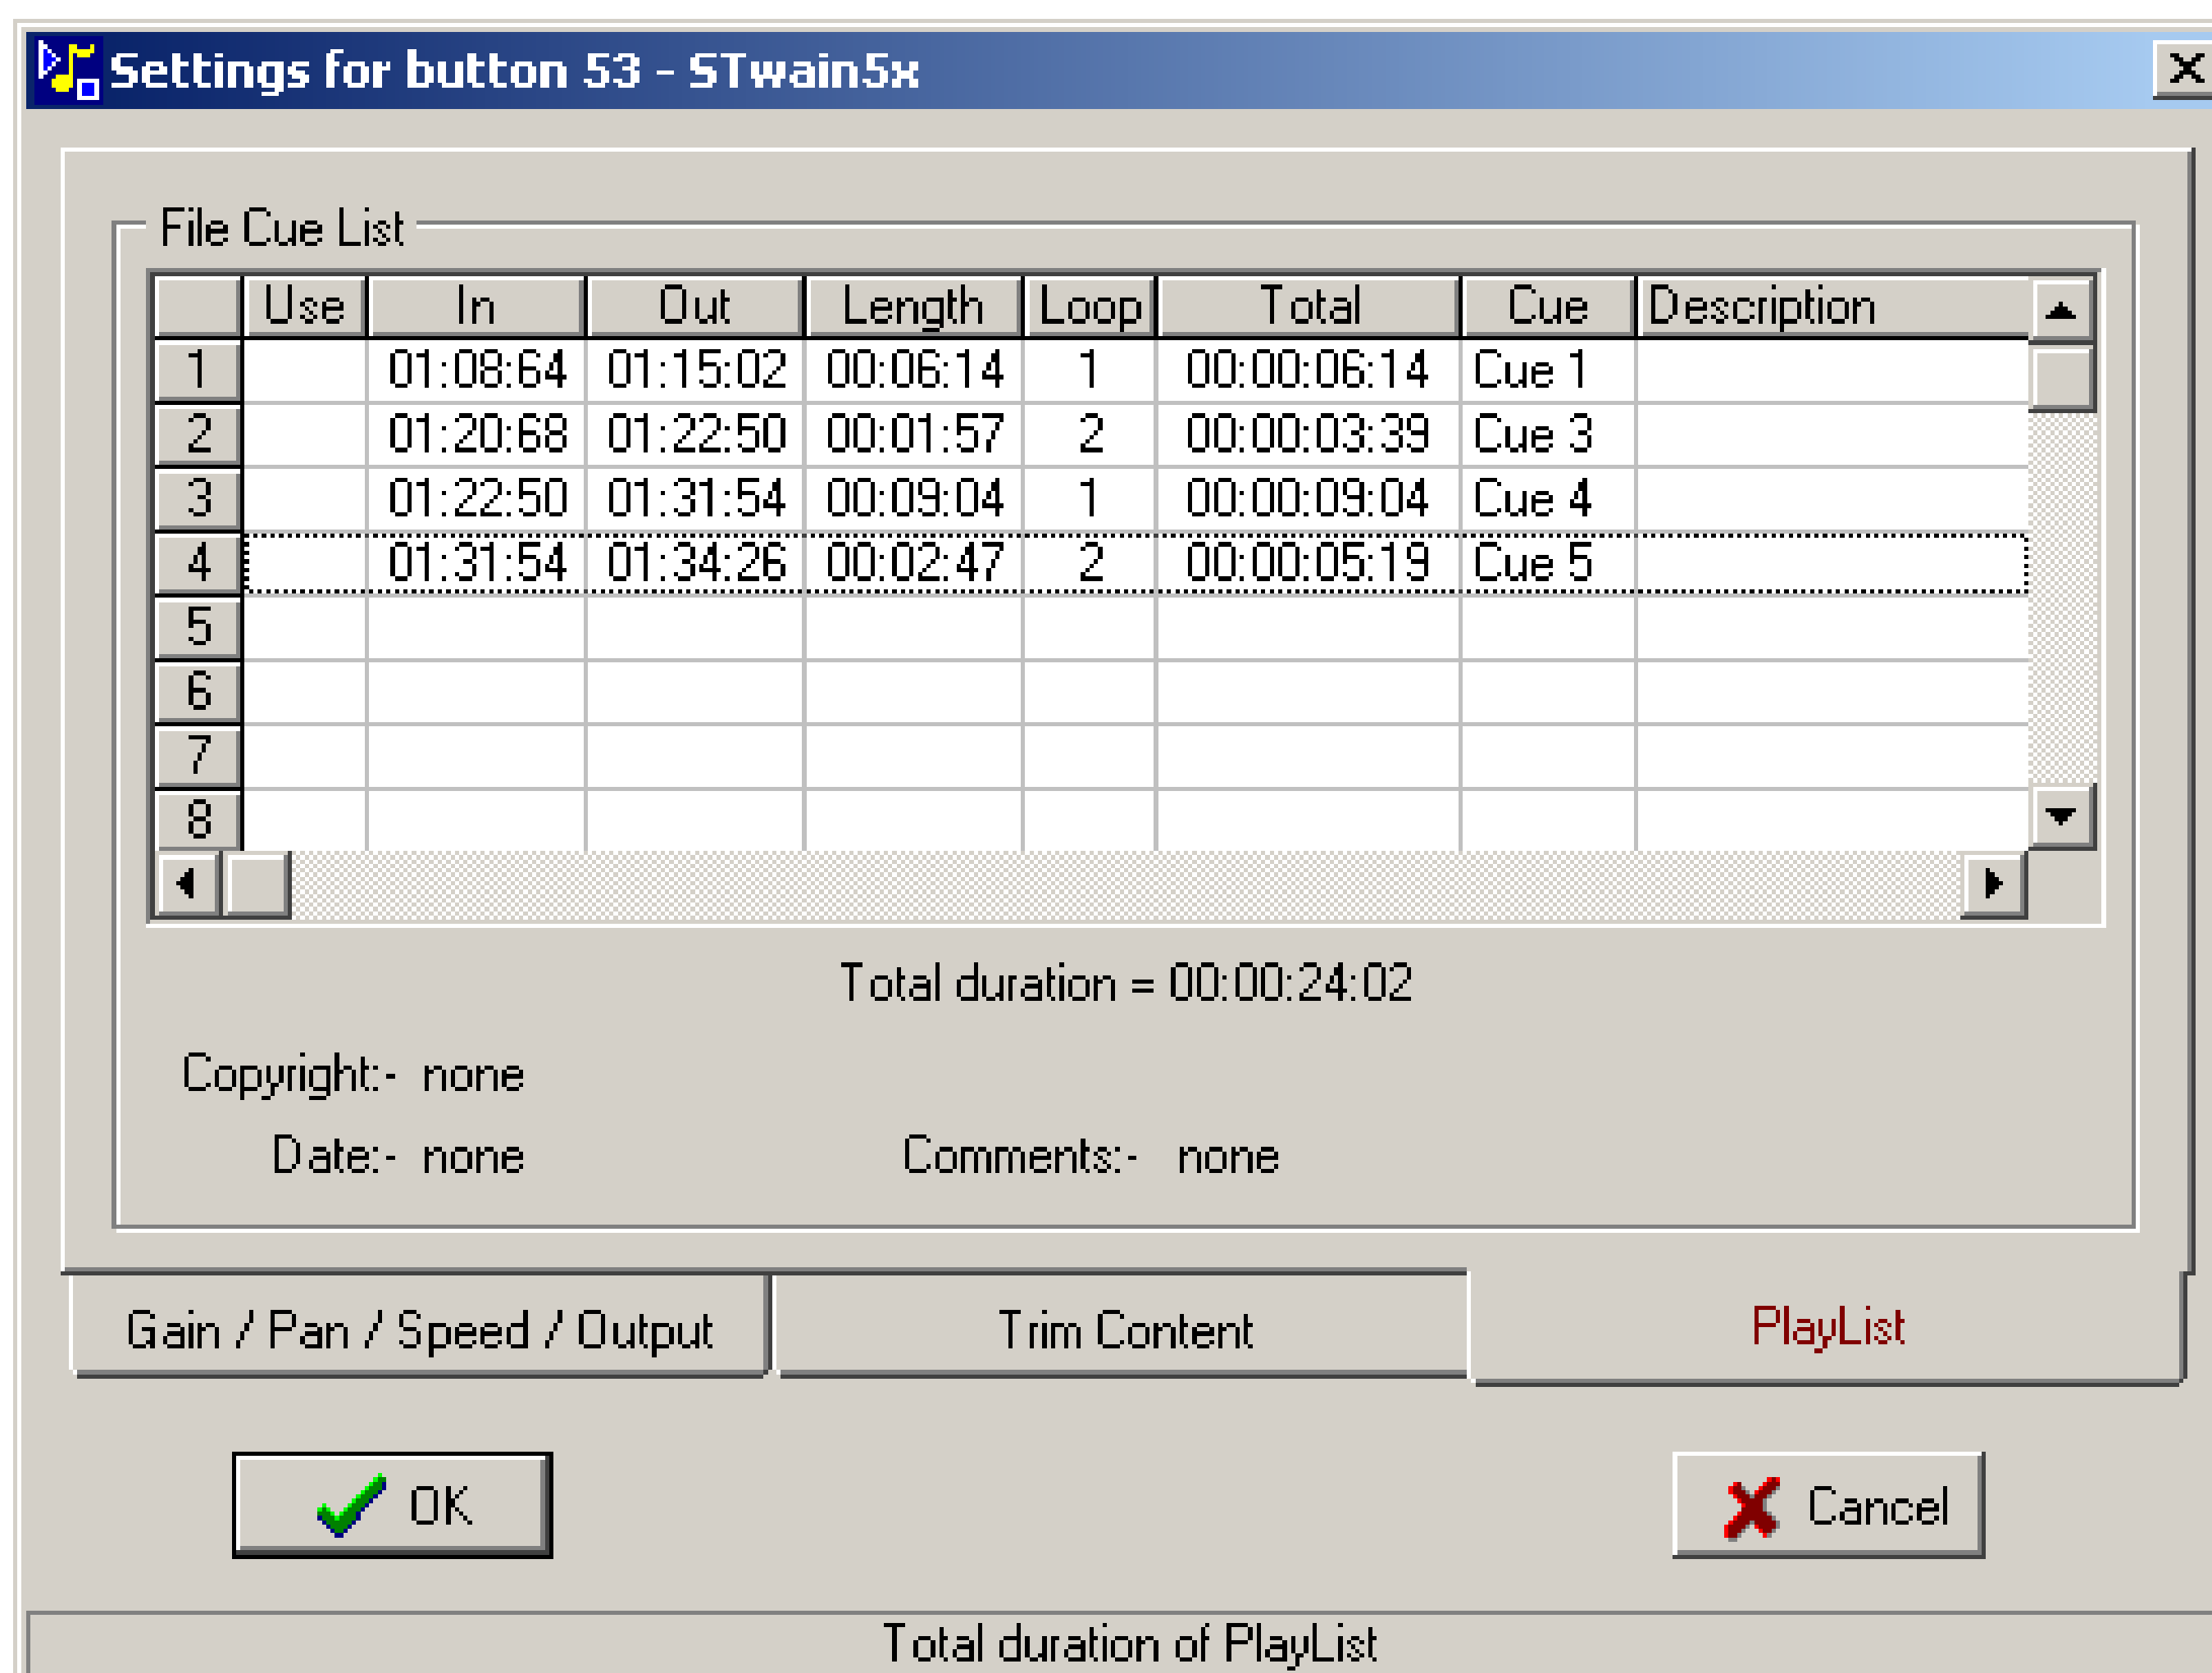

Above it was stated that buttons with active Playlists could not be controlled by Floating Position Bars, however a Playlist can be used as a list of cue points provided all the Playlist items are deselected.

Below is the Playlist page for button 53.

By default the Playlist items will be selected and a Floating Position bar assigned to this button will show the popup menu below with the Playlist cue points disabled - note the cue to Back 5 sec is also disabled, this is because that would be a point earlier than the start of the track

Now if the Playlist items are deselected

When the popup menu displayed again the Playlist In points are available as cue points, so allowing a track to be prepared with useful cues.

The Preset Cues are marked at the bottom of the scrollbar, below shows the situation after a cue up to Preset Cue 4

As with the Speed bar the Position bar can be resized by dragging the lower right corner of the window.

The Floating Position Bars differ from the other floating bars (Speed and Level) as they are saved in Session and Package files so that they will reappear at their saved size and positions when the session or package is recalled.

Note that the Position Bar does not have the usual Close button on the title bar, the only way to remove the Position bar is to either clear the button or uncheck the 'Use Floating Position Bar' menu item in the Trim window.

Audio SetUp - PlayList

PlayList

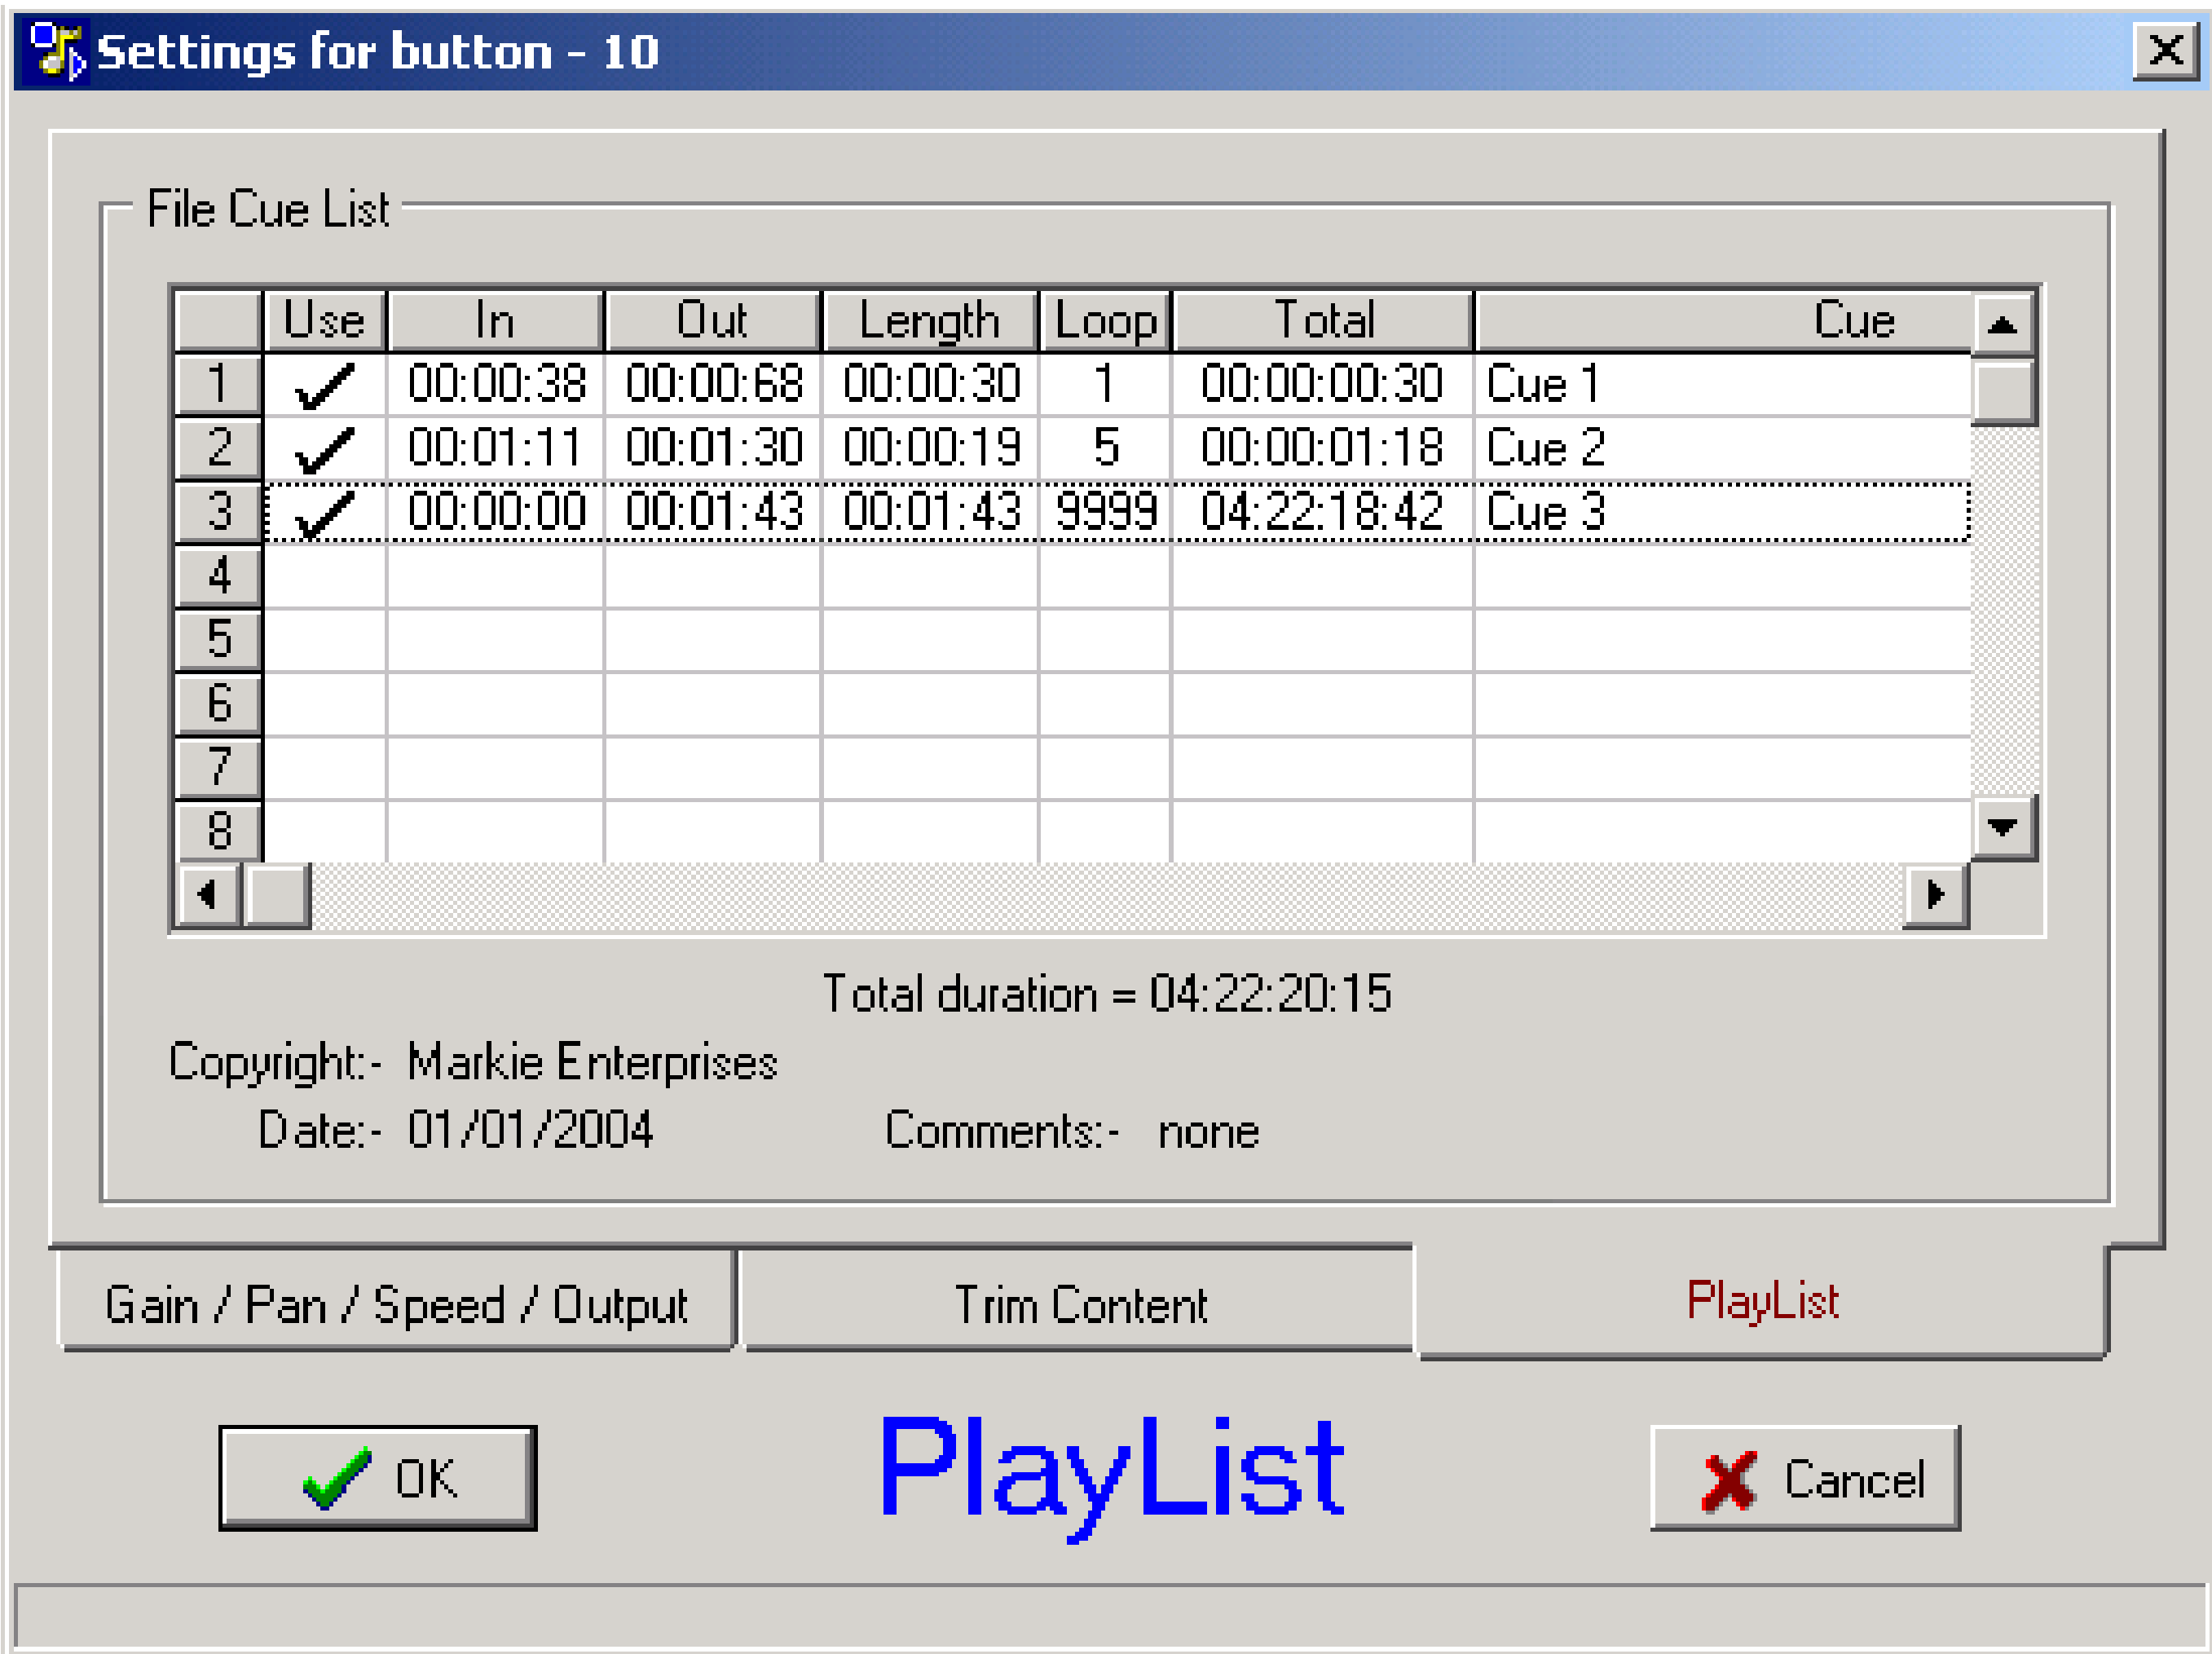

The WAV file specification allows for PlayLists to be embedded within the file, SpotOn will decode these lists and by default will play out the track following the playlist

A Playlist consists of a list of cues each with an In and Out point, additionally these individual cues can be set to repeat a number of times.

In the example below the playlist has three cues of length 00:68, 01:30 and 01:43, the cues are set to repeat 1x, 5x and 9999x respectively (SpotOn limits the number of repeats to 9999)

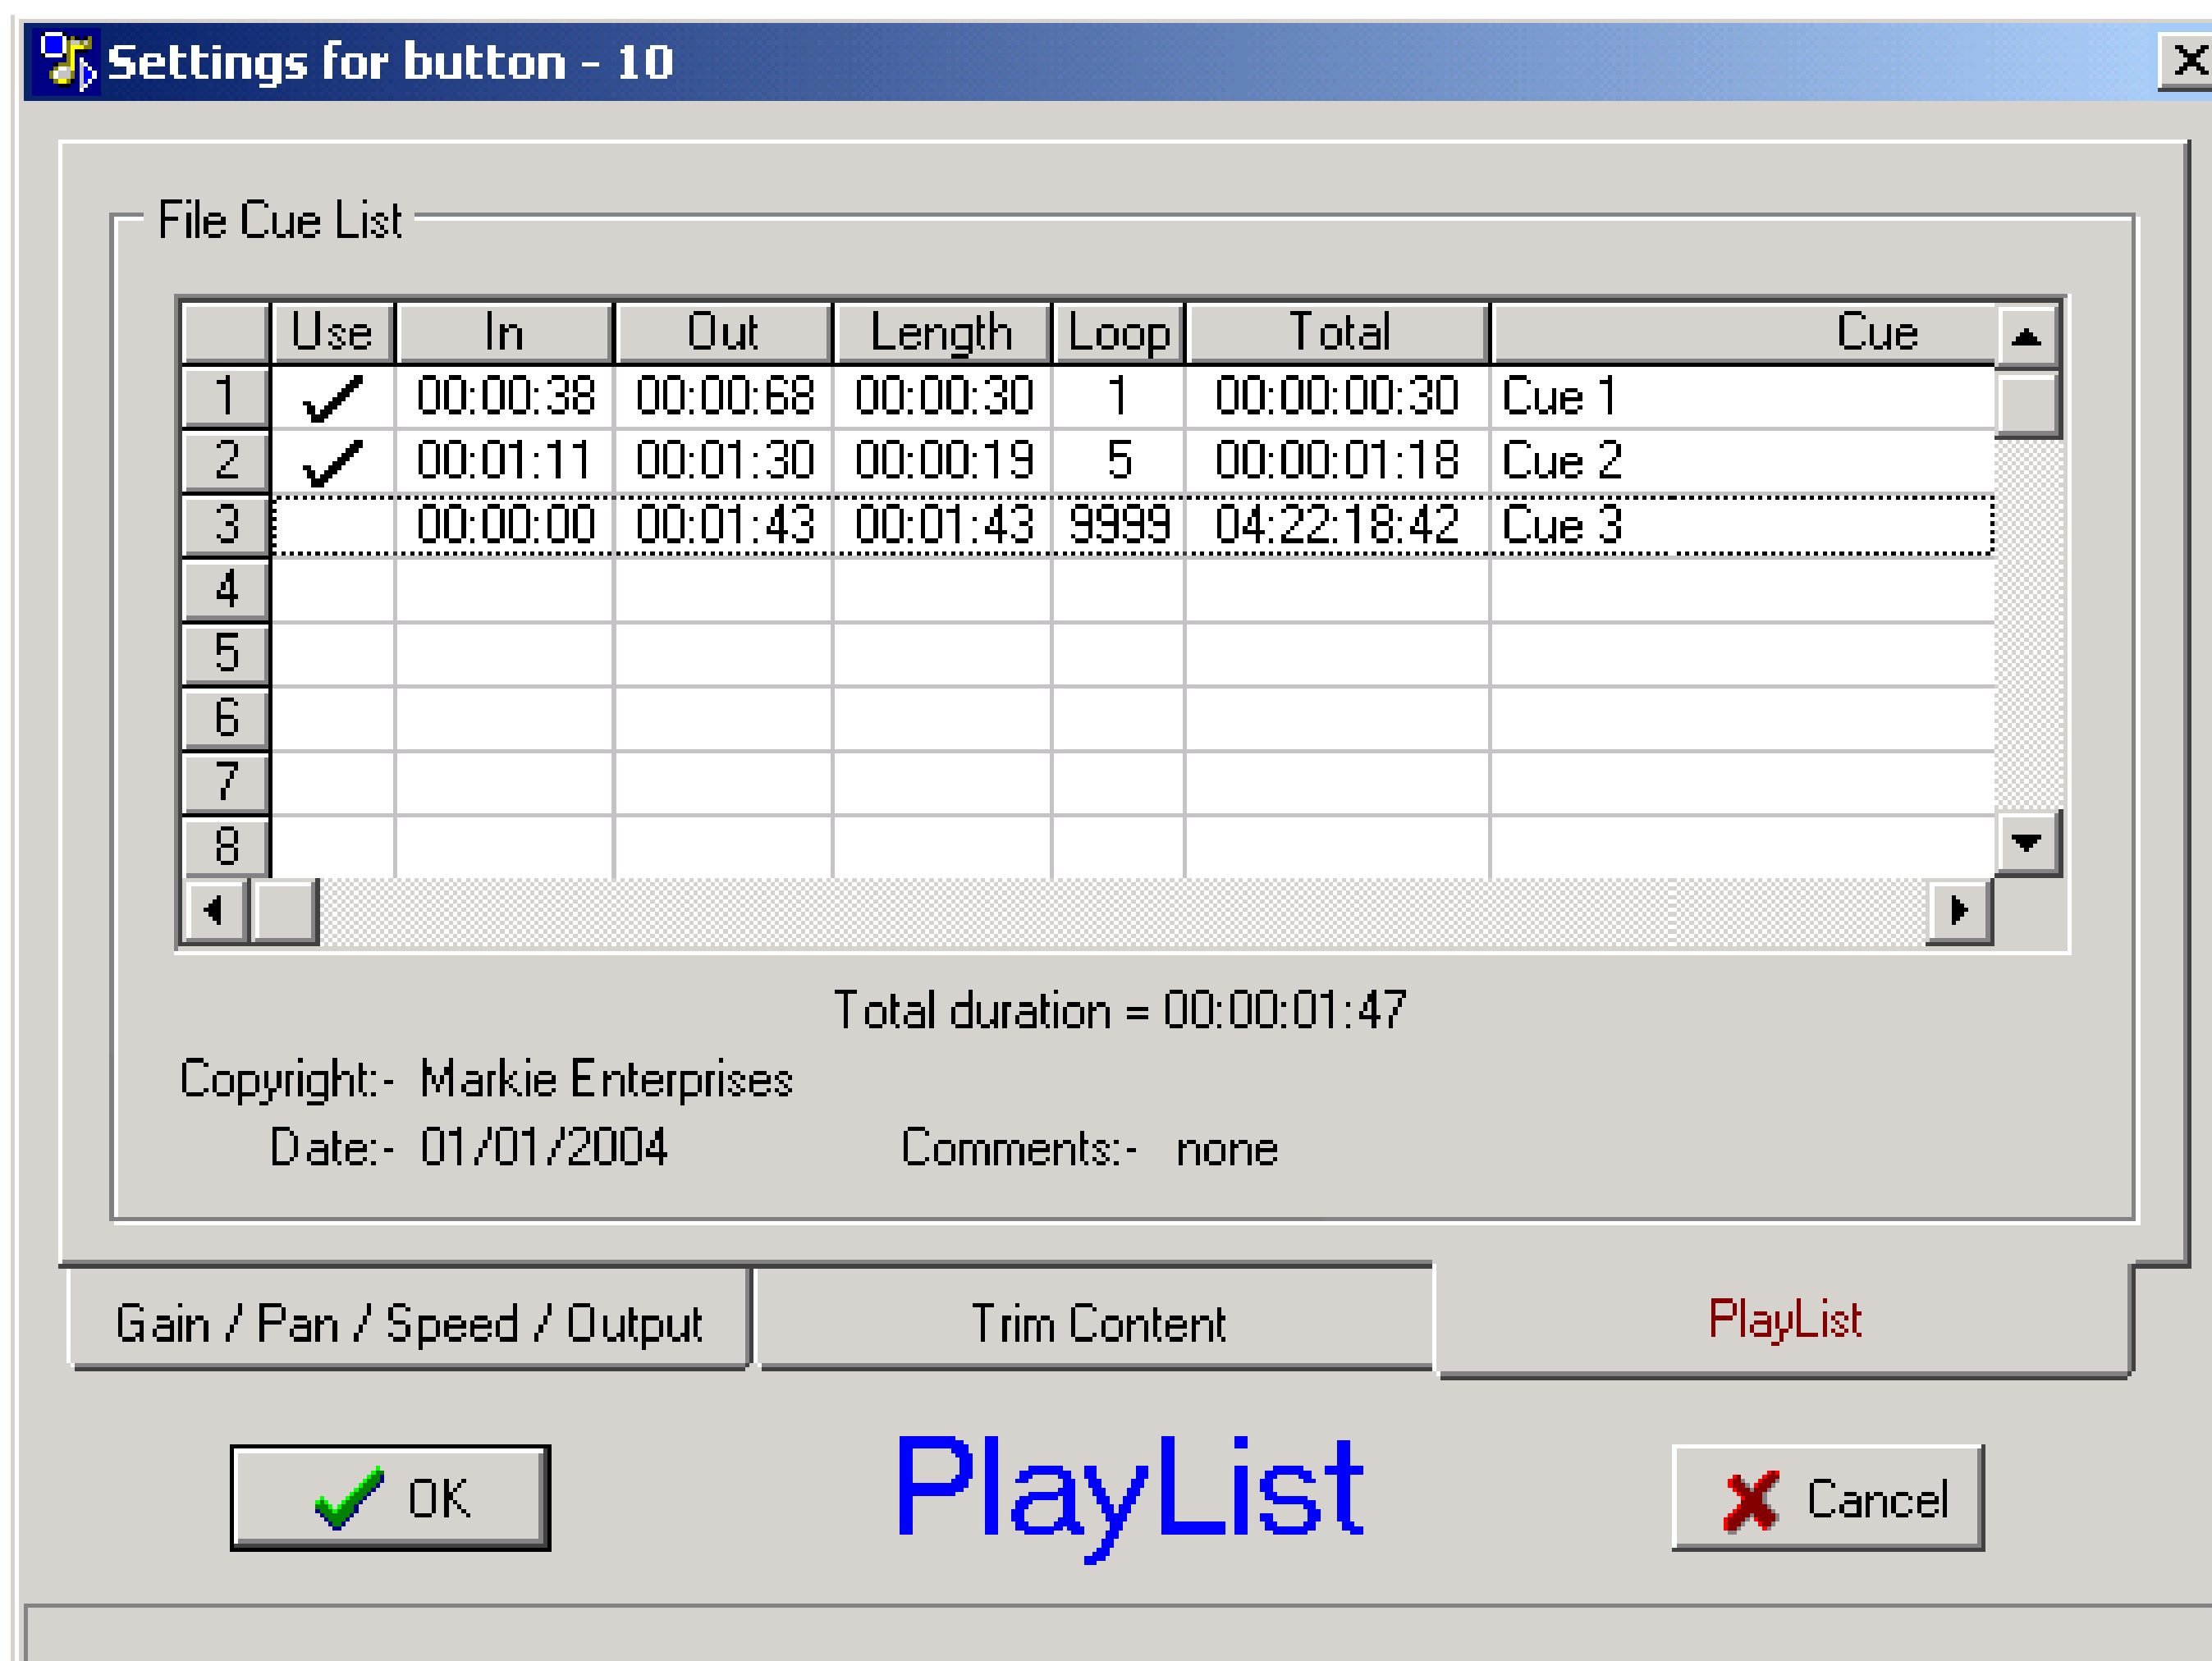

Including the repeats gives total durations for each item in the playlist of 00:00:00:30, 00:00:01:18 and 04:22:18:42

Comments, copyright and creation date are also shown if available.

As stated above if a playlist is detected it will be used by default, this is shown by the blue text PlayList at the bottom of the window.

If a subset of the playlist cues are required then they can be individually selected in the Use column, below only the cues 1 and 2 are selected

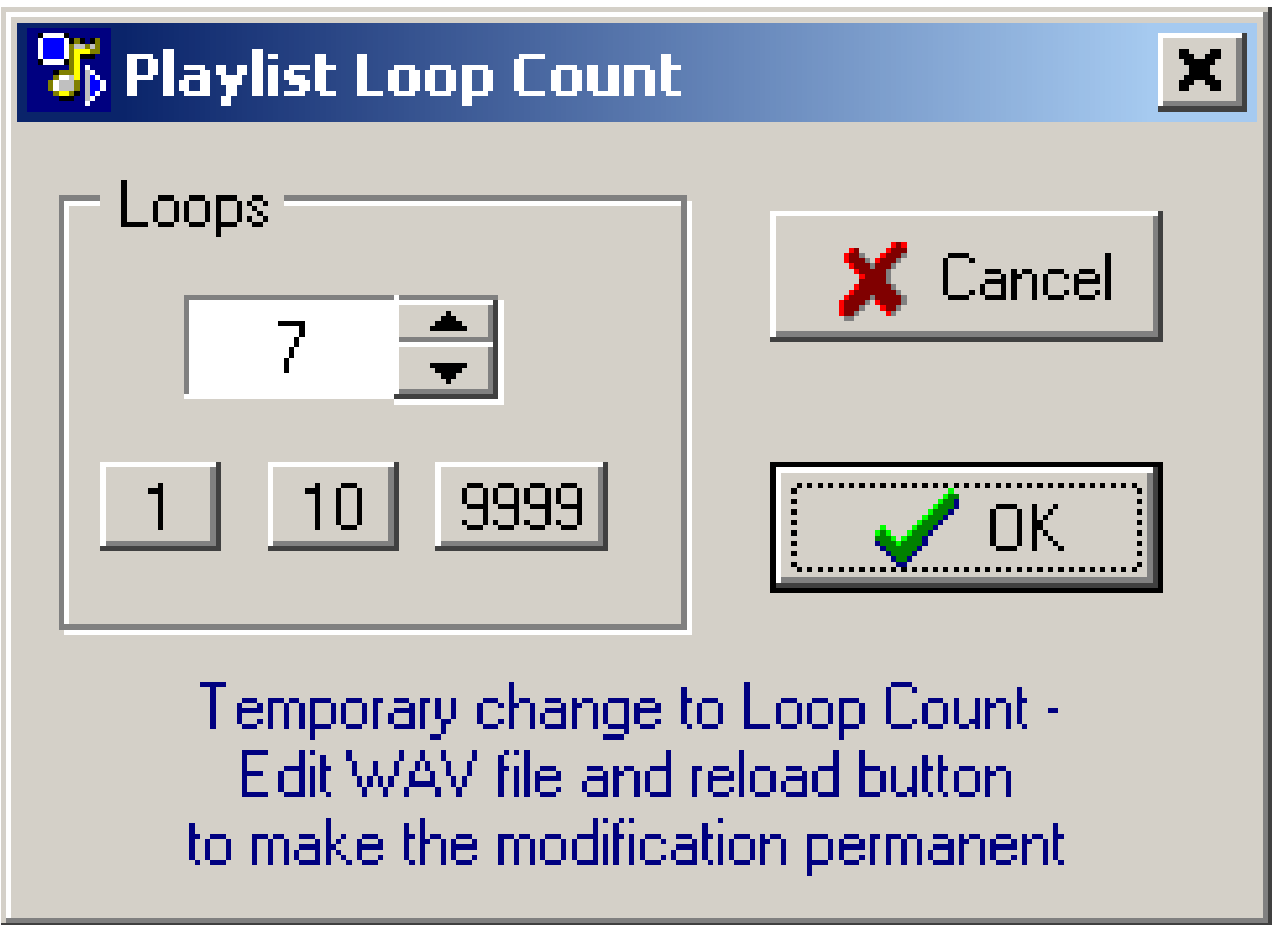

When any cue in the playlist is selected the trim edit page described above is disabled as the cues are effectively predefined

However if all the playlist cues are deselected then the trim edit window is enabled and the playlist is ignored as shown below

If a button is using a playlist then the duration text is modified with a leading 'P', if the total duration of the playlist is greater than 1 hour the duration is shown as below right

The number of loops for each playlist item is shown in the 'Loop' column, this value has been read from the data contained in the WAV file. However, the number of loops can be changed on a per button basis for the duration of the current session by right-clicking the entry in the loop column.

The dialog box above allows the loop count to be temporarily changed and affecting only one button, if a permanent change is required then the source WAV file should be edited externally and reloaded into SpotOn

The loop count will be shown in red text if it is different to the values contained in the original WAV file

The change to the loop count will be maintained across session save/load operations, however if SpotOn detects any change to the Playlist contained within the WAV file then the values will be reset to match the WAV file

If a modified loop count is present then the right-click menu will show an additional item allowing the value to be set to the original value extracted from the WAV file

Right-clicking on the In column will display the options to cue to the In Point or Cue up and Play from the In Point, this facility is only available when the Playlist item is deselected.

	Use	In	Out	Length	Loop	Ti
1	✓	00:00:01	00:03:14	00:03:12	1	00:00

Midi Assignment

Selecting the Midi option from the button popup menu displays the dialog box below, here the incoming Midi notes that causes the button to play or stop can be set along with the outgoing Midi note that is sent when the button starts to play or stops.

Below is the default setup with no Midi In and no Midi Out notes selected, the range for Midi notes is 0..127 and for Midi channels 1..16.

Midi SetUp for button - 6

Midi Control for Play/Stop

☐ Set from next Midi Input

Note In that triggers Play

☐ 0 0/C

Chan-1/Note-0/On not used

☐ Fast Midi Mute (none)

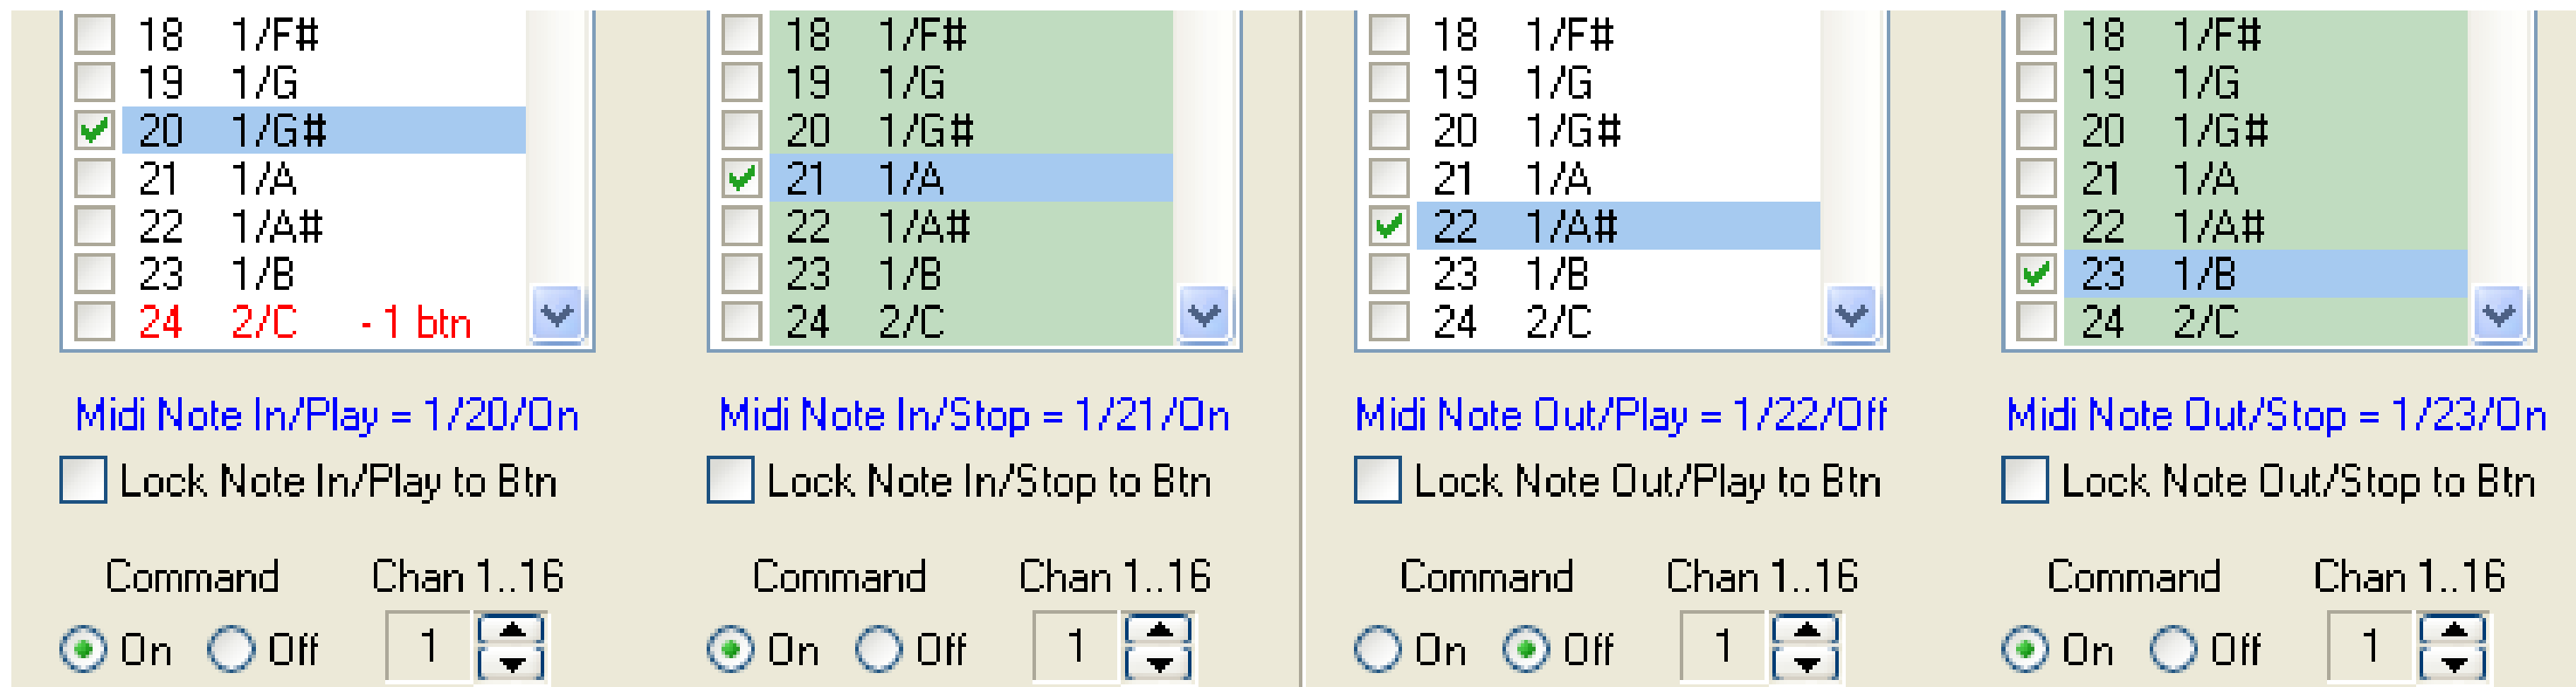

OK Cancel

There are four sections in this dialog: -

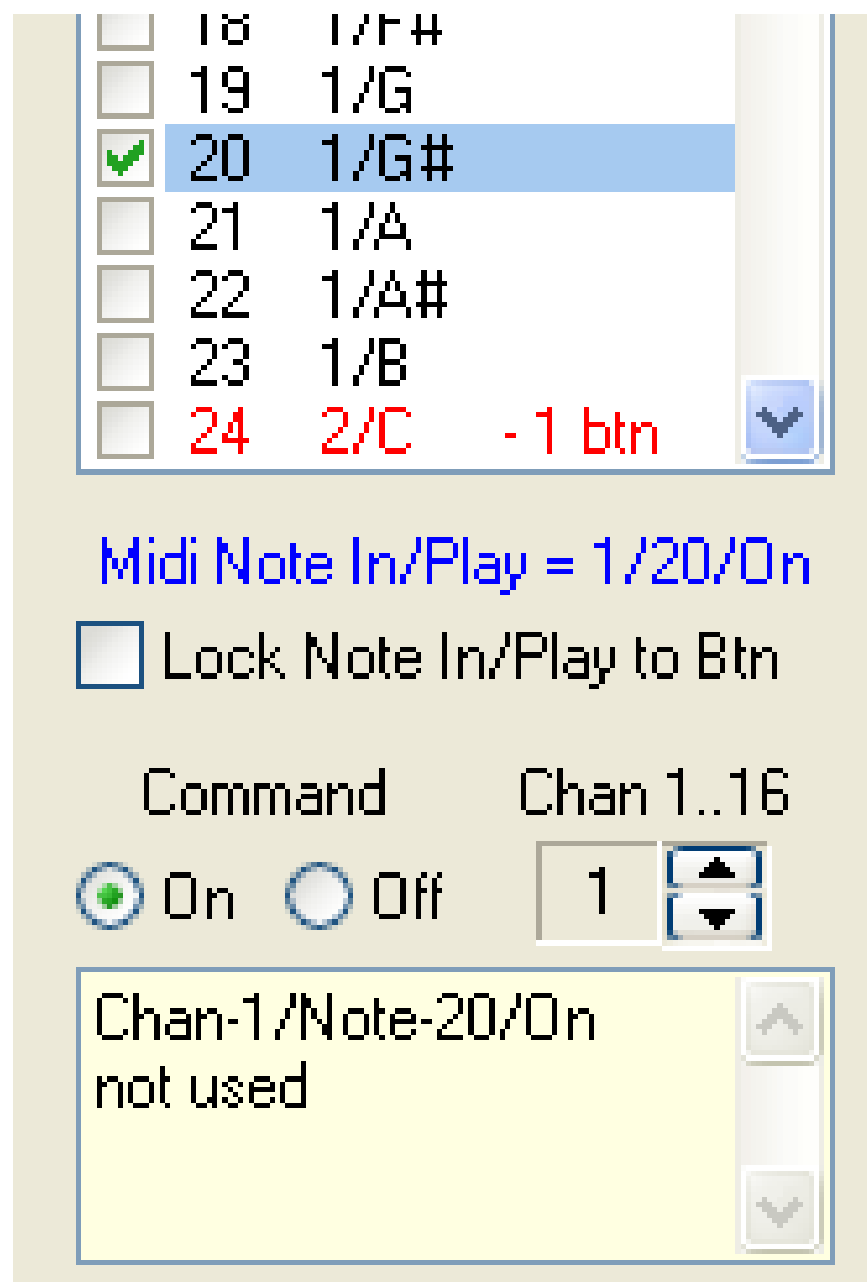

- | | |
|--------------|--------------------------------------|
| Left | Note In that triggers Play |
| Left Centre | Note In that triggers Stop |
| Right Centre | Note Out sent when button is Played |
| Right | Note Out sent when button is Stopped |

N.B. The Midi Note out on Stop is not triggered when tracks are stopped via - Escape, Page Stop, All Stop or a fade out "Stop All on Play"

Separate notes can be set for the Midi In/Play, Midi In/Stop and Midi Out/Play and Midi Out/Stop actions, the full specification of the selected note is shown below the list, eg "Midi Note In/Play = 1/20/On" translates into Channel 1, Note 20, Note On

If other Midi notes on the same Midi channel are used by other buttons, then the note entry will be shown in red text along with the number of other buttons using the note

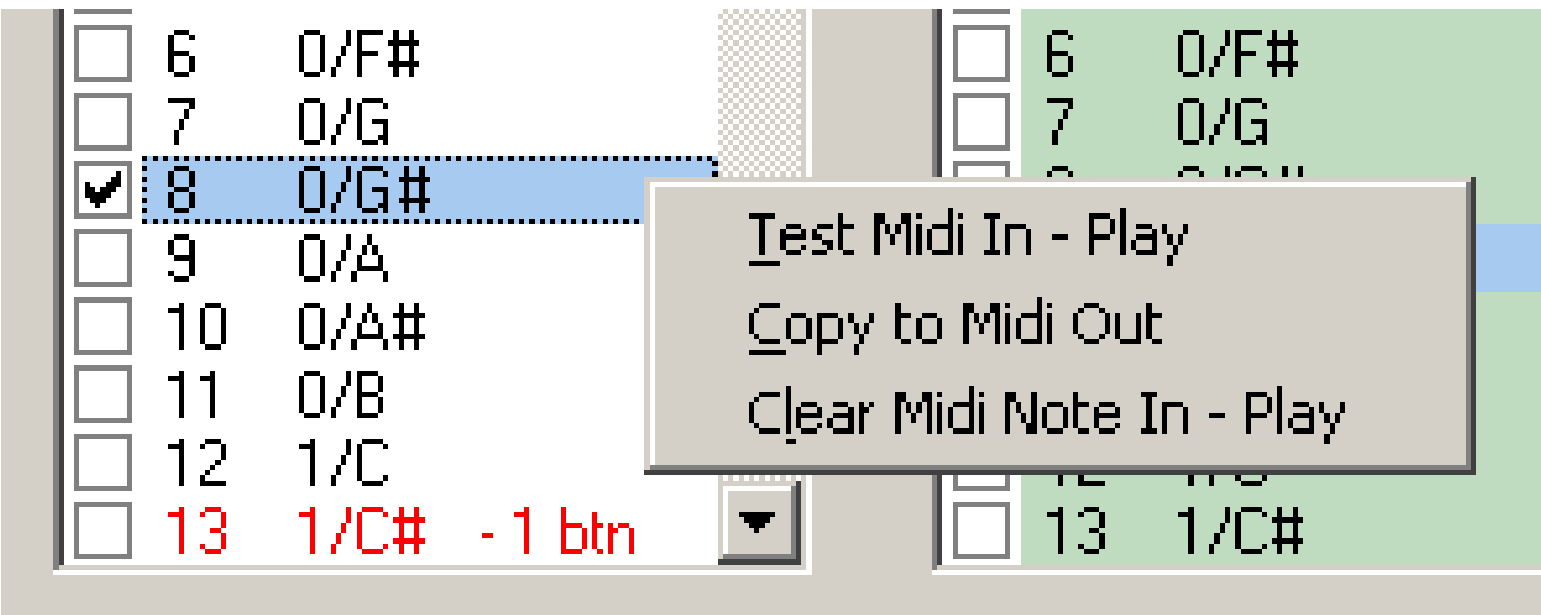

Selecting the notes without checking them reveals any other buttons that may be using the same Channel/Note/Action combination

The Lock Note check boxes allow the Midi settings to be permanently assigned to the selected button, so that which ever track is loaded onto the button the Midi settings remain.

The original settings of any track transferred to a button with the Lock Note enabled are saved and will be restored when the track is moved off the Lock Note button.

The Midi Note In and Out actions can be tested by right-clicking any note and choosing Test

Midi In or Out as appropriate.

Midi In/Play

Midi In/Stop

Midi Out/Play

Default Midi Out Velocity/Volume is set to 127 (maximum).

Also the Midi In/Play selection can be copied to the Midi Out column by clicking the popup menu option, if the Midi In channel is set to 'Any' then the note copied to Midi Out will retain the existing channel number otherwise it will take the Midi In/Play channel number.

The Midi In and Out functions can be individually enabled/disabled either via the Options|Midi Control menu item, or by clicking the Midi status panels at the bottom of the main window.

The text in the status panel will briefly flash red when an incoming Midi signal is detected or an outgoing Midi signal is generated

Buttons that have either Midi In or Midi Out assignments can be designated by additional icons

These are enabled via the main menu Display|Show Midi InOutoption

The "Set from Next Midi Input" checkboxes at the top of the three columns allow the Midi notes to be automatically set from the next Midi note to be sent to SpotOn. This allows the Midi notes to be set without the possible confusion of Midi note/channel numbering.

In some circumstances there is the need to use very fast Midi On/Off sequences eg 80mS on and 50mS off, the Fast Midi Mute option redirects the Midi notes On/Off to be UnMute/Mute. The mute action is much faster than continually stopping and restarting a track.

For this option to work the track has to be looped

A typical example of use would be a sensor on a rotating wheel in a game show that produces Midi On/Off notes whose length and spacing changes with the speed of the wheel.

As the track is looped, the output will be unmuted between receiving a Midi Note On message and a subsequent Midi Note Off message, in some circumstances this is not desirable so it is possible to set a maximum unmuted timeout by right clicking the checkbox above and selecting the appropriate duration. Selecting none disables the timeout feature.

Regions

Most button menu options only apply to one button at a time, Regions allow actions to be performed with multiple buttons.

There are two types of Region - a Source Region and a Target Region, these are indicated by yellow/black and red/black chequer patterns respectively as shown below.

00:52	2aGA X@00:02	3aGA P~:56	4aG1 01:16	5aG1 02:07	6a
1 - e	Ronan1	Eric Prydz	Belinda - Heaven - Guide	Trombone Stab	Er C
00:52	10aG1 04:18	11aG1 P~:52	12aG2 02:00	13aG1 X@00:03	14a
5 5	1kHz_16_44_AB_M8	Trombone Stab	Eric Prydz	Eric Prydz	E
0:07	18aG5 00:20	19aGA 00:02	20aG2 P~:56	21aG2 P~:56	22a
	1kHz_16_44	Eric Prydz -	Eric Prydz -		E

Source Region

The source Region is defined by holding down the left Alt key, depressing the left mouse button and dragging the mouse to select a rectangular block of buttons.

Right clicking a button in the source Region displays a Region popup menu

The Cut, Copy and Paste Special actions refer to the whole selected source Region, in this example 8 buttons.

The Paste Special option works as described in [Edit|Paste Special](#) for a single button but in this case is applied to all buttons in the source Region.

Target Region

The target Region is defined by holding down the left Alt key, depressing the right mouse button and dragging the mouse to select position of the target buttons.

The target Region is always the same layout as the source Region in this case 2 rows by 4 columns, this region cannot be positioned to overlap a page edge, but it can be dragged to any position on any page by dragging over the page name tabs

The Target Region also has a right click menu

The Paste and Swap actions refer to the whole selected target Region and are only enabled when the source Region has been copied to the clipboard.

Multiple Selections

An additional facility is available when selecting source regions allowing a non-contiguous region of buttons to be highlighted.

This is achieved using the Ctrl+Alt+left click action which will toggle the button in/out of the source region selection. This method of selection can also be used to define the tracks to be [burned to CD](#)

~:52	2aGA X@00:02	3aGA P~:56	4aG1 01:16	5aG1 02:07	6a
t - e	Ronan1	Eric Prydz ◆ Q	Belinda - Heaven - Guide K	Trombone Stab > 0/44	Er C
~:52	10aG1 04:18	11aG1 P~:52	12aG2 02:00	13aG1 X@00:03	14
5 5	1kHz_16_44 _AB_M8	Trombone Stab	Eric Prydz > E	Eric Prydz > E	E
0:07	18aG5 00:20	19aGA 00:02	20aG2 P~:56	21aG2 P~:56	22a
	1kHz_16_44	Eric Prydz -	Eric Prydz -		E

The Region selection highlighting can be cleared via the right click popup menus or by pressing Escape - note pressing Escape will also stop all tracks that are playing.

Windows Sounds

Windows produces sounds as a result of certain activities such as emptying of the Recycle Bin, these sounds are not disabled by selecting 'No Sounds' in the Windows Control Panel|Sounds and Audio Devices|Sounds|Sound Scheme.

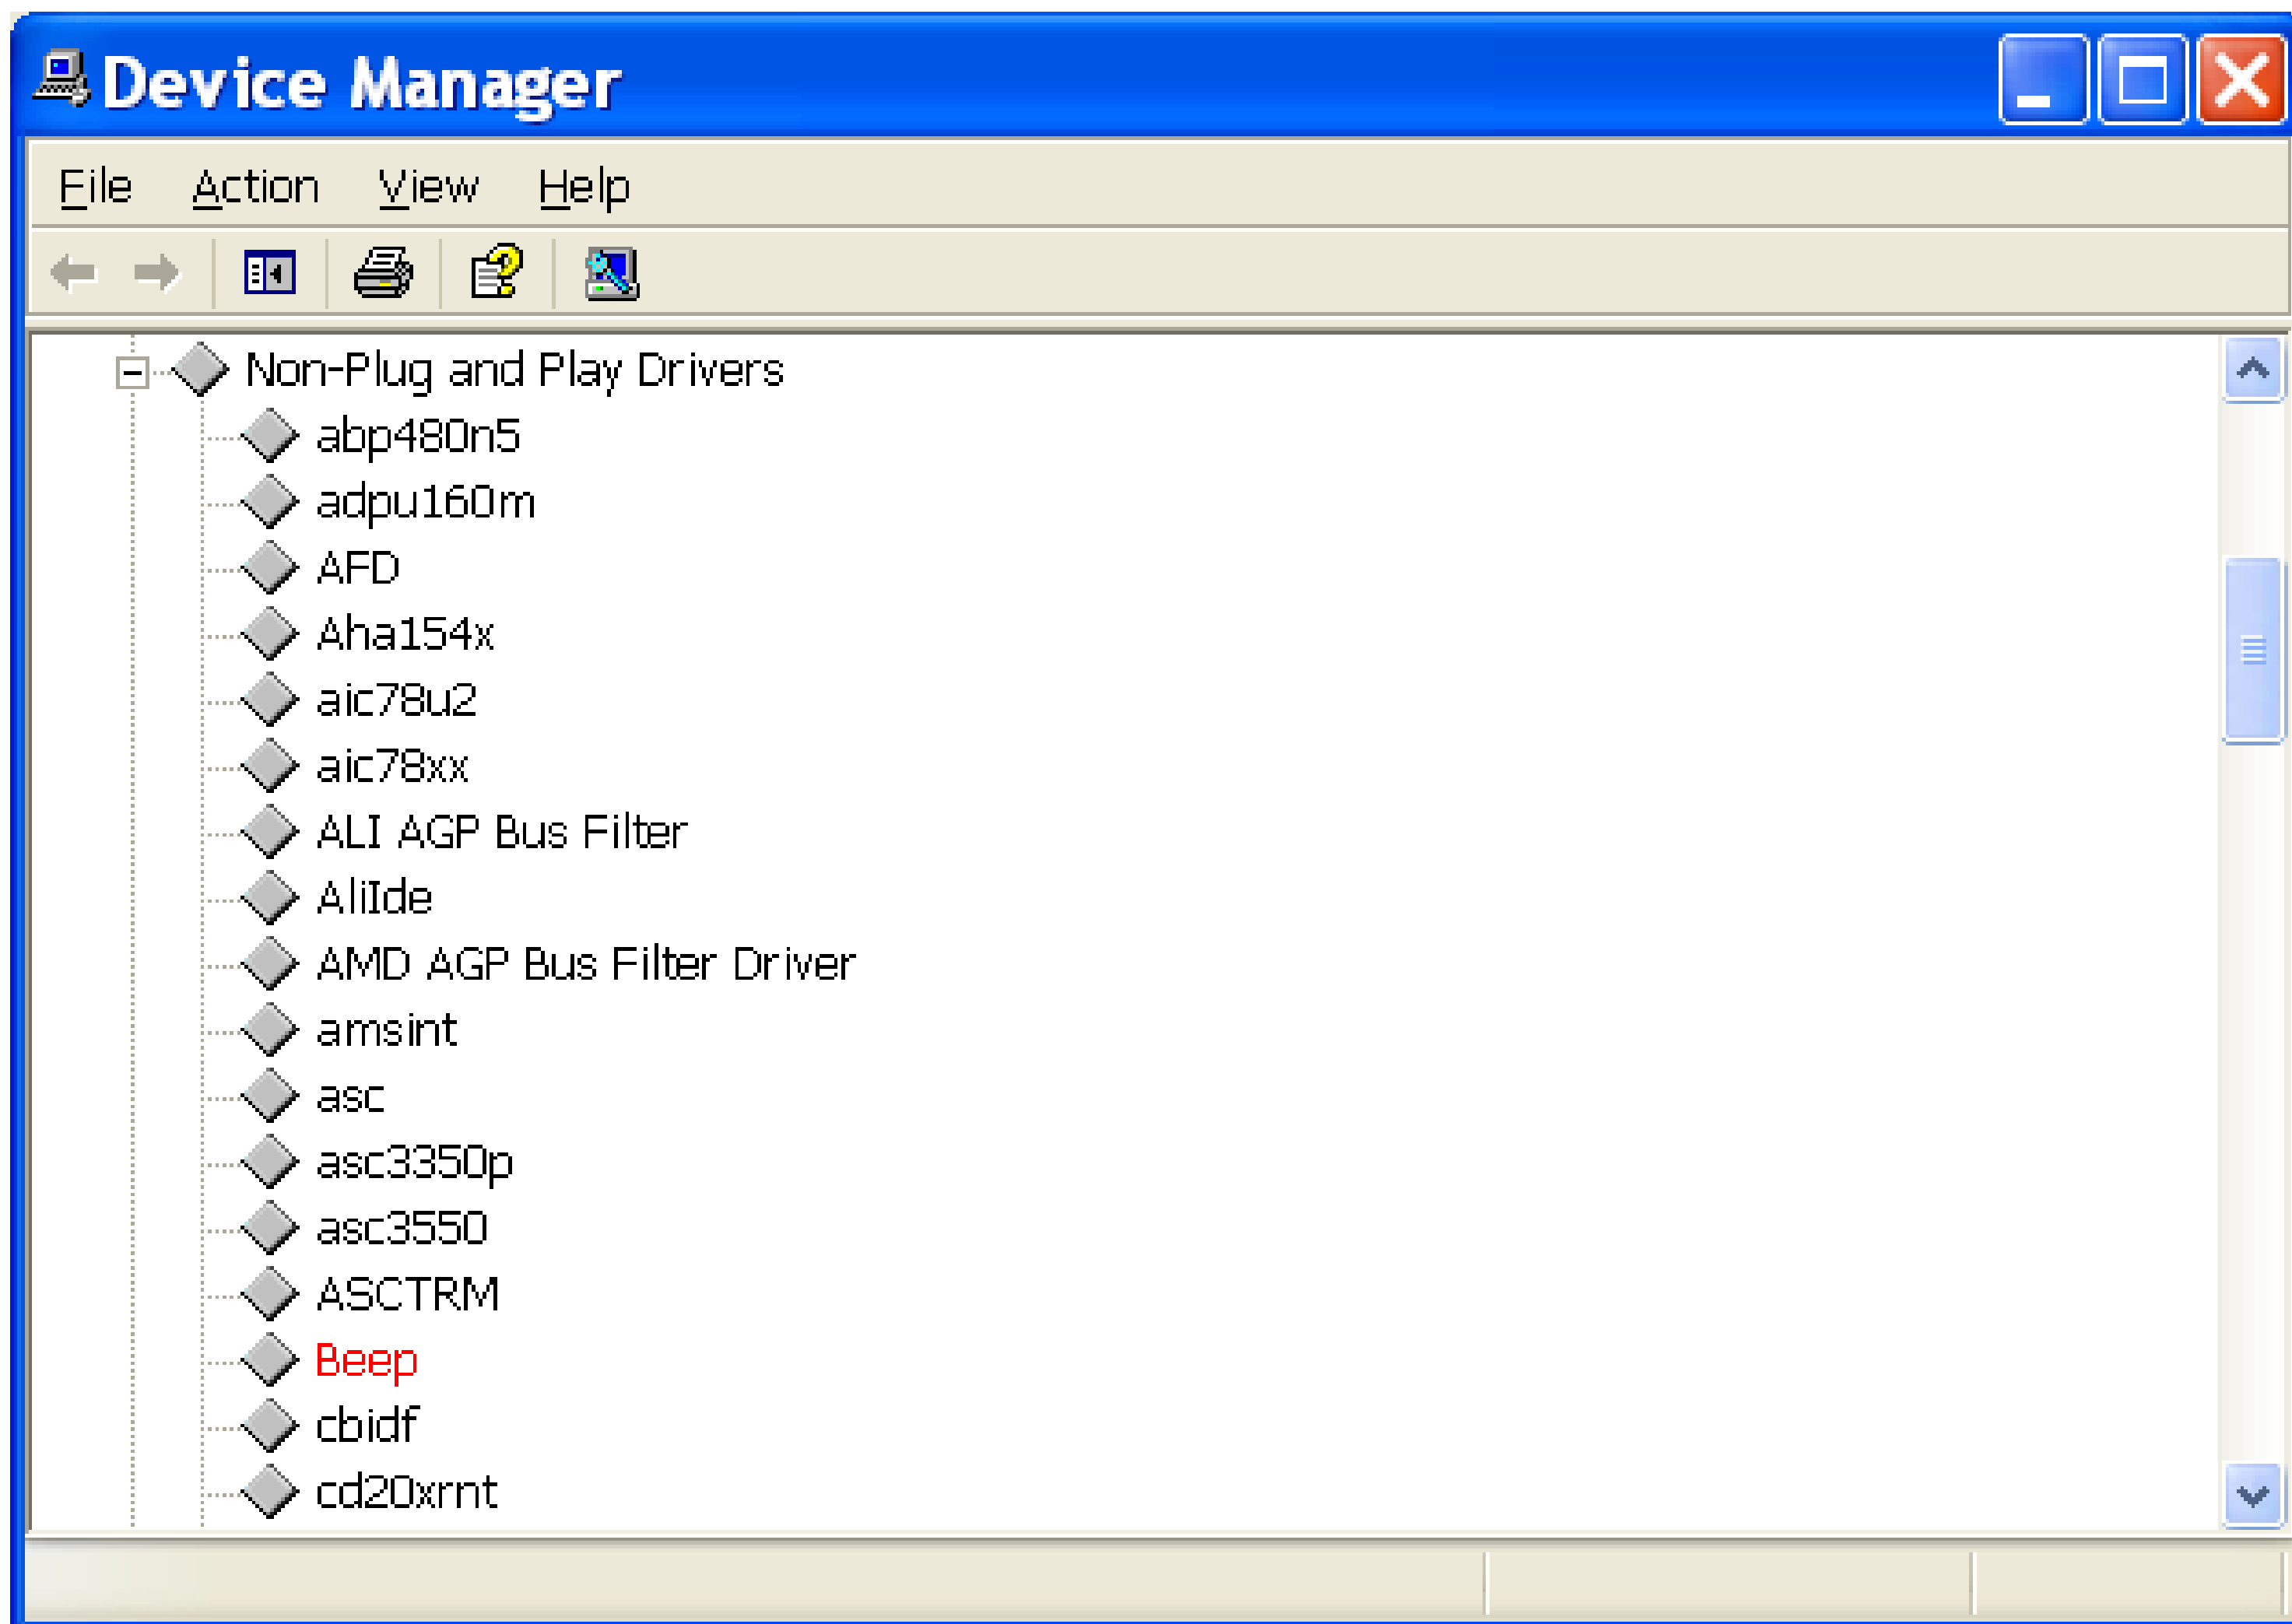

However, another way of disabling the computer 'Beep' is via the Control Panel|System|Device Manager.

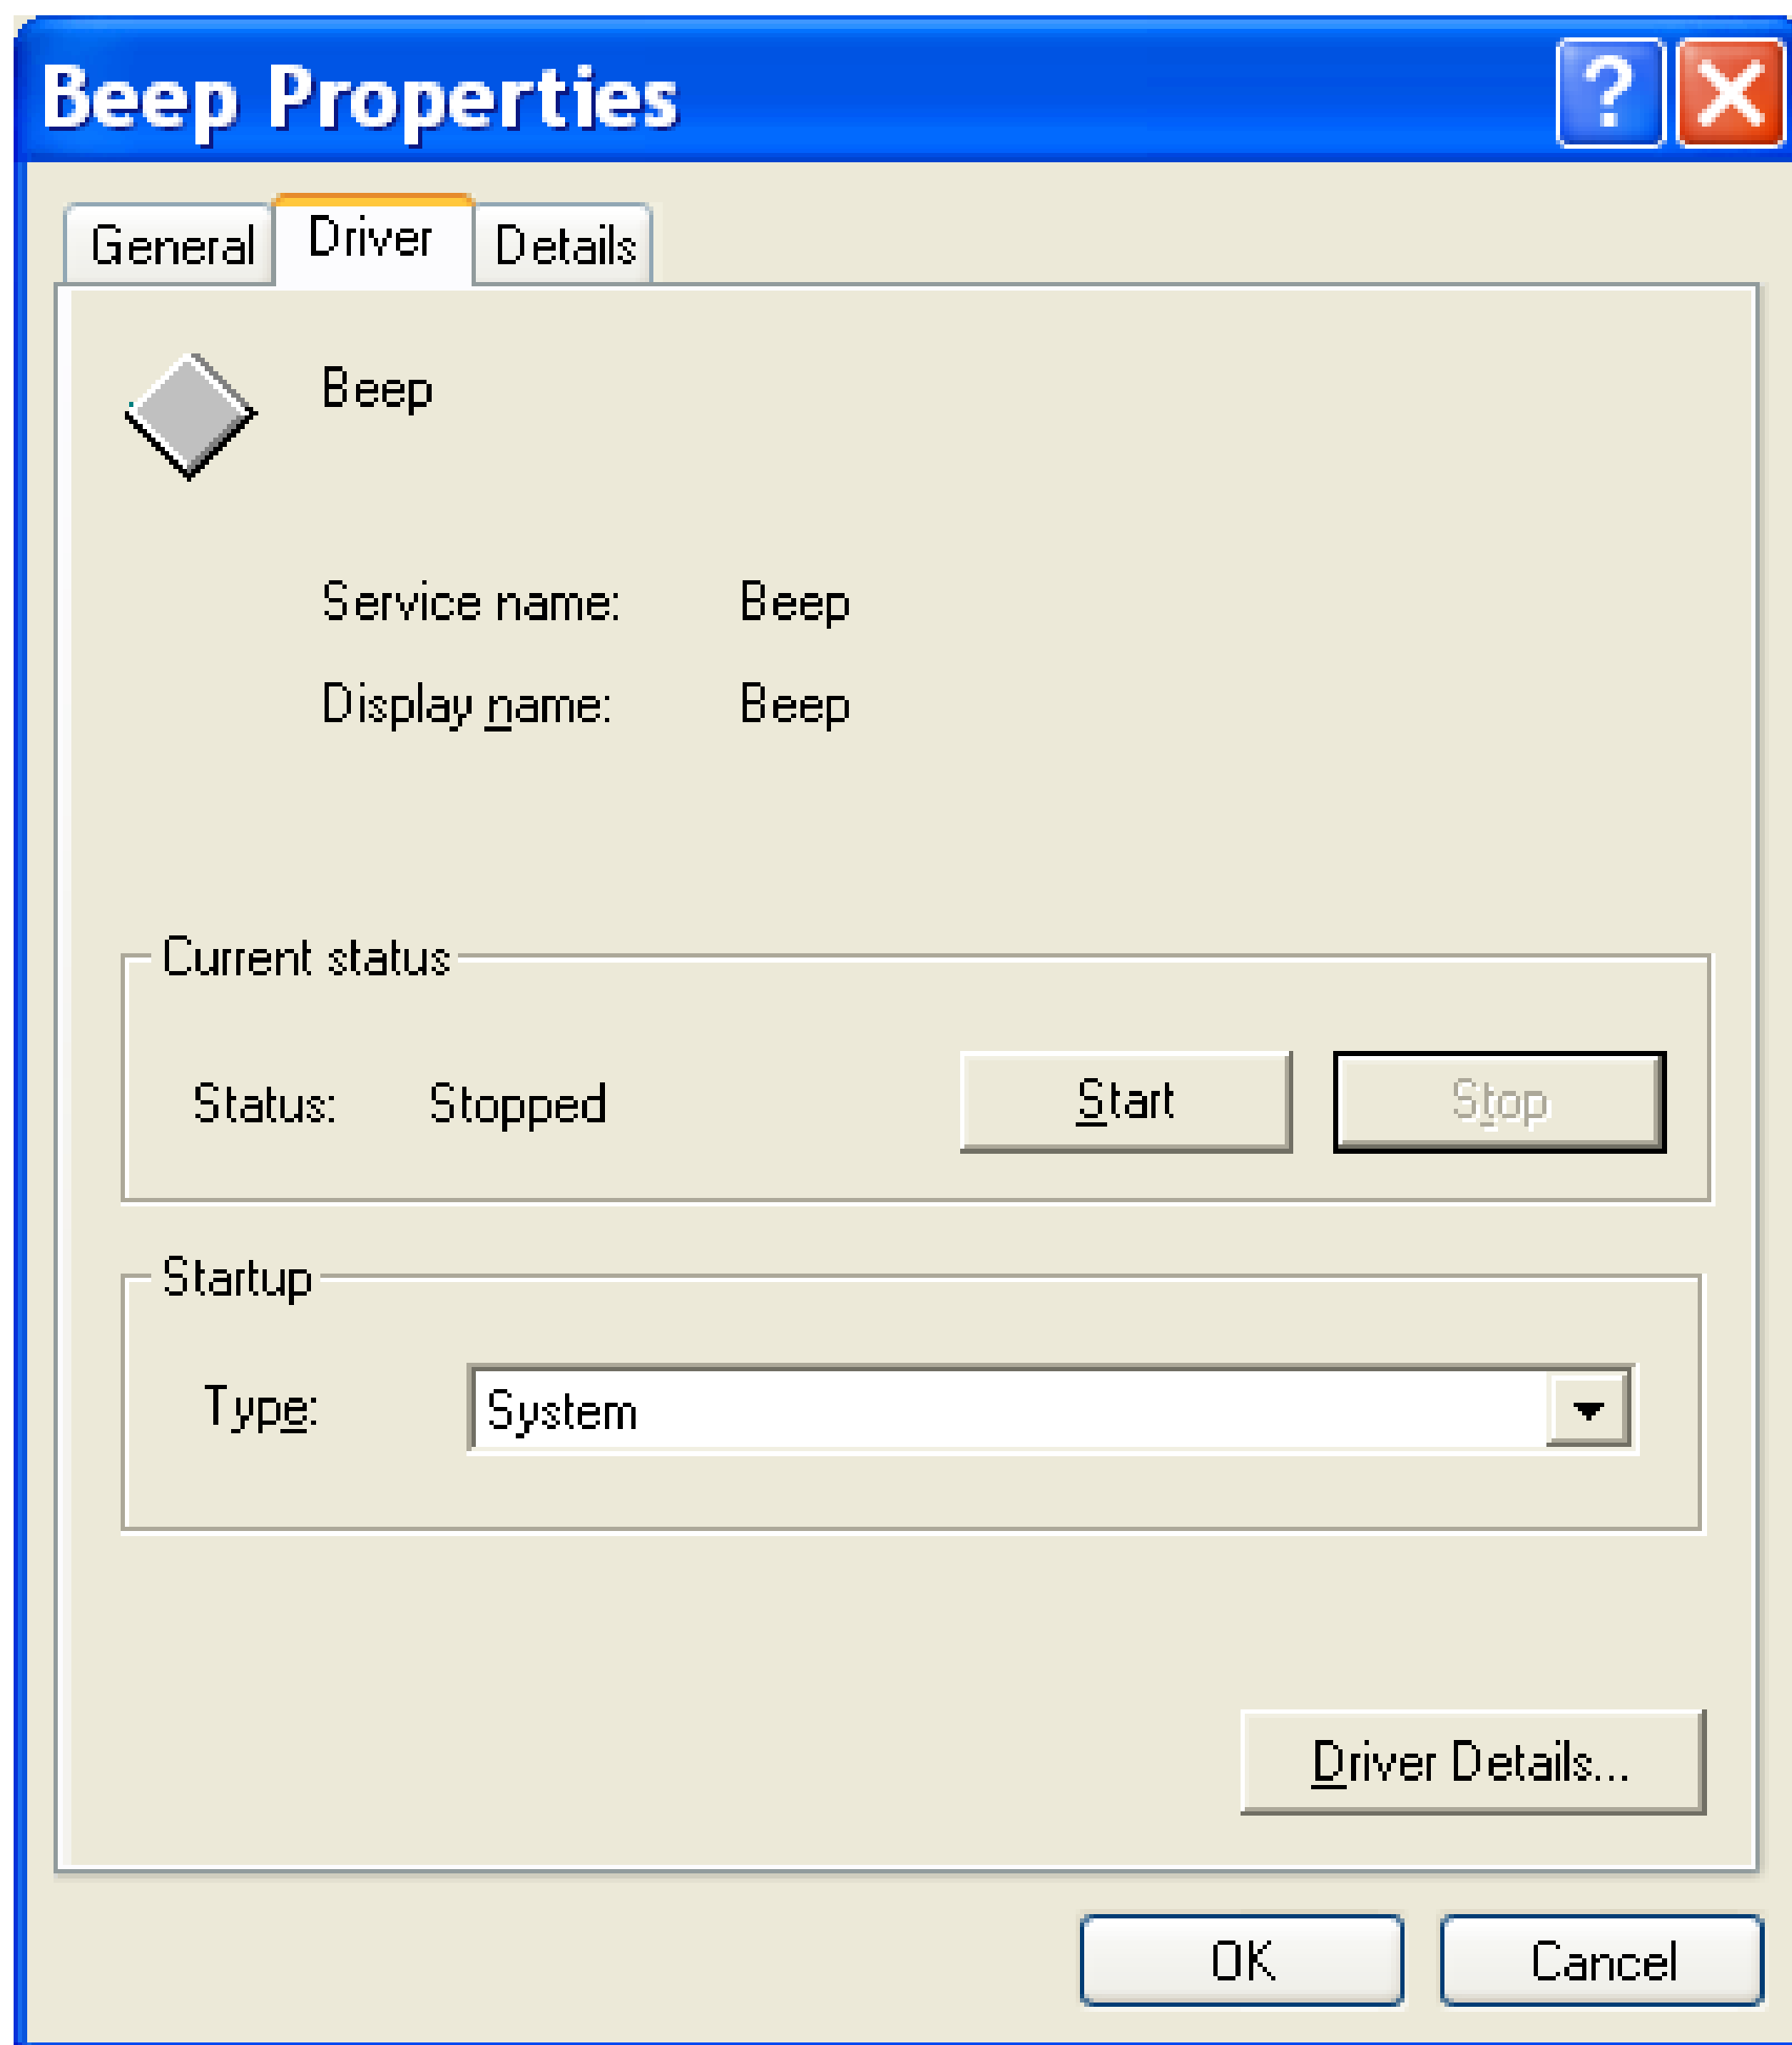

Select 'Show Hidden devices' from the View menu

A new entry titled Non-Plug and Play Drivers will appear, open this tree and select 'Beep'

Choose the Driver tab in Beep properties and click the Current Status 'Stop' button

Finally set the StartUp mode to be disabled instead of System

Advanced Operation

Blocks, Sessions and Packages

These types of files can be loaded via the File menu items, additionally SpotOn will accept Block (*.blk), Session (*.dta) and package (*.pkg) files that are 'dropped' onto the application after being 'dragged' from Windows Explorer.

Also package and session files can be dropped onto a SpotOn desktop icon, the application will then open and load the dropped file.

Package Folder Structure

Packages contain session data and audio in one composite file, when extracted all the audio files will be copied to the chosen folder. The disadvantage of this is that any folder structure that may have originally existed would be lost when the package was extracted.

For example if the folder structure below existed in the original session, with audio files in the myBeds, myFx and myMusic folders

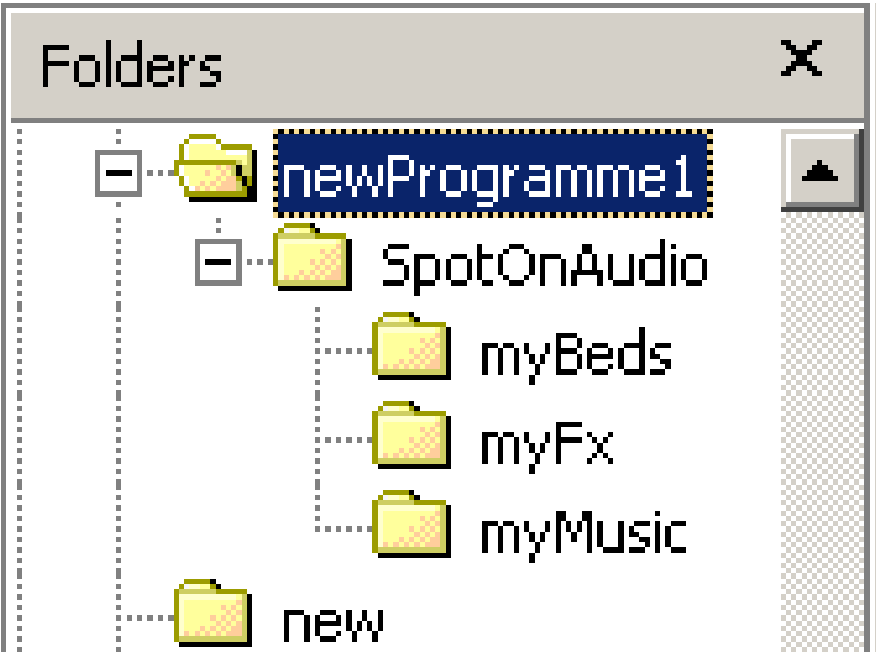

and then a Package file made from the session and subsequently extracted onto another computer into the newProgramme folder, the structure would be: -

The myBeds, myFx and myMusic subfolders have been lost as all the audio has been extracted to the newProgramme folder.

To avoid this there is a 'magic' folder name "SpotOnAudio" which if present in the file path of the audio files ensures that any subfolders of SpotOnAudio will be preserved.

So if the original session was build using something like the example below and then saved as a package...

When the package is extracted to the newProgramme1 folder, the subfolder structure is maintained

PlayLists

A Playlist consists of predefined cues played out in sequence with the option of repeating each cue number of times.

Below are the details of a Playlist containing 3 cues

	Use	In	Out	Length	Loop
1	✓	00:00:38	00:00:68	00:00:30	1
2	✓	00:01:11	00:01:30	00:00:19	9999
3	✓	00:00:00	00:01:43	00:01:43	1
4					

Cue 1 is played once followed by cue 2 (effectively looped indefinitely) and then finally to cue 3 to end the sequence.

This type of Playlist can be used as a basis for the Intro-Loop-Outro type of sequence, however the main problem is that the time cue 2 has to loop for is unknown at setup time - depending on some external events.

To cover this situation there is a method of forcing SpotOn to step on to the next Playlist entry, so if Cue 2 was looping and was on loop 125 the program can be triggered to complete loop 125 and then step onto cue 3.

Cue 3 would play to the end and stop.

Users with a three button mouse or a mouse with a scroll wheel can click the middle button/scroll wheel to trigger the effect. in this case the currently playing cue in the Playlist will complete one final loop then step onto the next cue in the Playlist.

Note: normally the middle button click would pause/unpause a track, but as Playlists cannot be paused, the same key combination has been used to trigger starting the next playlist section at the end of the current loop/pass.

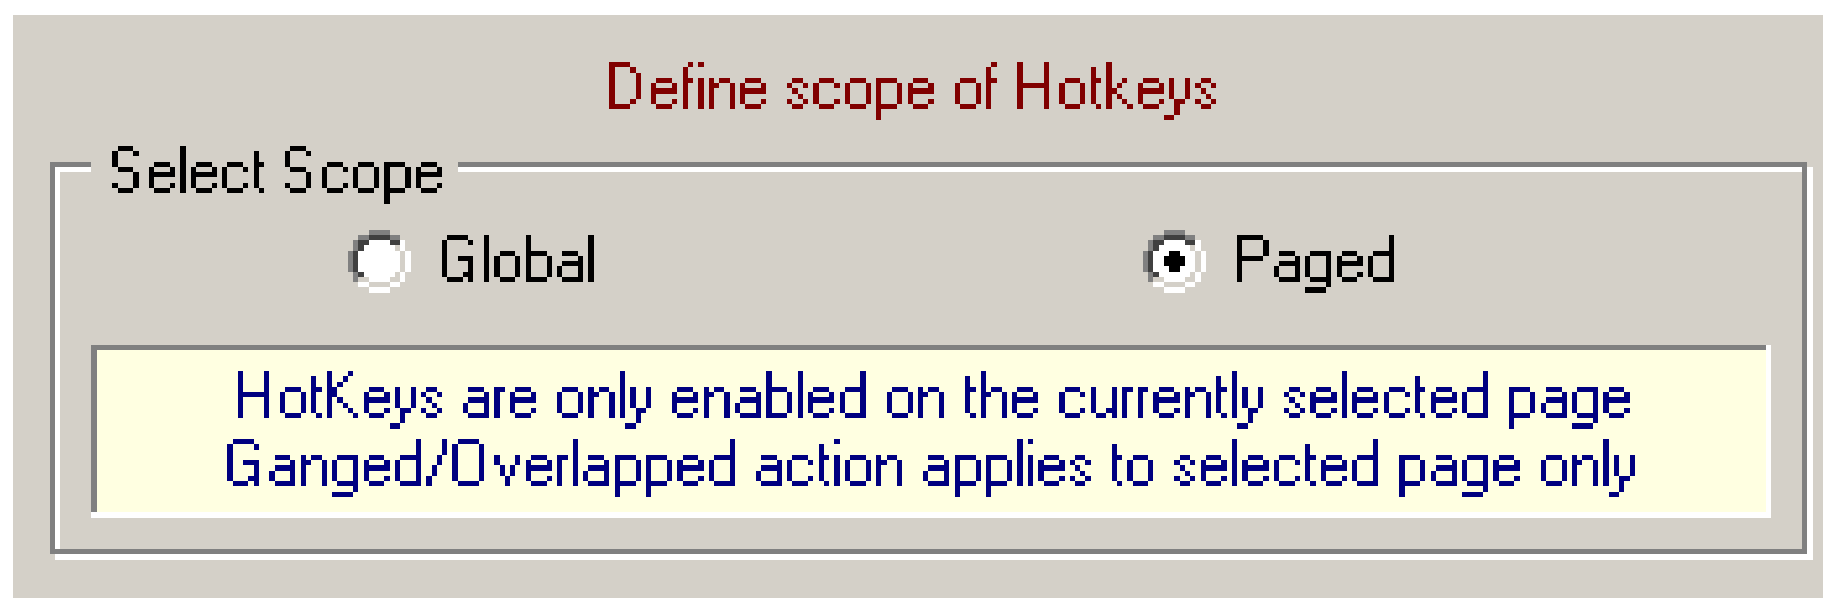

When the button receives the message it will briefly flash the Track Number text to red on yellow

Immediately after the message has been received the Track number text reverts to its Playing color and the time remaining text will appear underlined

HotKeys

The scope of the HotKeys can be either Global or Paged, set with the selection box shown below.

When Global is selected the HotKeys are enabled on all pages and with Paged Hotkeys are only enabled on the currently selected page.

When more than one button is assigned to the same hotkey there are two modes of behaviour - Ganged and Overlapped.

In the ganged mode all buttons that have the same hotkey will be played together at the same time, this is similar to a simple form of [master/slave link](#).

In the overlapped mode the operation is a little more complicated, this mode is intended to cover the situation where the same sound is required to be played several times at random intervals with subsequent sounds starting before the previous sound has completed.

A typical example is a two chime door bell where the bell is sounded twice in quick succession, the decay on the second chime must be allowed to continue when the bell is sounded again, so this precludes the playing of the same button as this would terminate the decay.

In the example below Overlapped Mode causes the pressing hotkey 'Z' to initially play button 35, if the sound is allowed to stop a further press of the hotkey will again play button 35.

If however the hotkey is pressed before the sound has stopped the next available button with the same hotkey will be played, in this case button 36.

So providing the sounds to be played are relatively short e.g. 1..3 seconds a group of 5 or 6 identical buttons should suffice.

The Ganged/Overlapped setting applies globally to all hotkeys.

Overlapped operation can be triggered in a similar way by Midi In messages and also via mouse left-click.

With mouse left-click the overlapped mode is only active when the following conditions are met: -

- 1, duplicate hotkeys are assigned to buttons
- 2, hotkeys are enabled
- 3, hotkey text is showing on buttons Display|Show Hotkey Text
- 4, overlapped hotkey mode is selected

Then left-clicking on any of the buttons on the overlapped hotkey group will cause the overlapped play action to start.

Midi

The scope of the Midi In Play messages can be either Global or Paged, set with the selection box shown below.

When Global is selected the Midi In Play messages are enabled on all pages and with Paged they are only enabled on the currently selected page.

When more than one button is assigned to the same Midi In Play message there are two modes of behaviour - Ganged and Overlapped.

In the ganged mode all buttons that have the same Midi In Play message will be played together at the same time, this is similar to a simple form of [master/slave link](#).

In the overlapped mode the operation is a little more complicated, this mode is intended to cover the situation where the same sound is required to be played several times at random intervals with subsequent sounds starting before the previous sound has completed.

A typical example is a two chime door bell where the bell is sounded twice in quick succession, the decay on the second chime must be allowed to continue when the bell is sounded again, so this precludes the playing of the same button as this would terminate the decay.

In the example below Overlapped Mode causes the sending Midi In Play message 'Z' to initially play button 35, if the sound is allowed to stop a another Midi In Play message 'Z' will again play button 35.

If however the Midi In Play message is sent before the sound has stopped the next available button with the same Midi In Play message will be played, in this case button 36.

So providing the sounds to be played are relatively short e.g. 1..3 seconds a group of 5 or 6 identical buttons should suffice.

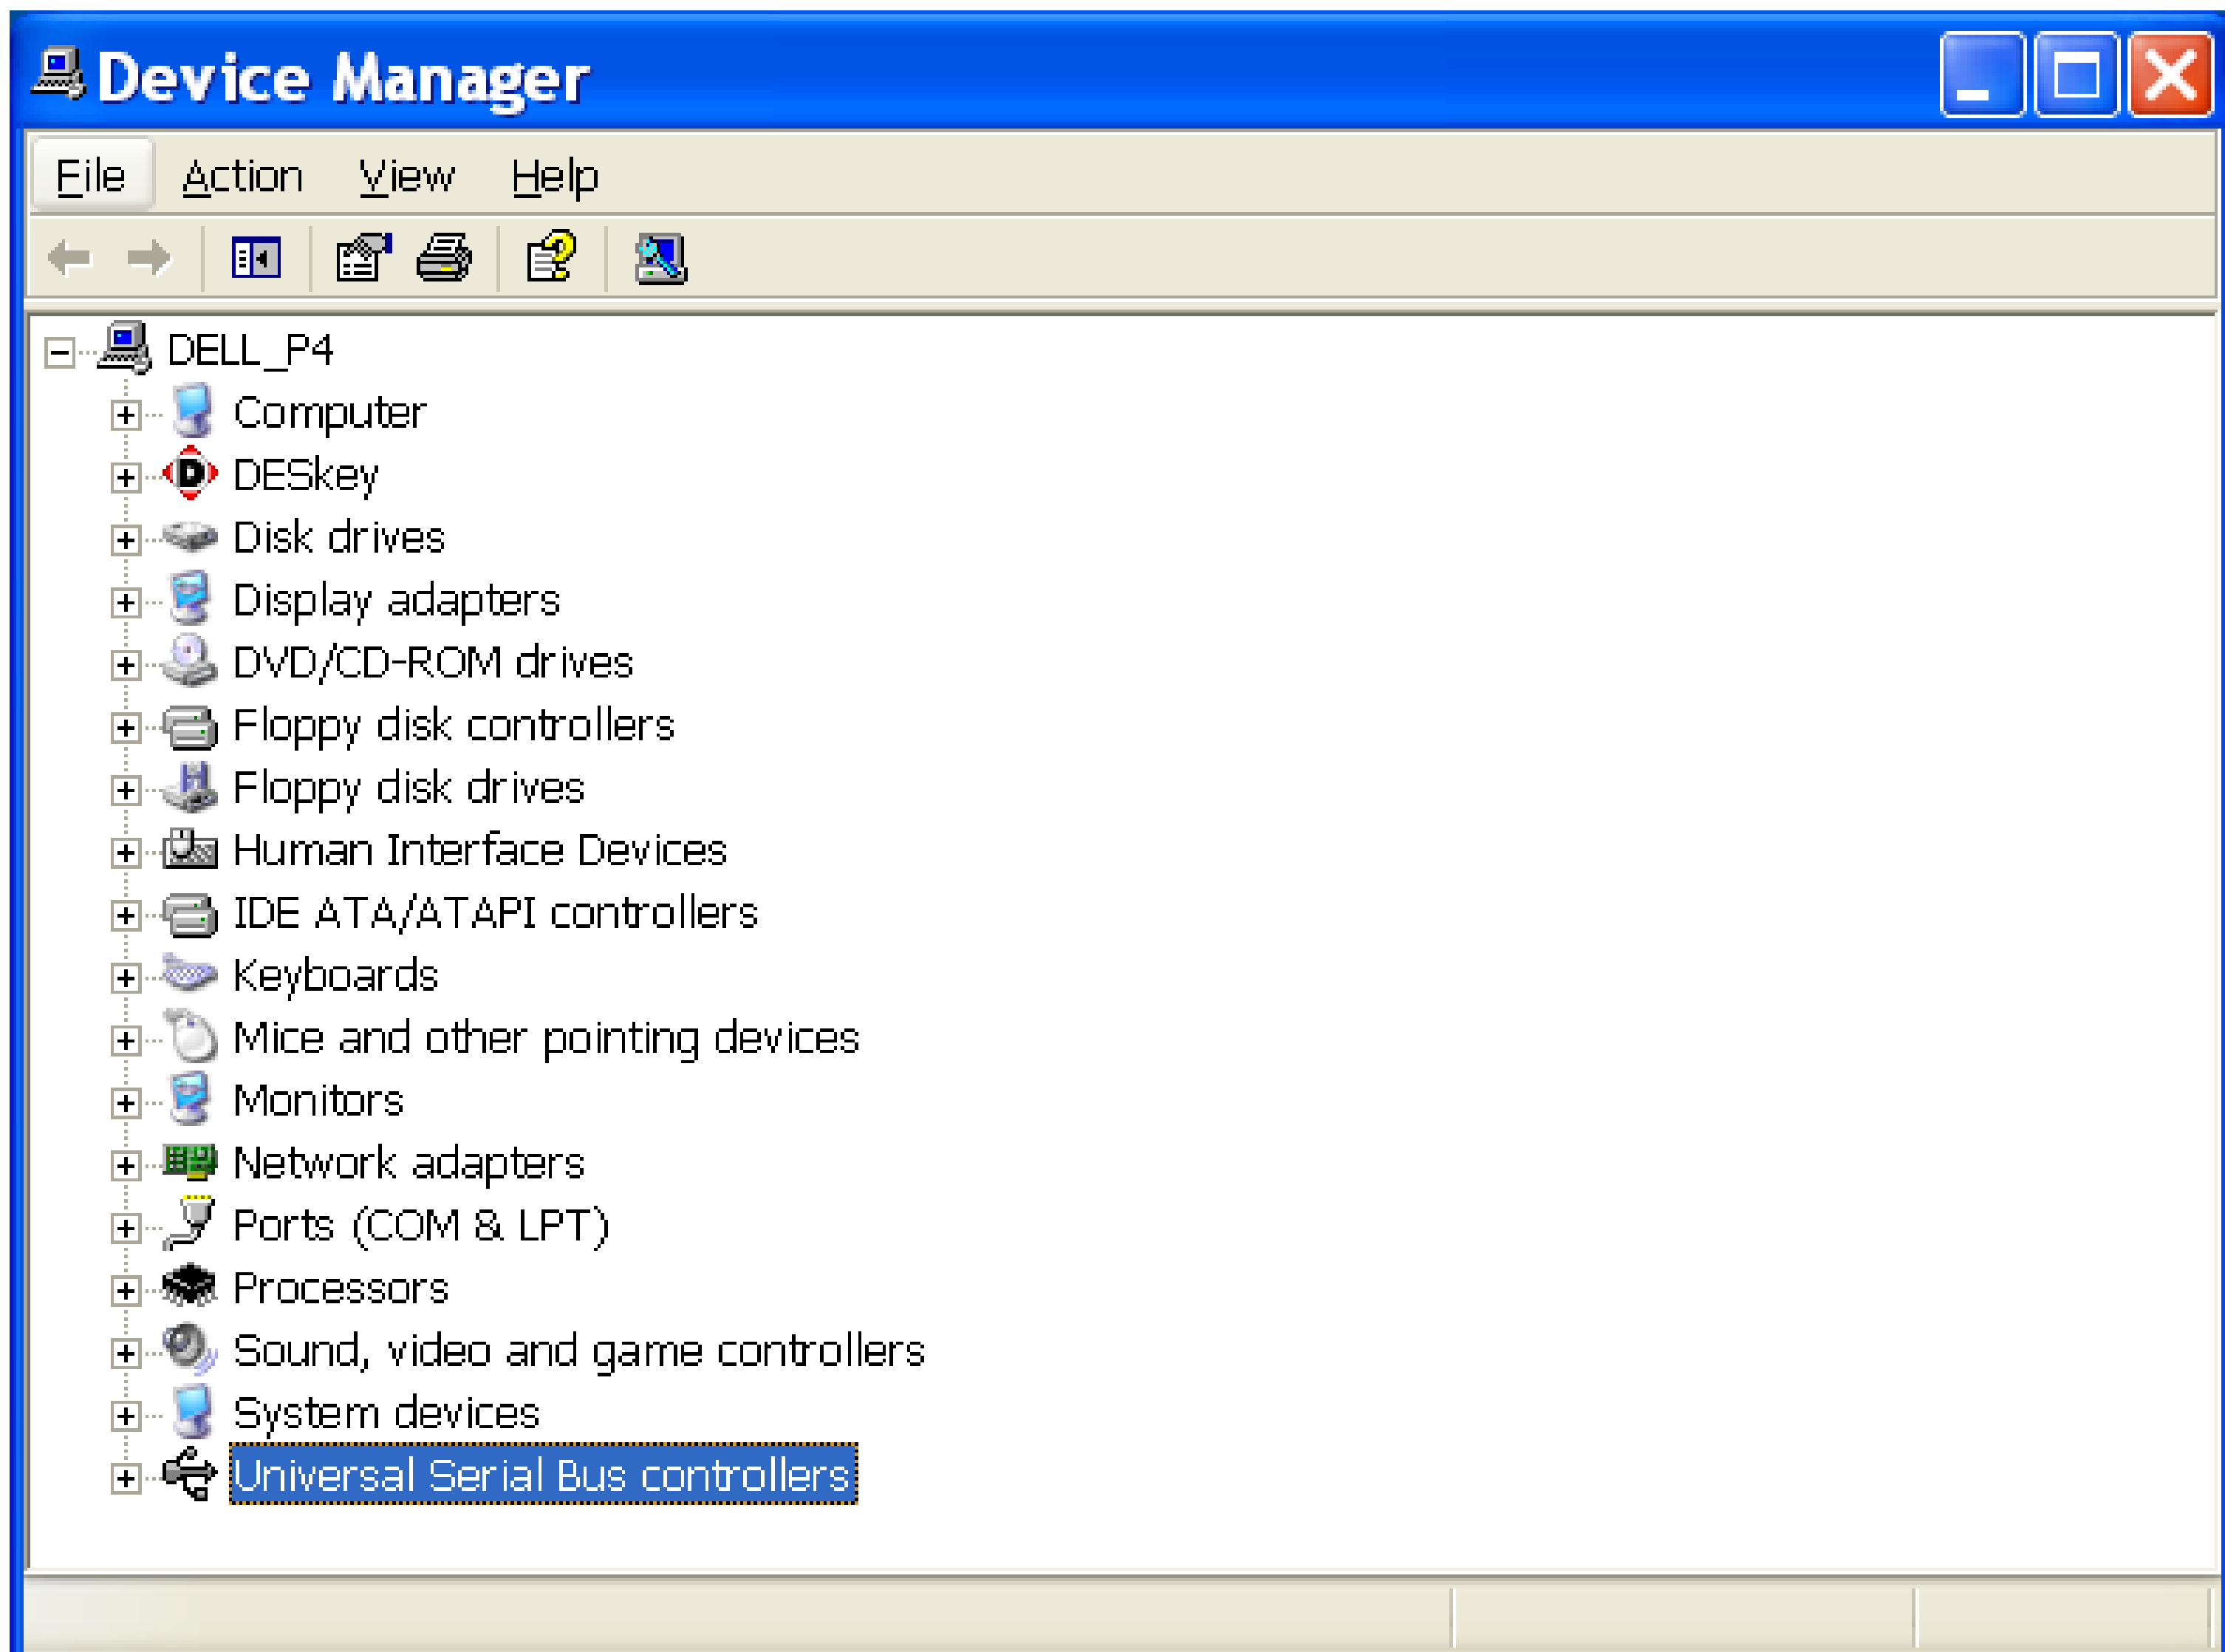

2	21a 00:00	20a 00:01	20a 00:00	00a 00:00	01a 00:02	02a 00:01
	ding	ding	ding	ding	ding	ding
	<u>Z</u>	<u>Z</u>	<u>Z</u>	<u>Z</u>	<u>Z</u>	<u>Z</u>
1	35a 00:01	36a 00:01	37a 00:01	38a 00:01	39a 00:01	40a 00:01

The Ganged/Overlapped setting applies globally to all Midi In Play messages.

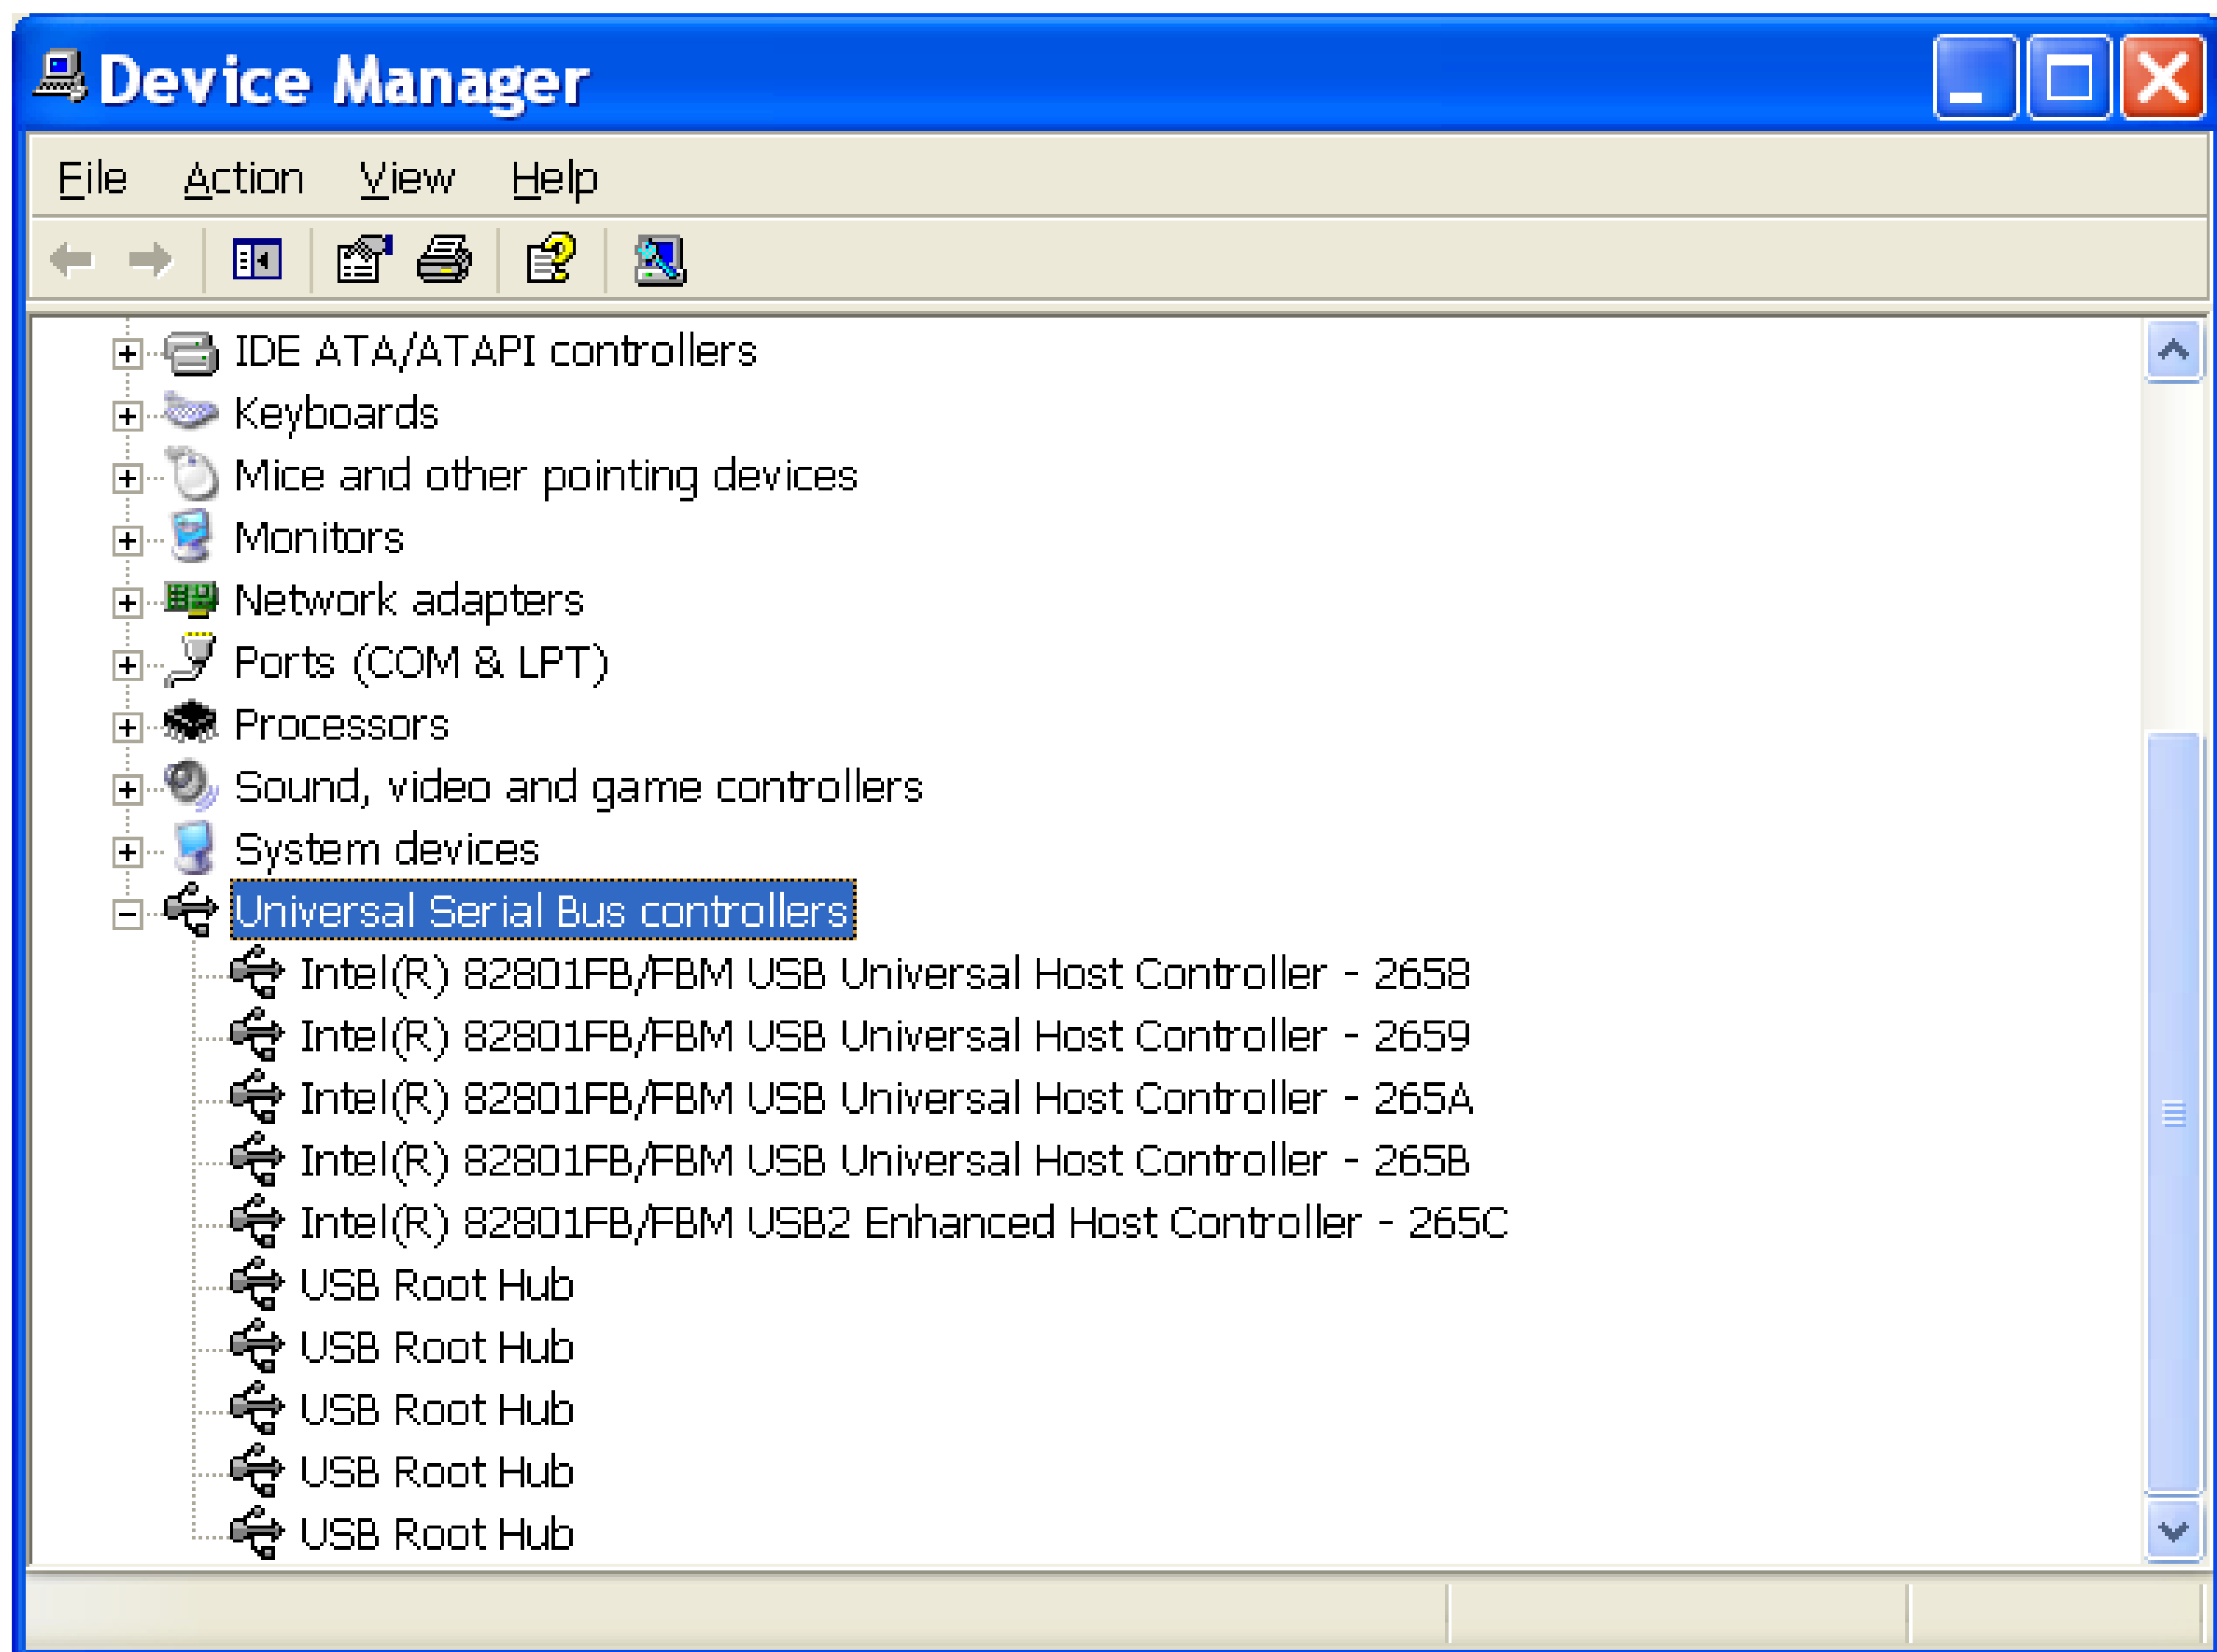

USB Power Management

The Windows XP operating system has the ability to control the amount of power supplied to the various USB ports, this only becomes a problem with SpotOn when the power to the USB dongle is switched off.

To check the USB port power settings open Windows Control Panel and select System, then on the Hardware tab select Device Manager. Scroll to the bottom of the device list to display the entry 'Universal Serial Bus Controllers'.

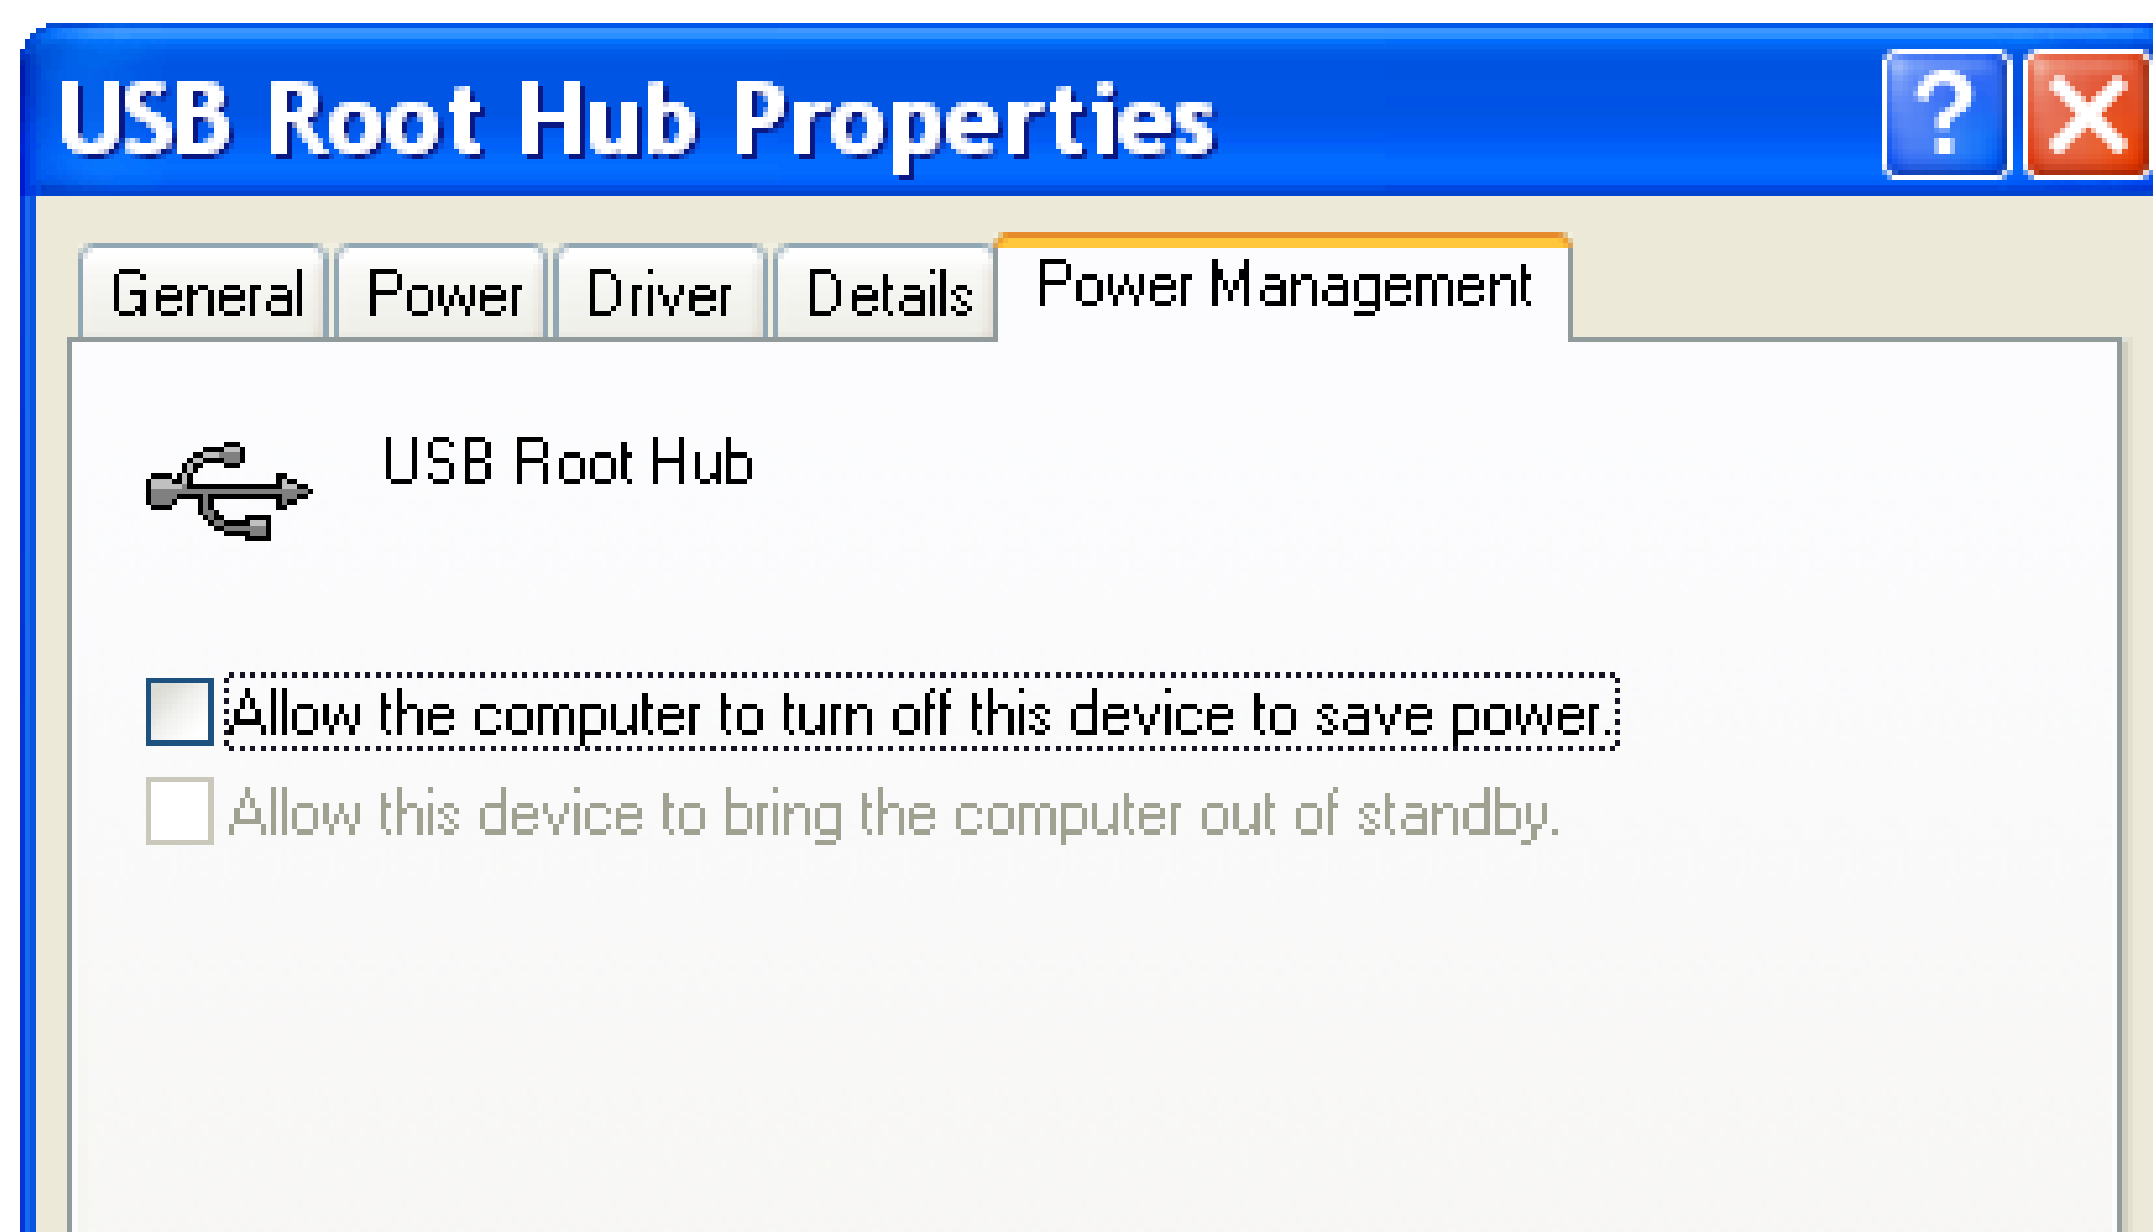

Open the 'Universal Serial Bus Controllers' item

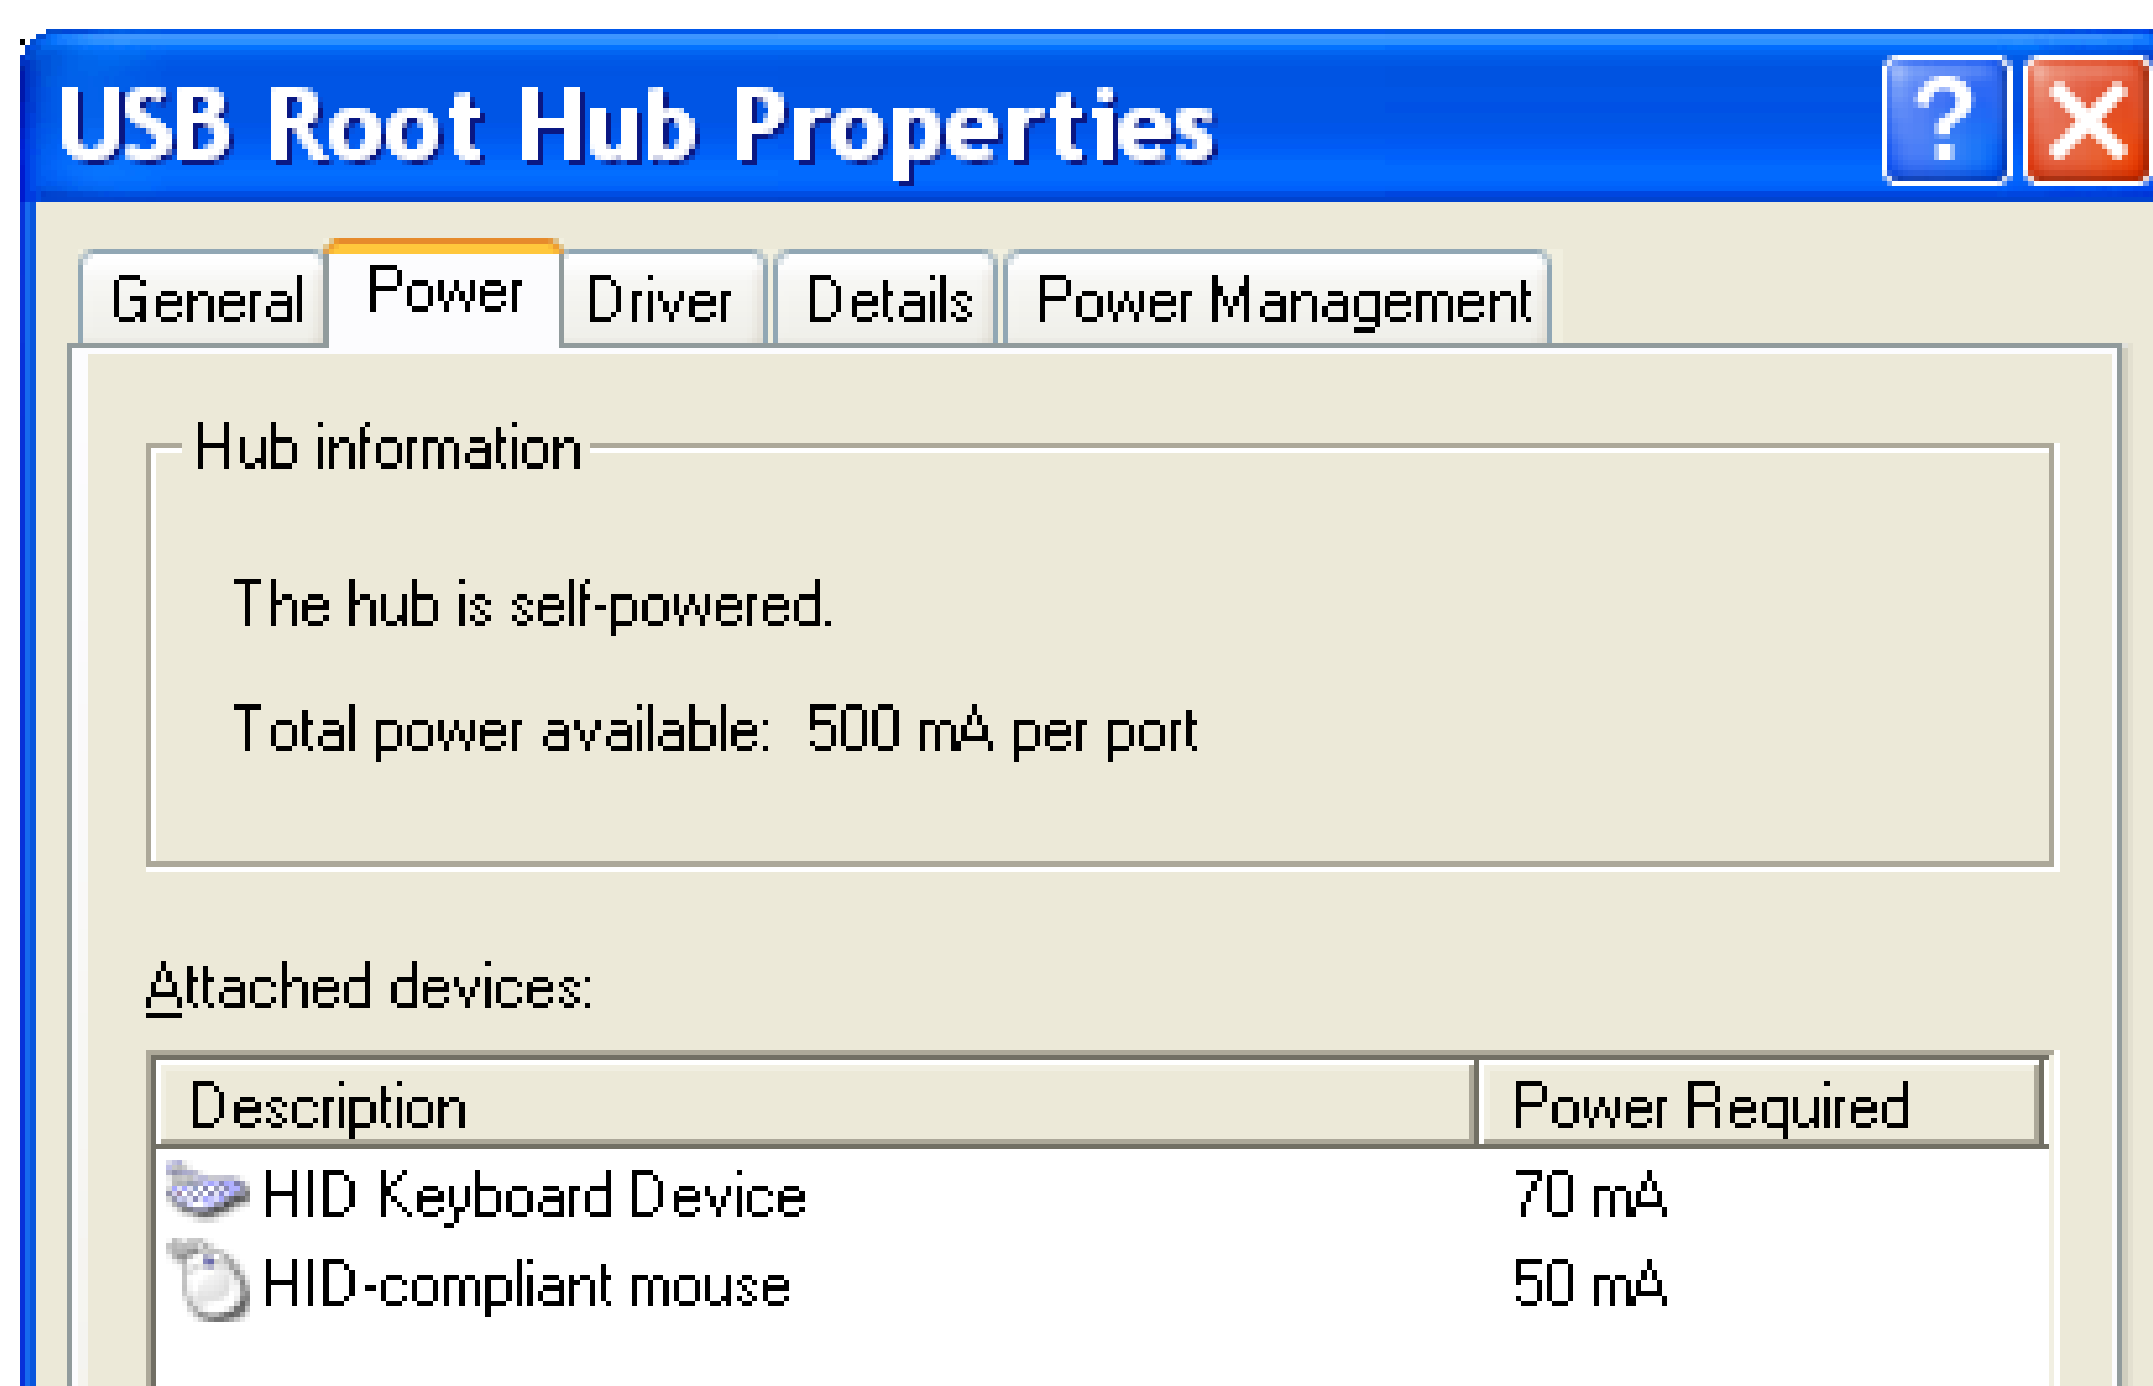

Now select each of the USB Root Hub entries in turn and open up the associated Power Management tab

Uncheck the 'Allow the computer to turn off this device to save power' option

Make this change on all USB hubs to which a SpotOn dongle could be fitted, this is to cover the situation where the dongle is removed and placed in a different USB port.

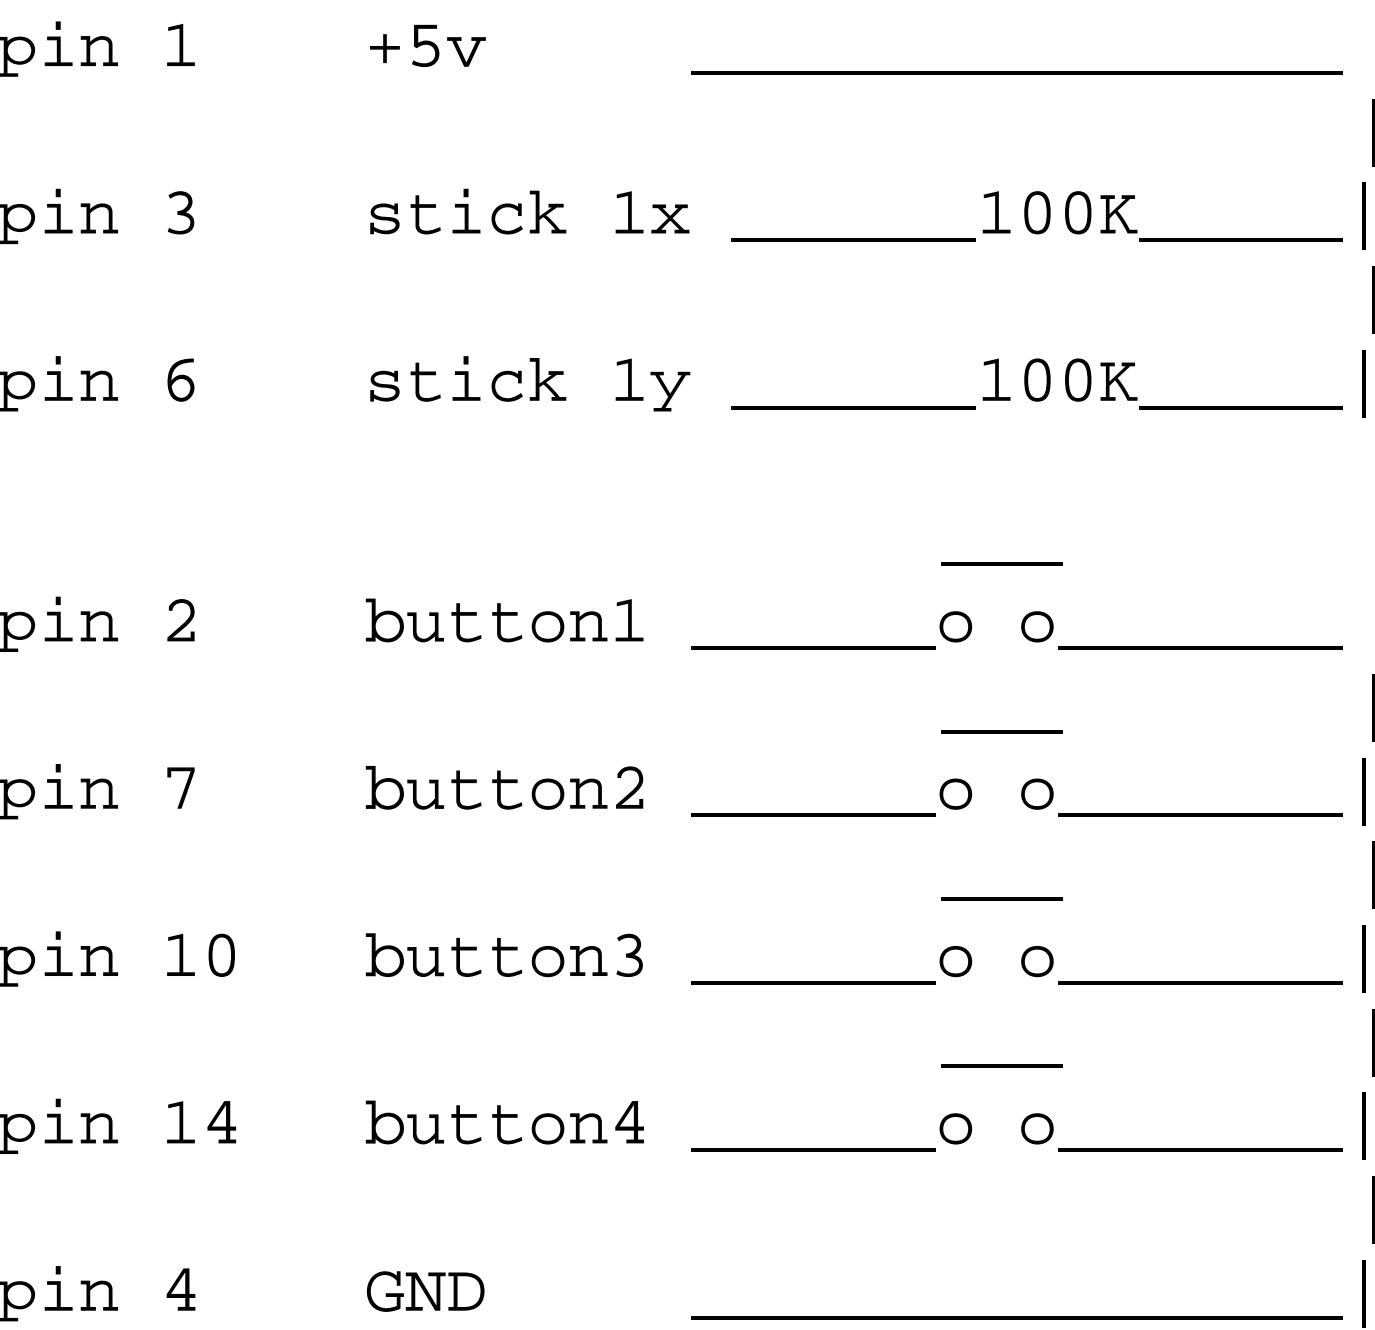

It is possible to identify which port has the USB dongle fitted by examining the details on the Power tab.

Game Port Connections

Joystick/GPI

The conventional Game Port found on most Sound Cards is a 15 pin D-type socket, to use the Fire buttons as GPI inputs make the connections as described below

Soundcard

- 1 : +5vDC
- 2 : Stick 1 button 1
- 3 : Stick 1 X-position
- 4 : Gnd
- 5 : Gnd
- 6 : Stick 1 Y-position
- 7 : Stick 1 button 2
- 8 : +5vDC
- 9 : +5vDC
- 10 : Stick 2 button 1
- 11 : Stick 2 X-position
- 12 : MIDI
- 13 : Stick 2 Y-position
- 14 : Stick 2 button 2
- 15 : MIDI

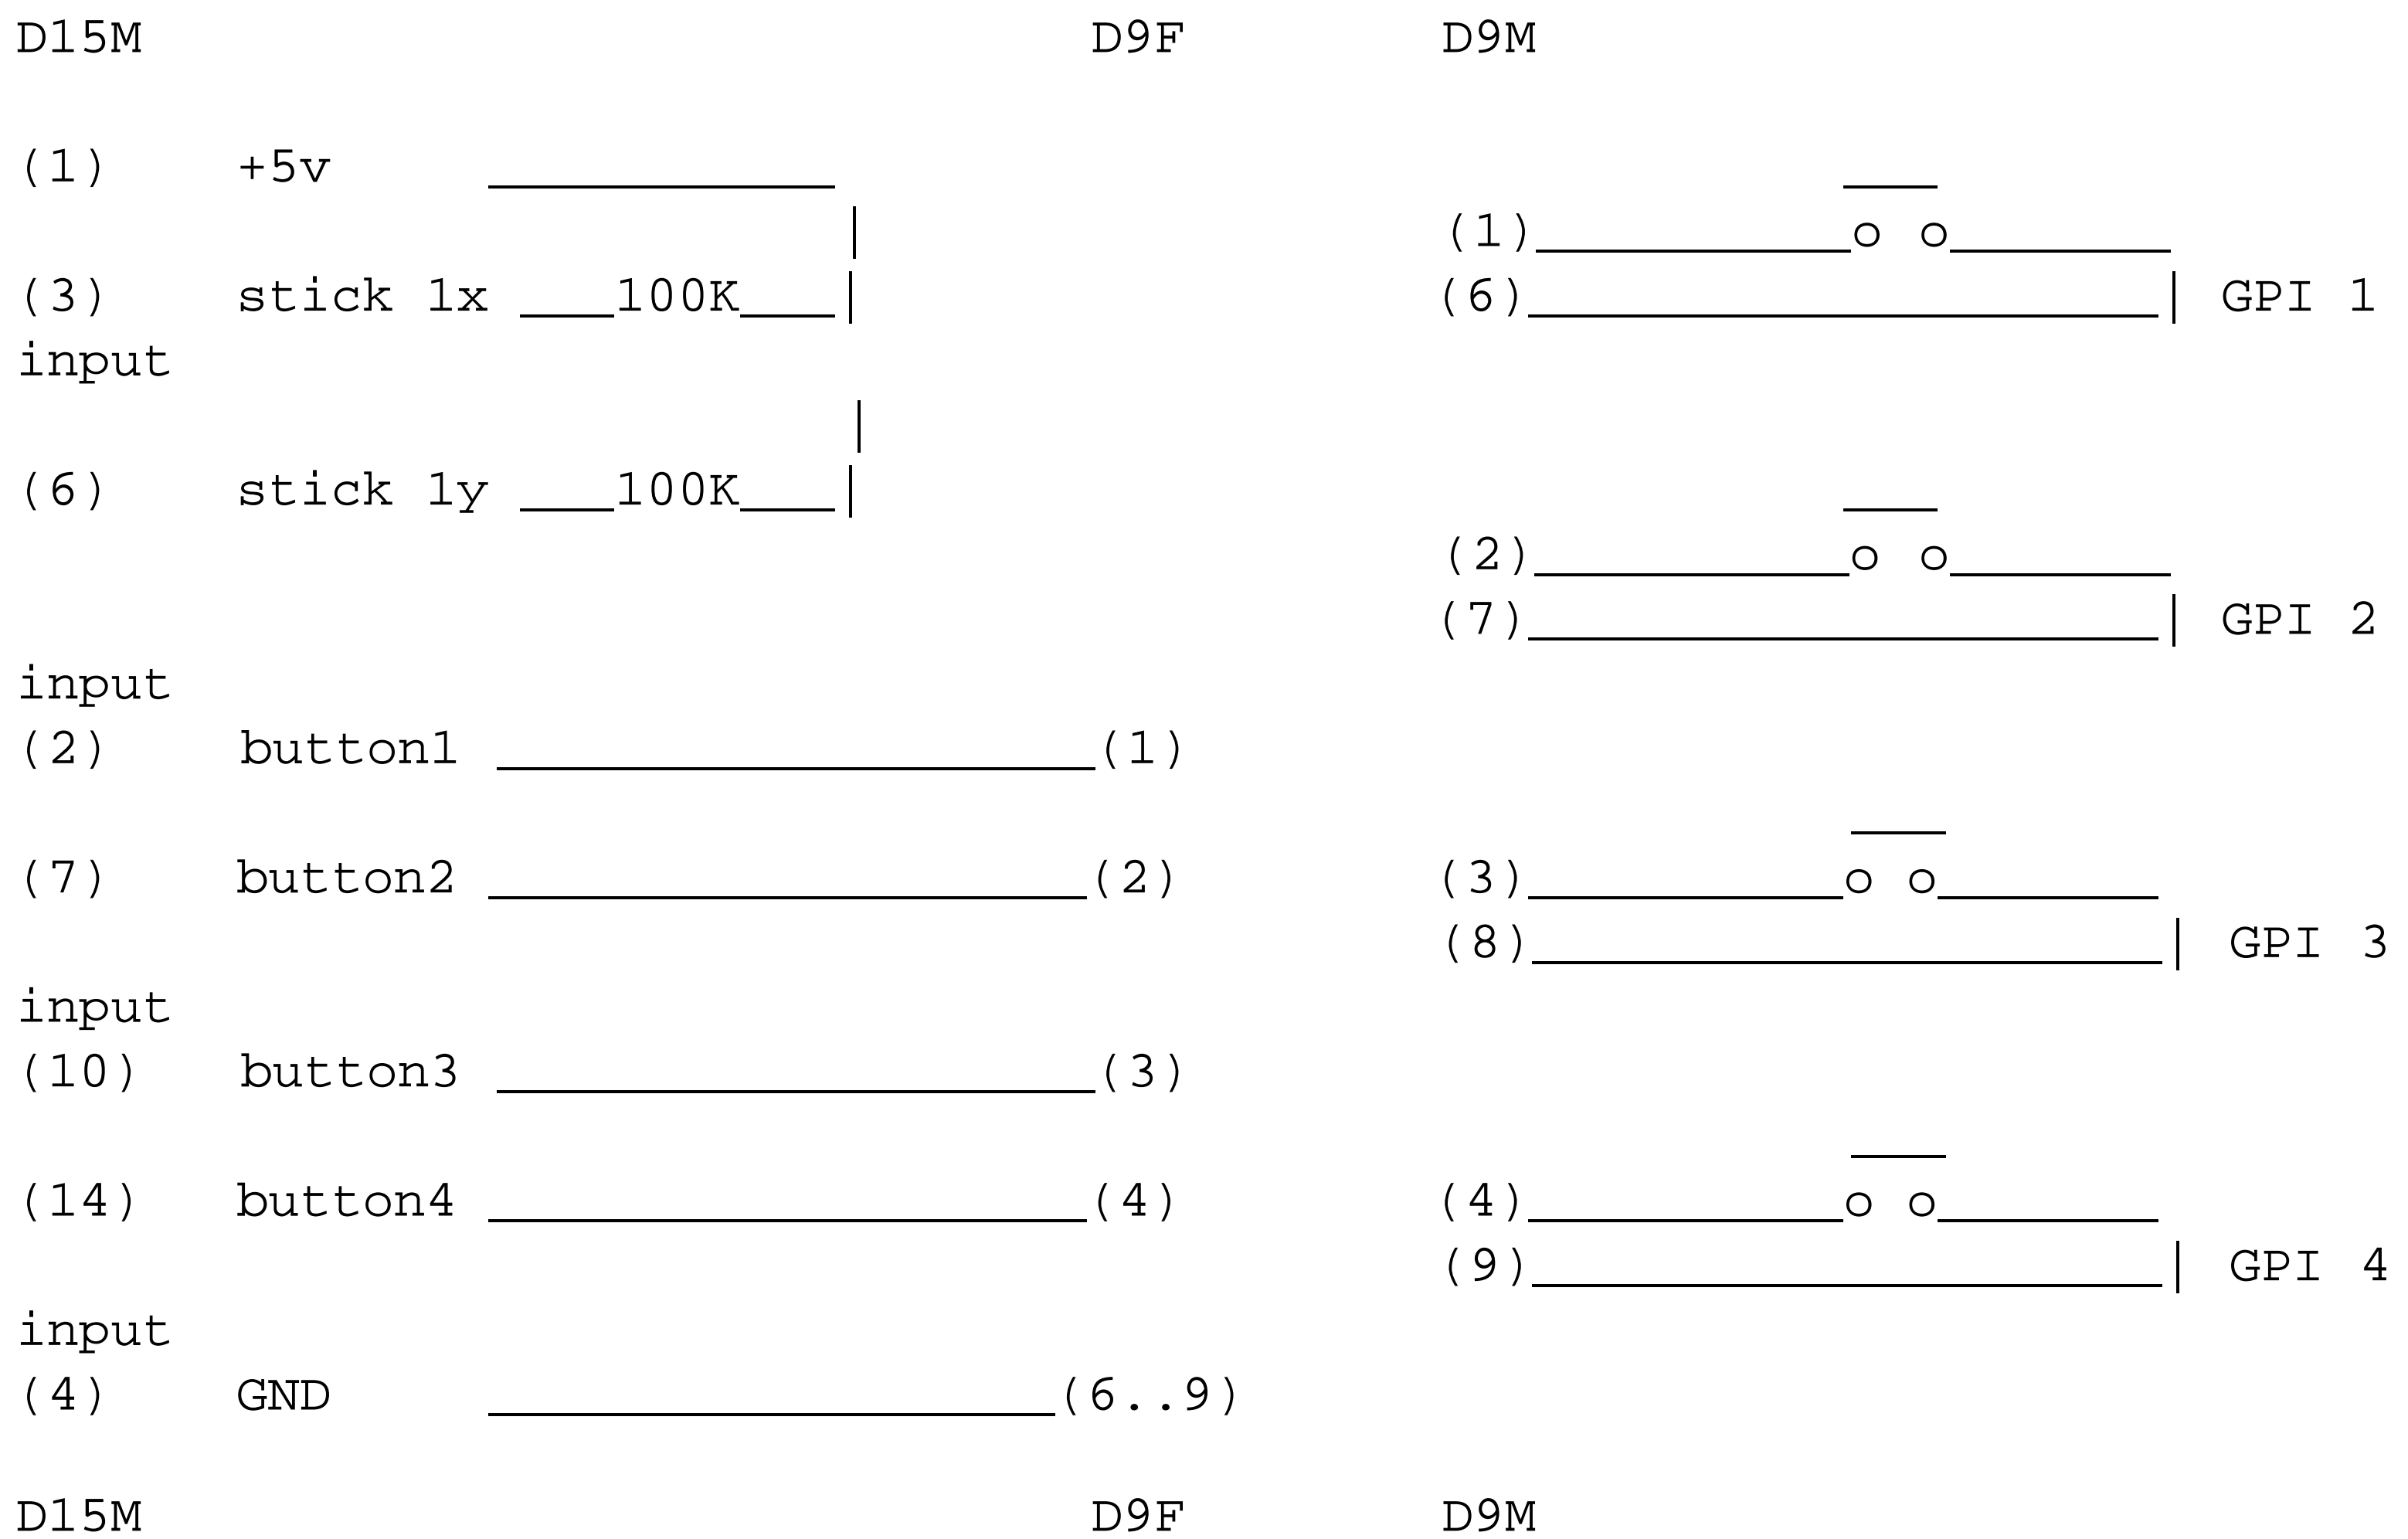

Take care with the routing of the +5v supply as this may not be current limited on the sound card

A suggestion below consists of two cables a D15M..D9F that remains connected to the PC and a loose cable D9M..(4 x jack plugs) that connect to the GPI sources.

The advantage of this is that the two resistors on pins 3/6 of the D15M are always connected to the PC, and so avoids the situation where the GPI device is inadvertently disconnected, causing SpotOn to poll for a non-existent 'joystick'.

As an alternative to using two leads the 2 x 100K resistors could be mounted directly on the GPI card connector pins inside the computer, this should only be attempted by those with

suitable experience.

It is recommended that some form of protection is applied to the sound card inputs an Opto or Relay isolated interface would be suitable.

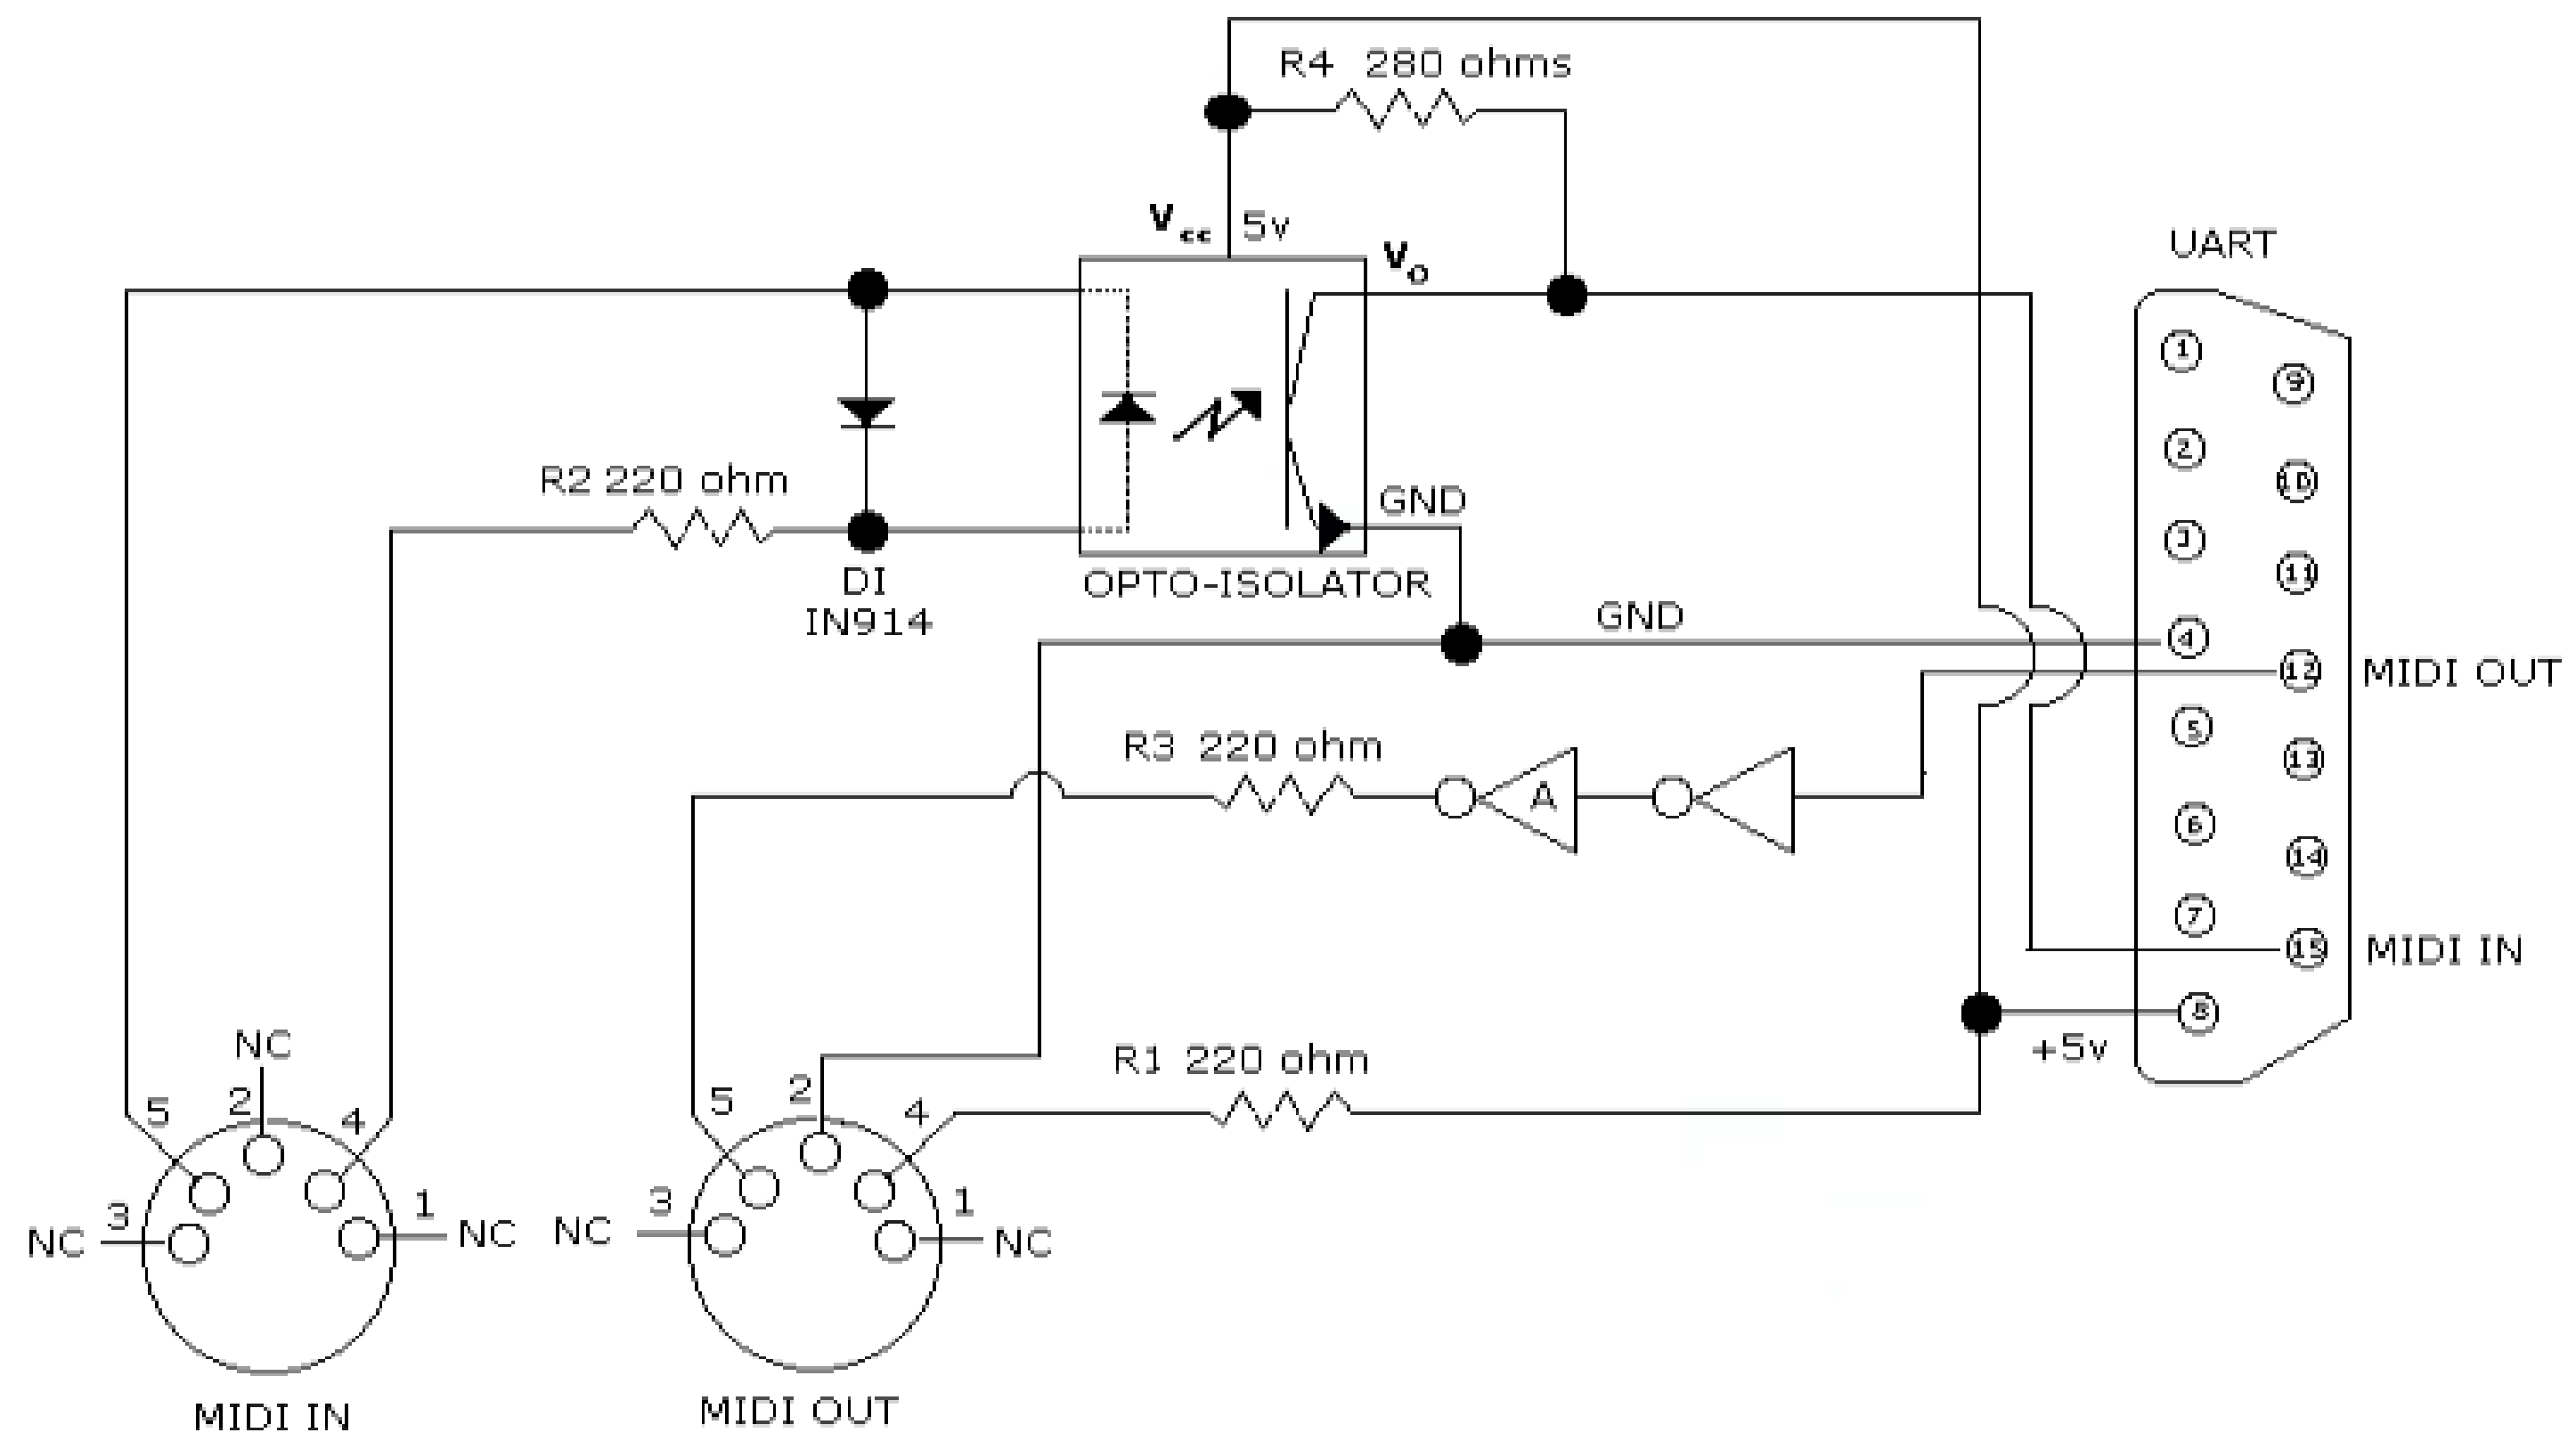

Alternatively a USB joystick can be used to provide the GPI inputs, in this case slightly more work will be required to extract the button signals from the joystick, but the internal wiring of such devices is usually simple.

Midi

Game ports on many computers support Midi In/Out, the signals on the 15 way game port connector are not suitable for direct connection to a Midi device.

The diagram below from the Midi Manufacturers Associationshows one interfacing method

Computer Sound Card Game Port to Standard MIDI Connector

UDP/TCP Commands

Control via UDP /TCP

SpotOn can respond to messages passed to the computer running SpotOn via a UDP or TCP connection, the message protocol is defined below.

SpotOn will listen on UDP/TCP port 4650

Midi	Midi messages via UDP
Cues	Play and Stop tracks by name
List	List track names
Note	List Midi notes assigned to buttons
Errors	Error codes

Midi Commands

The message format consists of 8 bytes (0..7)

Bytes 0..3 form the header

Byte 0 = 'M'

Byte 1 = 'I'

Byte 2 = 'D'

Byte 3 = 'I'

Bytes 4..6 form the data

Byte 4 = Midi Status

Byte 5 = Midi Data1

Byte 6 = Midi Data2

Byte 7 is a checksum of bytes 0..6 modulus 0x100

(Note On, Note Off, All Notes Off and All Notes Stop are the only commands implemented)

SpotOn will reply with a message of the same format

Bytes 0..3 form the header

Byte 0 = 'M'

Byte 1 = 'I'

Byte 2 = 'D'

Byte 3 = 'I'

Bytes 4..6 form the data

Byte 4 = Reply code

Byte 5 = not used

Byte 6 = not used

Byte 7 is a checksum of bytes 0..6 modulus 0x100

Reply code can take the values:-

Error_None	0	message received correctly
Error	1	header bytes not recognised
_UnRecognisedHeader	2	checksum byte in header does not match
Error	2	calculated checksum
_BadHeaderChecksum	3	Message data invalid format
Error _BadData	4	"Midi over UDP" disabled in SpotOn menu
Error _NotEnabled	4	options
Error _Unknown	5	unknown error detected

Status, Data1 and Data2 are the standard Midi message bytes.

Status byte

The Status byte carries the channel number and the on/off state - the channel number is represented by the lower 4 bits (0..15) and the on/off state by the upper 4 bits (0x8 = off and 0x9 = on).

NB Midi Channel numbers in the message are 0..15 - SpotOn will translate this range into 1..16

So for channel 0 On the status byte would be 0x90
and for channel 0 Off the status byte would be 0x80

Similarly for channel 2 On the status byte would be 0x92
and for channel 2 Off the status byte would be 0x82

Data1 byte

The Data1 byte carries the Note number 0..127

So for note 2 the Data1 byte would be 0x02
and for note 33 the Data1 byte would be 0x21

Data2 byte

Data2 byte is generally ignored by SpotOn so can be left at 0x00

As an example the Midi message for Channel 1, Note 2 On, comprises 0x91,0x02,0x00

However when sending a Note On message the Data2 byte refers to the volume/level of the note, normally this is ignored by SpotOn, but when the option 'Convert Velocity=0 to Note Off' (Options|Midi Control) is selected, a Note On message with Data2 set to 0 will be interpreted as a Note Off. When Data2 has any value other than zero, the action of the Note On message is not modified

Similarly:-

Midi message for Channel 15, Note 2 Off, comprises 0x8F,0x02,0x00

Midi message for Channel 0, All Notes Stop, comprises 0xB0,0x78,0x00

Midi message for Channel 0, All Notes Off, comprises 0xB0,0x7B,0x00

All Notes Stop will stop all tracks immediately

All Notes Off will stop all tracks using their fade out times

The All Notes Off and All Notes Stop messages directed to Channel 0 act globally on all buttons irrespective of whether they have any midi assignments

The All Notes Off and All Notes Stop messages are only recognised when the Channel value is set to 0, messages directed to channels 1..15 are ignored

Additional Commands

Additional commands for listing tracks and playout control are also implemented under the CUES and LIST messages detailed below.

LIST Command

The message format consists of 8 bytes (0..7)

Bytes 0..7 form the header

Byte 0 = 'L'

Byte 1 = 'I'

Byte 2 = 'S'

Byte 3 = 'T'

Byte 4 = 0x00 // 0x00 to list button titles, 0x10 to list track numbers playing

Byte 5 = 0x00

Byte 6 = 0x00

Byte 7 is a checksum of bytes 0..6 modulus 256

LIST Reply

The message format consists of 8 bytes (0..7) the data length is limited to 256 bytes so several message packets may be sent. The number of packets and packet number are coded into byte 6.

When bit 7 of byte 6 is set low the bits 0..6 represent the number of packets in the message and that this is the first packet.

When bit 7 of byte 6 is set high the bits 0..6 represent the index number of this packet

Bytes 0..7 form the header

Byte 0 = 'L'

Byte 1 = 'I'

Byte 2 = 'S'

Byte 3 = 'T'

Byte 4 = 0x00 // 0x0? button titles, 0x1? track numbers playing, LSN = Error Code

Byte 5 = number of Data bytes following header including final checksum

Byte 6 = MSB=0: number of packets; MSB=1: packet index (PacketIdx=[Byte6 and

0x7f])

Byte 7 is a checksum of bytes 0..6 modulus 0x100

Byte 8..N-2 data bytes

<3 digit Button number><=><BtnTitle><crLf>

Byte N-1 = LSB of 16 bit checksum of bytes 8..N-2 modulus 0x10000

Byte N = MSB of 16 bit checksum of bytes 8..N-2 modulus 0x10000

examples:-

001=BtnTitle1**crLf** 002=BtnTitle2**crLf**
.....320=LastBtnTitle**crLf**

button 1 title is 'BtnTitle1'

button 2 title is 'BtnTitle2'

...

button 320 title is 'LastBtnTitle'

CUES Command

The message format consists of 8 bytes (0..7)

Bytes 0..7 form the header

Byte 0 = 'C'

Byte 1 = 'U'

Byte 2 = 'E'

Byte 3 = 'S'

Byte 4 = 0x00

Byte 5 = LSB of number of Data bytes following header including final checksum

Byte 6 = MSB of number of Data bytes following header including final checksum

Byte 7 is a checksum of bytes 0..6 modulus 256

Byte 8..N-2

<+,-,*,!><n,[n],[nn]><BtnTitle><;><+,-
,*,!><n,[n],[nn]><BtnTitle><;>

+ = Play

- = Stop

\$nnn = play button nnn, number range 1..320

%nnn = stop button nnn, number range 1..320

@ nnn= loop button nnn, number range 1..320

*n = Select page n, number range 1..8

! = All Stop

^ = Page Stop

[n] = delay play by n*100mS

[nn] = delay play by nn*100mS maximum delay is 5 seconds

Byte N-1 = LSB of 16 bit checksum of bytes 8..N-2 modulus 65536

Byte N = MSB of 16 bit checksum of bytes 8..N-2 modulus 65536

examples:-

CUES+BtnTitle1;-BtnTitle2;+[10]BtnTitle3;*4

Play BtnTitle1

Stop BtnTitle2

Play BtnTitle3 after delay of 1 second (10*100mS)

Change to page 4

CUES!

Stop All tracks

To send the command to Play a button with a button text 'test' use the following byte sequence:-

0x63 0x75 0x65 0x73 0x00 0x07 0x00 0xB7 0x2B 0x74 0x65 0x73 0x74 0xEB 0x01

Which represents:-

CUES!!!!+test!! // Where ! indicates binary values

Bytes 0..7 form the header

Byte 0 = 'C'

Byte 1 = 'U'

Byte 2 = 'E'

Byte 3 = 'S'

Byte 4 = 0x00

Byte 5 = 0x07 LSB of number of Data bytes following header including final checksum

Byte 6 = 0x00 MSB of number of Data bytes following header including final checksum

Byte 7 = 0xB7 checksum of bytes 0..6 modulus 0x100

Bytes 8..17 form the message data

Byte 8 = 0x2B '+'

Byte 9 = 0x74 't'

Byte 10 = 0x65 'e'

Byte 11 = 0x73 's'

Byte 12 = 0x74 't'

Byte 13 = 0xEB LSB of checksum of bytes 8..12 modulus 0x10000

Byte 14 = 0x01 MSB of checksum of bytes 8..12 modulus 0x10000

CUES Reply

The message format consists of 8 bytes (0..7)

Bytes 0..7 form the header

Byte 0 = 'C'

Byte 1 = 'U'

Byte 2 = 'E'
Byte 3 = 'S'
Byte 4 = nn // Error code
Byte 5 = 0x00
Byte 6 = 0x00
Byte 7 is a checksum of bytes 0..6 modulus 0x00

The NOTE command returns a list of the Midi notes assigned to the active buttons

NOTE Command

The message format consists of 8 bytes (0..7)

Bytes 0..7 form the header

Byte 0 = 'N'
Byte 1 = 'O'
Byte 2 = 'T'
Byte 3 = 'E'
Byte 4 = 0x00
Byte 5 = 0x00
Byte 6 = 0x00
Byte 7 is a checksum of bytes 0..6 modulus 256

NOTE Reply

The message format consists of 8 bytes (0..7) the data length is limited to 256 bytes so several message packets may be sent. The number of packets and packet number are coded into byte 6.

When bit 7 of byte 6 is set low the bits 0..6 represent the number of packets in the message and that this is the first packet.

When bit 7 of byte 6 is set high the bits 0..6 represent the index number of this packet

Bytes 0..7 form the header

Byte 0 = 'N'
Byte 1 = 'O'
Byte 2 = 'T'
Byte 3 = 'E'
Byte 4 = 0x00
Byte 5 = number of Data bytes following header including final checksum
Byte 6 = MSB=0: number of packets; MSB=1: packet index (PacketIdx=[Byte6 and 0x7f])
Byte 7 is a checksum of bytes 0..6 modulus 0x100

Byte 8..N-2 data bytes

<3 digit Button number><=><BtnMidiNote><crlf>

Byte N-1 = LSB of 16 bit checksum of bytes 8..N-2 modulus 0x10000
Byte N = MSB of 16 bit checksum of bytes 8..N-2 modulus 0x10000

examples:-

```
001=02/064/1crlf 002=**/123/0crlf 005=?/?/?/?/?crlf
.....320=LastBtnMidiNotecrlf
```

```
button 1 Midi note is '02/064/1' - Channel 3, Note
64, On
button 2 Midi note is '**/123/0' - any channel, Note
123, Off
button 5 Midi note is '?/?/?/?/?' - no Midi note
assigned
...
button 320 title is 'LastBtnTitle'
```

NB Midi Channel numbers in message are 0..15 -
SpotOn will translate this range
into 1..16

Error Codes

Reply code can take the following values:-

Error_None	0	message received correctly
Error		
_UnRecognisedHeader	1	header bytes not recognised
Error		
_BadHeaderChecksum	2	checksum byte in header does not match calculated checksum
Error _BadData	3	M message data invalid format
Error _NotEnabled	4	"Midi over UDP/TCP" disabled in SpotOn menu options
Error _Unknown	5	unknown error detected
Error _BadData	6	checksum word in data does not match calculated checksum
Checksum		
Error_BadMsgByteCount	7	number of bytes given in message is invalid

Midi Channel Numbering

The Midi Channel numbering started off as a bit of a mess and has now stabilised into a slightly smaller mess.

Originally there was a user option to switch between 0 and 1 based Midi Channel numbering as viewed by the operator, the underlying code always worked on 0 based as that agreed with the raw Midi data values being handled. The default setting for the users was 0 based.

Then Midi over UDP then came along and was coded as 0 based, after some/many comments and a survey on IBSNet the conclusion was to hard code SpotOn to be 1 based so the users always see the Midi channels numbered 1..16.

Unfortunately changing the Midi over UDP to also be 1 based would break existing third party code so the decision was made to leave the UDP/TCP commands as 0 based.

PBus Control

SpotOn can be controlled via the industry standard PBus commands, the PBus interface is most commonly found on vision switchers/mixers where it allows generic remote control commands to be incorporated into the timeline of the memory system. SpotOn currently responds to two PBus commands Recall and Trigger.

The PBus interface is strictly RS485 which is configured as one master (switcher) and many slaves (devices), normally the master transmits messages and the slaves perform some task, the slaves represented by SpotOn do not send a reply on the PBus interface.

To use an RS485 interface on a standard PC either a RS232/485 or a RS232/422 converter will be required.

PBus Control can be enabled via the Options menu or by shift right-clicking on the GPI In panel in the status bar. The GPI In panel text is shown underlined when PBus control is enabled

the text colour will flash cyan when a PBus trigger is received (text flashes red when GPI triggers are received)

The PBus setup screen is shown below.

PBus SetUp

Port Number

☐ None
☒ Com 1 ☐ Com 5 ☐ Com 9 ☐ Com 13
☐ Com 2 ☐ Com 6 ☐ Com 10 ☐ Com 14
☐ Com 3 ☐ Com 7 ☐ Com 11 ☐ Com 15
☐ Com 4 ☐ Com 8 ☐ Com 12 ☐ Com 16

Baud Rate

☐ 9600 ☐ 19200 ☒ 38400

Stop Bits

☒ 1
☐ 2

Parity

☒ None ☐ Odd ☐ Even

Defaults

Address Range 10..11 - Buttons 1..200

Base Address
 Number of Addresses

Registers 0..99 at Addr 10 refer to Btns 1..100
 Registers 0..99 at Addr 11 refer to Btns 101..200
 Registers 0..99 at Addr 12 refer to Btns 201..300
 Registers 0..31 at Addr 13 refer to Btns 301..320

☒ OK ☒ Cancel

The screen is split into three sections ports, format and addresses.

Ports

Here the PC com port to be used as the PBus input is assigned, only ports 1..4 can be selected and those ports that are not fitted or otherwise unavailable are greyed out. In the example ports 1+2 are available, ports 3+4 are not available - not fitted in this case - and ports 5..16 not available for selection

Format

The image shows a configuration window for SpotOn. It has three sections: Baud Rate, Parity, and Stop Bits. The Baud Rate section has three radio buttons: 9600, 19200, and 38400. The Parity section has three radio buttons: None, Odd, and Even. The Stop Bits section has two radio buttons: 1 and 2. A Defaults button is located at the bottom right.

Section	Option	Selected
Baud Rate	9600	No
	19200	No
	38400	Yes
Parity	None	Yes
	Odd	No
	Even	No
Stop Bits	1	Yes
	2	No

Defaults button

The format of the data sent on the PBus is defined by the master - usually the vision switcher - so the SpotOn settings for baud rate, parity and number of stop bits can all be changed to match. The default values are highlighted in bold text and these values can be set by clicking the Defaults button

Addresses

The image shows the Address Range configuration window. It has a title bar 'Address Range 10..11 - Buttons 1..200'. Below the title bar, there are two spin boxes: 'Base Address' set to 10 and 'Number of Addresses' set to 2. Below these, there are four lines of text: 'Registers 0..99 at Addr 10 refer to Btns 1..100', 'Registers 0..99 at Addr 11 refer to Btns 101..200', 'Registers 0..99 at Addr 12 refer to Btns 201..300', and 'Registers 0..31 at Addr 13 refer to Btns 301..320'.

Address Range 10..11 - Buttons 1..200

Base Address: 10 Number of Addresses: 2

Registers 0..99 at Addr 10 refer to Btns 1..100
 Registers 0..99 at Addr 11 refer to Btns 101..200
 Registers 0..99 at Addr 12 refer to Btns 201..300
 Registers 0..31 at Addr 13 refer to Btns 301..320

As there is one master and one or more slaves connected to the PBus, there has to be a method of identifying each separate slave. This is achieved by using 'addresses' 0..23, each slave can respond to commands sent to one or more addresses.

In the Address section SpotOn can be set to use a range of contiguous addresses formed by a base address and then the number of addresses. In the example above the base address is 10 and the number of addresses is 2 giving the address range 10 and 11.

If you increase the number of addresses to 3 then SpotOn acts as devices 10, 11 & 12 with device 10 representing buttons 1..100, device 11 buttons 101..200 and device 12 buttons 201..300.

The commands to play say button 120 would be: -

Recall Device 11 register 20 // arms button 120 ready to play (button 20 in device 11 range of 101..200)

Trigger Device 11 function 1 // to play button ..

Trigger Device 11 function 0 // to stop button

The commands to play say button 54 would be: -

Recall Device 10 register 54 // arms button 54 ready to play (button 54 in device 10 range of 1..100)

Trigger Device 10 function 1 // to play button ..

Trigger Device 10 function 0 // to stop button

Message Format

The PBus protocol is ASCII based and the two commands recognised by SpotOn are Recall and Trigger: -

Recall - Rddddddrr<cr>

The first byte is the ASCII keyword for Recall (R)

Next is a 6 byte field of ASCII characters (dddddd) this is a bit map identifying which range of buttons are included in the Recall

Followed by a 3 byte field of ASCII characters (rrr) giving the register number (SpotOn button) to be recalled

Trigger - Tddddddg<cr>

The first byte is the ASCII keyword for Trigger (T)

Next is a 6 byte field of ASCII characters (dddddd) this is a bit map identifying which range of buttons are included in the Trigger

Followed by a single ASCII character (g) giving the function to be performed (0 = SpotOn Stop, 1 = SpotOn Play)

Locked Attributes

Locked attributes refers to the 'Lock Note', 'Lock HotKey' and 'Lock Colour' to button checkboxes

☐ Lock Note In/Play to Btn

☐ Lock Note In/Stop to Btn

☐ Lock Note Out to Button

☐ Lock HotKey to button

Lock colour to button ☐

When checked, these will 'Lock' the attribute to the button number, meaning that if the button is reloaded with another track then the attribute will remain unaffected.

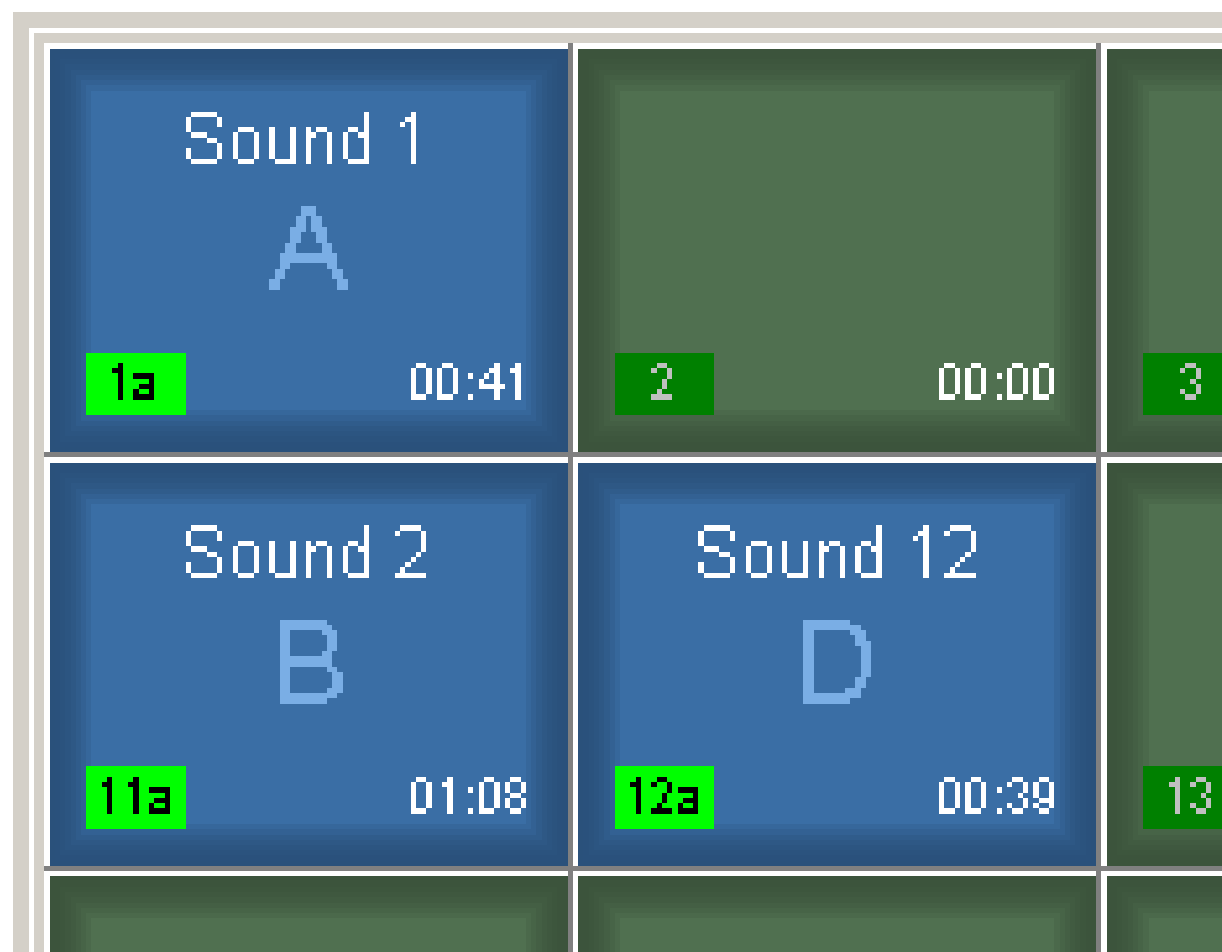

This allows a fixed set of attributes (Colours, HotKeys and Midi notes) to remain assigned whilst buttons are reloaded, the following description applies to both HotKeys and Midi notes.

Below is a section of the main screen showing buttons 1, 2, 11, and 12, at this stage no hotkeys have been assigned to any of these buttons.

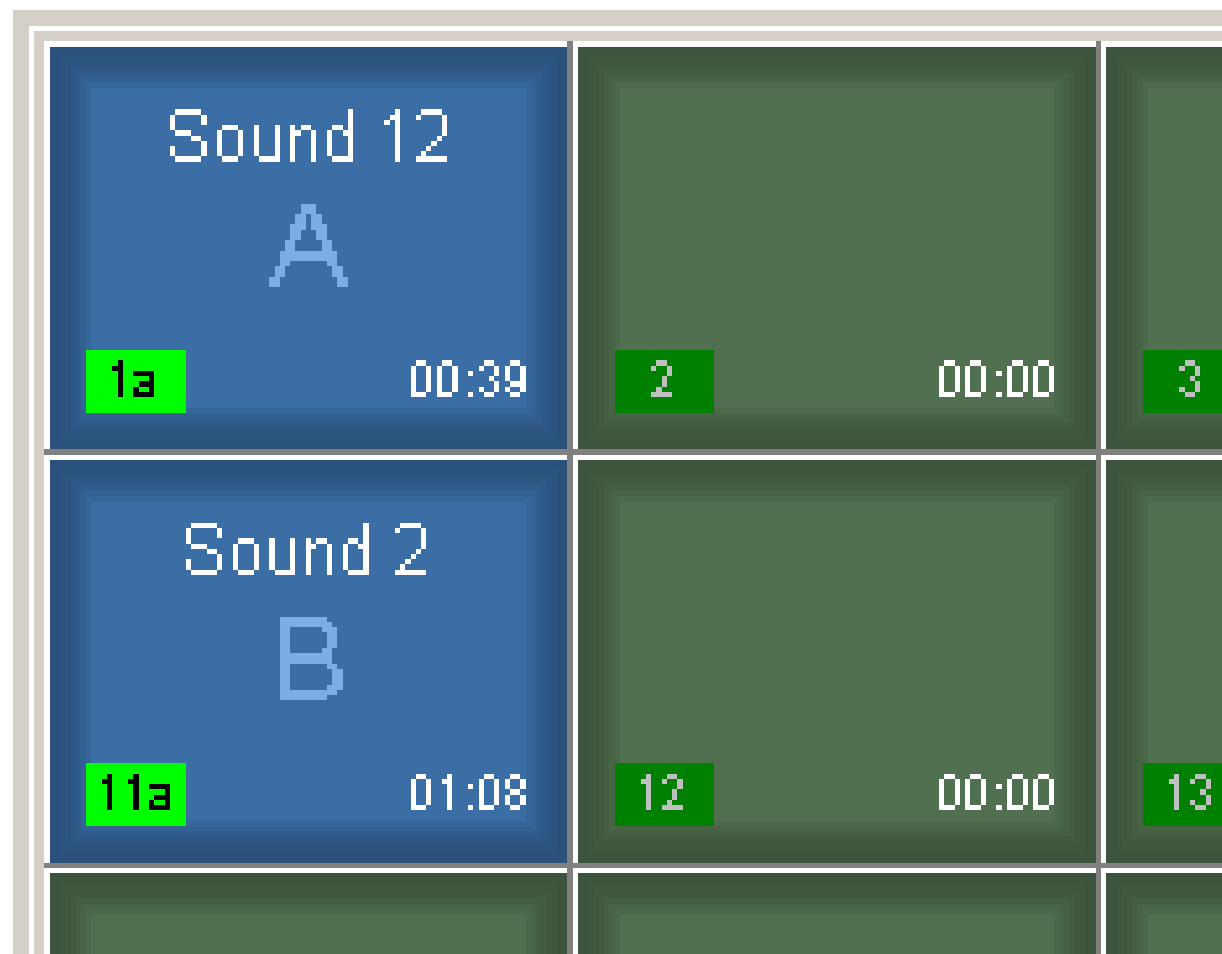

Now the HotKeys A, B, C and D are assigned and the HotKey on button A is 'Locked to button'

Cut and pasting button 2 onto button 11 results in button 11 contents being entirely replaced by those from button 2.

Now cut and pasting button 12 onto button 1 gives: -

Here button 1 has retained the HotKey 'A' that it had before, due to it being Locked to the button.

Now if button 1 is moved to button 2, button 2 takes its original hotkey assignment

If a completely new track is loaded onto button1 it will take the Locked hotkey assignment

The only method of removing the Locked hotkey is to either uncheck the 'Lock HotKey to button' checkbox for button 1, or to 'Clear' the button from the popup menu

Button Icons

Unassigned button with no track loaded and default color scheme

Assigned button with no modifiers, audio output is routed to o/pA. Track name is SOUND 7 and length 2s

Assigned button with no modifiers, audio output is routed to o/p B

Button parameters are being edited

Button is playing

Button is playing with Highlight Play option

Button is selected in "Step To Next" mode and will play on press of Spacebar

Button is selected in "Step To Next" mode and will play on press of Spacebar - Highlight Step to Next Selected

Button is selected in "Step To Next" mode and is playing

Button is selected in "Step To Next" mode and is playing - Highlight Step to Next Selected

Fading In

Fading out

Track is within 3 seconds of end

Track Duration label showing Elapsed Time instead of the default Time Remaining

Track audio is muted

The track will loop continuously over its full length or between its In and Out points if specified

The track will loop continuously over its full length or between its In and Out points if specified until stopped when then loop mode will be cancelled

When this track reaches the end or the start of its fade out time the next numbered track will be played

When this track is played all other tracks will be stopped using their fade out times

When this track is played all other tracks on the current page will be stopped using their fade out times

Stop track when left mouse button is released

When this track is played all other tracks will be stopped without using their fade out times

When this track is played all other tracks on the current page will be stopped without using their fade out times

This track will play when QWERTY key B is pressed

This track will play when function key F3 is pressed

This track will play when numeric keypad 5 is pressed with NumLock active and is in Ganged mode

This track will play when numeric keypad 5 is pressed with NumLock active and is in Overlapped mode

This track will play when Midi In Channel/Note received is 5/24 and is in Ganged mode

This track will play when Midi In Channel/Note received is 5/24 and is in Overlapped mode

A GPI becoming active will play this track

A GPI becoming active will play this track and more than one GPI is assigned to this track

A specified Midi message will play or stop the track

Track has Midi In messages for both Play and Stop assigned

A specified Midi message will be sent when this track starts to play

In point of track has been trimmed

Out point of track has been trimmed

Both the In and Out points have been trimmed

Speed has been adjusted

Both the In and Out points have been trimmed along with a change in speed setting

Track is a PlayList of total duration 3 seconds

Track is a PlayList with total duration greater than 1 hour

PlayList has just received an exit repeat loop message, see [Advanced Operation](#)

PlayList has previously received an exit repeat loop message see [Advanced Operation](#)

Button is a Link Master

Button is currently waiting until Play Delay expires and will then Play

Button is currently waiting until Play Delay expires and will then Play

Button paused

Button being played in Preview mode via assigned preview output

Button played externally by GPI, Midi...

Most combinations of options

Command Line Switches

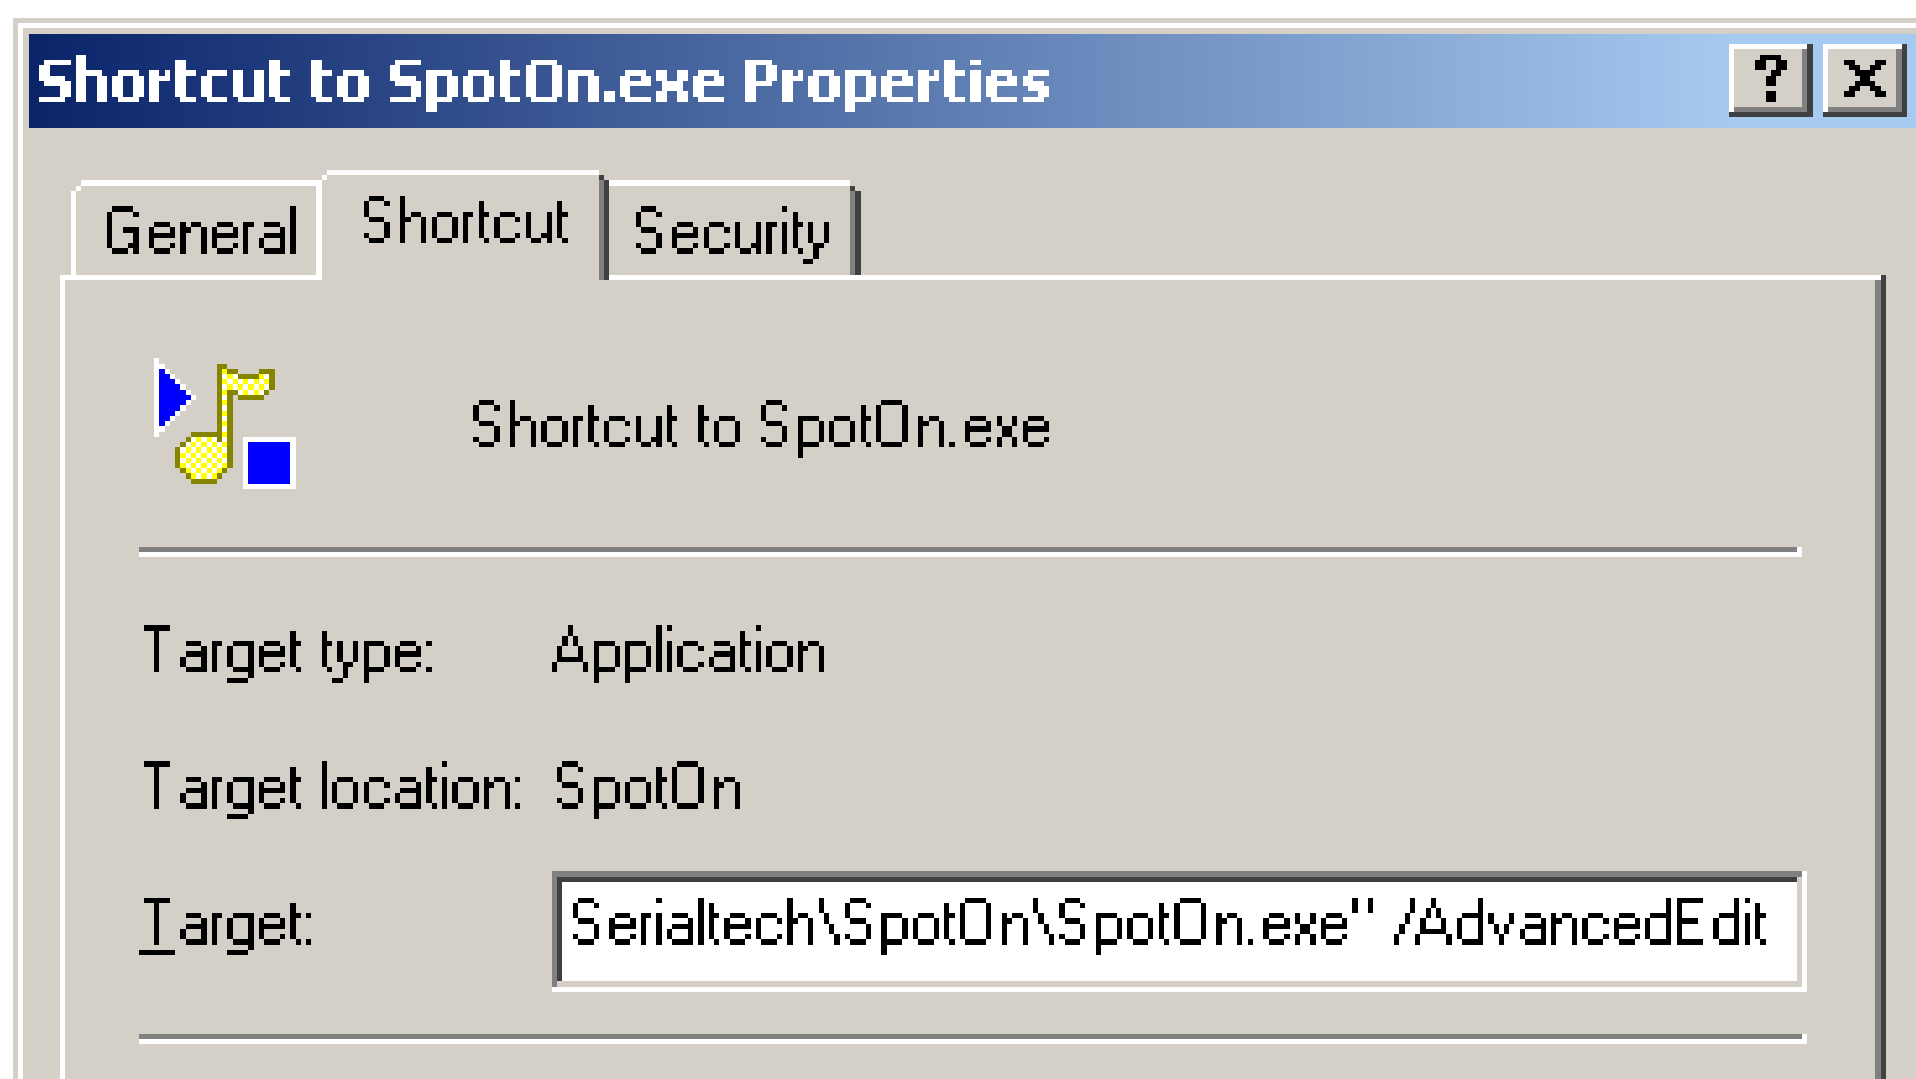

SpotOn can be started with a number of command line switches: -

/adminpassword	opens up Engineering and Admin menus on startup
/AdvancedEdit	starts SpotOn in Advanced Editing mode
/AltAppDataDir	redirects saving of all local system files to new folder eg /AltAppDataDir="c:\temp"
/Multi2	forces multichannel enabled version to run in 2 channel stereo mode
/Multi4	enables handling of 4 channel audio tracks (surround)
/Multi6	enables handling of 6 channel audio tracks (5.1)
/Multi8	enables handling of 8 channel audio tracks (7.1)
/multipassword	password to enable multi-channel playout
/NoMenus	disables user menus at startup
/Prep	starts SpotOn with 16 audio output devices even if fewer are fitted
/KeyMonitor	displays dongle presence bargraph
/NoBtnText	removes all text from buttons
/HardwareMxr	opens output devices using hardware mixers if available
/ChaseTCode	enables the chasing to timecode for auto play buttons
/PlayBtns	auto play buttons in a comma separated list eg /PlayBtns172,173,200

To use these command line switches right click the shortcut to SpotOn on the Desktop and select properties, on the popup window choose the Shortcut tab and then examine the Target entry, which should be something like: -

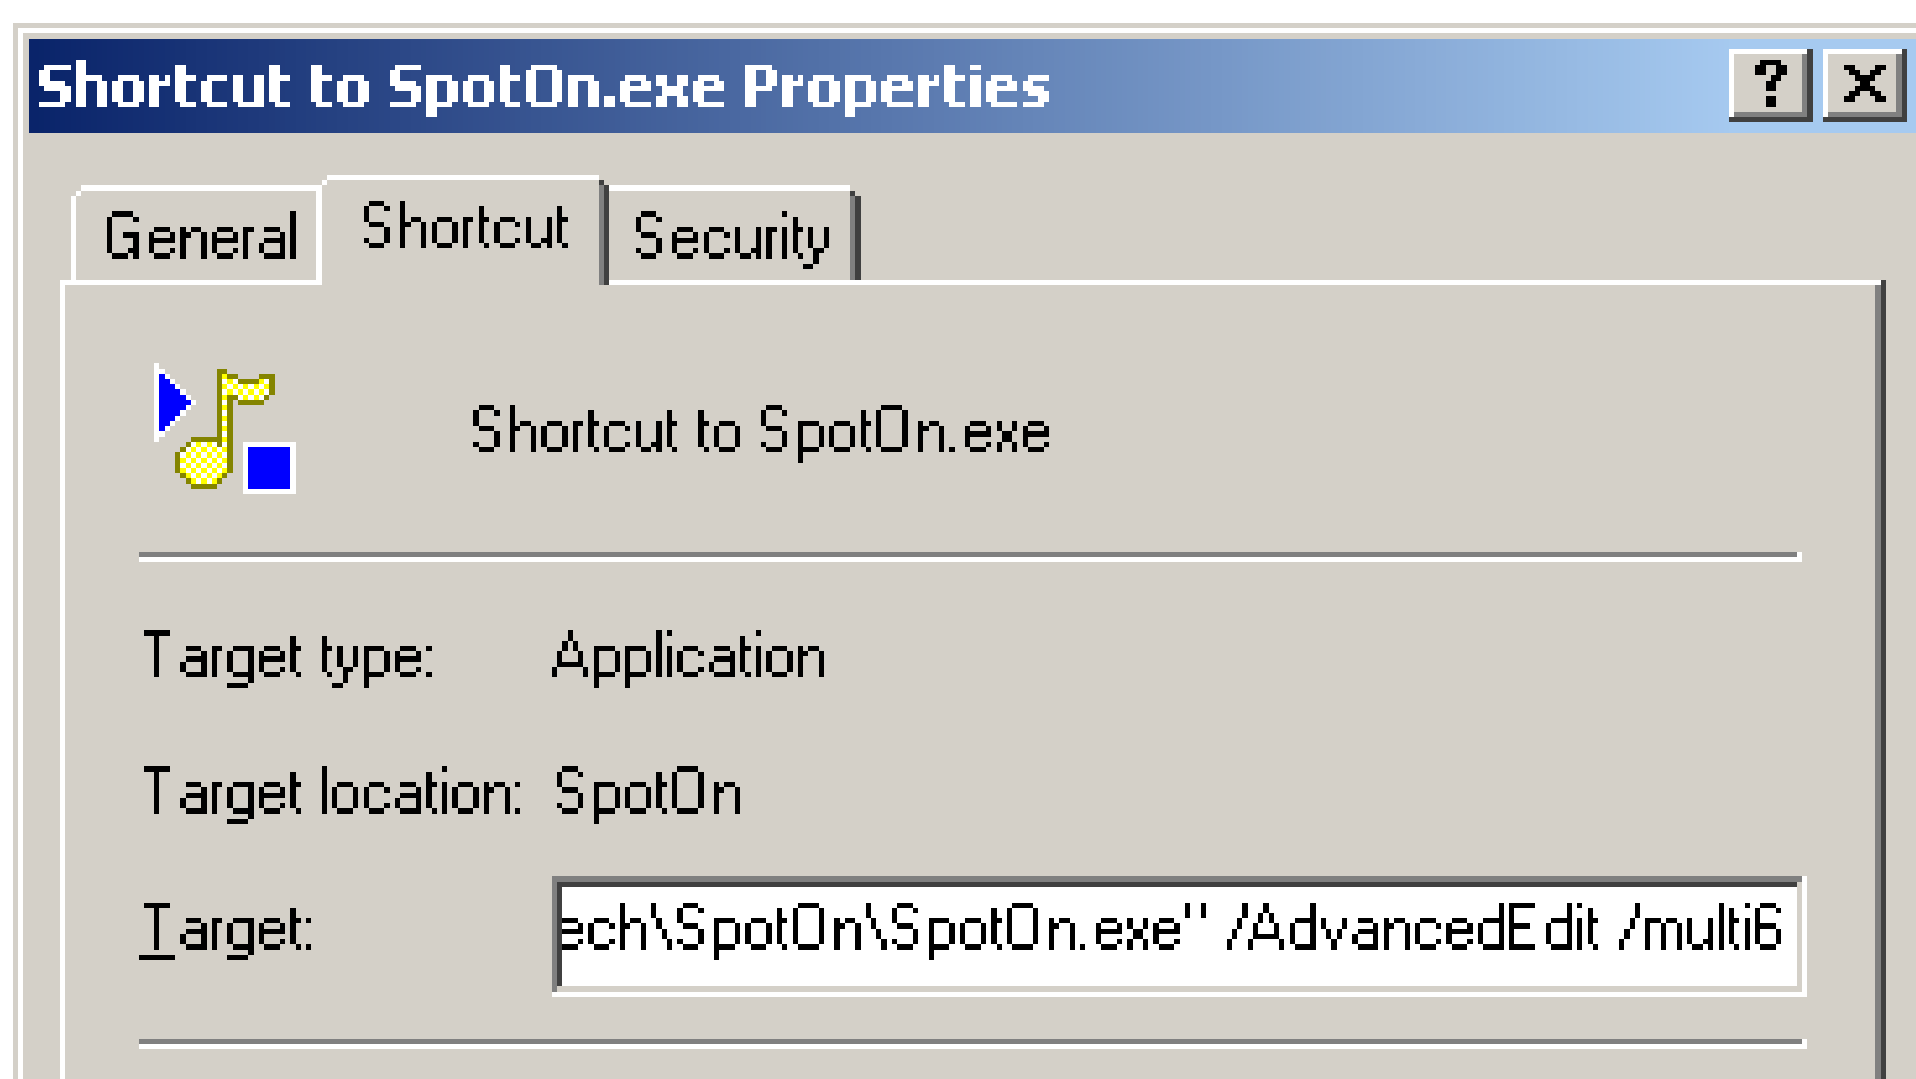

Command line switches can be added at the end on the entry after the closing double quote mark, for instance to use Advanced Editing: -

"C:\Program Files\Serialtech\SpotOn\SpotOn.exe" /AdvancedEdit

multiple switches can be included

"C:\Program Files\Serialtech\SpotOn\SpotOn.exe" /AdvancedEdit /Multi6

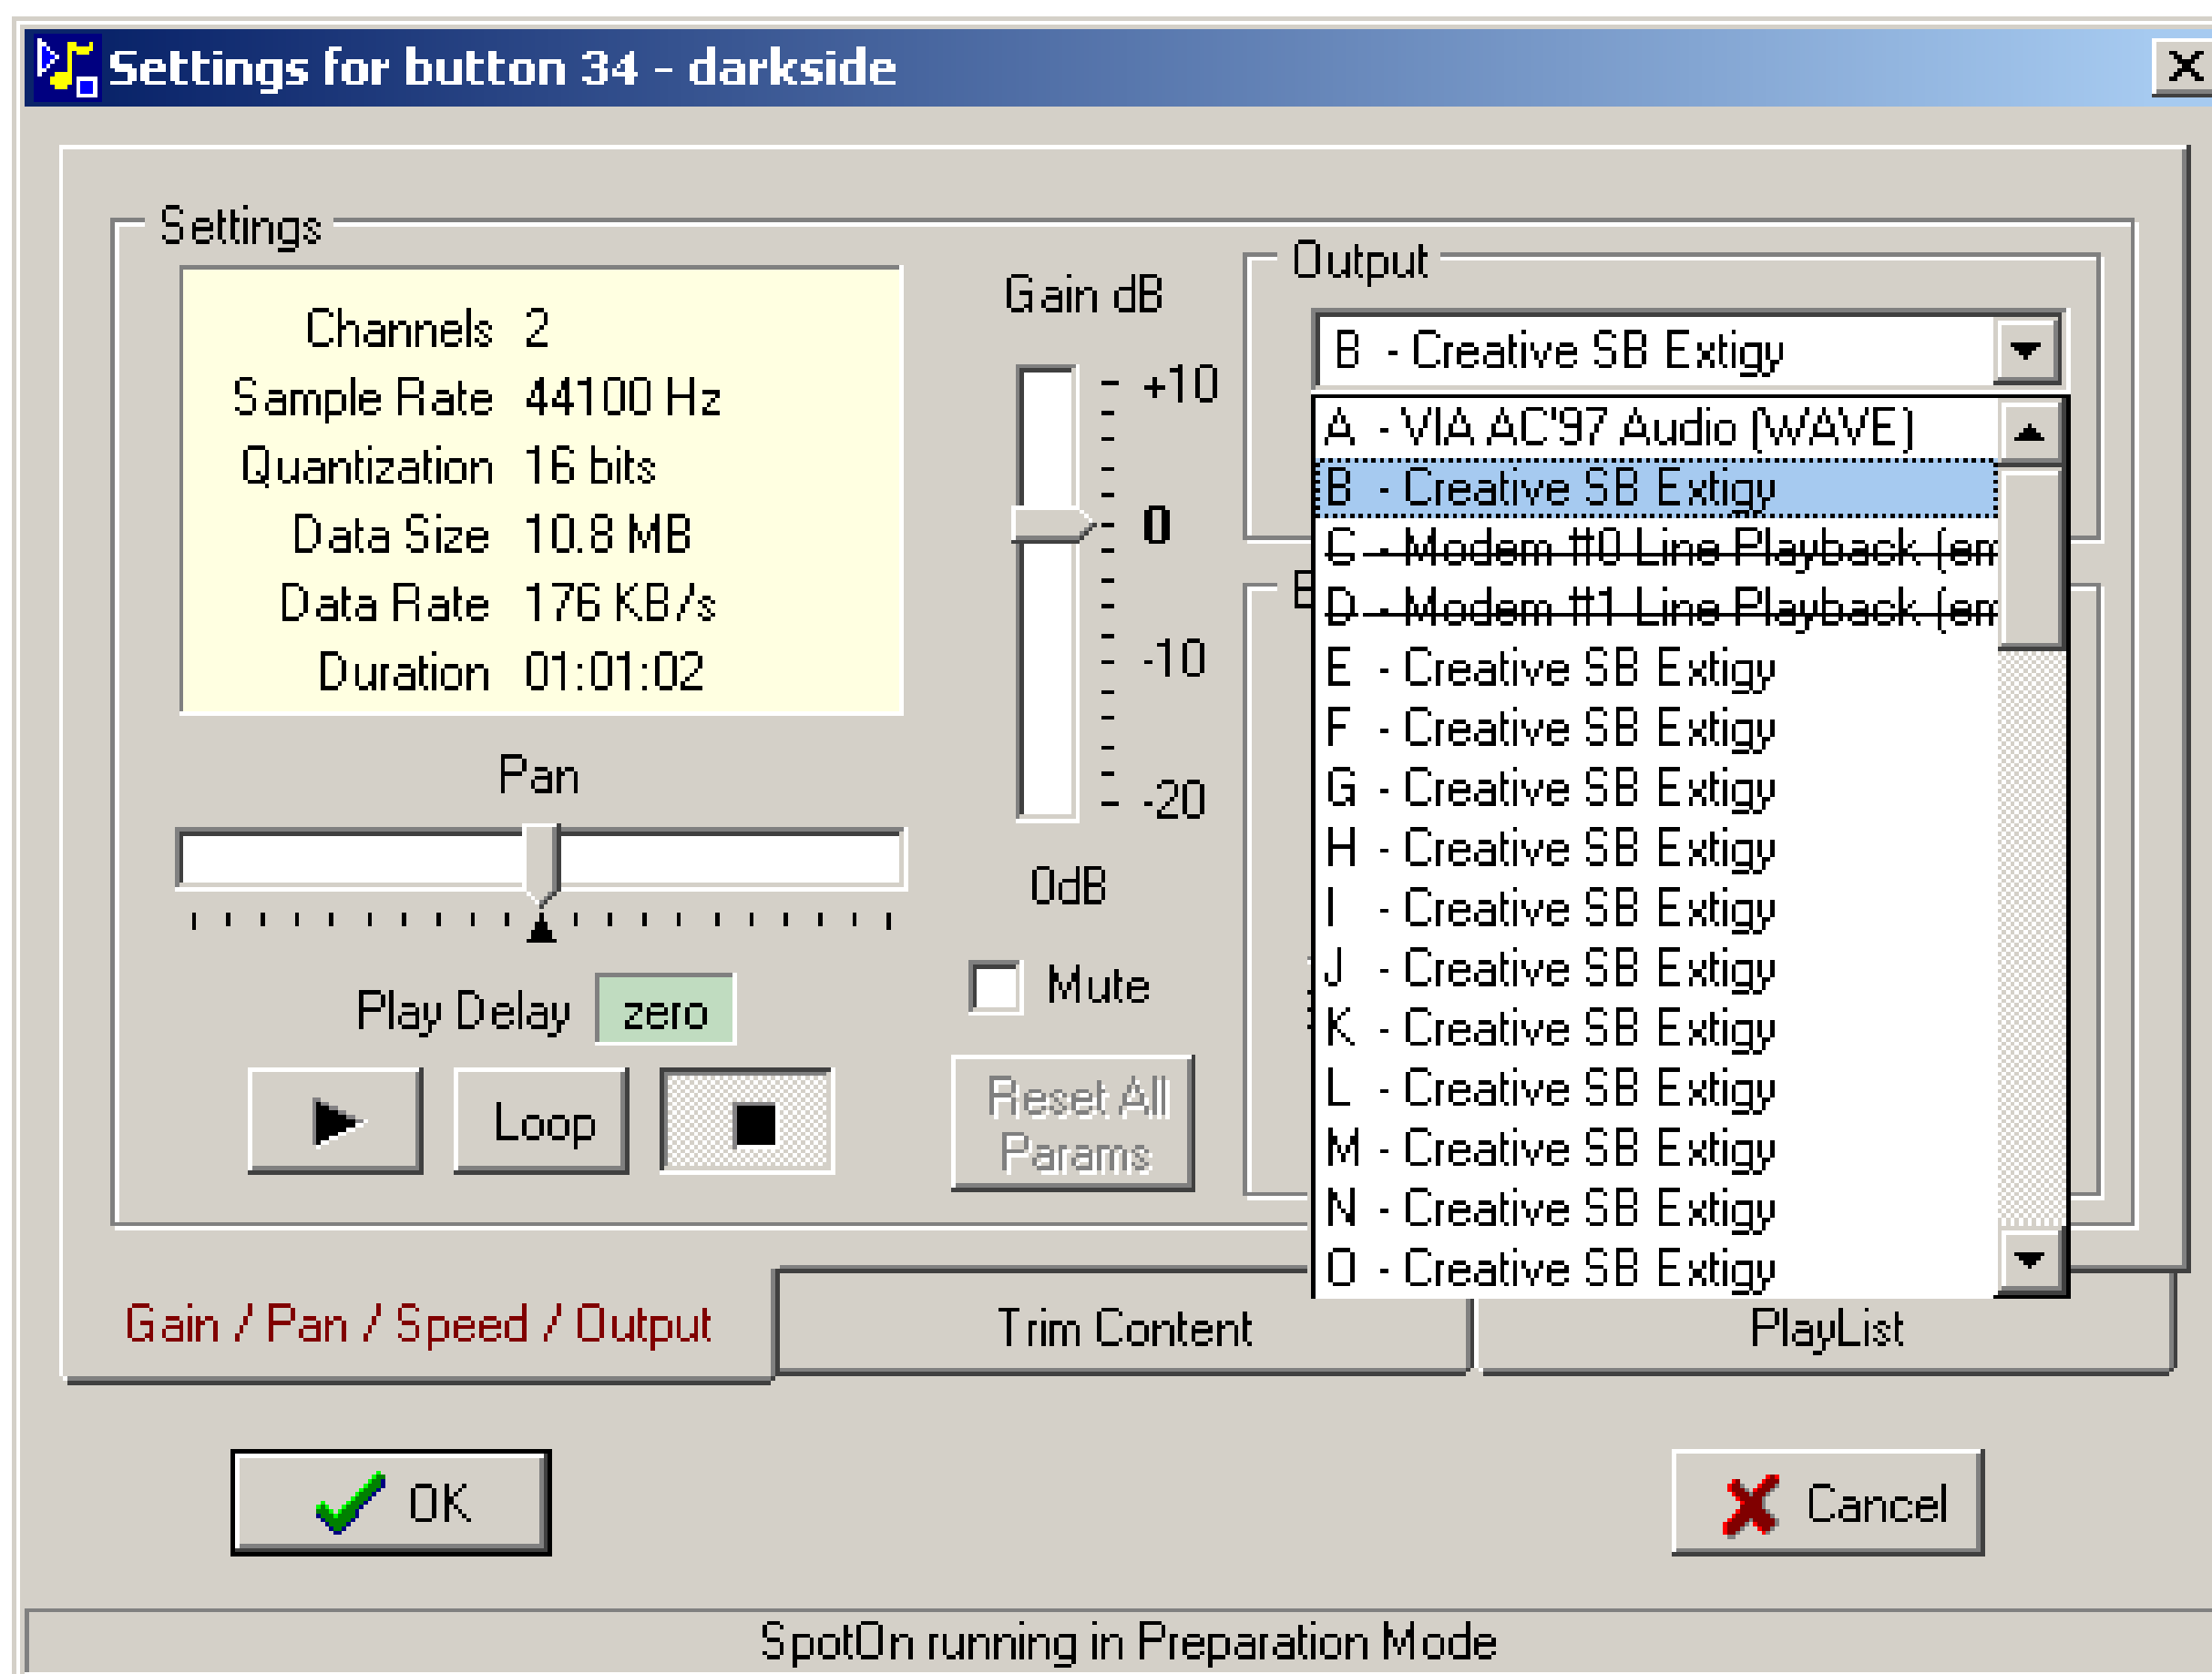

Preparation Mode

Preparation (Prep) mode is entered by using the /Prep command line switch, this will force SpotOn to provide 16 output devices even though only 1 or 2 may actually be present on the computer. This allow for packages to be prepared on a computer that does not have the same number of audio outputs as the eventual destination computer, eg laptop prep PC vs fully configured show PC.

When in prep mode the status bar will be coloured yellow

In the Audio window a long list of outputs will appear, the existing audio outputs are supplemented by additional references to the Windows preferred output device - in this case the Creative SB Exitgy

Settings

Parameters saved in Session or Package file (per session):-

Display

- Main Window position and size
- Main Window tab height S/M/L
- Main Window status bar height S/M/L
- Button shaded edge width %
- Button separator grid lines on/off
- Edged button text on/off
- Flash button number when playing
- Highlight buttons playing
- PopUp hints on/off
- Search menu button enabled on/off
- Menu icons on/off
- Flash tab when tracks are playing on/off
- Start number each page from 1 on/off
- Focus SpotOn when Scroll Lock key pressed
- Use output colour + colour table
- Use genre colours + colour table
- Double press of ScrollLock to bring SpotOn into focus
- Button right click Group Output popup
- Trim window level bar style
- Use soft waveform cursor in trim window
- Show external button trigger
- Button trigger size S/M/L
- Allow per button fonts
- Show tracks already played as black buttons
- Location of Position bars
- Level meter display mode PPM/dB

Midi

- Use Midi on on/off

XML Playout Logs

Playout logs are usually saved as human readable plain text files, the entries are tab delimited so that they can be read into a spreadsheet application for further processing.

If the playout log is required to be machine readable then checking the menu option XML Playout Logs in the [Engineering menu](#) will generate XML versions of the Playout Logs each time the logs are saved.

The format of the log is set out below: -

```
<?xml version="1.0" encoding="utf-8" standalone="yes"?>
<SpotOn_XML_Reports>
  <Playout_Logs Num_of_Logs="1">
    <Playout_SubLog SubLog_Num="1">
      <Items Num_of_Items="2">
        <Item Item_Number="1">
          <PC_Clock_Time Value="20: 10: 14" Hours="20" Minutes="10"
Seconds="14"/>
          <Button Number="1"/>
          <Output Device="a"/>
          <Trackname Text="SOUND1"/>
          <Filename Text="SOUND1.WAV"/>
          <Copyright Text="Copyright © Cinematronics 1995"/>
          <Comments Text="none"/>
        </Item>
        <Item Item_Number="2">
          <PC_Clock_Time Value="20: 10: 15" Hours="20" Minutes="10" Seconds="15"/>
          <Button Number="2"/>
          <Output Device="a"/>
          <Trackname Text="SOUND20"/>
          <Filename Text="SOUND20.WAV"/>
          <Copyright Text="Copyright © Cinematronics 1995"/>
          <Comments Text="none"/>
        </Item>
      </Items>
    </Playout_SubLog>
  </Playout_Logs>
</SpotOn_XML_Reports>
```

The log file is automatically saved to a daily file PlayLog_ddmmyy.xml in the same folder as the plain text file PlayLog_ddmmyy.txt.

The daily log has entries appended whilst SpotOn is running, if SpotOn is shutdown and restarted during the day then a new 'SubLog' entry will be added to the XML file

```
<?xml version="1.0" encoding="utf-8" standalone="yes"?>

Screen Saver

As of version v0.80 SpotOn will be installed with its own screen saver as below: -

To set up the screen saver right-click on the desktop and select the properties option from the popup menu

In the properties dialog choose the Screen Saver tab and scroll down the list of installed screen savers to locate SpotOn

On selecting the SpotOn screen saver a preview will appear in the dialog box

The screen saver display options can be accessed by clicking on the 'Settings...' button, there are only two parameters to adjust - Horizontal and Vertical speed. The 'Test' button displays the screen saver full screen mode in order to see the effects of the settings.

Click on OK on both dialog boxes to change to the SpotOn screen saver

Sound Card Mixers

Computer Sound Cards have the ability mix audio from several sources into one output, the way this is implemented is not the same on all sound cards.

There are two main methods of mixing audio sources

- a,perform the calculation in software using the computer CPU
- b,perform the calculation in hardware on the sound card

The waveform display below shows the result of slowly fading out a 1kHz sine wave over 5 seconds, the steps in level can be clearly seen and heard, this fade was performed by the CPU in a Software Mixer.

Below is the same fade operation, but this time performed by a Hardware Mixer on the sound card, the main difference is that the changes in level are made up of smaller steps, producing a much smoother fade.

Another difference between Software and Hardware mixer can be seen when the level changes during the fade are examined in detail

In the Software Mixer the level changes are instantaneous causing harmonic distortion represented by clicks on the output

However when using the Hardware Mixer the level changes are ramped over a 5mS period so much reducing the audible distortion during the fade

So in conclusion it is preferable to take advantage of any Hardware Mixers that may be available, the Info|Status menu option will list the facilities offered by the installed sound output devices

Below is the result of interrogating an On-Board sound card, which reports under "Maximum Hardware Mixing - all buffers" a value of 1. This means that only the first sound track loaded will be played out via a Hardware Mixer, all others being handled in a Software Mixer

Supports hardware mixed secondary 16 bit buffers
Supports hardware mixed secondary 8 bit buffers
Supports hardware mixed monophonic buffers
Supports hardware mixed stereo secondary buffers
Maximum hardware mixing - all buffers = 1
Minimum hardware mixing - static buffers = 1
Minimum hardware mixing - streaming buffers = 1
Free hardware mixing - all buffers = 0
Free hardware mixing - static buffers = 0
Free hardware mixing - streaming buffers = 0
Maximum hardware 3D - all buffers = 0
Maximum hardware 3D - static buffers = 0
Maximum hardware 3D - streaming buffers = 0

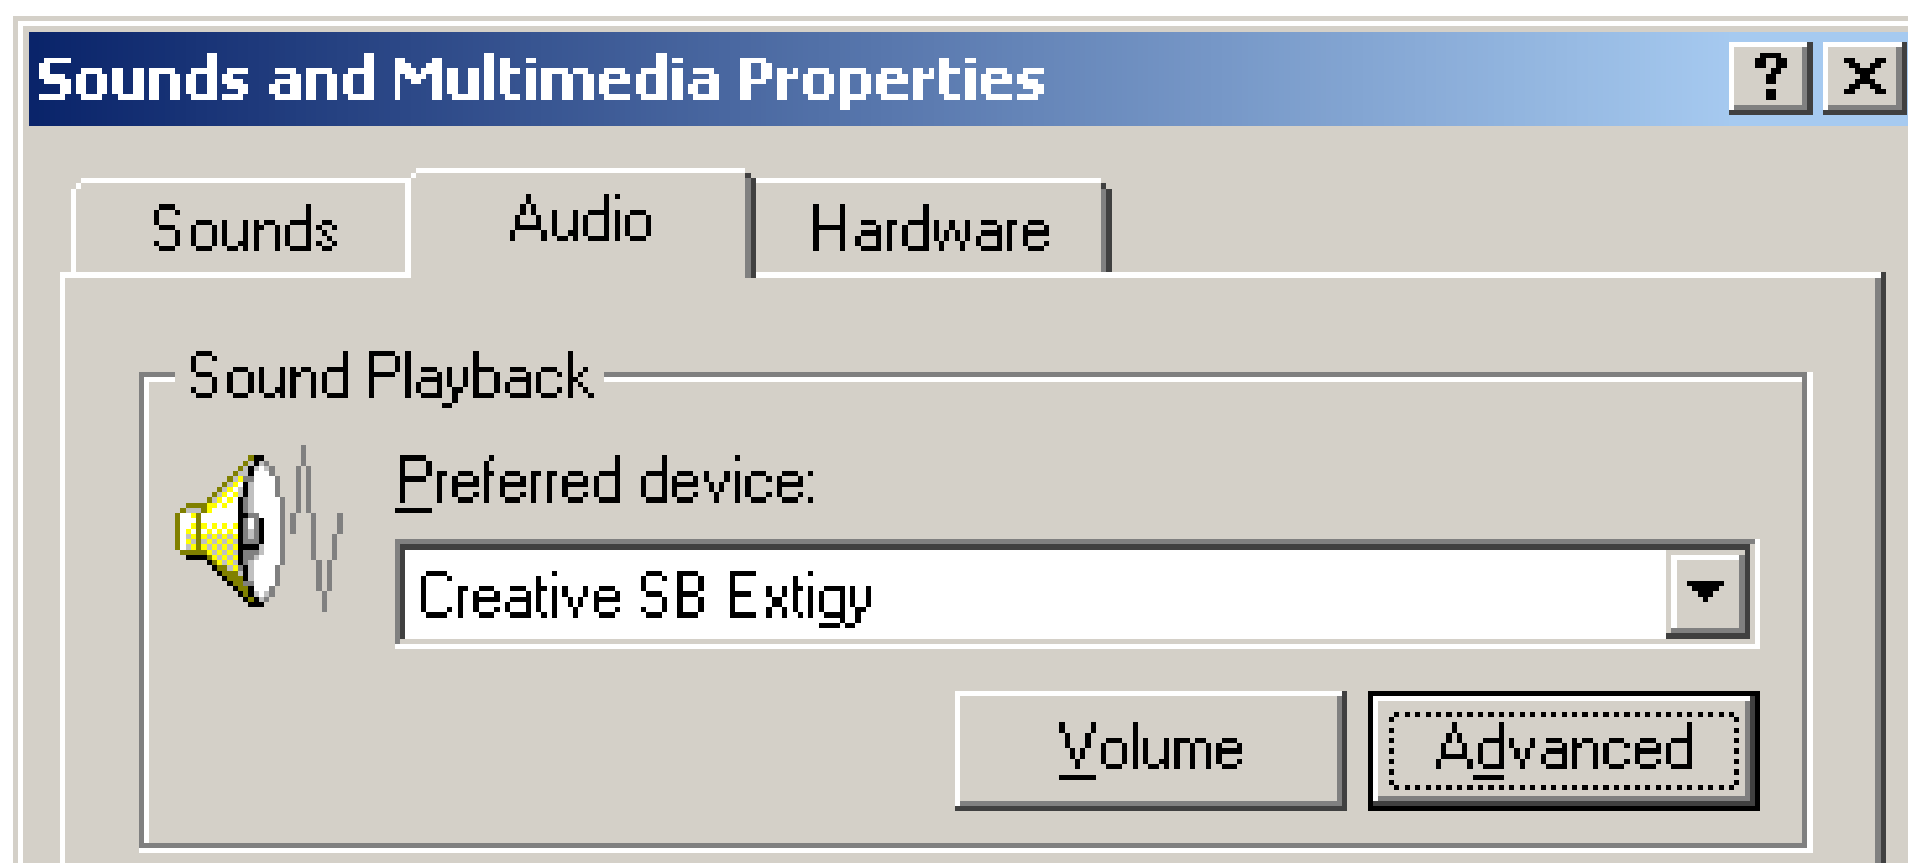

Similarly interrogating an external sound card reports under "Maximum Hardware Mixing - all buffers" a value of 64, meaning the first 64 sound tracks loaded will be played out via a Hardware Mixer and any subsequently loaded tracks via the Software Mixer

Supports hardware mixed secondary 16 bit buffers
Supports hardware mixed secondary 8 bit buffers
Supports hardware mixed monophonic buffers
Supports hardware mixed stereo secondary buffers
Maximum hardware mixing - all buffers = 64
Minimum hardware mixing - static buffers = 64
Minimum hardware mixing - streaming buffers = 64
Free hardware mixing - all buffers = 63
Free hardware mixing - static buffers = 63
Free hardware mixing - streaming buffers = 63
Maximum hardware 3D - all buffers = 64
Maximum hardware 3D - static buffers = 64
Maximum hardware 3D - streaming buffers = 64

The menu option Global|Optimize Tracks will reload all the audio tracks such that the most frequently used tracks are allocated to Hardware Mixers. This option would be used between a rehearsal and a recording as at that time SpotOn would have recorded the track usage

Audio Processing

SpotOn uses the Windows sub-system to process the audio signals and pass them onto the Sound Card, this sub-system has two parameters that are access via the Control Panel, Sound and Multimedia applet.

On the Audio tab select Advanced, then the Performance tab

The settings should be as above, a description of the options follows (extracted from Microsoft documentation).

Hardware Acceleration

None

Forces DirectSound into emulation mode. In this mode, DirectSound applications run as though no DirectSound driver is present. All mixing is done by DirectSound in user mode, and the resulting audio data is played back through the waveout API, the result is typically a large increase in latency.

Basic Setting

The Basic setting disables hardware acceleration of DirectSound secondary buffers. Under this setting, all DirectSound applications run as though no hardware acceleration is available, regardless of the capabilities of the sound card that is being used.

Standard Setting

The Standard setting enables hardware acceleration of DirectSound secondary buffers but disables vendor-specific extensions such as EAX (Creative Technologies' environmental audio extensions)

*Full Setting

The Full setting enables full acceleration of DirectSound secondary buffers. This is the default setting in Windows 98/Me and Windows XP.

Sample Rate Conversion Quality

Good

Uses linear interpolation to achieve reasonable accuracy if converting similar sampling rates; for example, converting a 12-kHz rate to a 13-kHz rate.

Multipoint interpolation

Uses a simplified version of high-end multipoint interpolation to achieve a signal-to-noise ratio of approximately 70 decibels.

*Best

High-end multipoint interpolation, uses oversampling to achieve a signal-to-noise ratio greater than or equal to 90 decibels.

Sample Rate Conversion Process

SpotOn sets up the Windows sub-system (WSS) sampling frequency to be 48kHz or 44.1kHz, (the default value is 48kHz).

The WSS negotiates with the sound card and establishes a sample rate for the transfer of audio data, it assigns a sample rate corresponding to the higher of 44.1 kHz and the highest rate available on the audio device. (In Microsoft® Windows XP SP1, Windows Server 2003, and later, the highest sample rate supported is 200 kHz)

When SpotOn requests connection of an audio stream to a device, the WSS queries the device to determine whether it supports the incoming rate. If the device supports the incoming rate, the WSS passes the incoming stream to the device without Sample Rate Conversion (SRC). Otherwise, the WSS maintains the current output rate, and the WSS uses SRC to convert the input rate to the current output rate.

The table below set out the process for handling audio streams sampled at different frequencies.

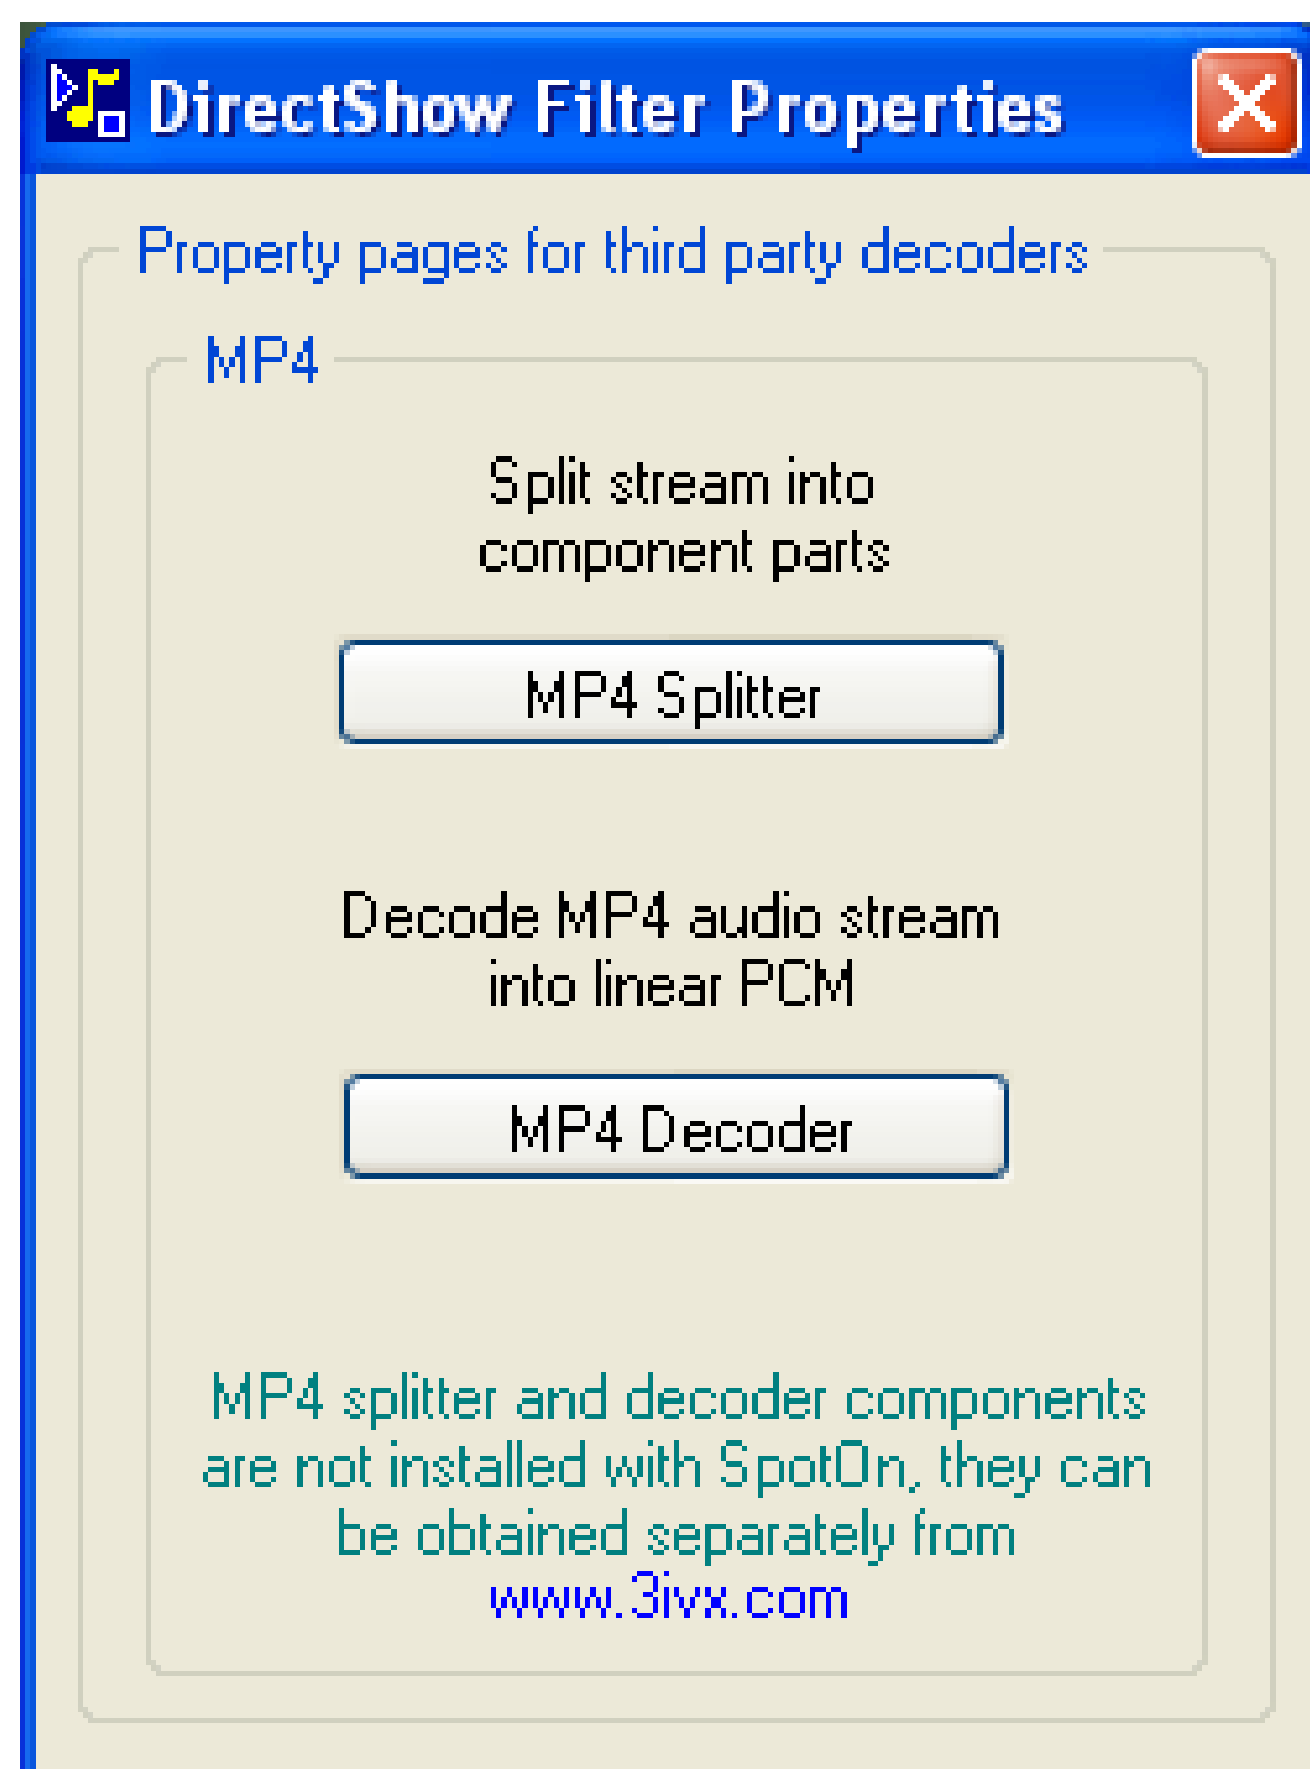

New incoming rate is equal to the current output rate.	Perform mixing only.
New incoming rate is equal to the rate of another input stream.	Mix the new input stream with the other input stream at the same rate to take advantage of the existing SRC from input to output.
New incoming rate is lower than the current maximum input rate.	Do SRC to the current output rate and mix.
New incoming rate is higher than the current maximum input rate.	<p>If the hardware supports the new input rate:</p> <p>Change the current maximum output rate and the hardware rate to the new incoming rate.</p> <p>Do SRC on all other streams to the new maximum output rate and mix them with the new stream. (When converting to the new maximum output rate, the WSS mixes together any input streams that happen to share the same sample rate <i>before</i> doing SRC on those streams.)</p> <p>If the hardware does not support the new input rate, maintain the current output rate and do SRC on the new incoming stream to the current maximum input rate.</p>

Sound cards with locking reference

With sound cards that have locking reference inputs, it is most likely that the WSS will have to convert all audio streams to the sample frequency set by the sound card locking feed. In this case the WSS cannot take advantage of the higher (oversampling) rates available in the sound cards without locking feeds. This results in a degraded SRC performance appearing as a loss of absolute frequency accuracy, for instance a 1000Hz tone might replay at 1012Hz when converting from a 8kHz sample rate to 48kHz.

This explains why professional sound cards with AES reference feeds (44.1kHz,48kHz) cannot achieve the accurate SRC of a lesser card which might have a very wide range of acceptable sampling frequencies (8kHz..200kHz).

Decoders

MP4

There are no MP4 decoders installed with SpotOn, however it is configured to work with the 3ivx range of MP4 decoder utilities, these can be obtained from www.3ivx.com and installed separately.

Examples of the property pages are shown below.

BLITS - 5.1 Surround Sound Ident

Notes on the derivation of the BLITS tone sequence © BSkyB 2007

It was in Autumn 2004 when Martin Black and Keith Lane, two of Sky Television's Senior Sound Supervisors, began to plan the implementation of 5.1 surround sound for Sky Sports' imminent live HDTV service.

One of the many and varied requirements which they identified early on in the project was a method of lining up in 5.1. It needed to be quick and simple to use and interpret, but effective and foolproof at the same time.

But it wasn't going to be quite that simple. Sky needed to derive a stereo Lt/Rt downmix from the 5.1, to provide the audio to accompany the simultaneous SD transmissions. This was to be achieved using Dolby DP563 prologic encoders, alongside the DP571 Dolby E encoders. So any ident format used would also need to work when folded down in this way, so as to make sense when only the stereo result was visible.

Problems with EBU Tech-3304 (2005) ^[2]

We identified three potential problems with the only current EBU document on multichannel lineup, the EBU Tech-3304 (2005) multichannel audio lineup tone.^[2]

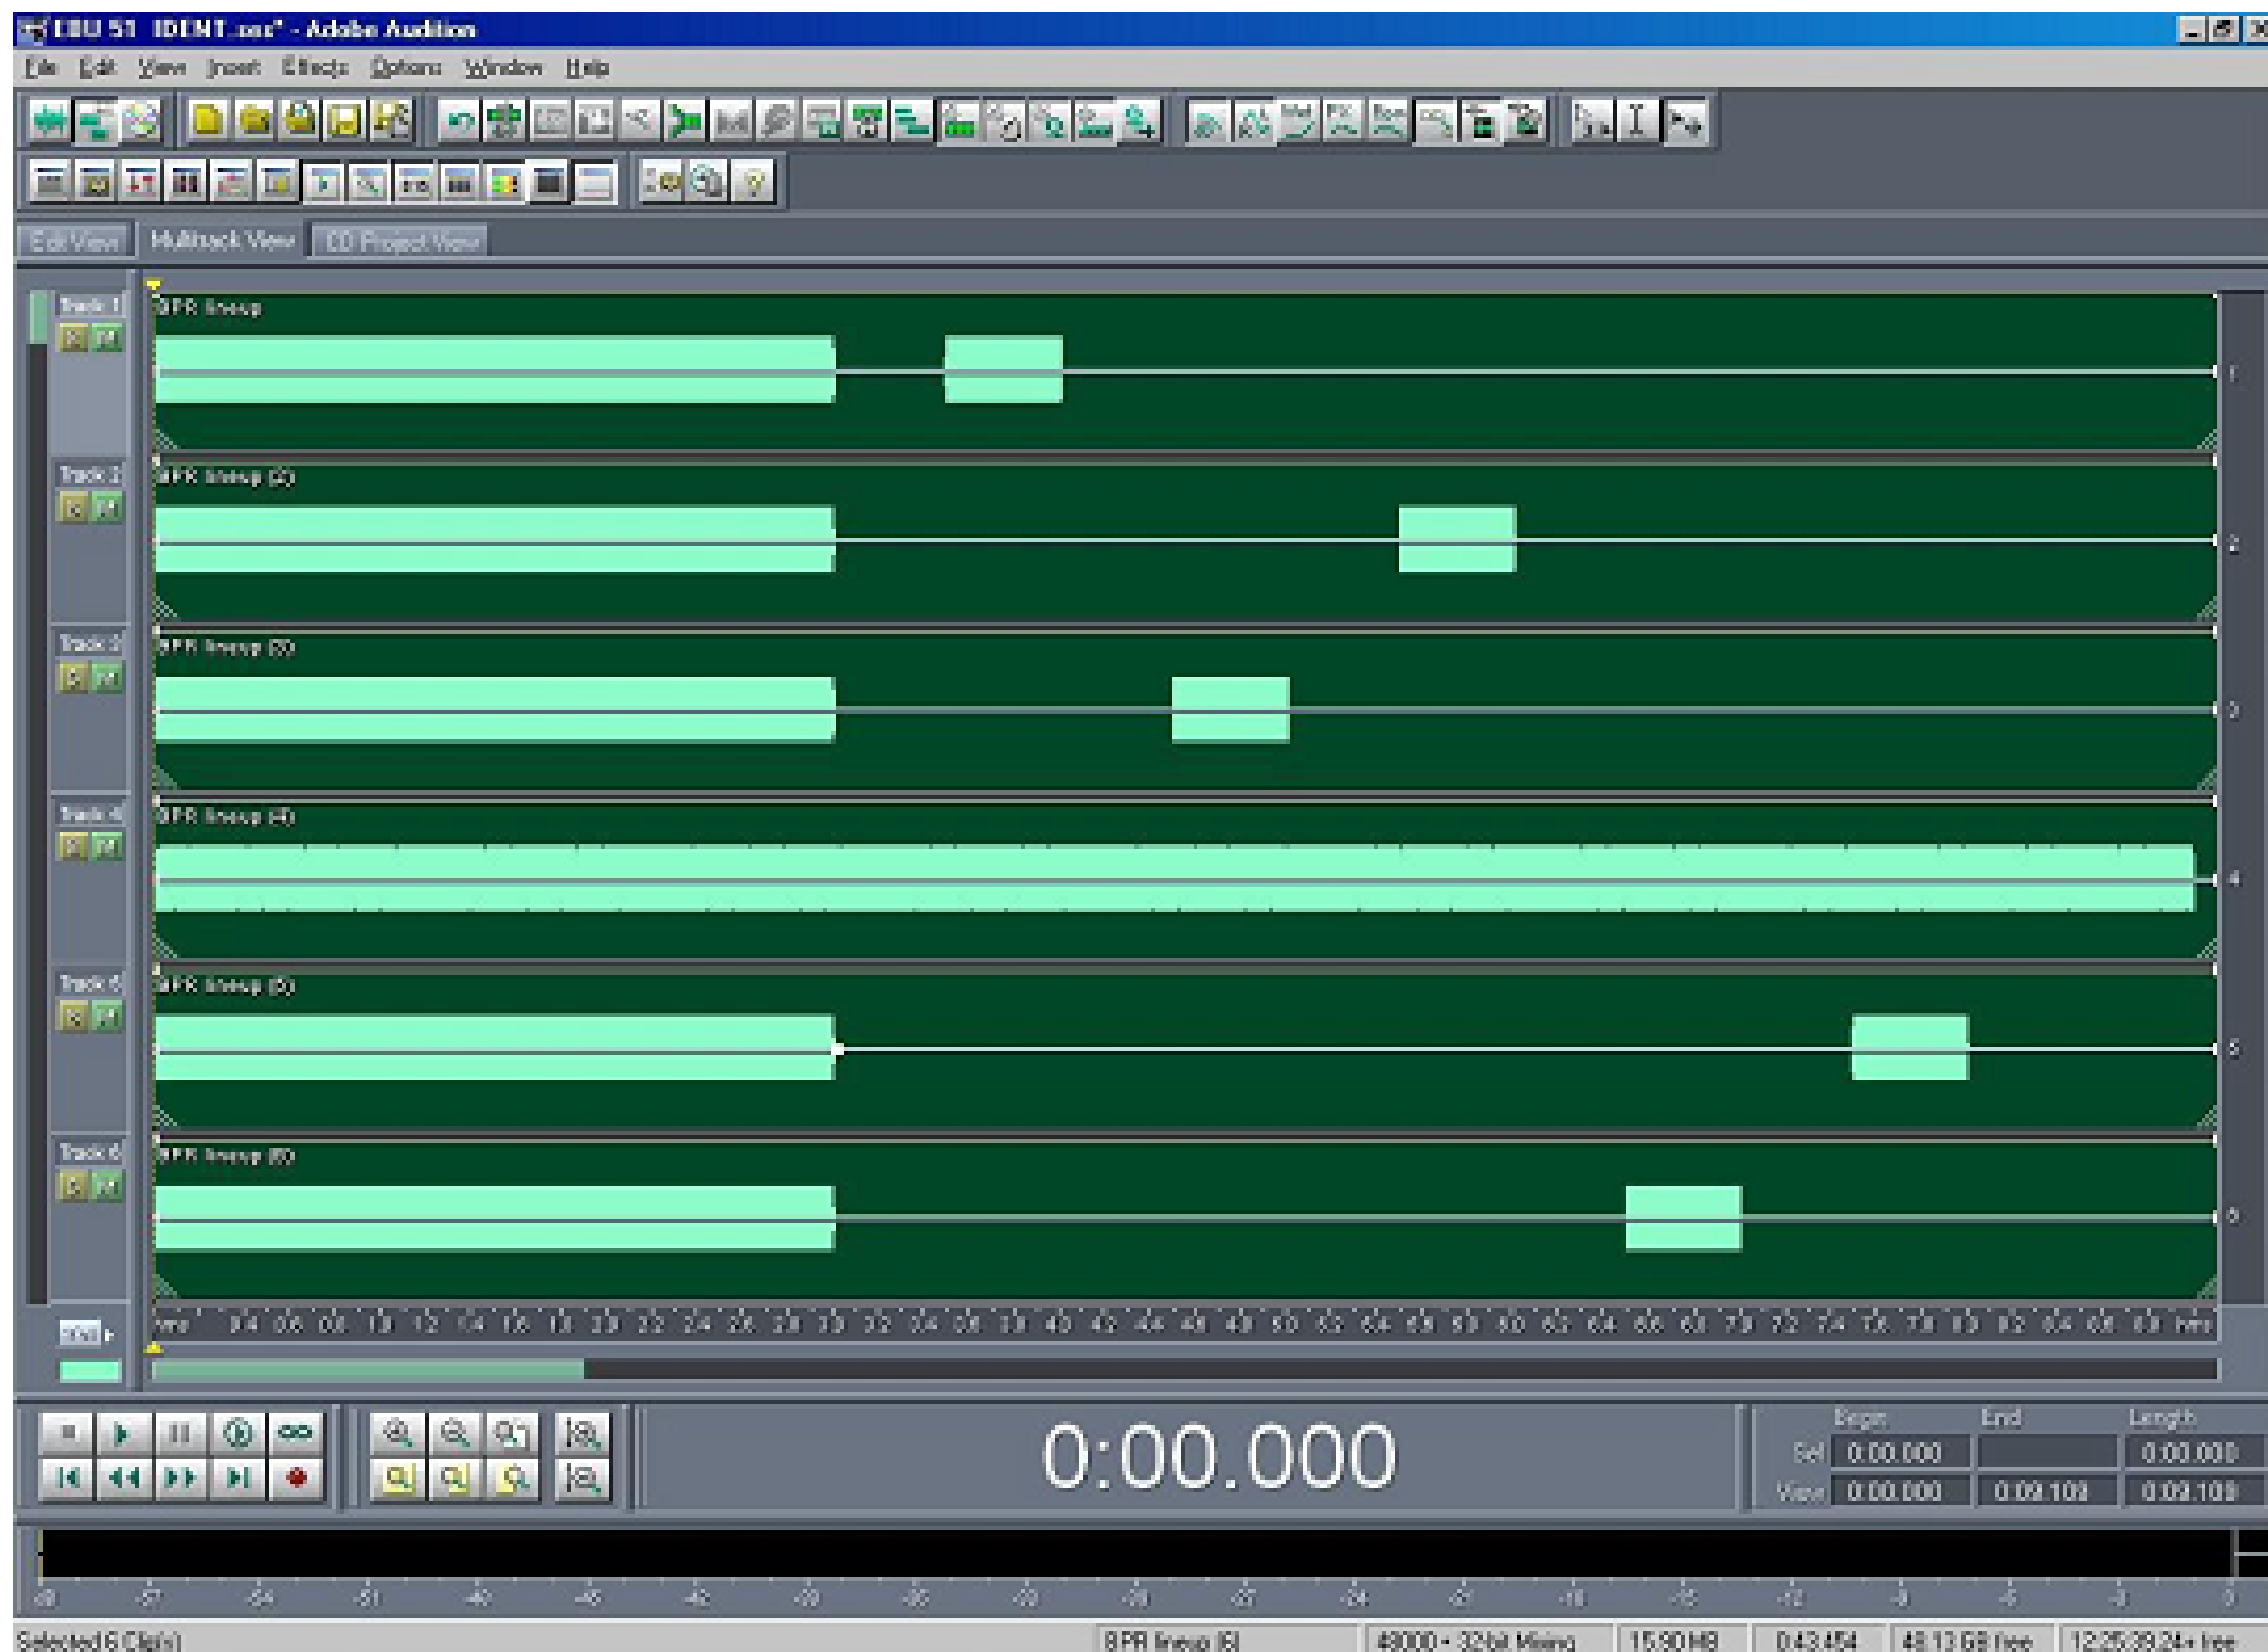

Figure 1: Adobe Audition screenshot:
EBU Tech 3304, in track-order: L, R, C, LFE, Ls, Rs [2] [3] [4]

1: Folddown

In the same way that adding in-phase left and right of stereo results in a 6dB level increase, so the issue of adding together (downmixing) up to six legs of a 5.1 signal needs careful consideration to avoid a similar, or potentially greater, resultant level increase with the stereo (and mono) folddowns.

The EBU Tech-3304 sequence was not considered to be suitable for Sky's requirements as it starts with 1kHz zero-level tone in-phase on the five mains legs simultaneously, along with 80Hz on the LFE channel.

[Incidentally, most 5.1-capable sound desks do a similar thing when tone-to-line is selected to a 5.1 output, so beware!]

Depending on the coefficients set in the folddown matrix, the resultant 'stereo' downmix could have the tones of the other four legs (C, LFE, Ls, Rs) added to the front L and R with little or no attenuation. This is clearly going to result in the stereo folddown being at an undesirably high level.

However, It was thought necessary to have an identical signal on all legs simultaneously at some point in the sequence, if only to provide a phase-check capability.

The BLITS ident achieves this with the third section of the sequence - a 2kHz tone on all legs, but at -6dBu (or -24dBfs).

[See Fig-3 below for the stereo folddown levels which result.]

2: Identing the individual channels

EBU Tech 3304 uses the same 1kHz tone to identify each of the legs. But steady single frequency tone is notoriously poor at providing directional clues to the ear. Secondly, and

arguably more importantly, it does not ident the legs in the order specified for broadcasting, but instead uses the older Film standard. [EBU Tech R48]

On the face of it this appears to be more useful when listening to the ident sequence on a 5.1 speaker system, as it cycles through the speakers sequentially in a clockwise direction. That's fine until you see it on a surround bargraph-type meter (e.g. a TFT display) where It jumps around confusingly rather than being sequentially left to right across the meter-legs

To solve these two problems, BLITS uses different tones for the various channels, and the order of tones in the sequence now matches that of the broadcast standard.

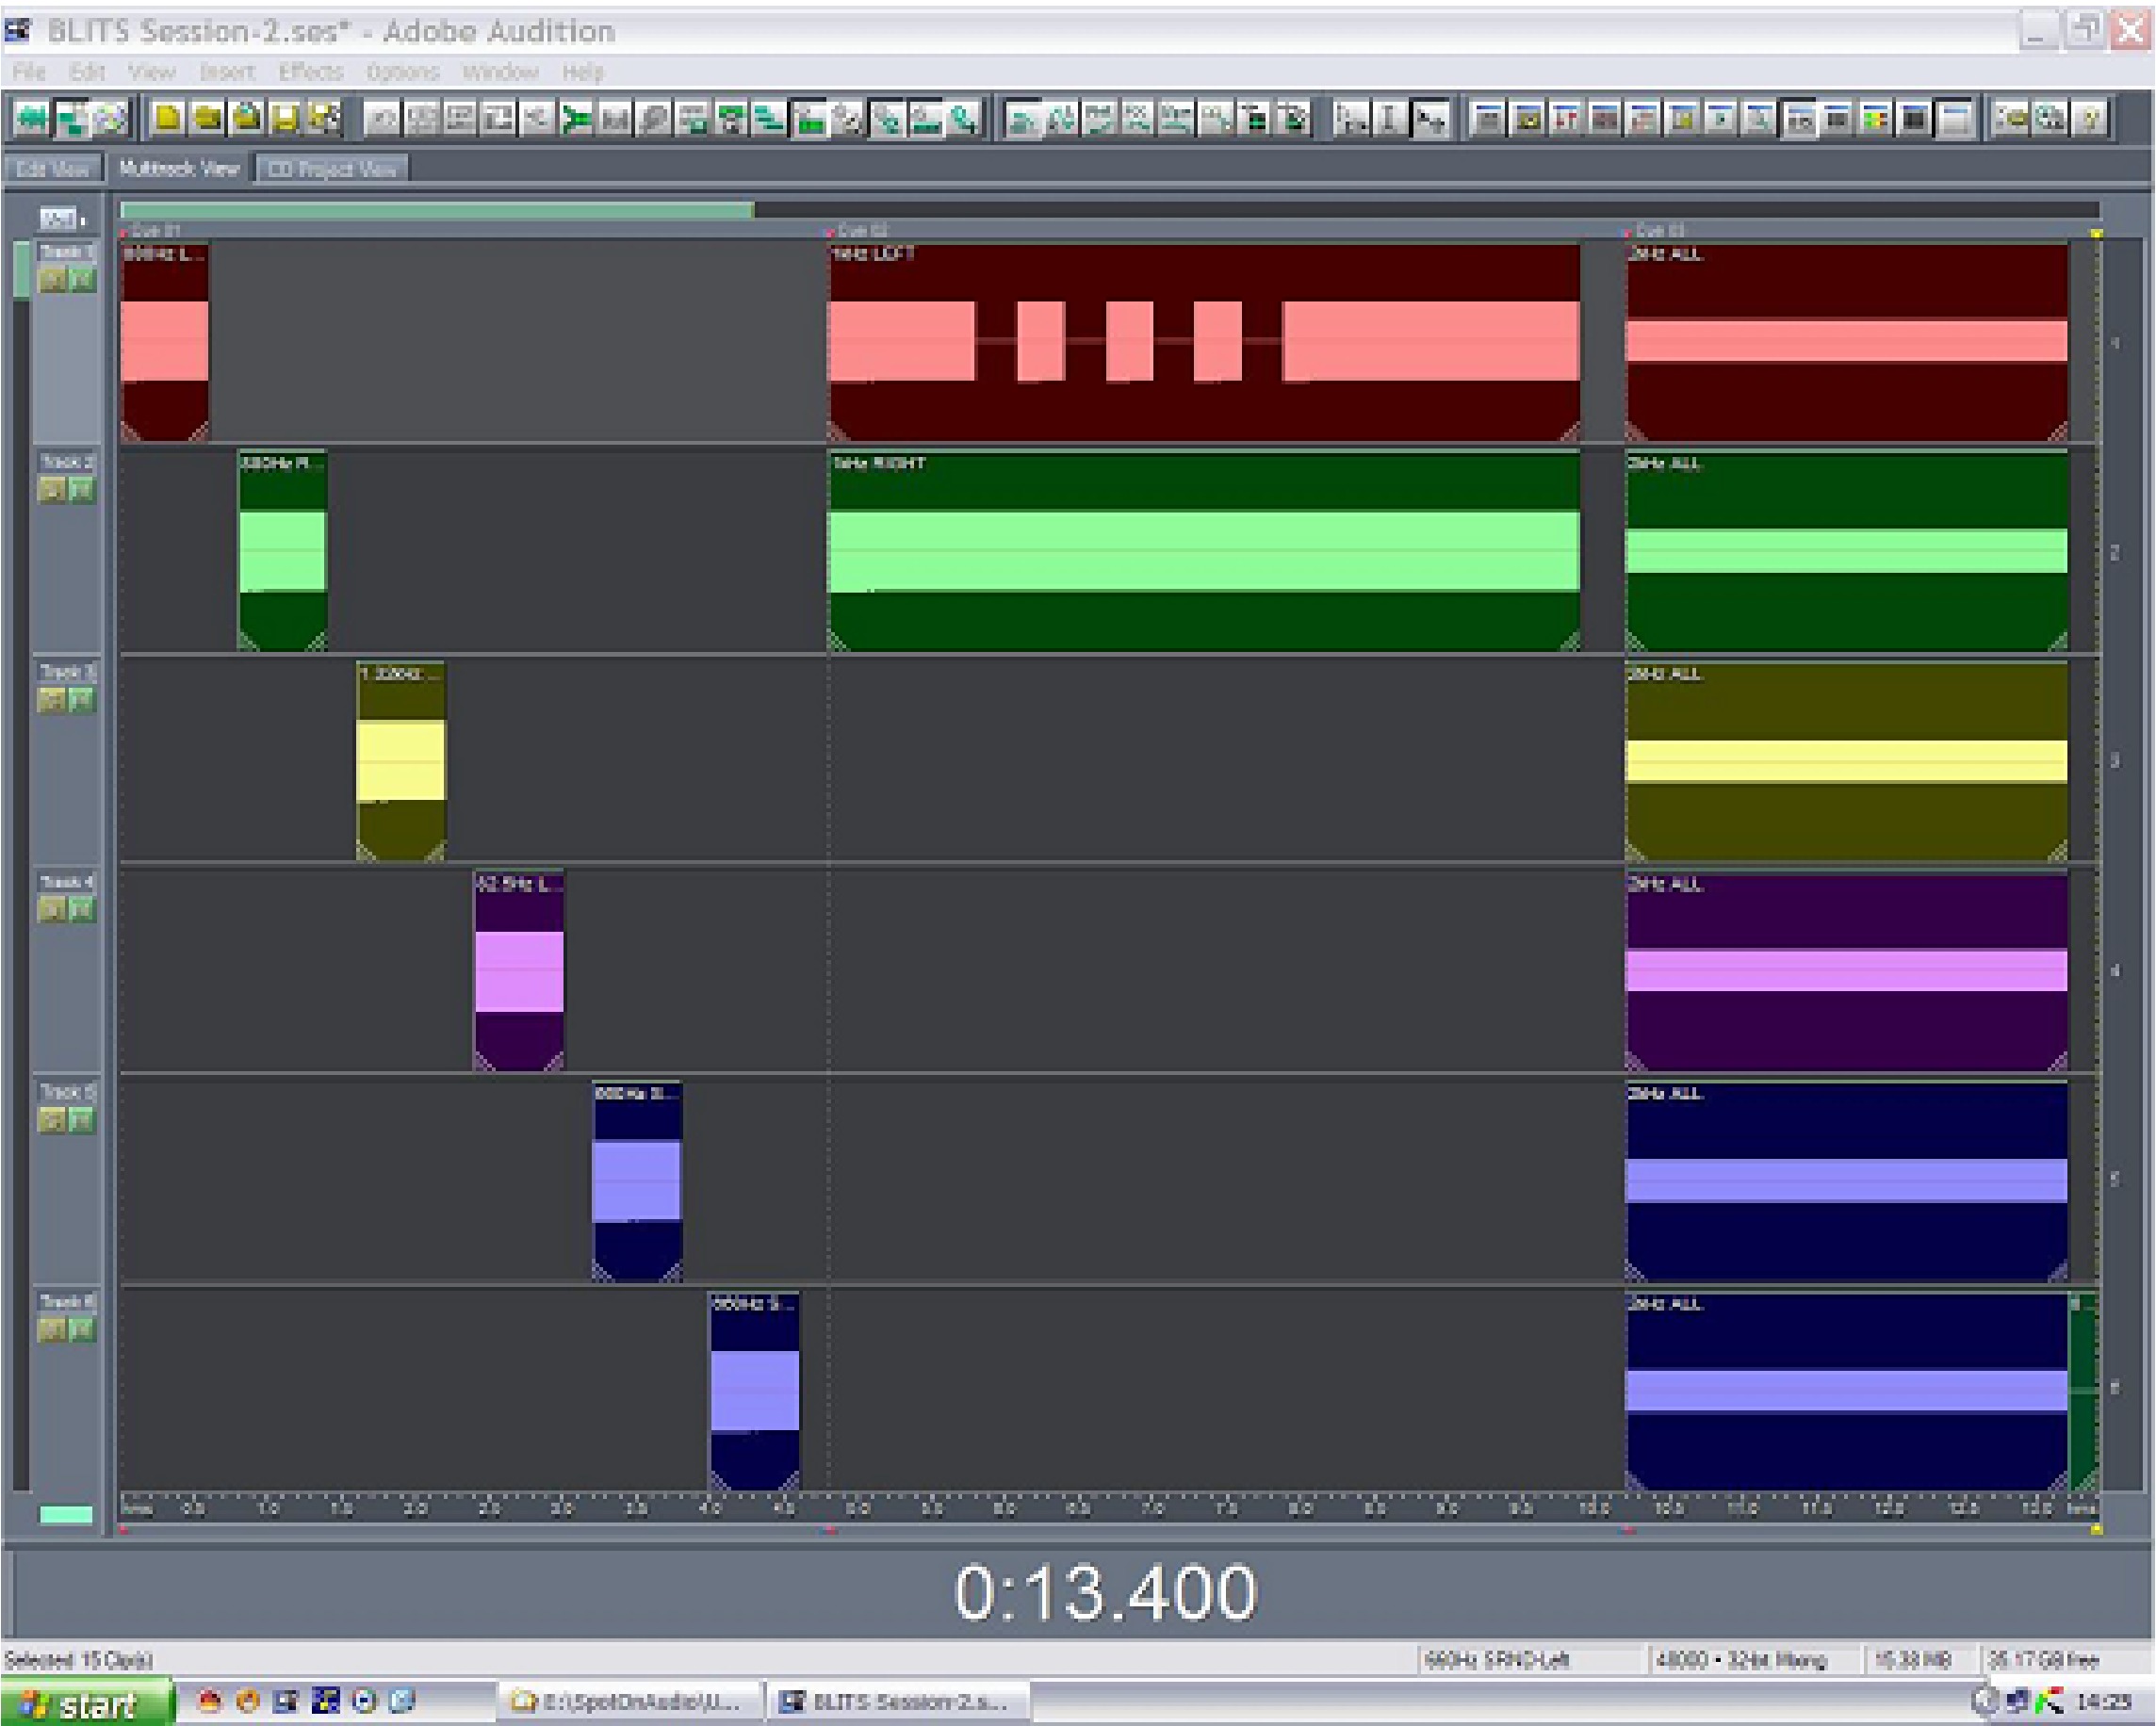

Figure 2: Adobe Audition screenshot:
The three sections of the BLITS ident, showing the sequence of components

Track order (top to bottom) is: L, R, C, LFE, Ls ,Rs

The frequencies used are based on the international musical standard of 440Hz (A), and the interval of a perfect fifth above it (E)

The actual frequencies are:

- | | |
|------------|--------------|
| L = 880Hz | R = 880Hz |
| C = 1320Hz | LFE = 82.5Hz |
| Ls = 660Hz | Rs = 660Hz |

Note that the sequence order also replicates the order of signals in the three 'stereo' pairs which make up the 5.1 signal in the digital broadcast world.[3] [4]

3: Making it easy in stereo too

Let's not forget that, even if you have the time/staff/facilities/necessity to create a stereo mix which is completely separate from the 5.1 (not likely to be the case with many live transmissions), HD viewers will still receive a metadata-controlled downmix of the 5.1 audio

by virtue of the set-top box's stereo output being a fold-down mix. This is currently the case on all Sky's HD platforms whenever an HD channel with 5.1 Dolby Digital sound is viewed with only stereo reproduction, such as when using a TV's stereo speakers fed via the STB's analogue SCART or digital HDMI output. So, even if a separate stereo mix is made by a broadcaster, it will not be heard by HD viewers listening in stereo.

Furthermore, on the Sky Sports' platform a simultaneous Lt/Rt fold-down, created by a Dolby DP563 prologic encoder, is used to deliver the stereo audio for the equivalent SD channel.

Figure 3: Adobe Audition edit screen - the vertical scale has been expanded for clarity
A 'real-world' fold-down of 5.1 BLITS sequence to Lt/Rt stereo (using a Dolby DP563 ProLogic encoder).

The downmix level-parameters can be deduced from looking at the levels of the six individual legs of the sequence, seen in the first section of the screen-shot, on the left.

In this case the current Sky Sports downmix settings can be deduced, which are;

Centre	-3dB
LFE	0dB
Ls & Rs	-6dB

This is equally visible on a stereo PPM when viewing the downmix 'on-the-fly'.

To aid in gauging relative levels in figure 3, the middle 'stereo ident' section is at 0dBu, since it is not changed by the downmix process.

It can be seen from this that the third, 'phase-check', section also folds down to around zero-level - which is just what we wanted!

The fold-down level information is also programmed into the Dolby-E metadata, and thence in the Dolby Digital metadata. It is the latter which the set-top box uses to create its stereo output for HD viewers without surround systems.

The purpose of the middle, front L/R only section, is to provide a 'familiar' signal to

operators - particularly transmission operators - with no experience of surround sound. They will only get to see the stereo downmix illustrated in figure 3. The first and last sections may mean little to them, but the middle '1kHz tone on L & R' is intended to strike a familiar chord (!).

The four breaks were needed because this was the minimum number which would differentiate a mono BLITS downmix from a mono EBU tone or GLITS tone downmix. Mono EBU (R49) produces a single level-dip, and mono GLITS produces three level-dips, so BLITS produces four. It also acts as another flag to the operator that the mix originated in 5.1.

In Use

The almost daily use of the BLITS Ident in Sky Sports HD/5.1 transmissions has proved to be a great success, and its usability and diagnostic performance have exceeded expectations. It is regularly used for:

- OB Line-up with MCR and studios
- OB and Studio Line-up with Transmission suites
- OB and Studio Line-up with VTR and EVS machines
- Studio line-up of reverse circuits with MCR and OB units

Oh, and a slight variant of it was also used by Robert Edwards and Ian Rosam for all 5.1 surround lineups during the 2006 World Cup in Germany.

Conclusions

BLITS is in almost daily use on over a dozen OB units in the UK to date, as well as in Sky's HD studios and MCR.

A 1RU commercially manufactured generator is available from CTP systems in Kent^[5]

Around twenty of these units are currently in use in the UK.

In addition to analogue and digital BLITS outputs, the CTP unit also provides a standard EBU R-49 stereo ident on front L/R as a switchable alternative output (by front panel switches and/or GPI inputs, with tallies).

A simultaneous, permanent EBU stereo output is also provided separately.

BLITS is also available as a 5.1 multichannel wav file from the author:
martin.black@bskyb.com *[File size is about 2MB zipped]*.

A 5.1 sound card is required to reproduce it correctly. A stereo-only card will generally only play back the front left and right channels.

Its copyright status is similar to shareware - it's licence-free to use, provided it's kept in its original form.

MultiChannel Sound

In addition to 2 channel Stereo, SpotOn can handle multi-channel WAV files containing 1,2,4,6 or 8 channels of audio, these files are referred to as interleaved WAV files.

Larger configurations are used in Digital Cinemas up to 22.2 (24 loudspeakers) for interest the layout is: -

Upper layer: Nine speakers above ear level

- | | |
|------------------|-----------------|
| Top Front Centre | Top Back Centre |
| Top Front Left | Top Front Right |
| Top Side Left | Top Side Right |
| Top Back Left | Top Back Right |
| Top Centre | |

Middle layer: Ten speakers at ear level

- | | |
|----------------------|-----------------------|
| Front Centre | Back Centre |
| Front Left of Centre | Front Right of Centre |
| Front Left | Front Right |
| Side Left | Side Right |
| Back left | Back Right |

Lower layer: Five speakers below ear level

Left Sub Woofer Right Sub Woofer

Bottom Front Left Bottom Front Right

Bottom Front Centre

Sound Card SetUp

SpotOn uses Microsoft DirectX to interface with the soundcards, for this to work correctly the soundcard must have a WDM driver, if in doubt check the manufacturers specification for compatibility with 'DirectX', 'DirectSound' or 'WDM'.

If in the Admin|Output Assign menu there are entries with references to 'WAVE' or 'Emulated' then these output will most likely not perform correctly.

Audio Science ASI5041/2/4

ASI 5041 - 4 stereo inputs and 4 stereo outputs, AES/EBU digital only.

ASI 5042 - 4 stereo inputs and 4 stereo outputs, balanced analog only.

ASI 5044 - 4 stereo inputs and 4 stereo outputs, both balanced analog and AES/EBU digital.

The Audio Science sound card model ASI5042/4 is an 8 output card and can be configured as: -

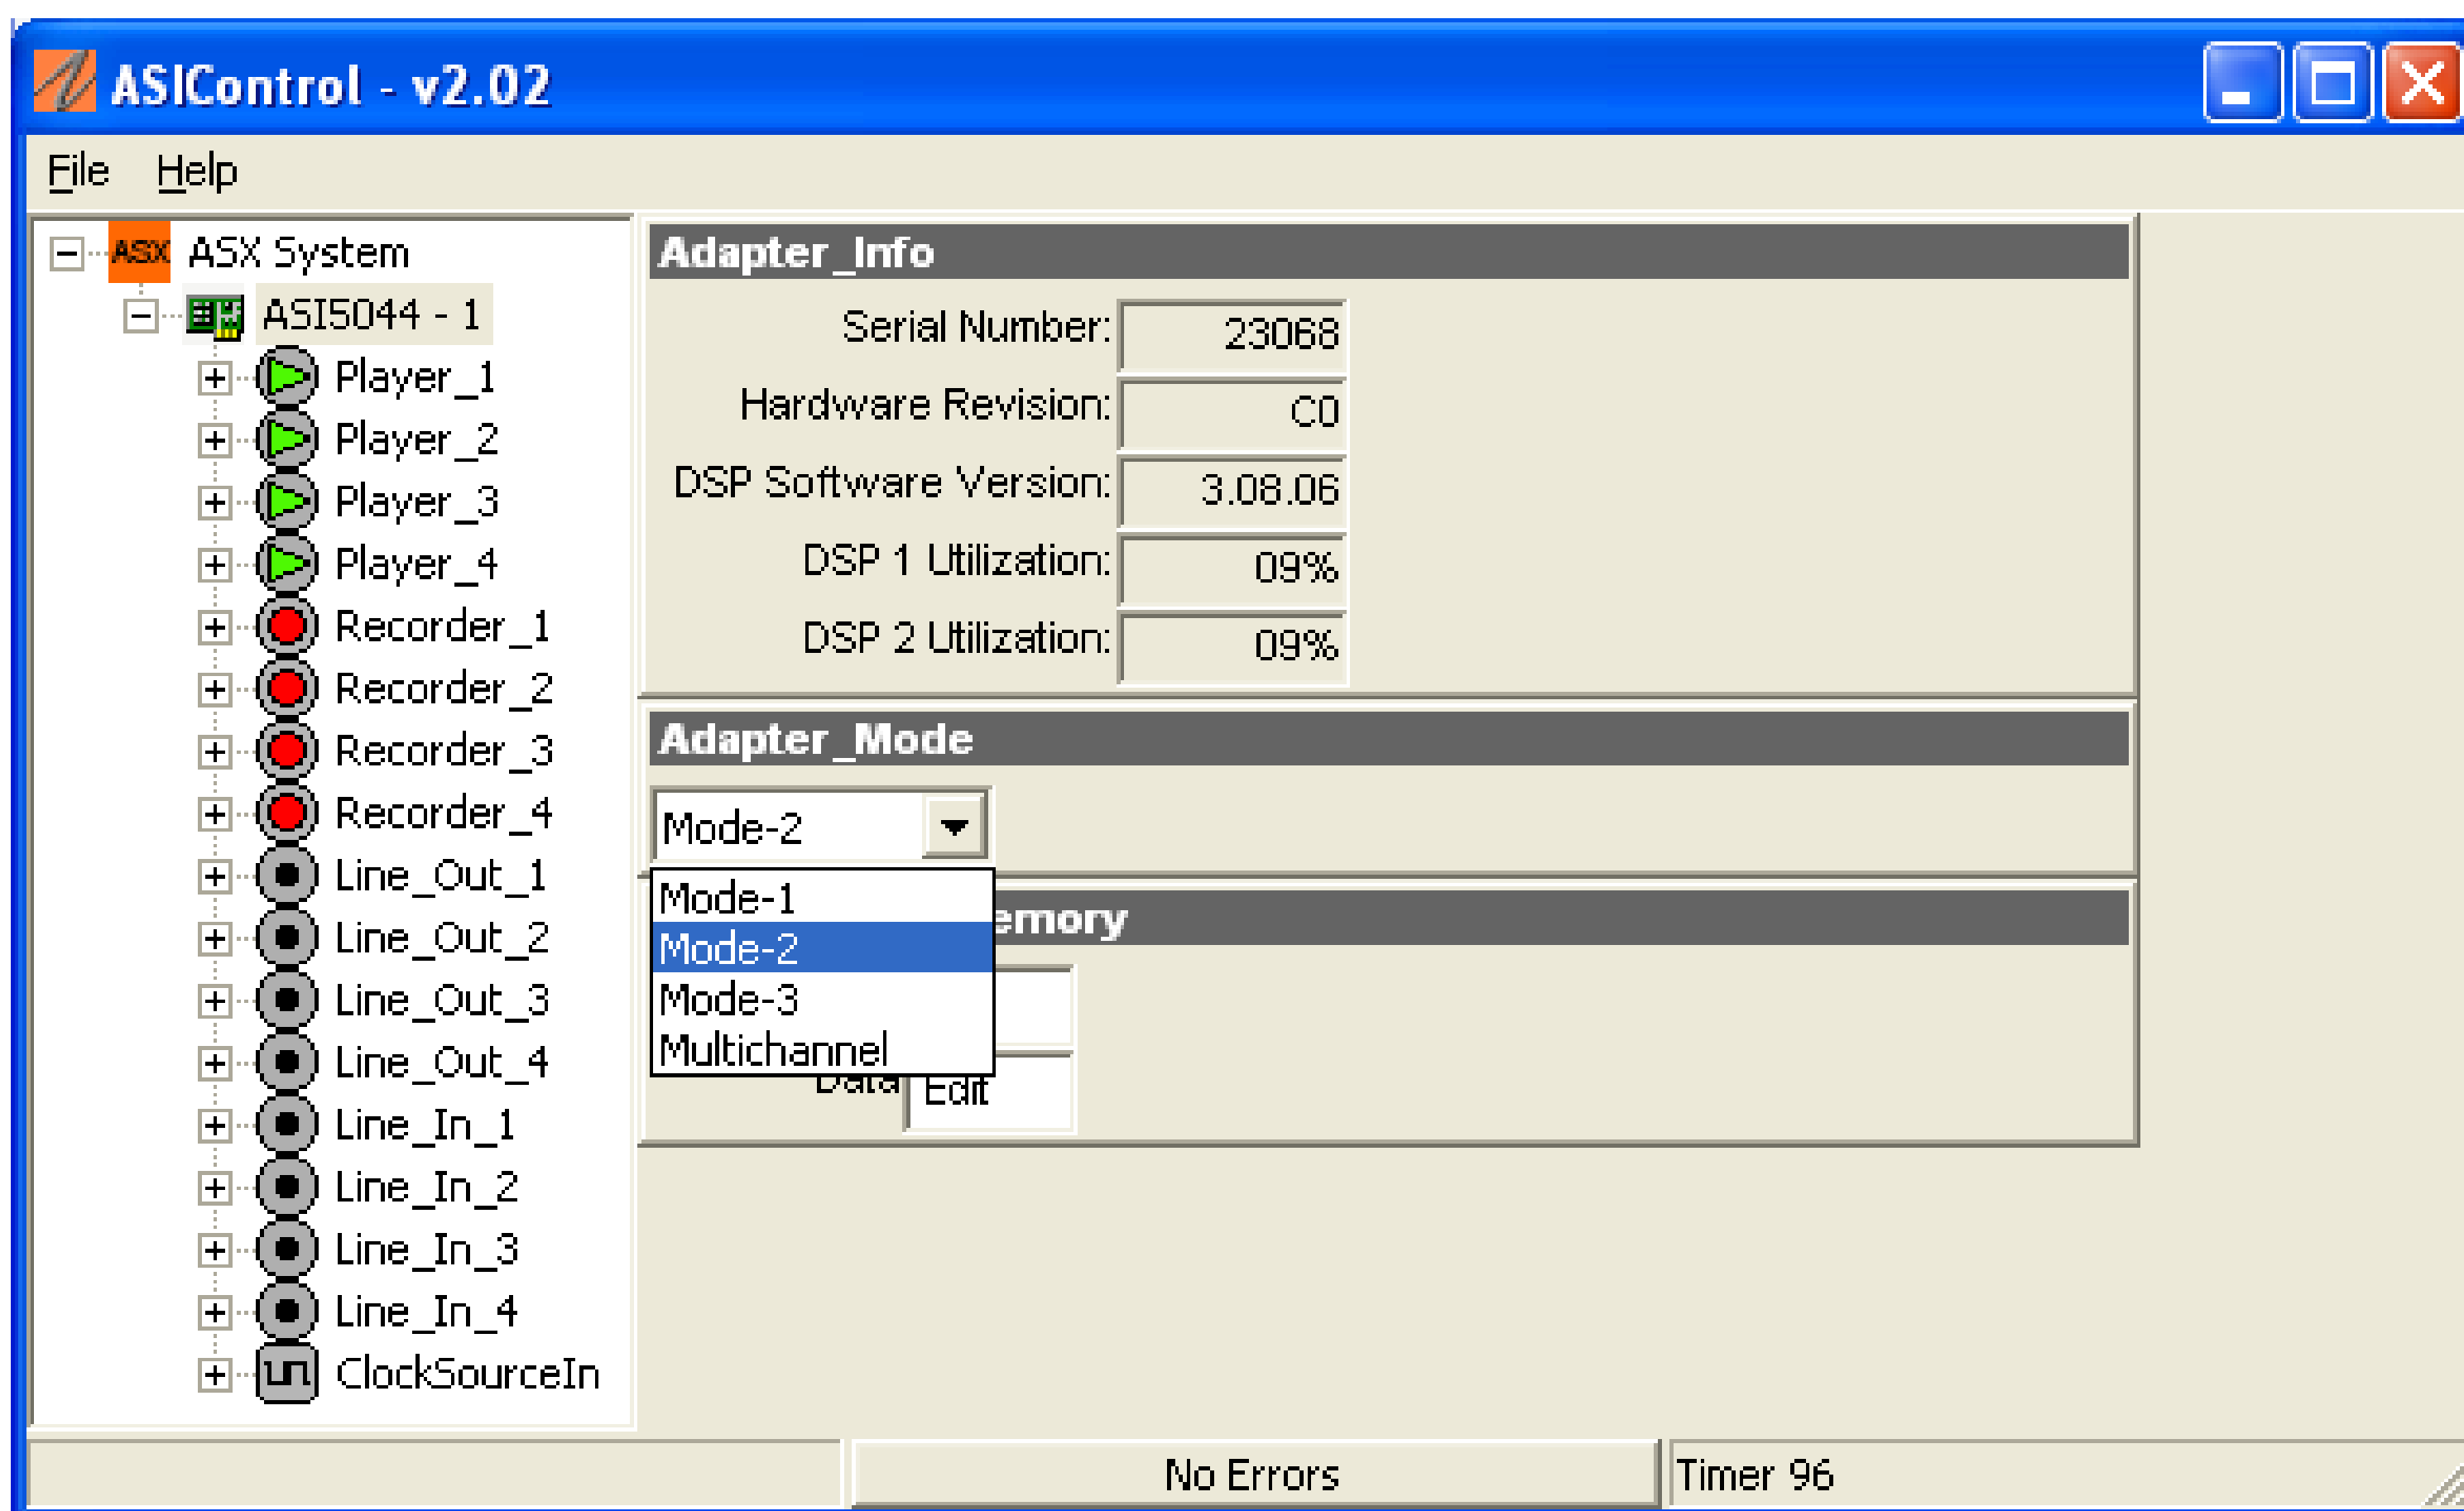

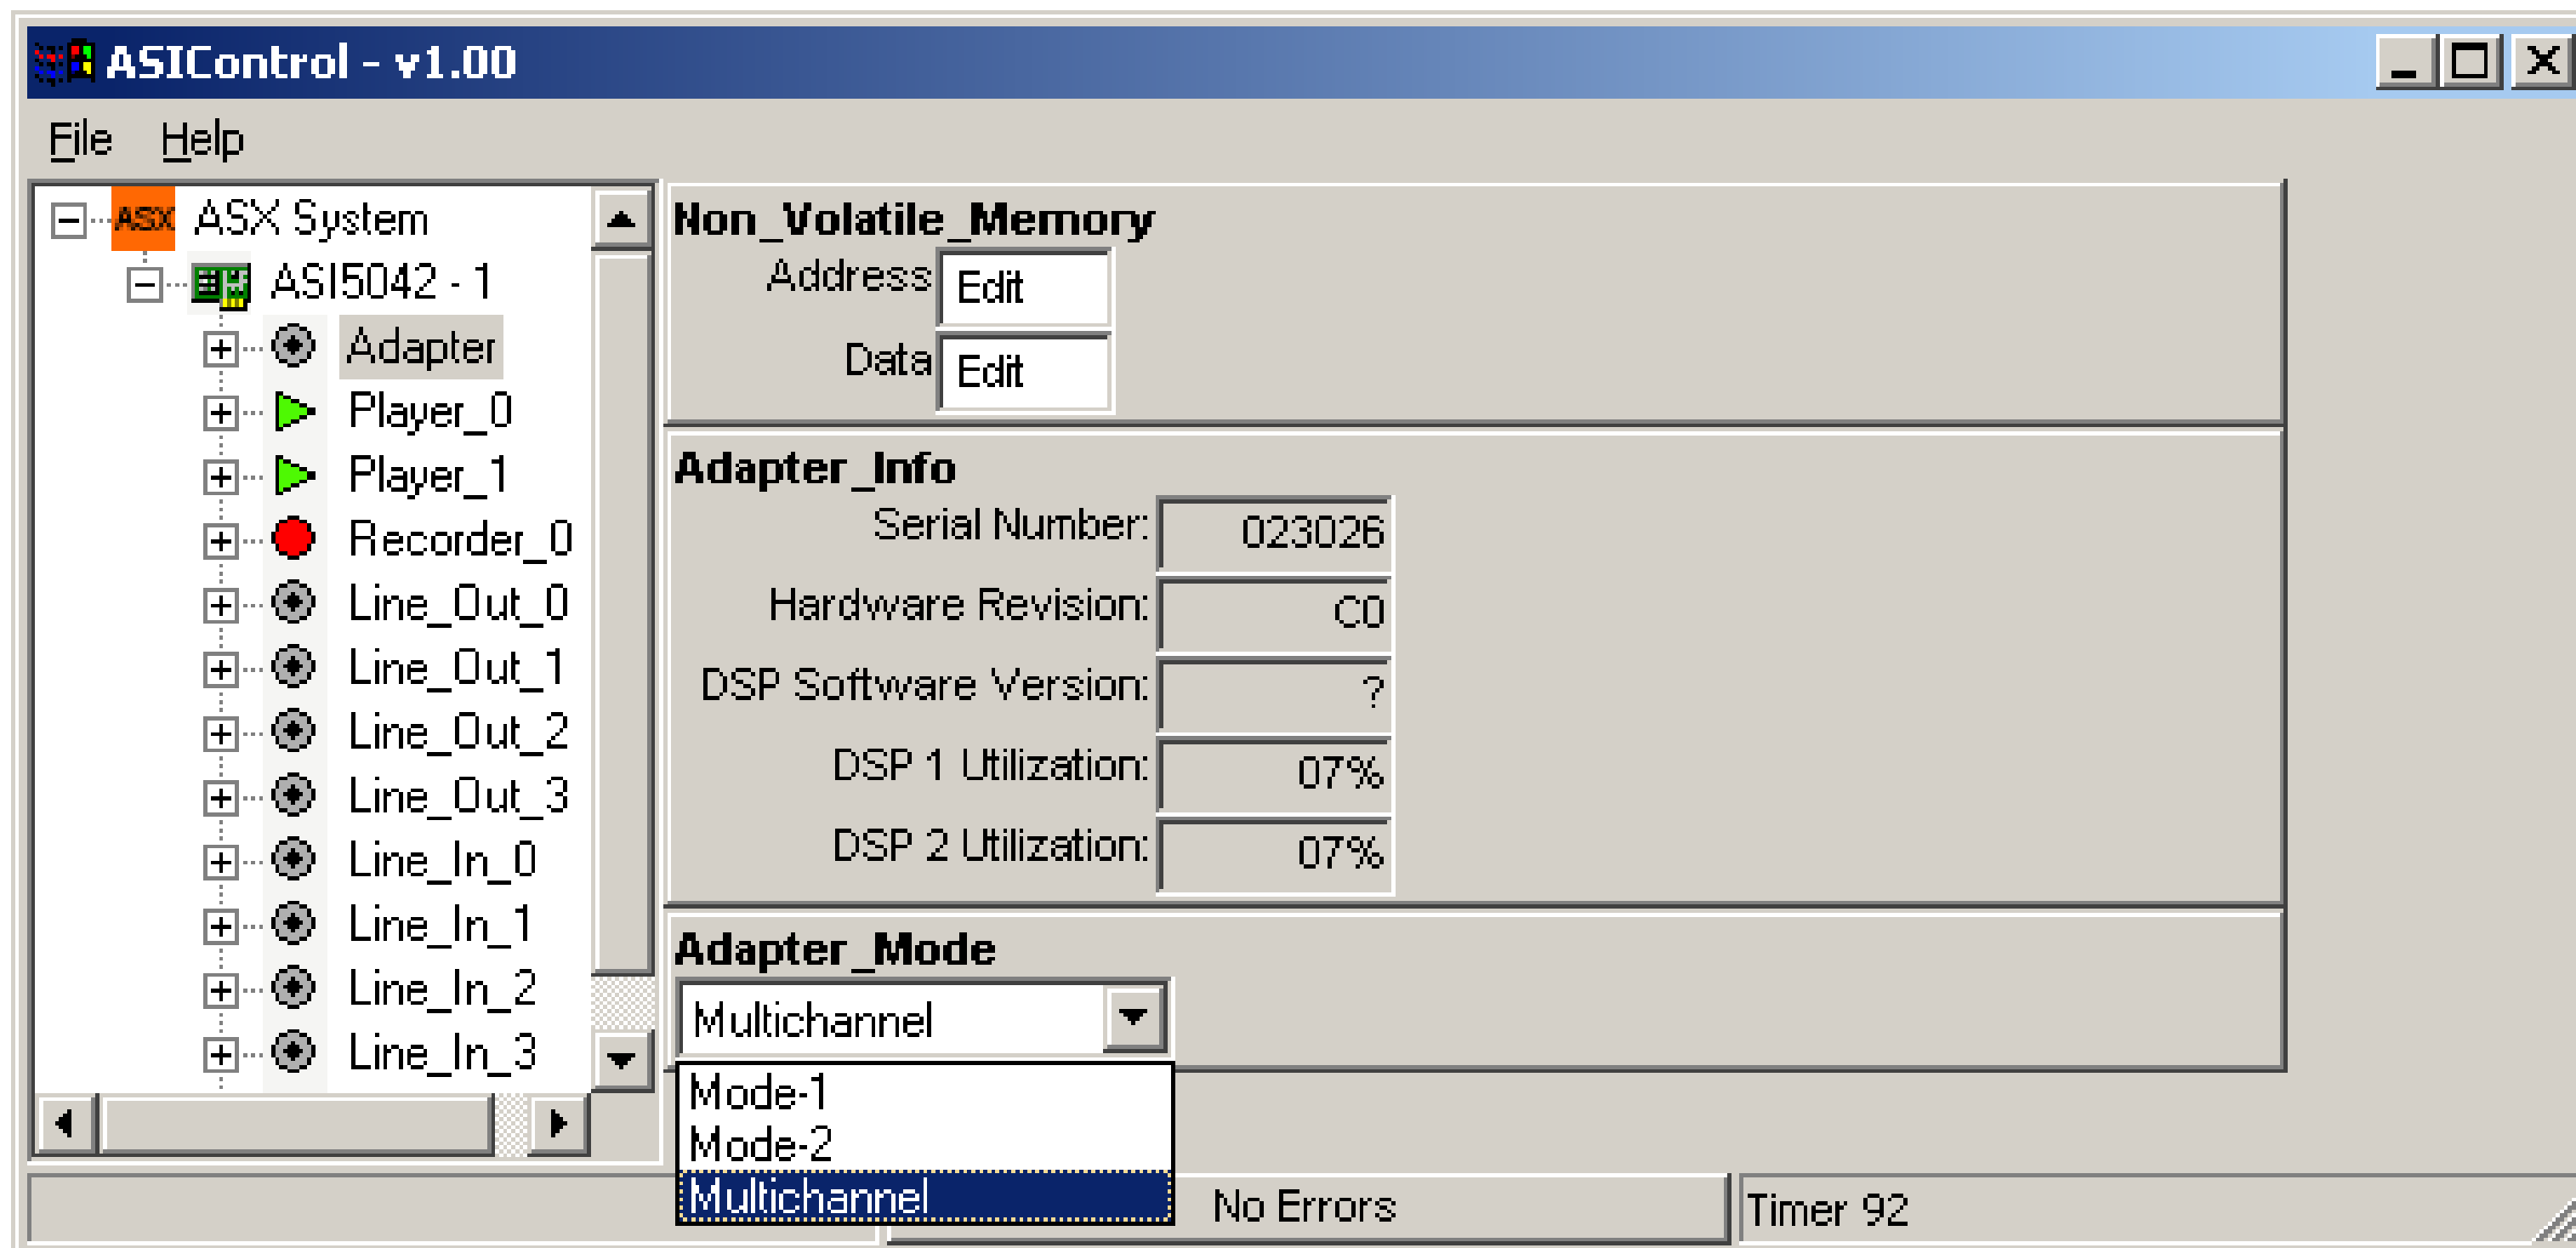

4 x 2 channel o/p/s (Mode2) or 1 x 8 channel o/p (MultiChannel)

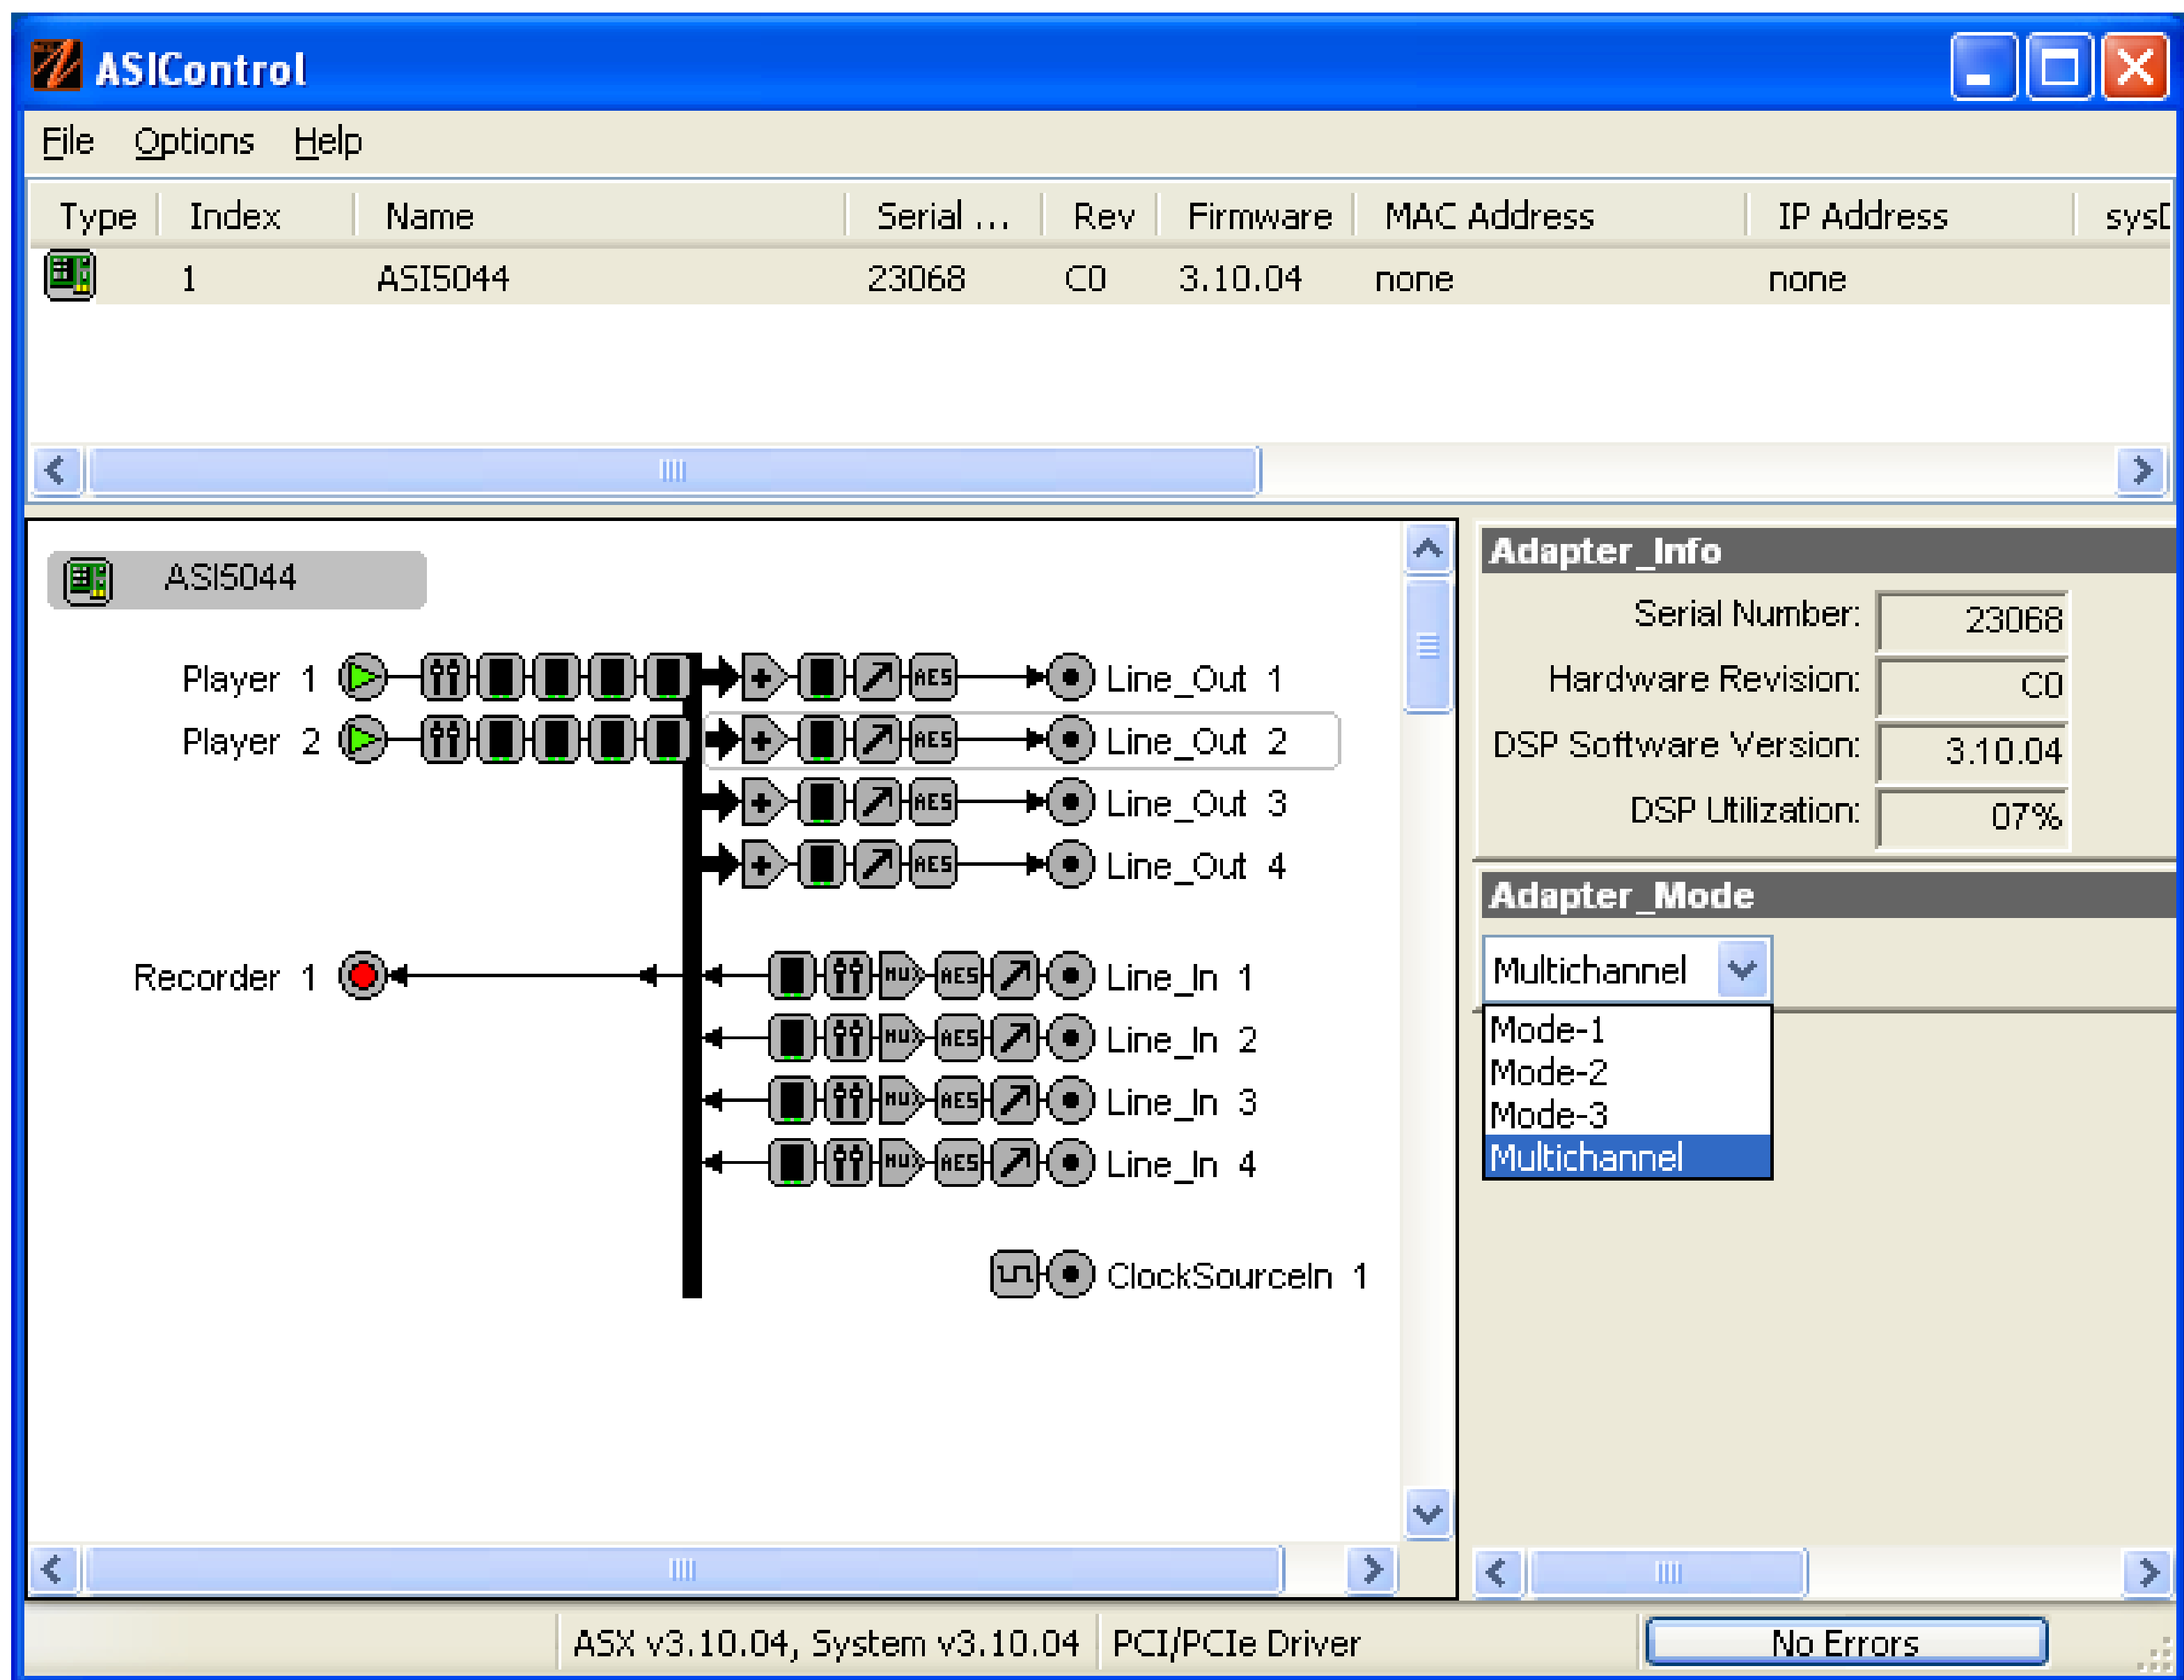

The selection is made using the Audio Science control utility, the computer must be rebooted after a change to reconfigure the sound card.

Multiple ASI5042 sound cards can be fitted to a PC, they are identified using header links on the sound card boards and will appear in the control utility window designated ASI5042-1, ASI5042-2....

The ASI5044 has AES digital and analogue inputs along with AES digital and analogue outputs, note that other than the 'Level' control the 'Volume' sliders have no effect on the AES inputs and outputs.

Highlight the appropriate adaptor and set the adaptor mode as shown below for either MultiChannel (MultiChannel) or Stereo (Mode-2)

The card presents itself to SpotOn as a number of entries in the Output Devices list: -

Here there are two cards in the system: -

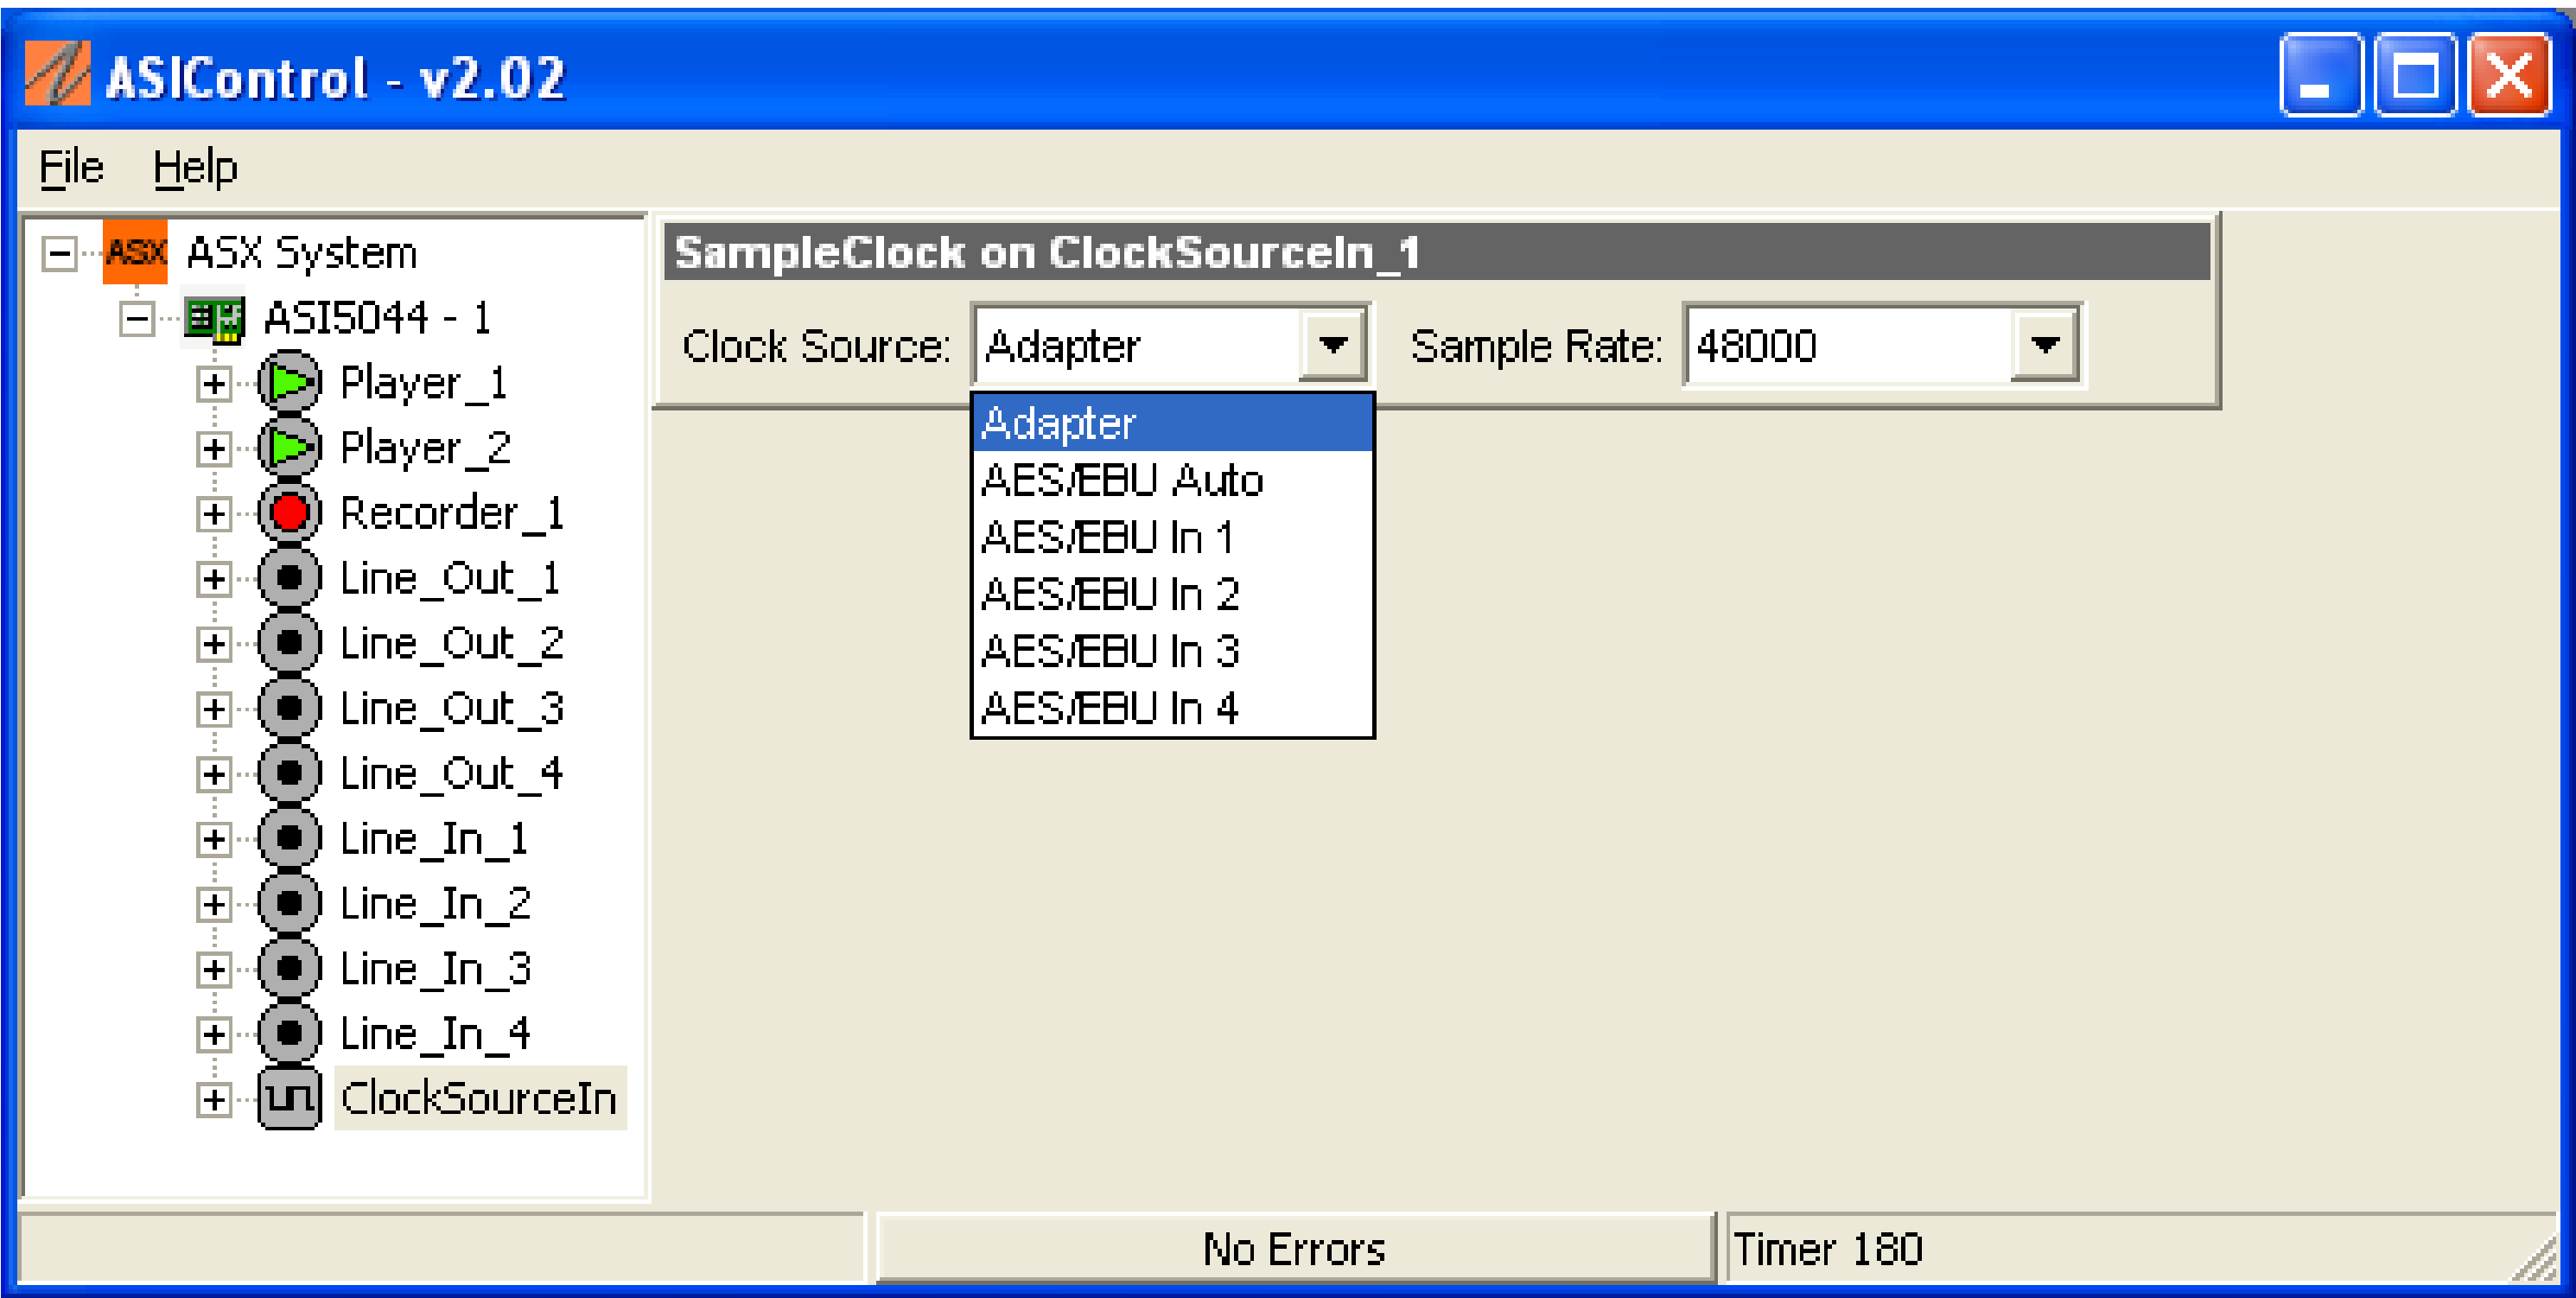

Card 1 (4 x 2 channel) implements 4 stereo devices D, E, F, G

Card 2 (1 x 8 channel) implements 2 x 8 channel devices H, I

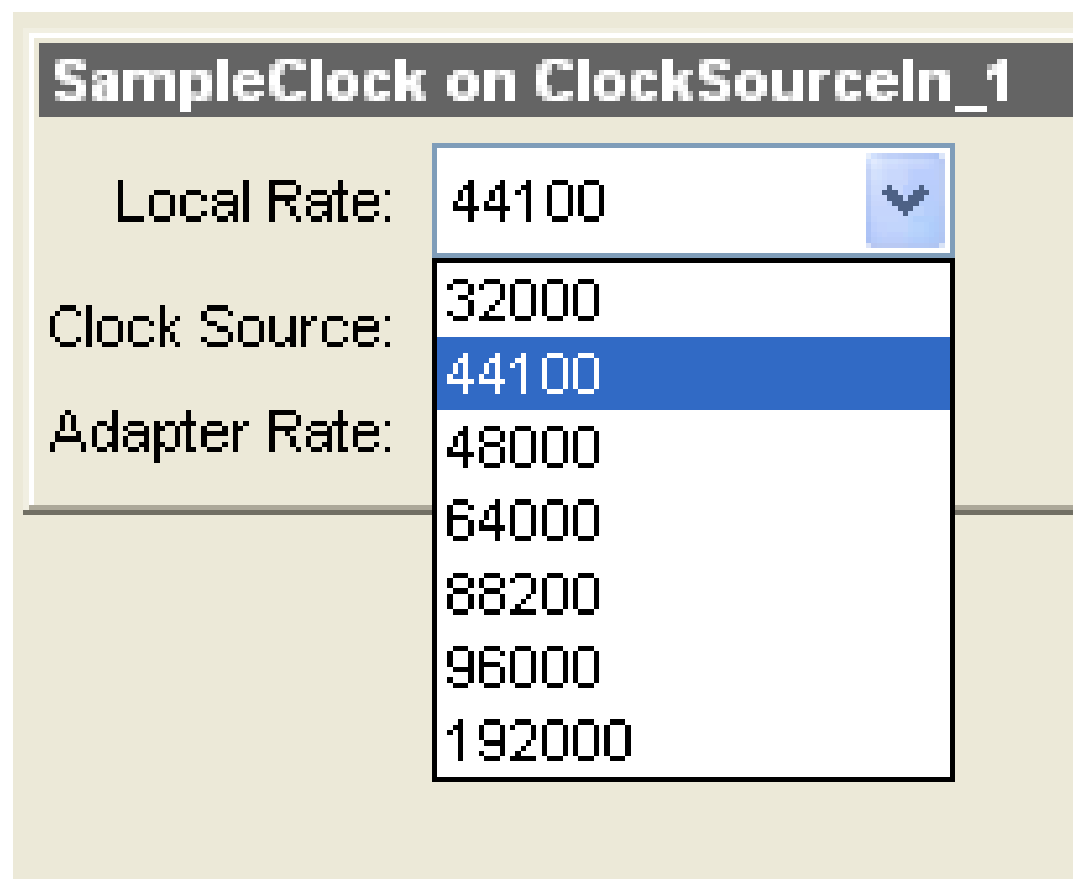

Both devices H and I can be used to access the multi-channel output as the two signals are

mixed together by the sound card.

The reference clock source can be derived internally (Adaptor or Local), from a selected AES input (AES/EBU In x) or from the first available input with a valid AES signal (AES/EBU Auto).

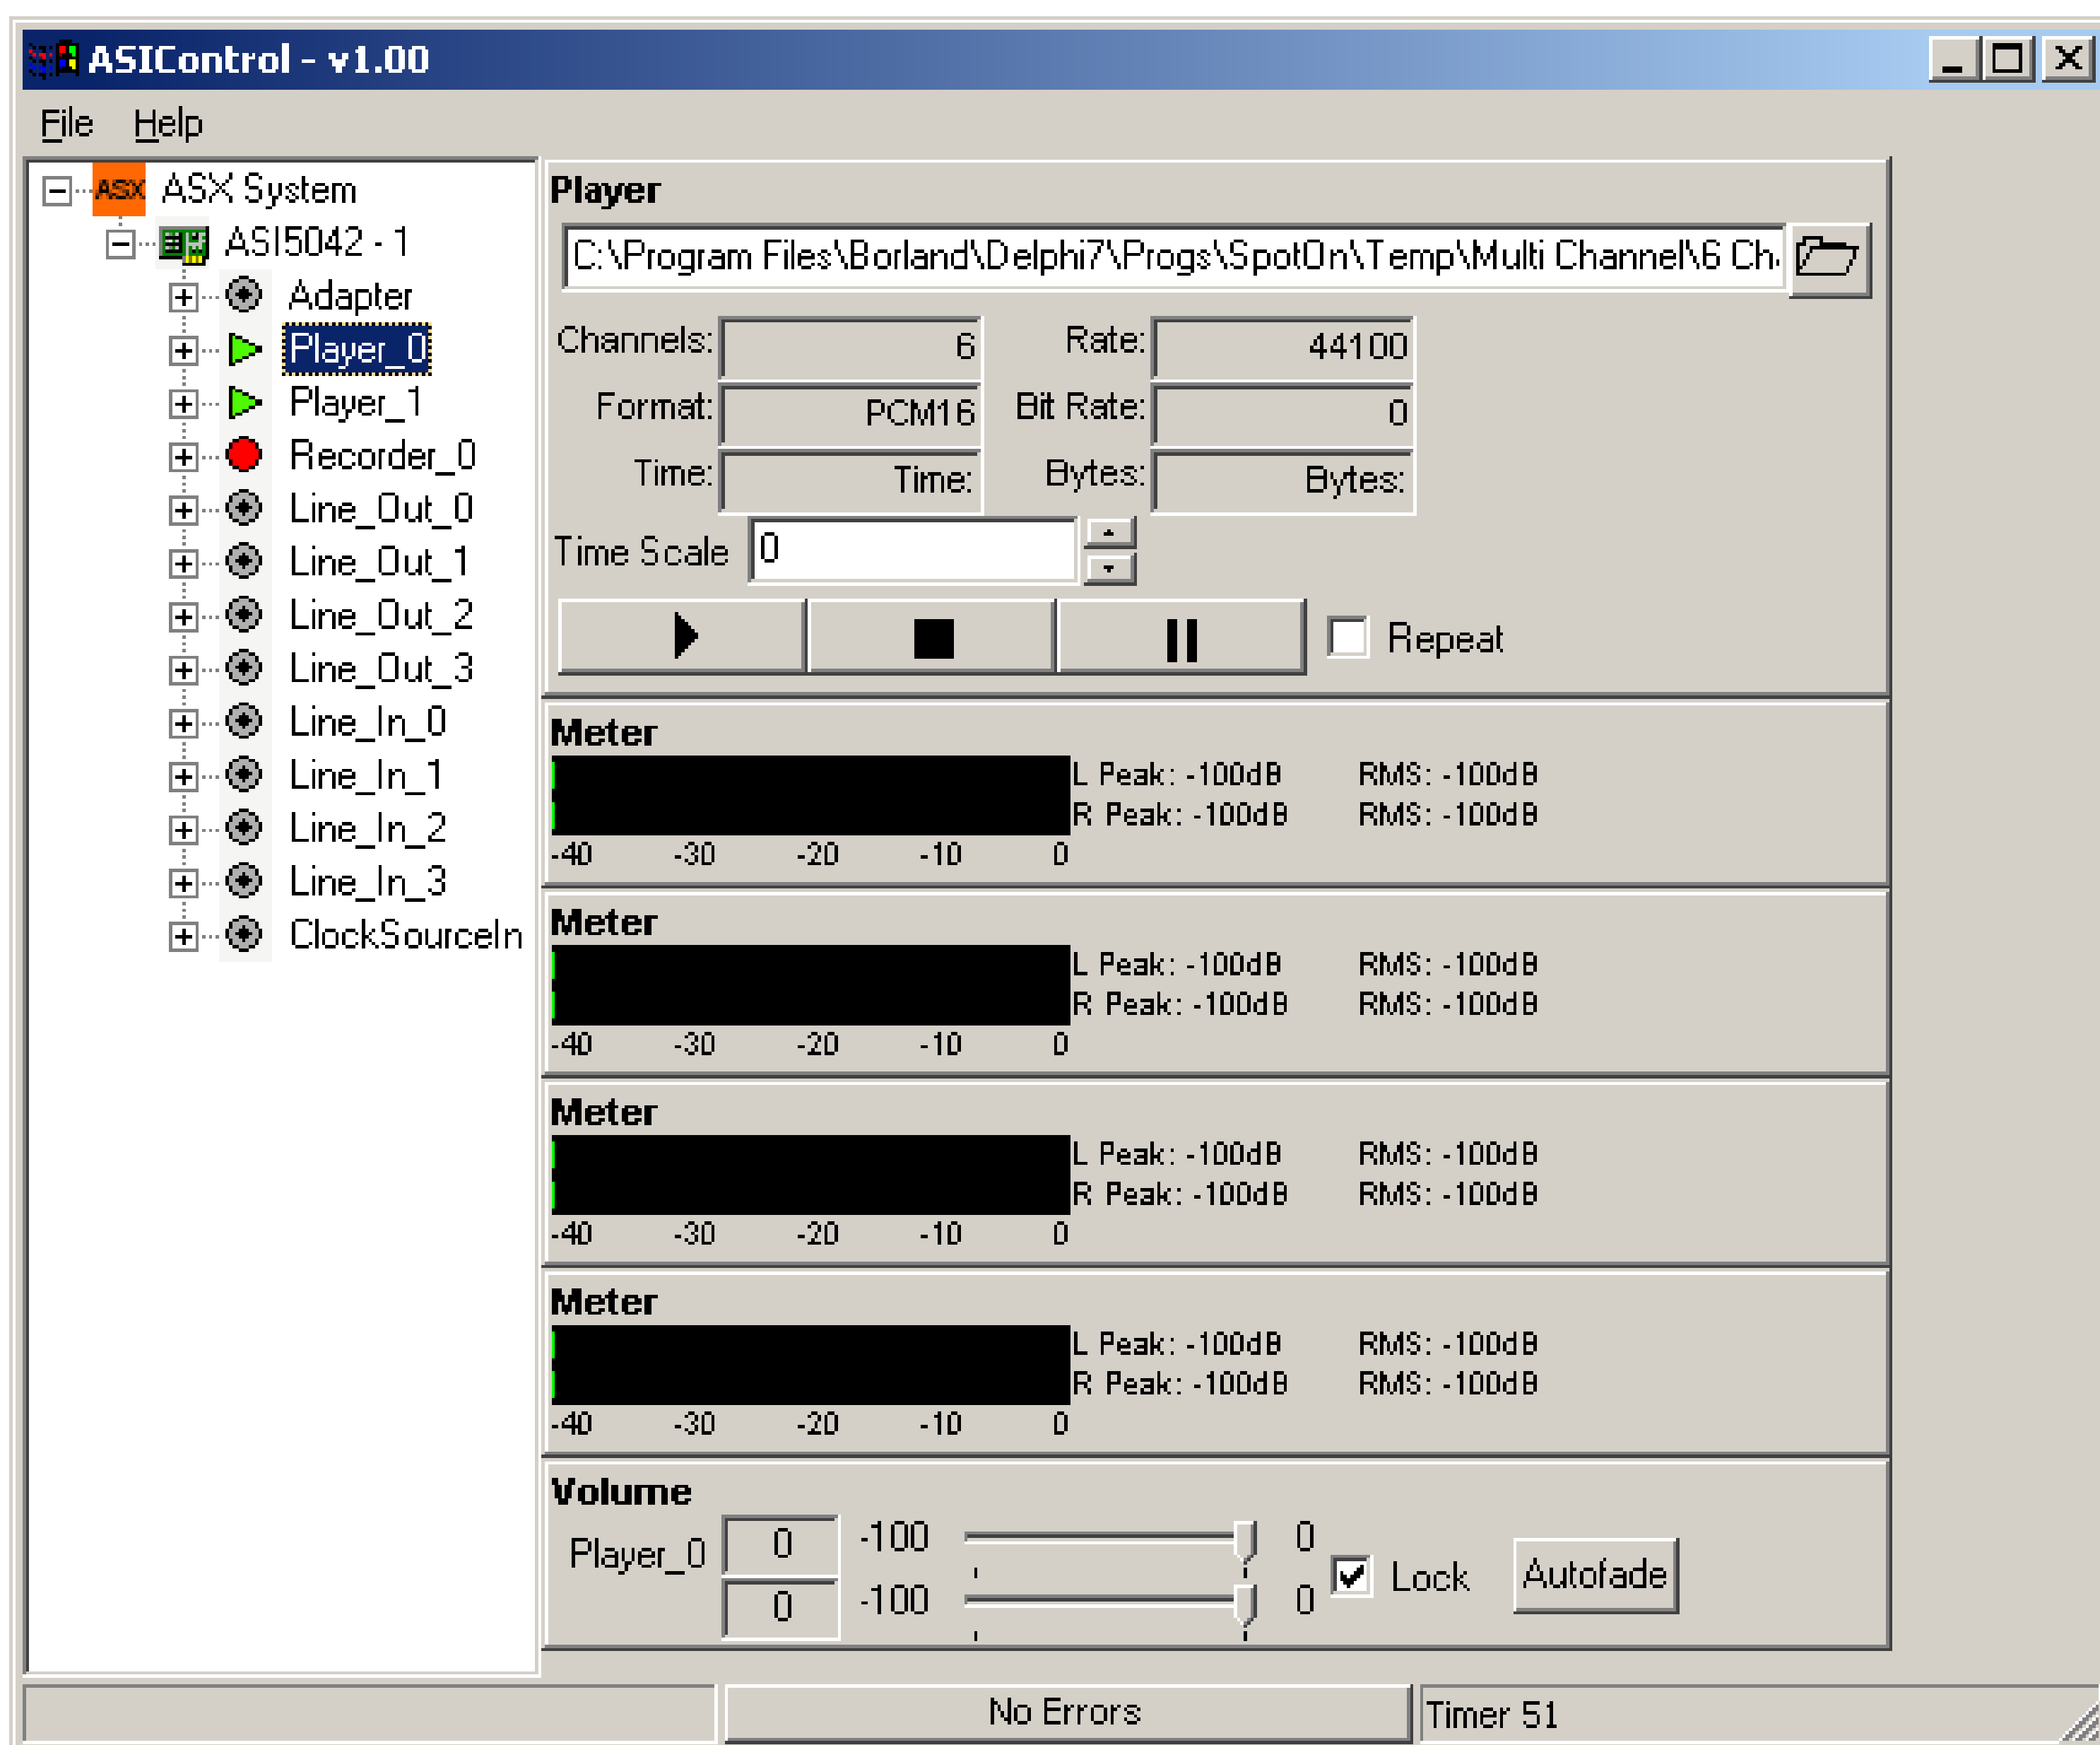

The local clock rate can be set to any of the standard values

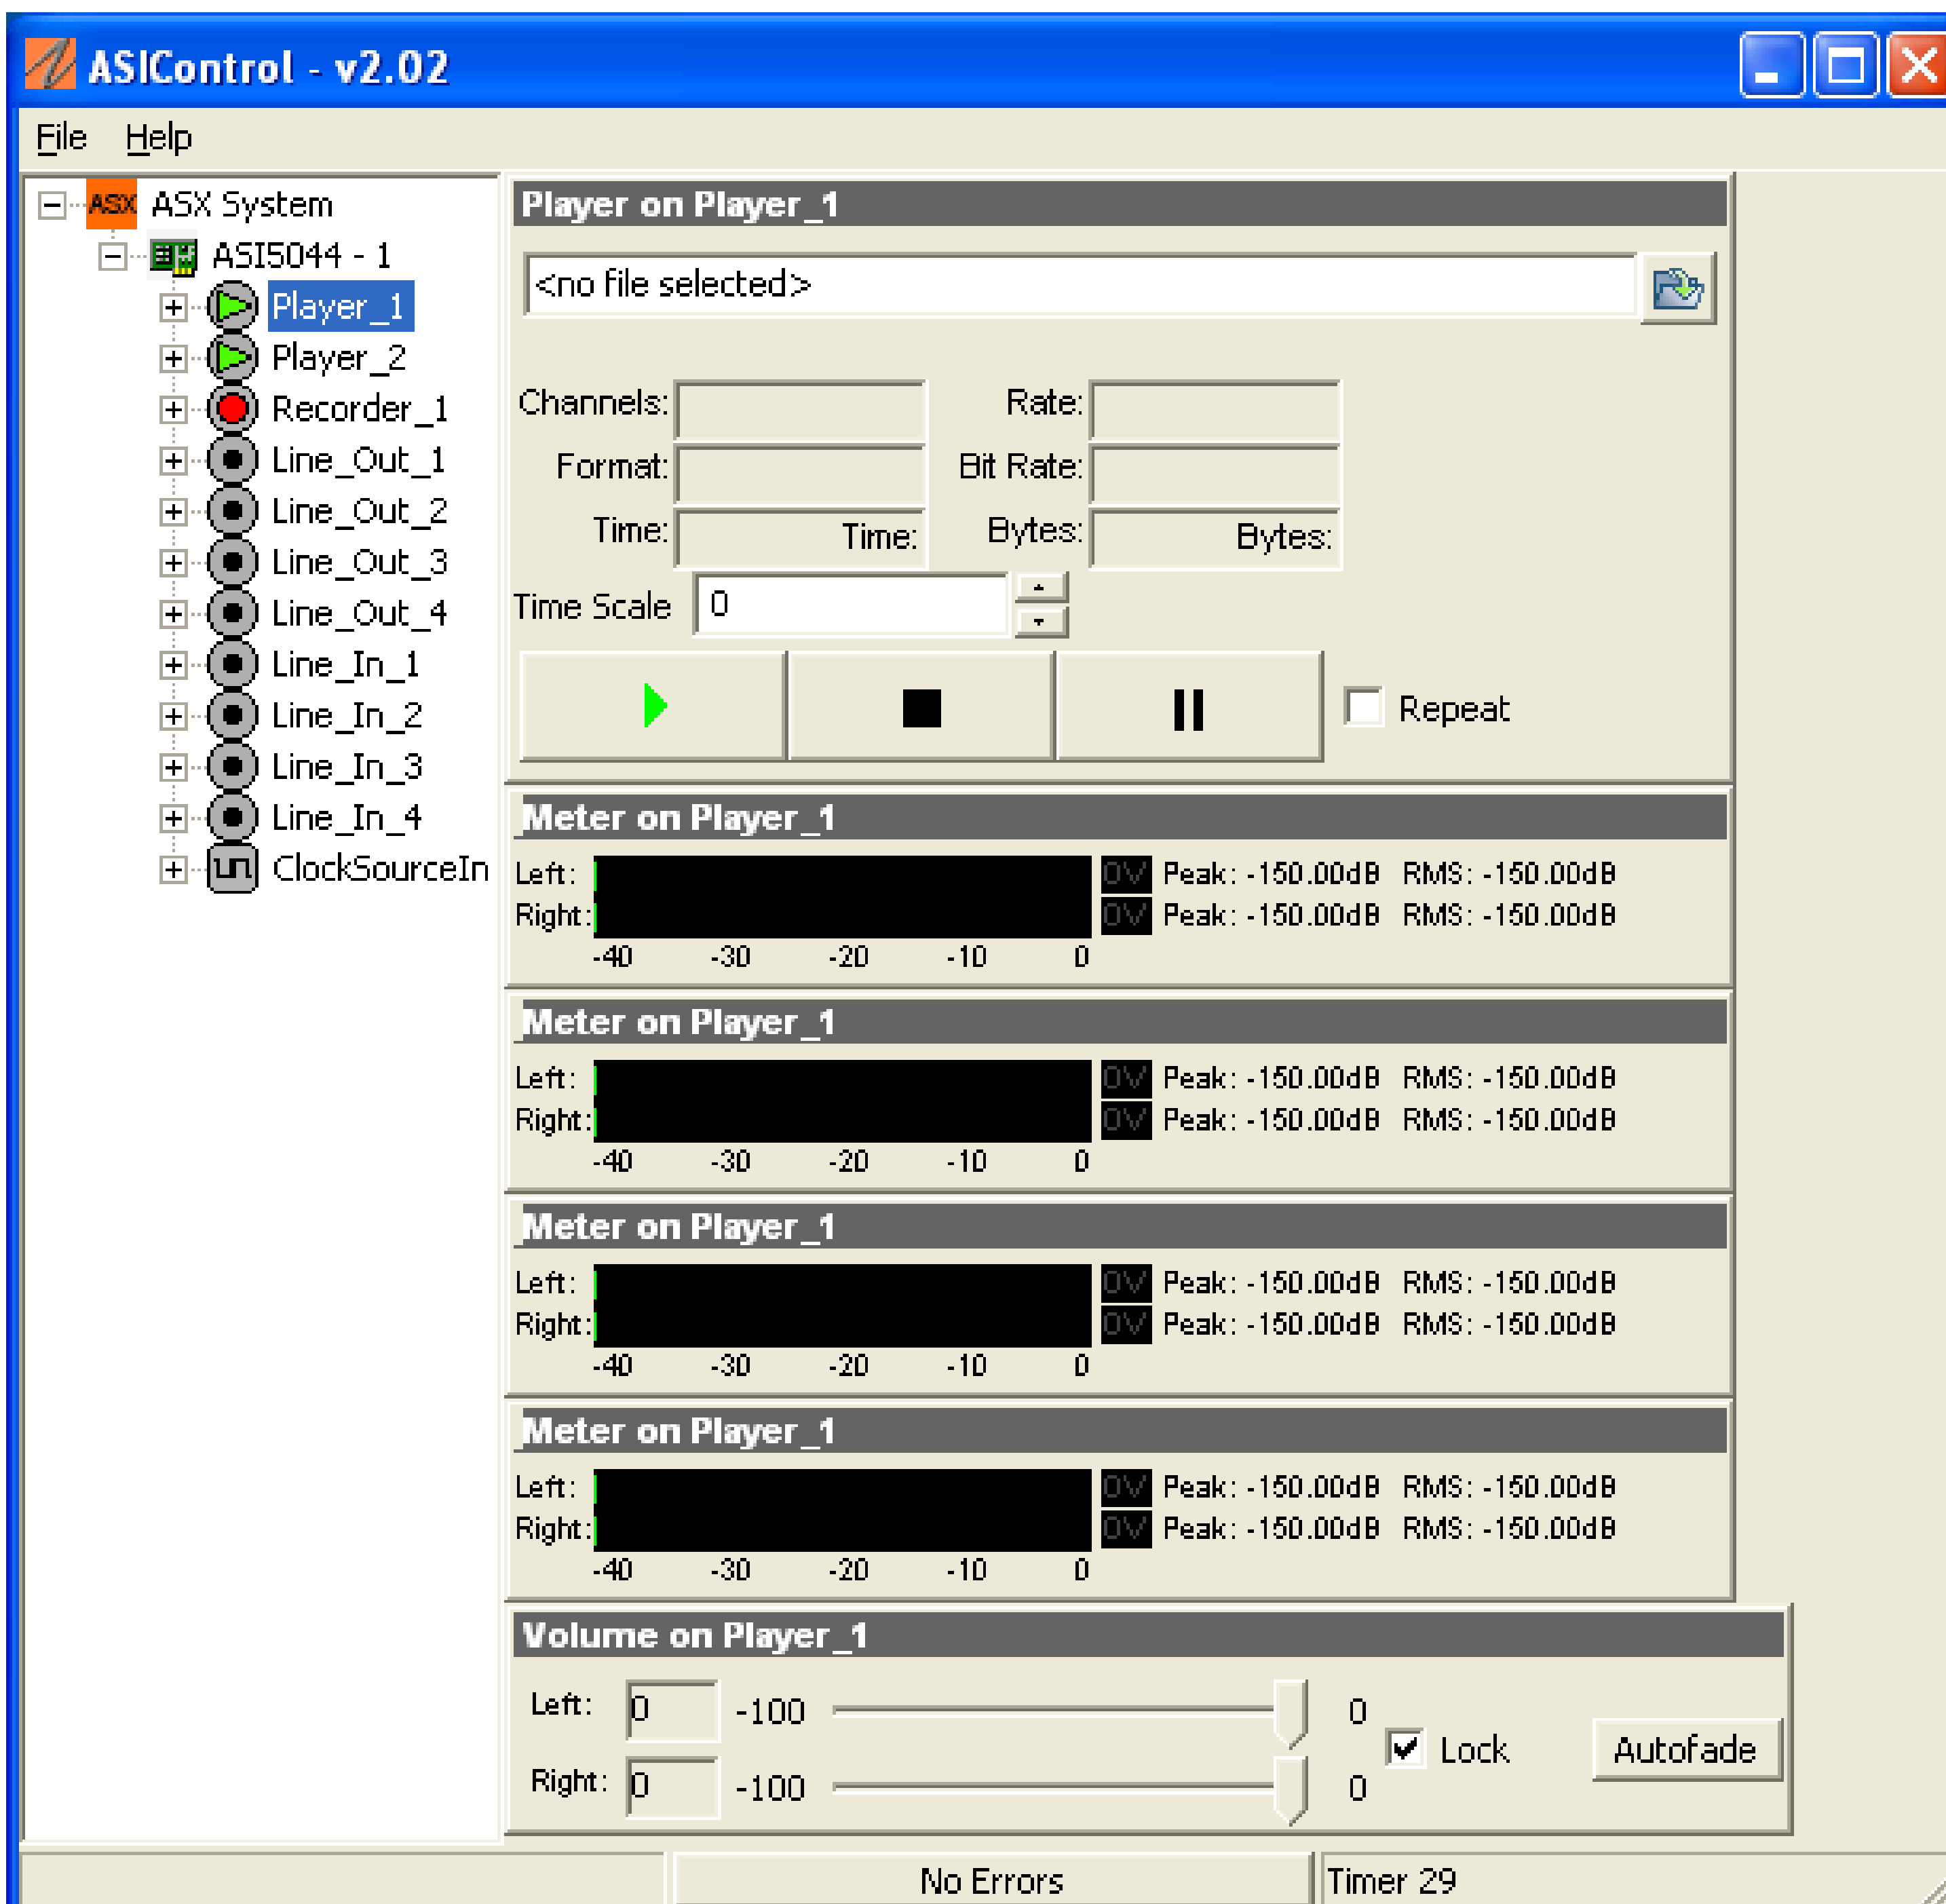

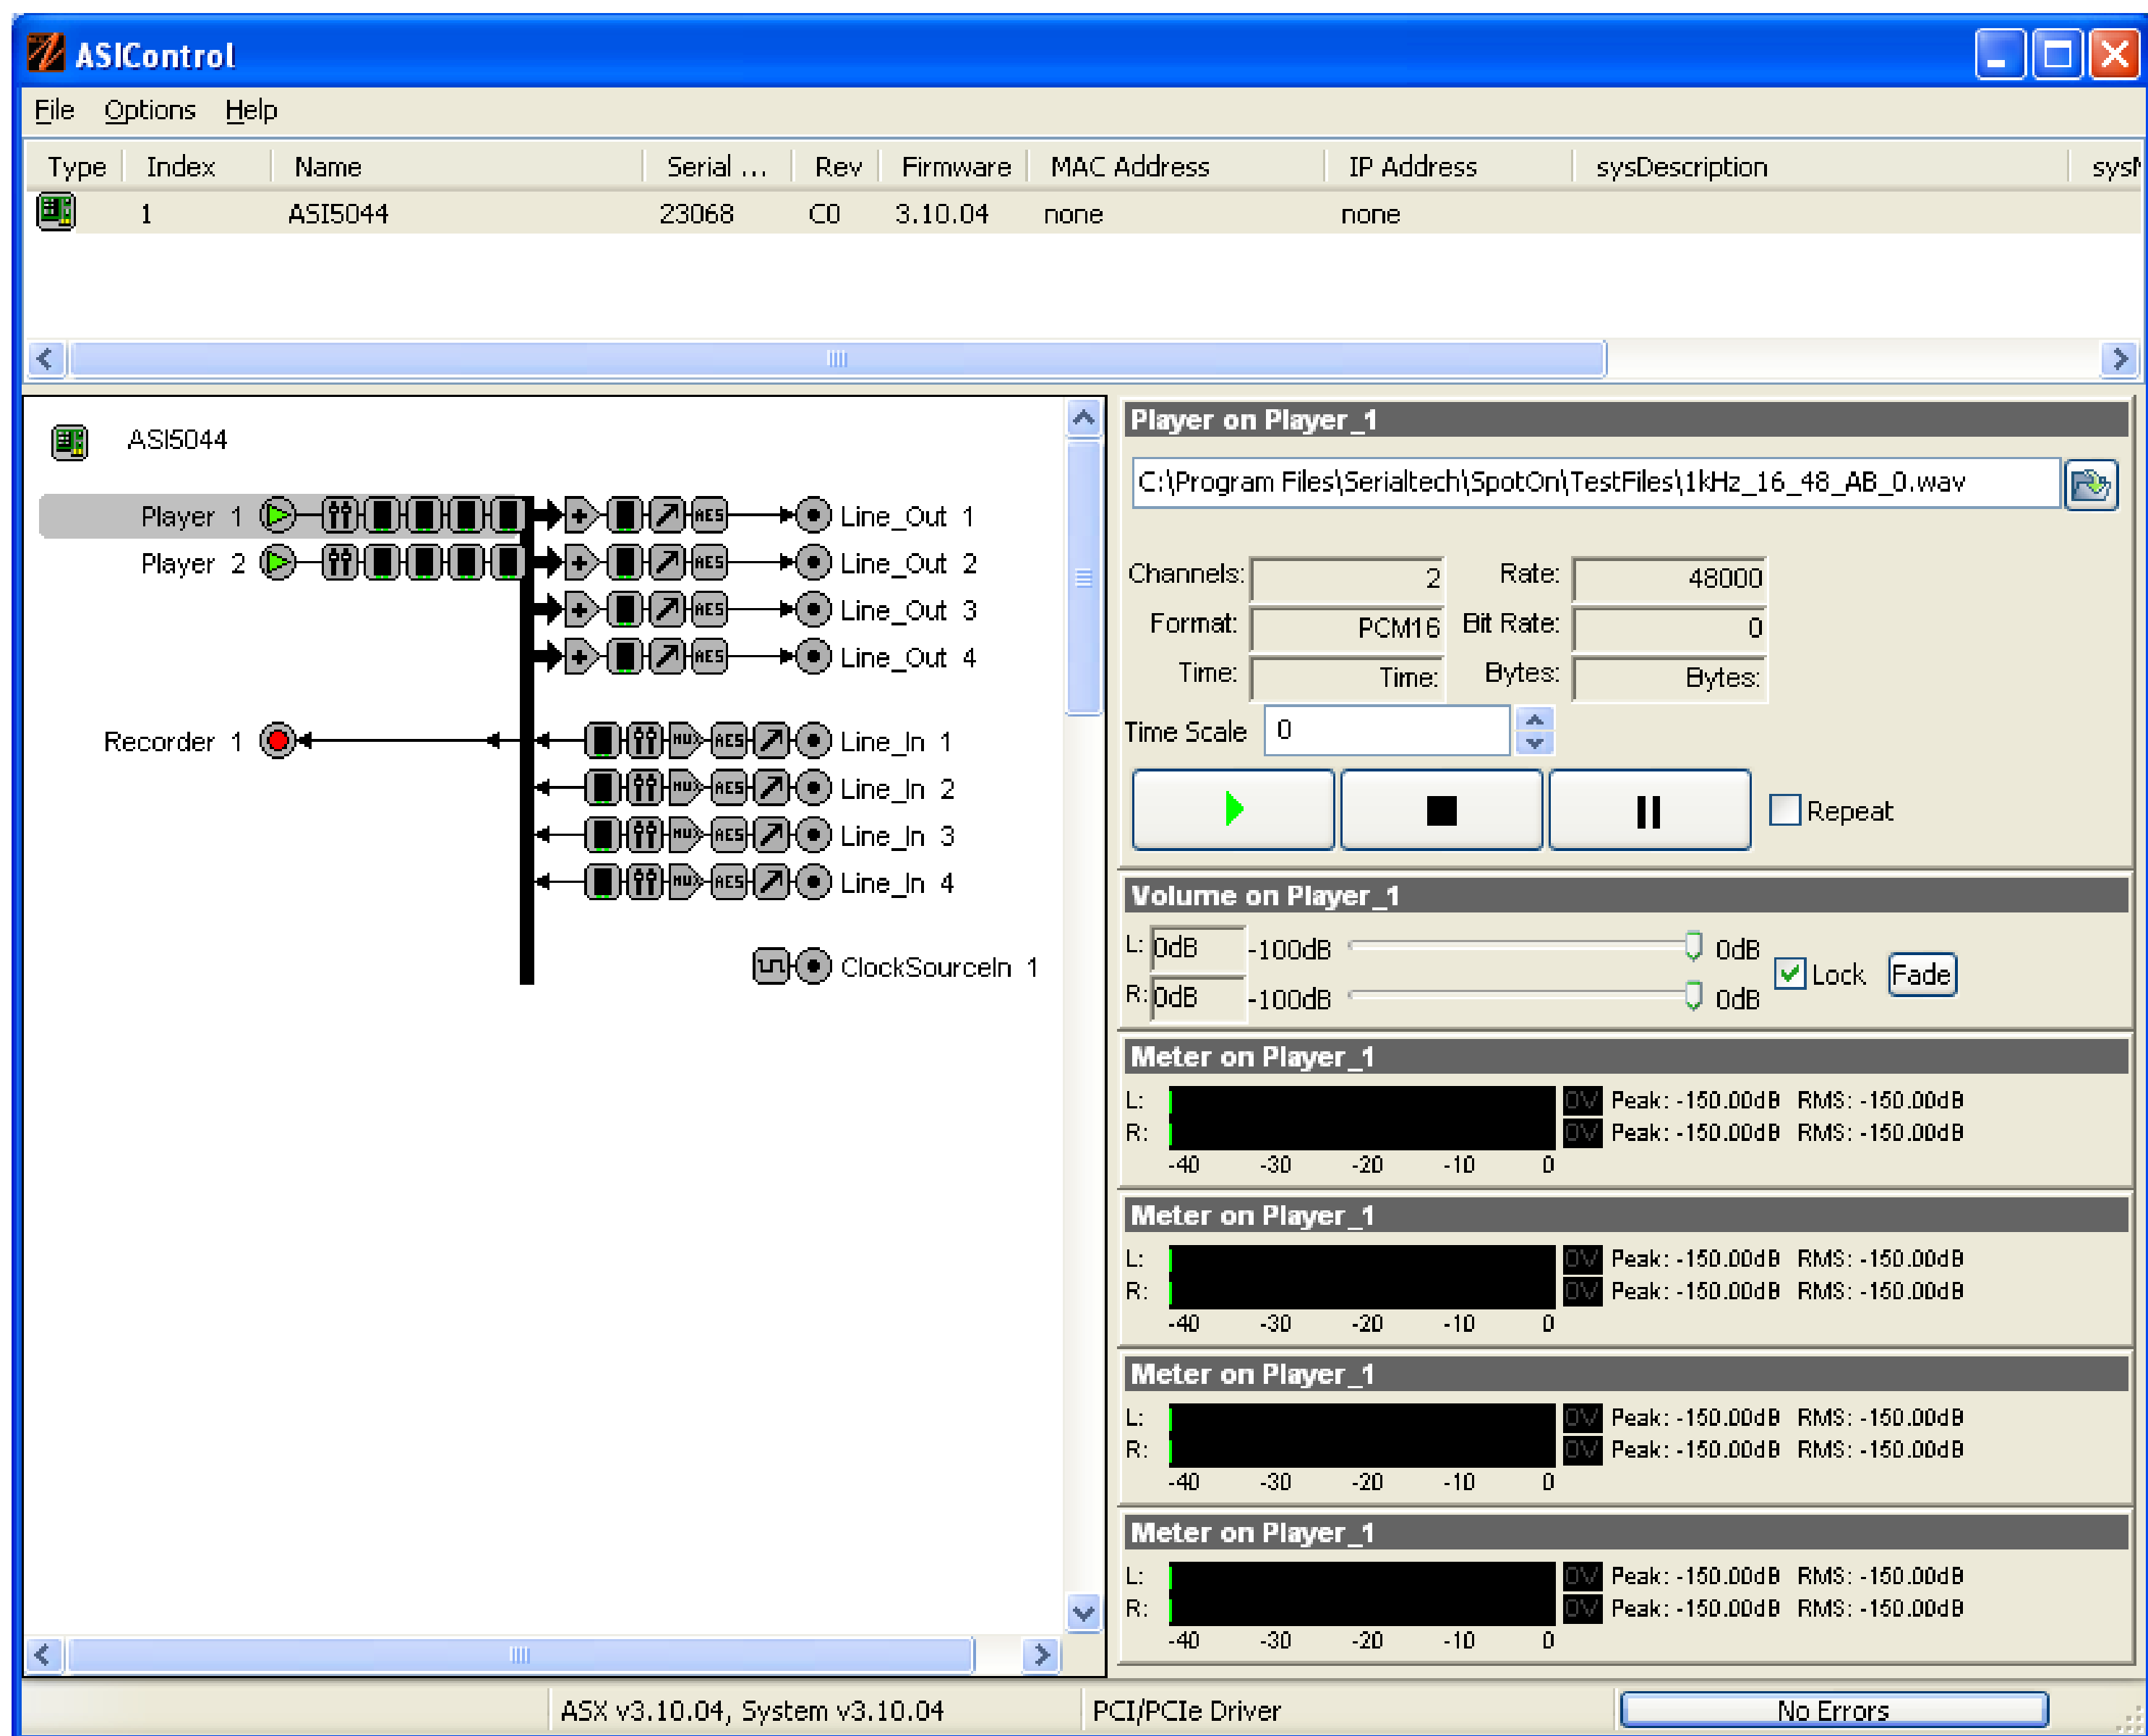

MultiChannel

The image below shows the section controlling Player_0 (device H), the meter bargraphs will show levels for the 8 channel audio and the volume slider setting the overall level of the contribution from Player_0, there is a similar page for Player_1 (device I).

Note the later versions of the driver list the devices starting from 1 not 0

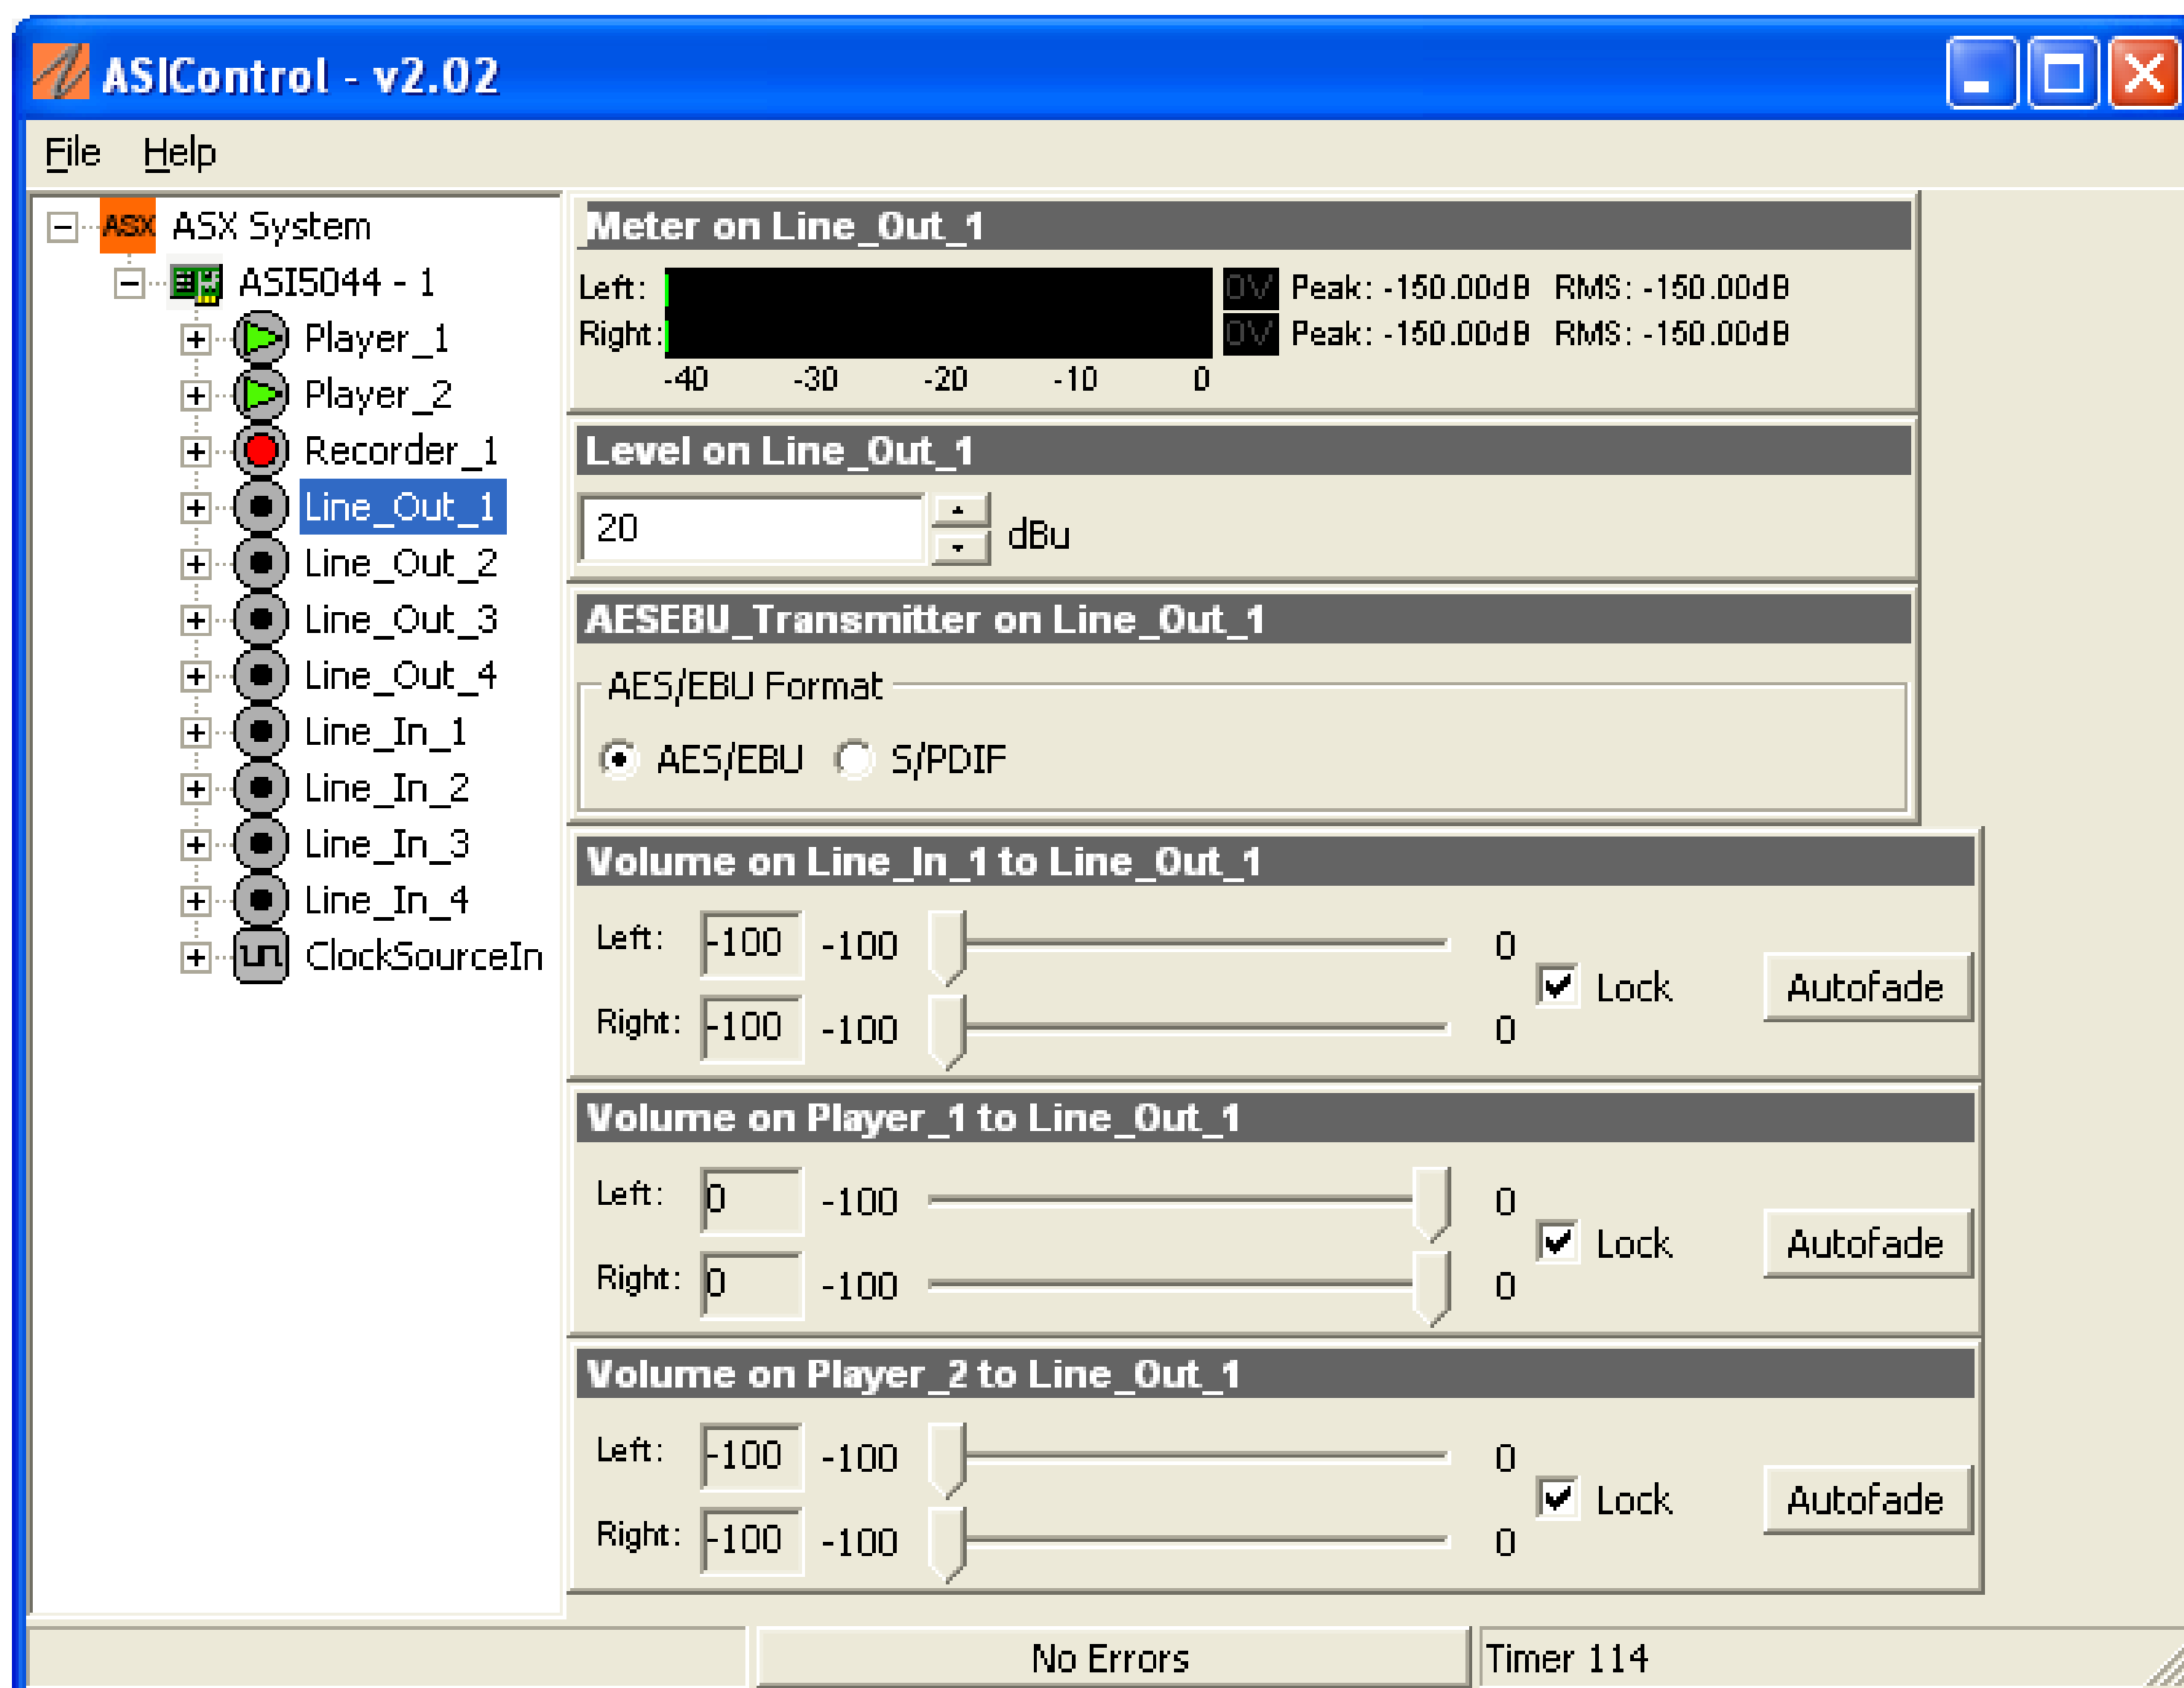

In multi-channel mode there are level controls for the four 2 channel outputs: -

Line_Out_0, Line_Out_1, Line_Out_2, LineOut_3

The audio routed to these outputs is a mix of the input and the two player streams, for use with SpotOn both the volume slider for Player_0 and Player_1 should be set to maximum on all four outputs Line_Out_0..3 as shown below.

Note the later versions of the driver list the devices starting from 1 not 0

The Level control showing 14dBu in the upper window and 20 dBu in the lower windows

sets the overall output level the nudge up/down buttons set the value so that a test file produces the correct level at the destination.

The Player_0 and Player_1 (Player 1, Player 2) volume controls above operate as live controls on the output level, however their settings are not restored after a restart of the PC - this is due to the levels being overwritten by the operating system. The levels used by the operating system are those set in the Control panel.

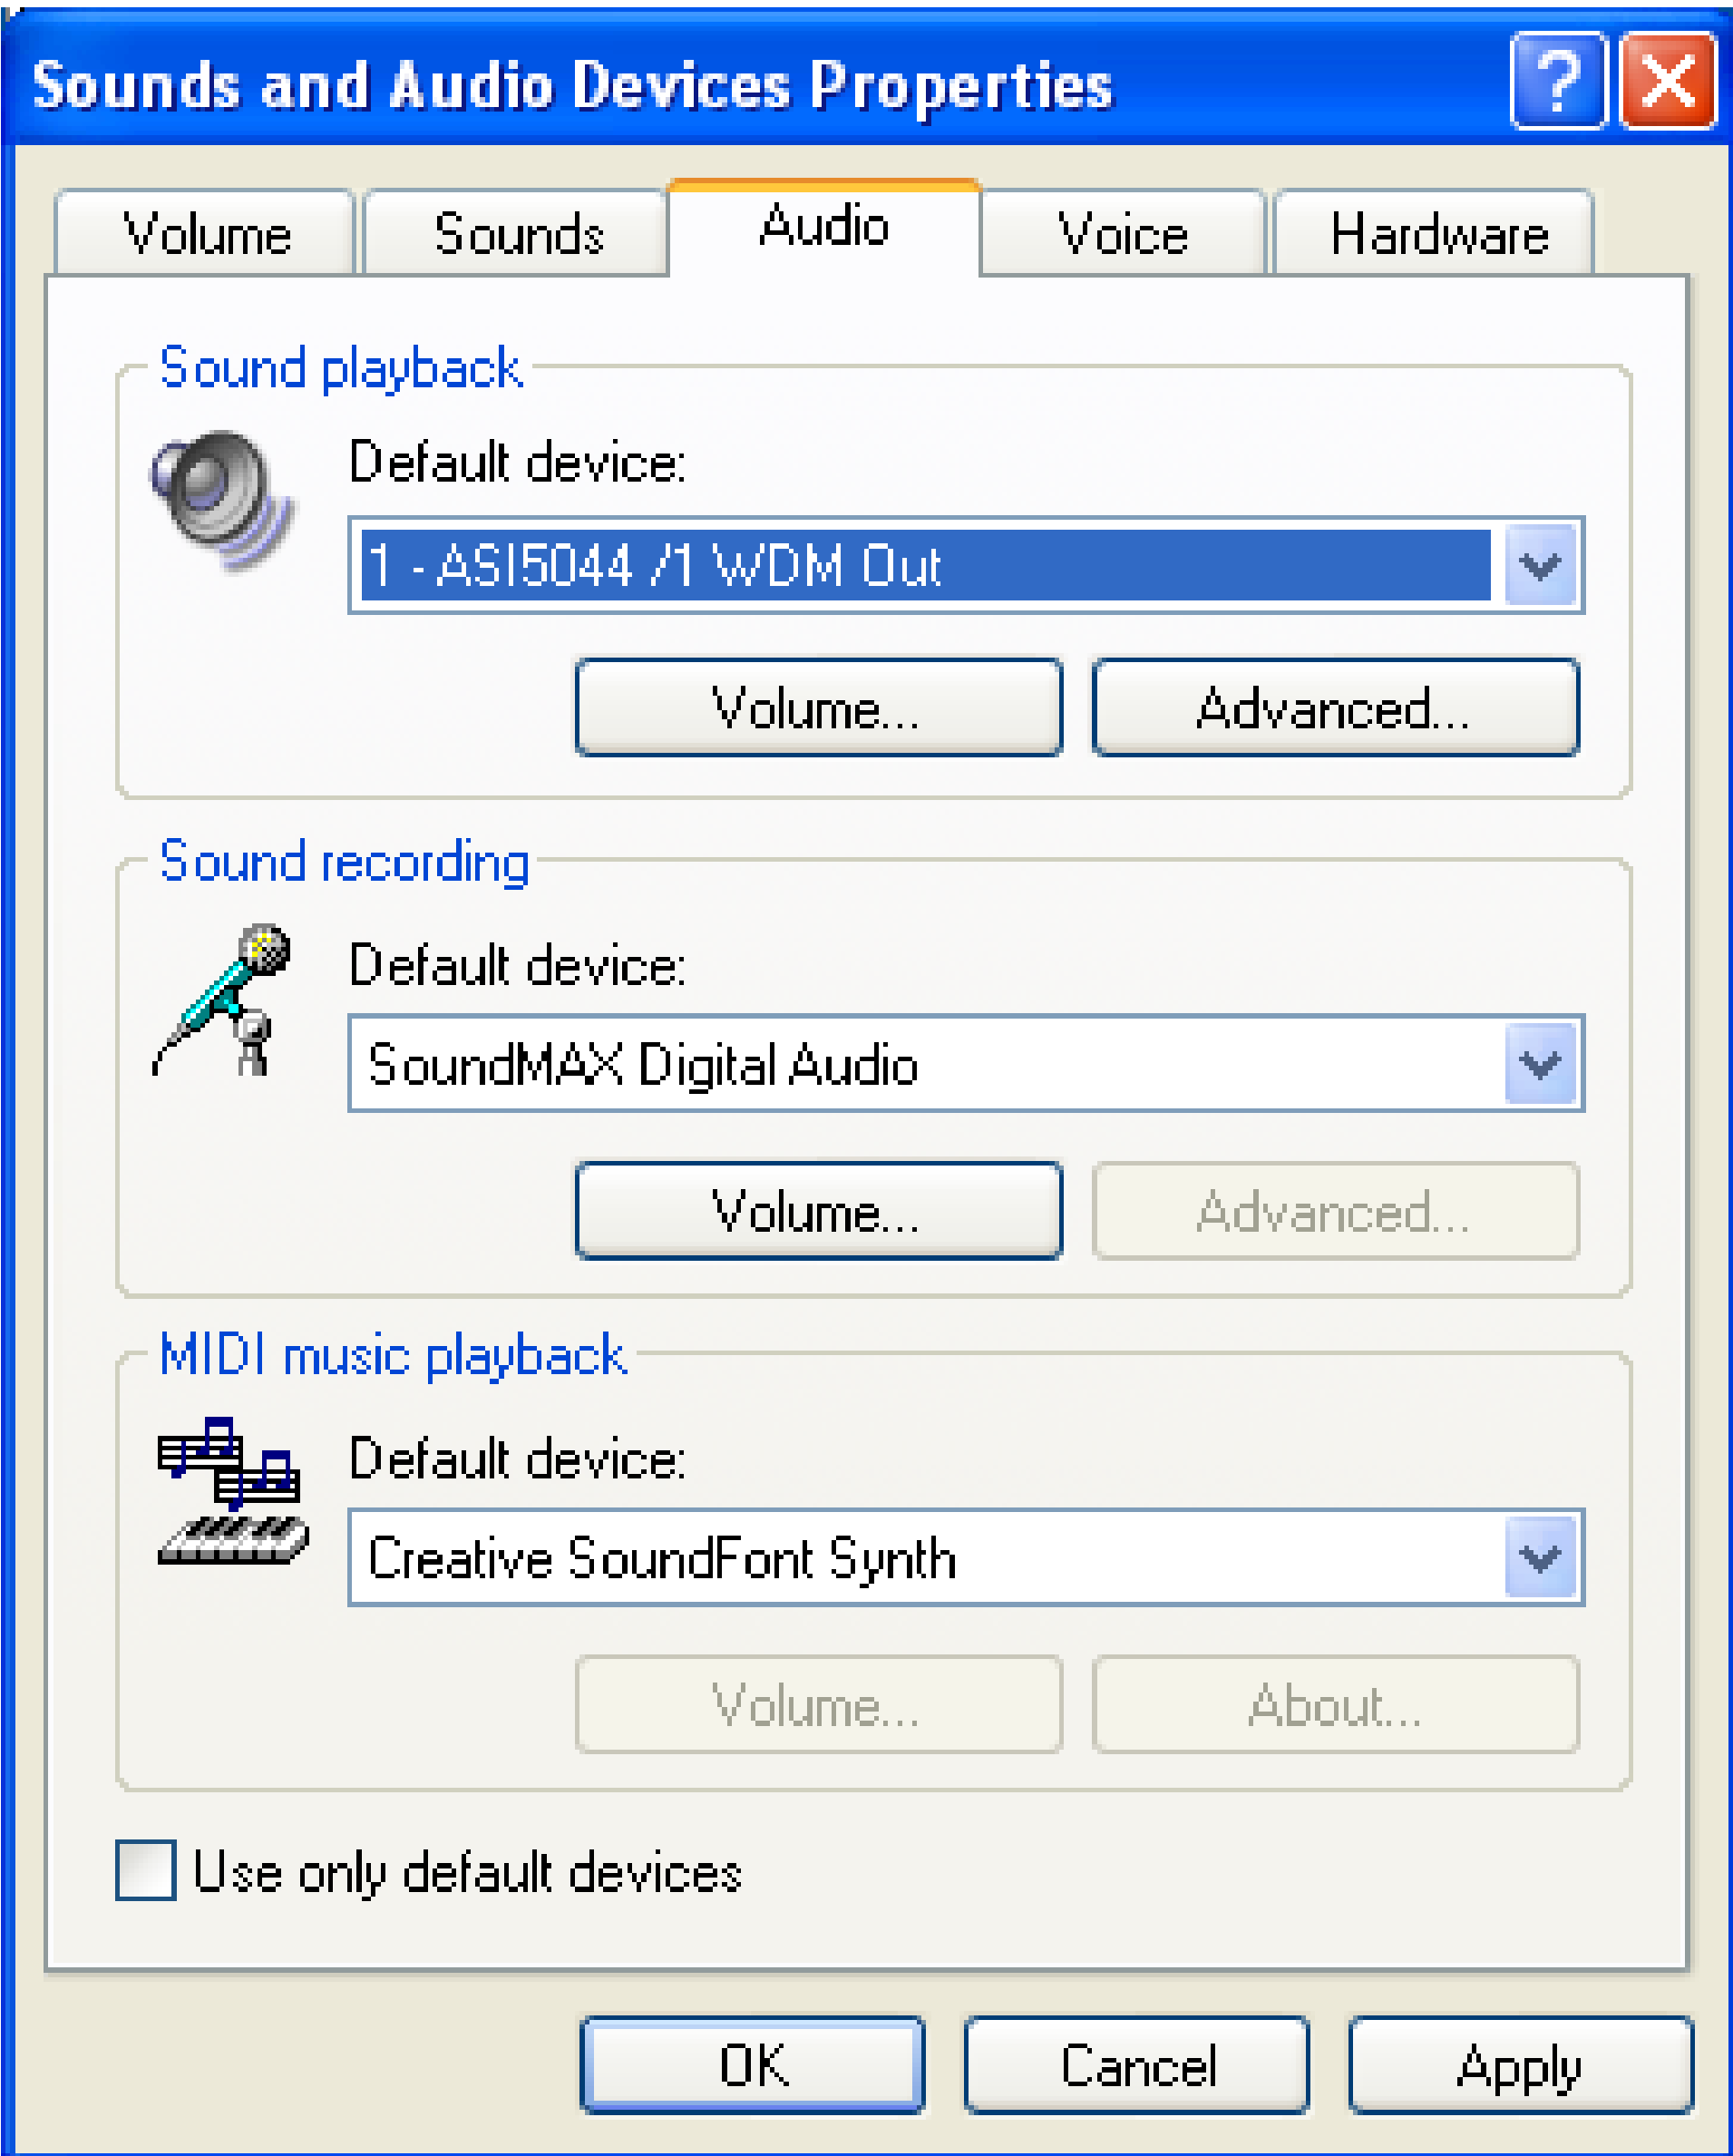

Select Control panel

then the Sounds and Audio Devices applet

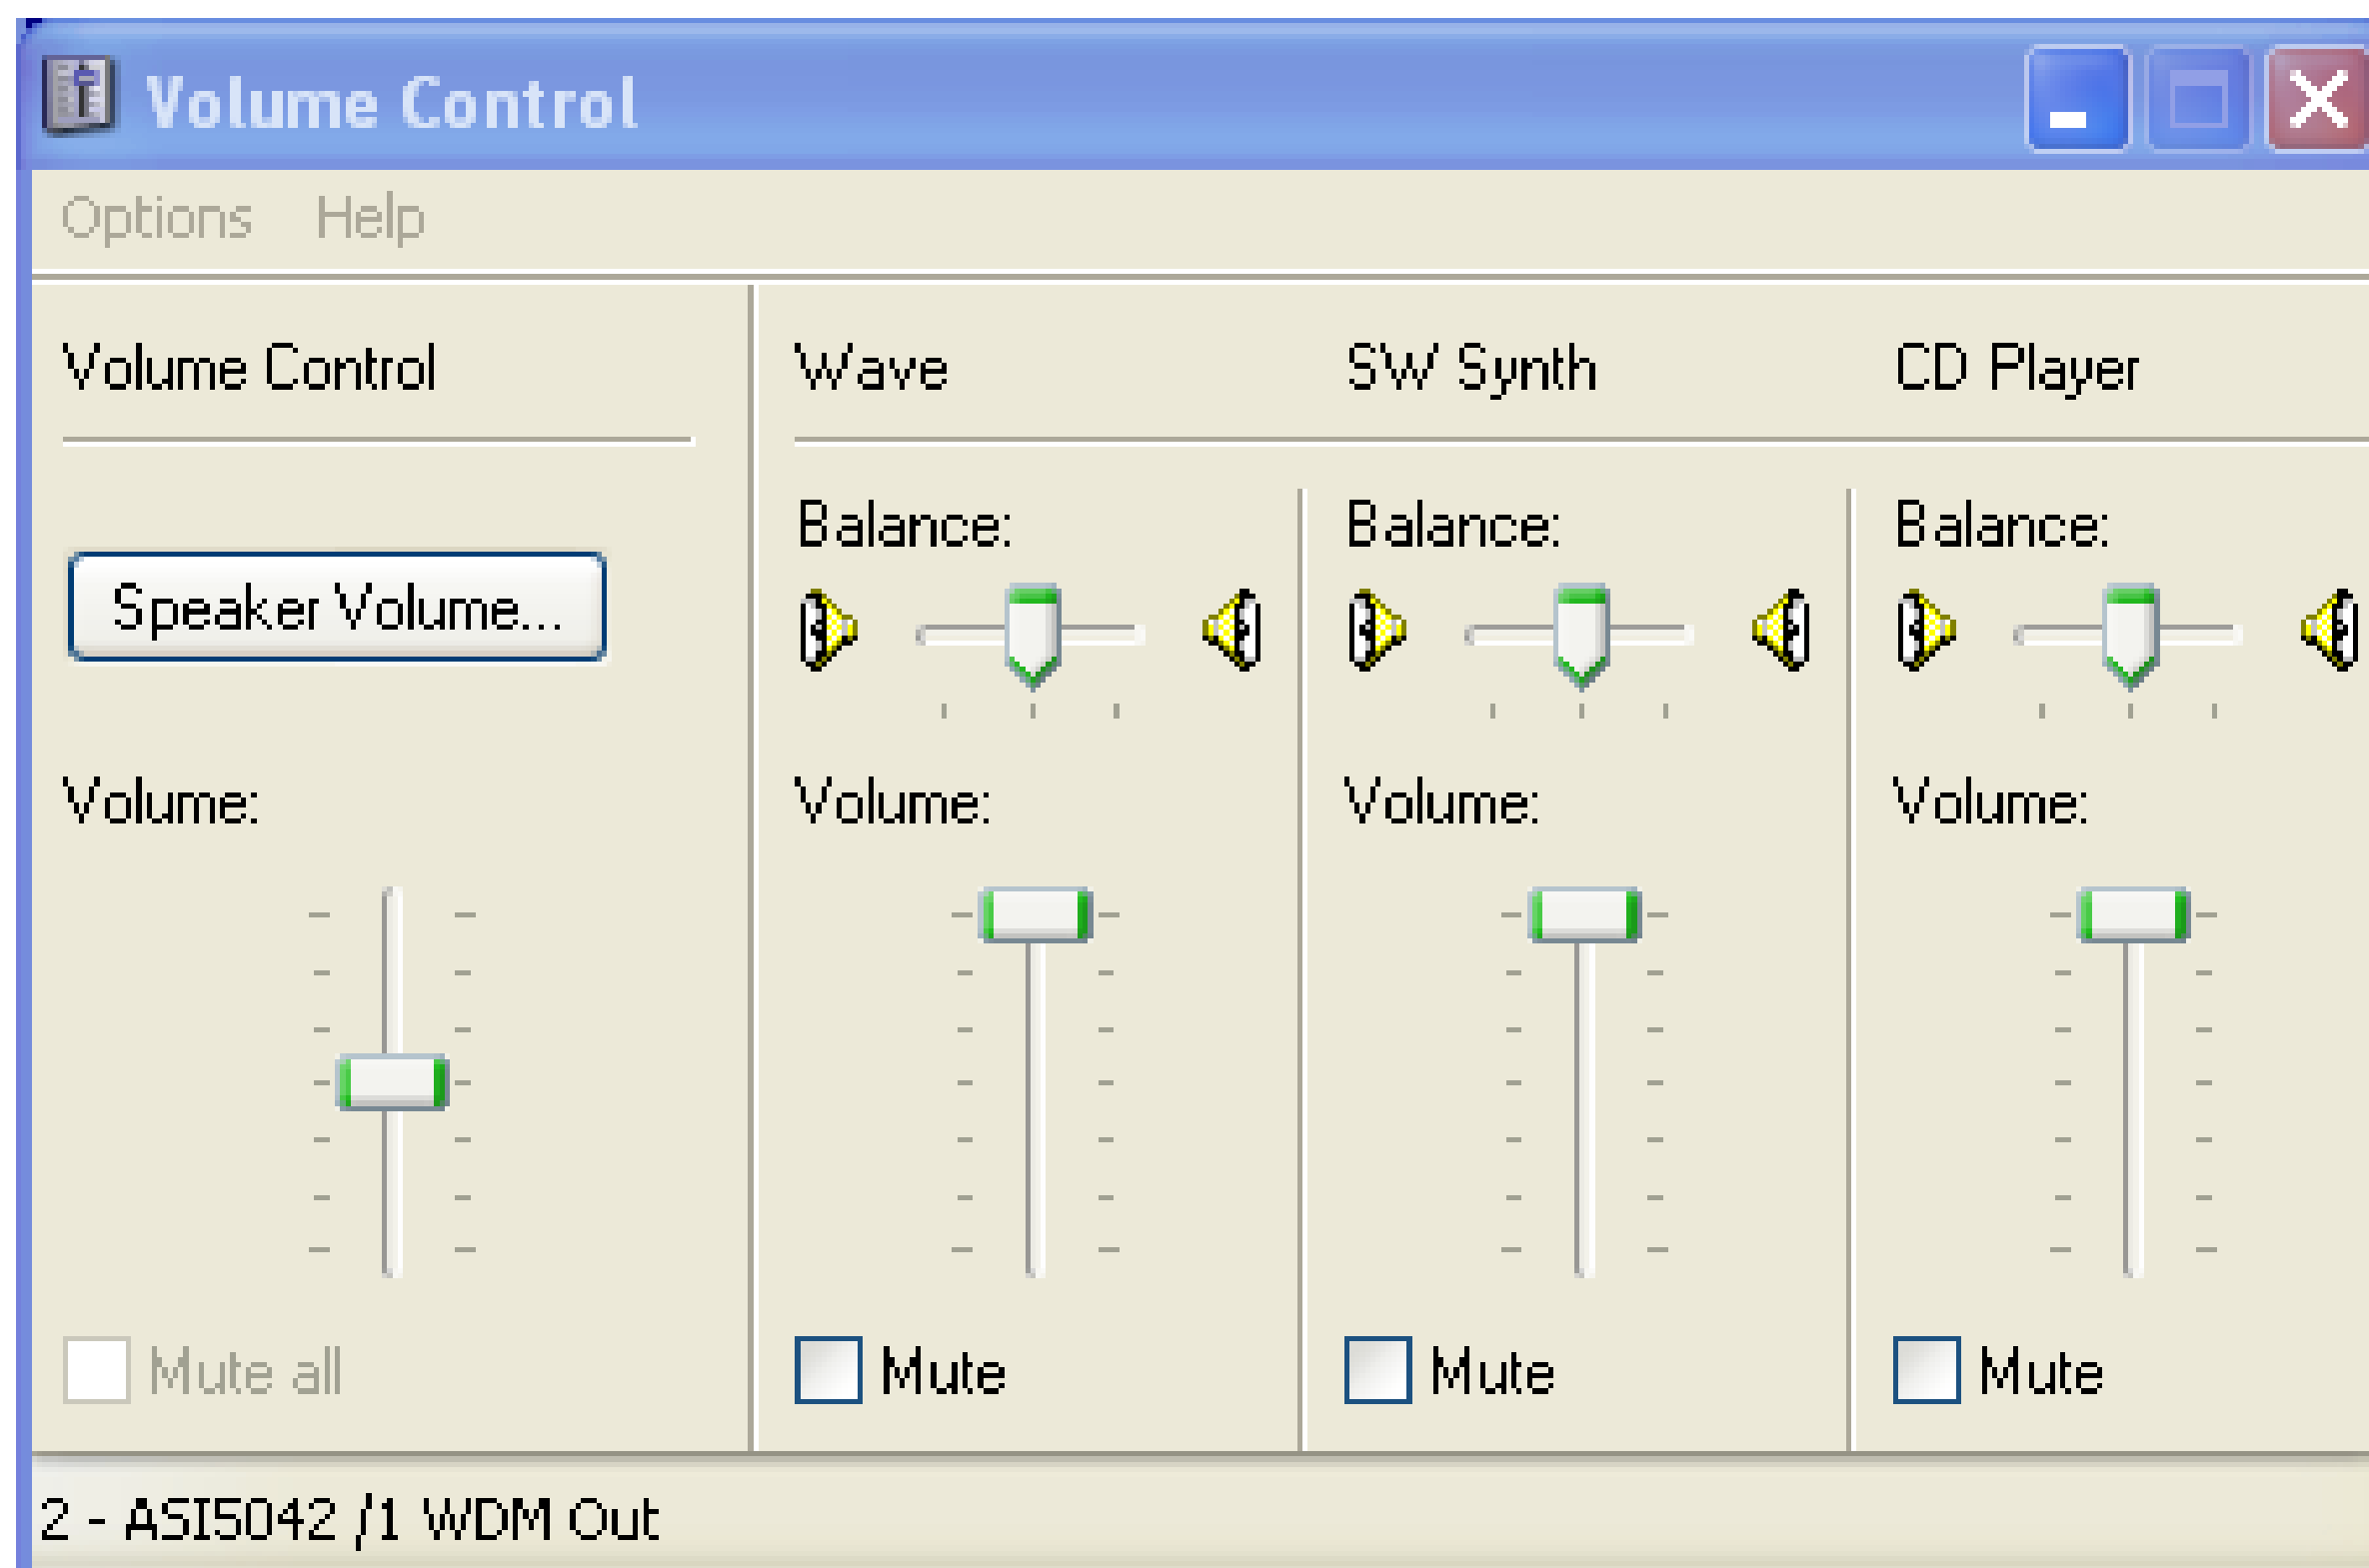

select the Audio tab

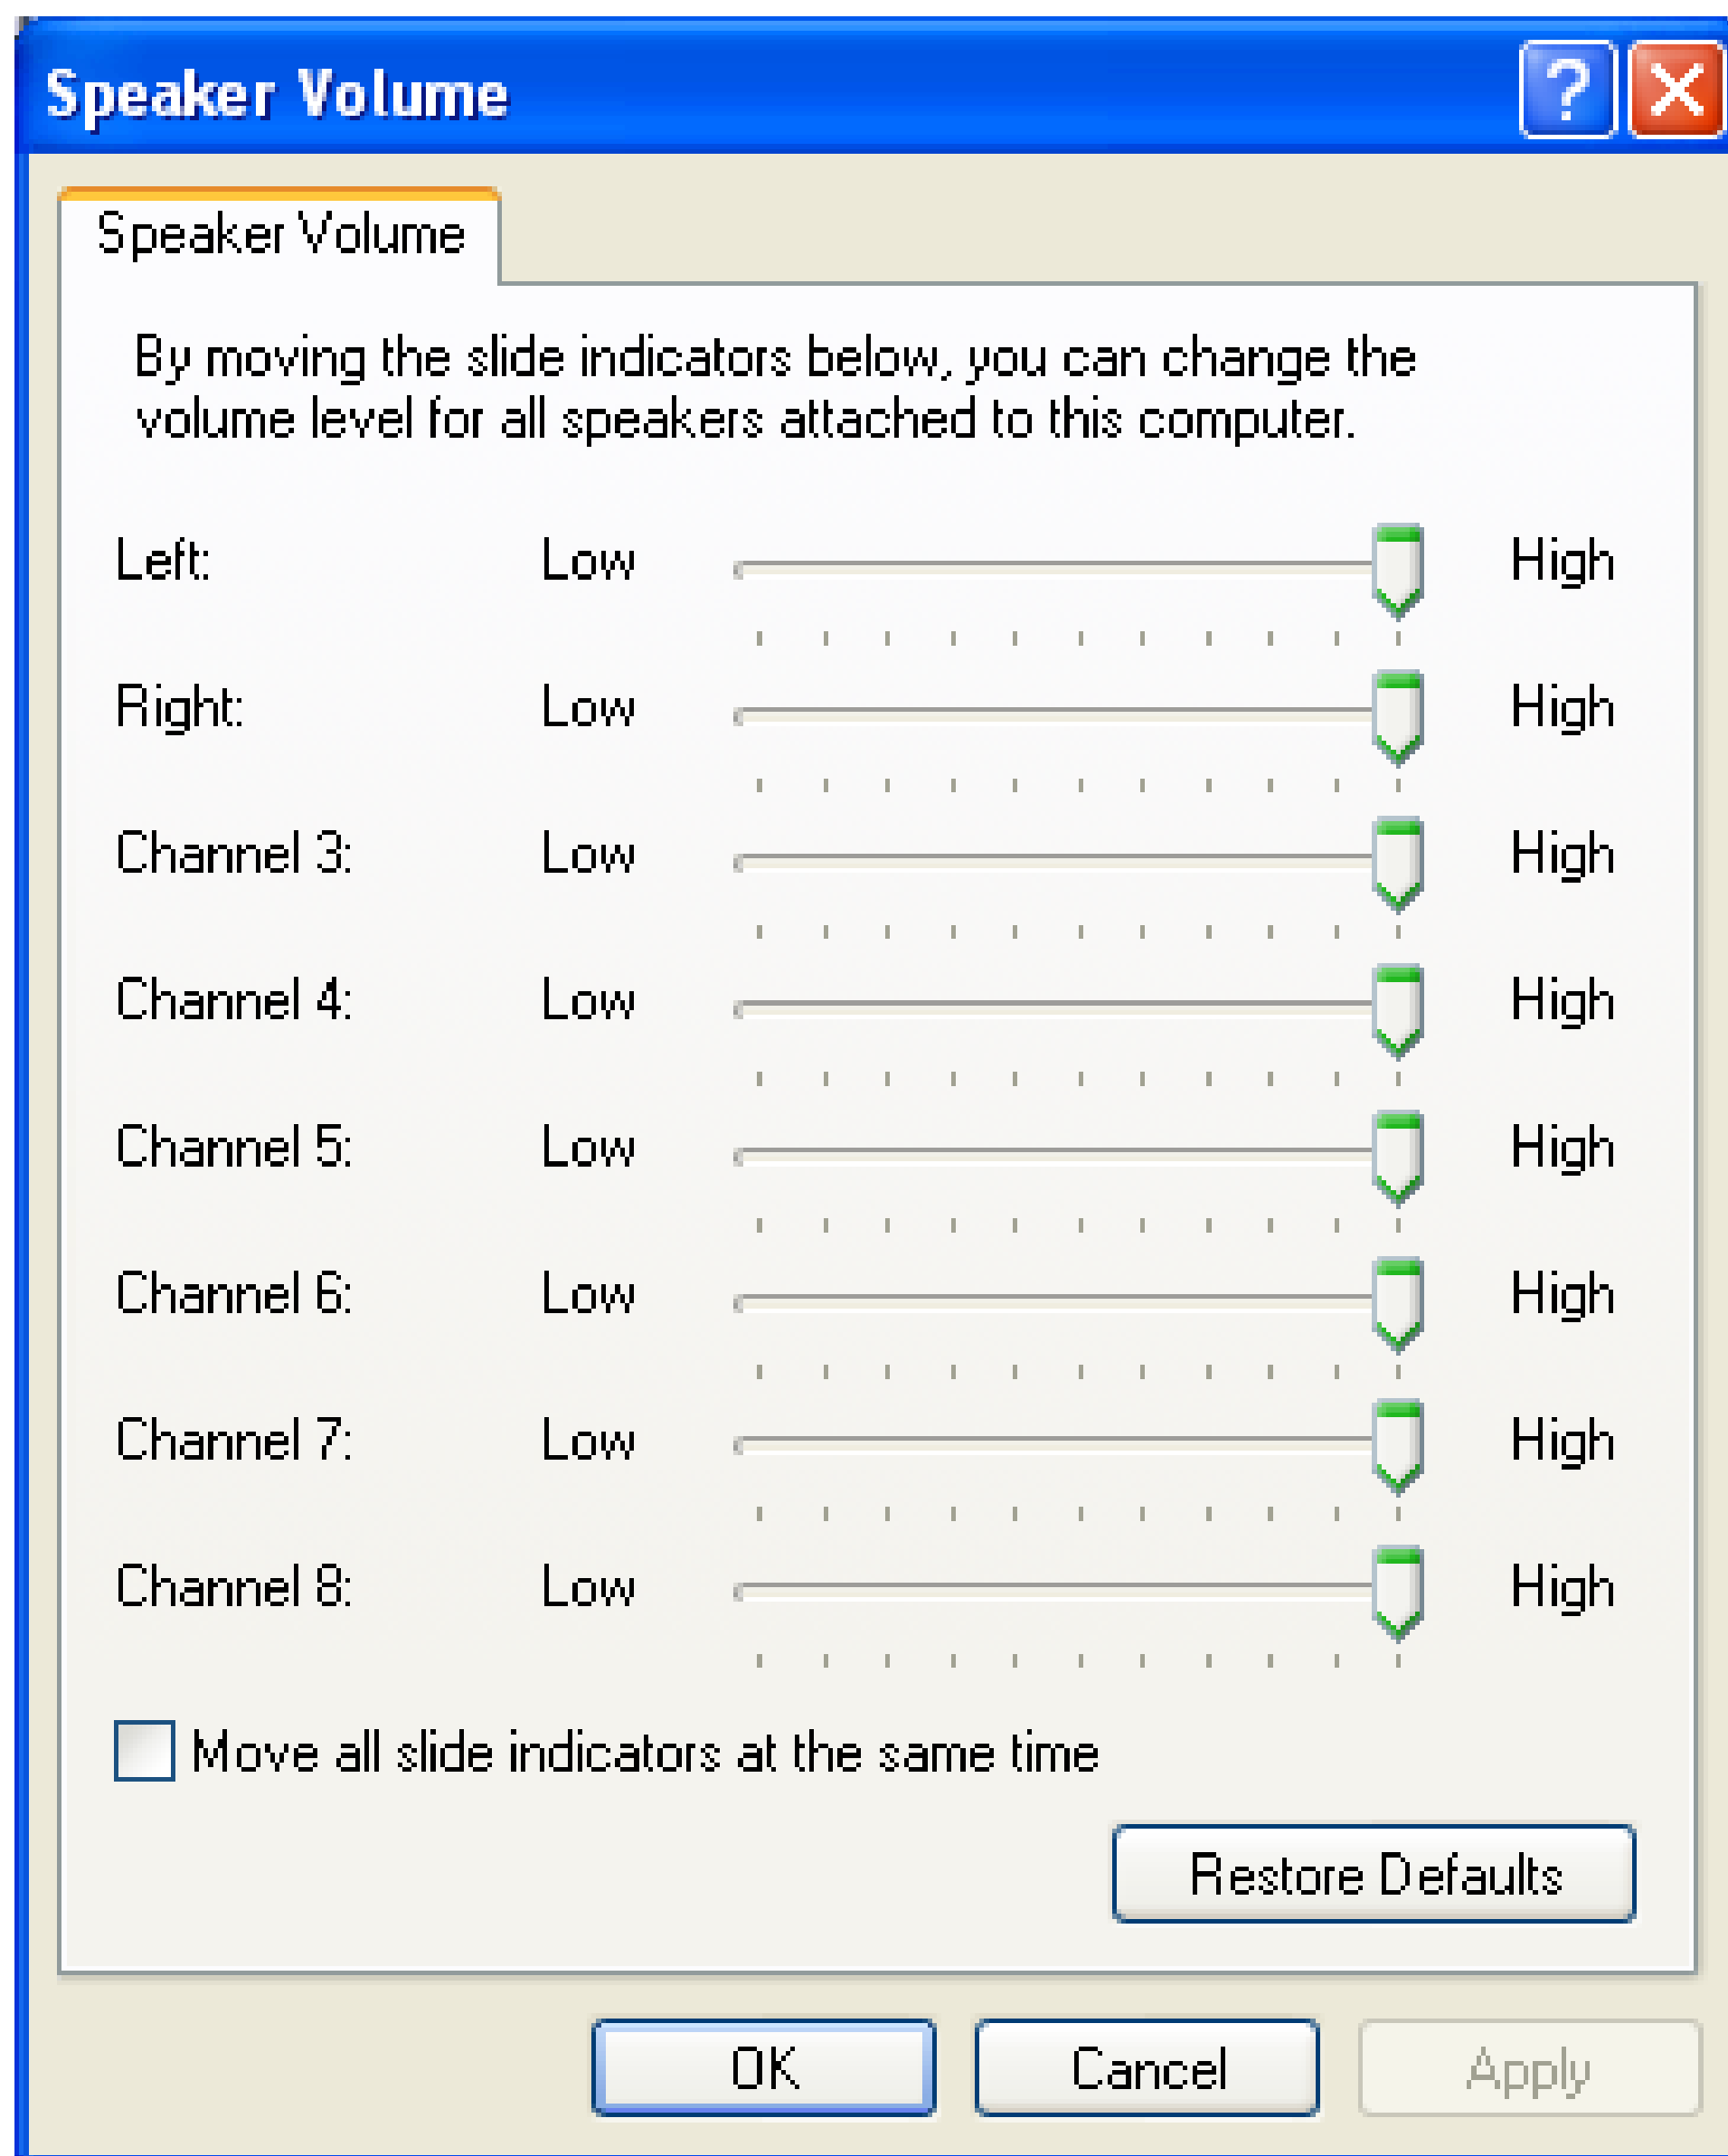

then select Volume button in the Sound Playback section.

The Windows volume controls have a different look when an AudioScience card is selected and it is set to MultiChannel mode, notice the Speaker Volume button on the left hand side.

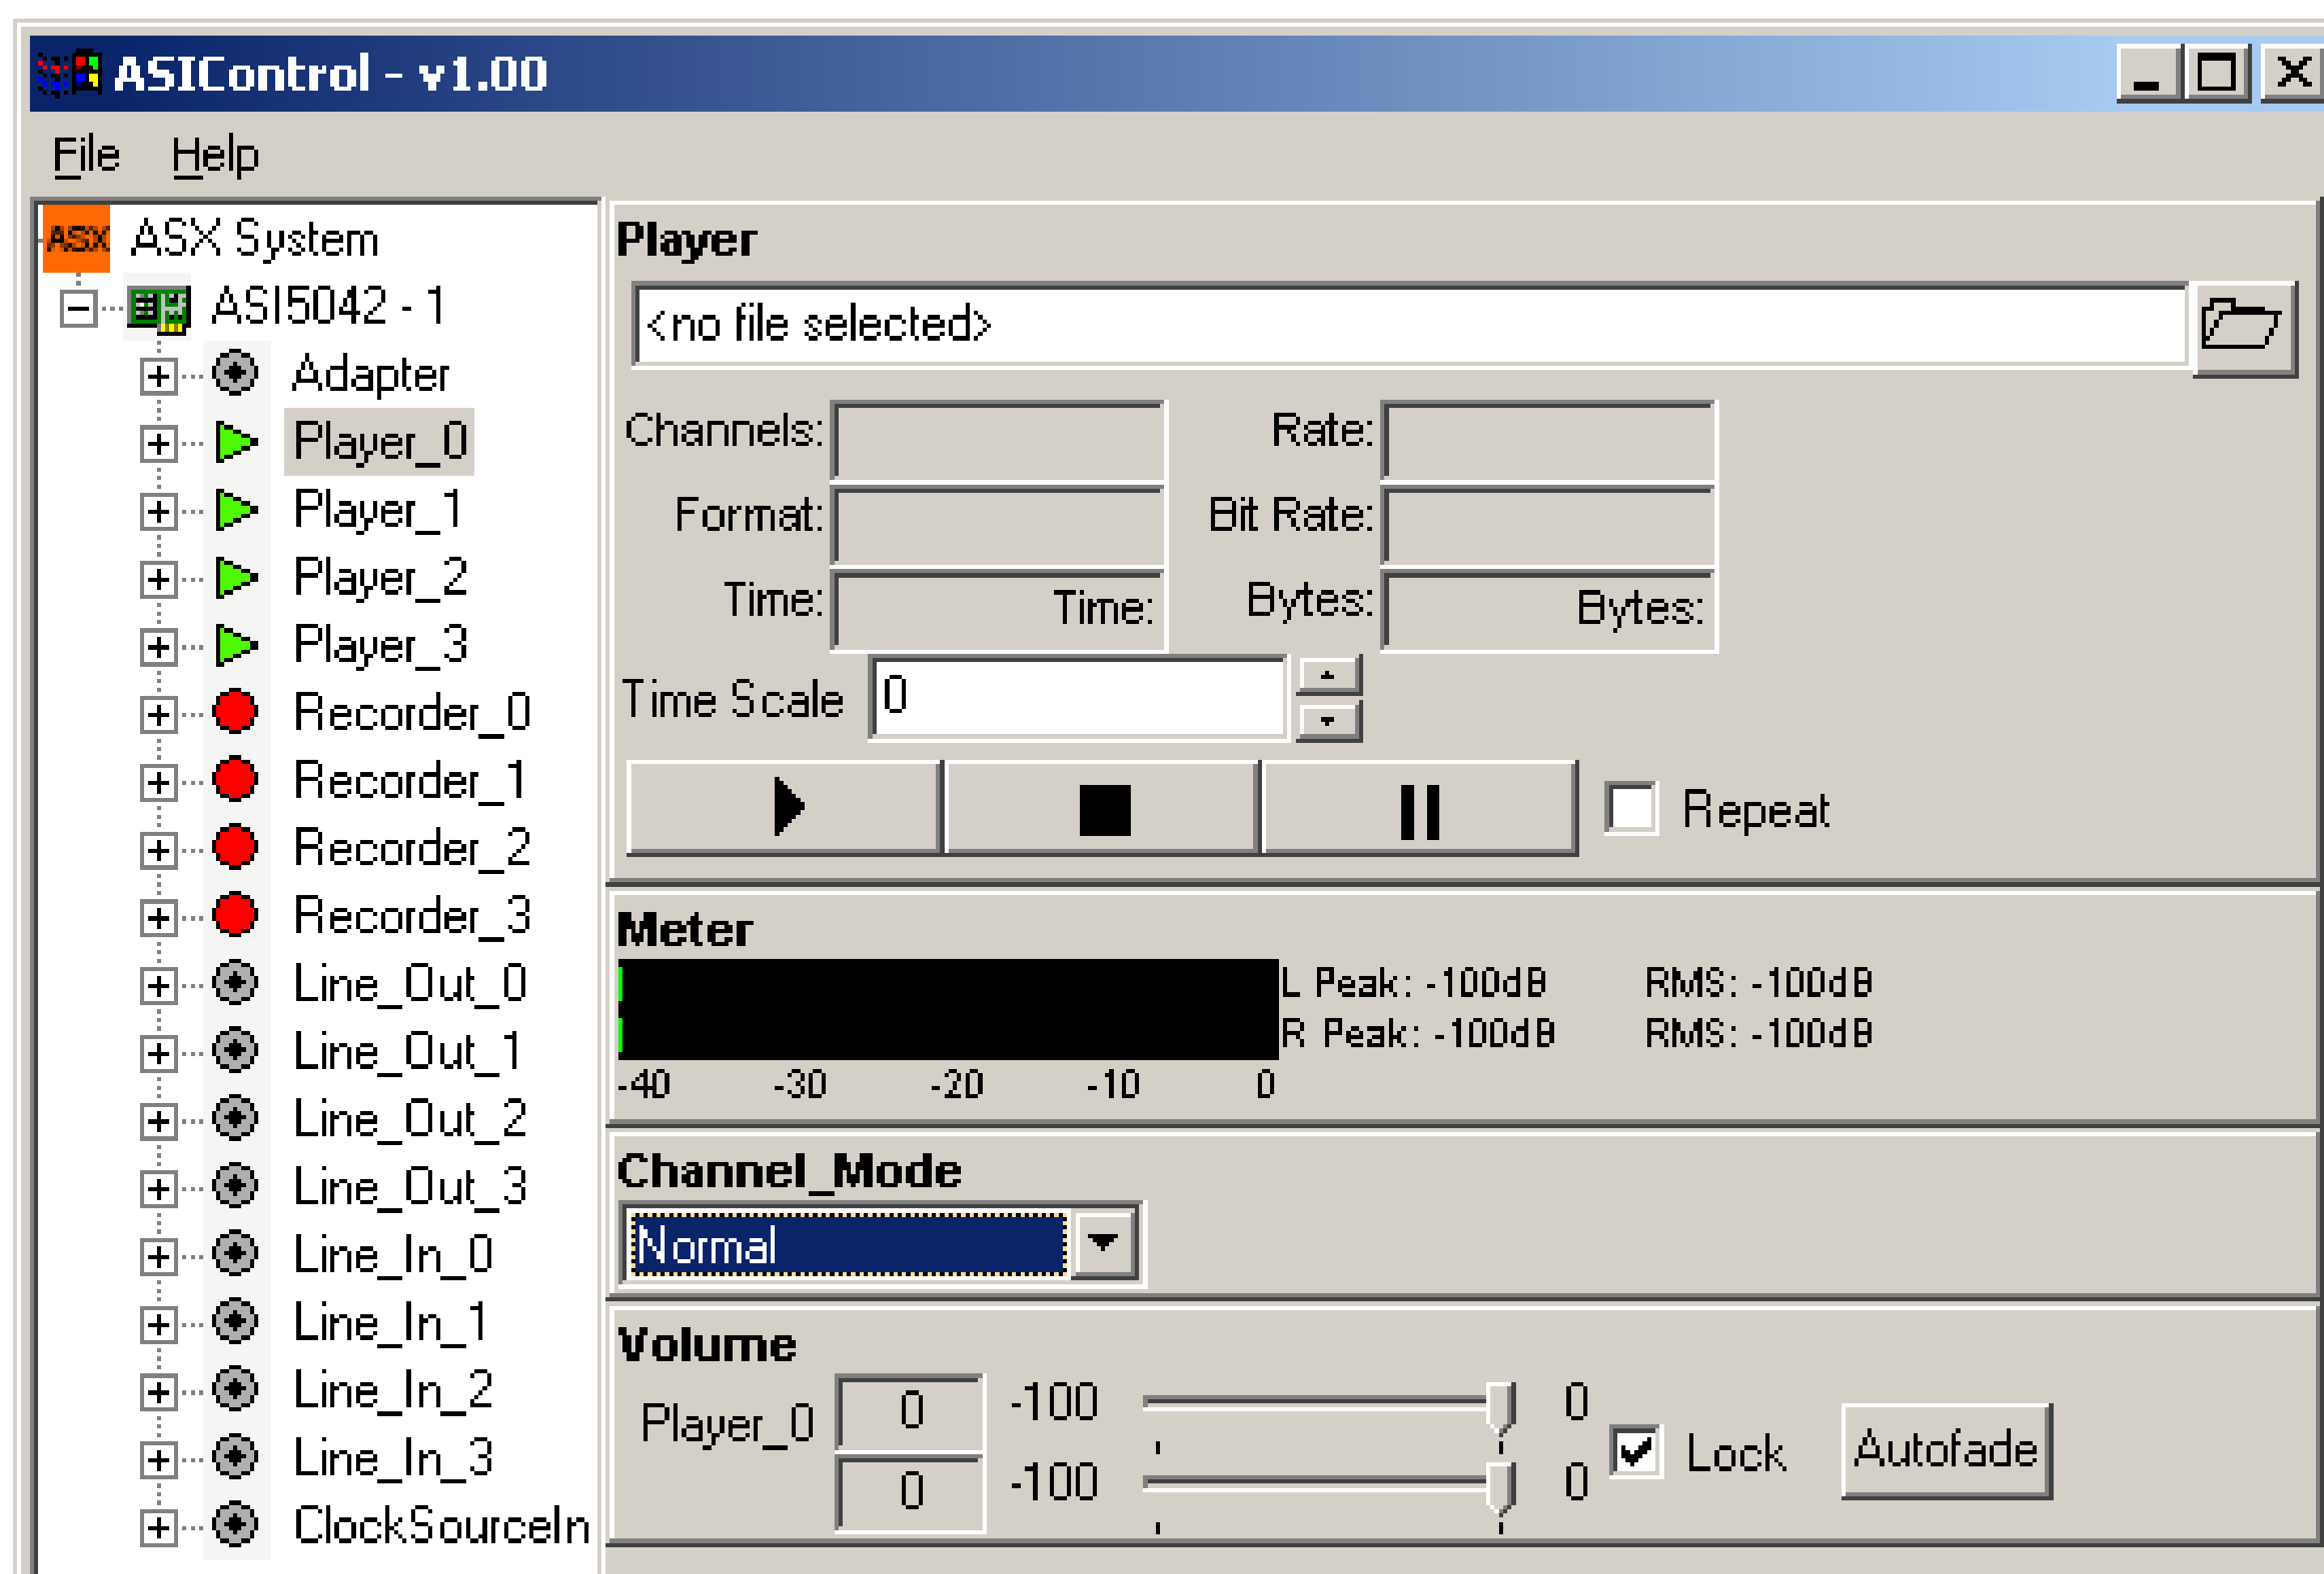

The Speaker Volume button displays a set of volume sliders for all the eight outputs of the device, these are the settings that are restored on a restart of the PC. Consequently the output levels have to be adjusted in this window, however it is usually sufficient to set all eight sliders to maximum.

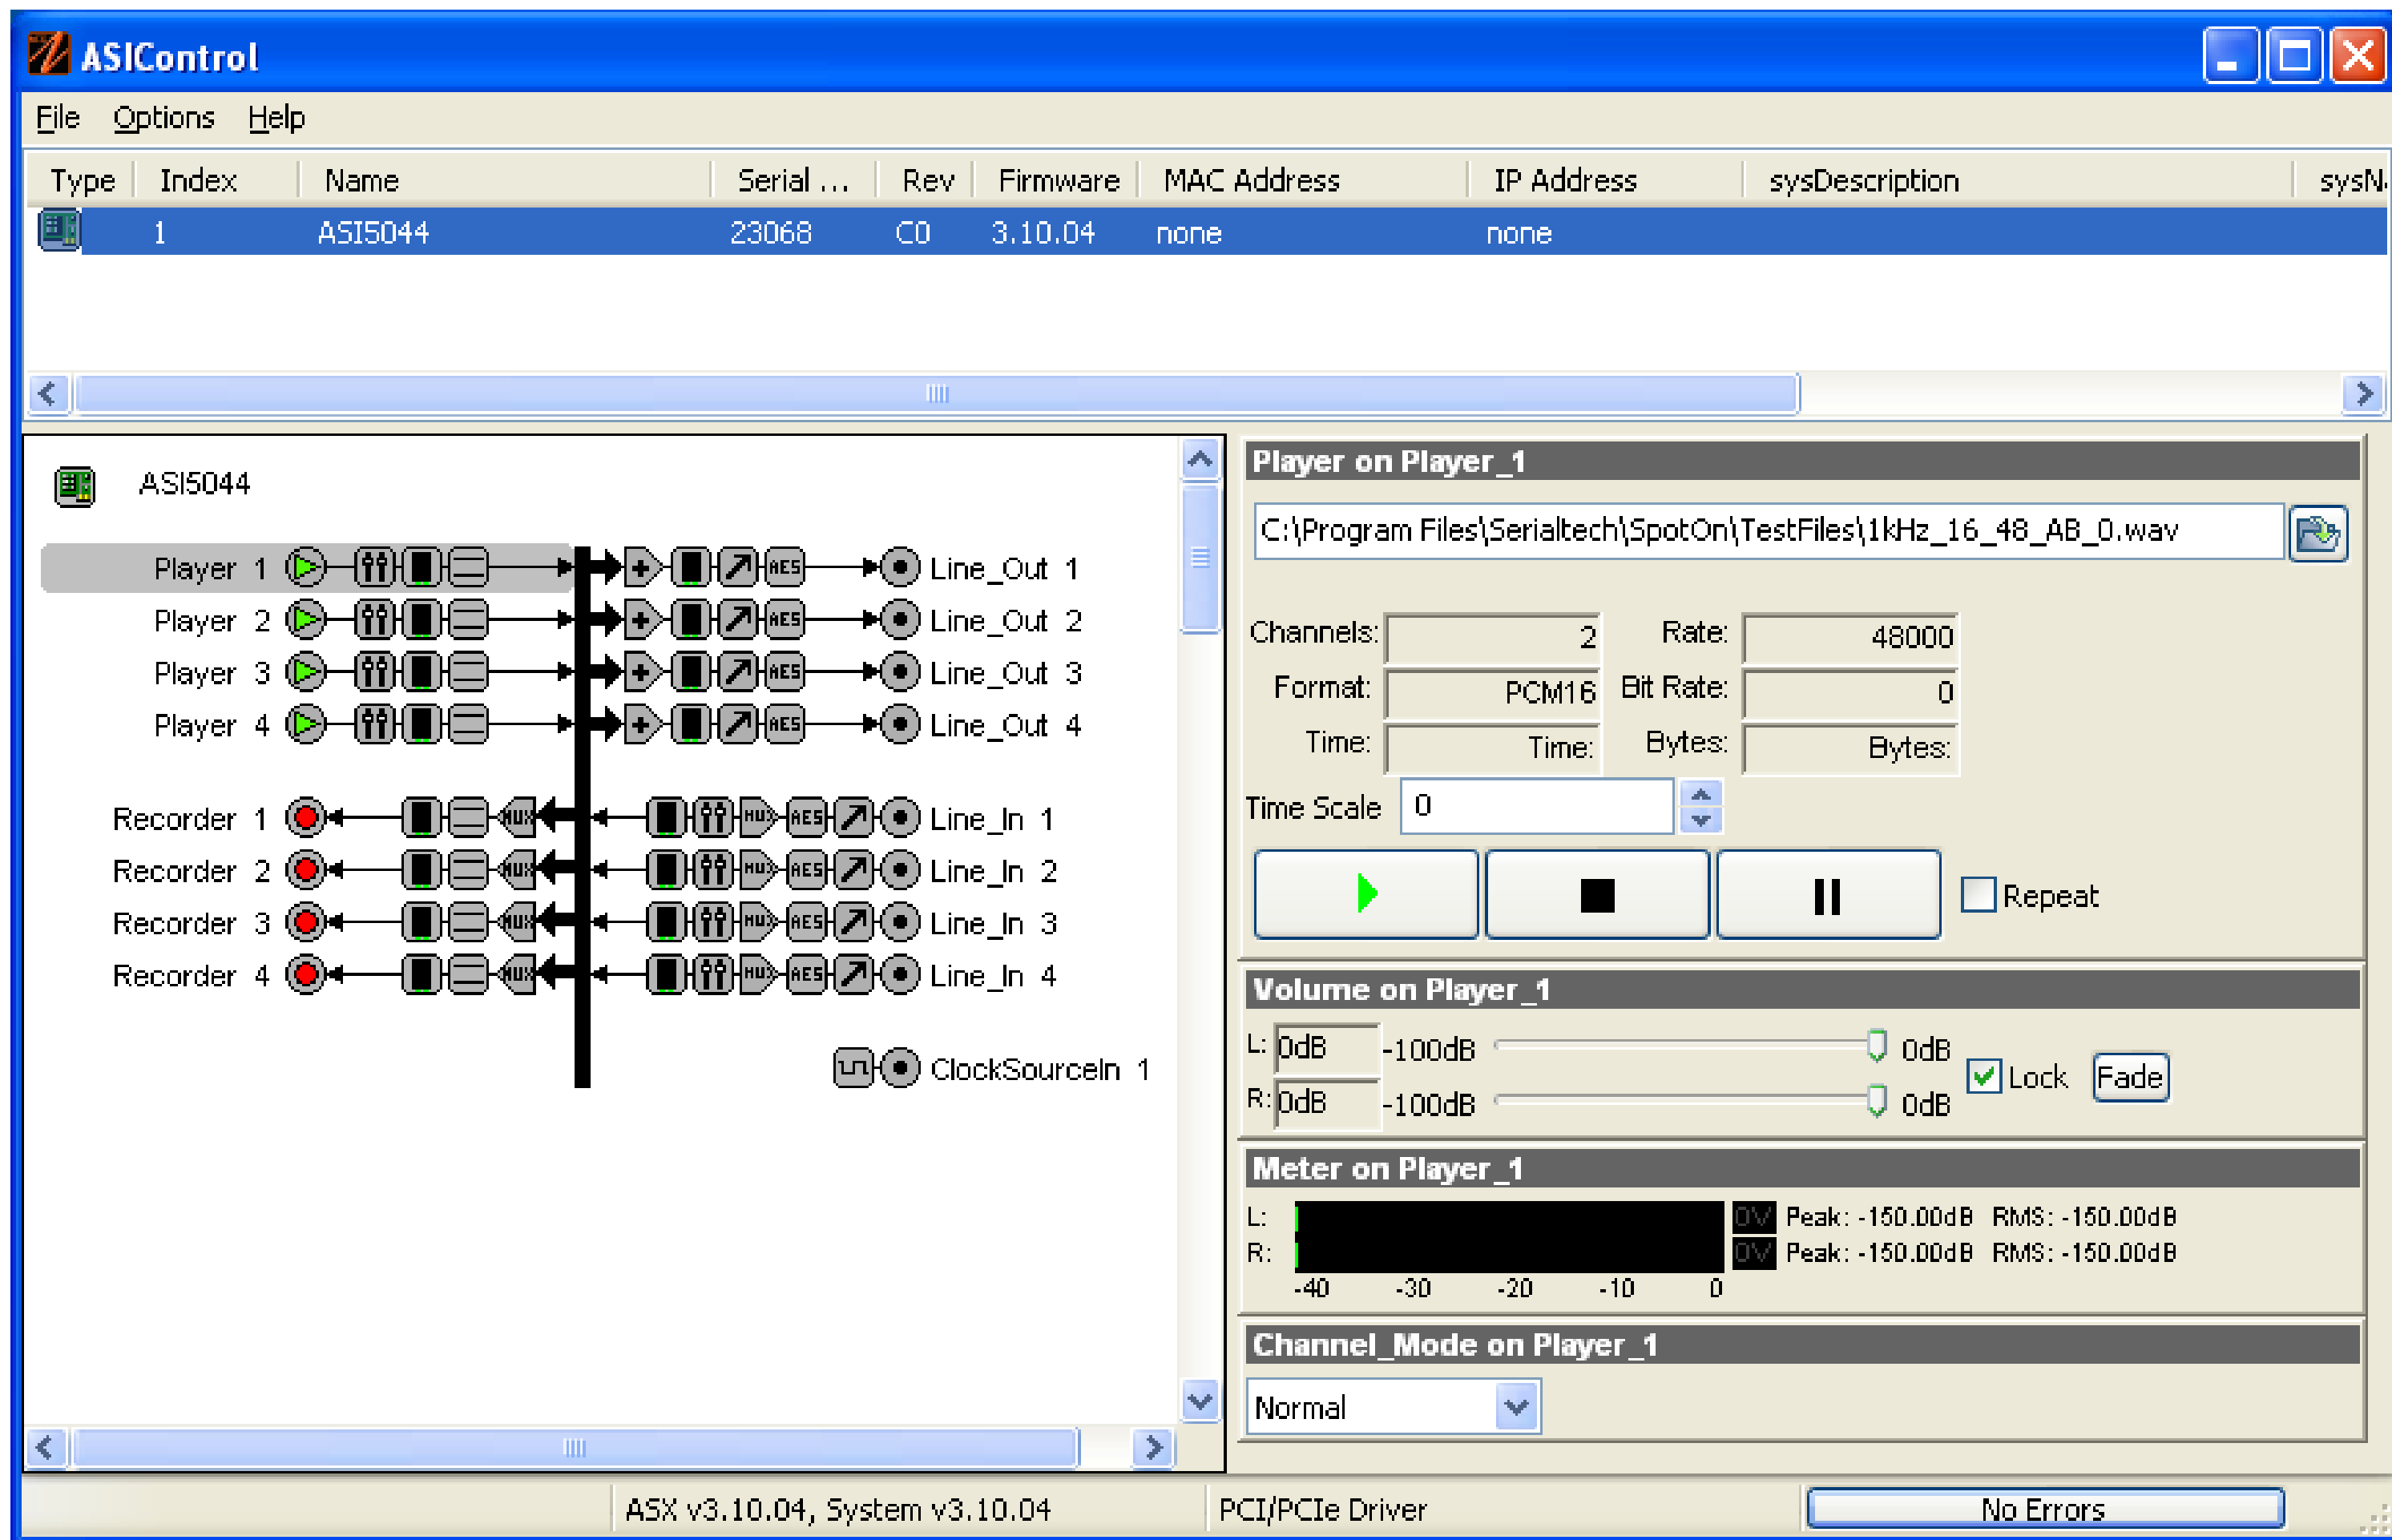

Stereo

In Mode 2 (4 x Stereo) there are four 2 channel devices implemented, designated Player_0, Player_1, Player_2, Player_3, the image below shows the settings for Player_0 (device D), here the volume slider should be set to maximum.

Note the later versions of the driver list the devices starting from 1 not 0

In stereo there are level controls for the four 2 channel outputs: -

Line_Out_0, Line_Out_1, Line_Out_2, LineOut_3

The audio routed to these outputs is a mix of the input and the four player streams, for use with SpotOn both the volume slider for Player_0 should be set to maximum on Line_Out_0 with sliders for Player_1, Player_2, Player_3 set to zero.

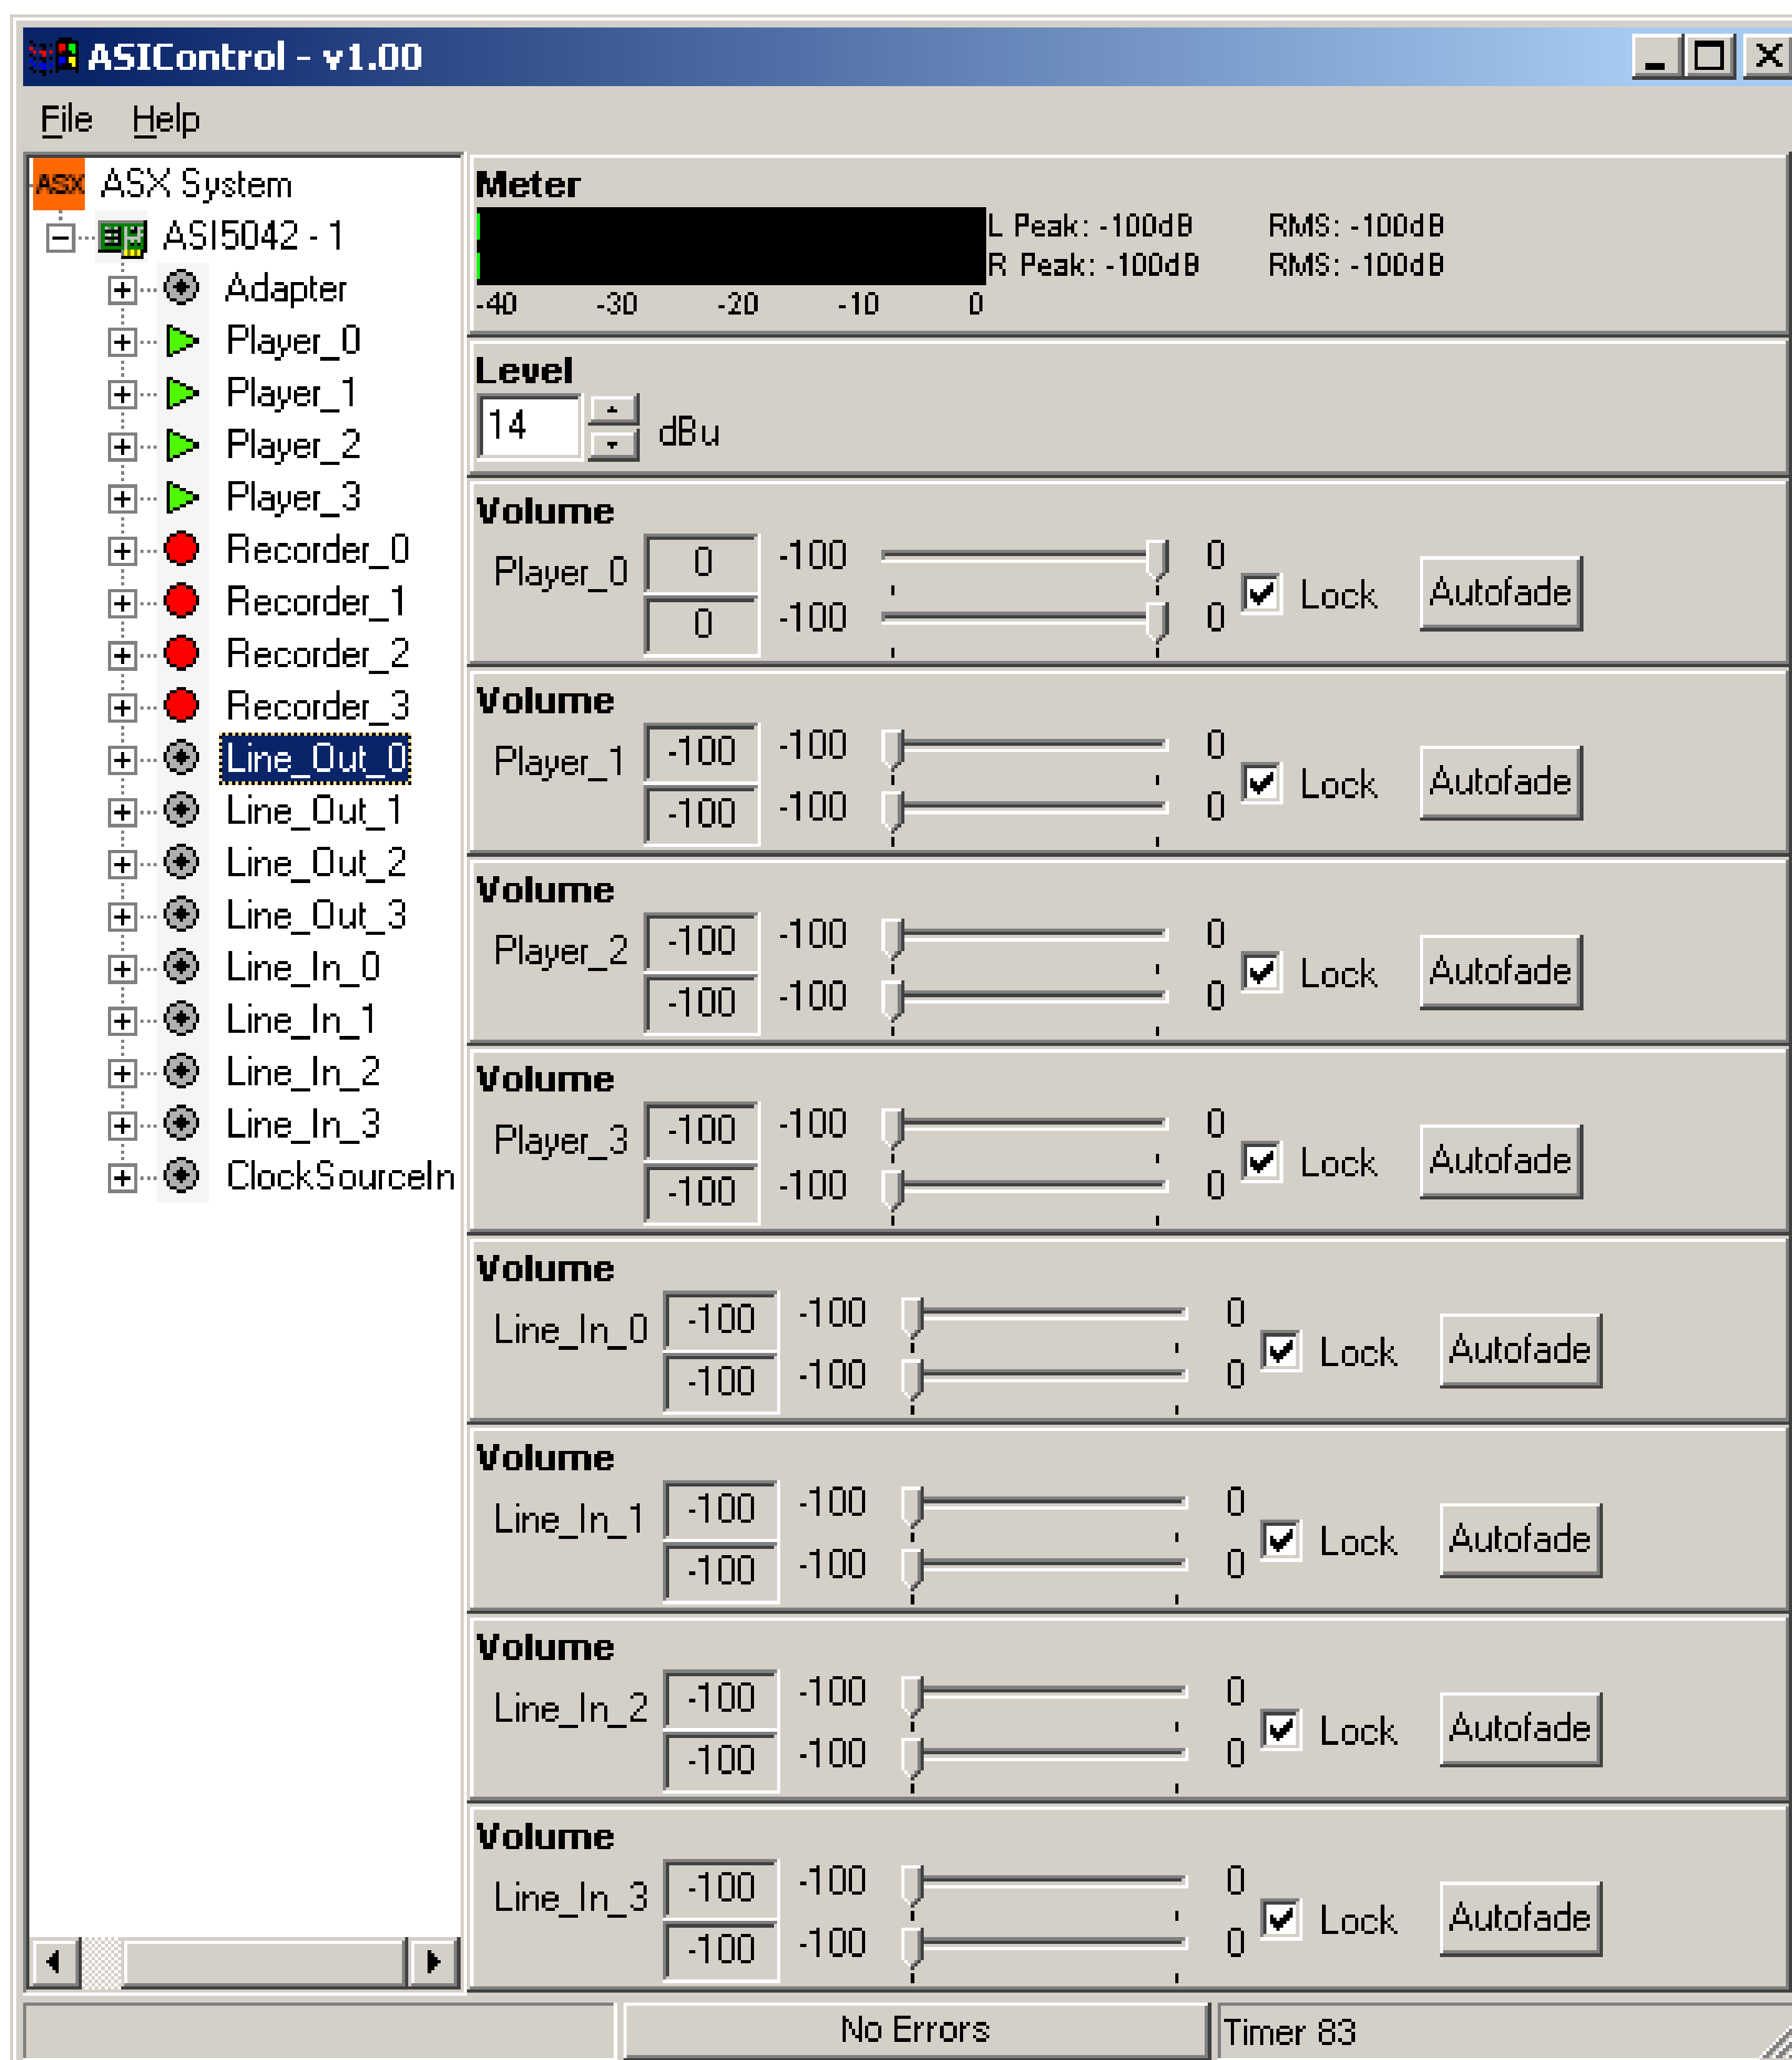

Similarly for: -

Line_Out_1 ... Player_1 slider should be at maximum and sliders for Player_0, Player_2, Player_3 at zero

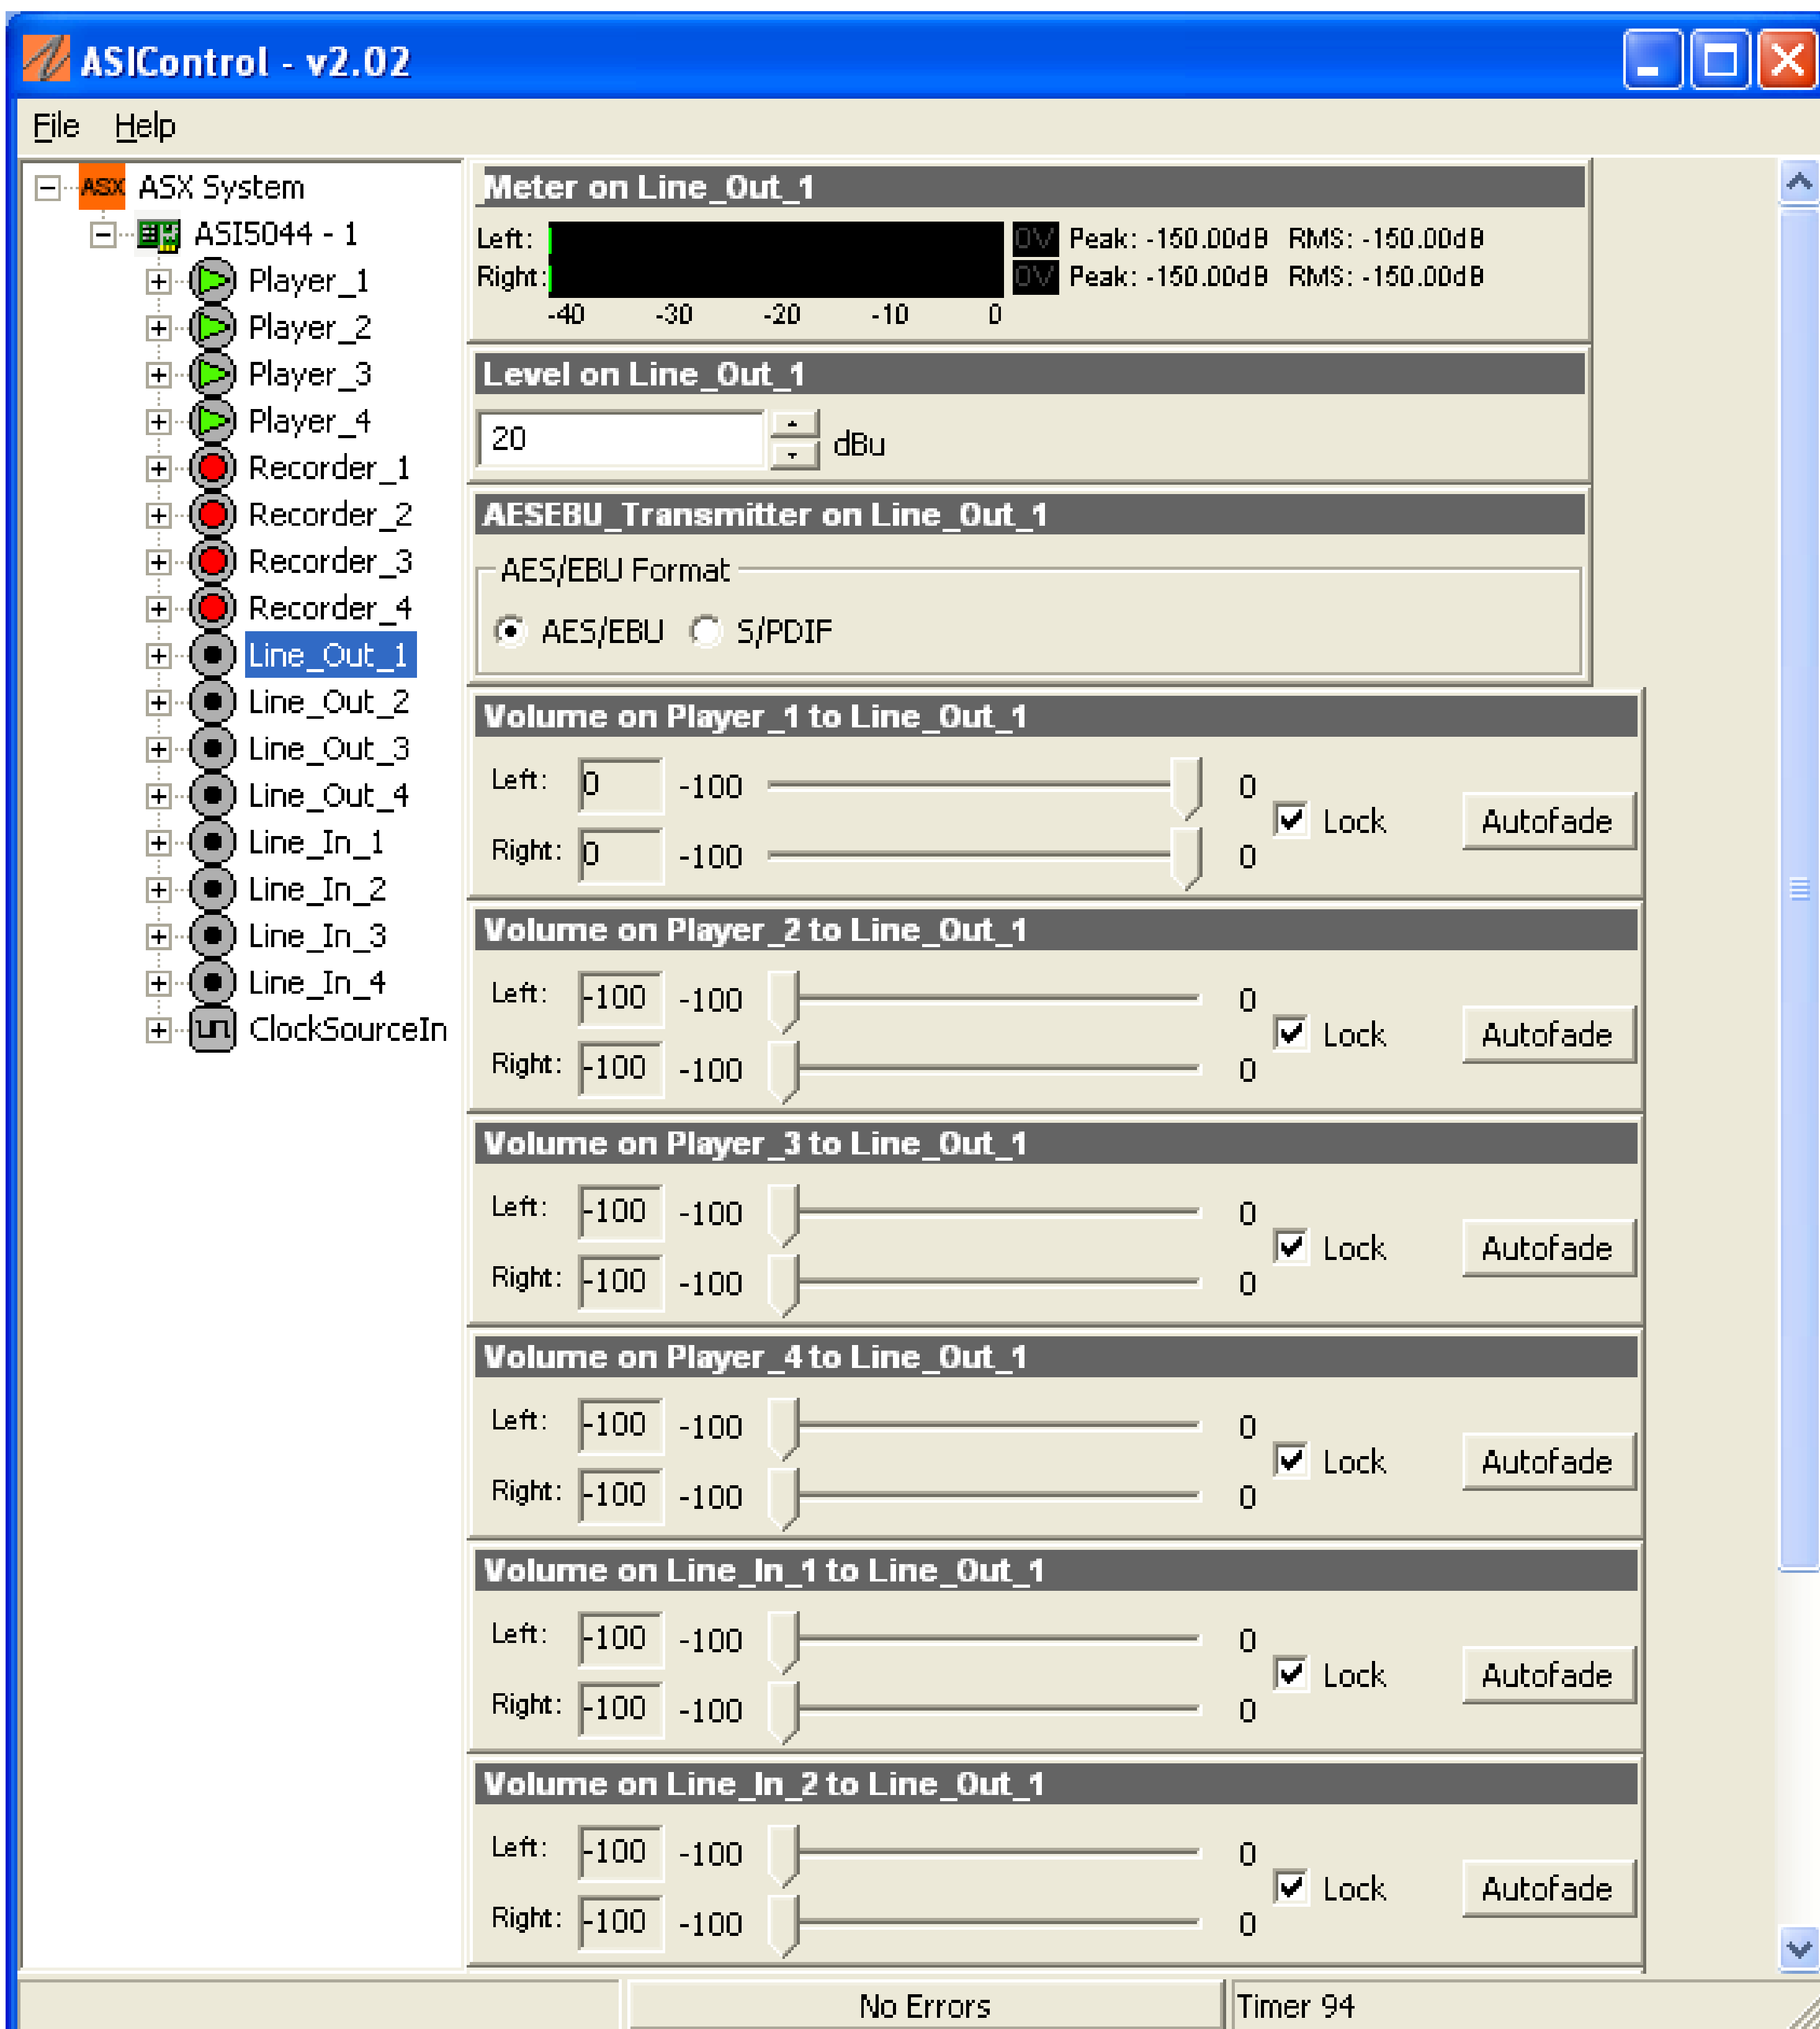

Line_Out_2 ... Player_2 slider should be at maximum and sliders for Player_0, Player_1, Player_3 at zero

Line_Out_3 ... Player_3 slider should be at maximum and sliders for Player_0, Player_1, Player_2 at zero

The settings for Line_Out_0 are shown below.

Note the later versions of the driver list the devices starting from 1 not 0

DigiGram VX422

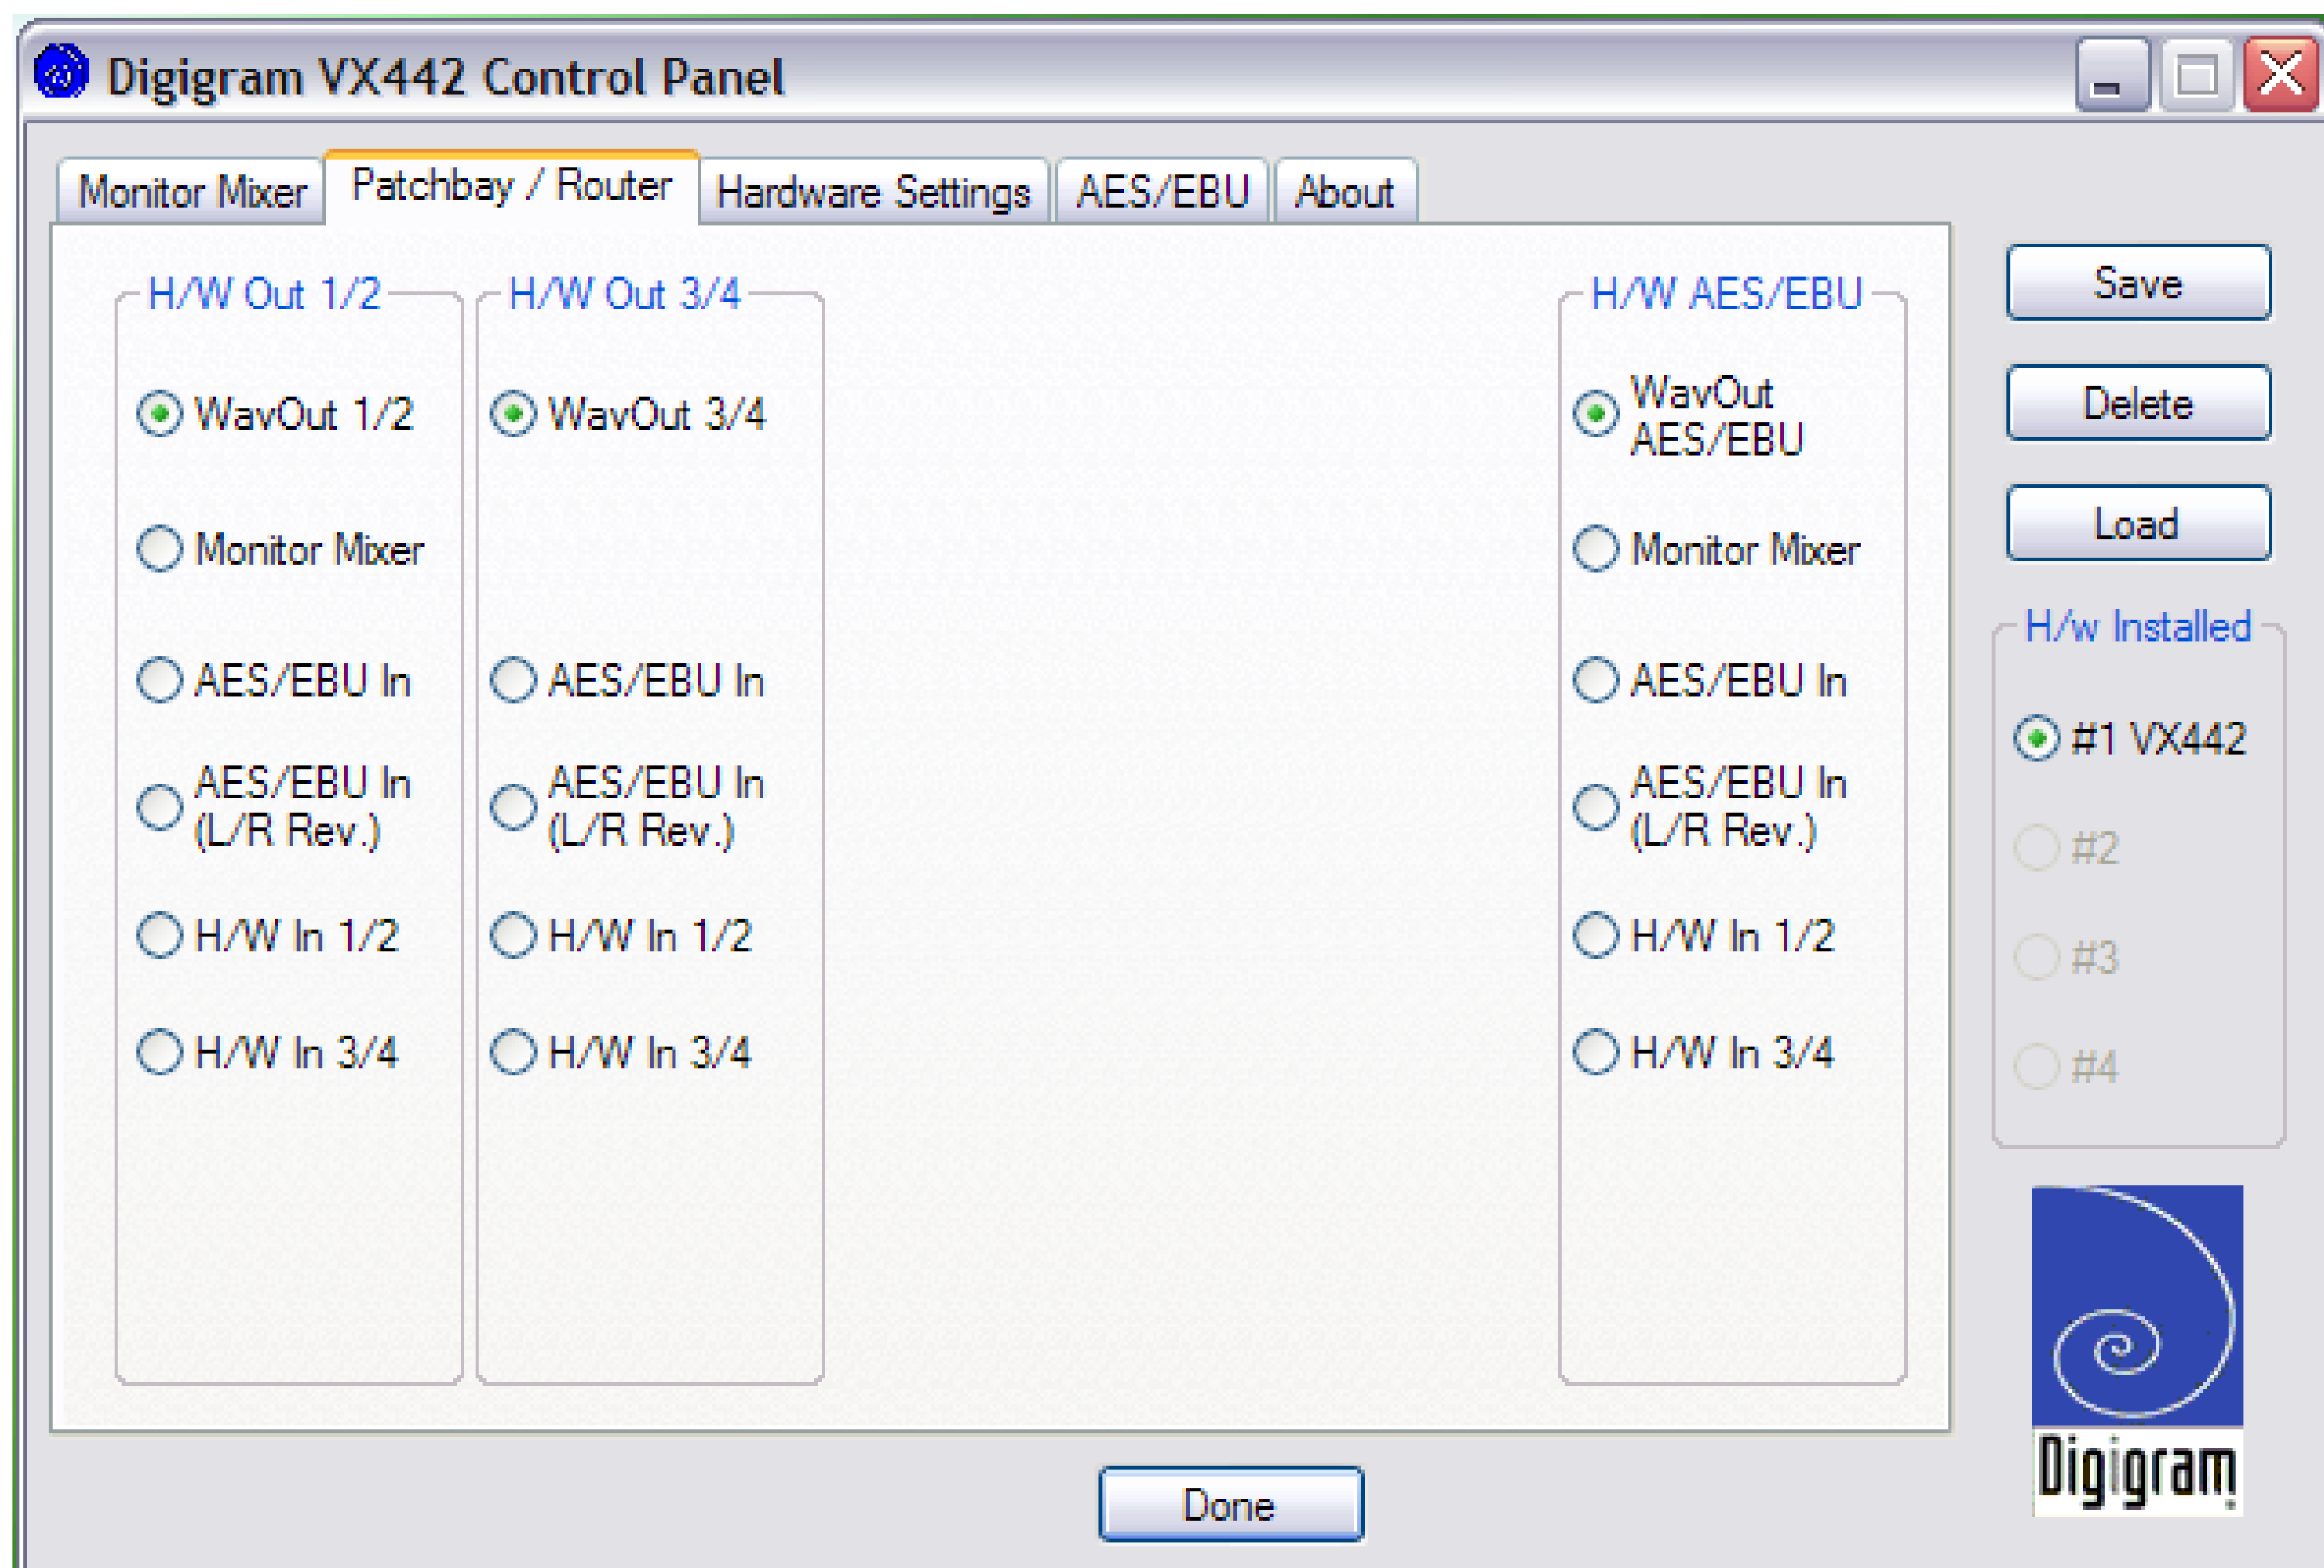

The DigiGram VX422 sound card is an 6 output card and is configured with 3 x 2 channel o/ps, these outputs are referred to as WavOut 1/2, WavOut 3/4 and WavOut AES.

The card is setup via a utility provided by the manufacturers and comprises a main window with five tabbed pages as shown below.

The first tab - Monitor Mixer - sets the contributions of the various output signals into a separate monitor mix, initially it is suggested that this is not used until the system is up and fully working, therefore the settings should be as shown above.

The second tab - Patchbay/Router - allows each hardware output pair to be itself a combination of various inputs, for simplicity the patching should be simple where only WavOut 1/2 is patched to H/W out 1/2 and WavOut 3/4 is patched to H/W out 3/4 etc.

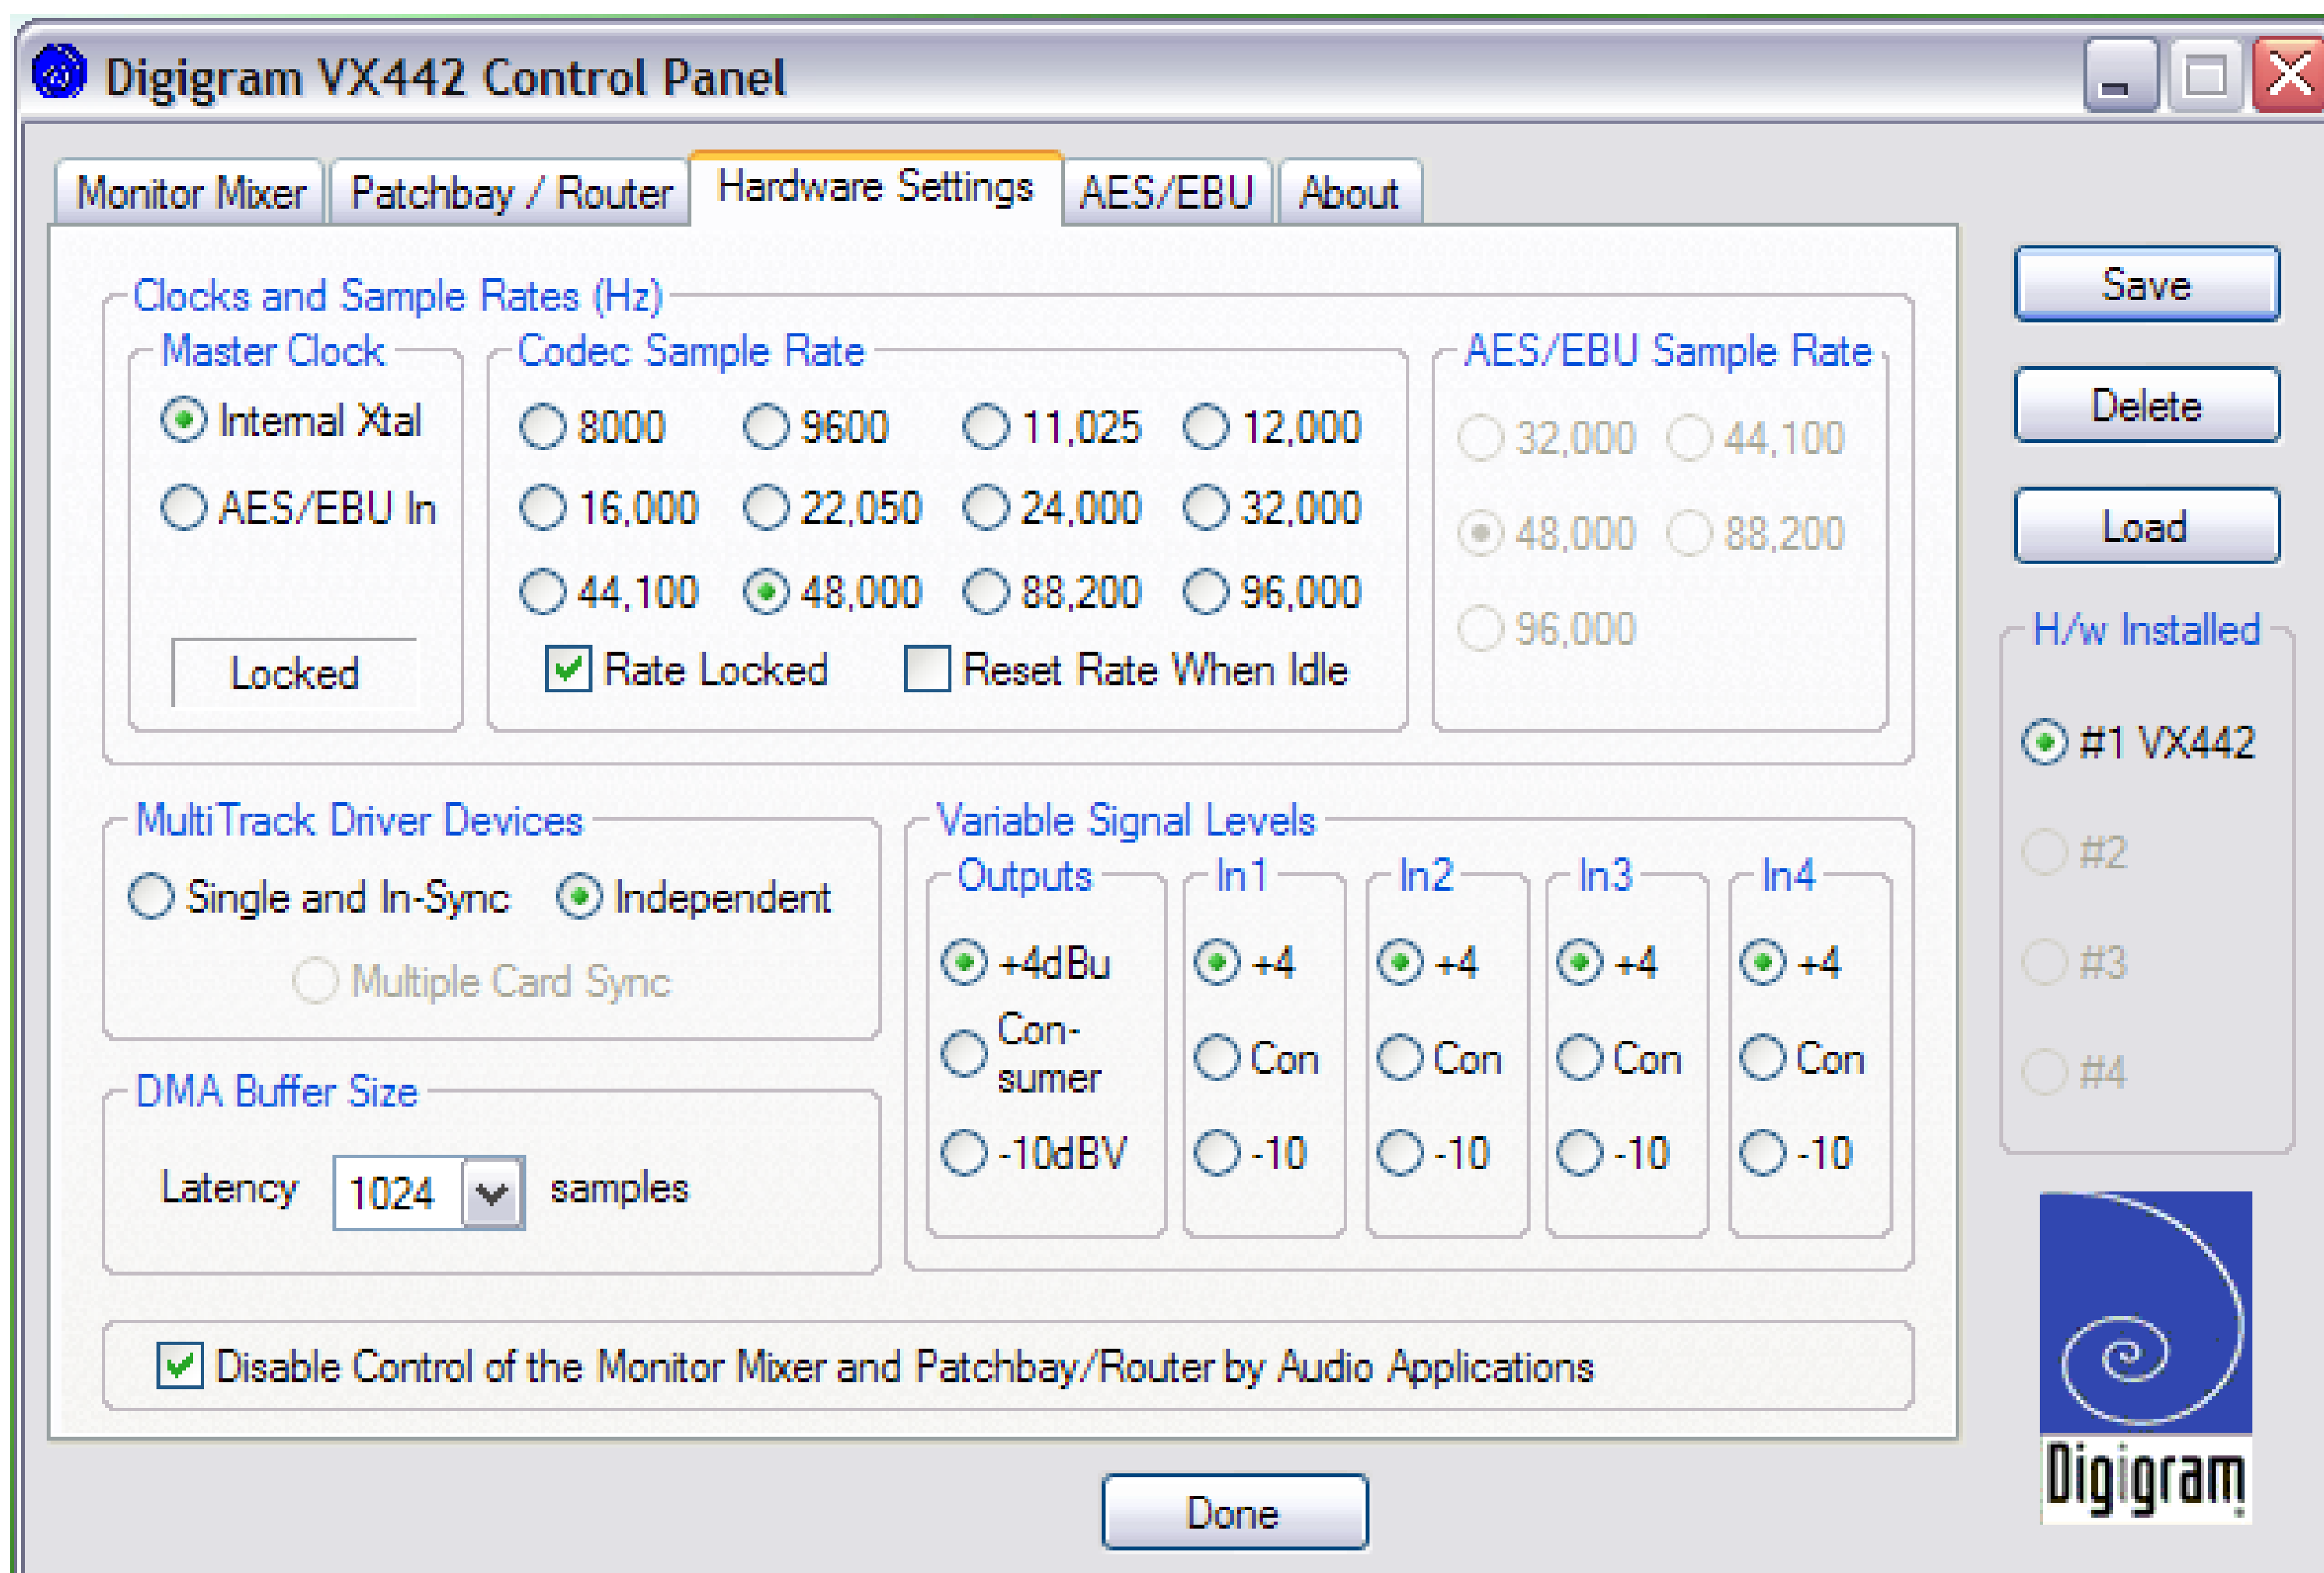

The sample rate and reference settings are made in the third tab, this is the tab where most mistakes are made so it is important to check the following items: -

Master Clock = Internal Xtal

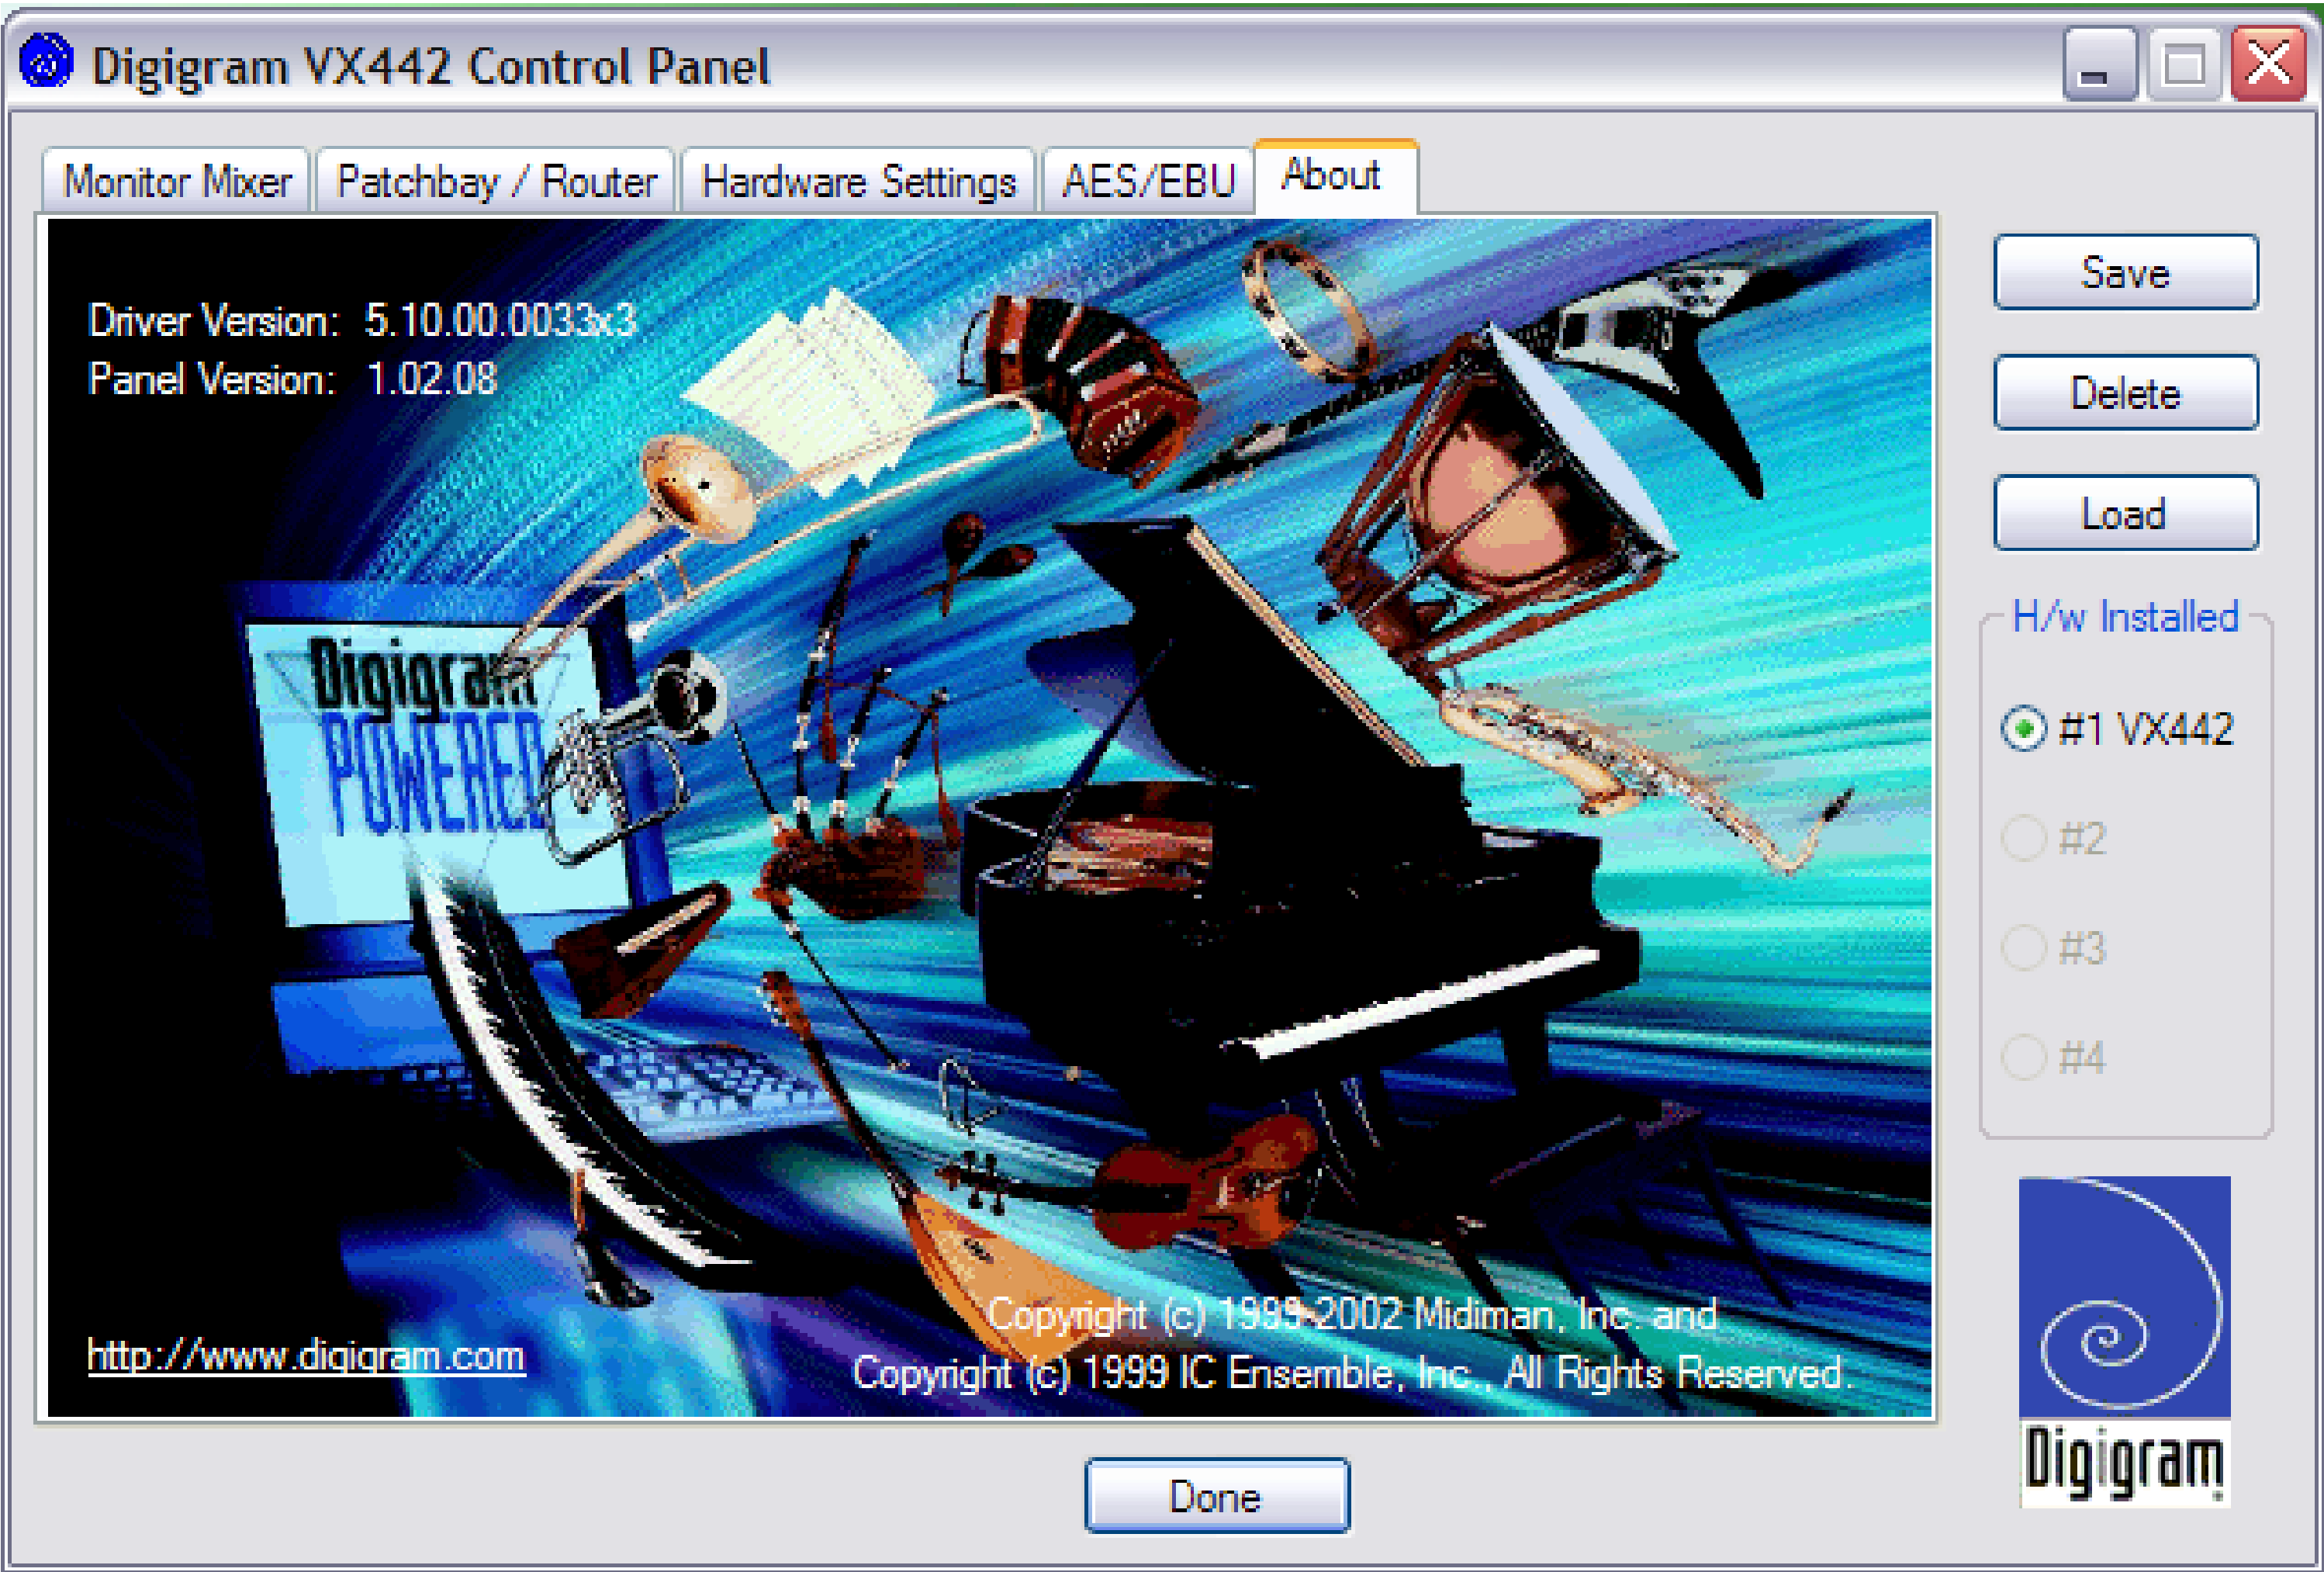

Codec Sample Rate = 44,100 or 48,000 as suits the installation with the 'Rate Locked' option checked

MultiTrack Driver Devices = Independent

DMA Buffer Size (latency) = 1024

The final tab is the DigiGram About screen

The card presents itself to SpotOn as 4 entries in the Output Devices list in the case below appearing as o/ps A..D: -

Only the first three outputs are required so o/ps D and E have been masked out and are

shown in red text.

Gina 3G

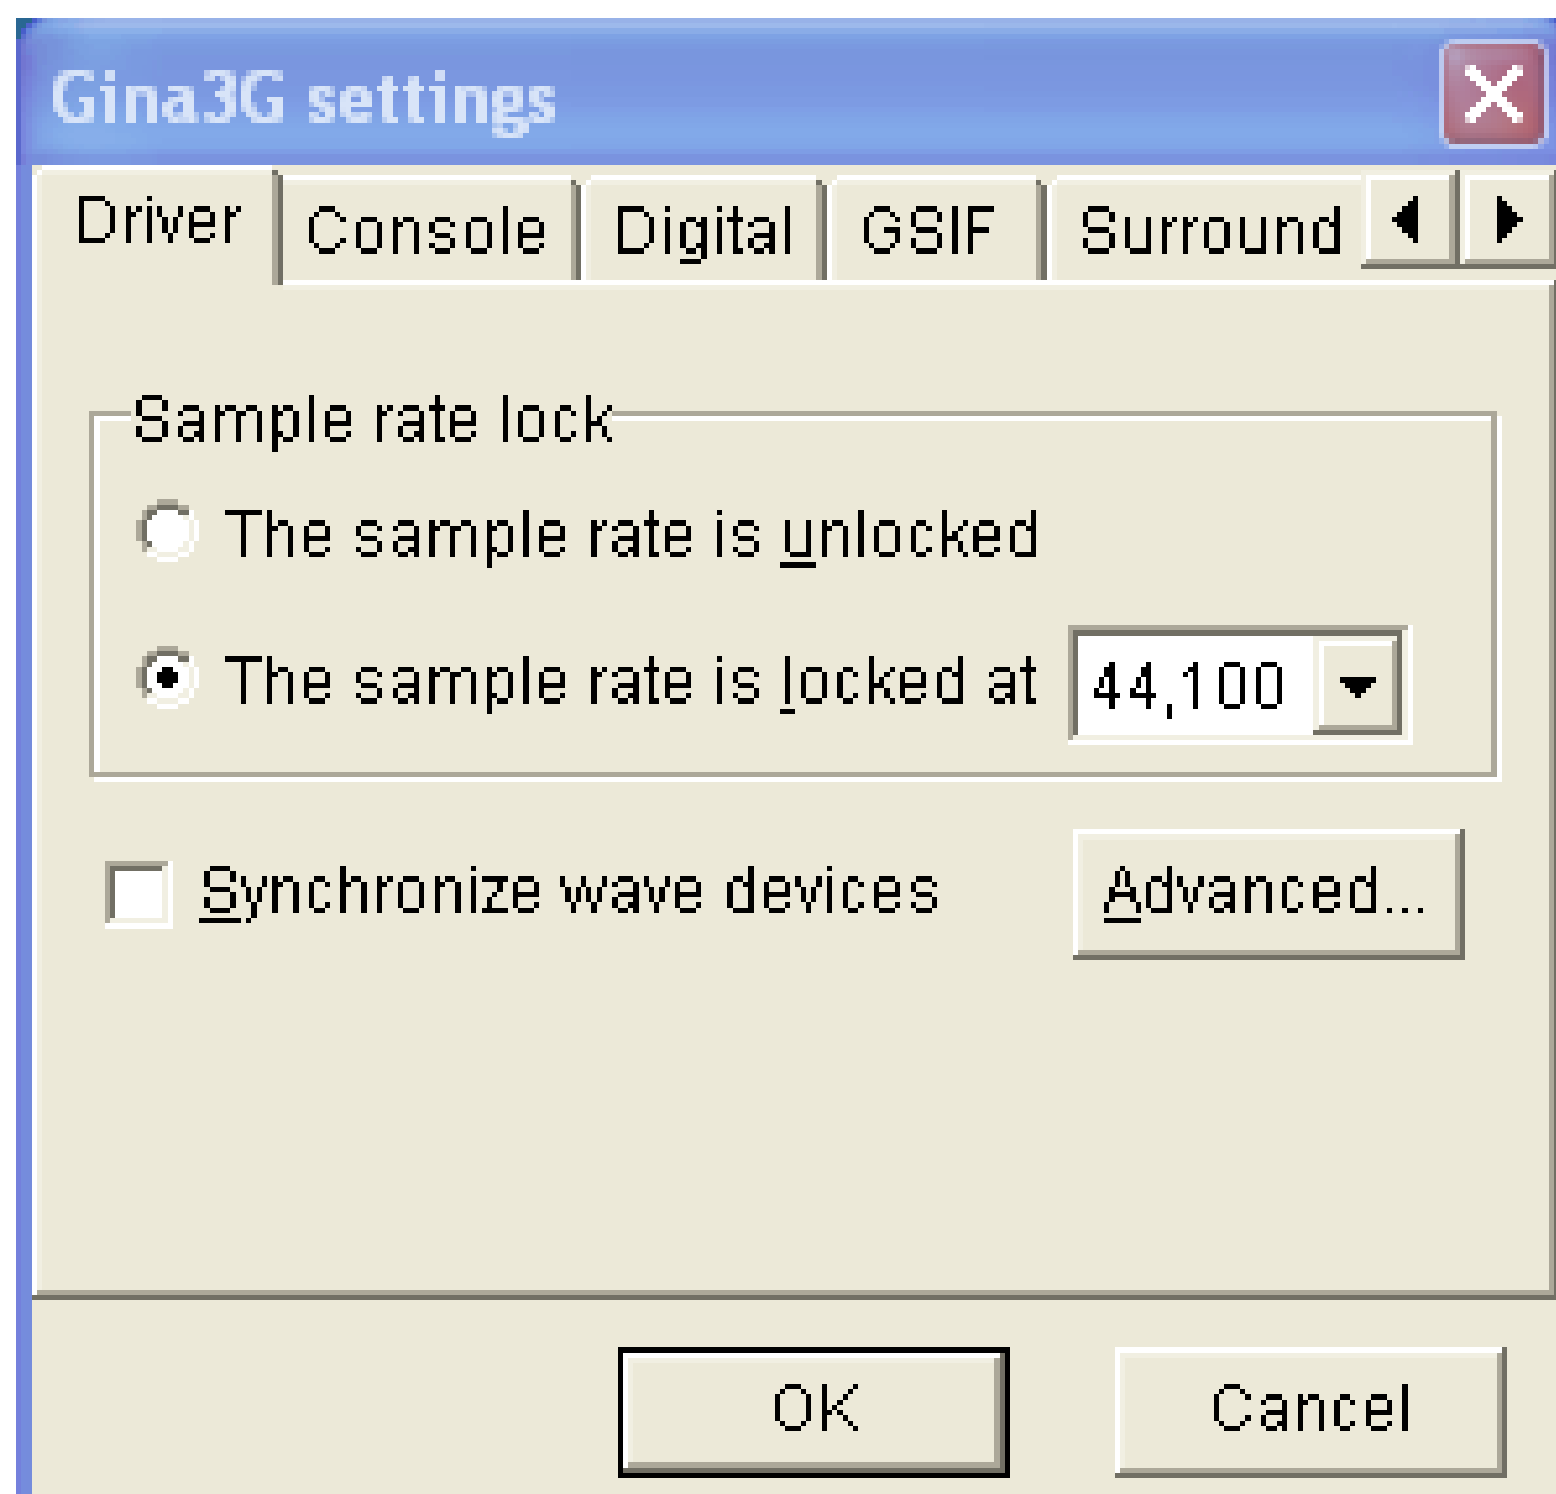

The Echo Gina 3G sound card is an 6 output card and is configured with 3 x 2 channel o/ps, these outputs are referred to as Analog out 1-2, Analog out 3-4 and Analog out 5-6

The card is setup via a utility provided by the manufacturers and comprises a main window as shown below.

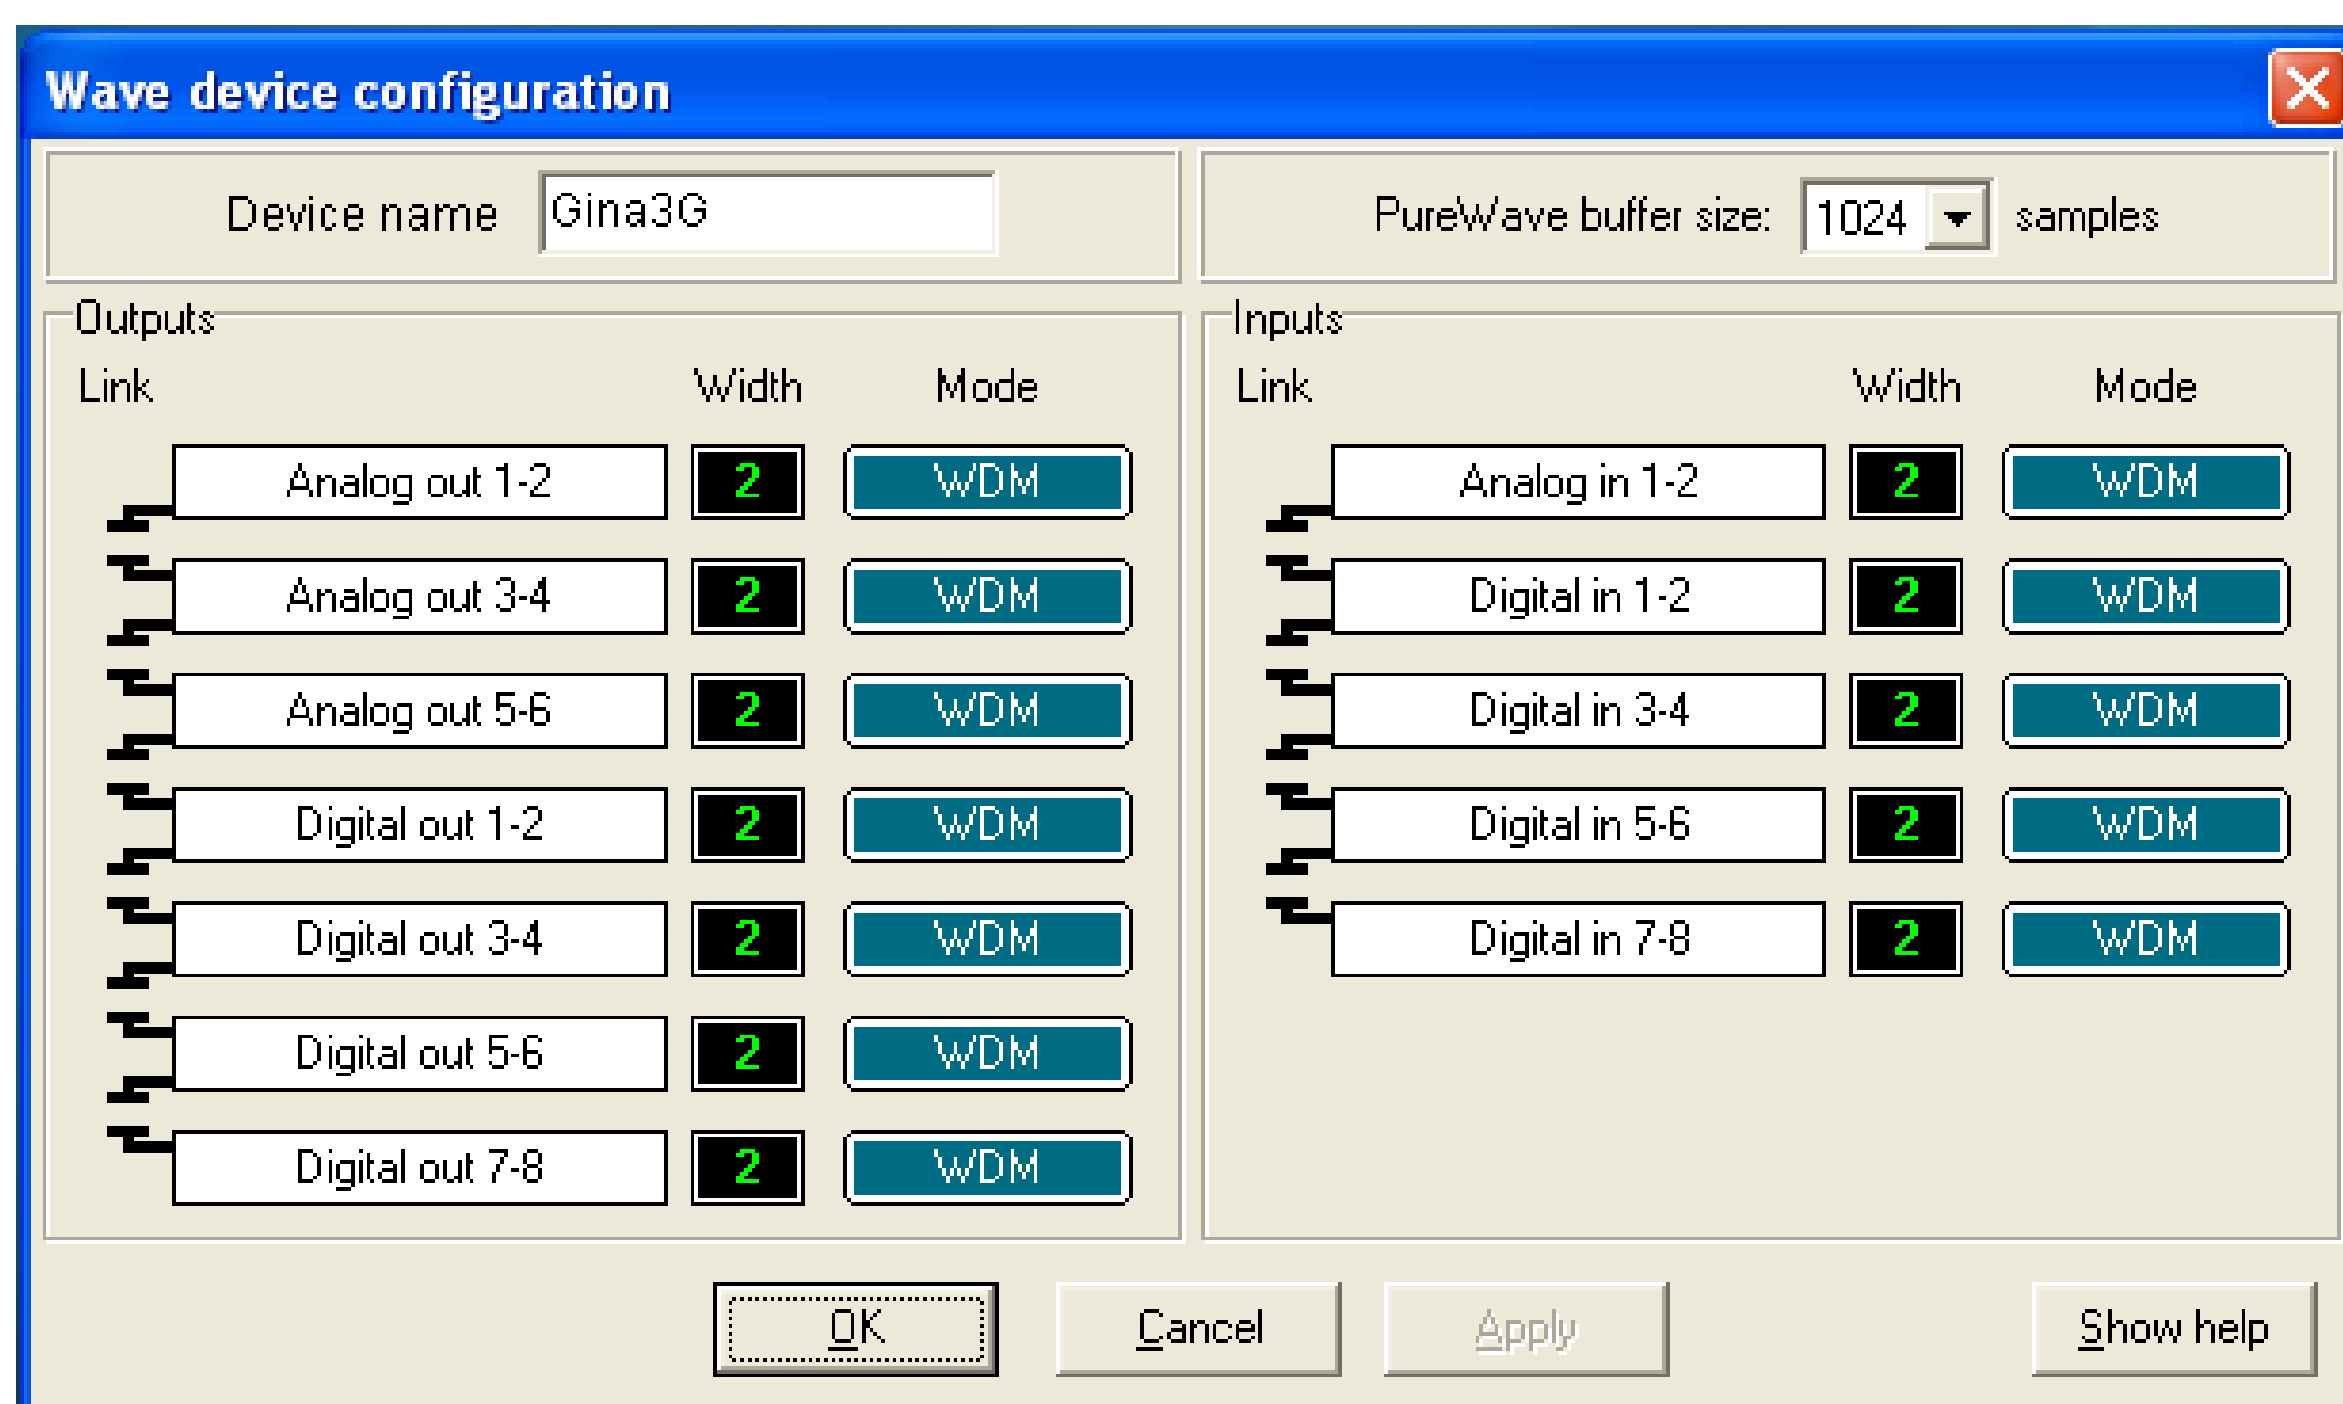

For normal use the faders and options should be as indicated above.

More detailed configuration options are available via the "Settings" button, this brings up a dialog box with 6 tabs.

Clicking on Advanced shows the output device mapping dialog, with the default of 3 stereo outputs.

For multichannel work the card can be used as 1 x 6 channel (5.1) as shown below, the channels are combined by clicking between the two horizontal bars to the left of the white boxes

Show help

For multichannel work the card can be used as 1 x 6 channel (5.1) + 1 x stereo channel as shown below, the channels are combined by clicking between the two horizontal bars to the left of the white boxes

The card presents itself to SpotOn as 8 entries in the Output Devices list in the case below appearing as o/ps A..H: -

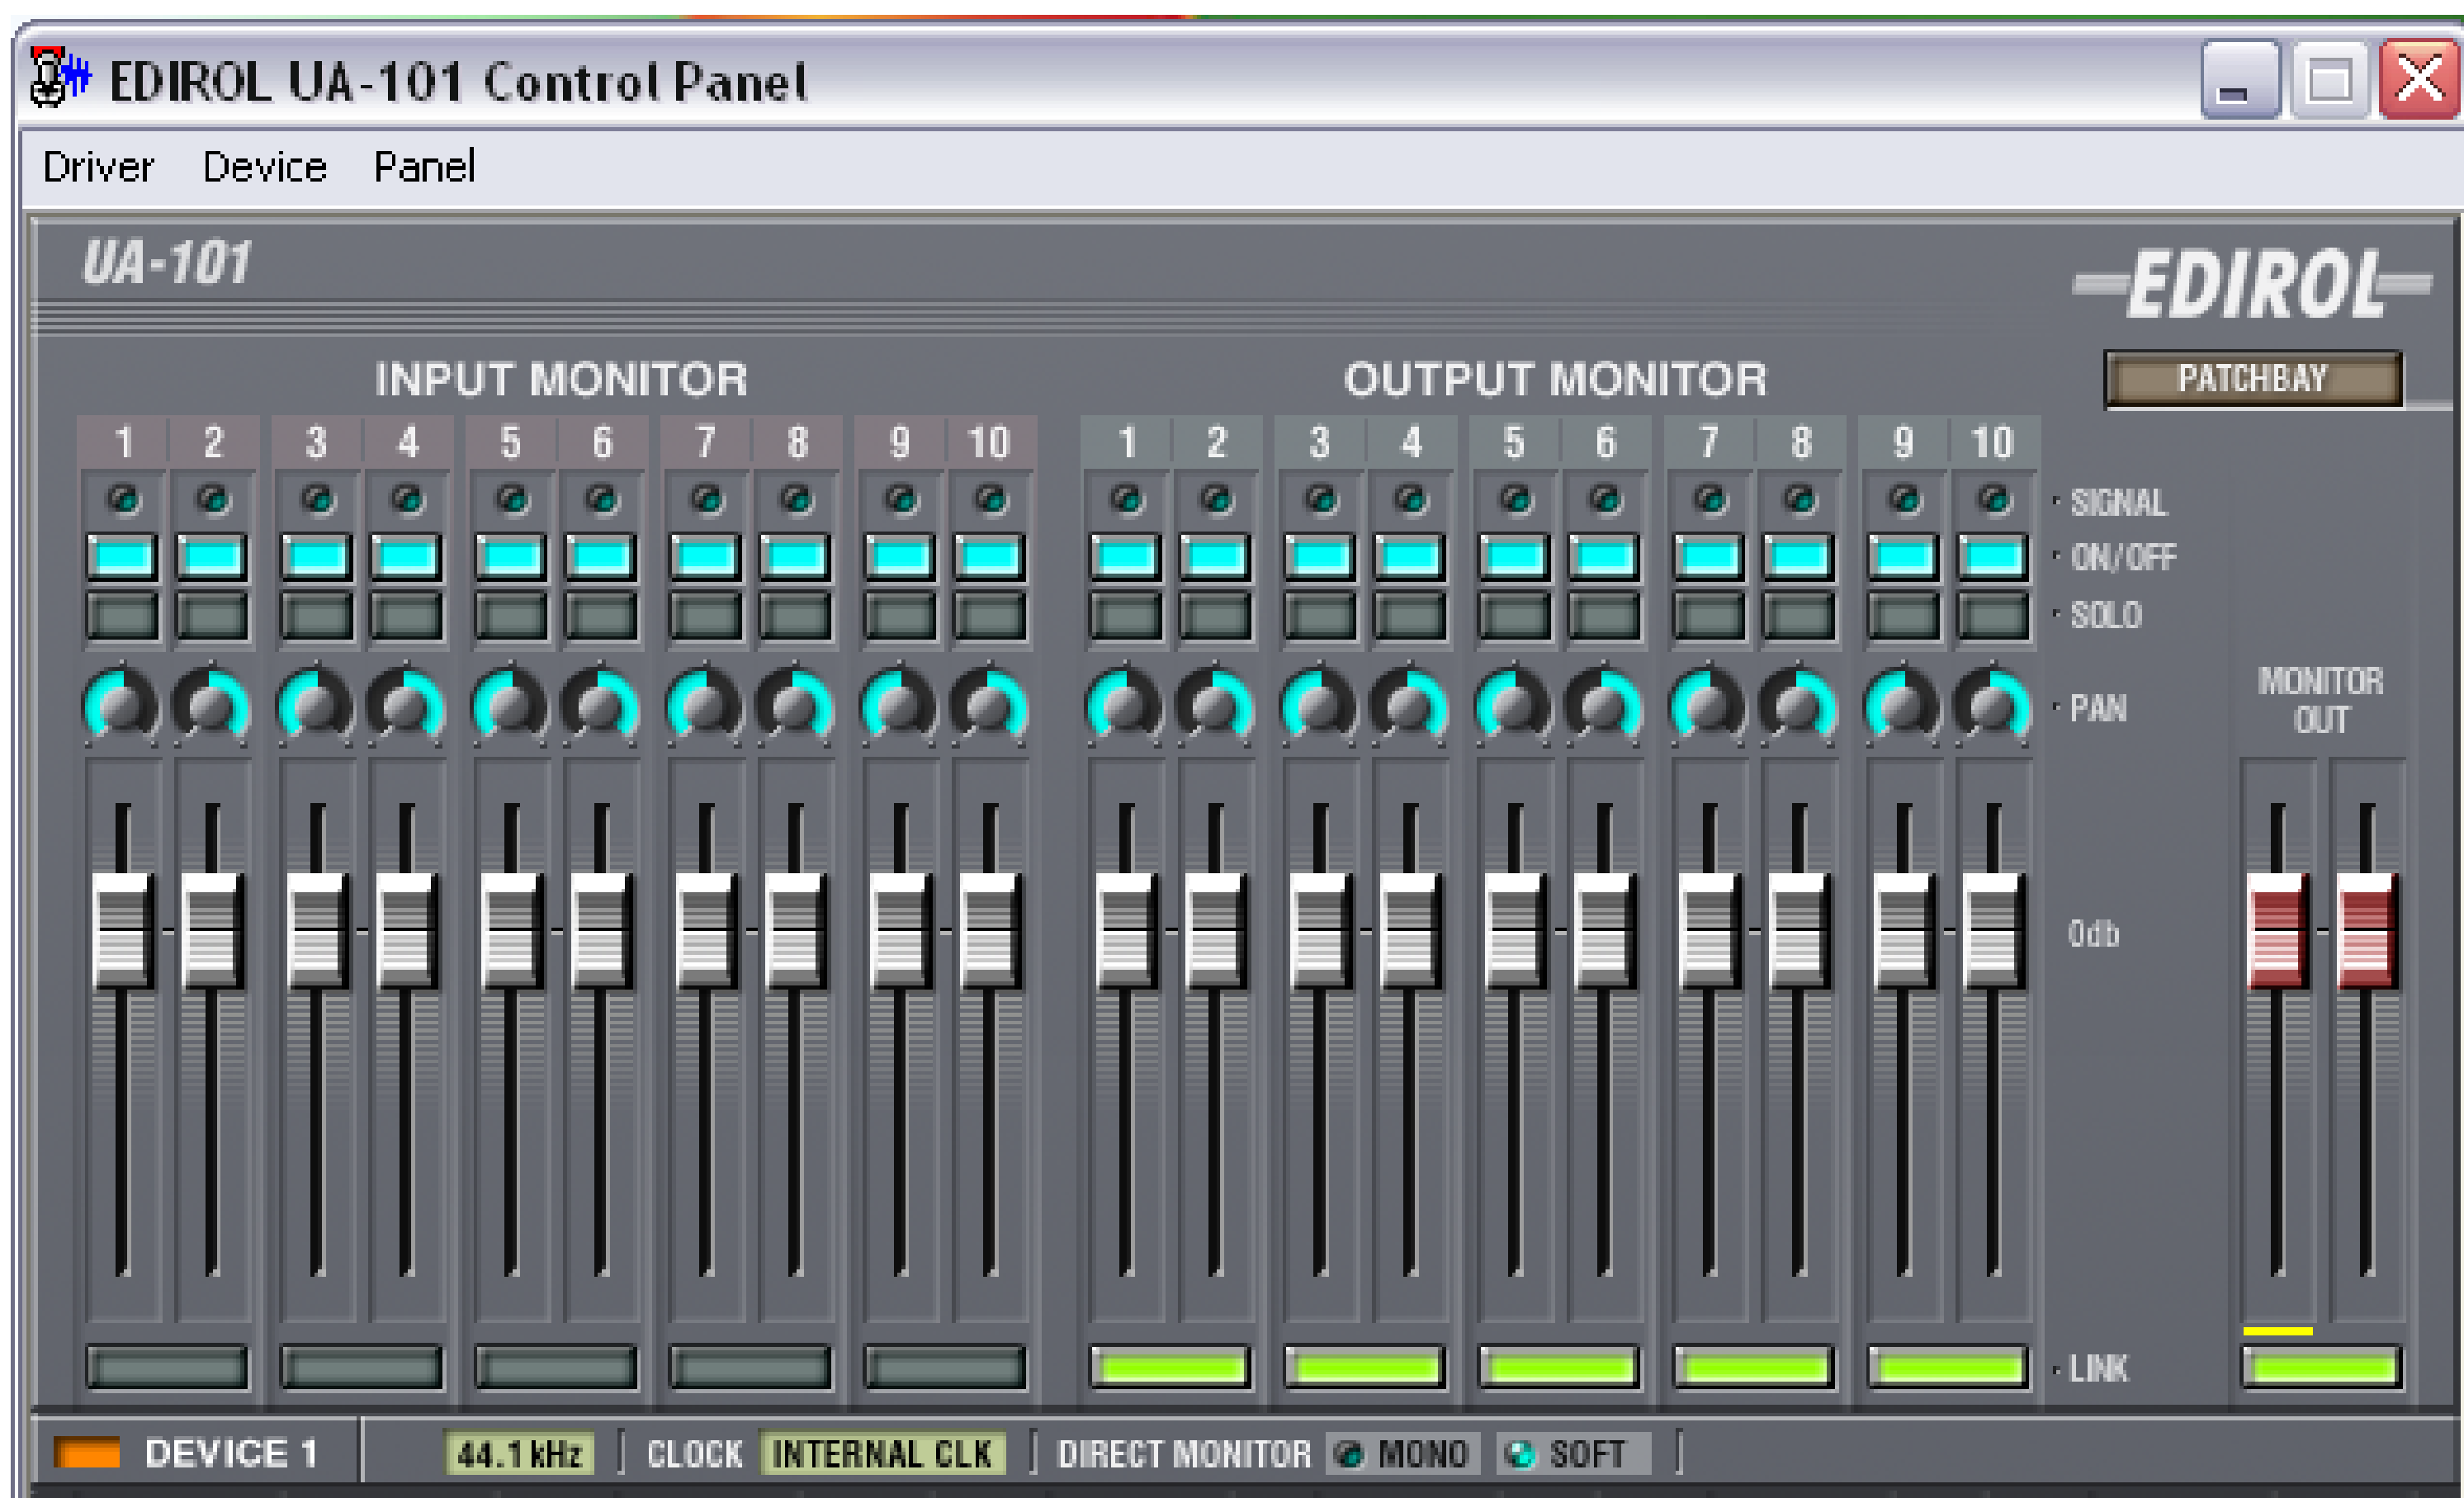

Edirol UA-101/UA-25

UA-101

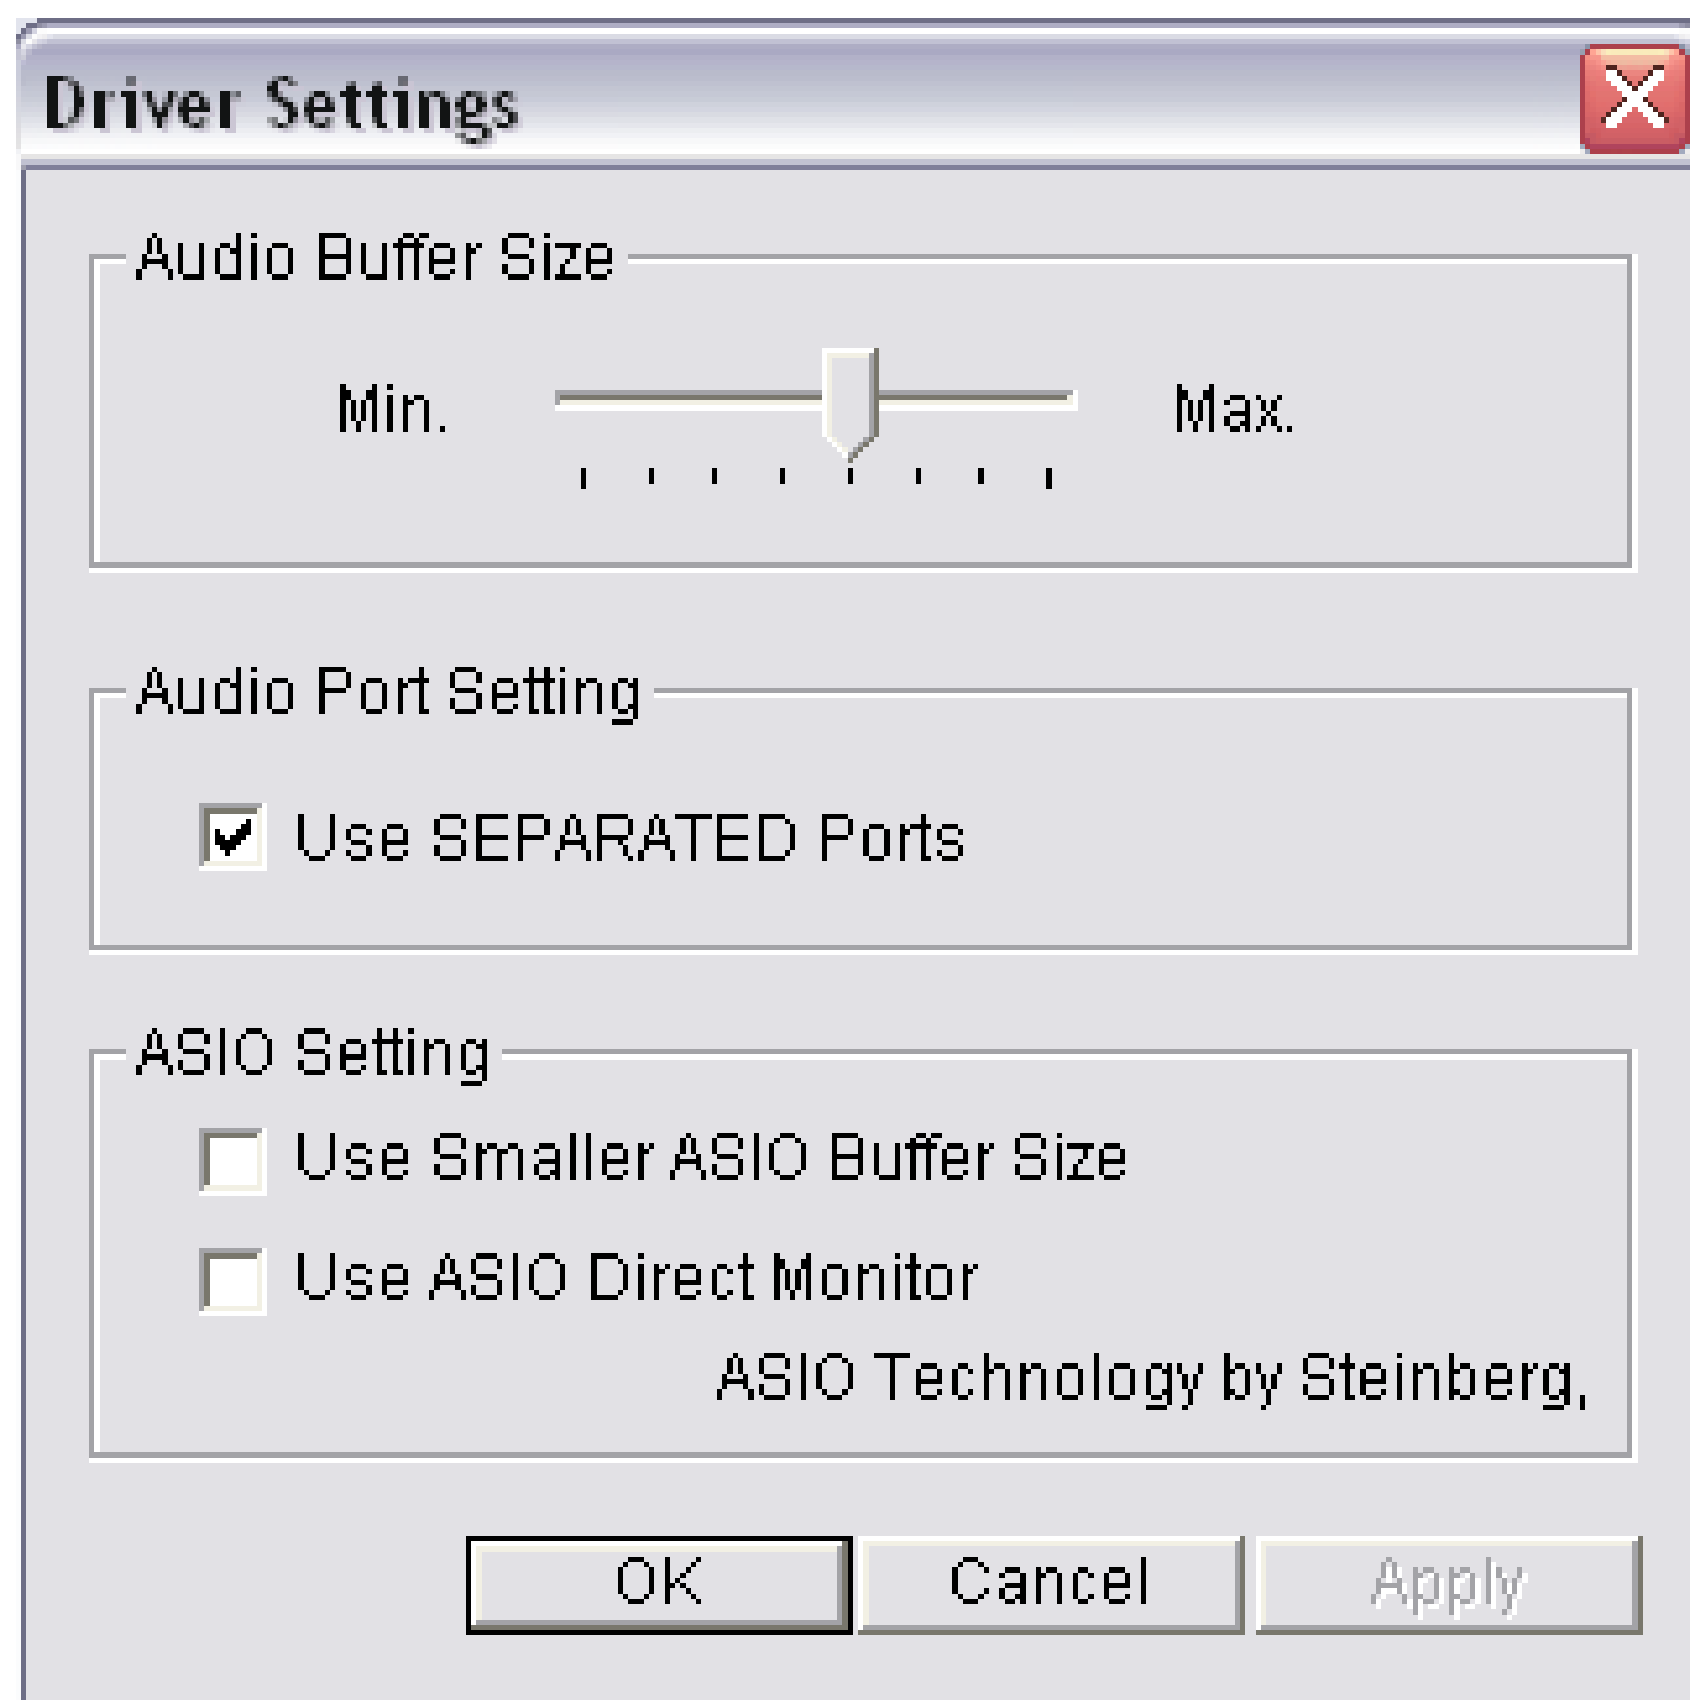

The Edirol UA-101 is a USB 2.0 soundcard with four analogue stereo outputs and a Midi In/Out interface.

Once the driver for the soundcard has been loaded and the computer restarted you can access the UA-101 settings from the icon in Windows Control Panel.

To setup the card first select Driver|Driver Settings.

In the Driver Settings dialog box the only item that should be checked is 'Use Separated Ports', all other items should be left unchecked. This allows Windows to access each individual output, however, this feature is only available when using a USB 2.0 compatible port on your computer.

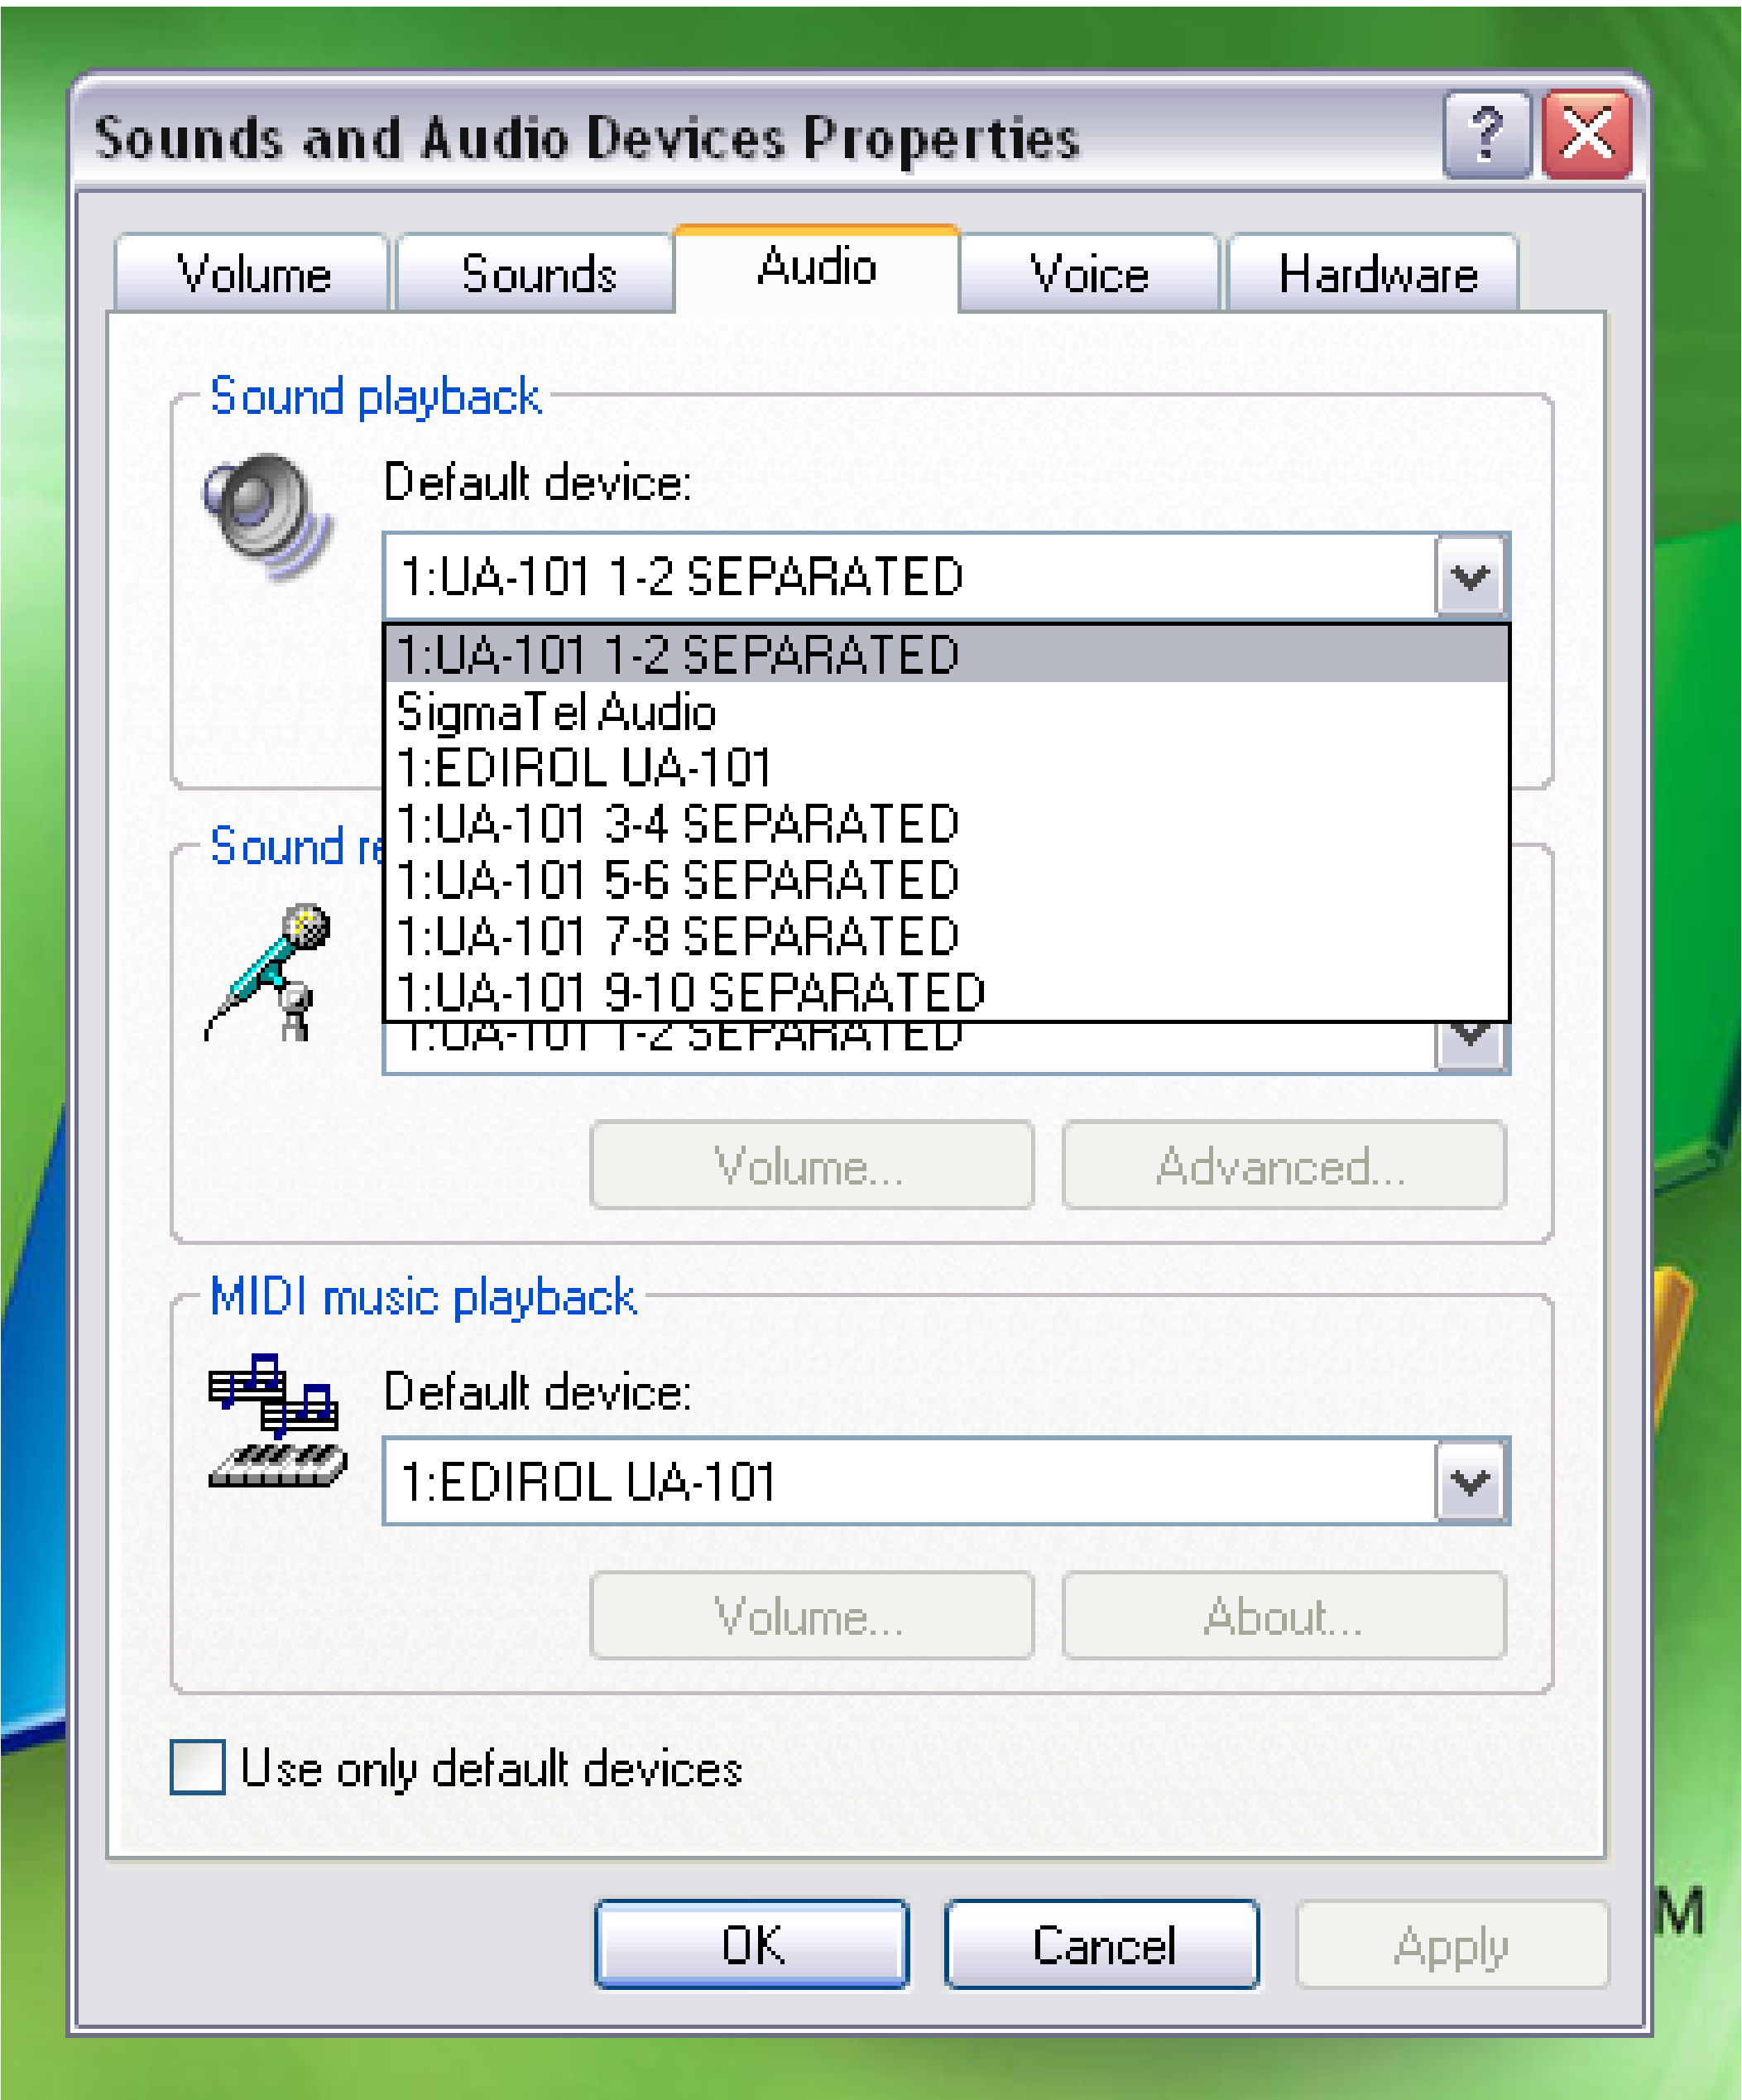

Next go to Device|Set Patch Bay menu

Ensure output patch is set as shown in the picture below, once changes have been made exit out of the UA-101 Control Panel and restart your computer.

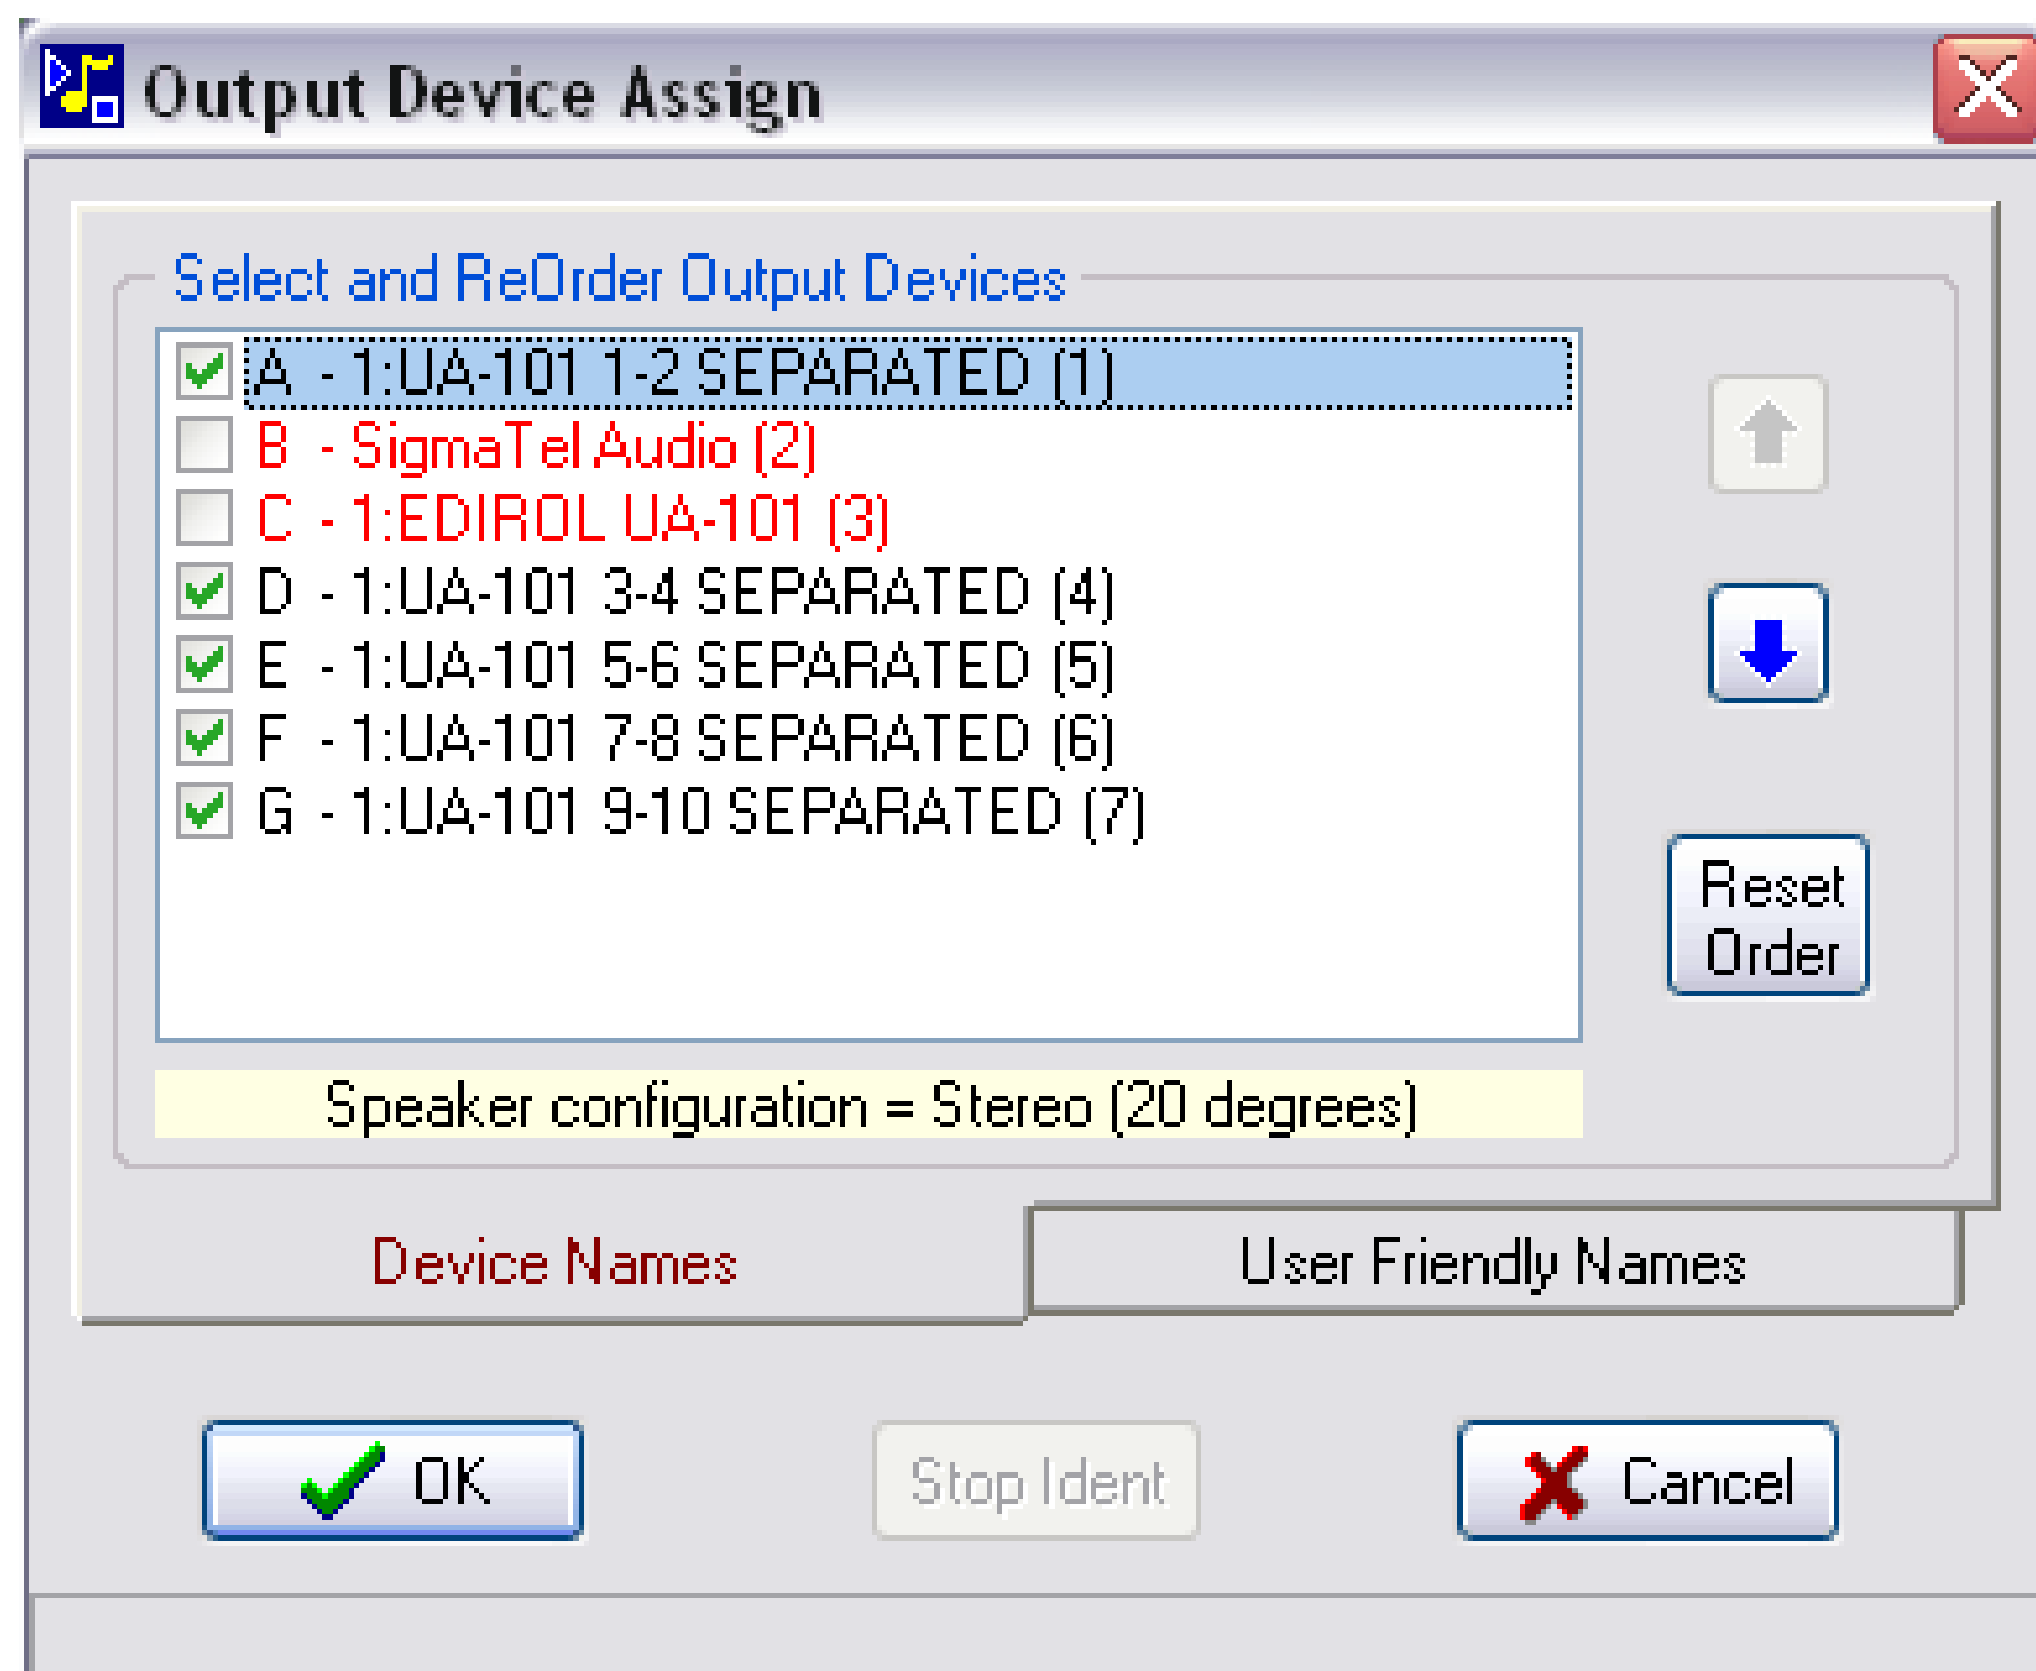

After restarting the computer access the Sounds and Audio Devices Properties icon in the Windows Control Panel.

Set the Sound Playback default device to be 'UA-101 1-2 Separated' .

Next run up SpotOn and go to the Admin menu, select the Output Device Assign item where the audio outputs from the UA-101 soundcard can bereordered.

Typical initial order is shown below

After reordering outputs

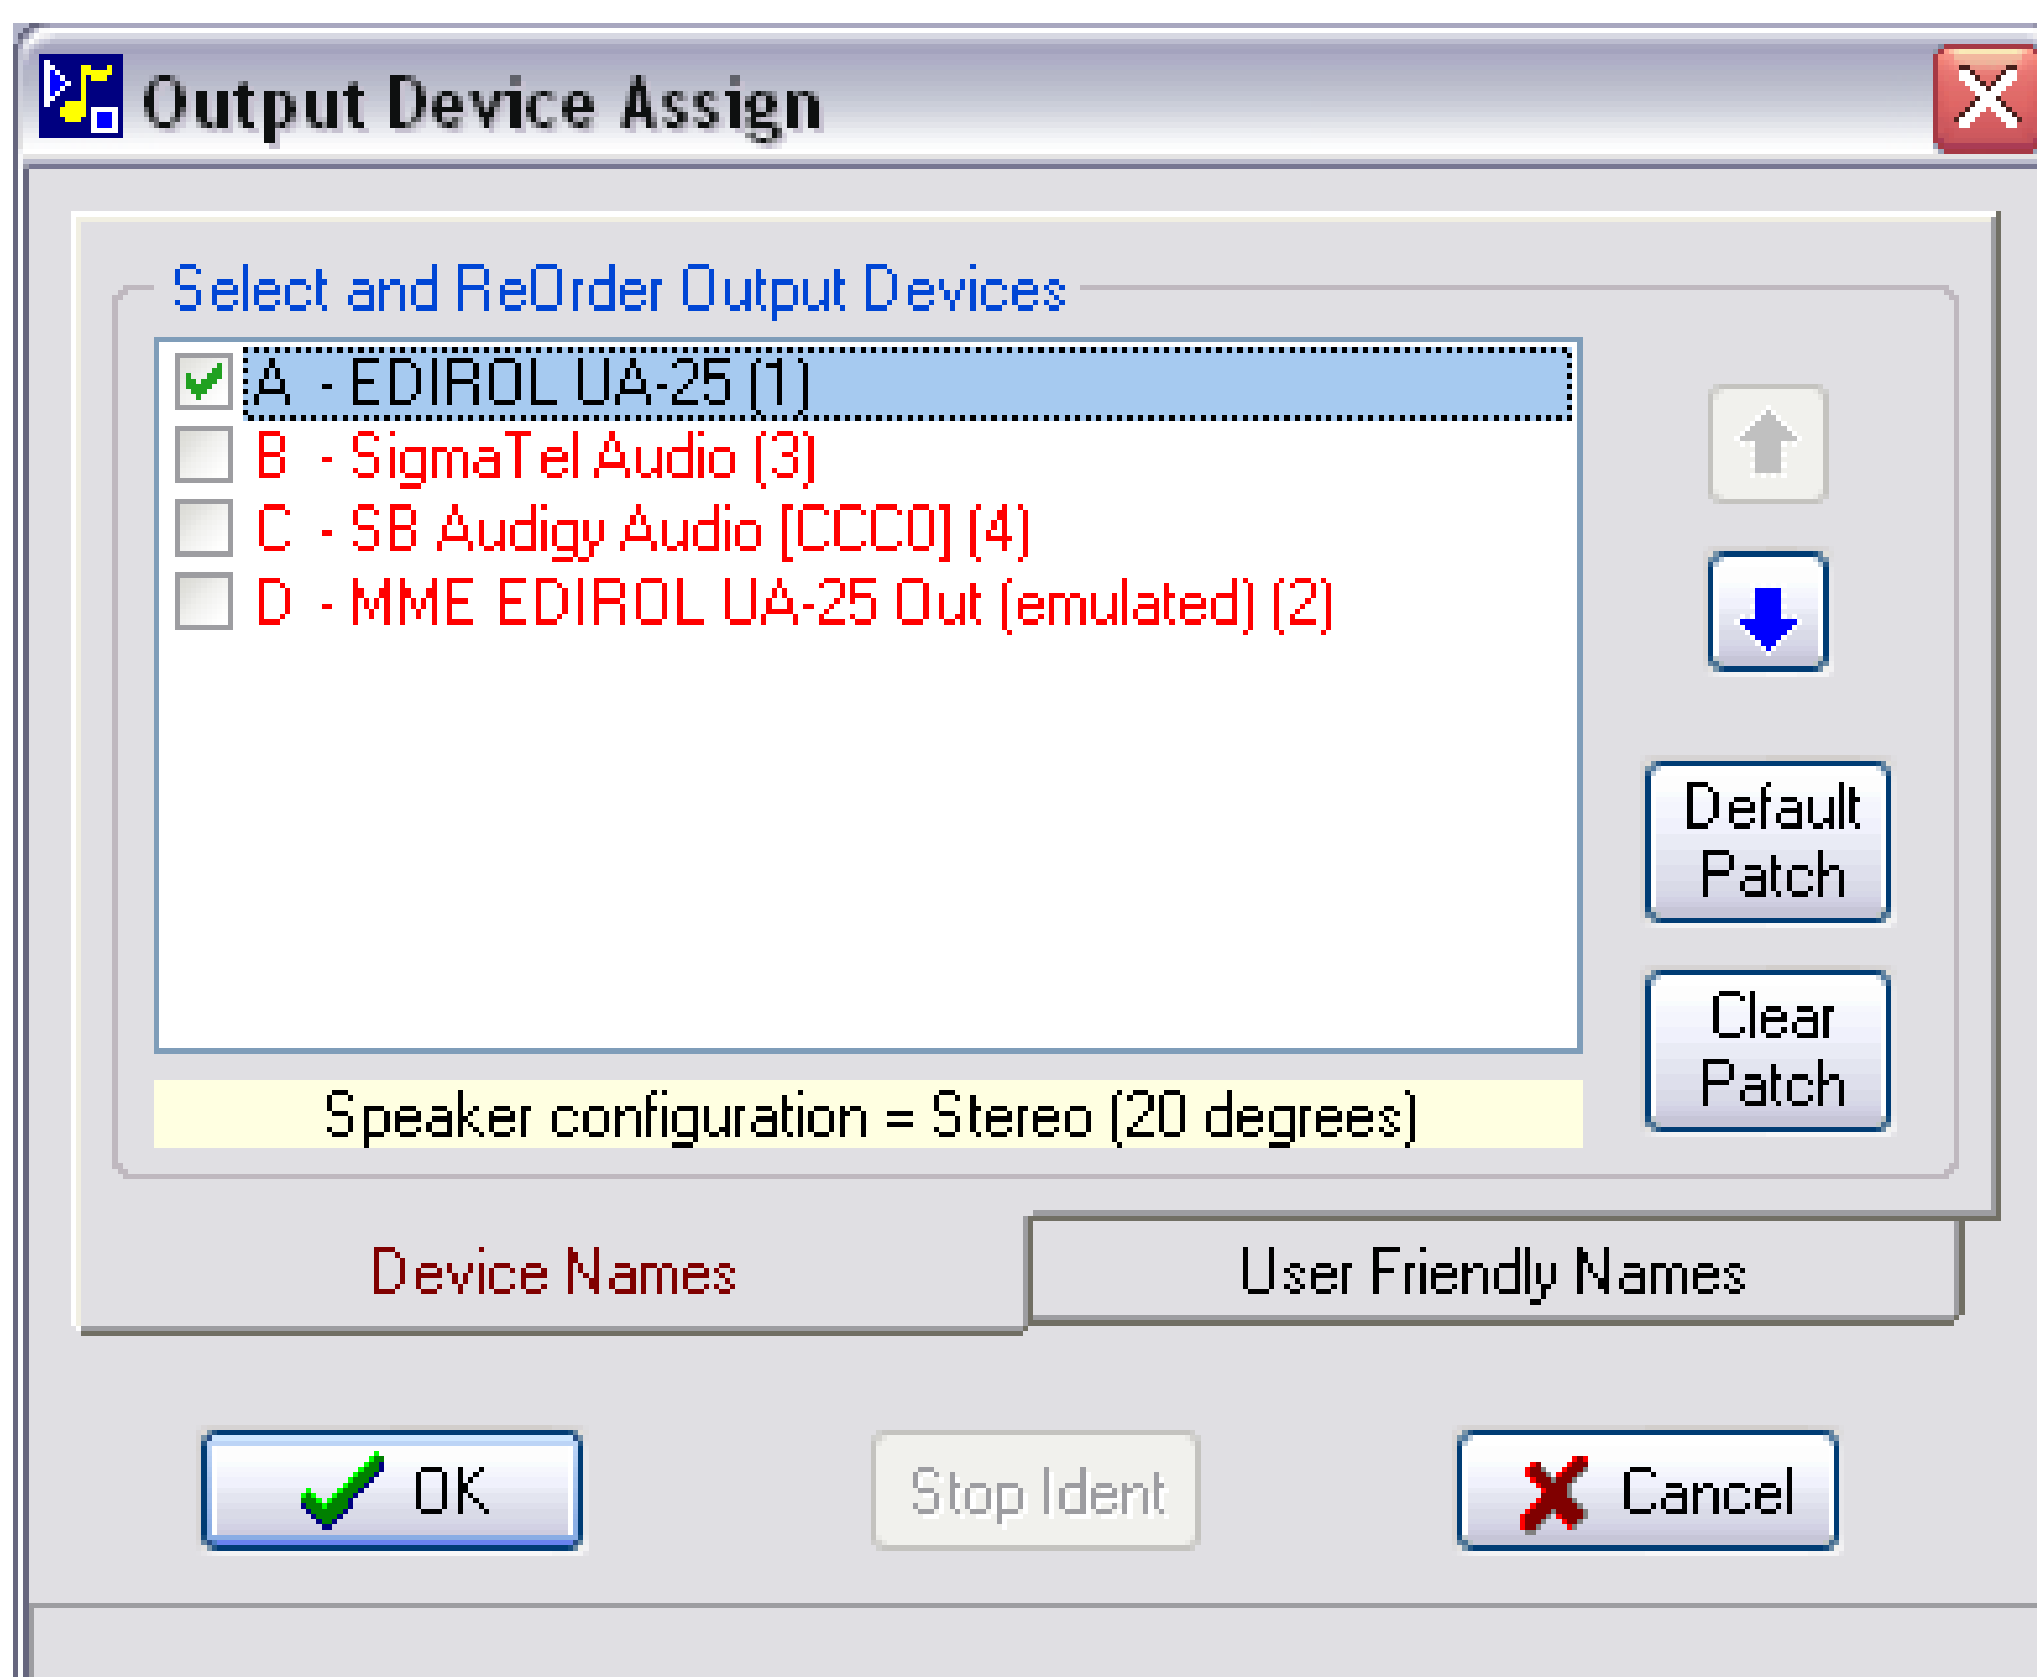

Note that after reordering the outputs, SpotOn will need to be restarted before the changes take effect.

It is recommended that the UA-101 soundcard is always plugged into the same USB 2.0 socket each time it is used, otherwise Windows will treat it as a new device and the output order assignment in SpotOn may well change.

Similarly, if the computer is started up without the UA-101 connected it may be necessary to re-assign the audio output device order next time SpotOn is used.

UA- 25

M-Audio Delta 1010

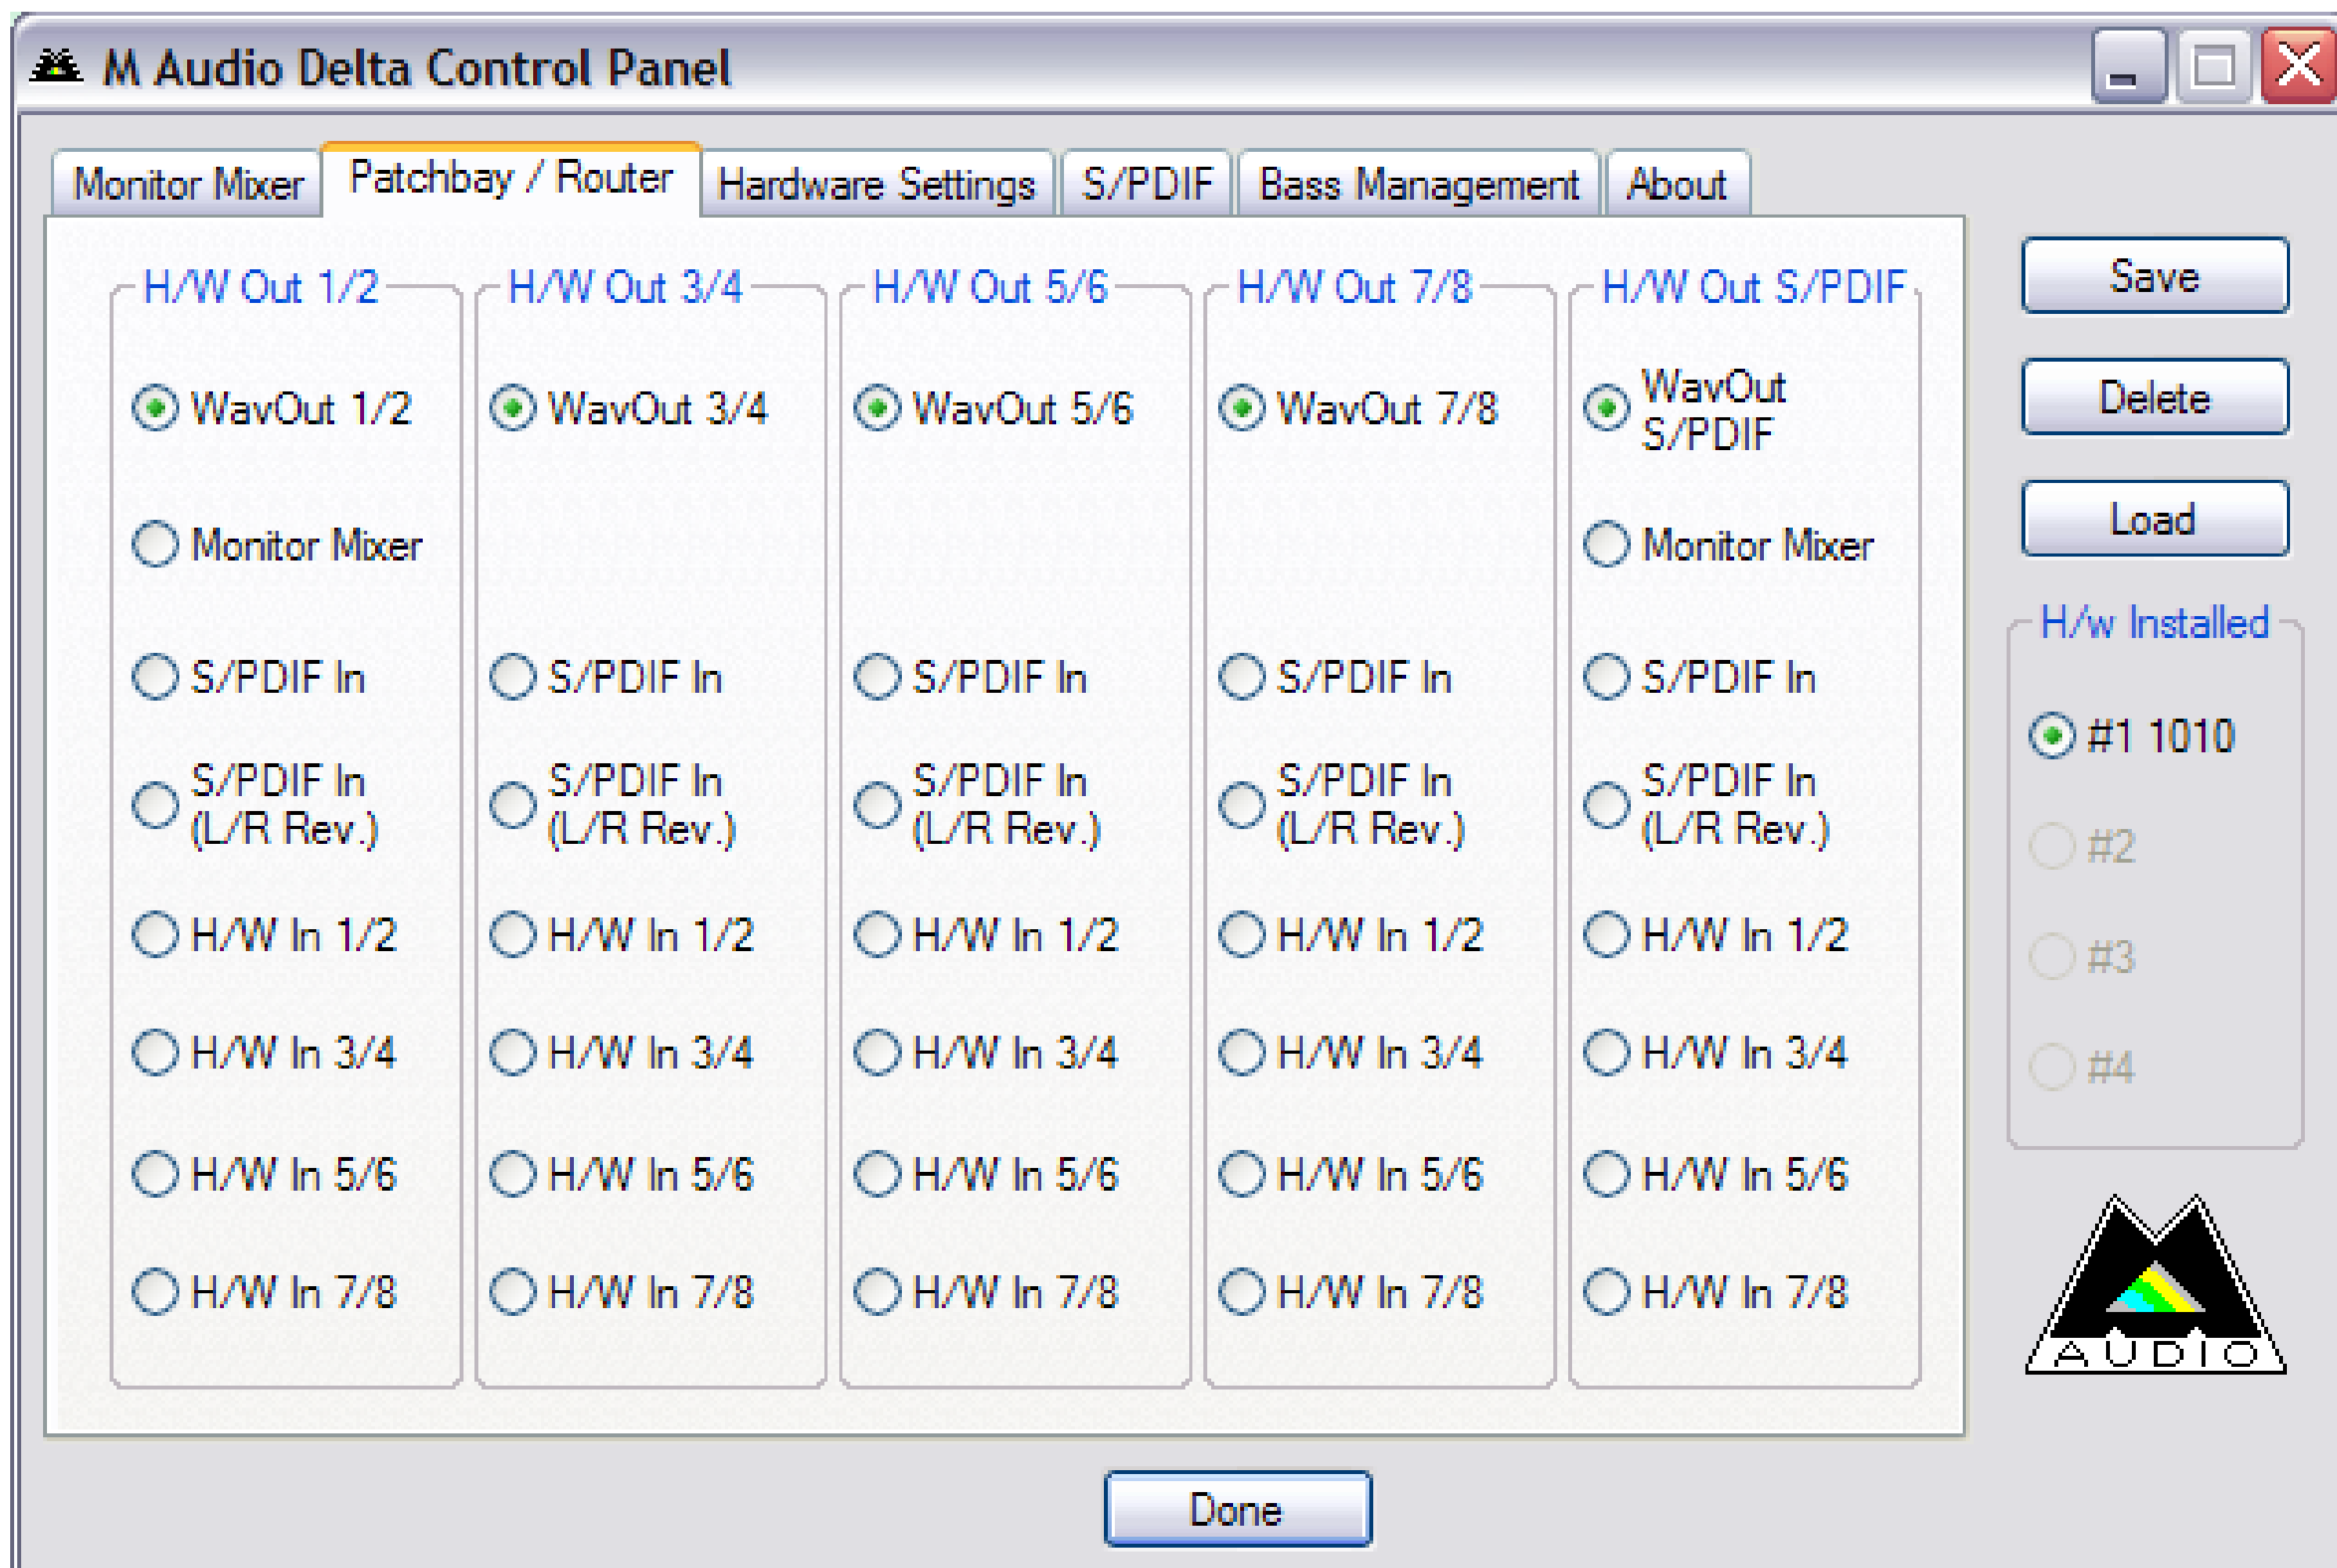

The M-Audio 1010 sound card is an 8 output card and is configured with 4 x 2 channel o/ps, these outputs are referred to as WavOut 1/2, WavOut 3/4, WavOut 5/6 and WavOut 7/8.

The card is setup via a utility provided by the manufacturers and comprises a main window with five tabbed pages as shown below.

The first tab - Monitor Mixer - sets the contributions of the various output signals into a separate monitor mix, initially it is suggested that this is not used until the system is up and

fully working, therefore the settings should be as shown above.

The second tab - Patchbay/Router - allows each hardware output pair to be itself a combination of various inputs, for simplicity the patching should be simple where only WavOut 1/2 is patched to H/W out 1/2 and WavOut 3/4 is patched to H/W out 3/4 etc.

The sample rate and reference settings are made in the third tab, this is the tab where most mistakes are made so it is important to check the following items: -

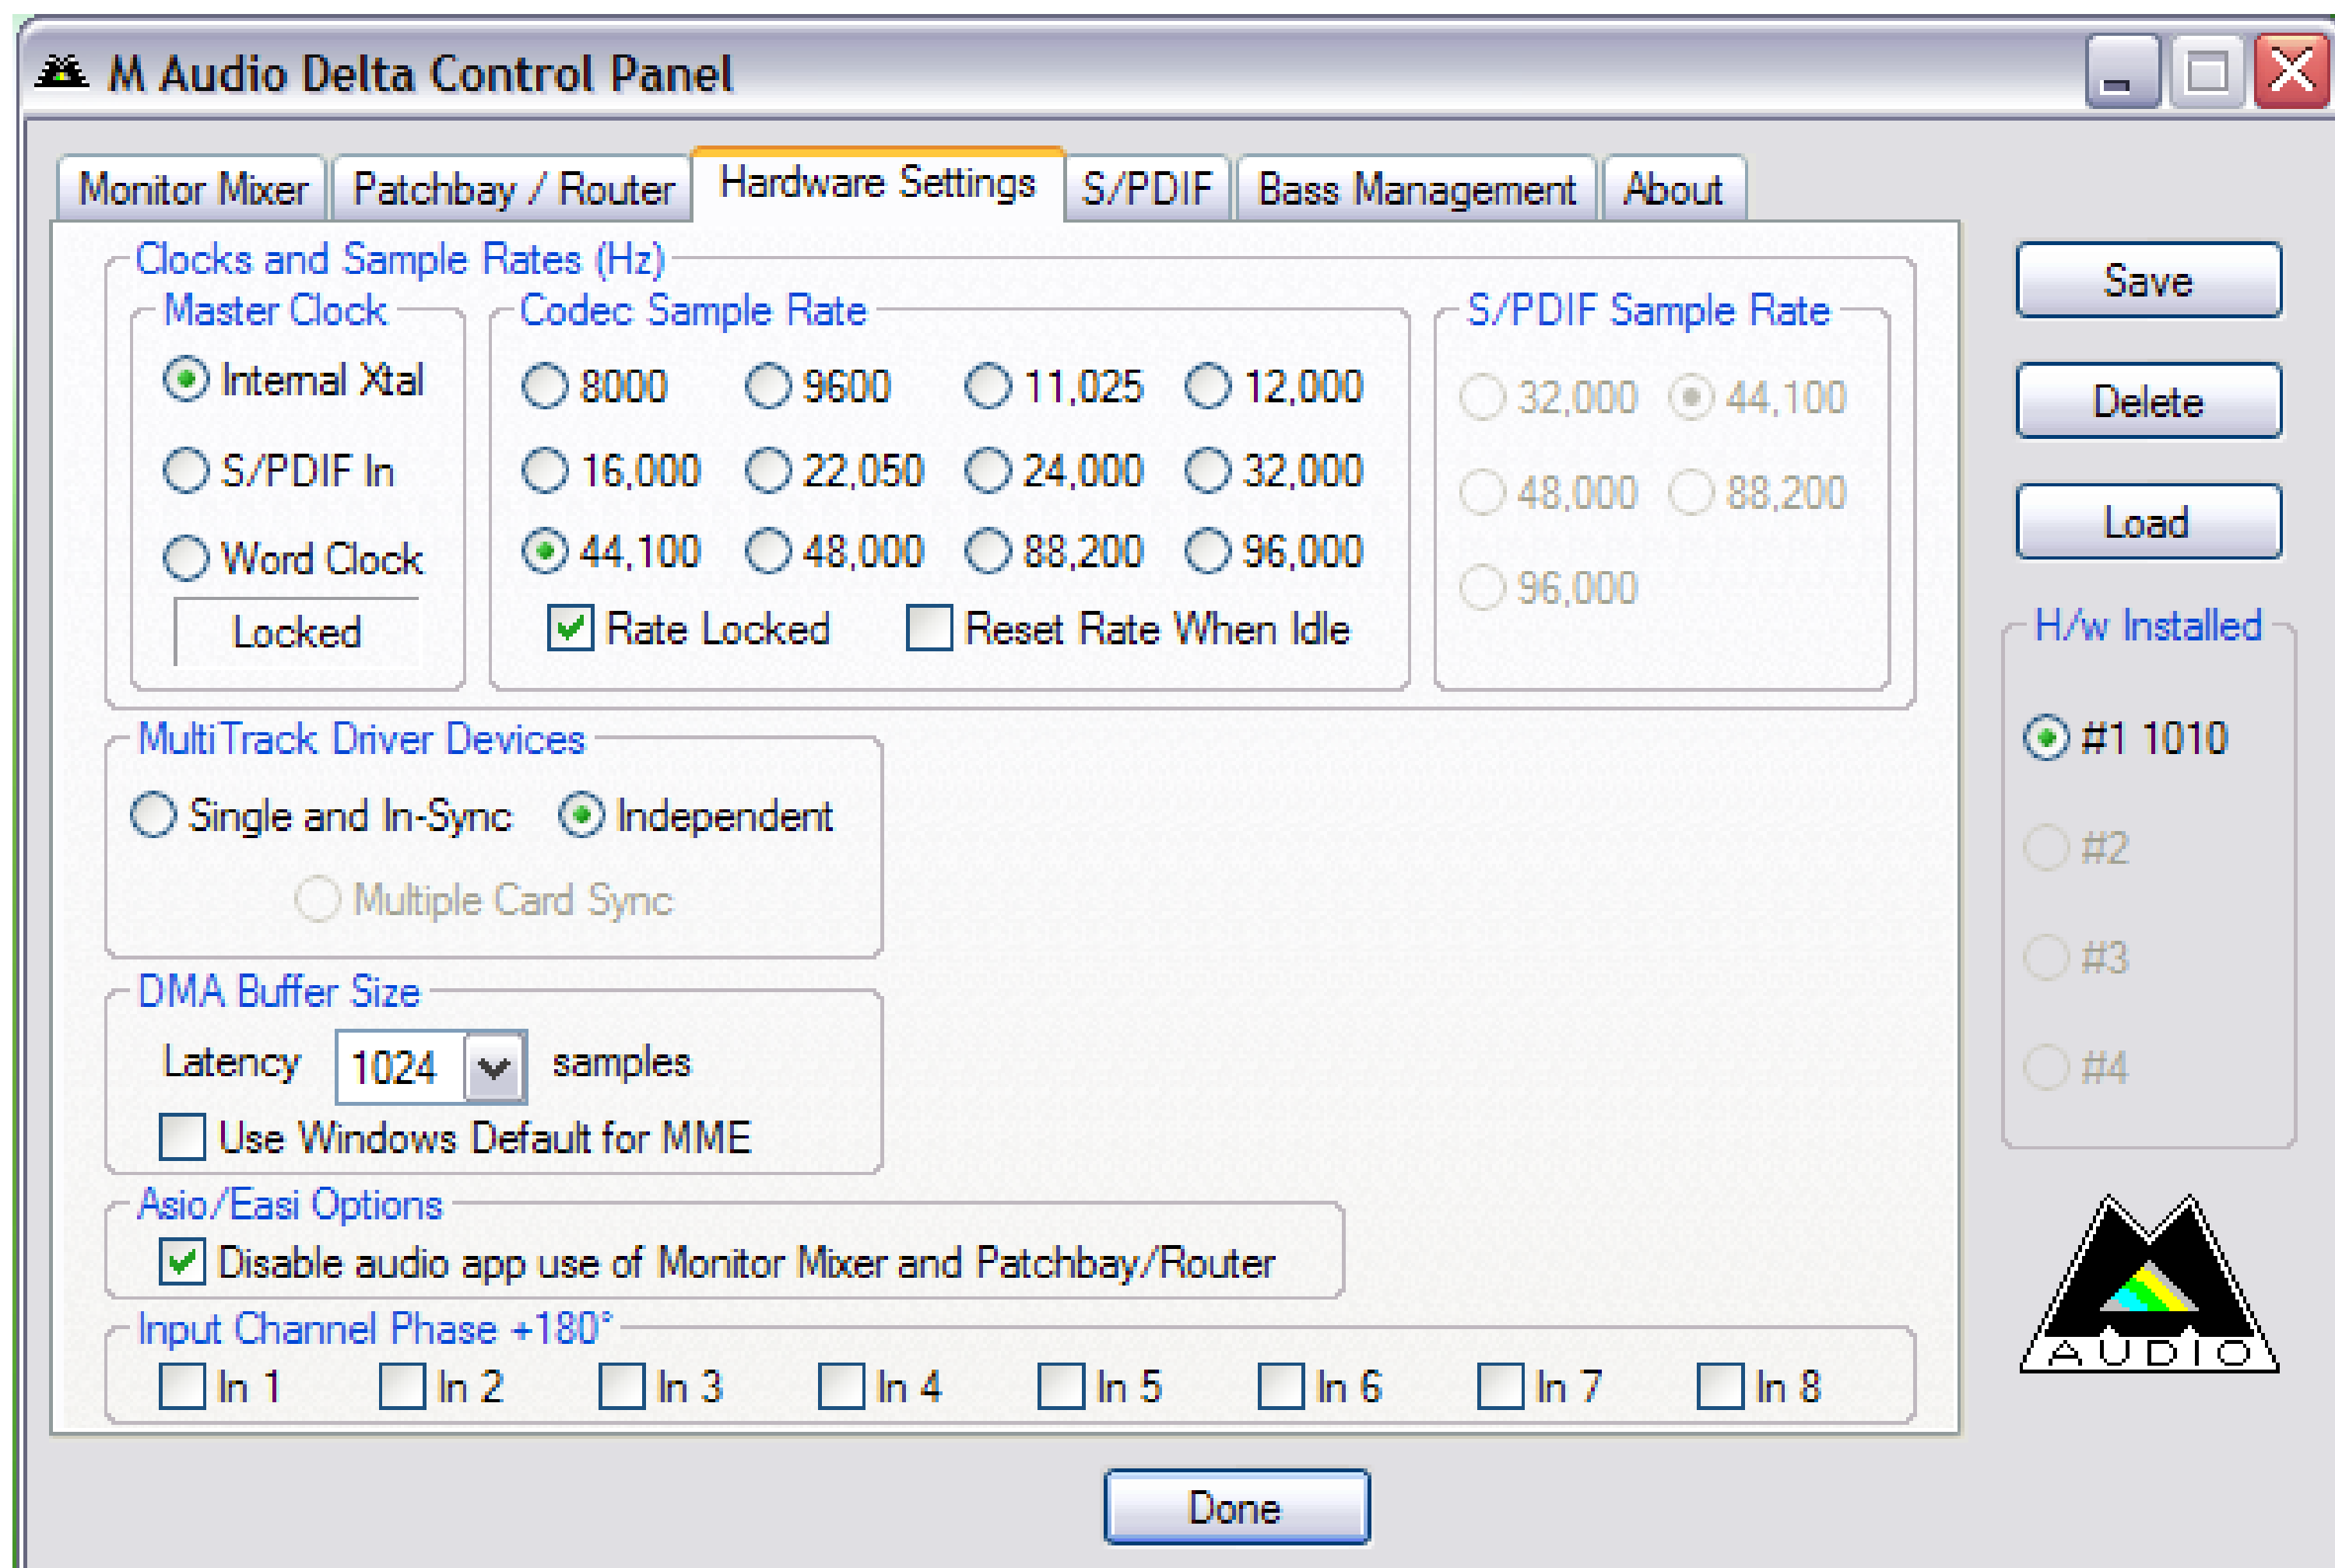

Master Clock = Internal Xtal

Codec Sample Rate = 44,100 or 48,000 as suits the installation

MultiTrack Driver Devices = Independent

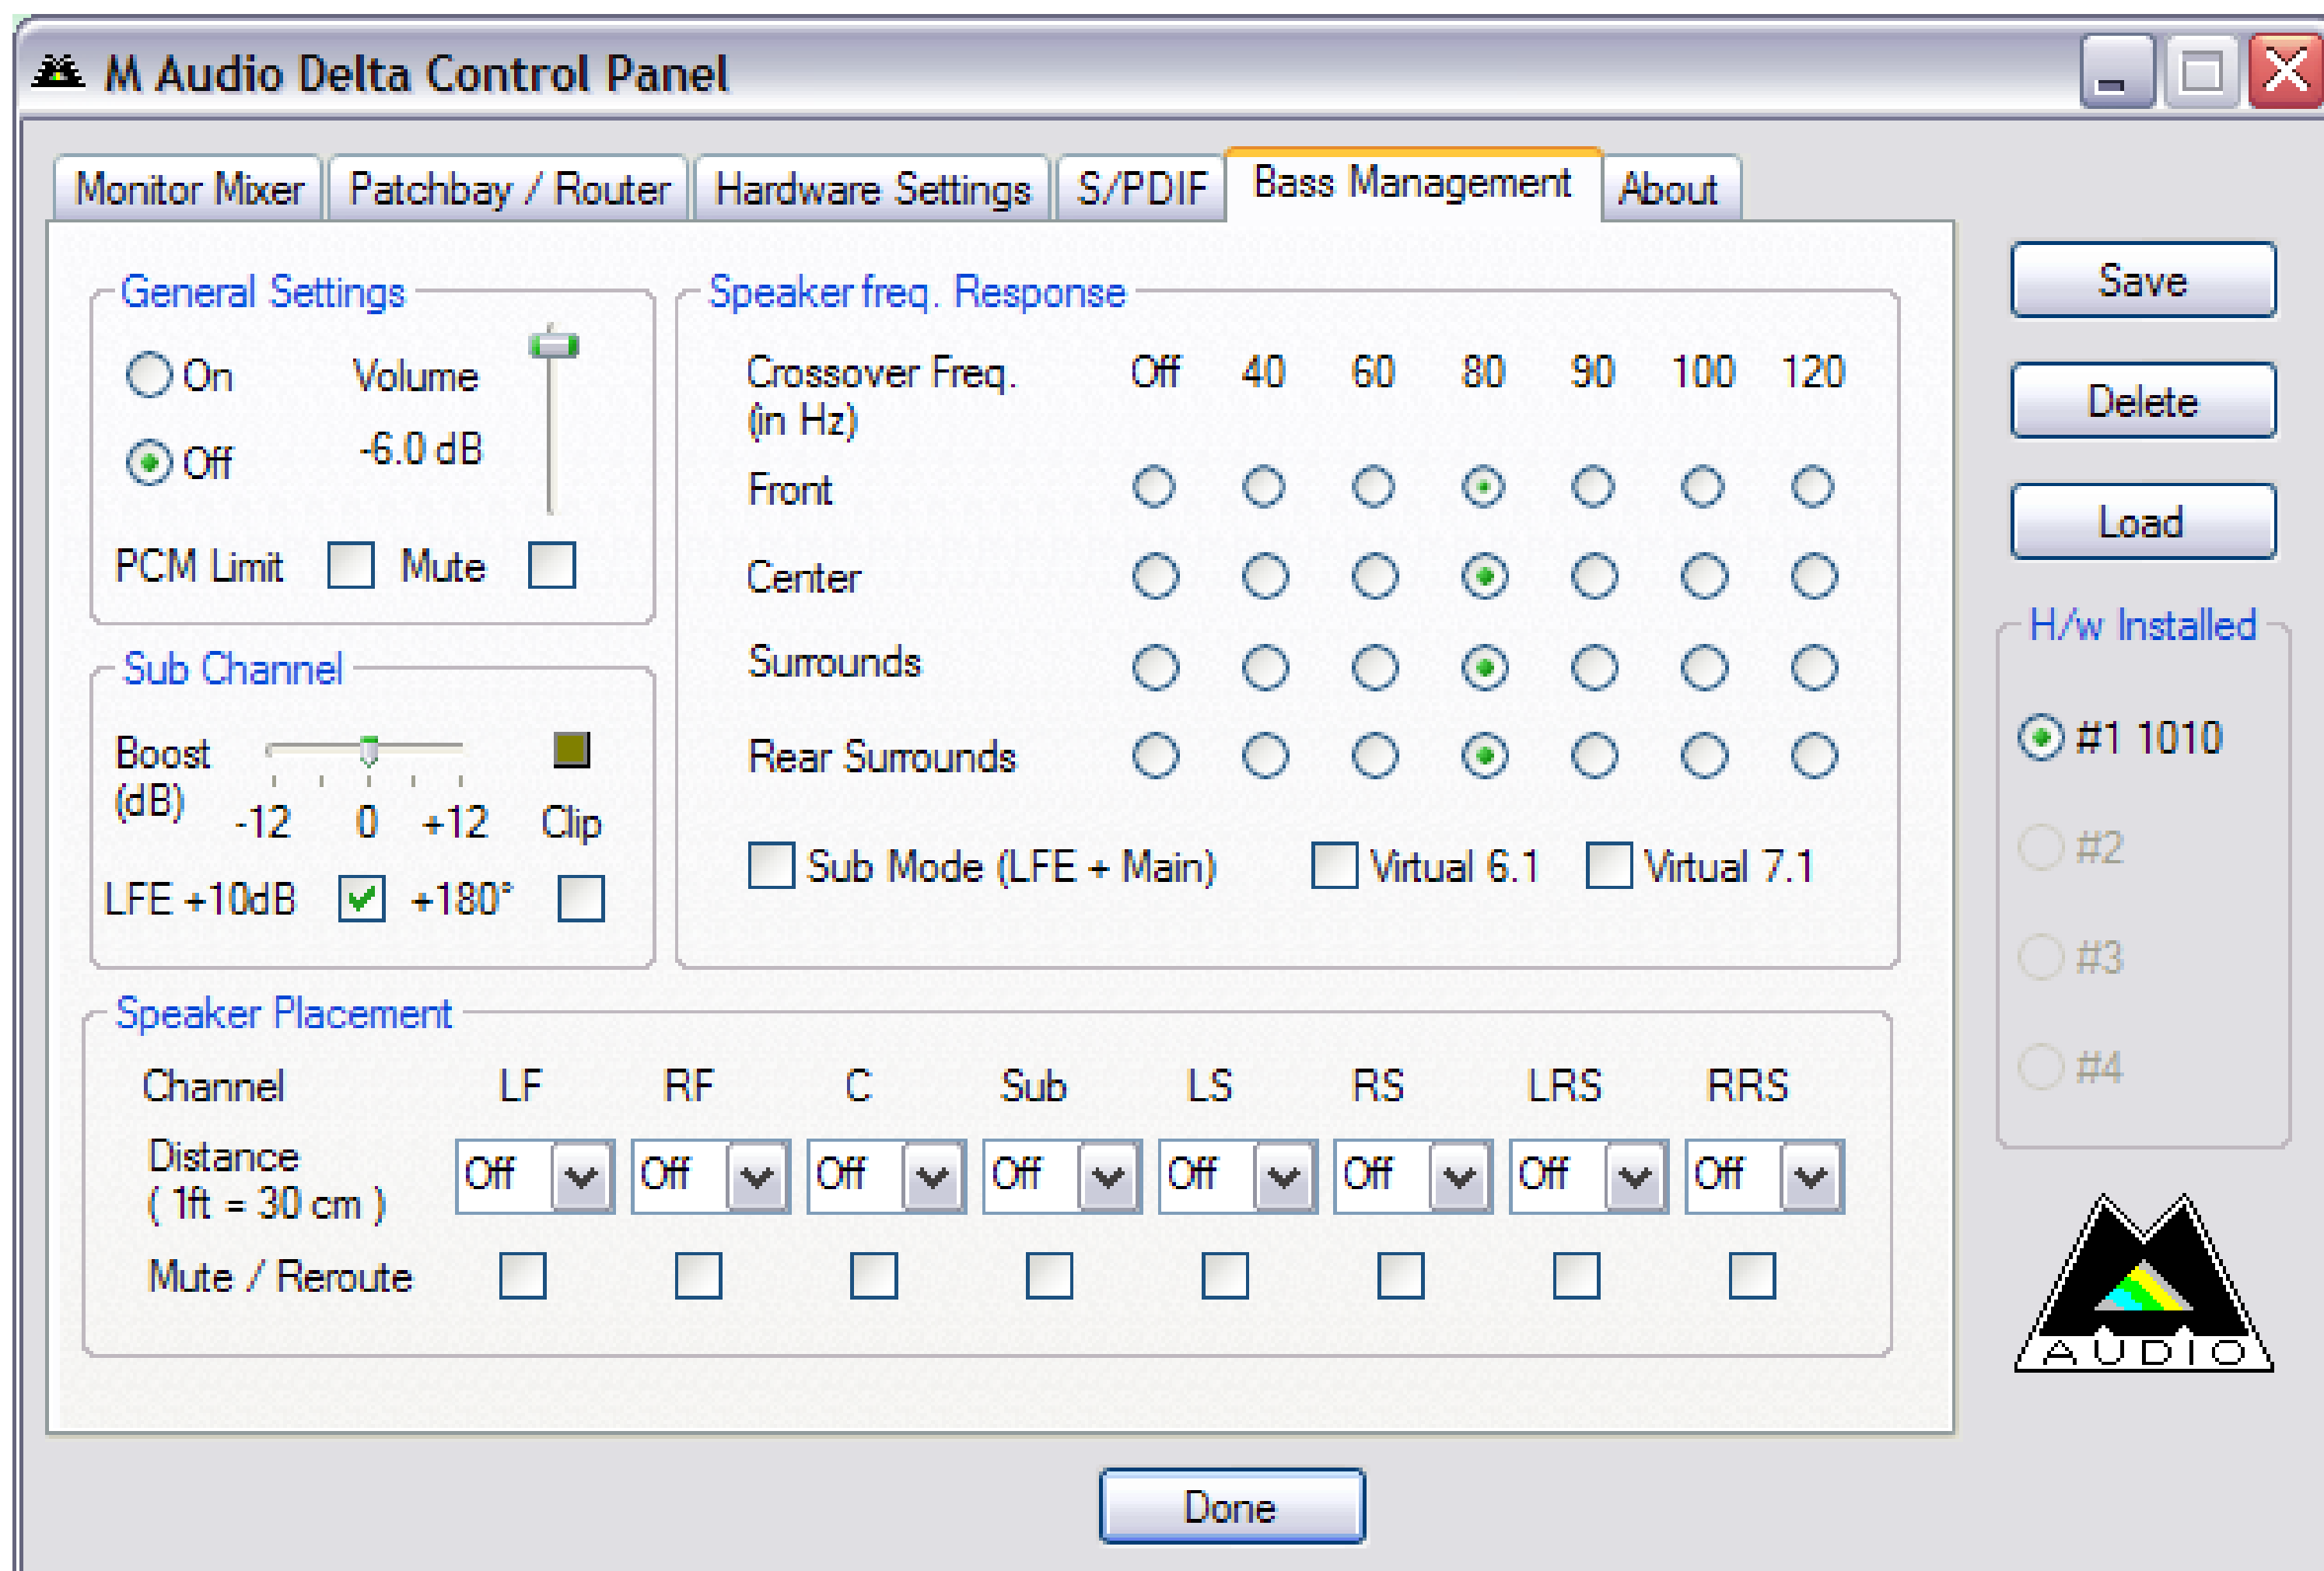

DMA Buffer Size (latency) = 1024

Asio/Easi Options = Disabled

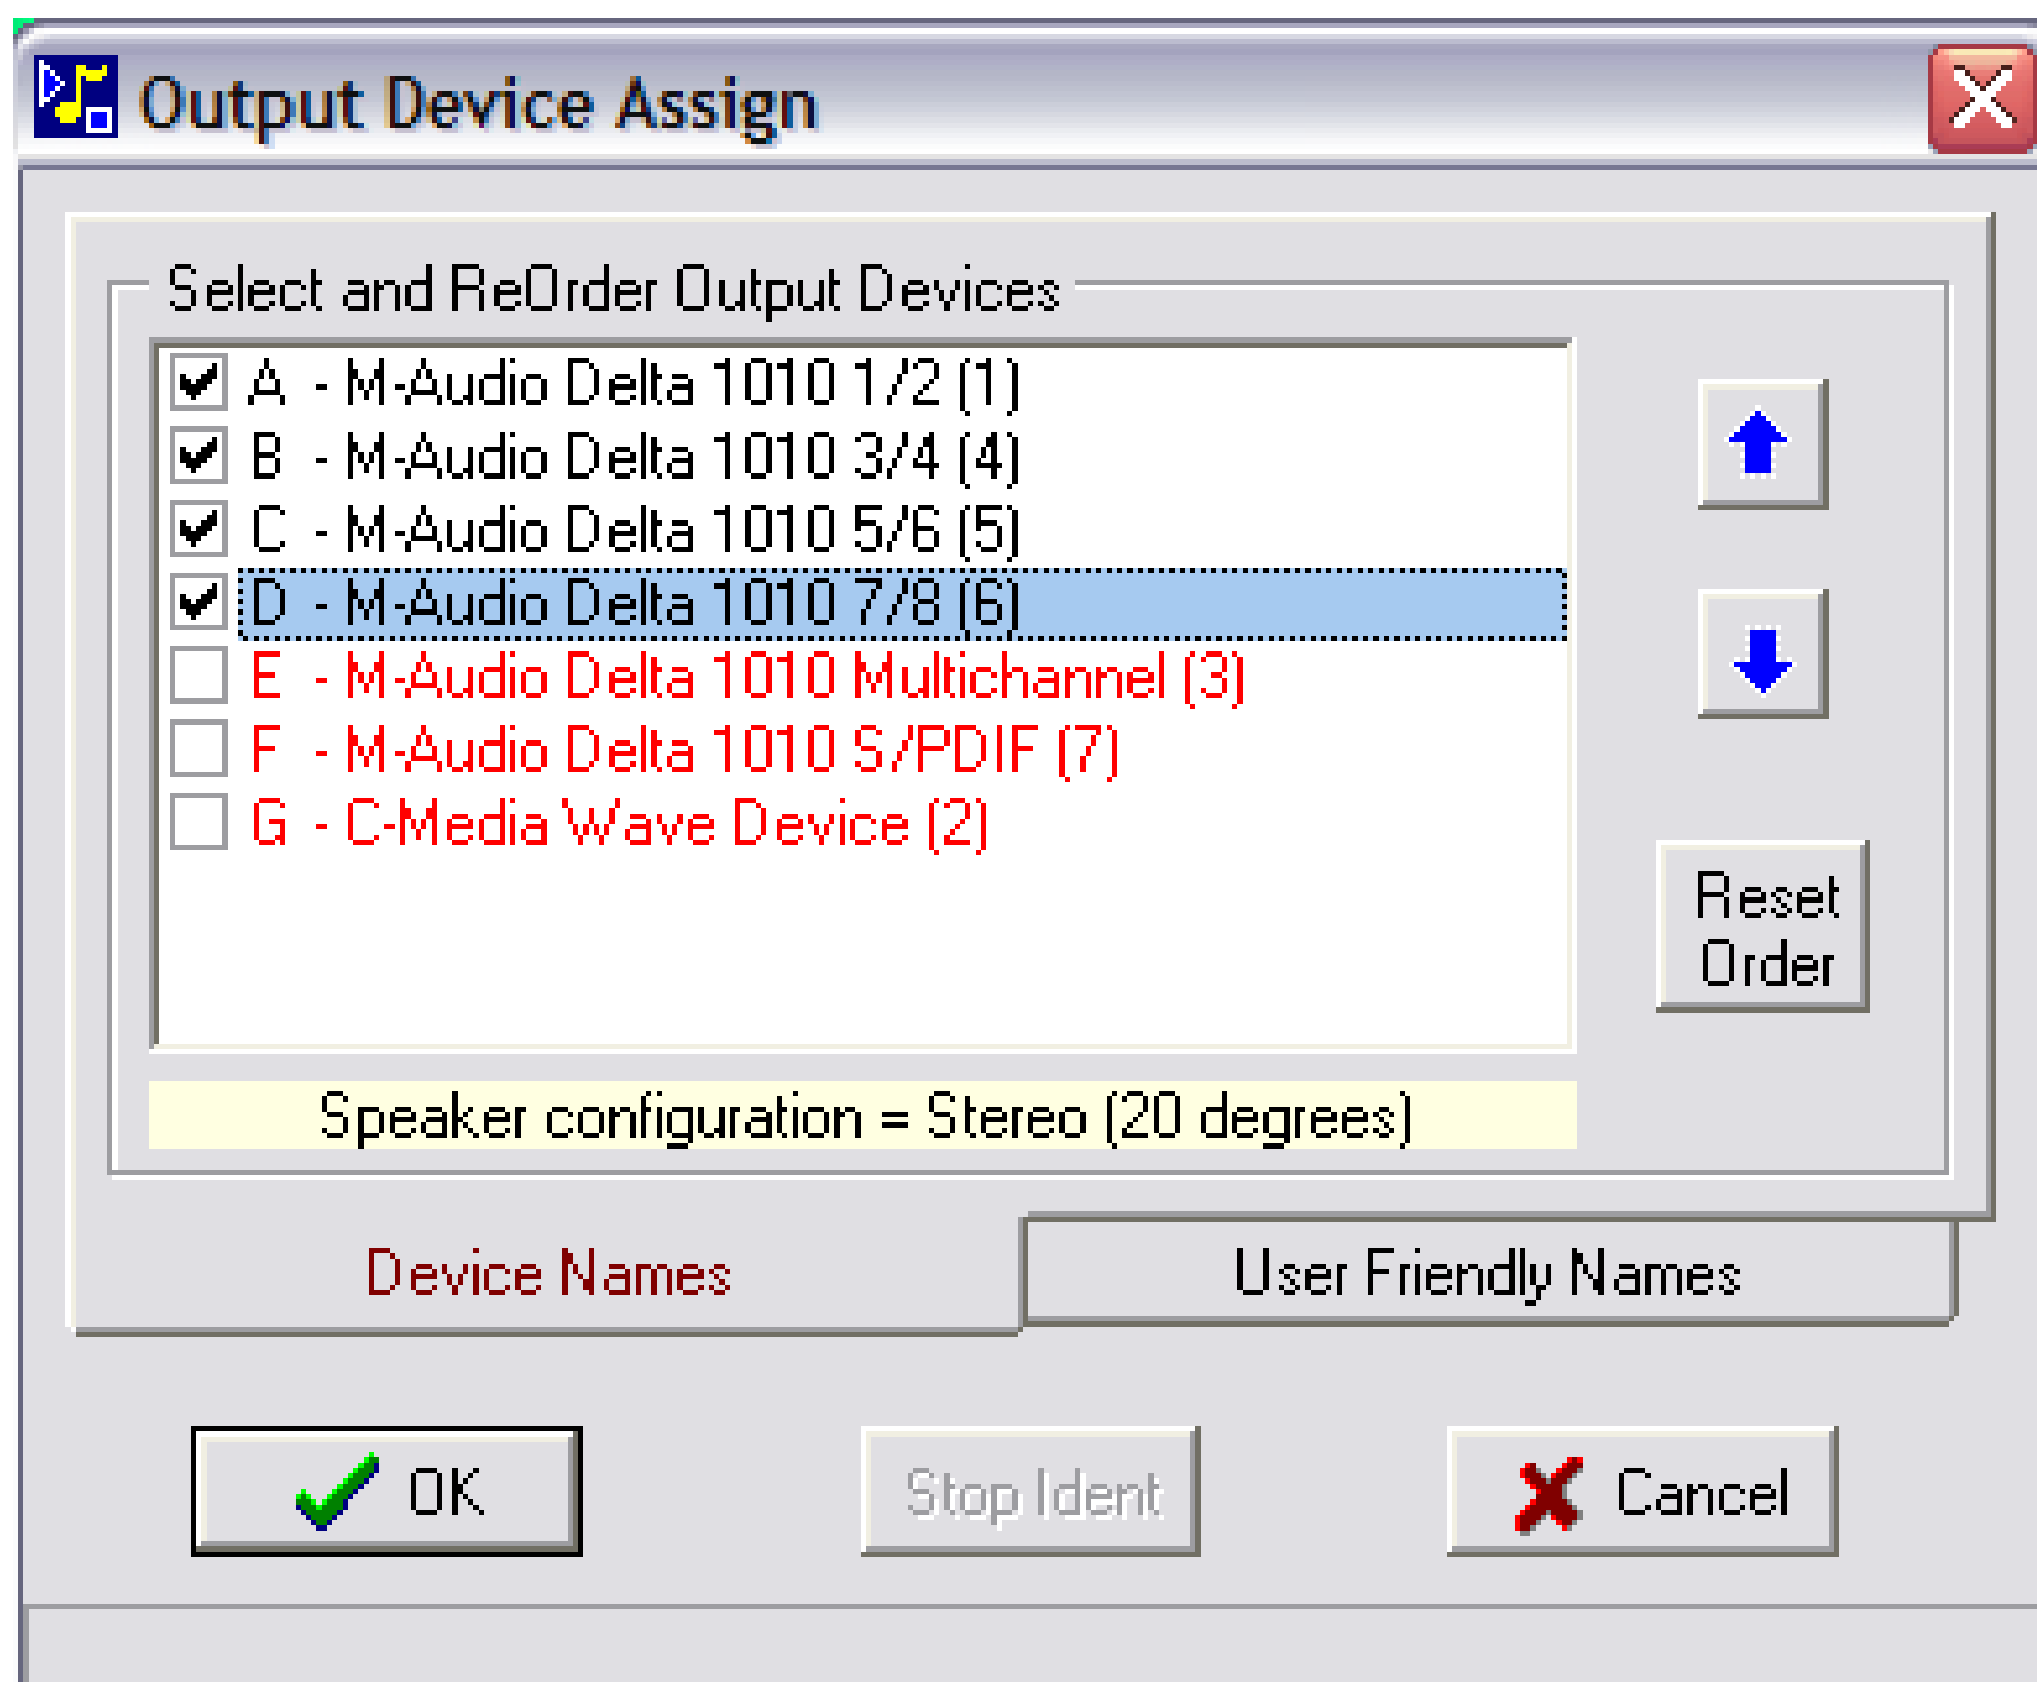

The S/PDIF page has no direct relevance to SpotOn performance and can be set as required

The Bass Management tab refers to surround sound effects, the M-Audio 1010 card does not directly support multichannel tracks played out from SpotOn so this tab has no effect and therefore the General Setting should be set to Off.

The final tab is the M-Audio About screen

The card presents itself to SpotOn as 6 entries in the Output Devices list in the case below appearing as o/p's A..F: -

Only the first four outputs are required so o/ps E and F have been masked out and are shown in red text.

The manufacturers default device names can be replaced with something slightly more meaningful as below: -

Screen shots of the later version of the MAudio control panel are shown below

M-AUDIO

RME HDSP AES-32

The setup of the RME cards involves two utilities Settings and Matrix/Mixer which will normally be available directly from the taskbar system tray.

The description on this page refers to the HDSP AES-32 card, for other RME cards see HDSP MADI , Fireface 800 or Multiface II

The Settings utility has three tabs, on the first tab it is important to uncheck the SyncAlign option as if left checked will prevent SpotOn from playing out tracks.

The AES output can be locked (Clock Mode) by one of two methods AutoSync and Master .

In AutoSync mode the preferred locking reference for the AES output is selected on the right hand side of the 'Input Status/Pref. Sync Ref' section, if the preferred reference is not present then the inputs will be scanned until a valid locking signal is found. If no valid locking signal is present then the card will revert to an internal reference.

In Master mode the card locks to the internal reference.

The System Clock section shows the current lock method and frequency.

The Output Format section should have the 'Professional' option checked as some broadcast equipment will reject AES data that does not have this flag set.

The last tab shows the About information, the tests were conducted using the Beta v17 WDM drivers

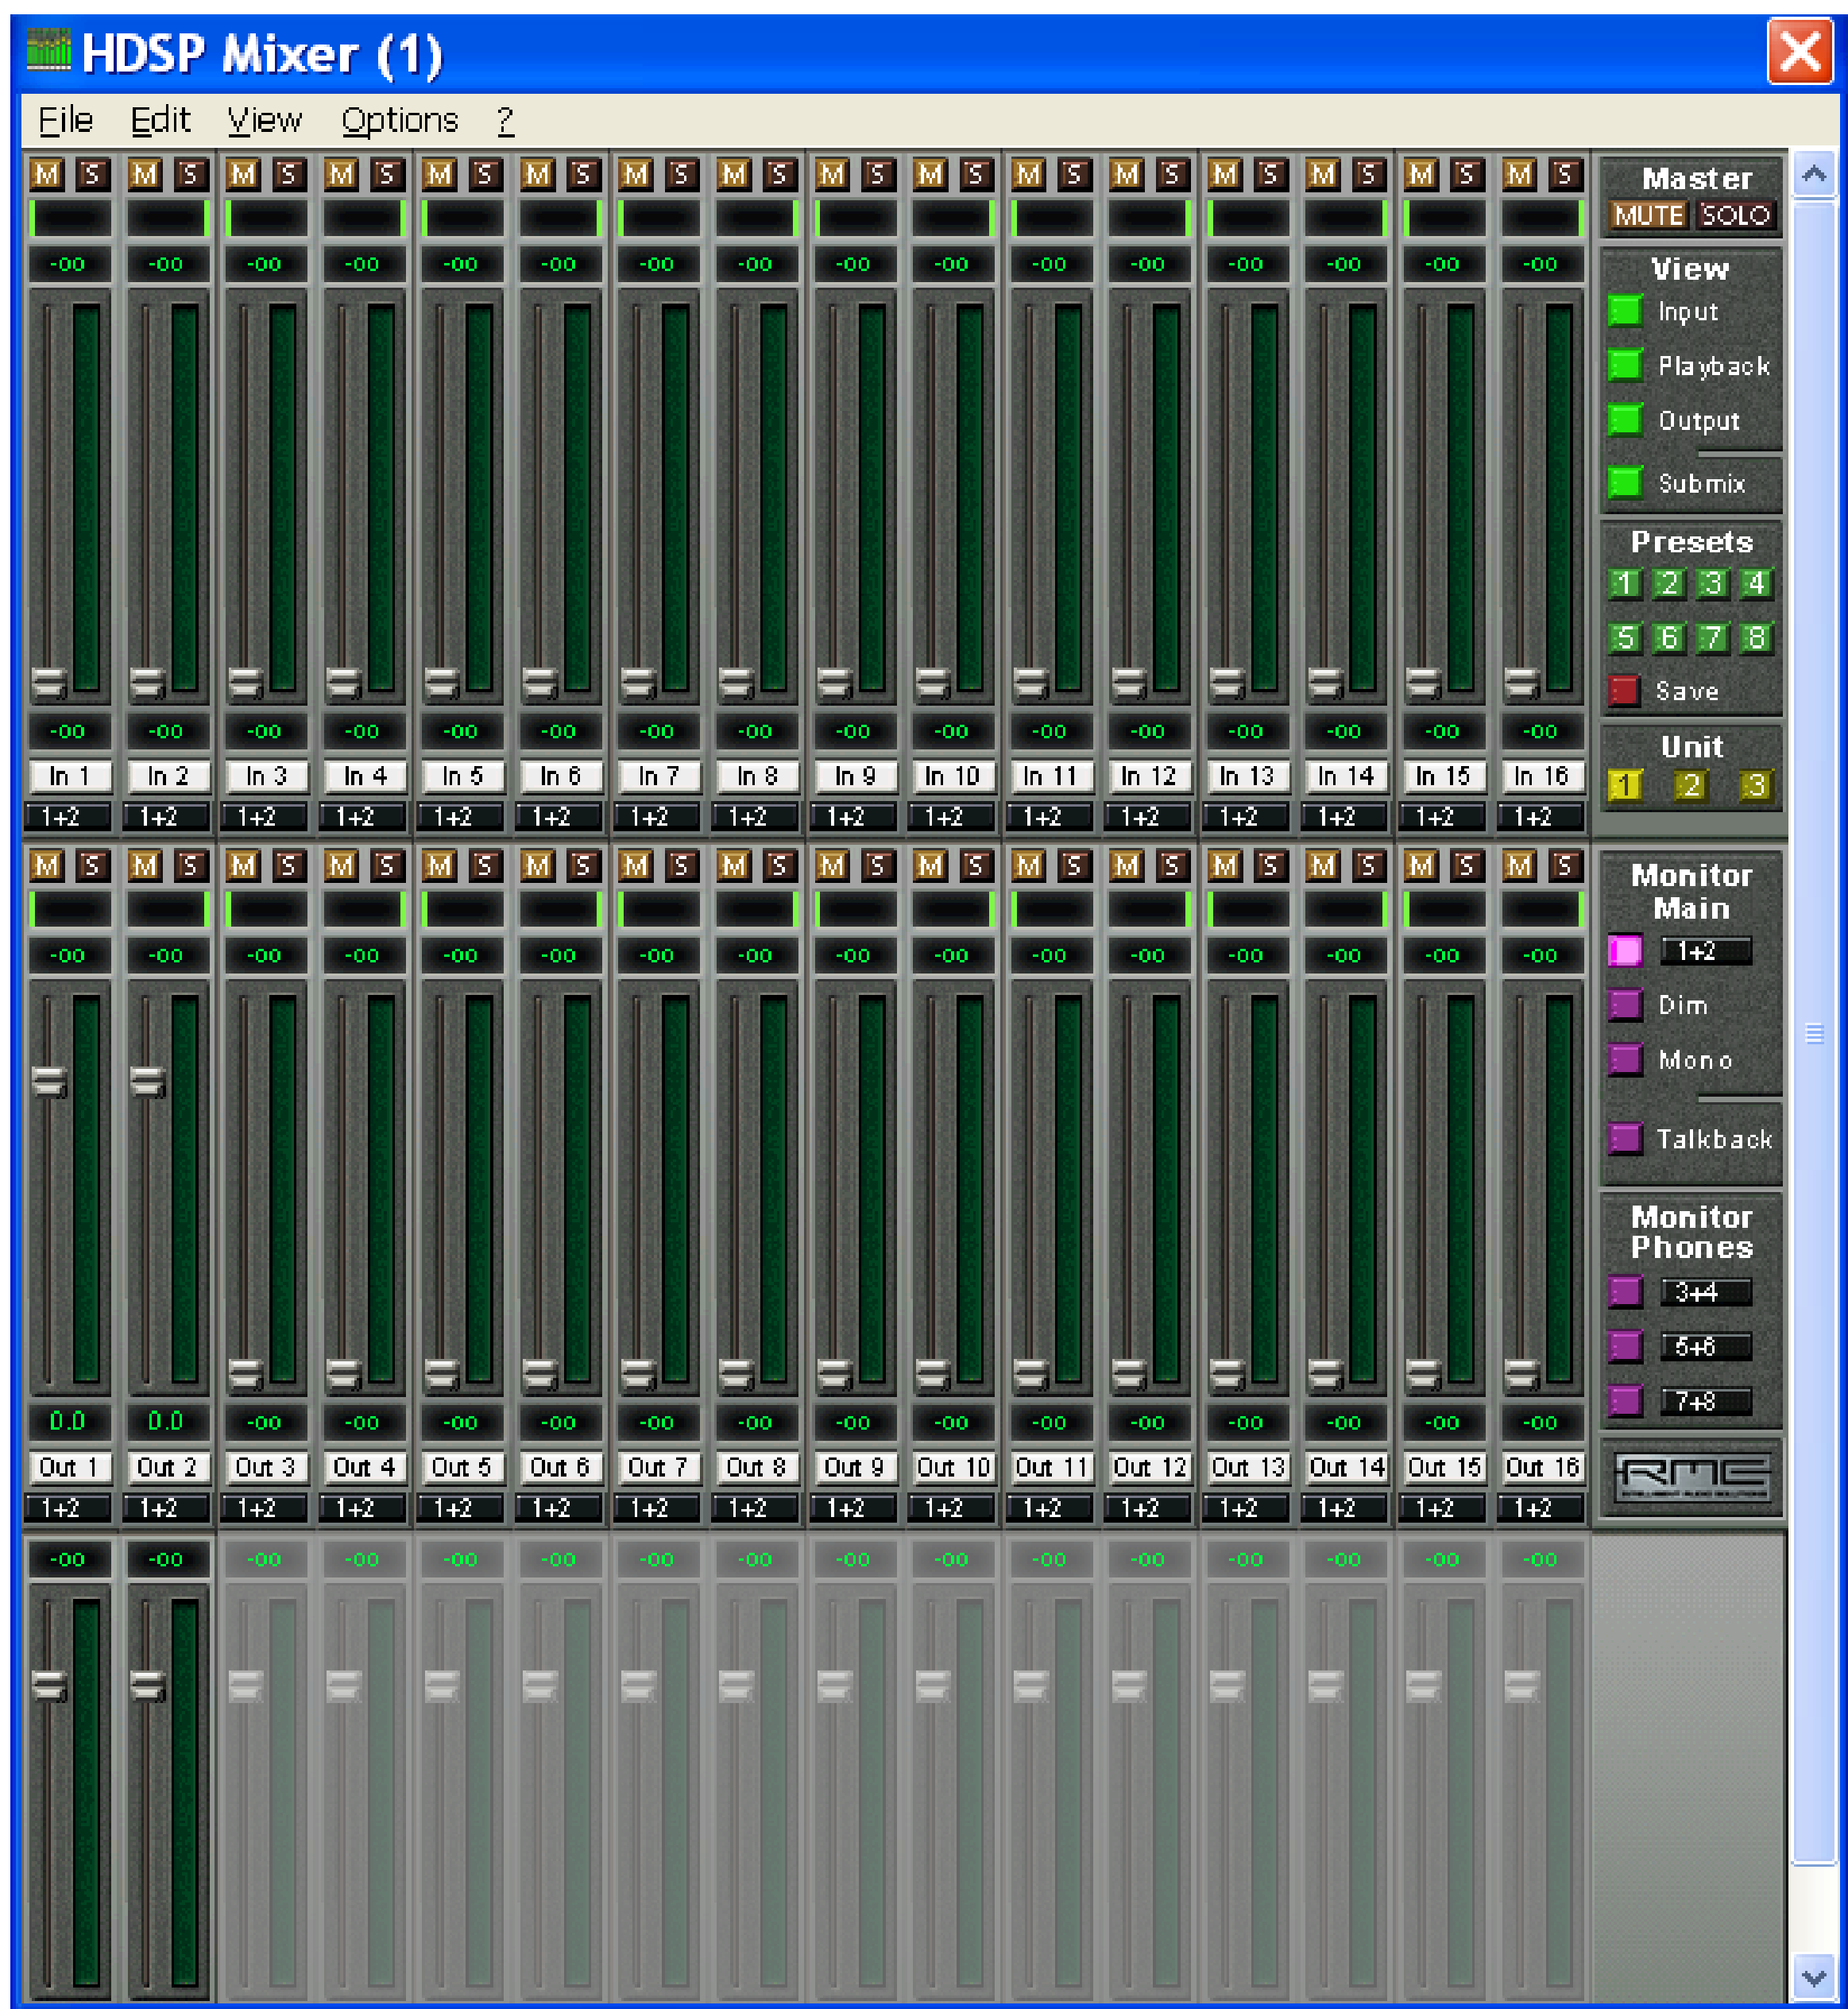

The Matrix utility allows the software output channels of the card to be routed to hardware outputs, the patch is normally 1:1 so that software output 1/2 is routed to hardware output 1/2 etc.

The card has 8 stereo outputs and the 16 individual channels are paired 1+2, 3+4, 5+6, 7+8, 9+10, 11+12, 13+14, 15+16.

Out 16																0.0	Out 16
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	

If the software outputs 3+4 are required to appear on hardware outputs 1+2, and software outputs 1+2 are to appear on hardware outputs 3+4 the following patch should be made

Consult the sound card manual for operation of the Mixer utility.

Sound card software outputs are listed as 8 stereo pairs, here shown as F..M

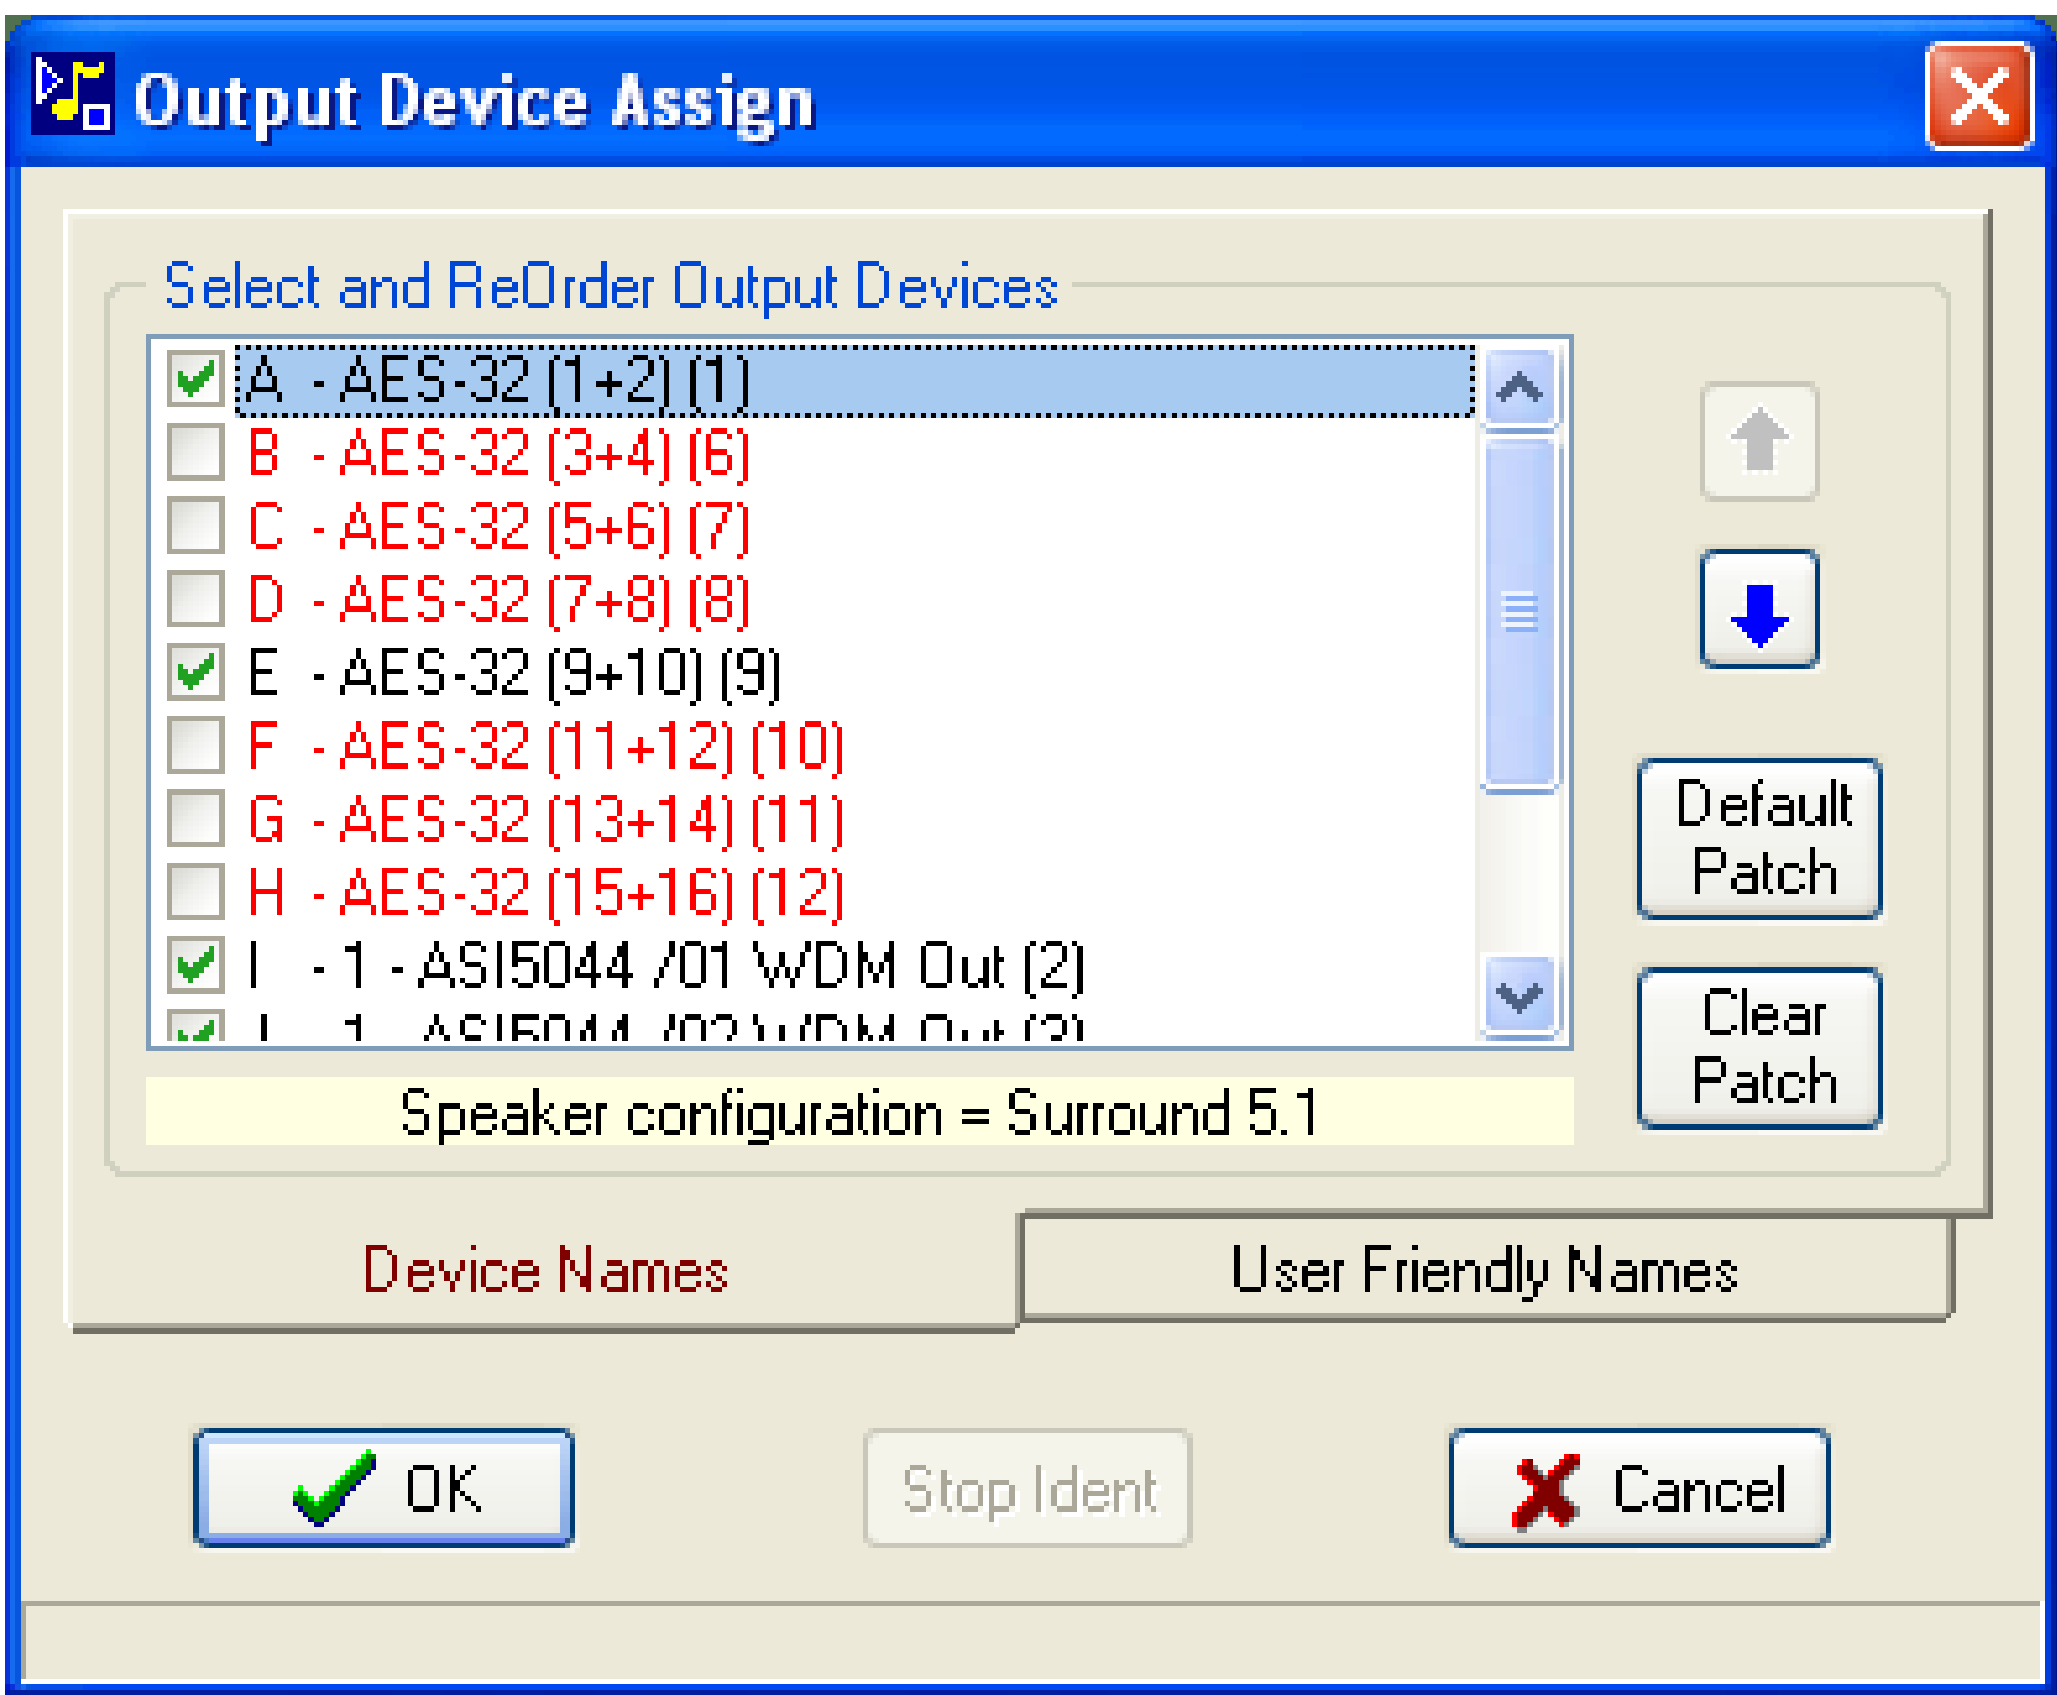

To use the RME card in multi-channel mode the 'interleaved' option must be checked on the first tab of the settings dialog

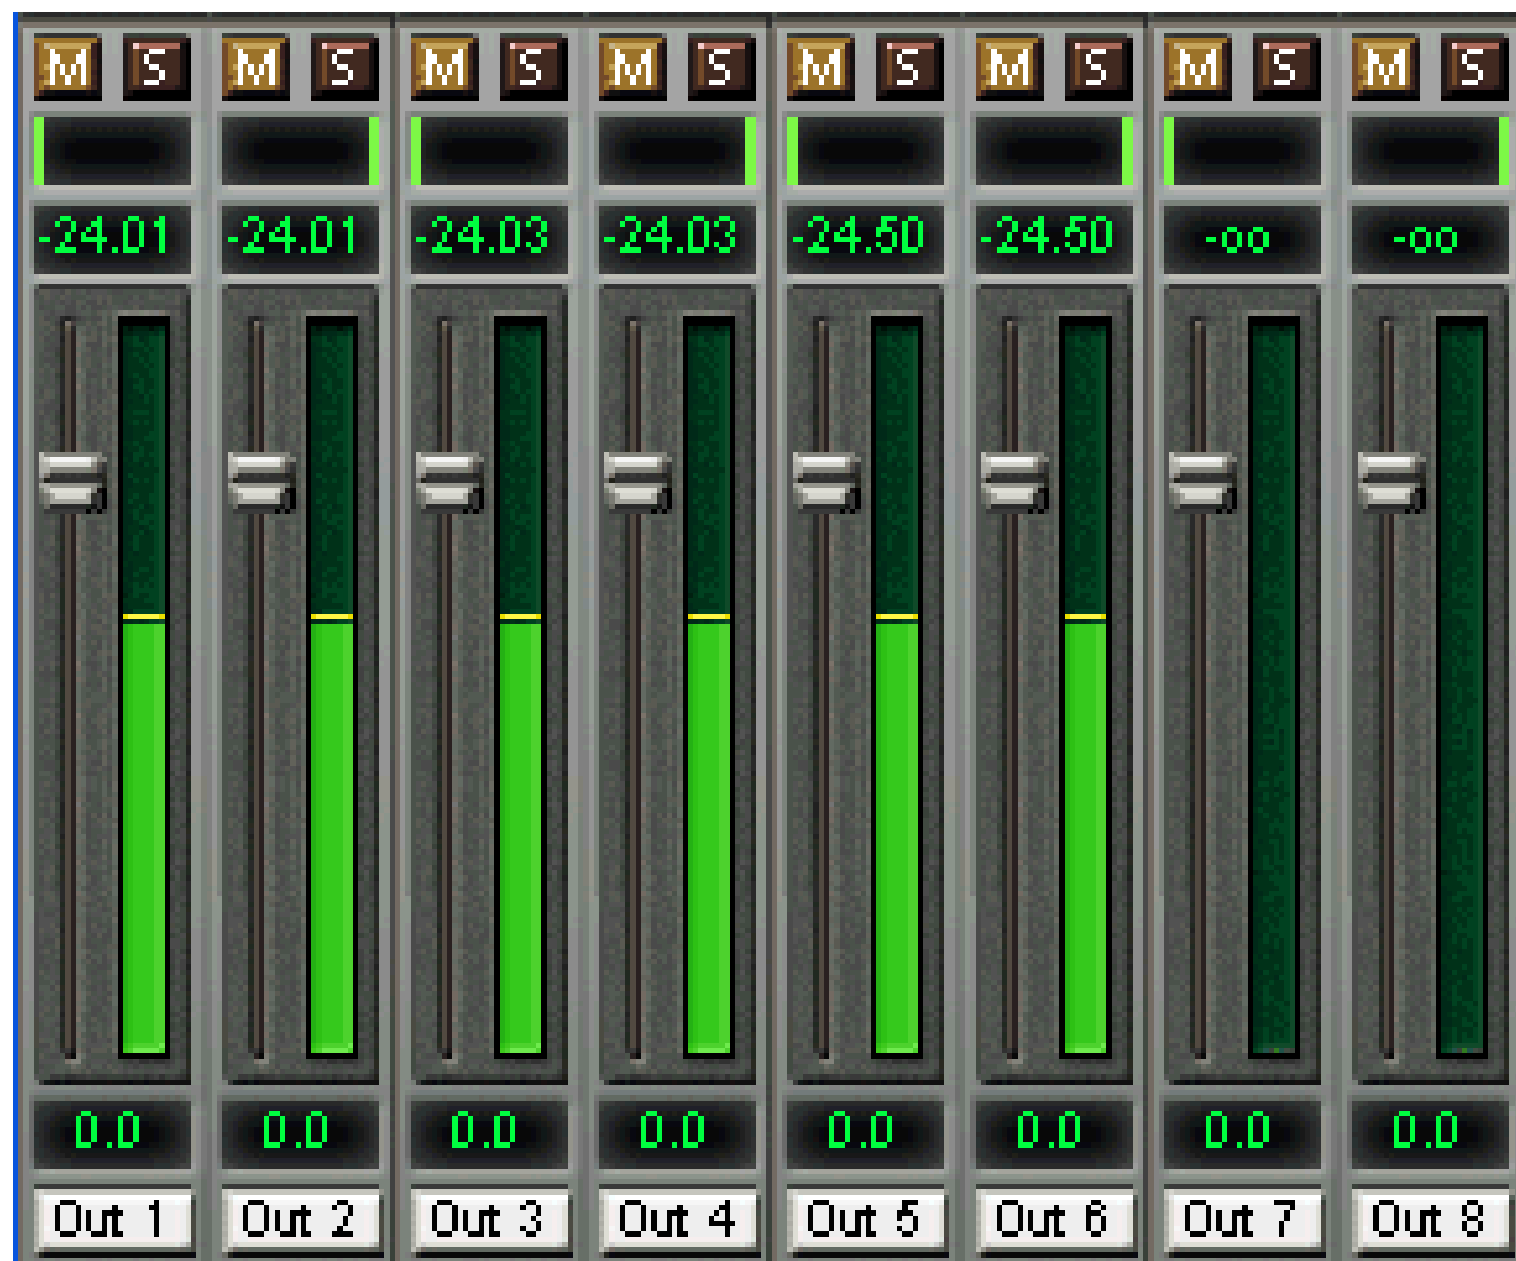

SpotOn must be restarted for this configuration change to be registered

With SpotOn in MultiChannel mode playing a multi-channel interleaved WAV file to outputs "1+2" will result in the individual channels appearing on outputs 1..8, similarly playing an interleaved WAV file on outputs "9+10" will result in the individual channels appearing on outputs 9..16.

Note that the remaining stereo output pairs 3+4, 5+6, 7+8, 11+12, 13+14 and 15+16 should not be used when in 'interleaved' mode as the results are unpredictable. Therefore these outputs must be masked in the Output Device Assign window as shown below.

The image below shows a 5.1 interleaved WAV test file playing with tone on all 6 channels.

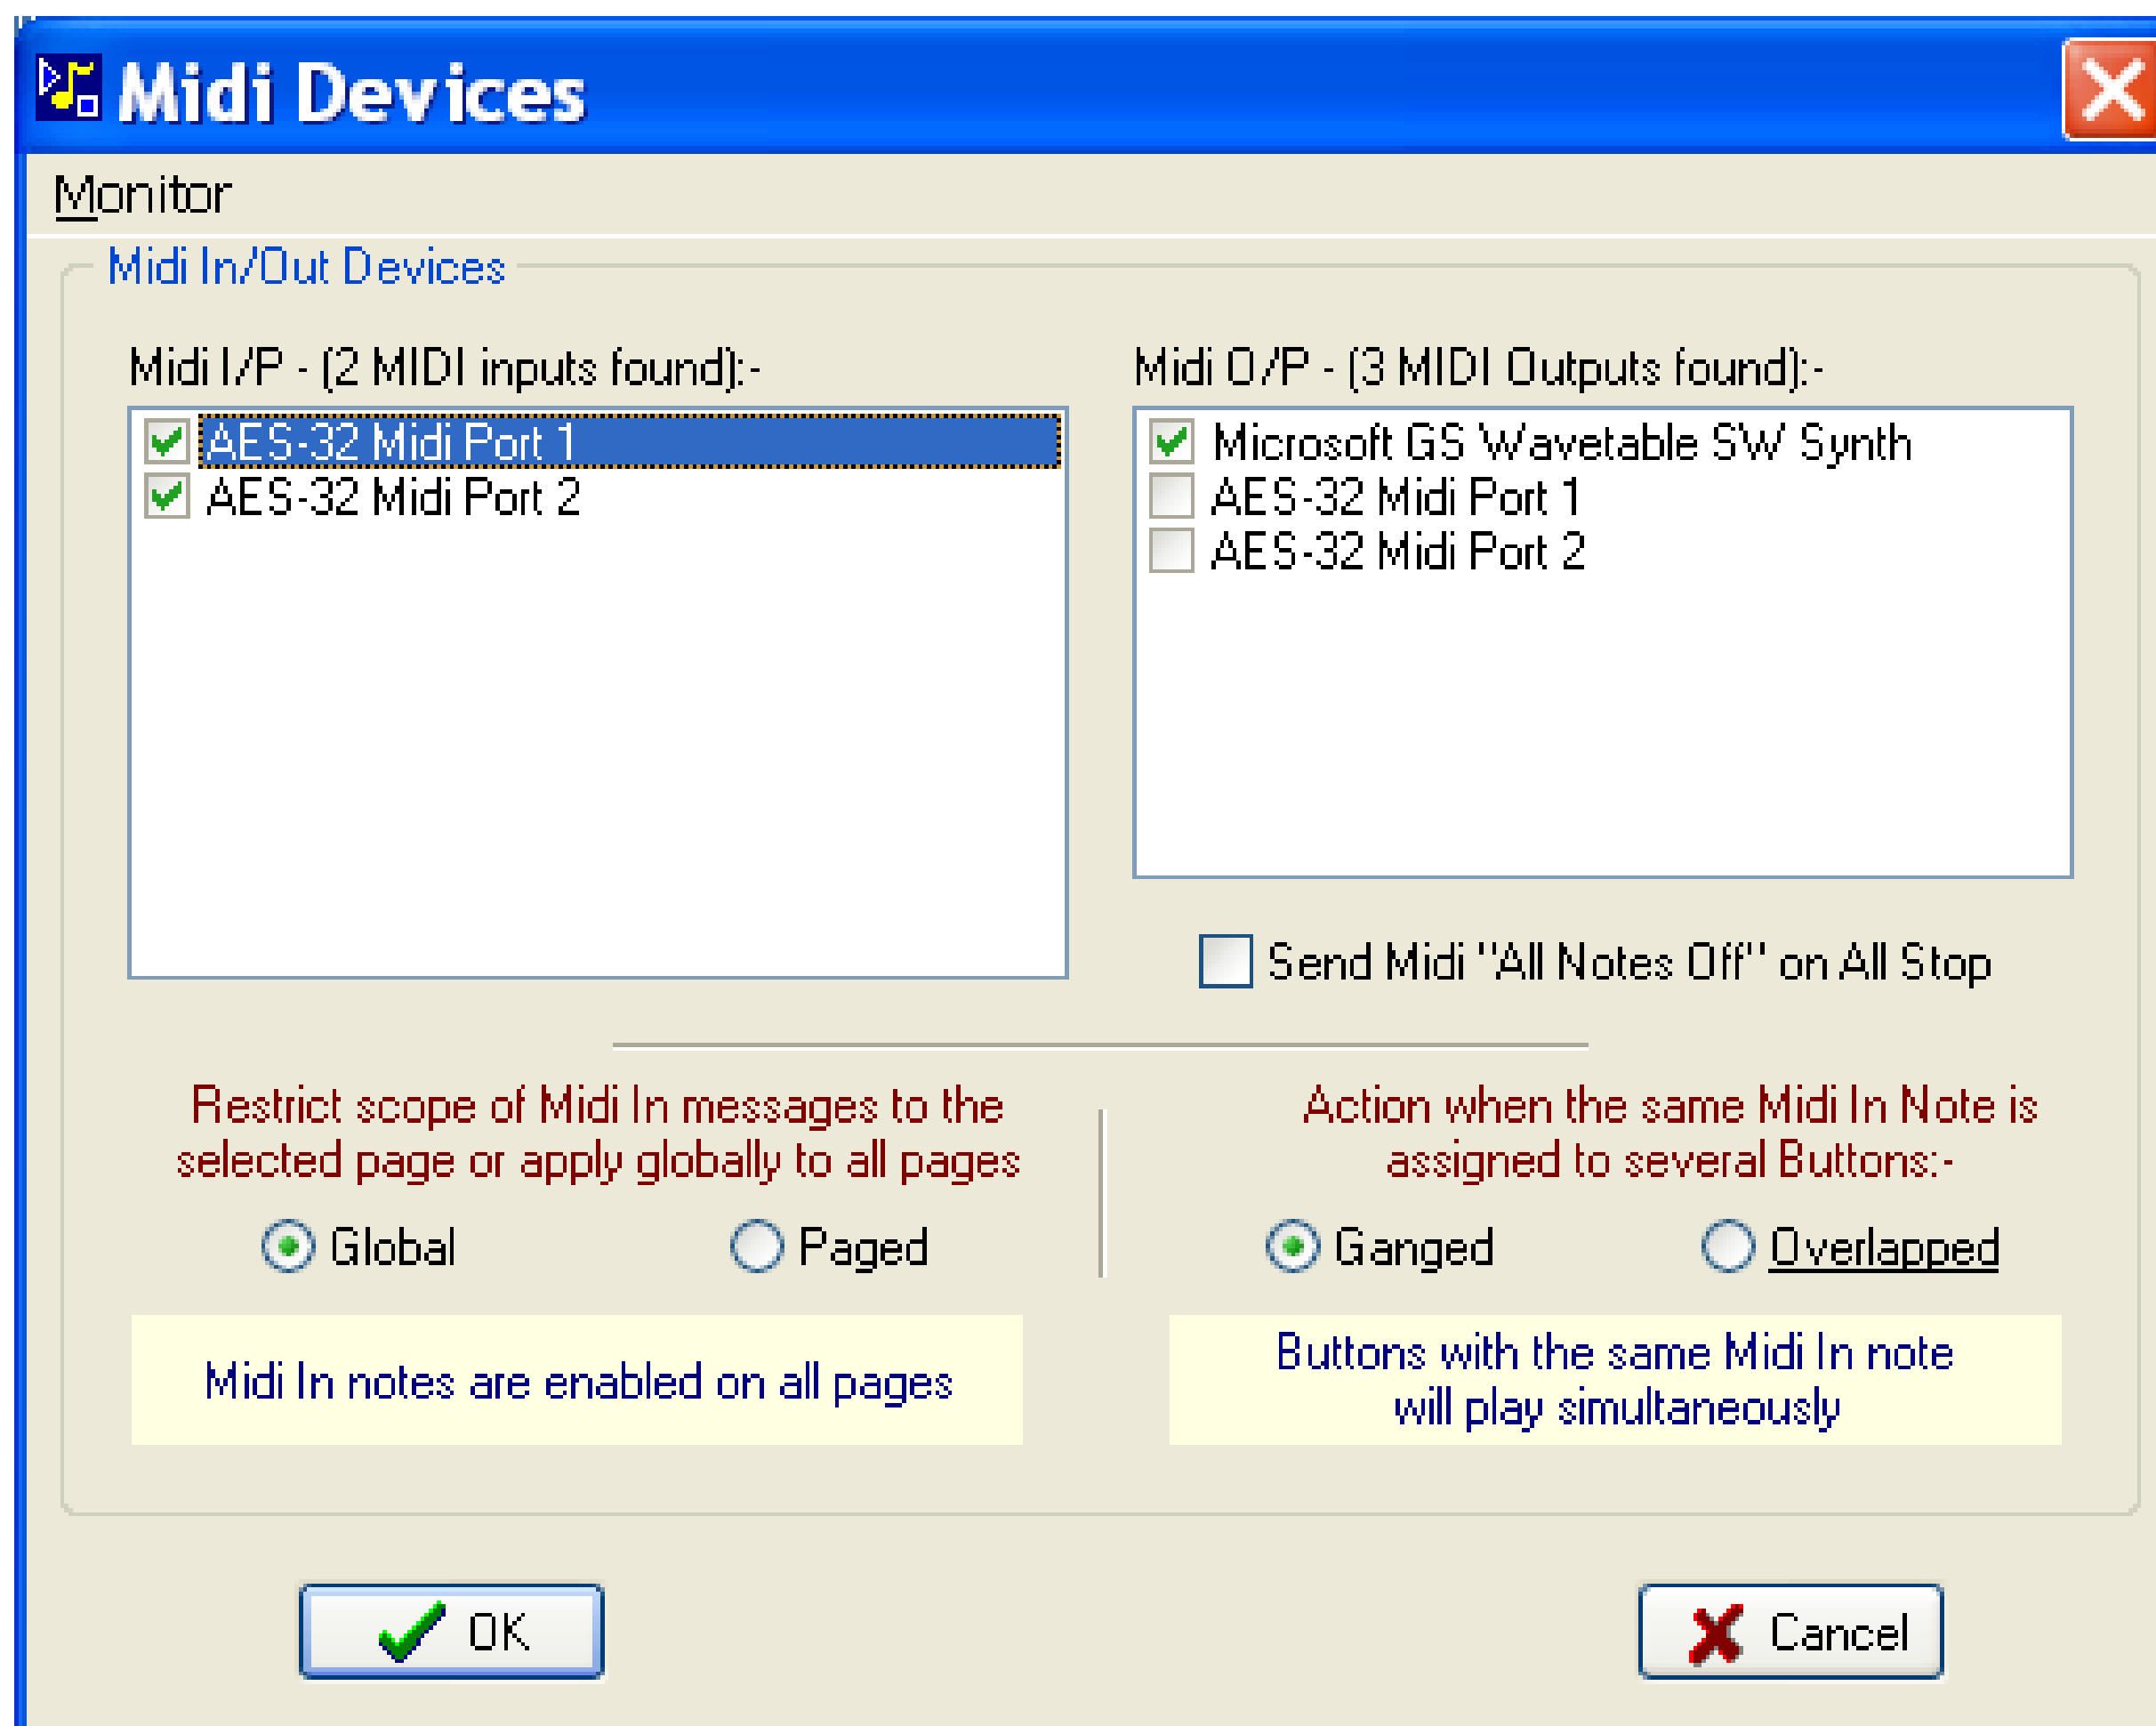

The configuration of this card can be more than a little confusing, the default operation with all software outputs routed to hardware outputs and all hardware inputs not contributing to hardware outputs can be recalled by using Preset 1

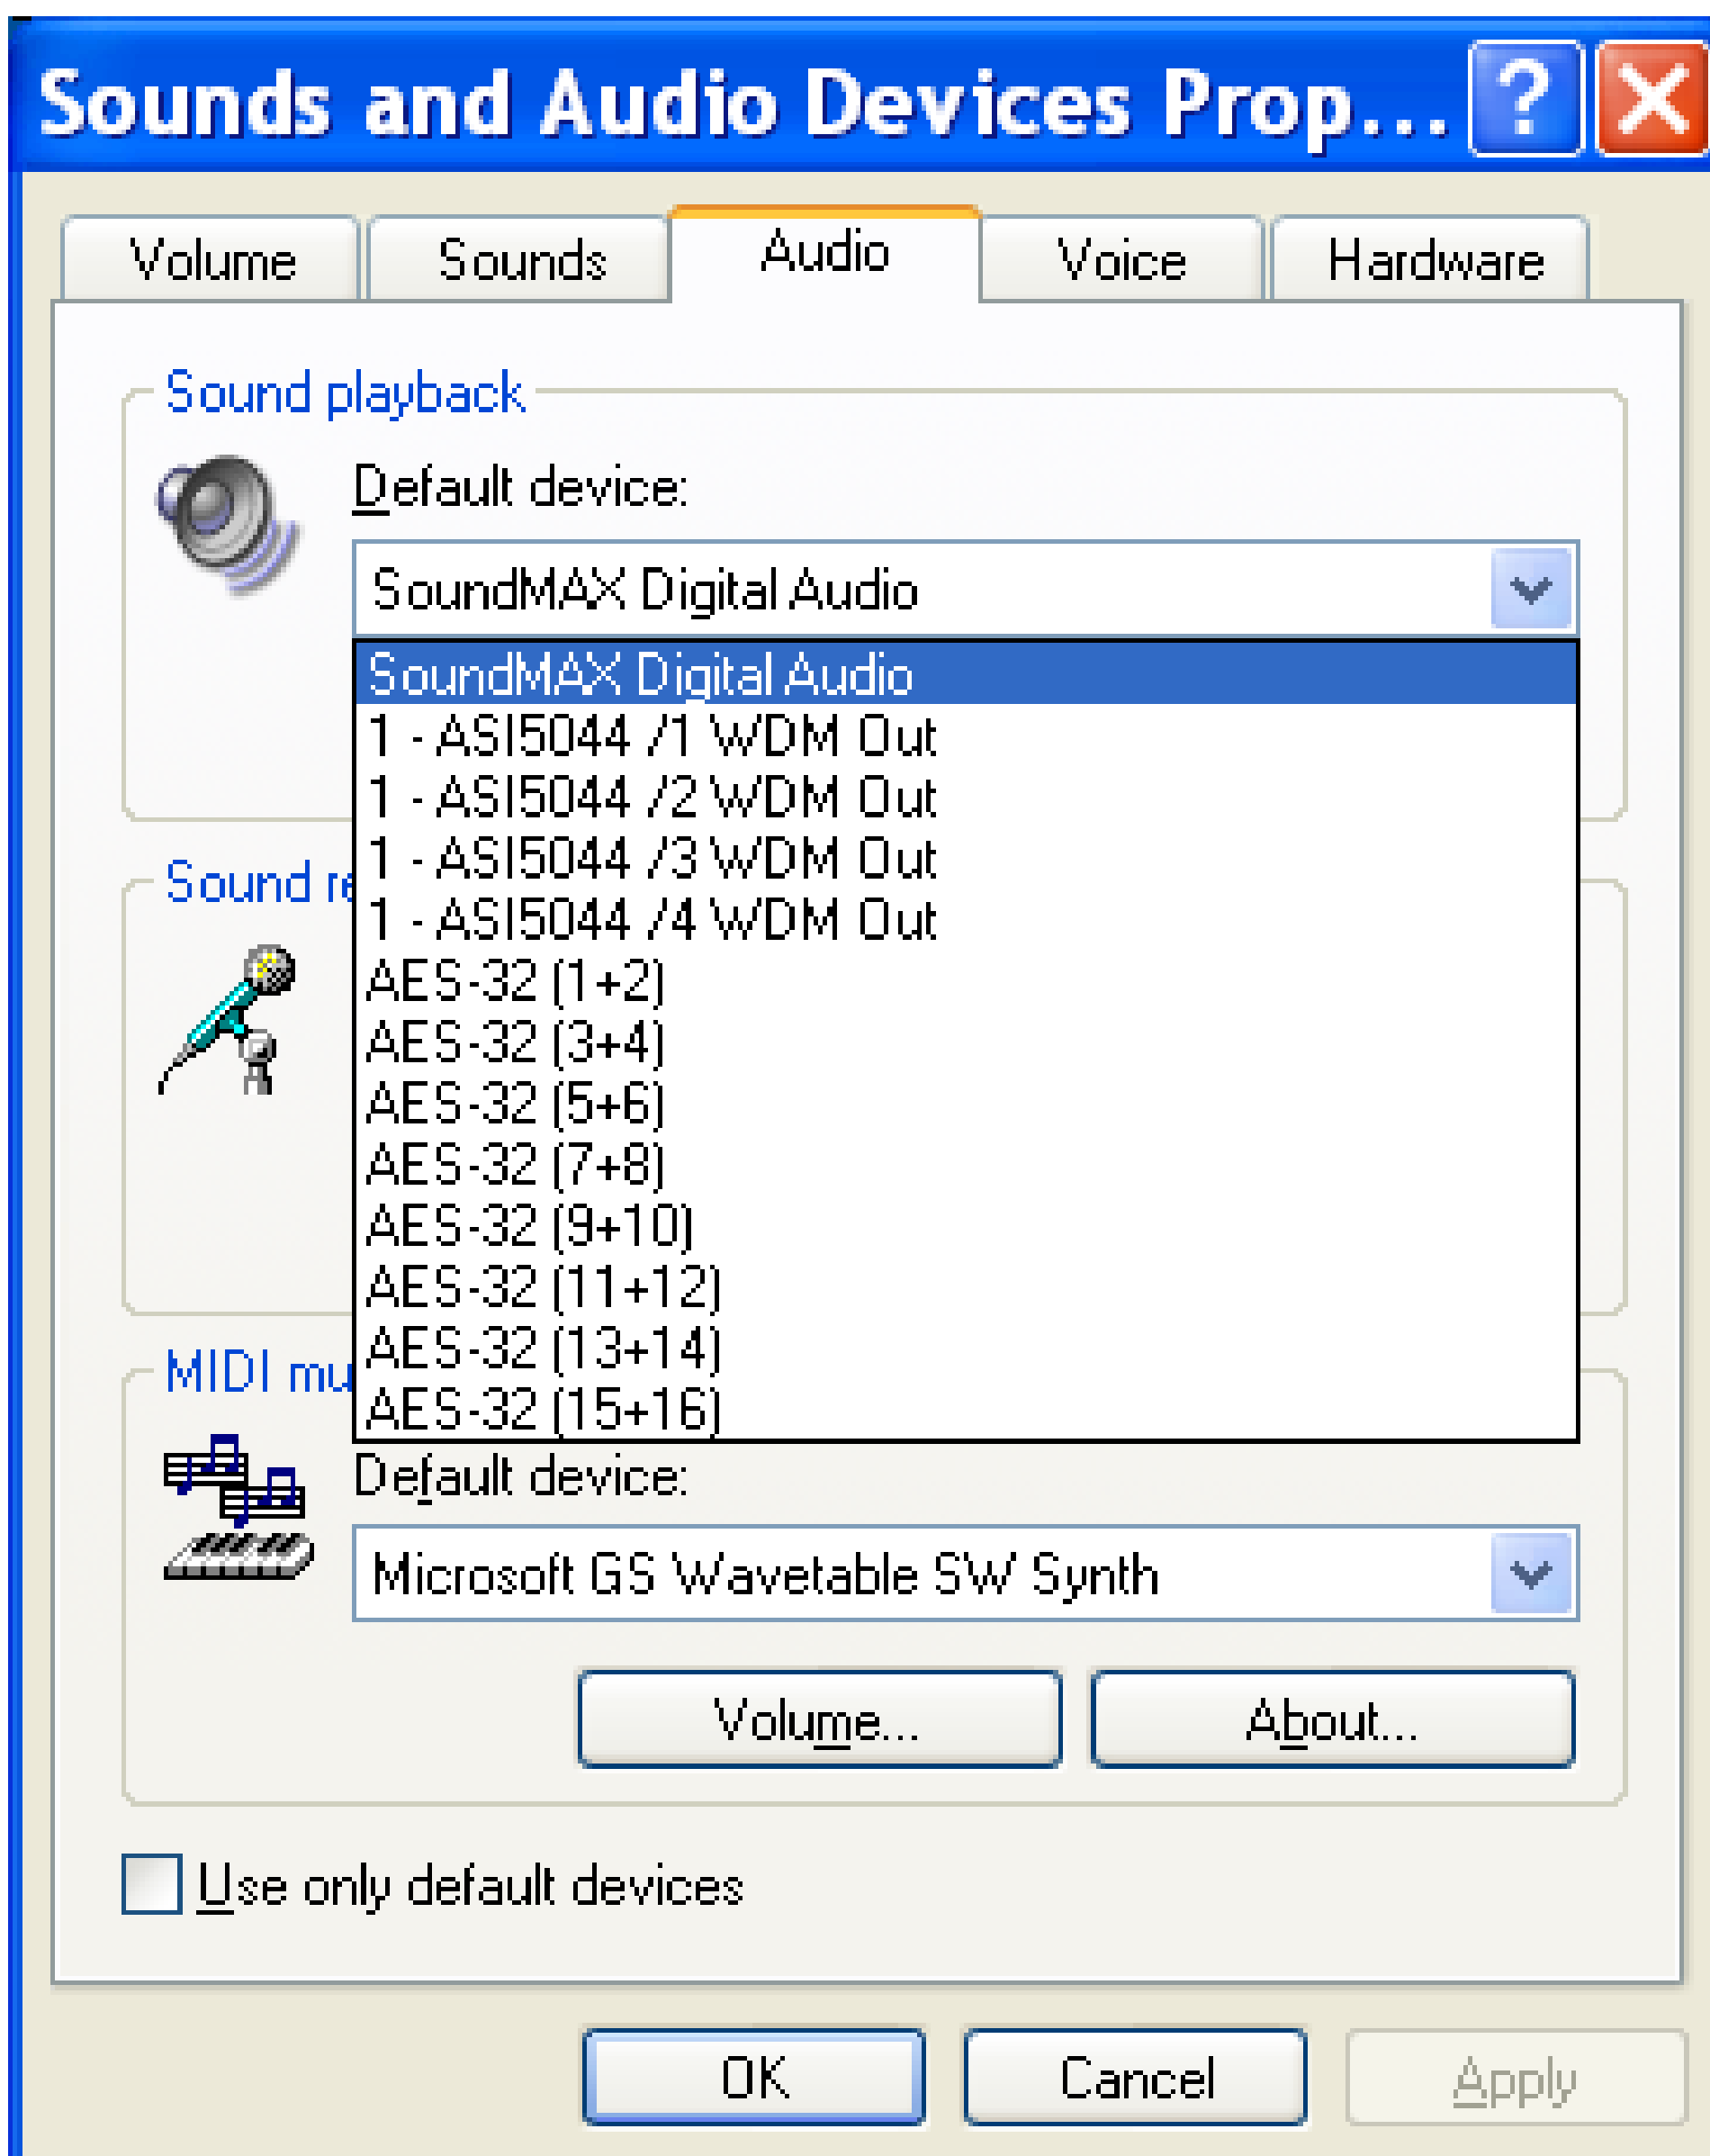

Make sure that this preset is not overwritten with the Save button

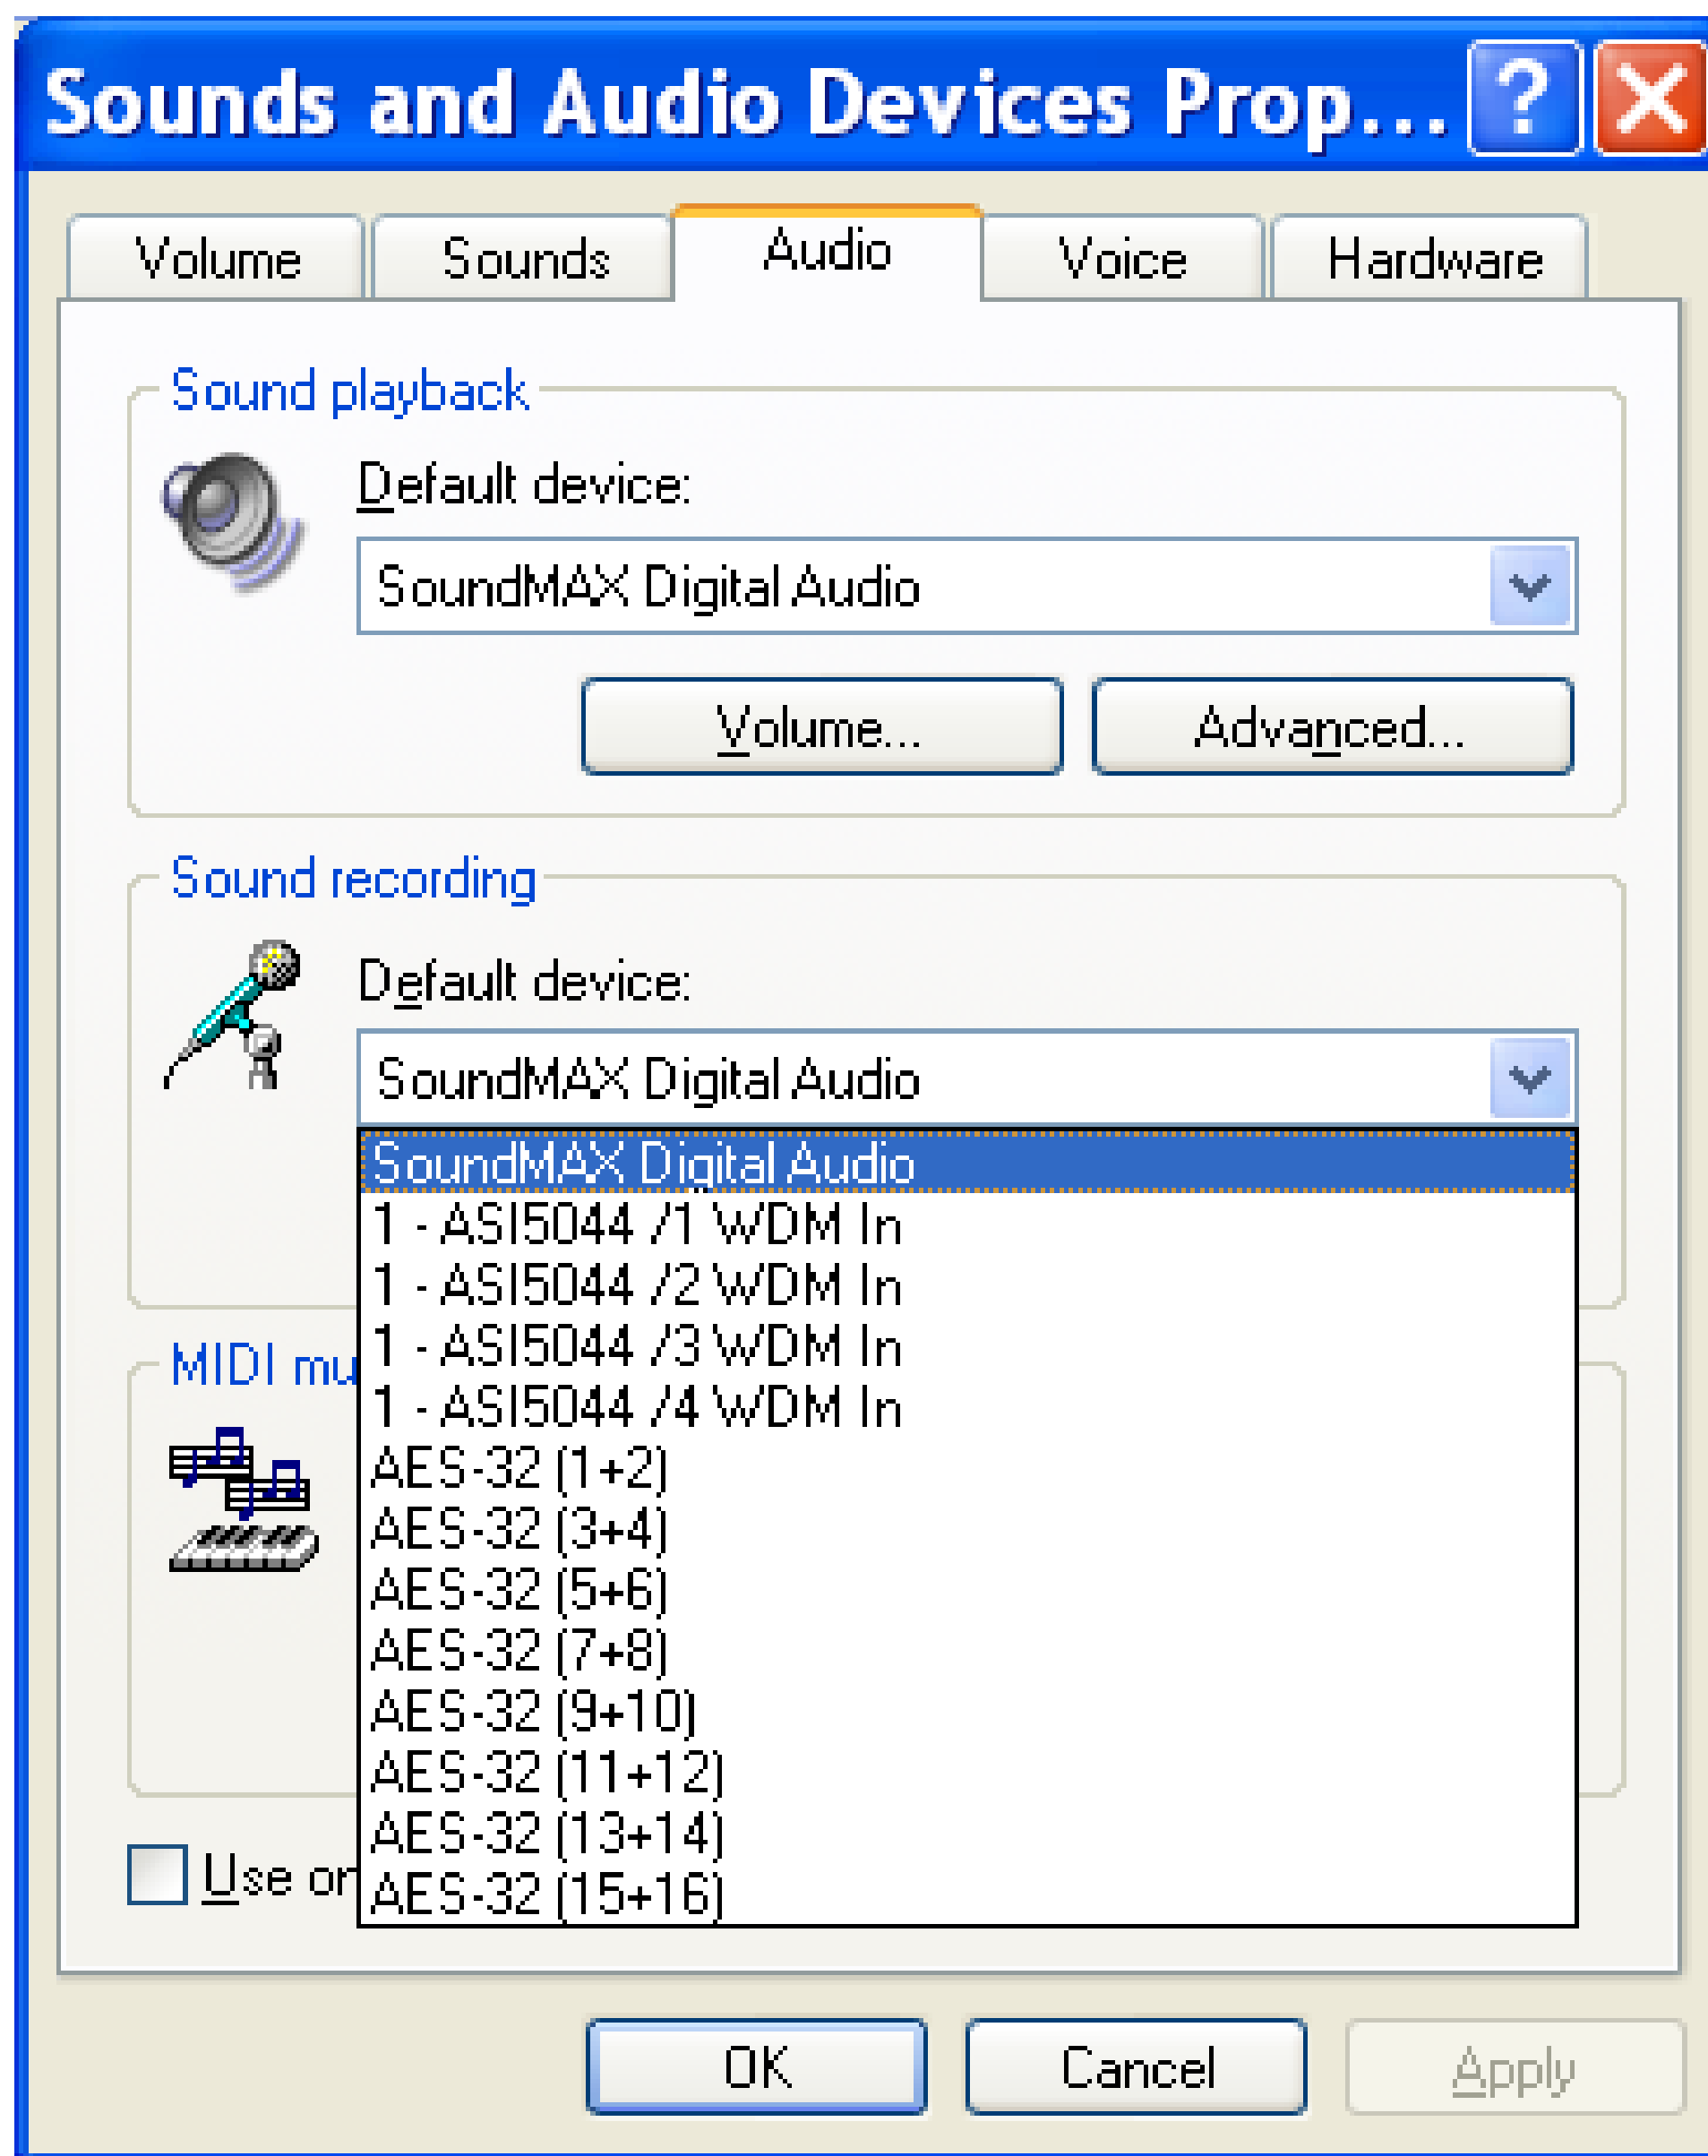

With some of the versions of the RME AES-32 sound card drivers prior to v3.0.66 the multichannel outputs appear in the incorrect order of 1,2,3,4,7,8 instead of 1,2,3,4,5,6 this can be corrected by either externally repatching the output cables or internally using the RME Matrix utility - see RME SetUp

The card has 2 MIDI input and 2 MIDI output channels, these will be shown in the SpotOn SetUp|Midi Devices menu.

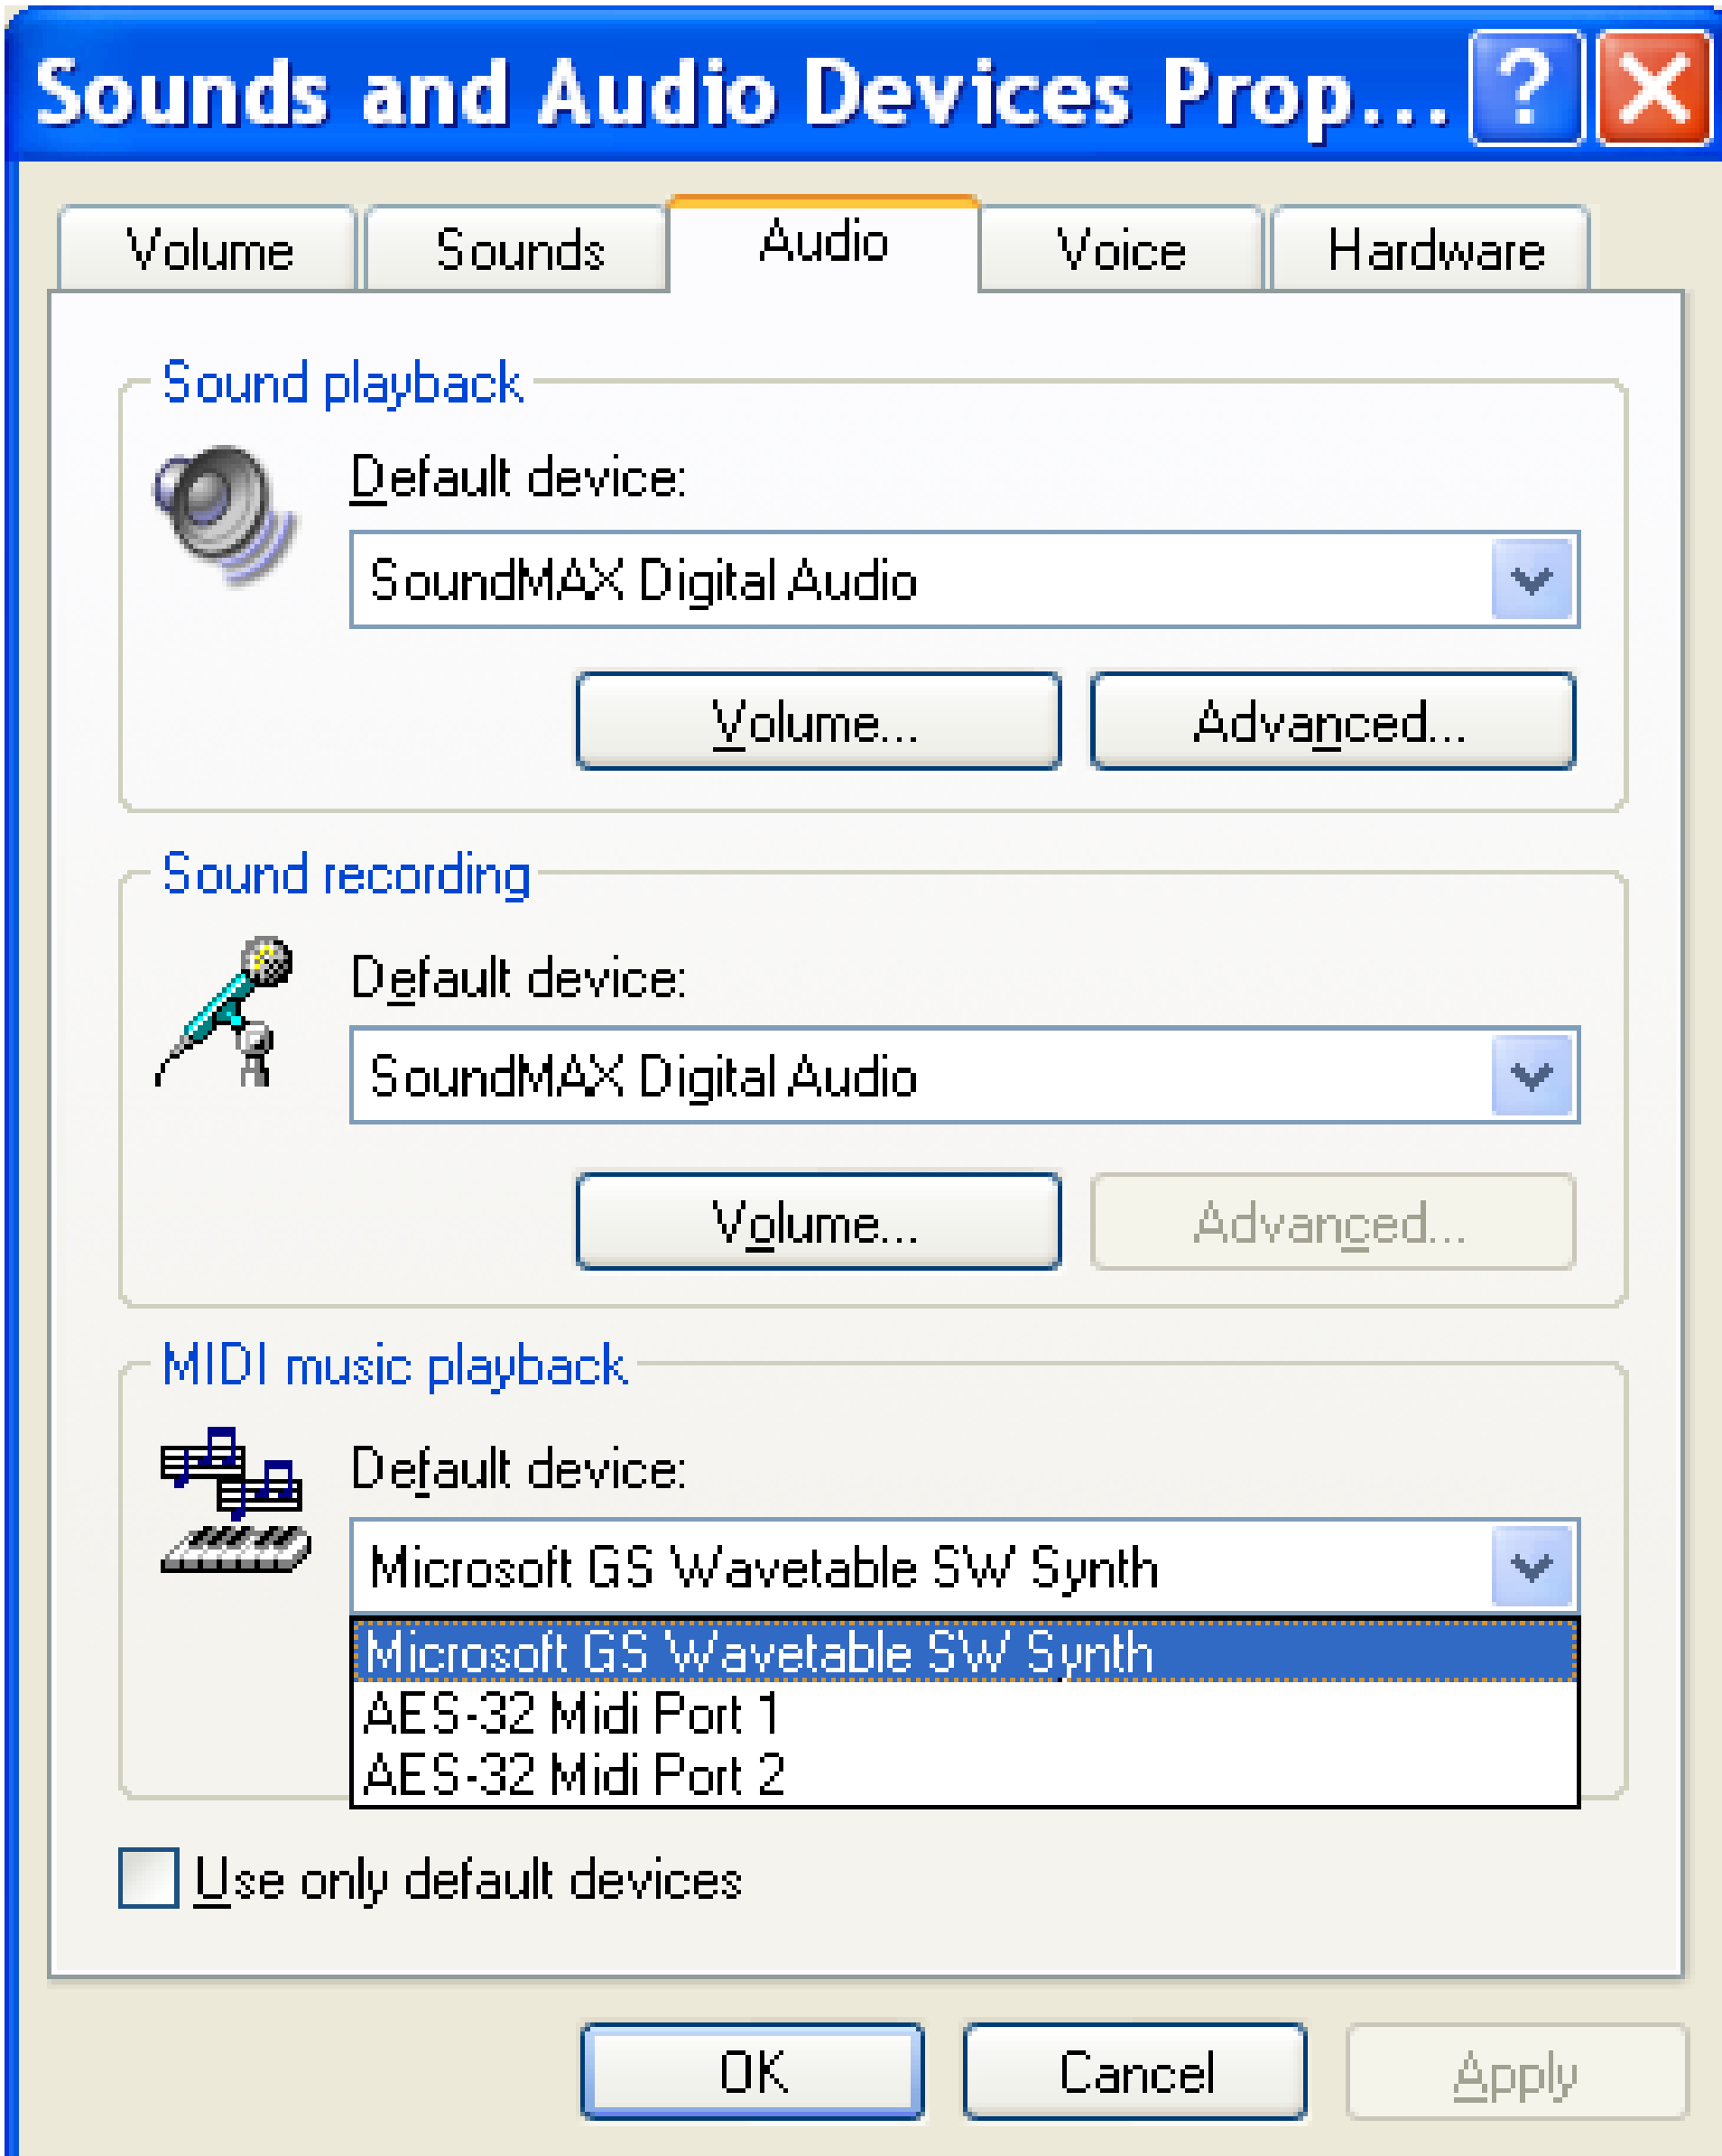

Windows Control Panel 'Sounds and Audio Devices' applet lists the 8 stereo outputs and inputs

The 2 channels of MIDI are also listed.

RME SetUp

With some of the versions of the RME AES-32 sound card drivers prior to v3.0.66 the multichannel outputs appear in the incorrect order of 1,2,3,4,7,8 instead of 1,2,3,4,5,6 this can be corrected by either externally repatching the output cables or internally using the RME Matrix utility.

Out 16															0.0		Out 16
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	

Alternatively the same result can be obtained using the AES-32 Mixer: -

First route SpotOn o/p 1 to physical output 1

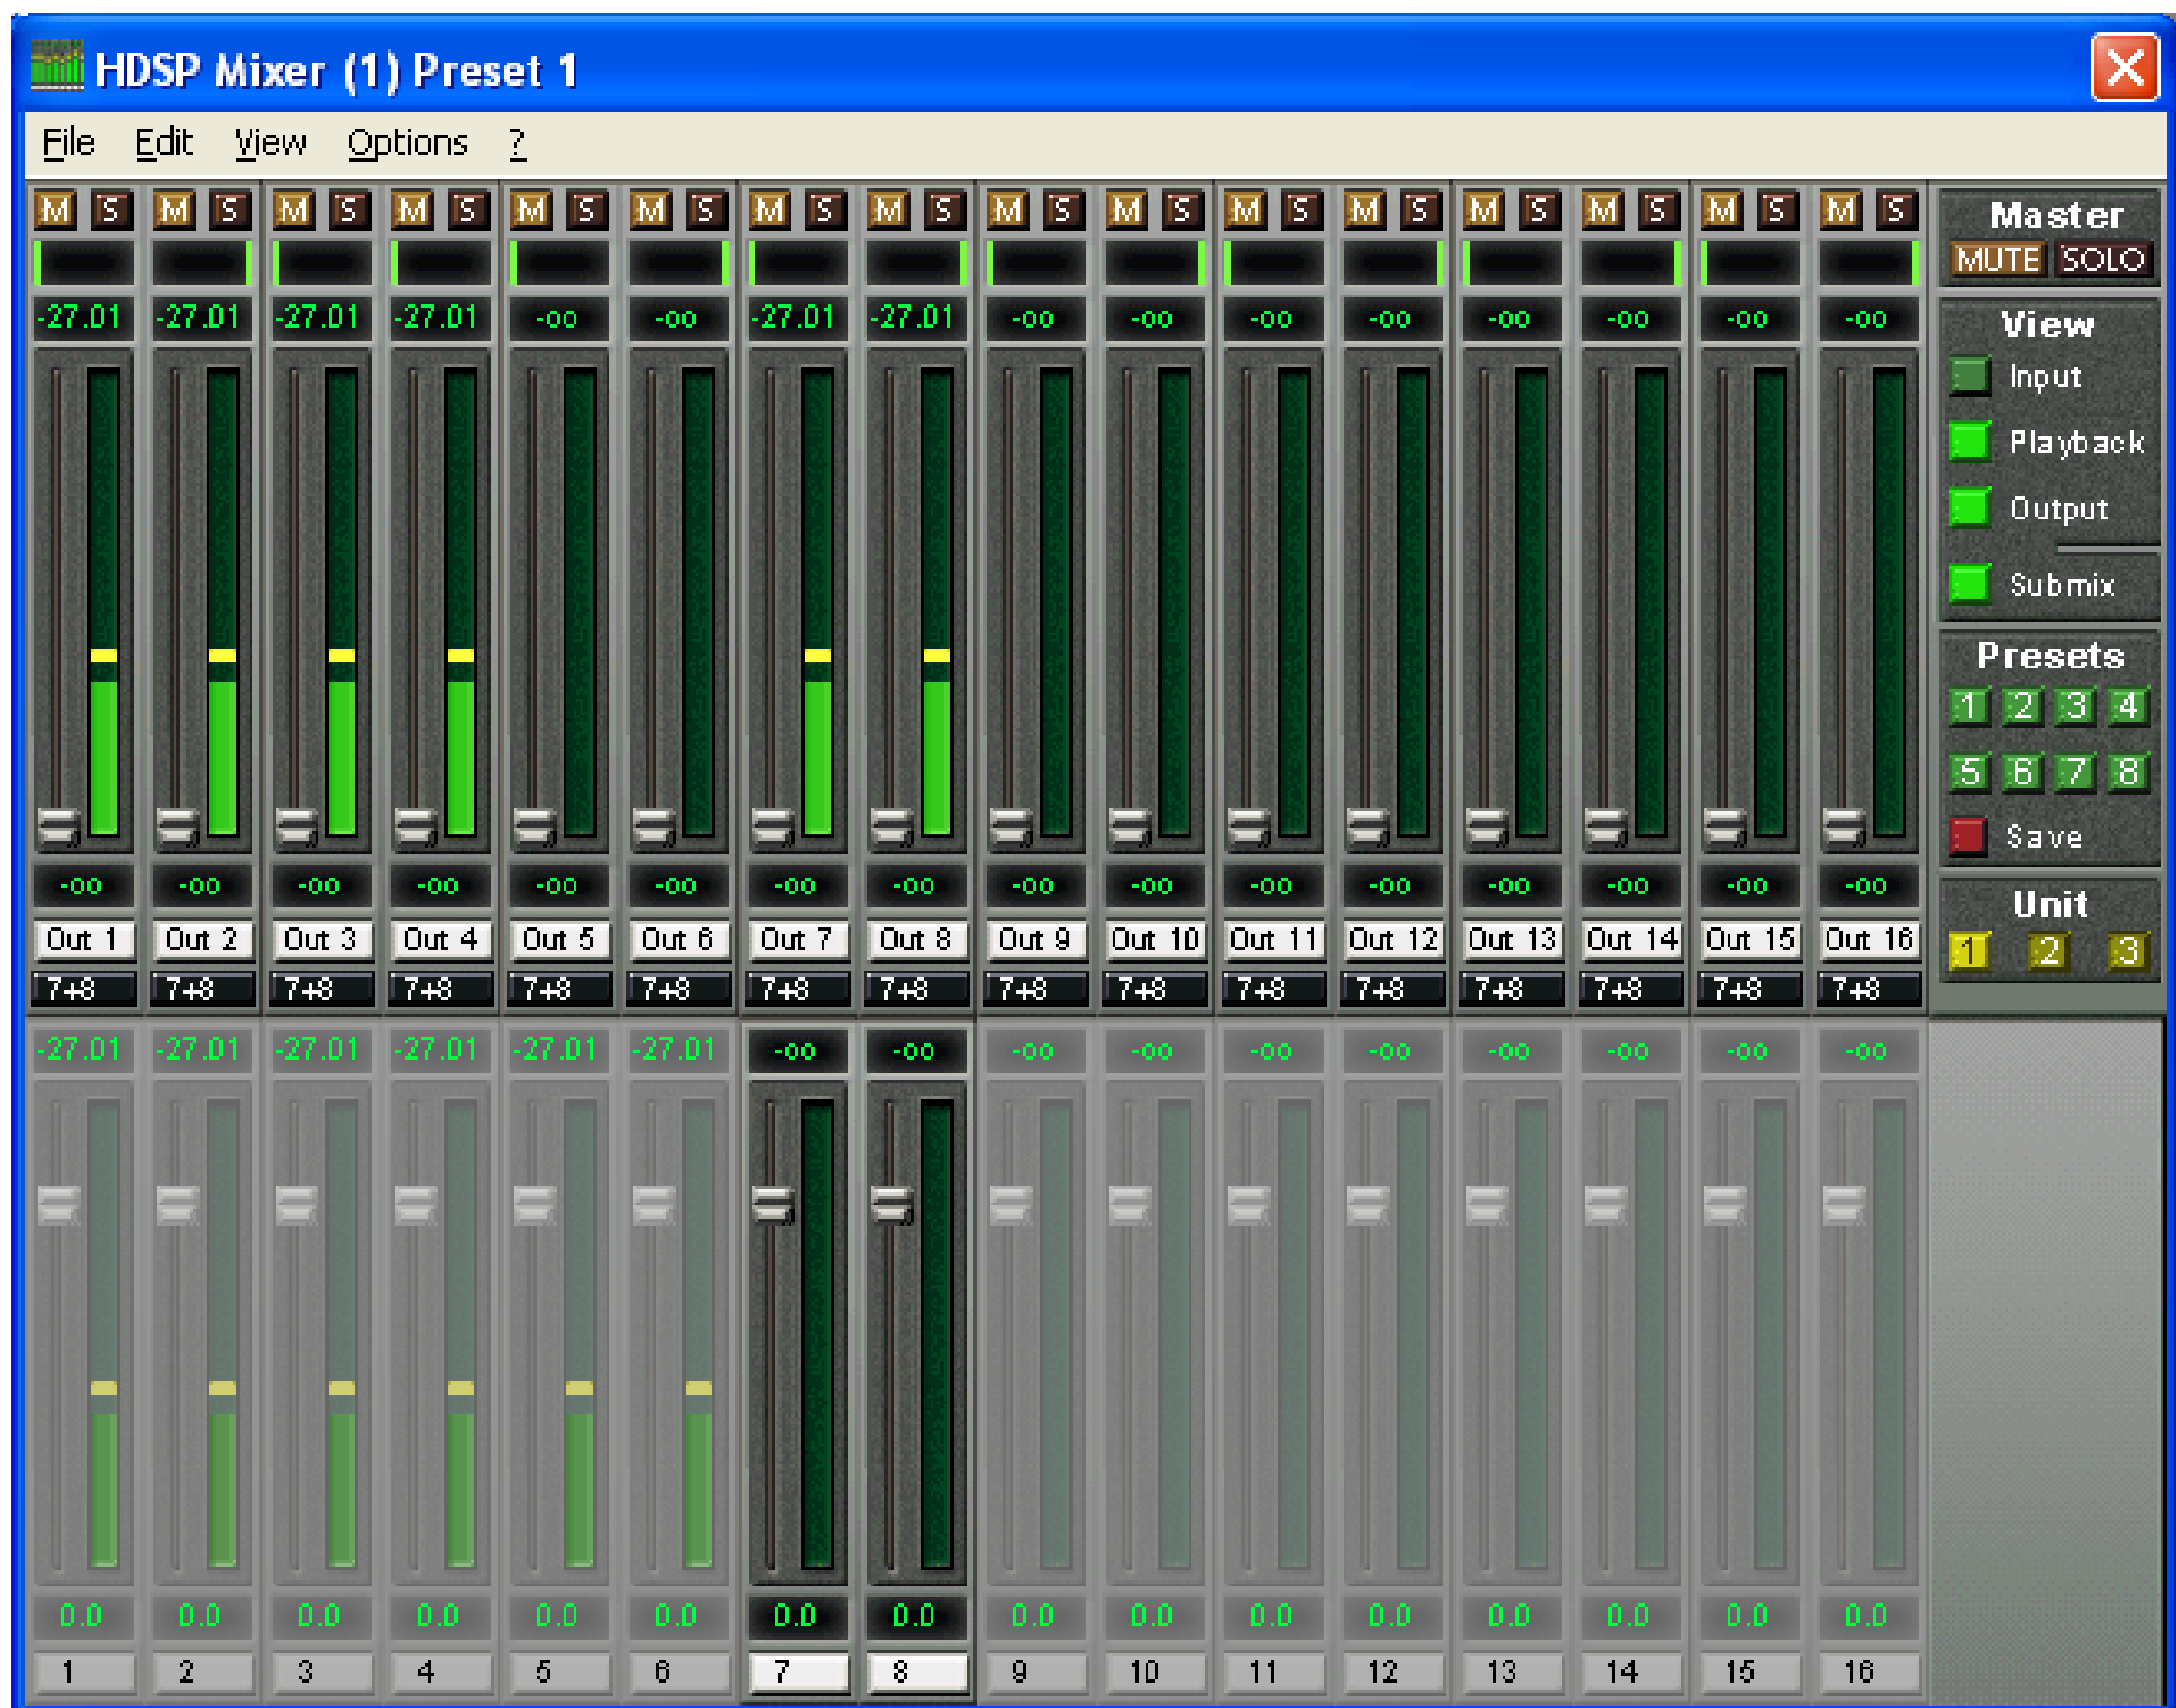

Next route SpotOn o/p 2 to physical output 2

This time set the physical outputs 5+6 to take the audio from SpotOn 7+8

Finally mute the contribution of SpotOn o/ps 7+8 to physical outputs 7+8

Save this configuration by pressing the Red Save button and then Preset 2, note Preset 1 contains the default settings.

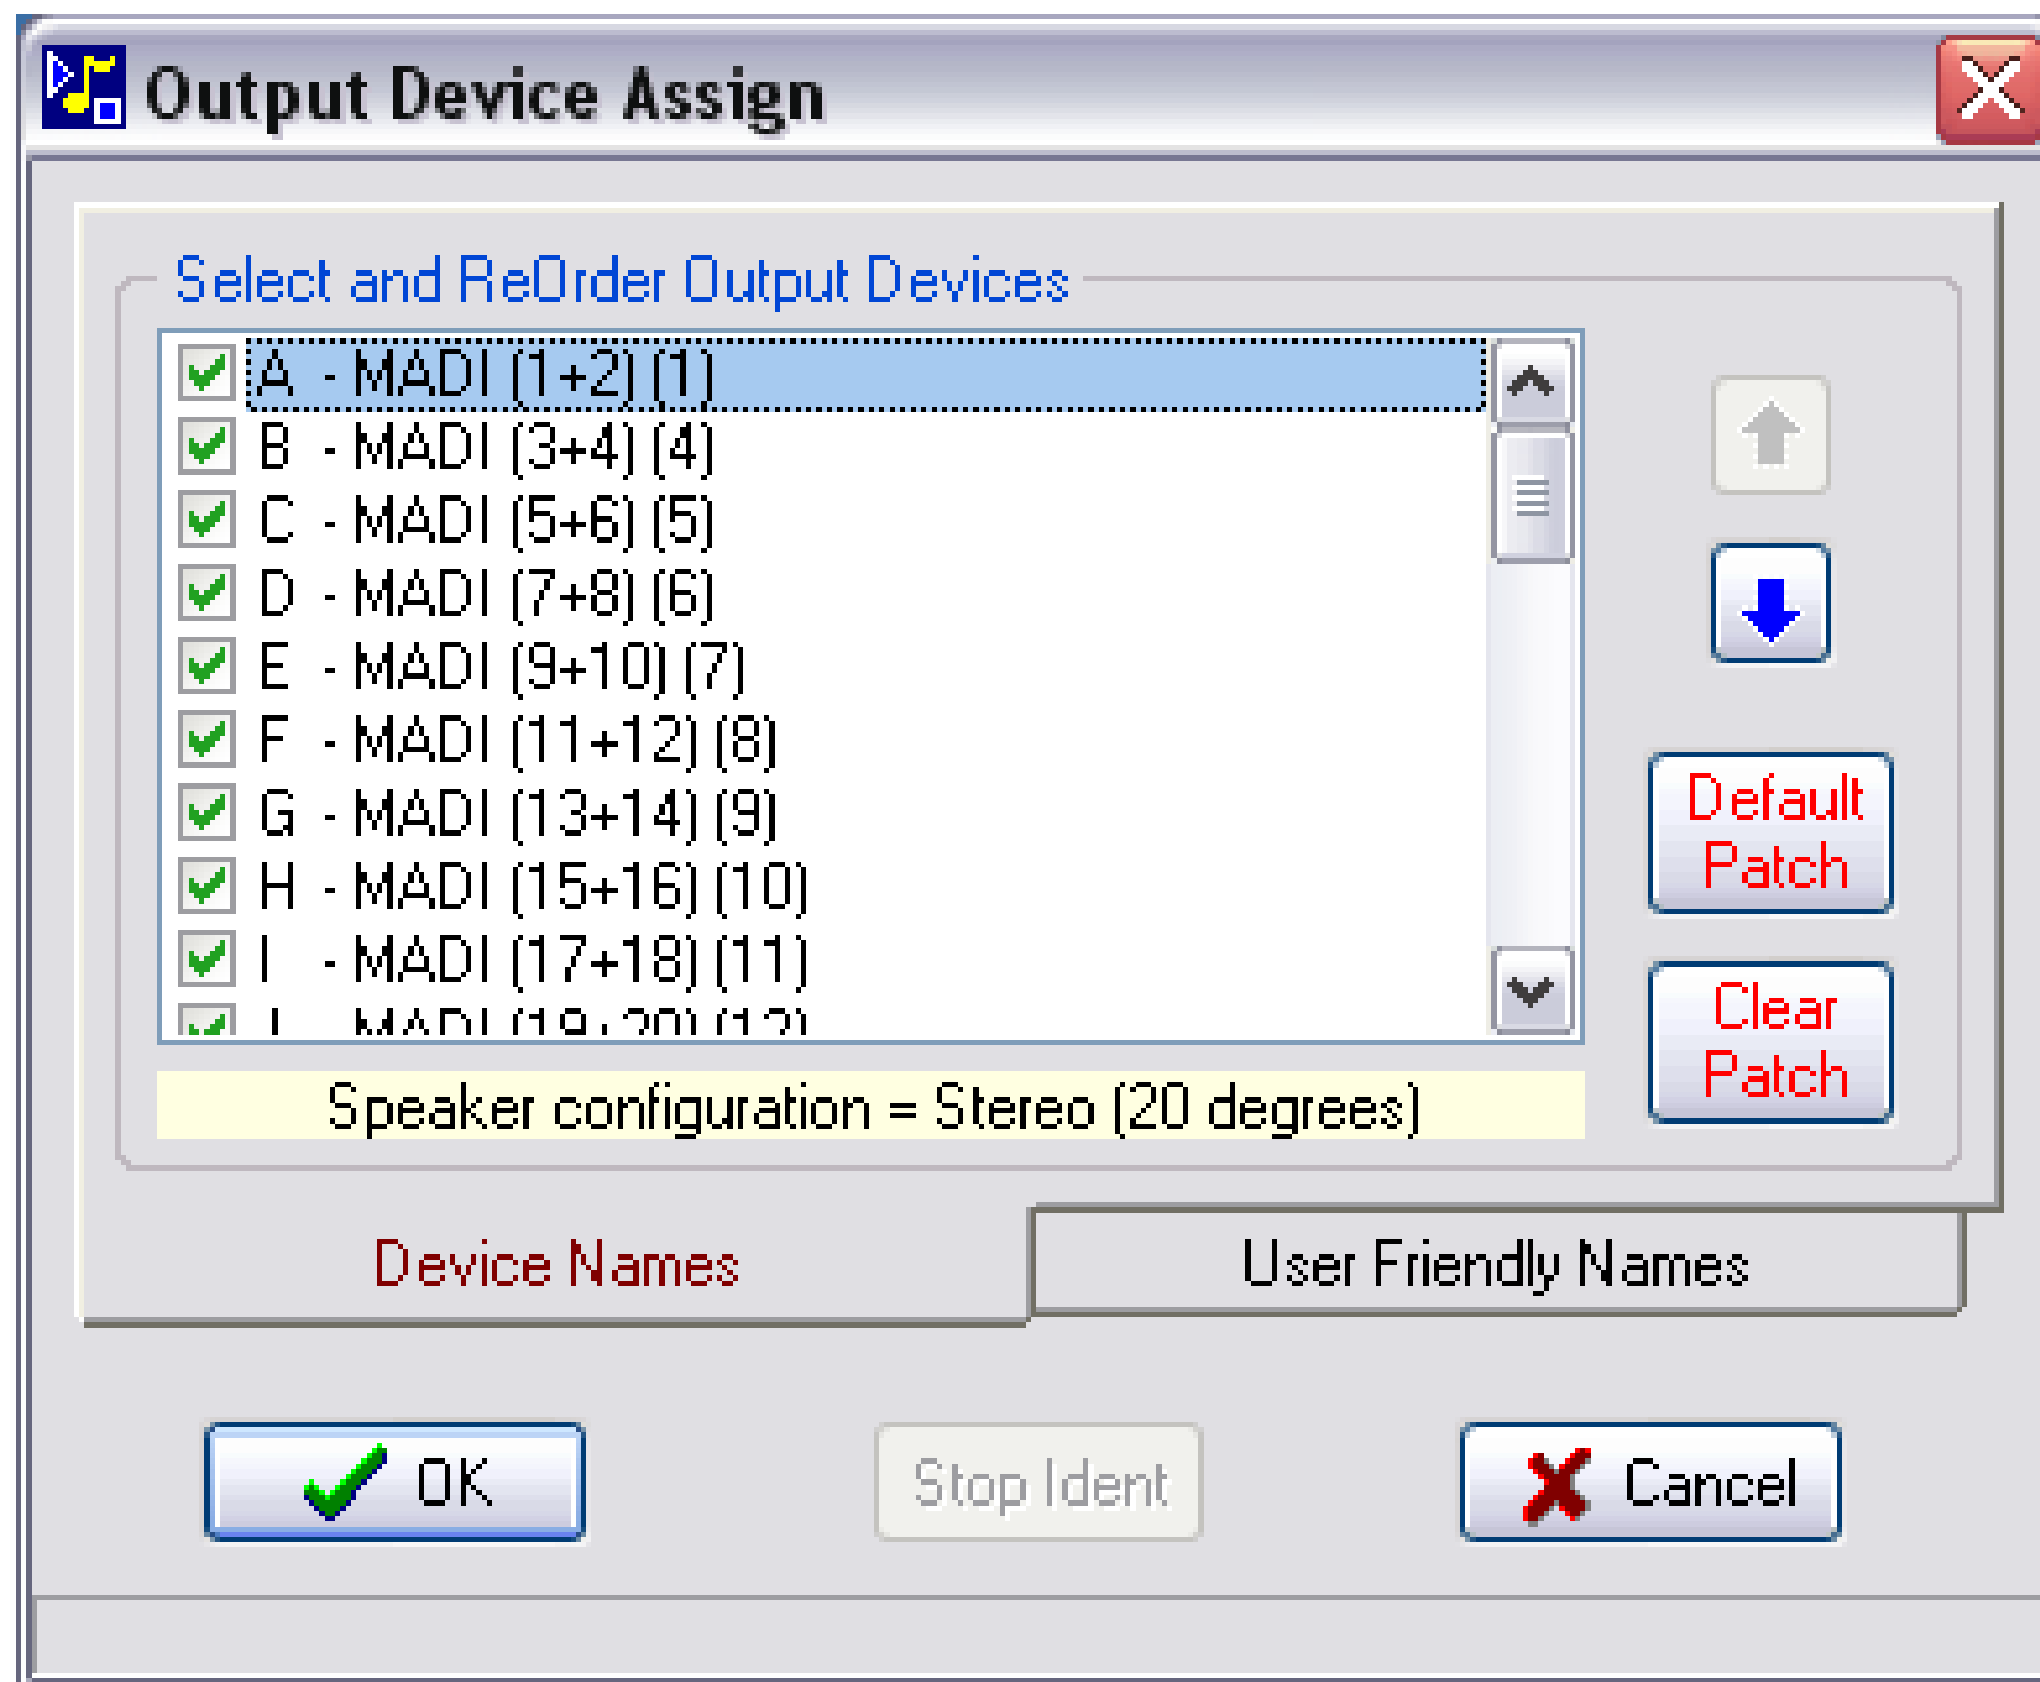

RME HDSP MADI

The RME HDSP MADI card is unusual in that it has 64 output channels, these are presented to SpotOn either as 32x stereo devices or when running in 6/8 channel surround sound mode 8x 5.1 devices.

The RME settings page is similar to their other cards.

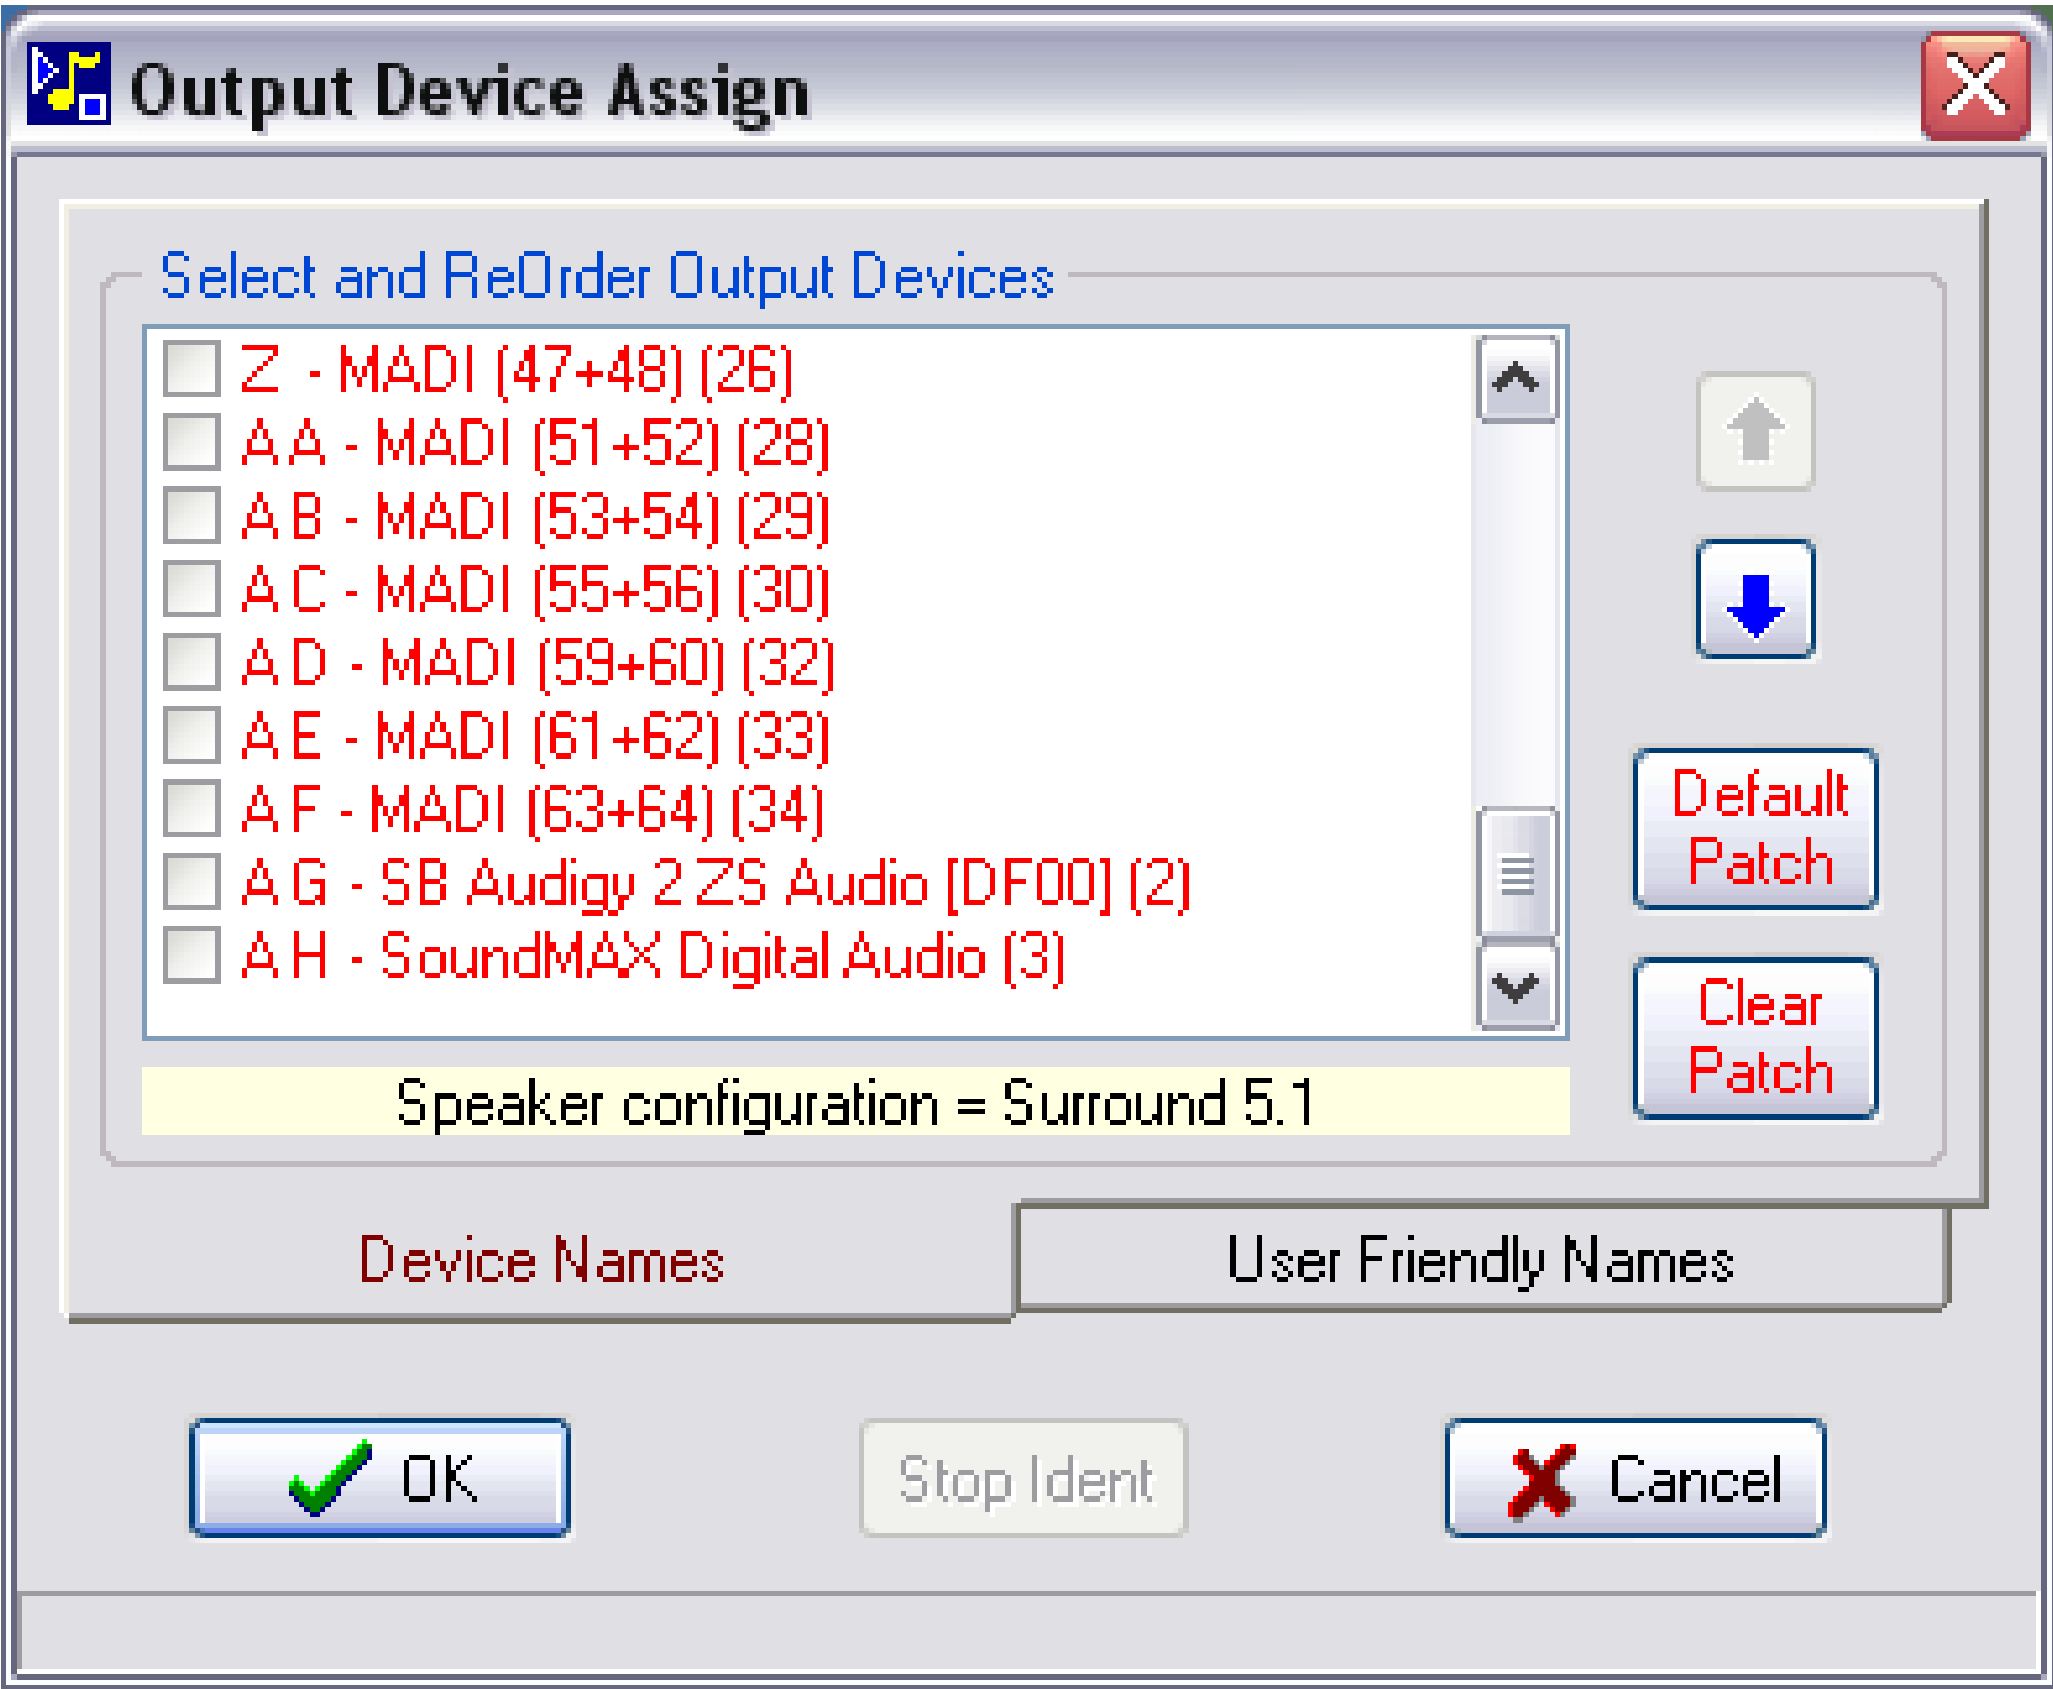

In SpotOn the outputs will be assigned as shown below as 32 stereo pairs.

Checking the RME settings Interleaved option will convert the card to offer 8 x 7.1 output devices

In this case the SpotOn outputs have to be reconfigured to bring the surround sound channels to the top of the list, output A is on channels 1+2 and output B on channels 9+10 and so on.

To complete the SpotOn setup the unused outputs 3..8, 11..16, >> 51..64 will have to be masked.

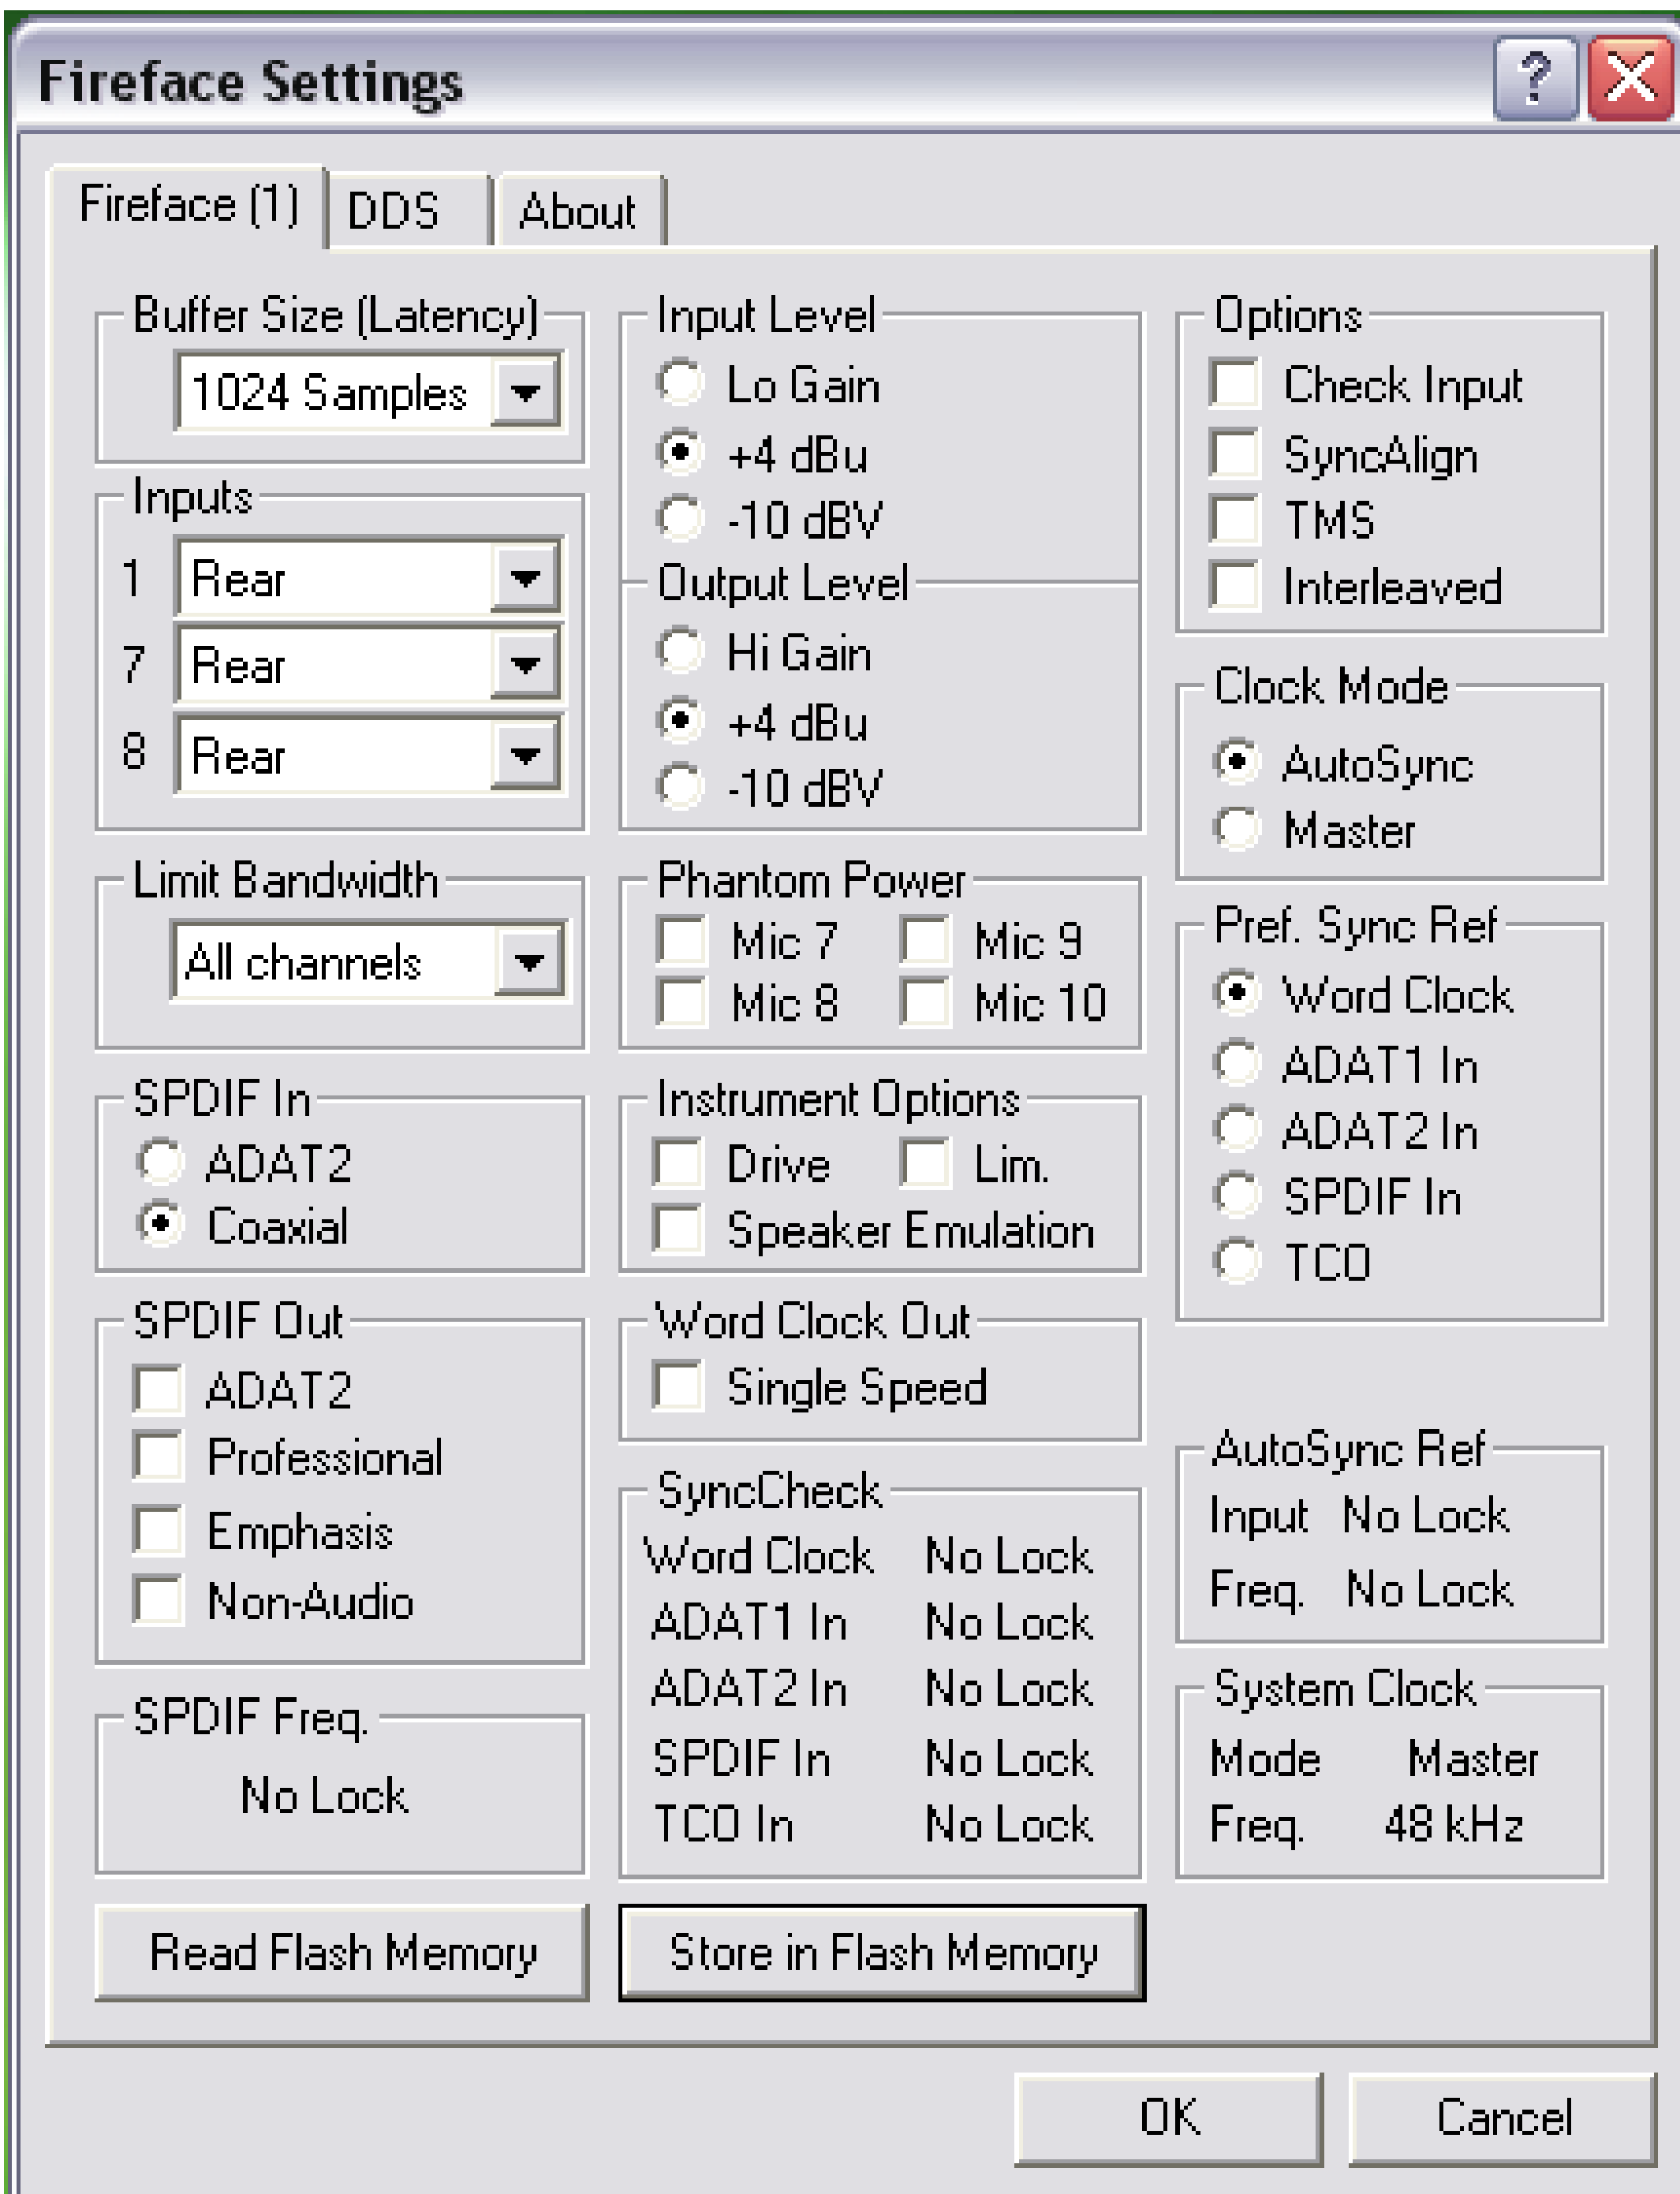

The RME 'TotalMix' utility is correspondingly large to accommodate the 64 channels, requiring a horizontal scroll bar to view all channels.

Below is a screen grab of the first 32 channels with a 5.1 (6 channel) test tone being played on SpotOn outputs A, B, C & D.

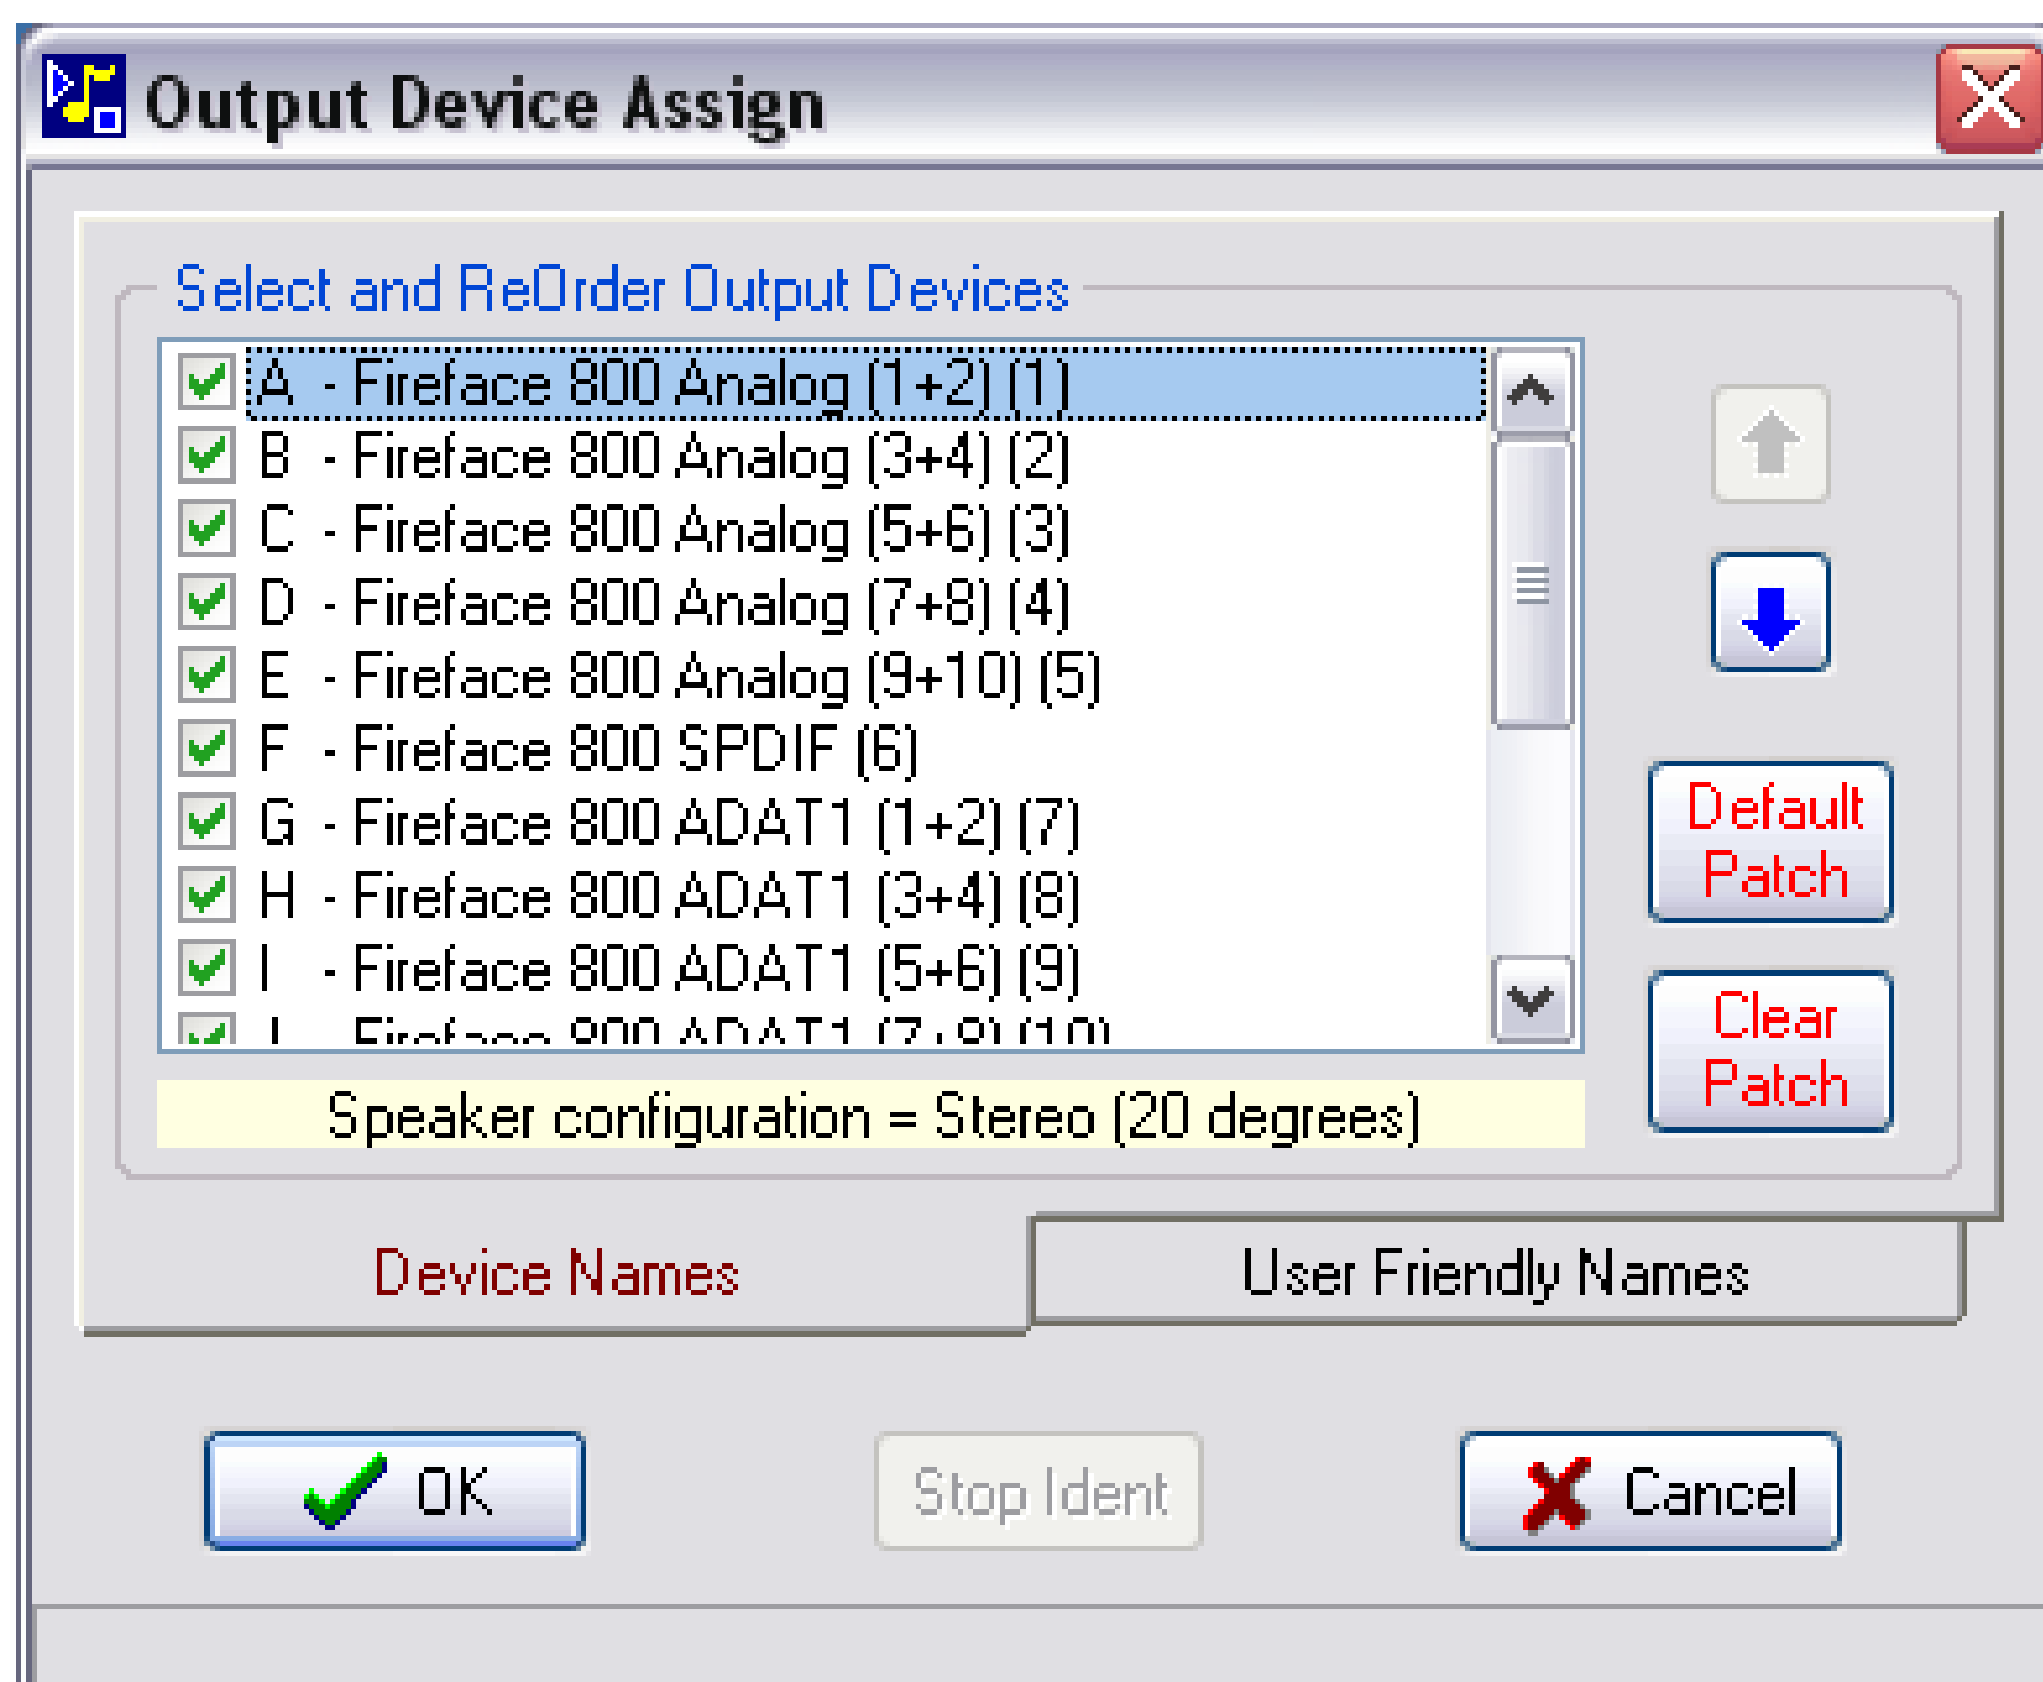

RME Fireface 800

The RME Fireface 800 has 10 channels of output (8 main + 2 preview) available in a variety of formats, the exact setup will depend on the individual user.

In Stereo mode with the Interleaved option unchecked, SpotOn will present the 5 stereo outputs.

In Interleaved mode only outputs 1+2 can be used in SpotOn for either 2 channel stereo or 6 channel surround sound files.

RME Multiface II

The RME Multiface II has 8 channels of output available in a variety of formats, the exact setup will depend on the individual user.

Cancel

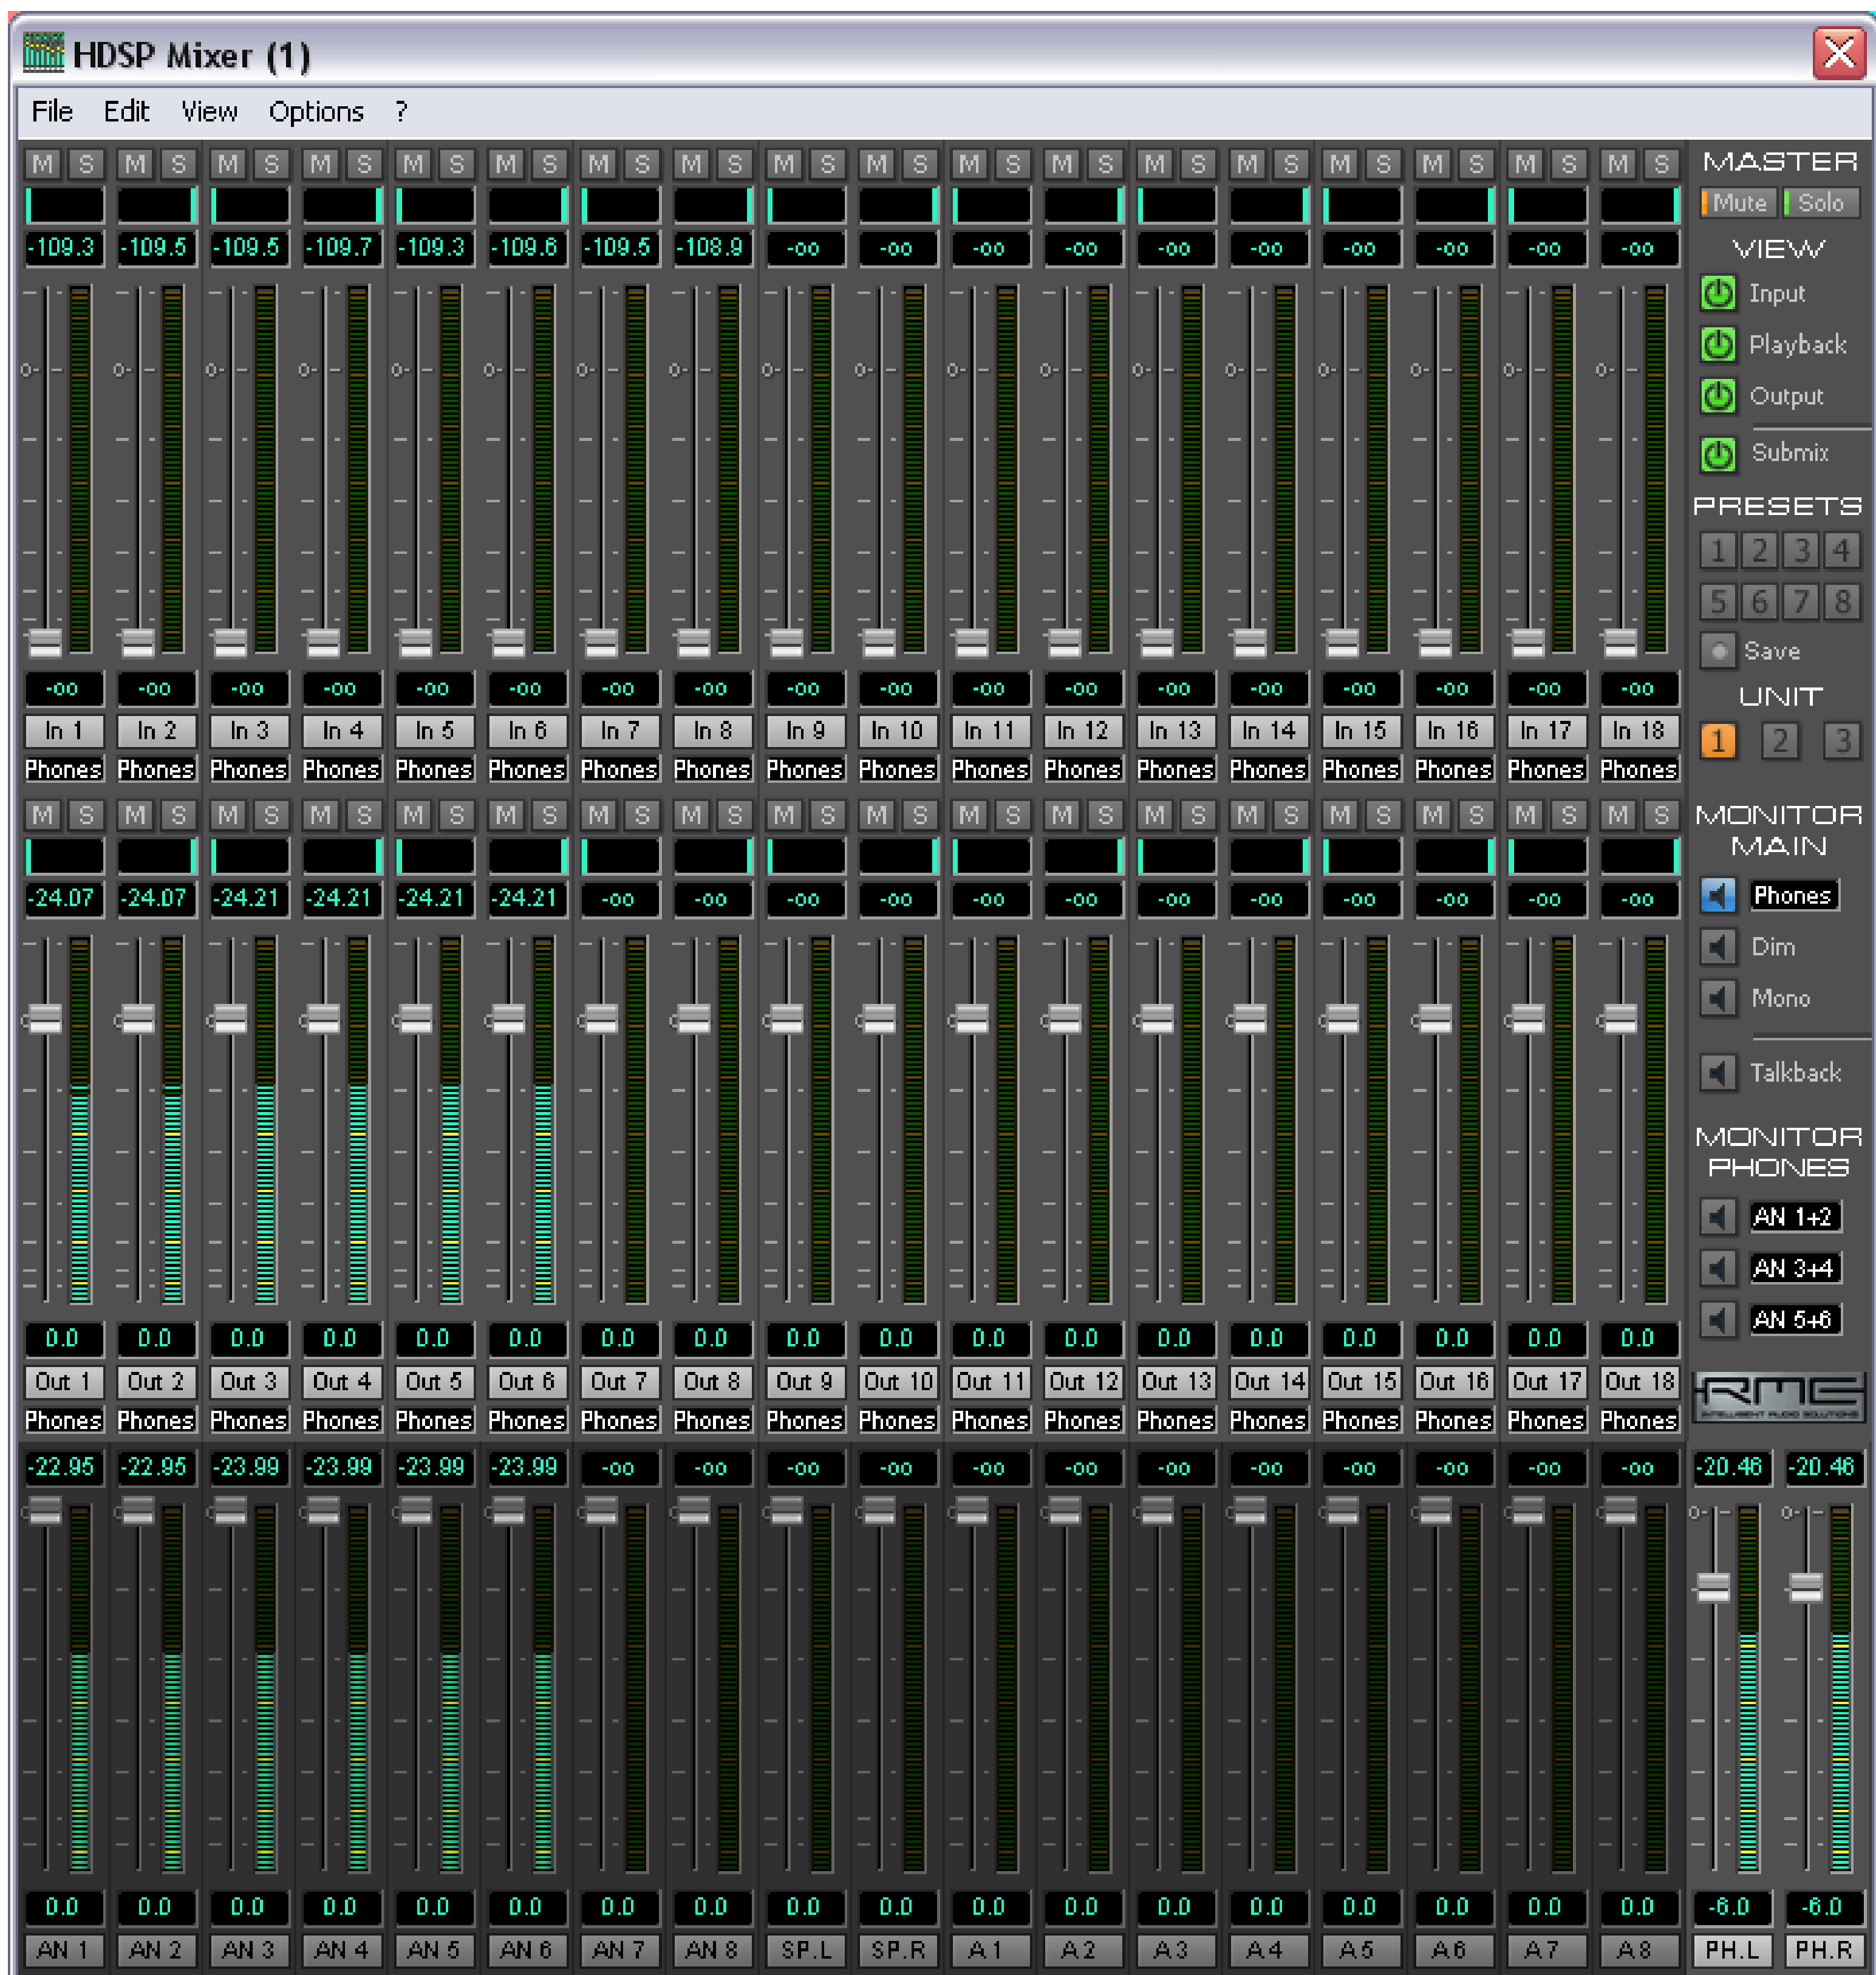

In the Stereo mode the Interleaved option is left unchecked, and SpotOn will offer a range of stereo output devices.

With the Interleaved option checked, the Multiface II will operate in multichannel mode.

The significance of this is that only outputs 1+2 can now be used, the others 3..8 must be masked.

The RME 'TotalMix' utility screen shot below shows a (6 channel) 5.1 test tone playing out on SpotOn output A

GPI Interfaces

Game Port Connections

GPI to Midi Convertor

GPI to Midi Converter

Game port connectors (D15 way) are becoming increasingly rare on modern computers, there are a few alternatives available to pass GPI signals into SpotOn.

One method is to convert the GPI signal (contact closure) to a Midi note and set SpotOn to trigger from that note.

A unit made in the UK by Kenton Electronics www.kenton.co.uk accepts 16 GPI inputs and patches these to 16 different Midi notes.

The GPIM-16 converter has 16 GPI (general purpose interface) inputs arranged on two 9 pin D sockets.

Each block of 8 inputs can be assigned a starting MIDI note number and subsequent inputs follow on consecutive note numbers. (default for first block is 36-43, and for the second block is 44-51).

Each block of 8 inputs can be set whether note offs are sent when the switches open (default yes).

The MIDI transmit channel for all inputs can be set (range 1 to 16, default 1).

The debounce value for all switch inputs can be set (range 1 to 100 milliseconds – default 10mS).

The inputs are arranged with internal pullups, so that shorting that input to ground will send the appropriate MIDI note-on message – releasing the short to ground will send a note-off message (unless disabled).

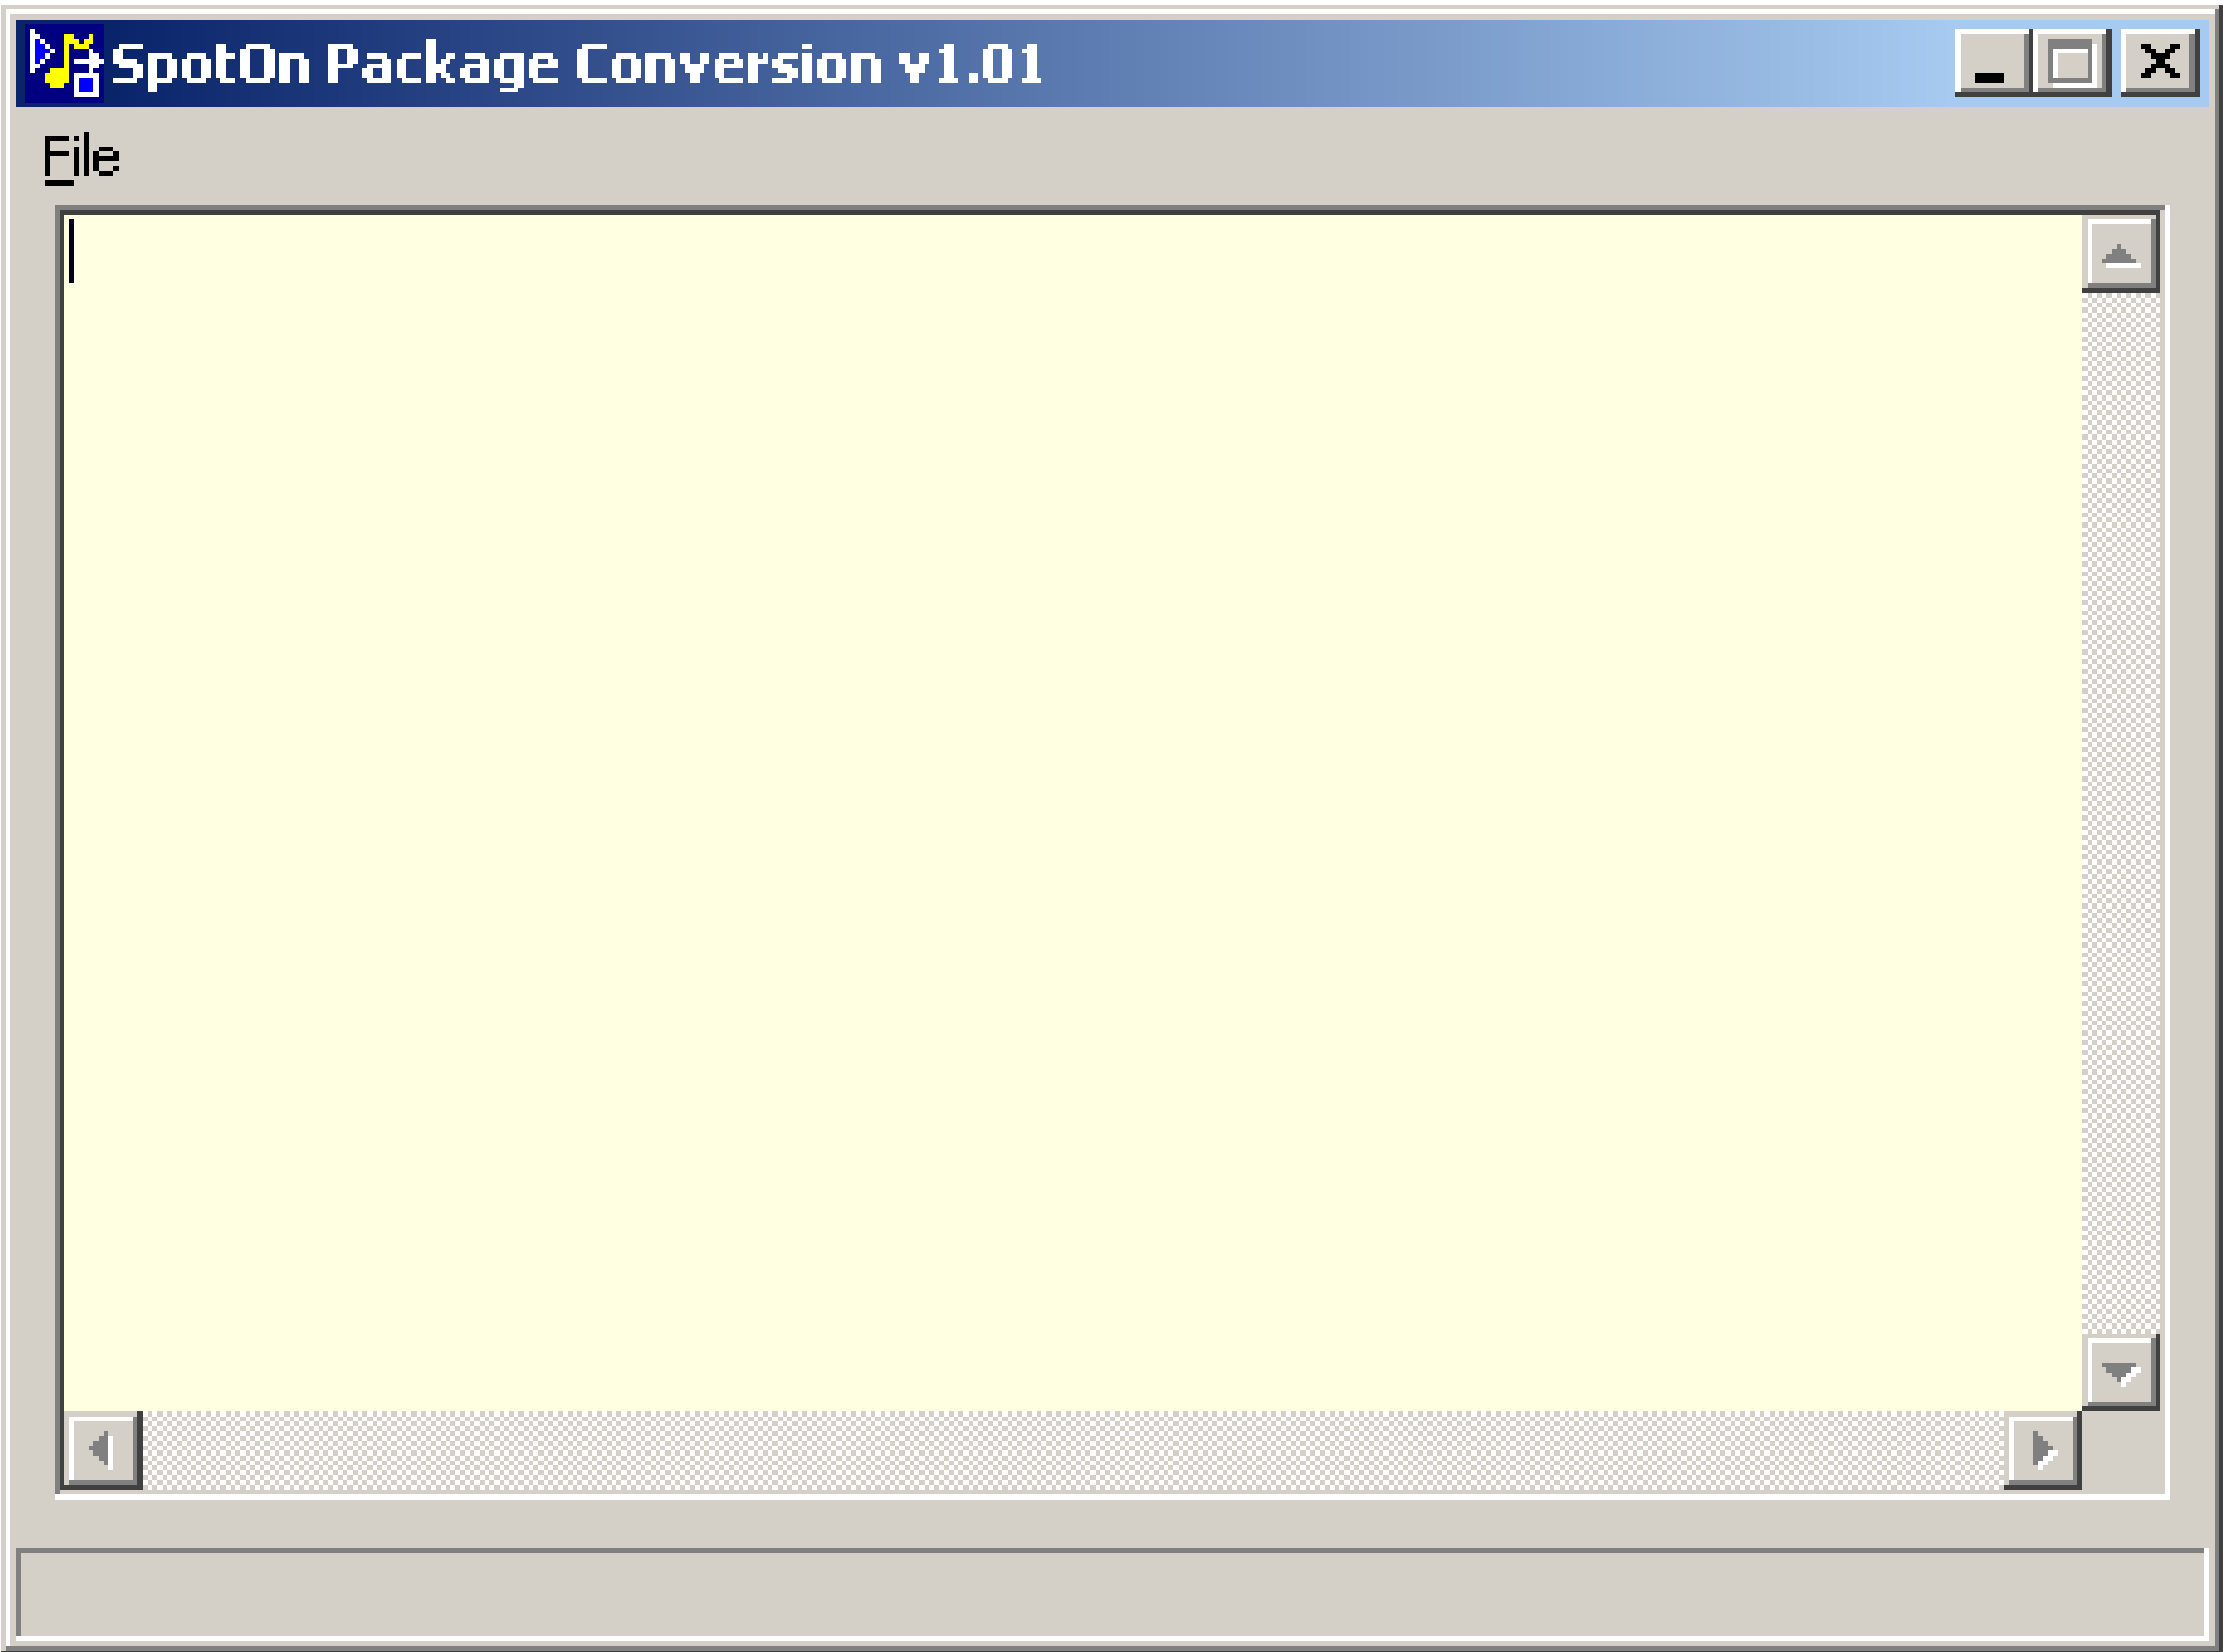

The GPIM-16 has two MIDI out sockets which both carry identical MIDI information. MIDI arriving at the MIDI input is merged with the data generated by the switch inputs and sent to the MIDI outs.

Editing of parameters is achieved by use of push buttons in conjunction with the LED display.

In order that settings cannot be accidentally changed, edit mode has to be enabled using a recessed push button.

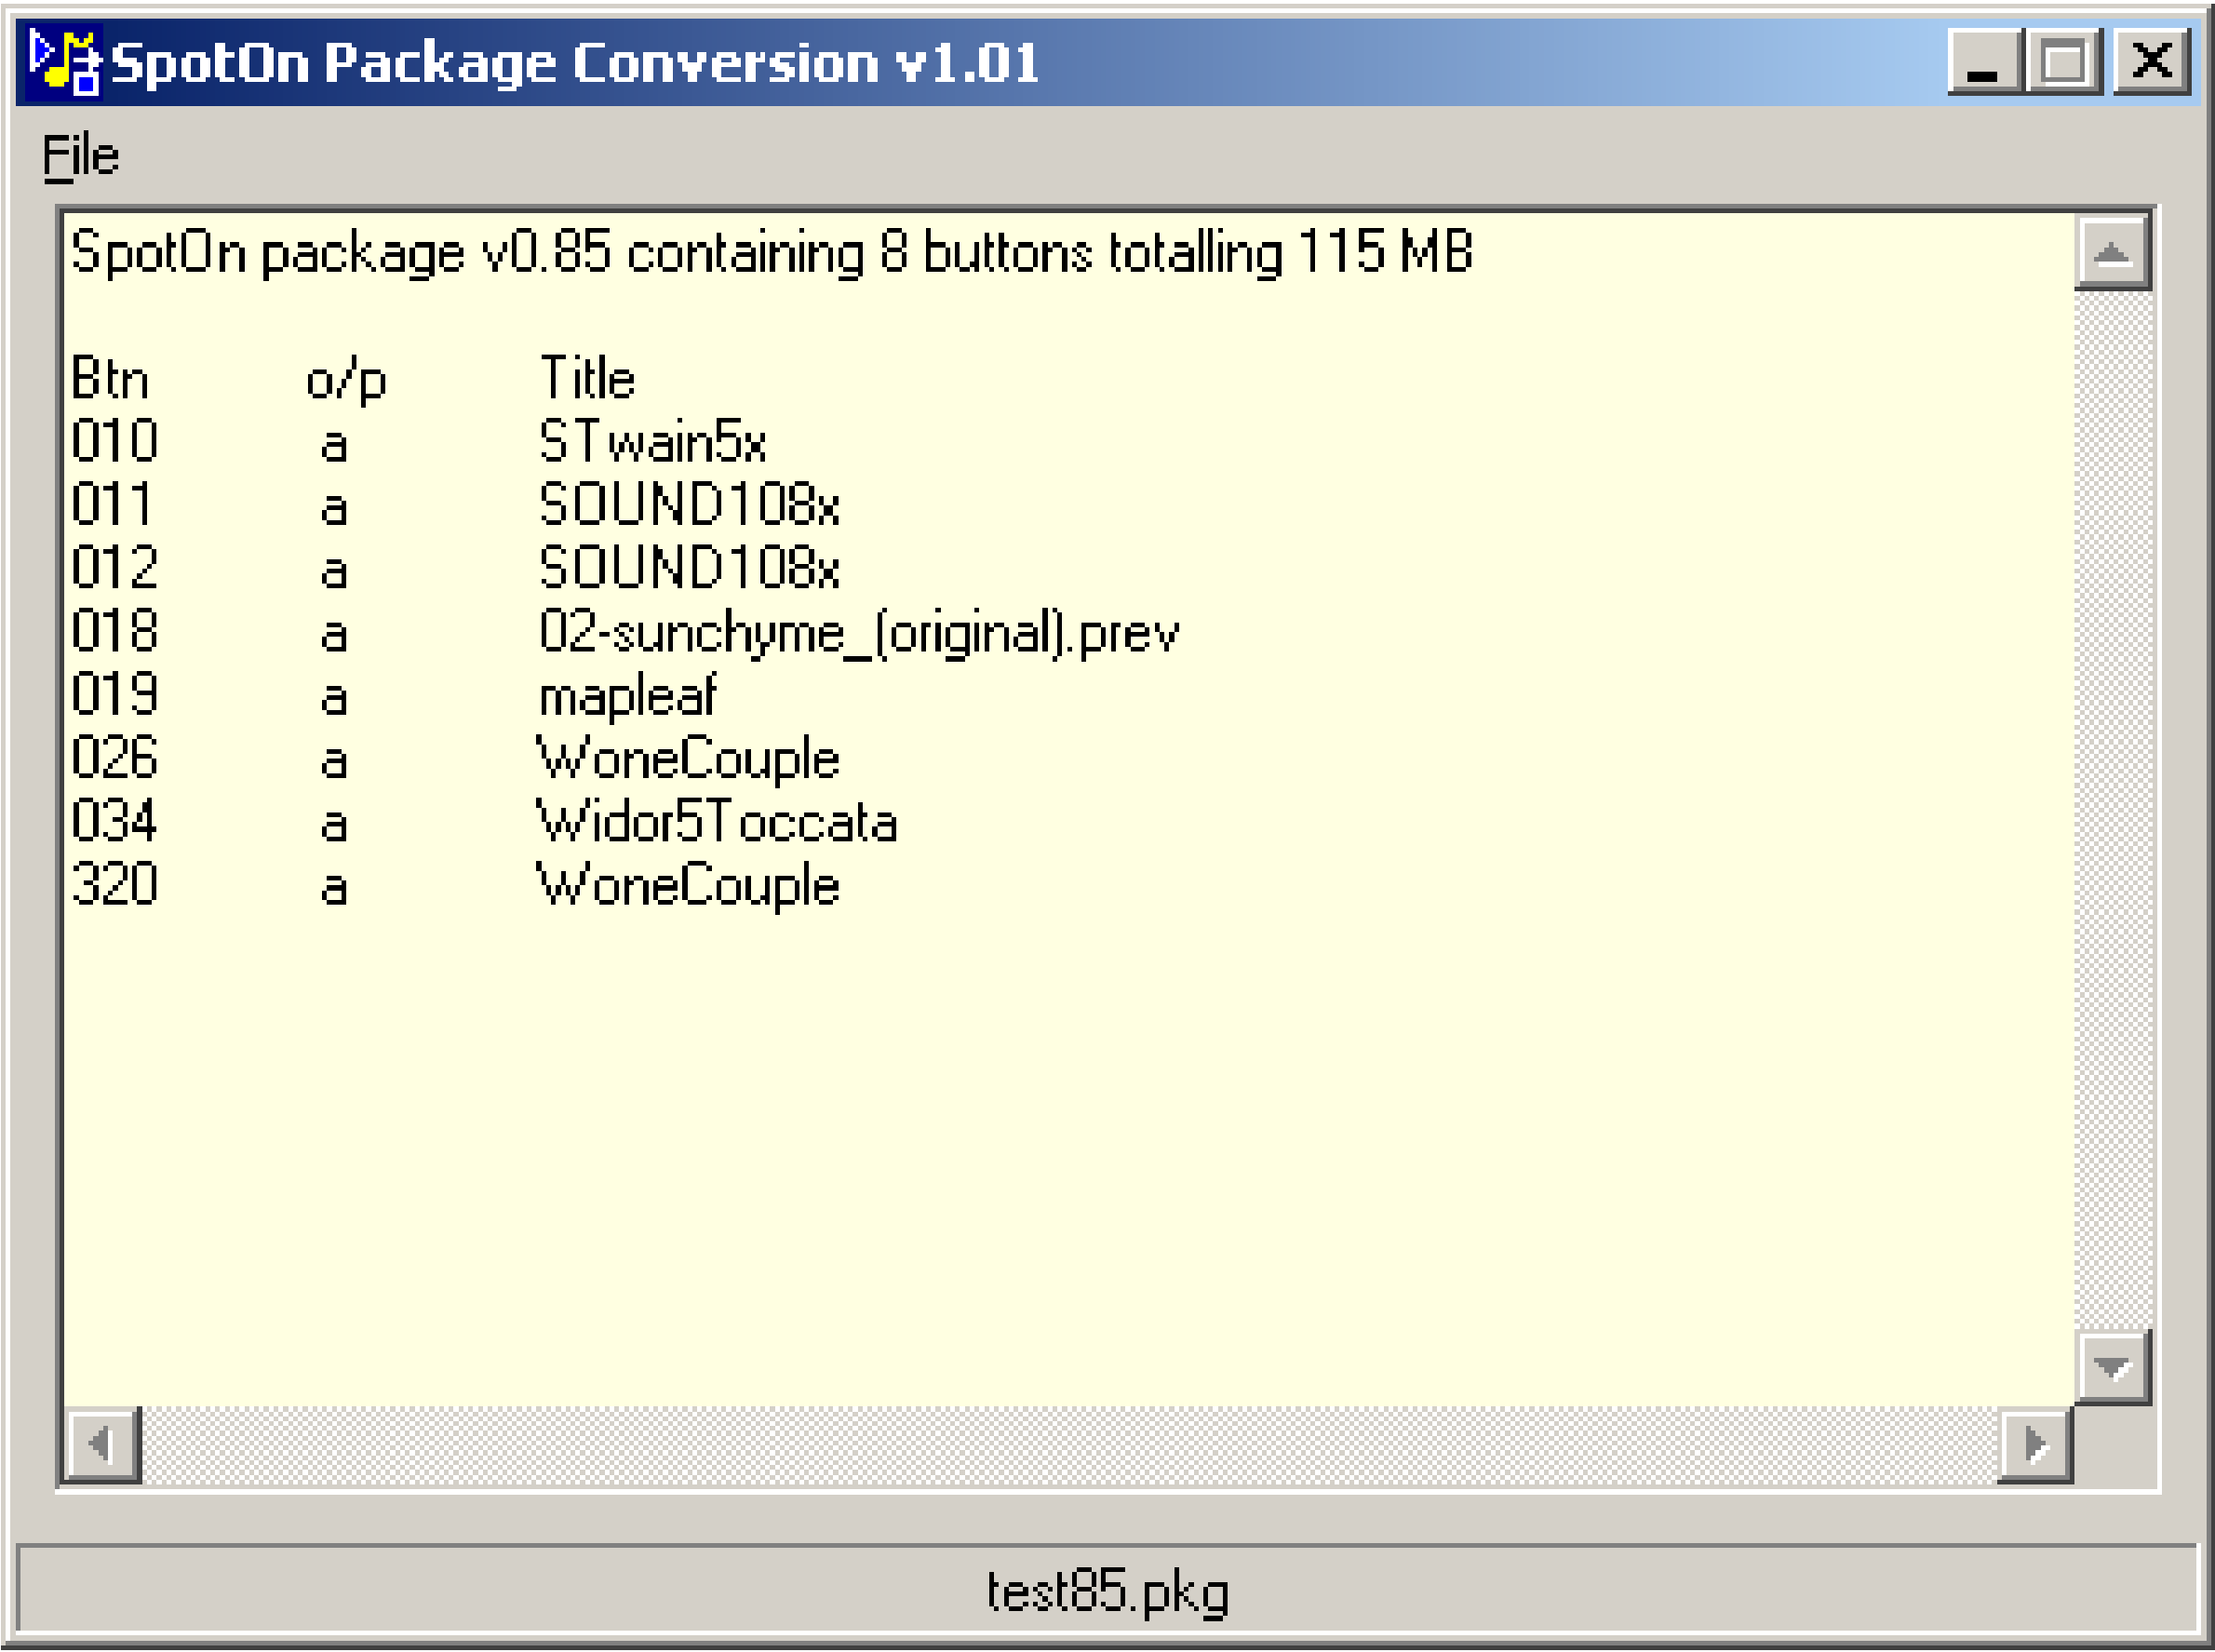

Package Converter

As SpotOn evolves there sometimes changes made to the file structure of the Packages, which makes the newer packages incompatible with older versions of SpotOn, Package Converter can overcome this problem by modifying the package file structure.

Select File|Open Package

Choose the package to be converted

The program will list the contents of the package along with the version number of SpotOn that made the package, in this case it was v0.85

Select the version number to convert to

Enter the location and name for the converted package, which can be the same as the original so saving time and disc space

A progress window shows the number of files converted

When the conversion process is complete, a summary is displayed in the status bar

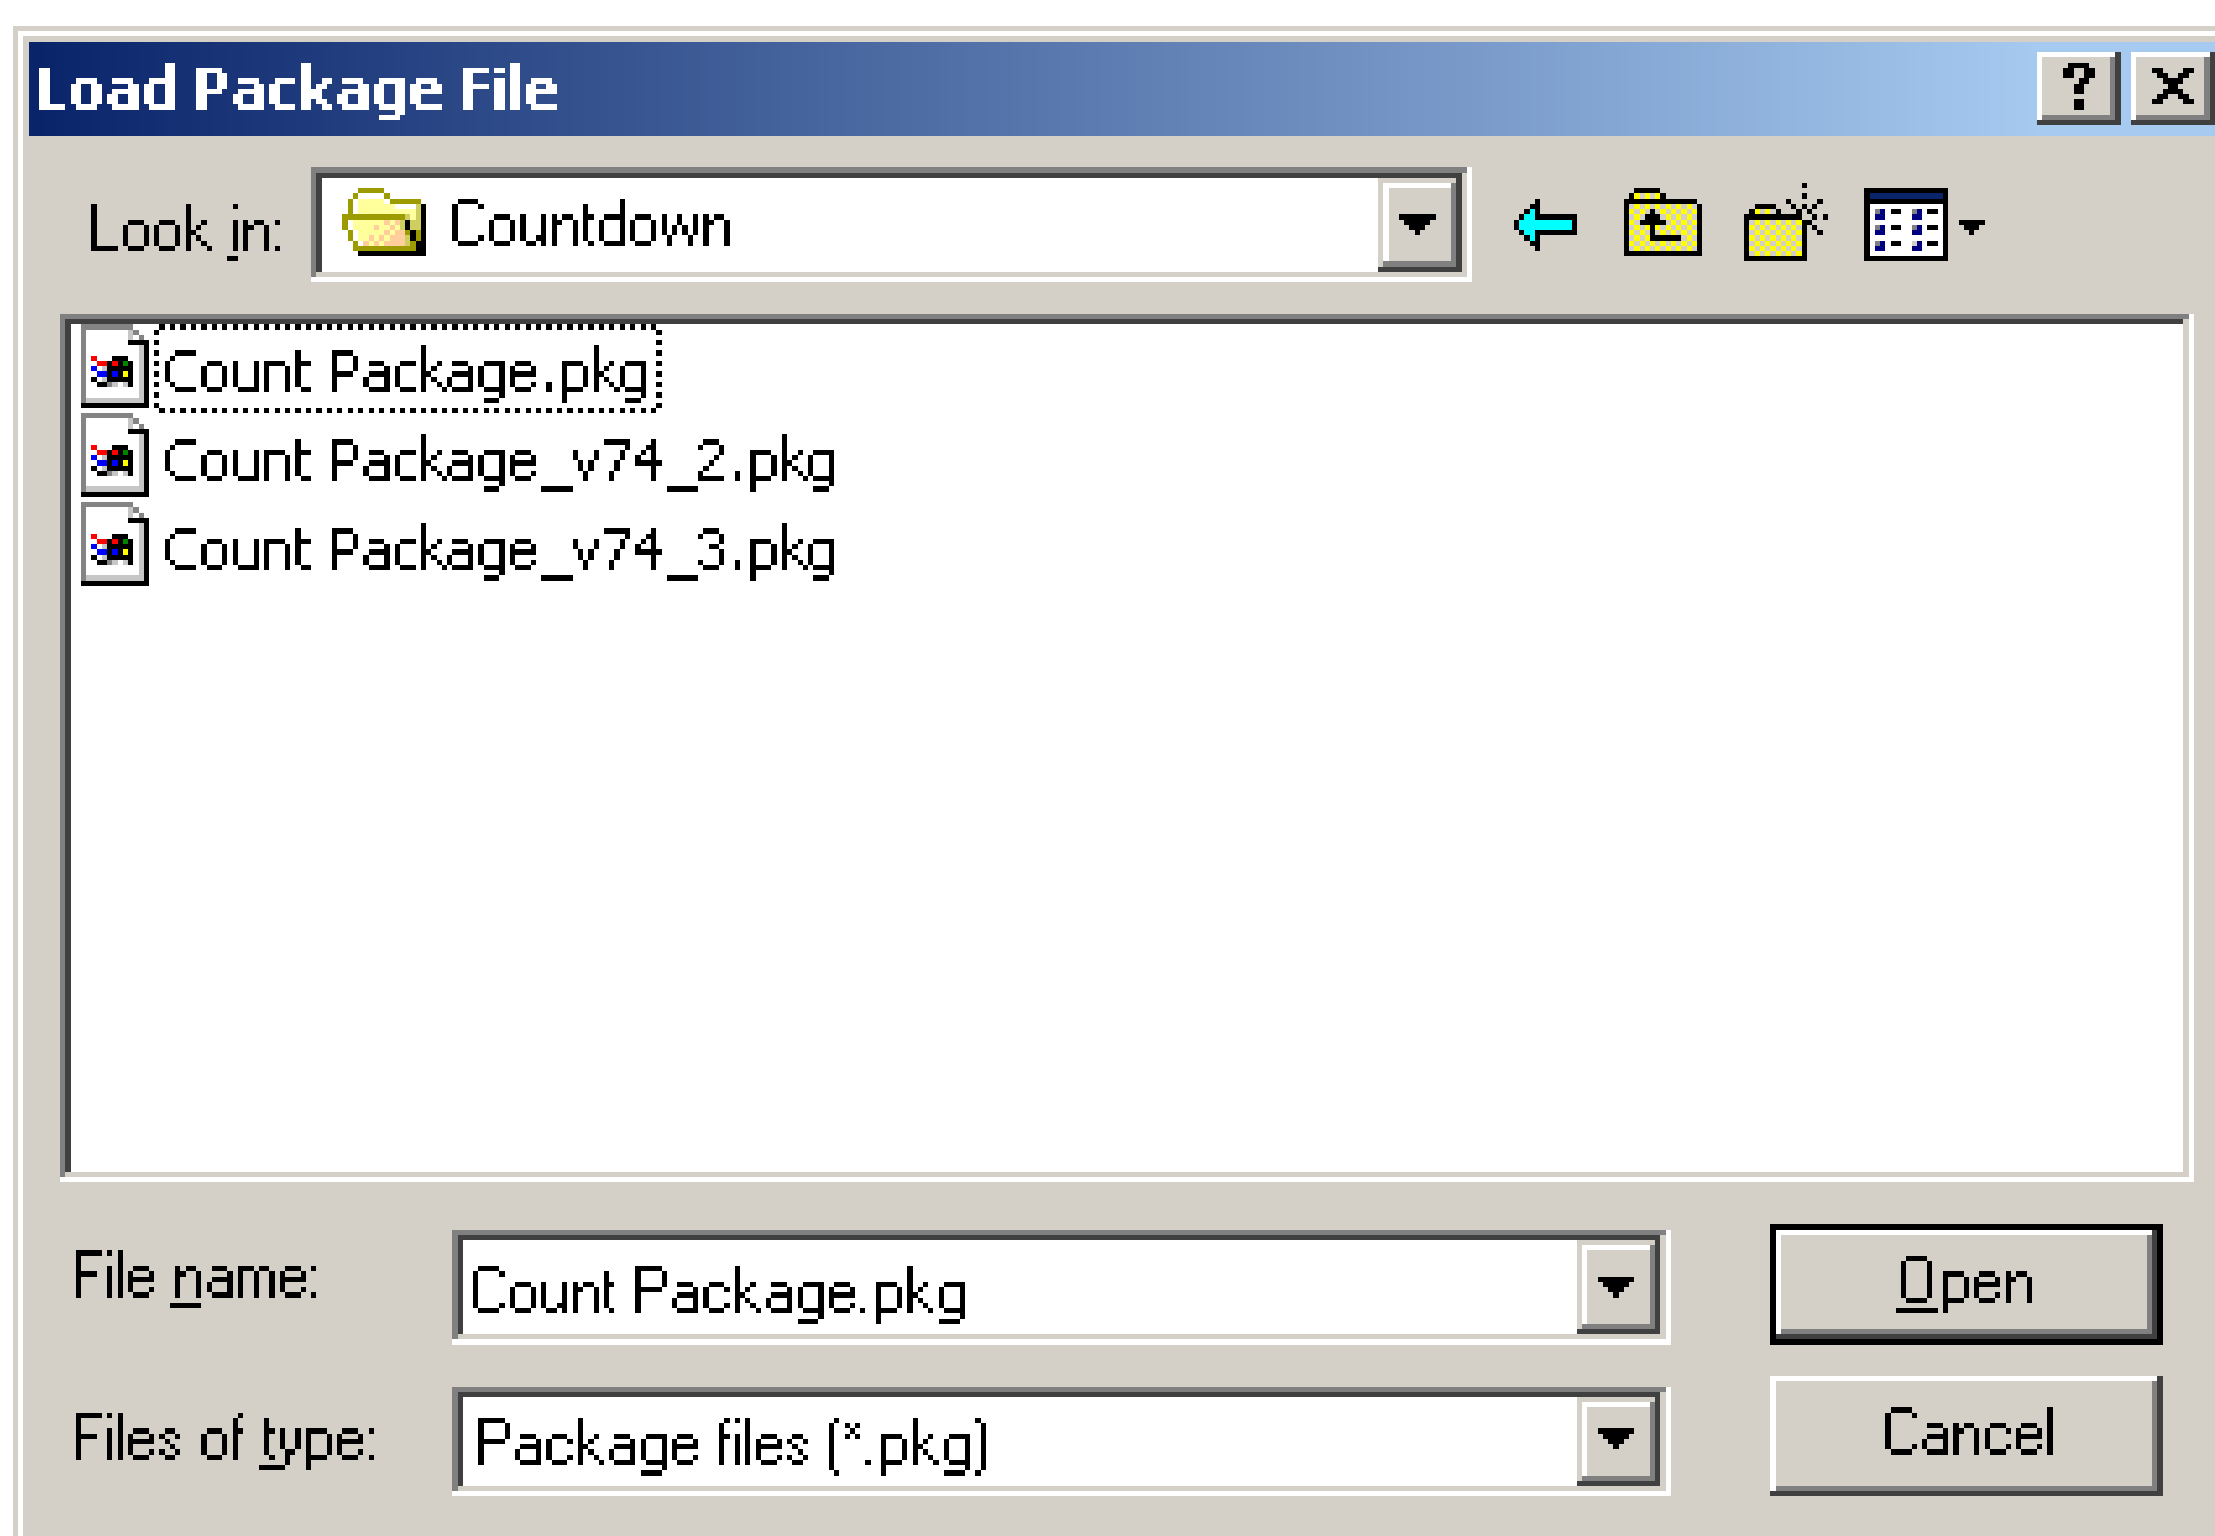

Package Extractor

SpotOn packages contain both button property information and audio data, sometimes it may be necessary to extract the audio data from a package for analysis or archiving.

A utility called UnPackageWAVs.exe is supplied and will be found in the Program Files\Serialtech\SpotOn folder, running the file will show the following dialog boxes.

Click on Select Package and navigate to the location of the package to be extracted

Once the package has been selected the next options are: -

- a, Extract a list of tracks contained in the package
- b, Extract the original unmodified WAV files with track list
- c, Extract the original WAV files using the gain, fade and trim settings applied by SpotOn along with a track list

The tracks will be extracted from the package and the selected modifiers applied, the extracted audio files will be saved with new names. Audio files that were originally mono are converted to stereo.

A track named 'test1' on button 1 with no modifiers applied will be saved as: -

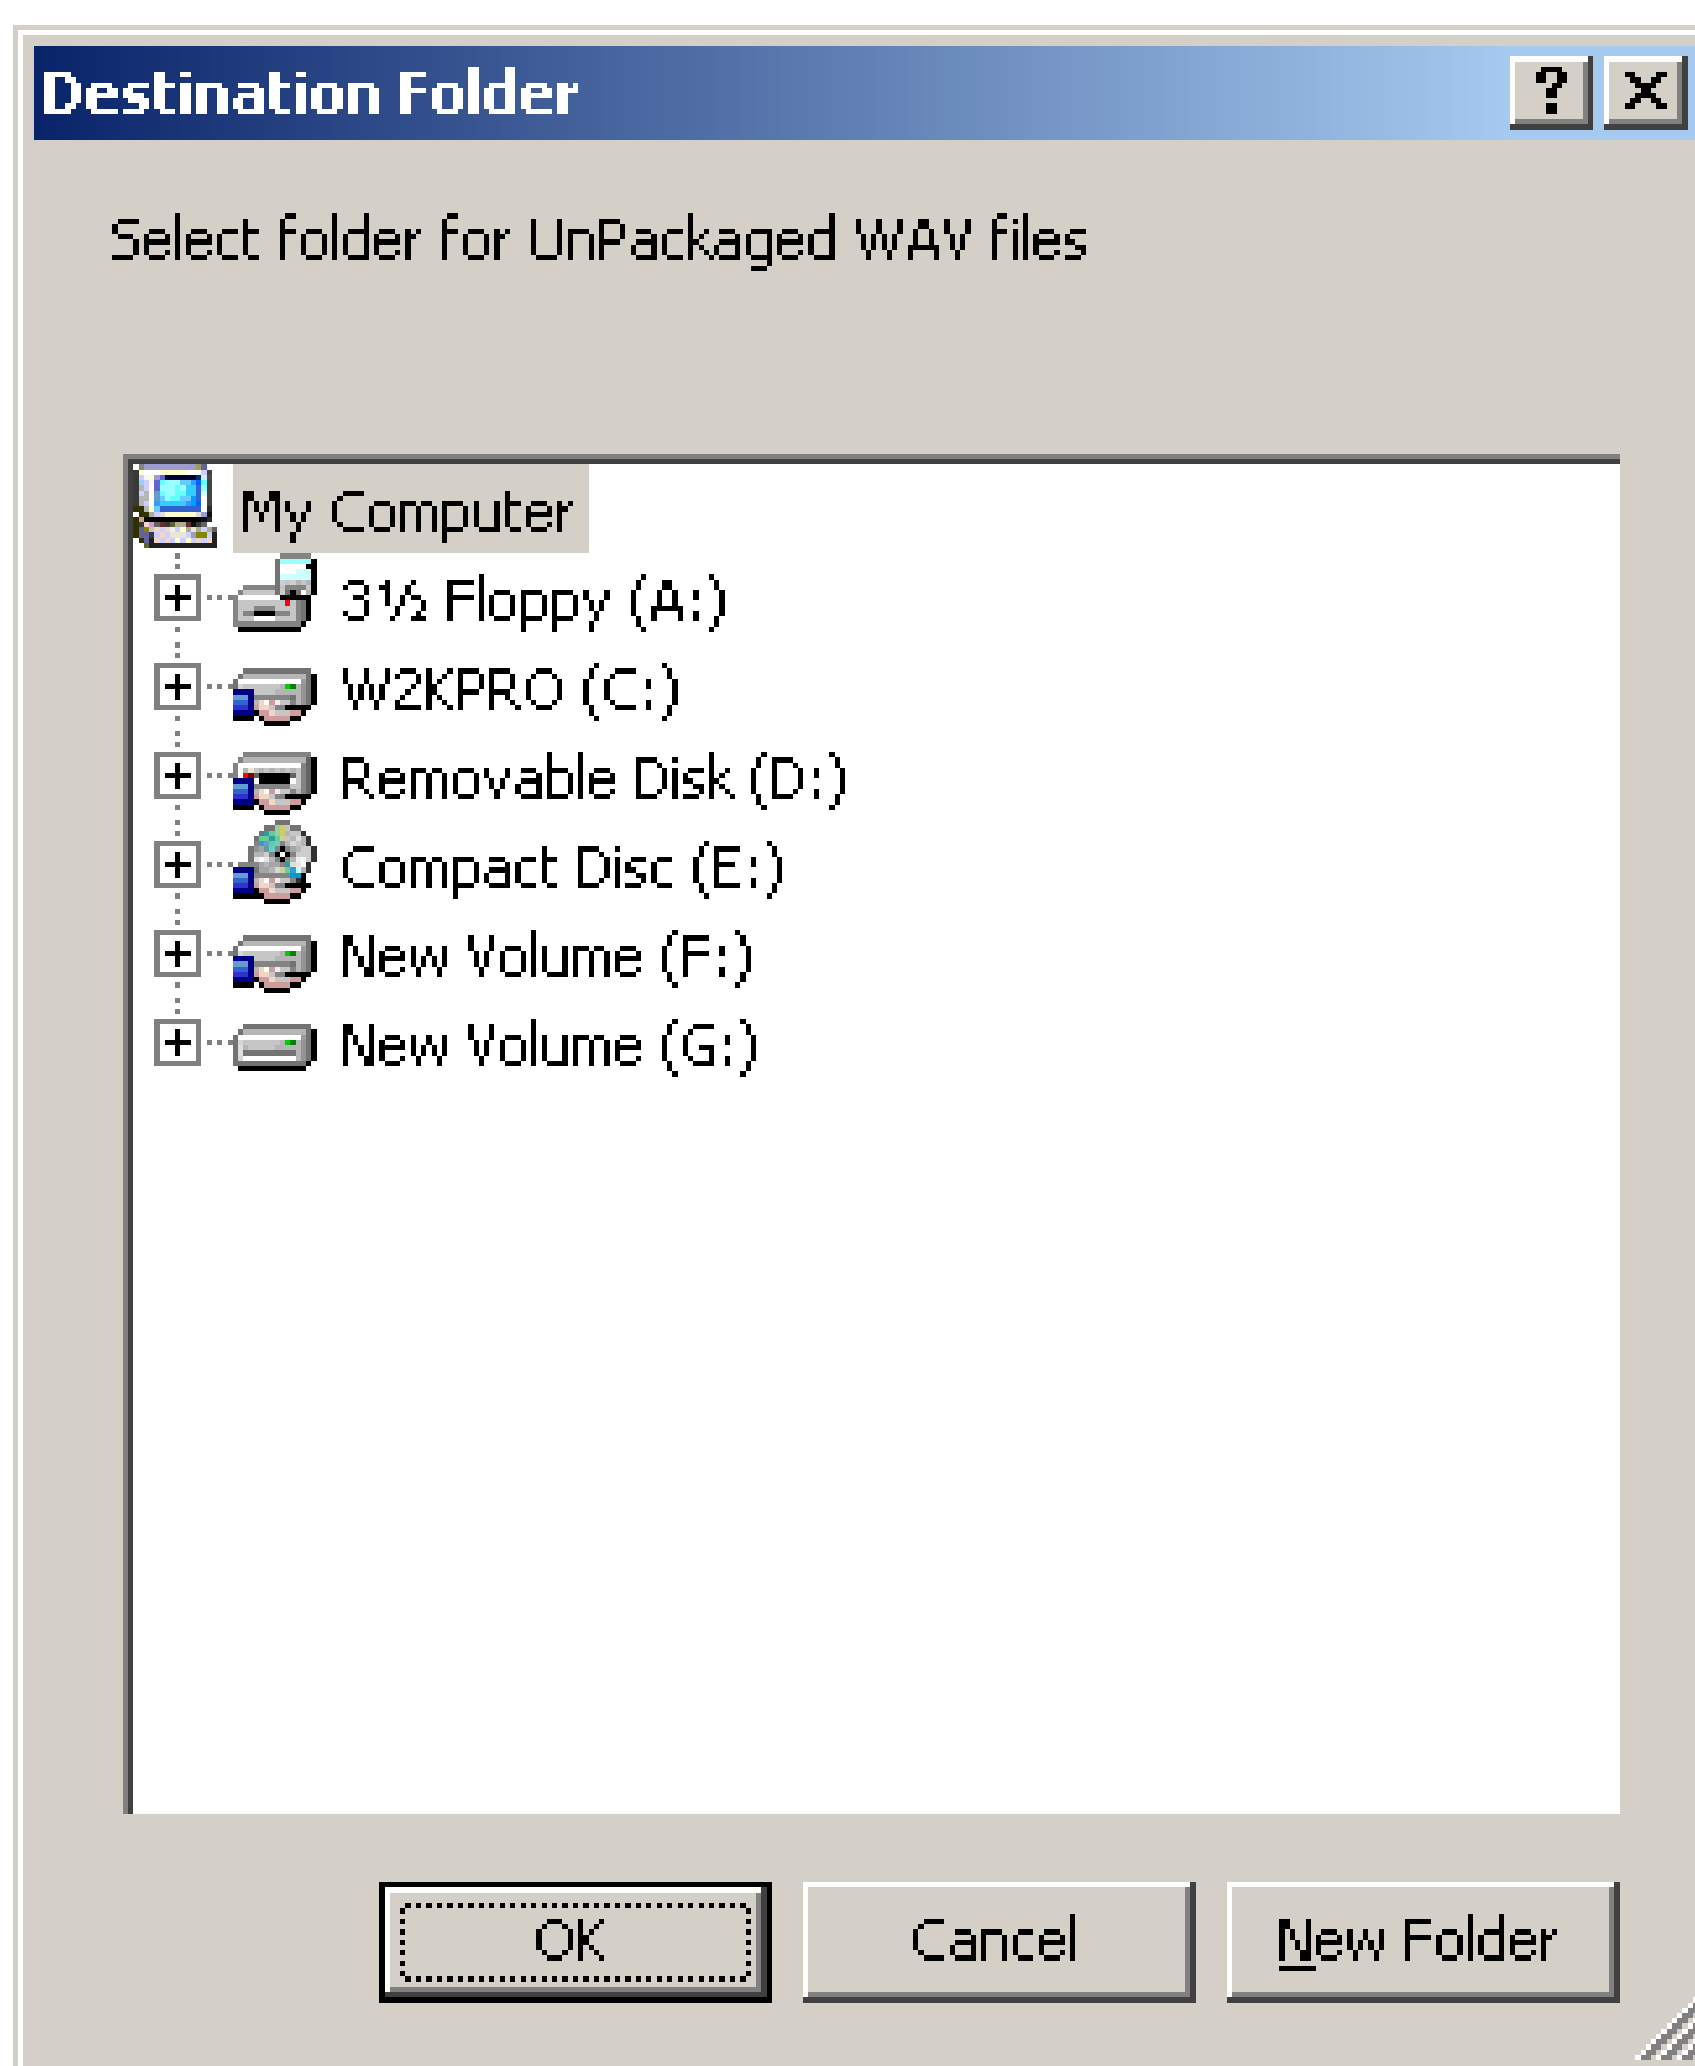

'001_test.wav'

A track named 'test1' on button 1 with modifiers applied will be saved as: -

'001_test_Mod.wav'

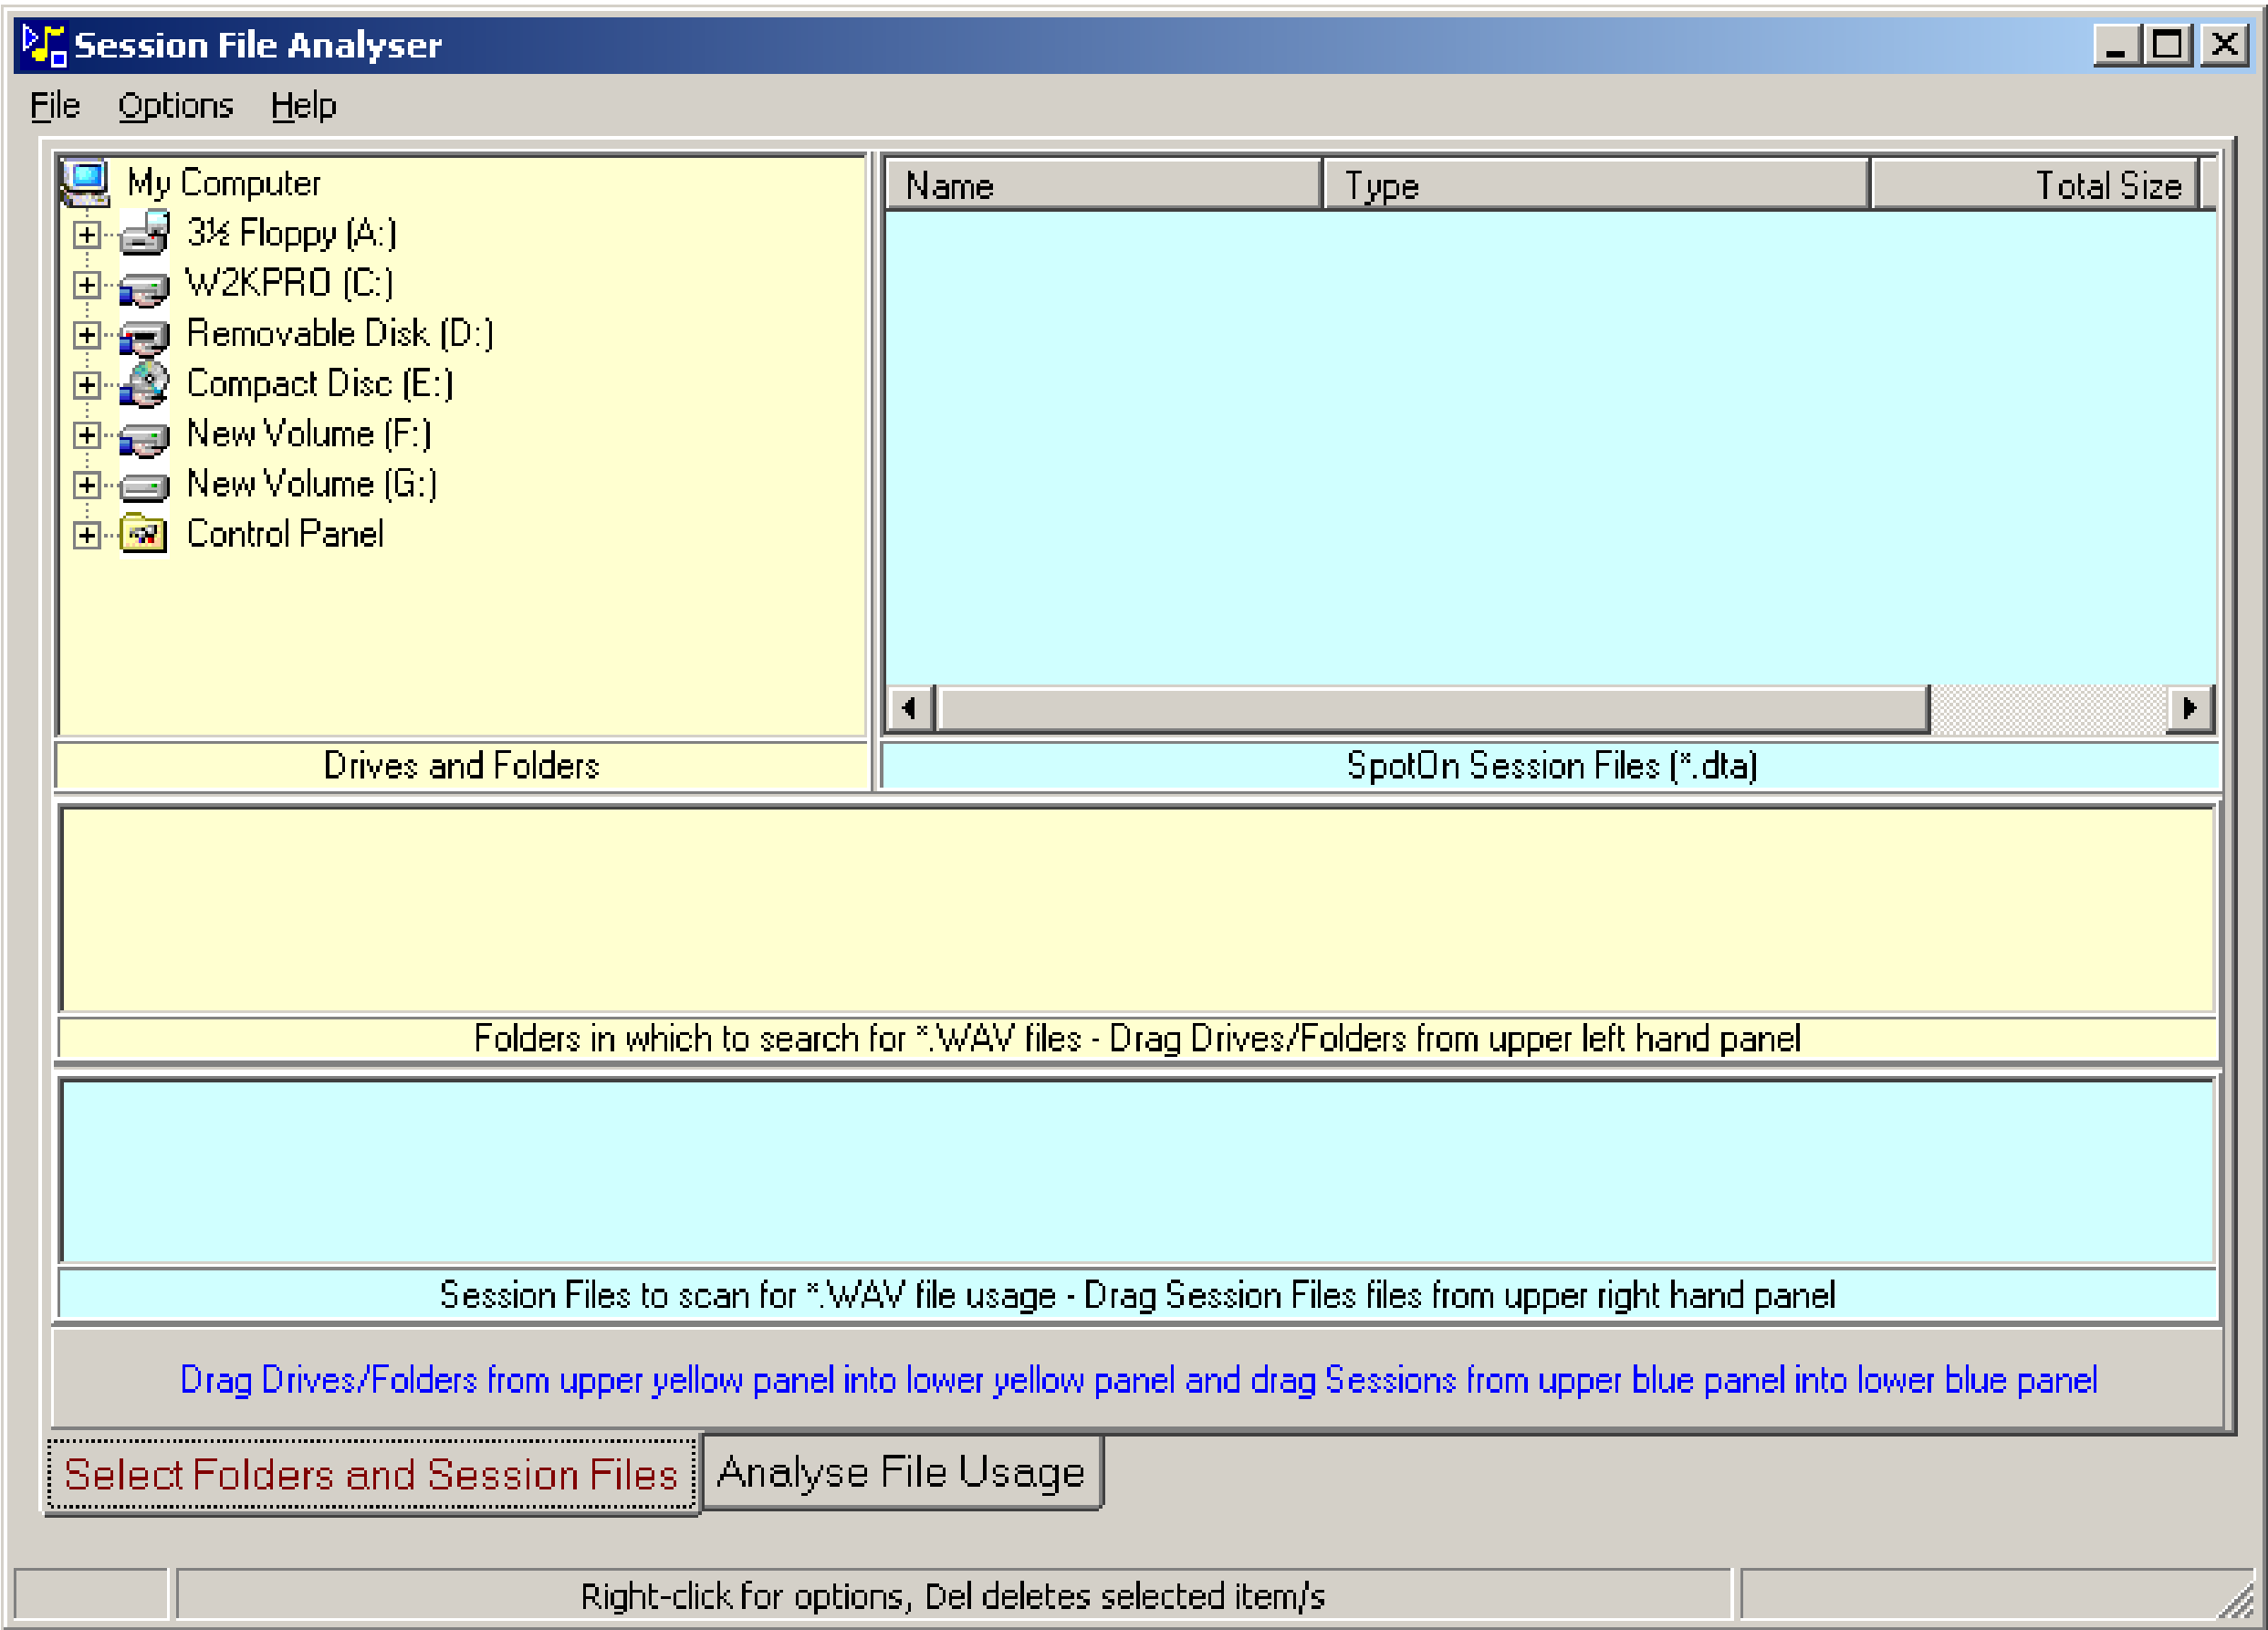

The three digit prefix refers to the button number so '023_sample_Mod.wav' would be the track from button 23.

Next the destination folder for the extracted WAV files and track list is assigned

and finally after the files have been extracted the initial window is redisplayed showing the version number of SpotOn that created the package.

Session Analyser

Session Analyser allows comparisons to be made between the files contained in a specified selection of disc folders and those referenced by SpotOn sessions.

The purpose of this comparison is to identify those audio files present on the disc that are not referenced by any of the selected session files, and allow the files to be moved to a new location pending deletion.

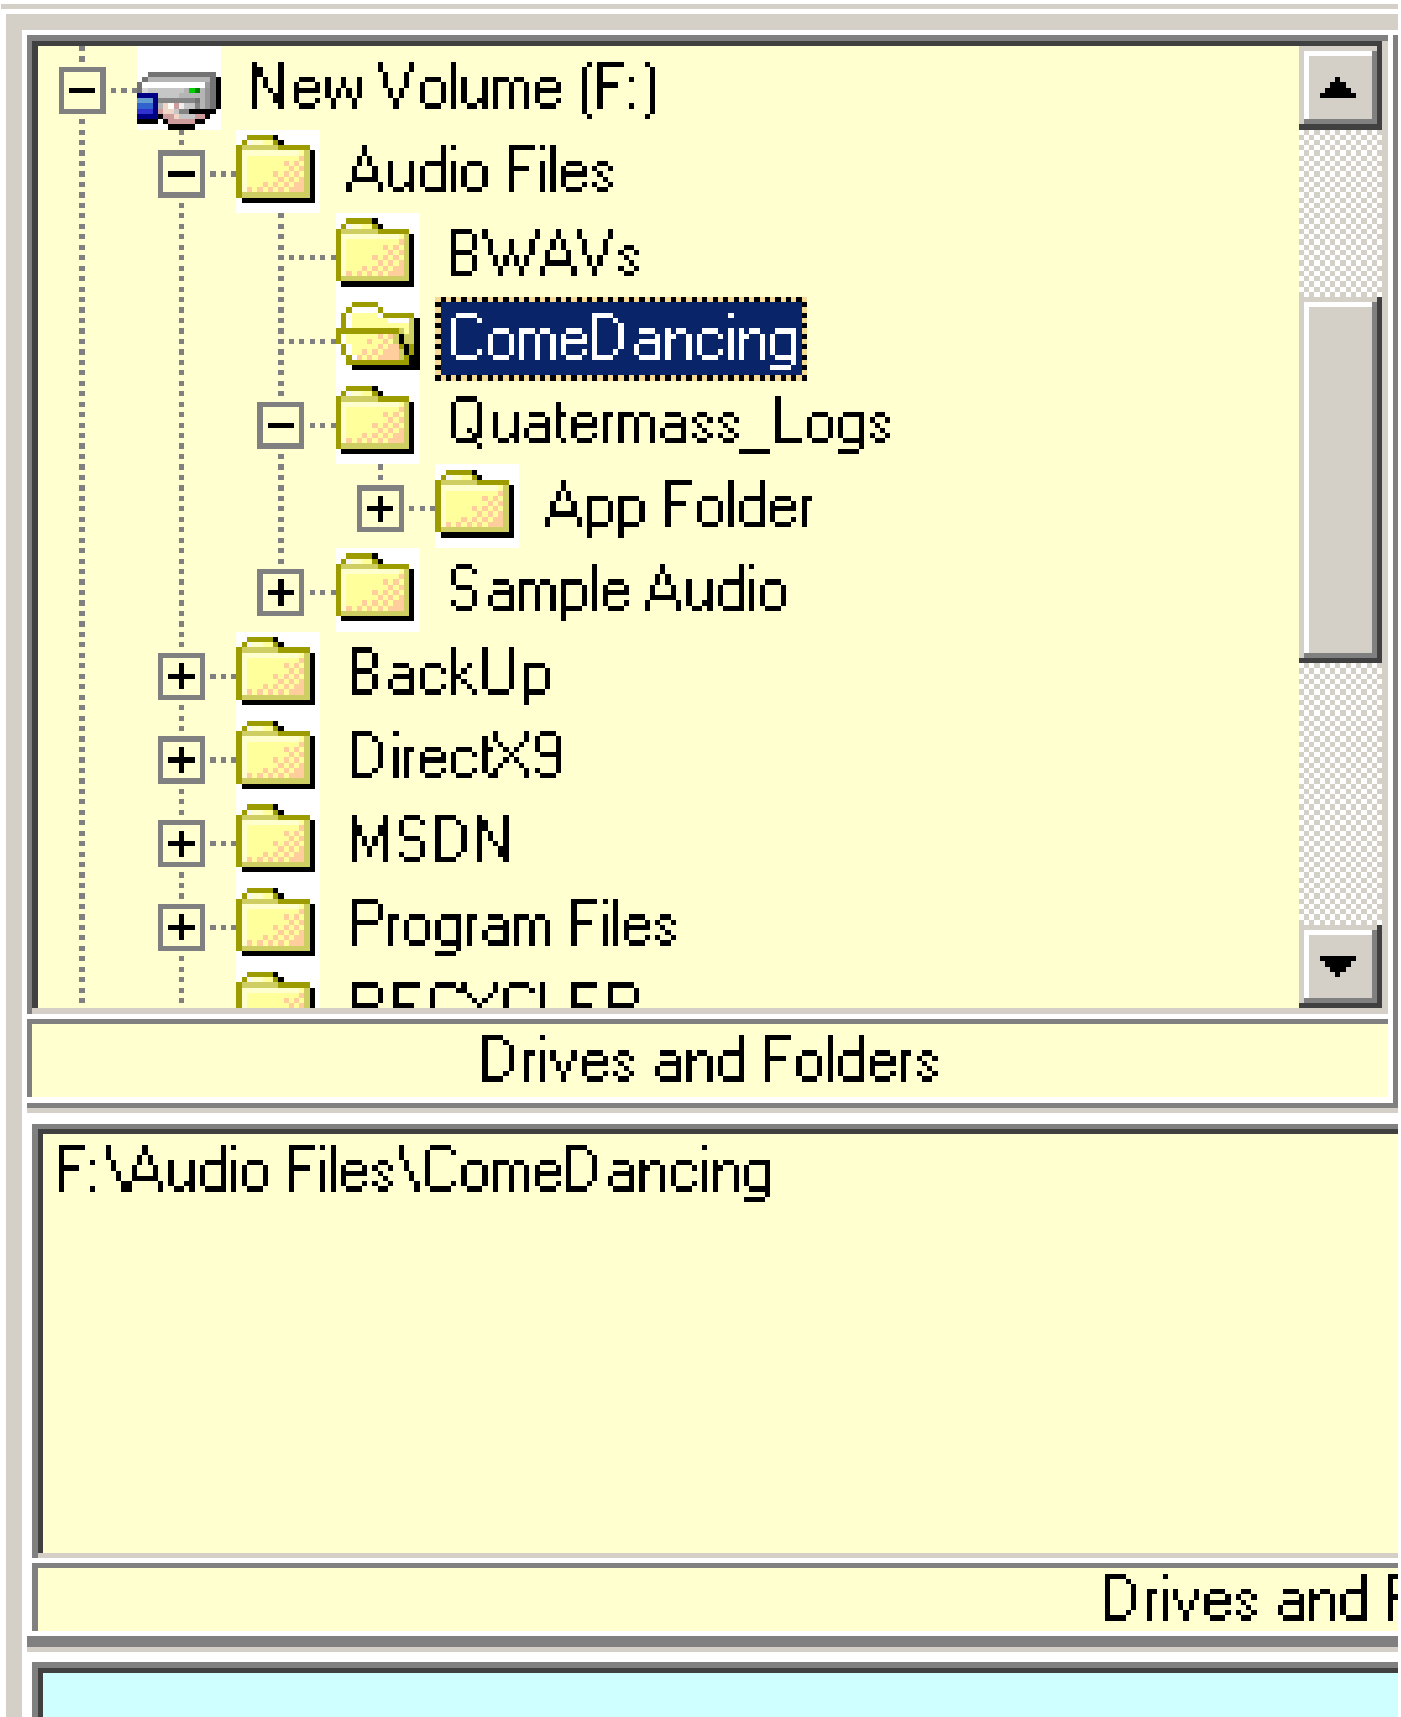

The action of moving files is only enabled when SpotOn is running in Administratormode

Disc Folders

The first page named 'Select Folders and Session Files' allows the disc search range to be specified, by identifying drives and/ or individual folders.

In the upper left hand panel a folder can be selected and then dragged down to the lower

search panel, items can only be dragged between panels of the same colour.

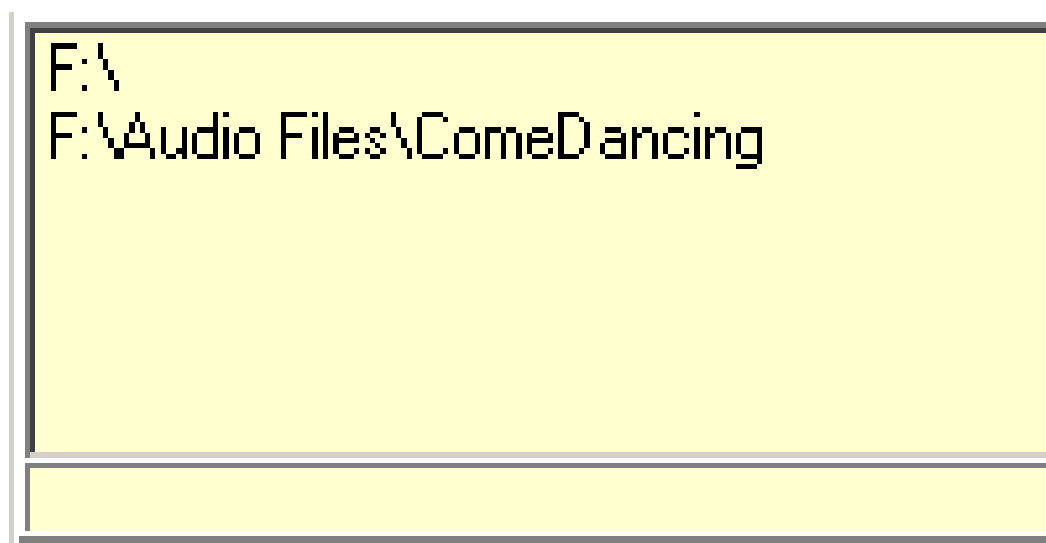

Similarly whole drives can be dragged into the search list

Entries in the list can be deleted by right-clicking in the list and selecting the appropriate option, the delete key will also remove the selected items

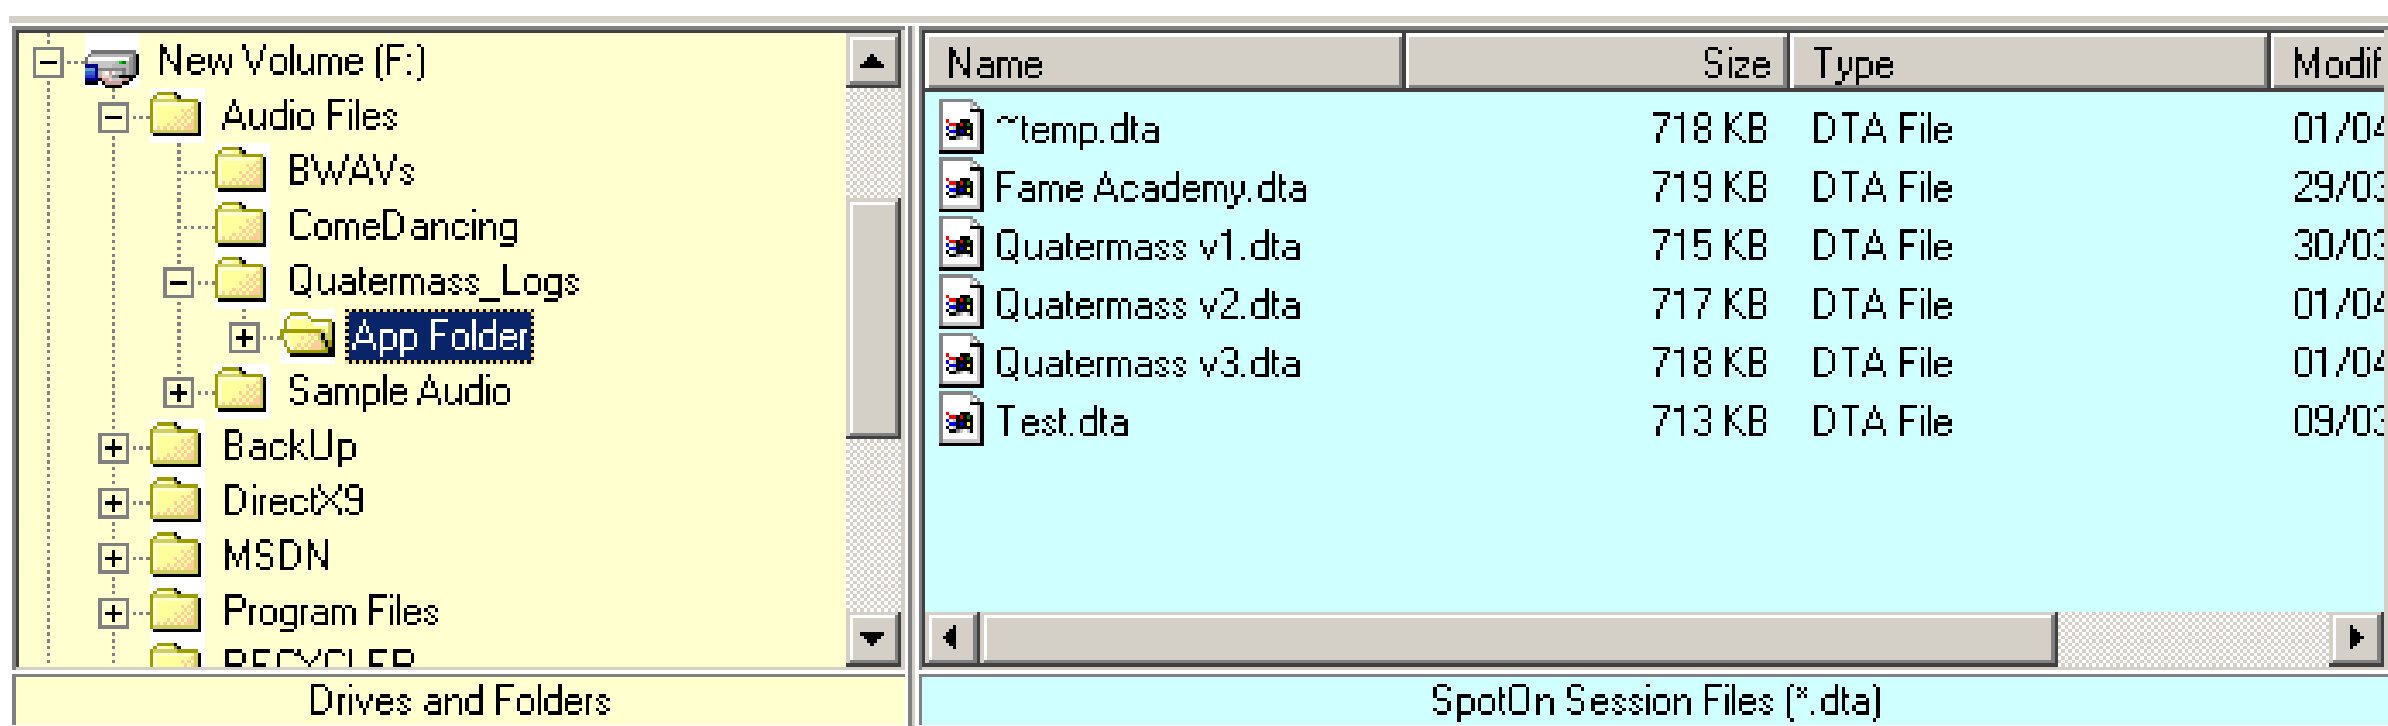

Here the G:/ entry has been removed

It is possible to include ambiguous entries in the search list, below the search of drive F:/ would include the folder F:/Audio Files/Come Dancing, so the second entry is redundant, the program filters out such situations during the analysis

Session Files

Session files are selected in a similar manner to the disc folders, they are filtered out from the selected folder and will appear in the upper right hand panel.

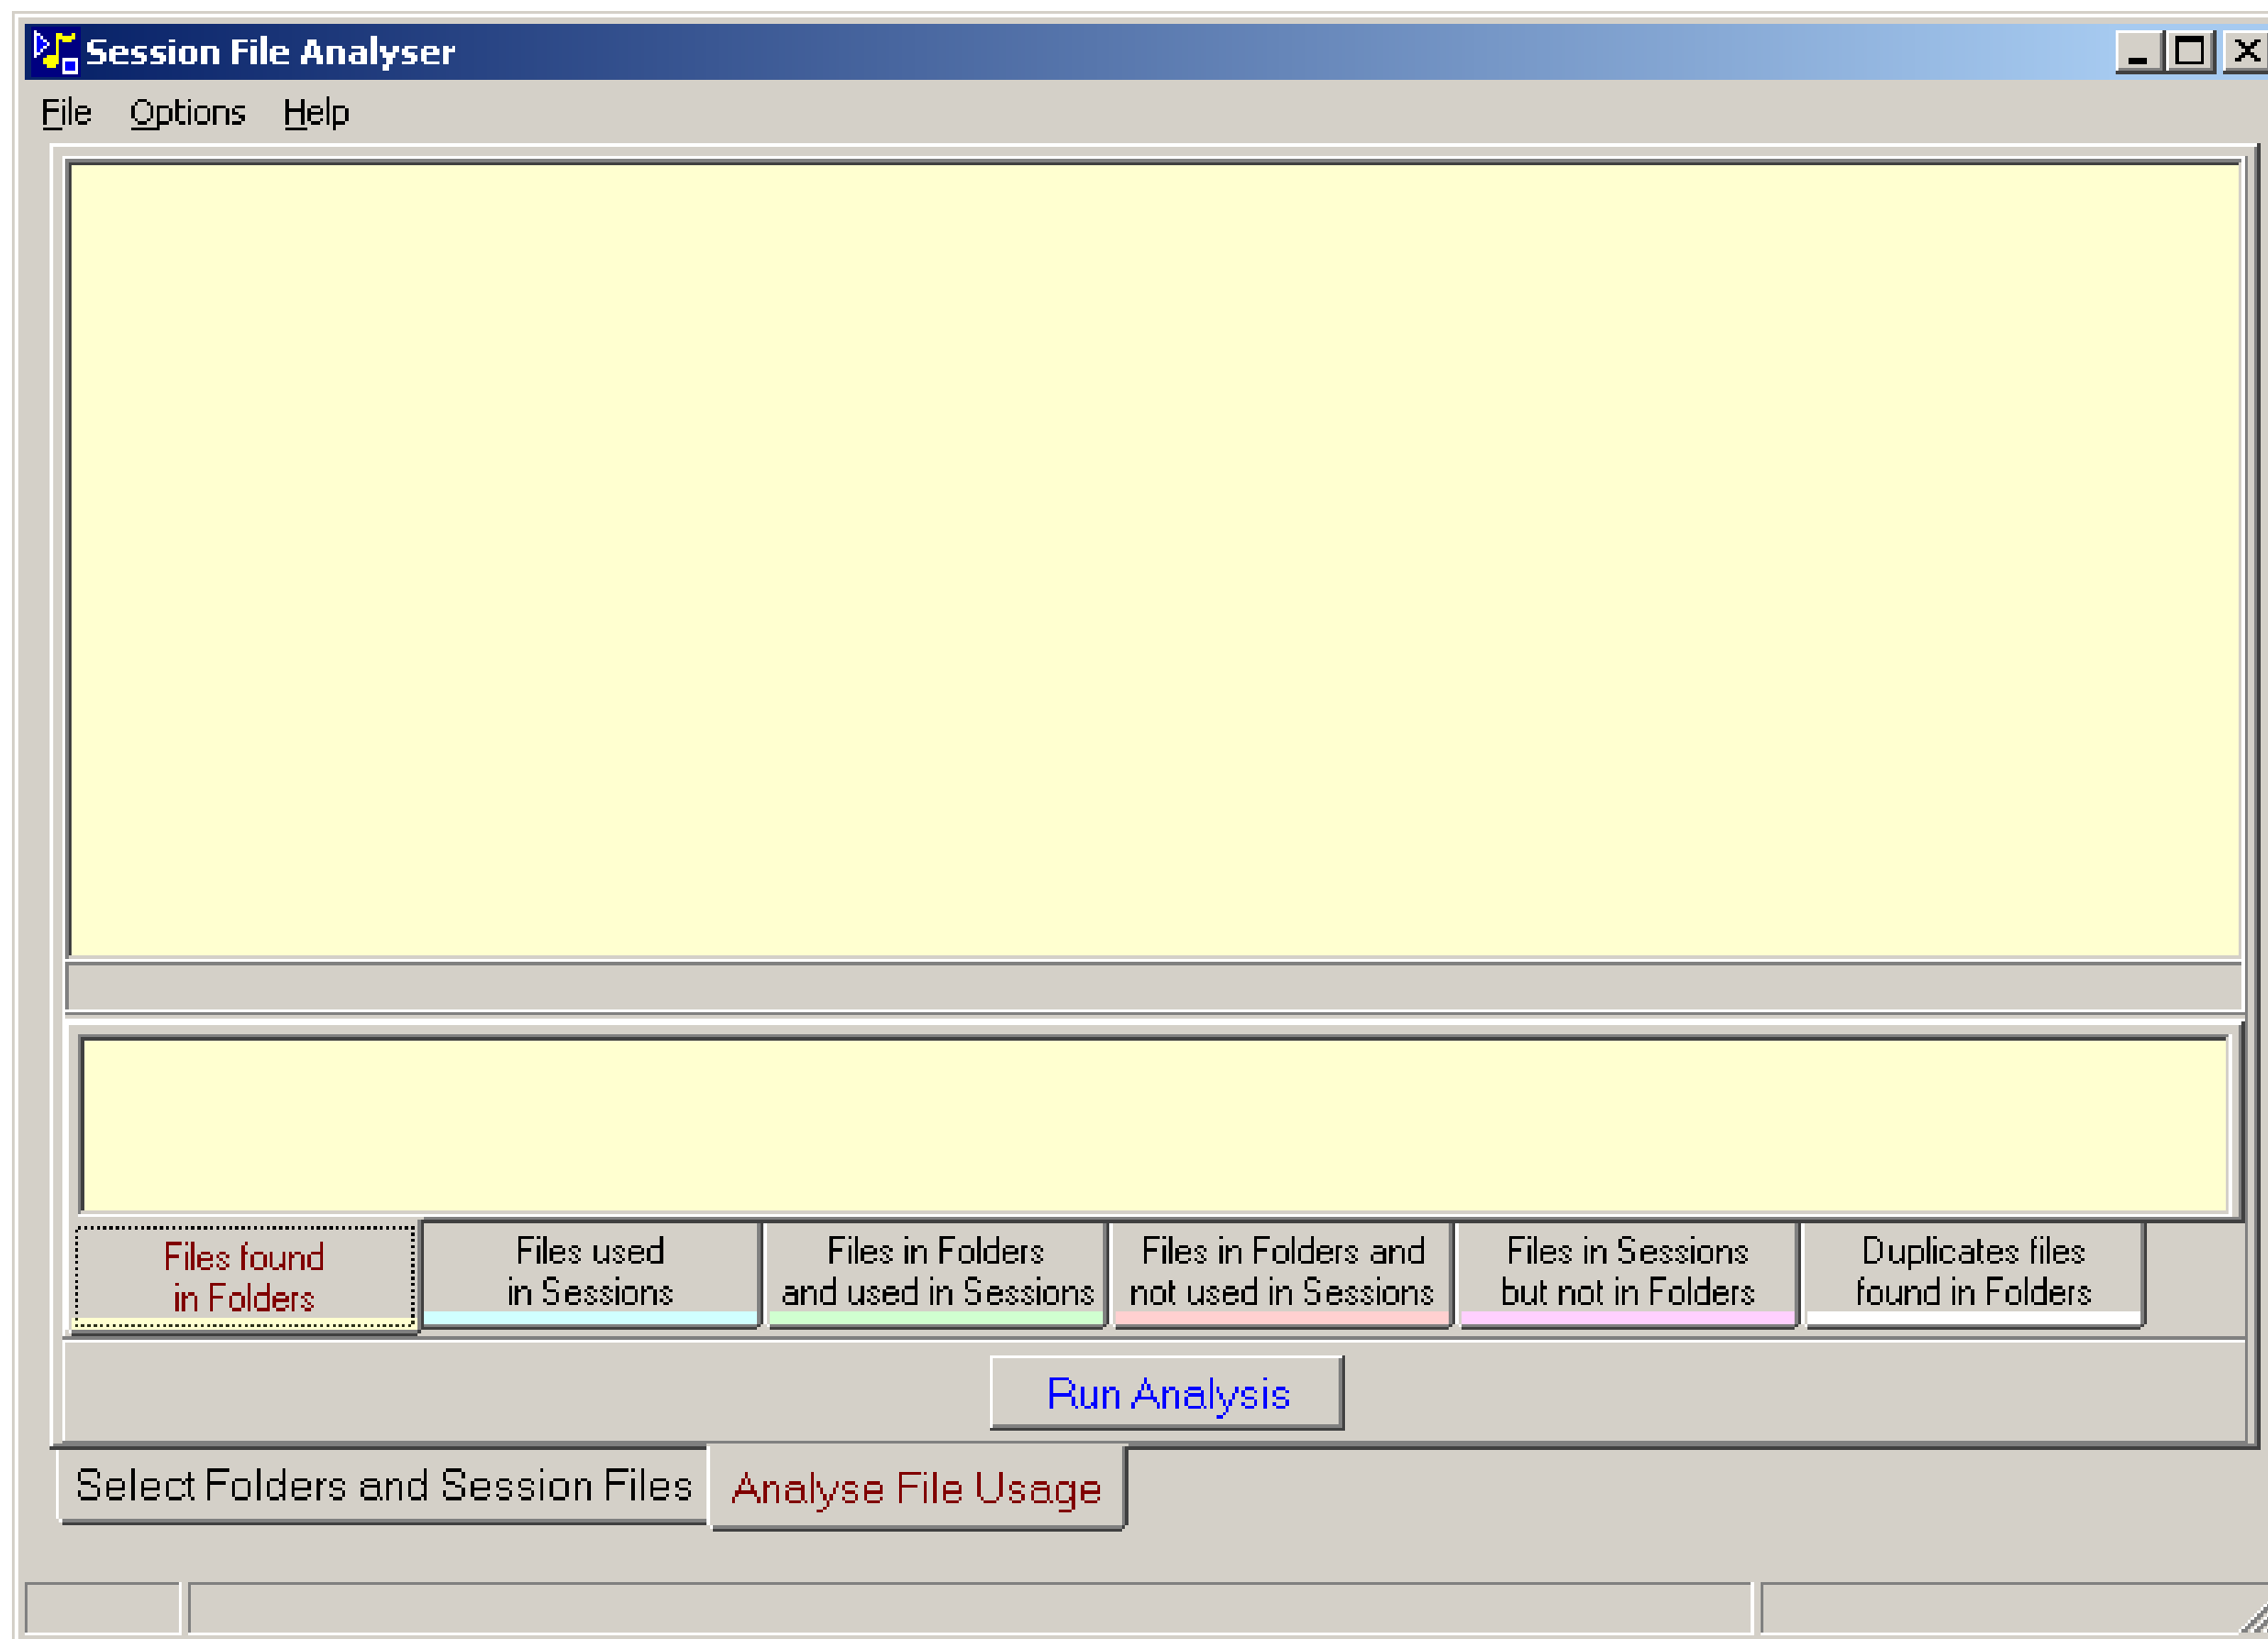

Using the Windows file selection options highlight the session files to be used in the analysis

Drag the selection to the lower panel

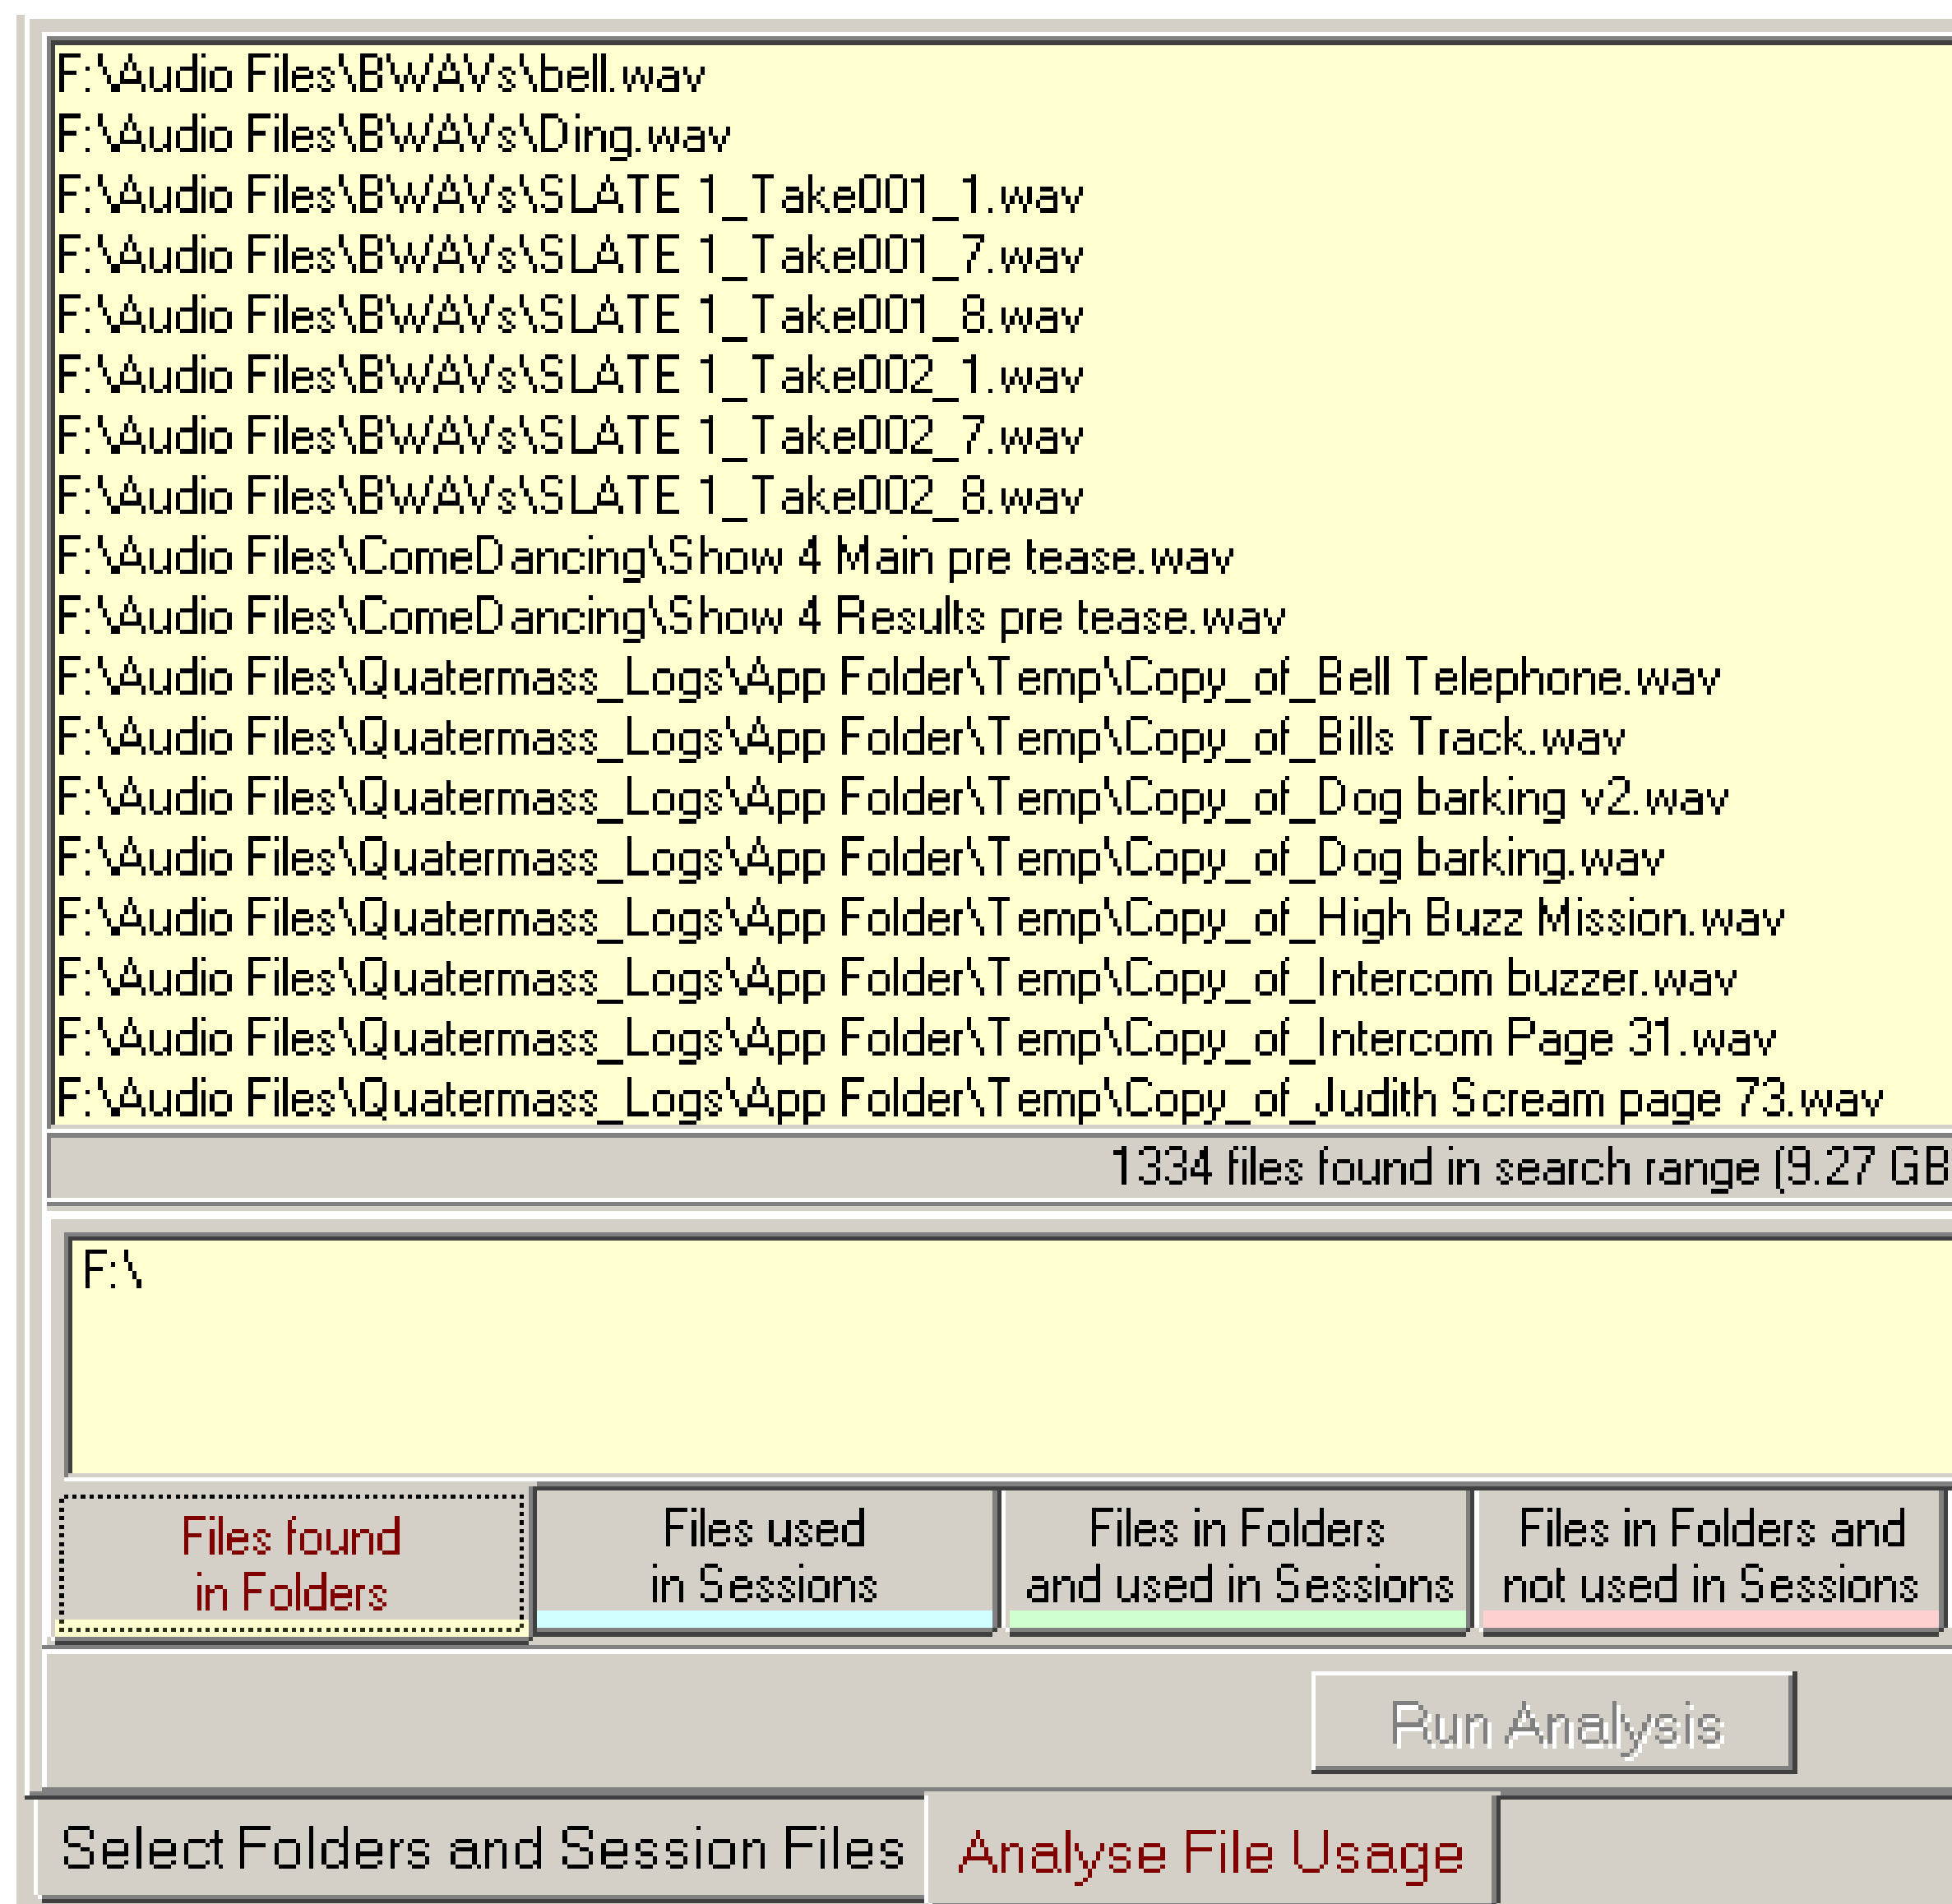

Analysis

Having completed the above steps the data is ready for analysis, select the second page 'Analyse File Usage'.

Click on the Run Analysis button to start the process, a progress box will appear showing how many files have been found versus files scanned.

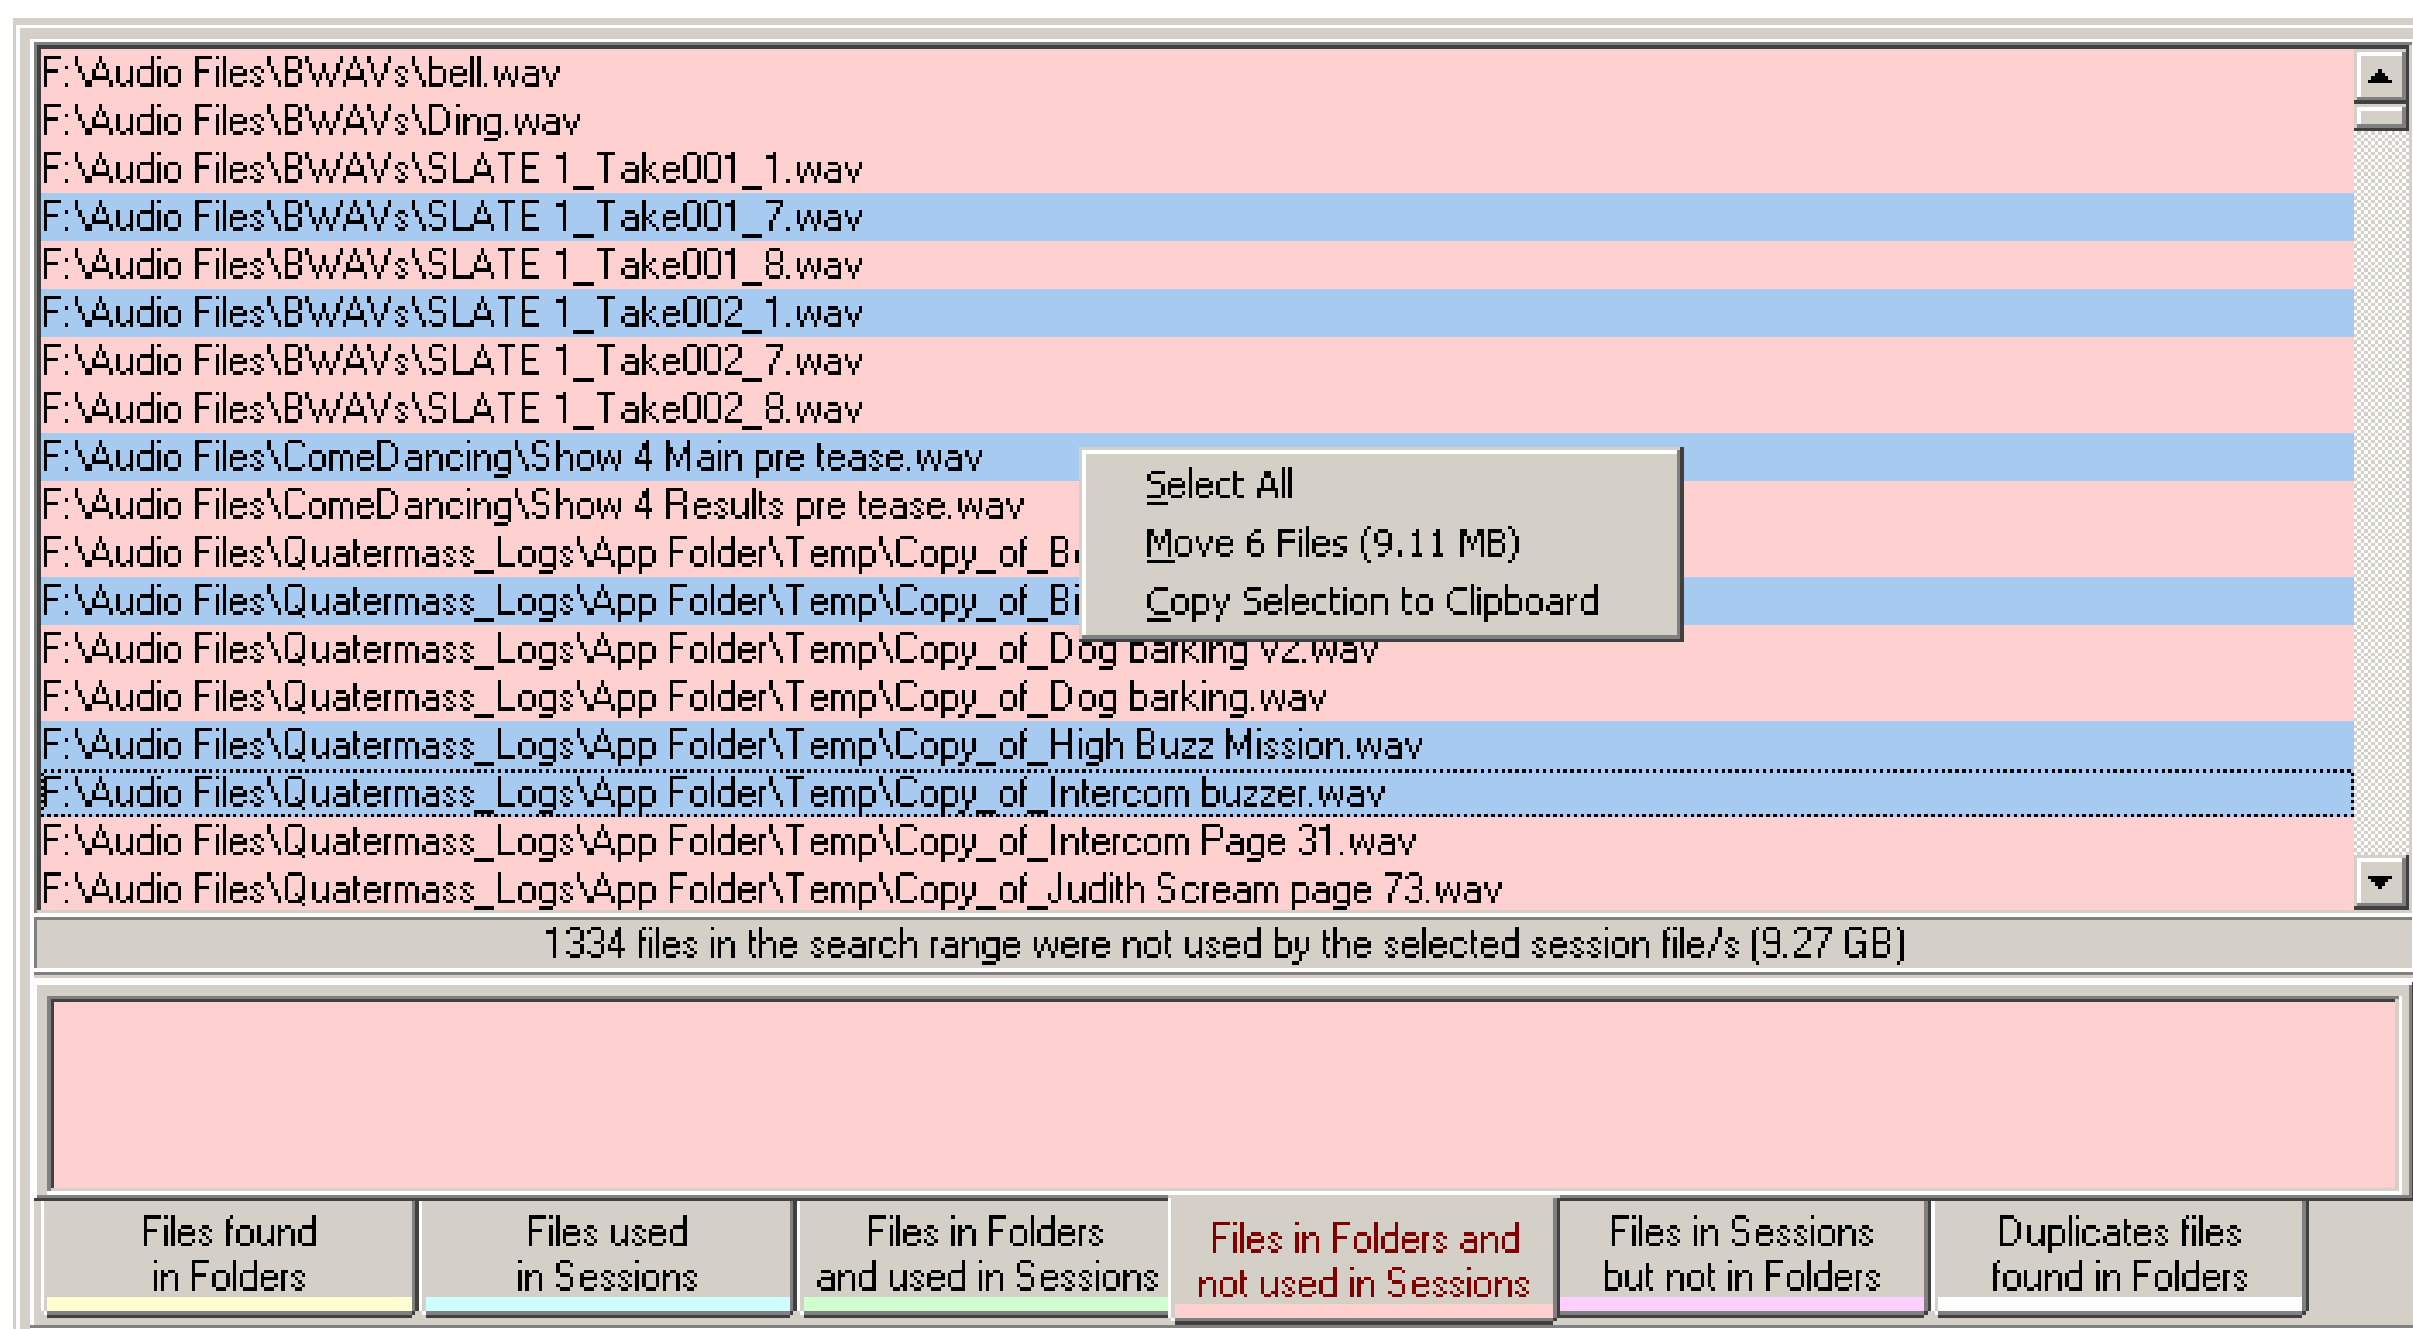

When the scan is complete, the results are loaded into the upper panel

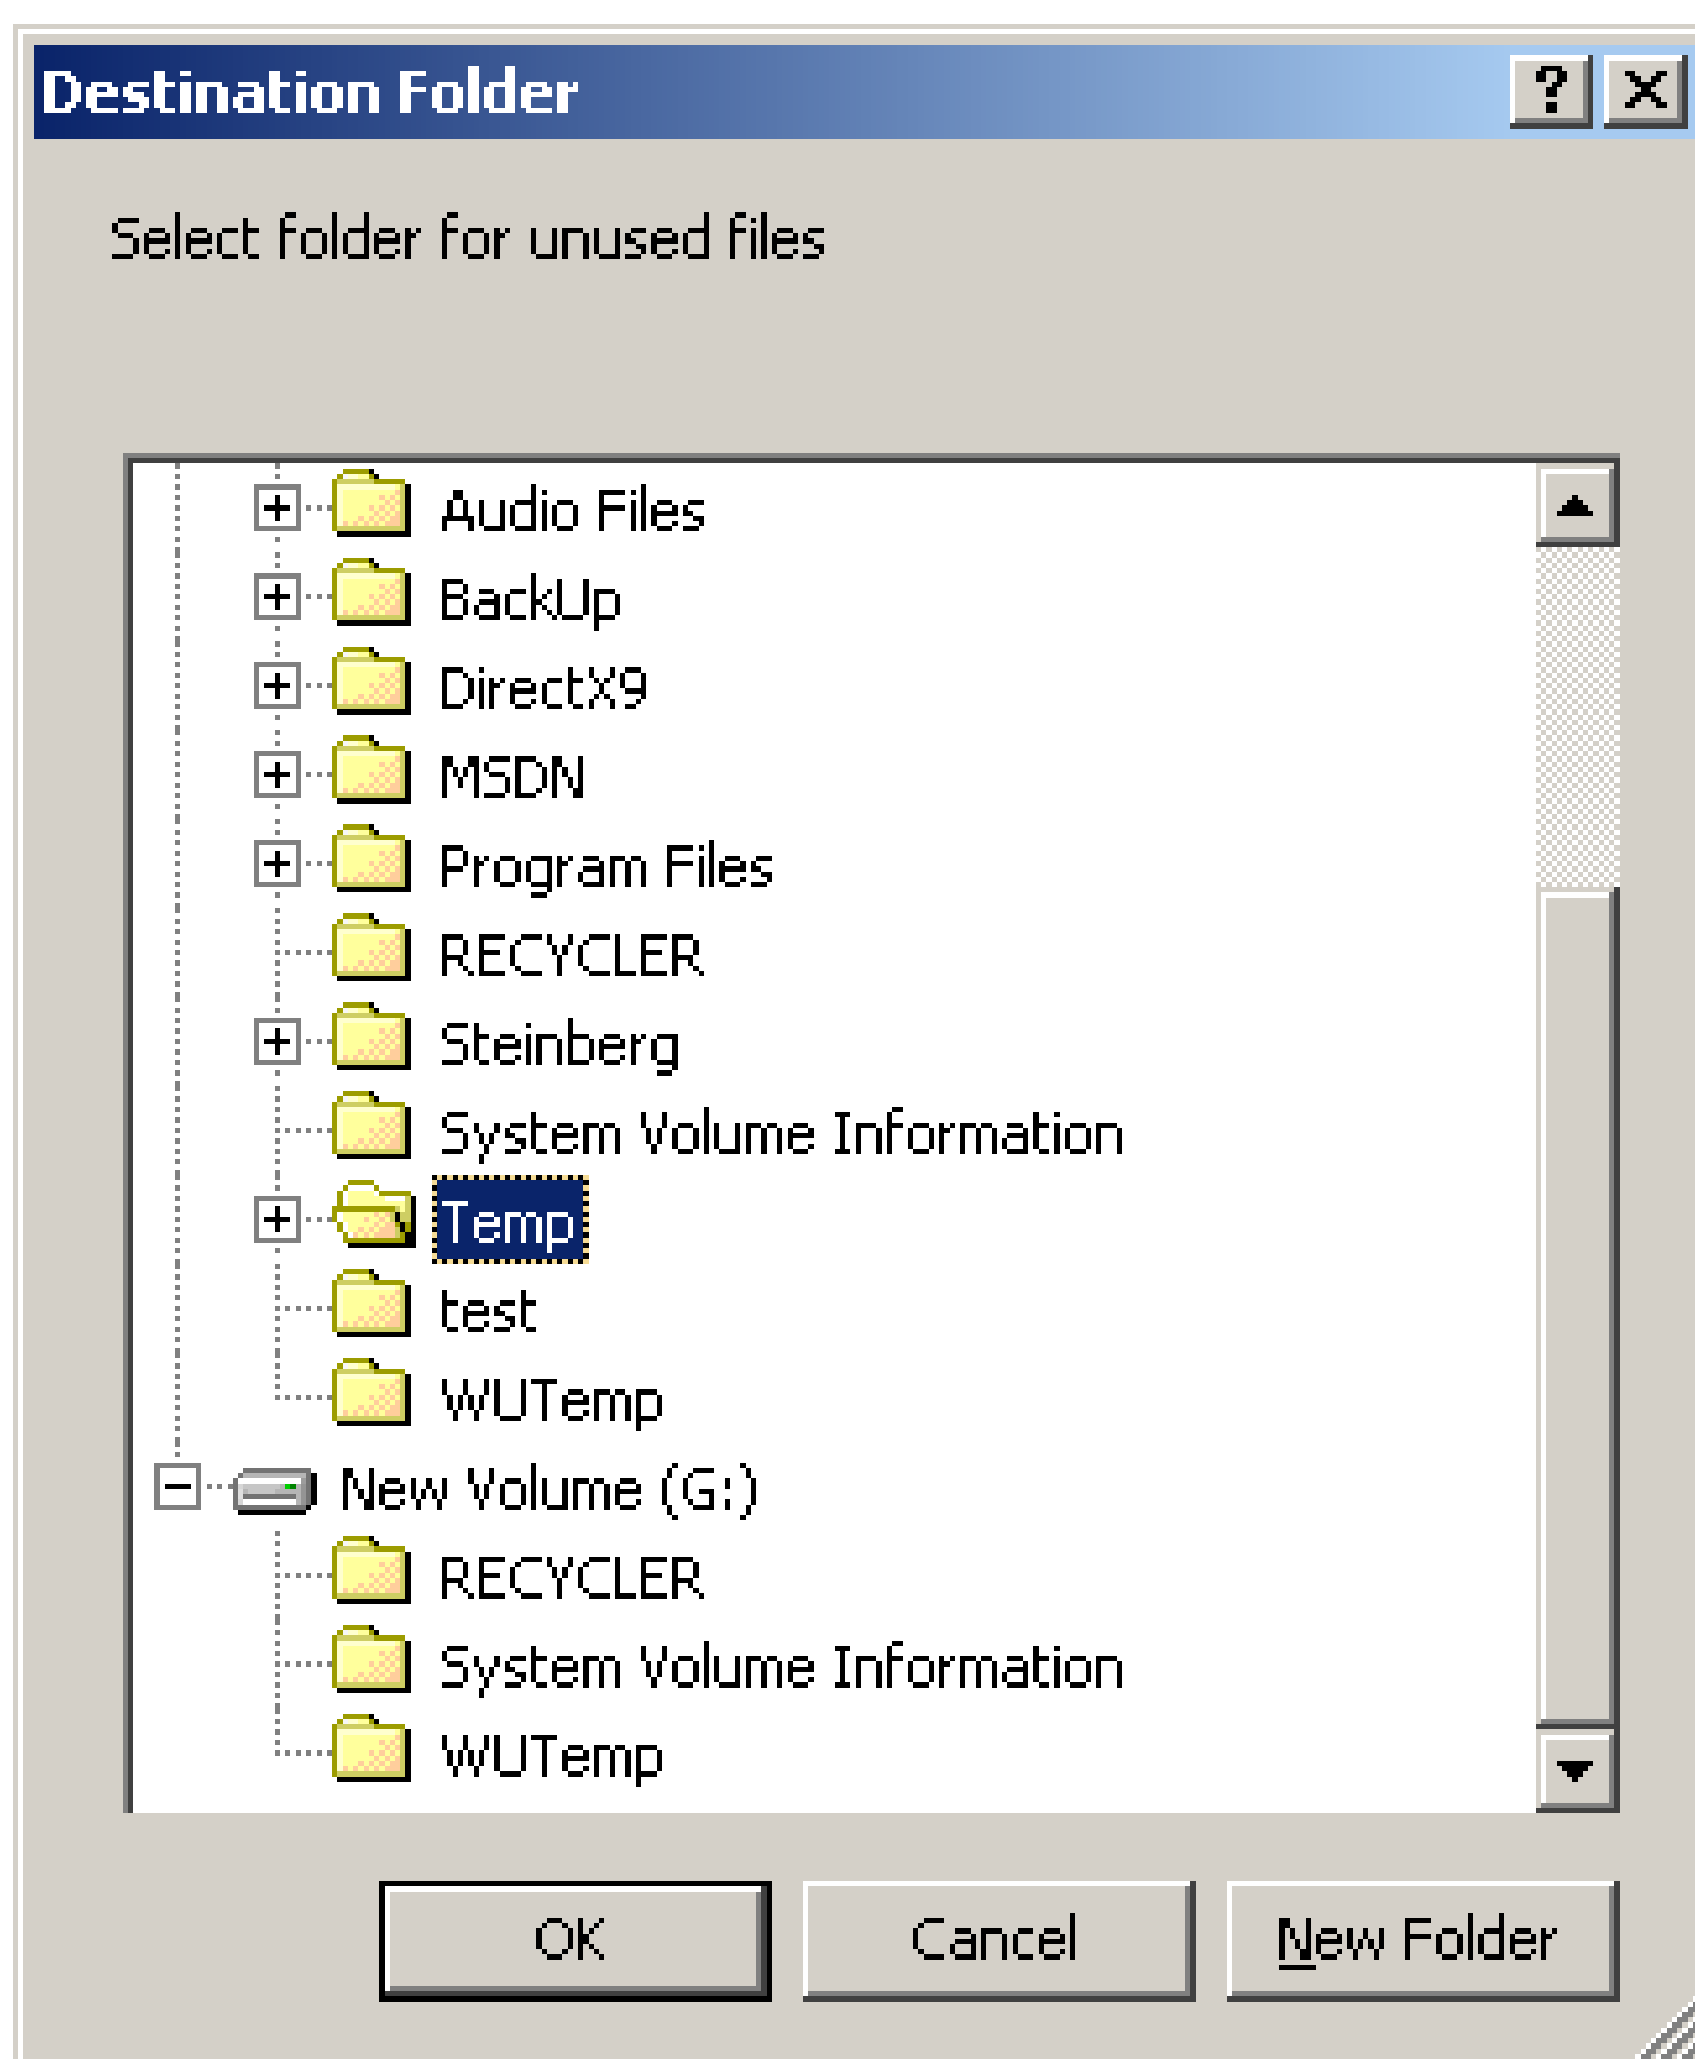

The 6 tabs under the results panel select the various sections: -

- | | |
|--|---|
| a, Files found in Folders | All *.WAV files found in the search path |
| b, Files used in Sessions | All *.WAV files referenced by the Session file/s |
| c, Files in Folders and used in Sessions | Files contained in both (a) and (b) |
| d, Files in Folders and not used in Sessions | Files in (a) but not in (b) |
| e, Files in Sessions but not in Folders | Files in (b) but not in (a) |
| f, Duplicate files found in Folders | Files that have the same names and sizes that appear in the search path |

The 4th tab is the one used to move files, select the files and right-click the selection

From the popup menu choose the Move xx Files option, which will display a Folder selection dialog to select the destination for the moved files.

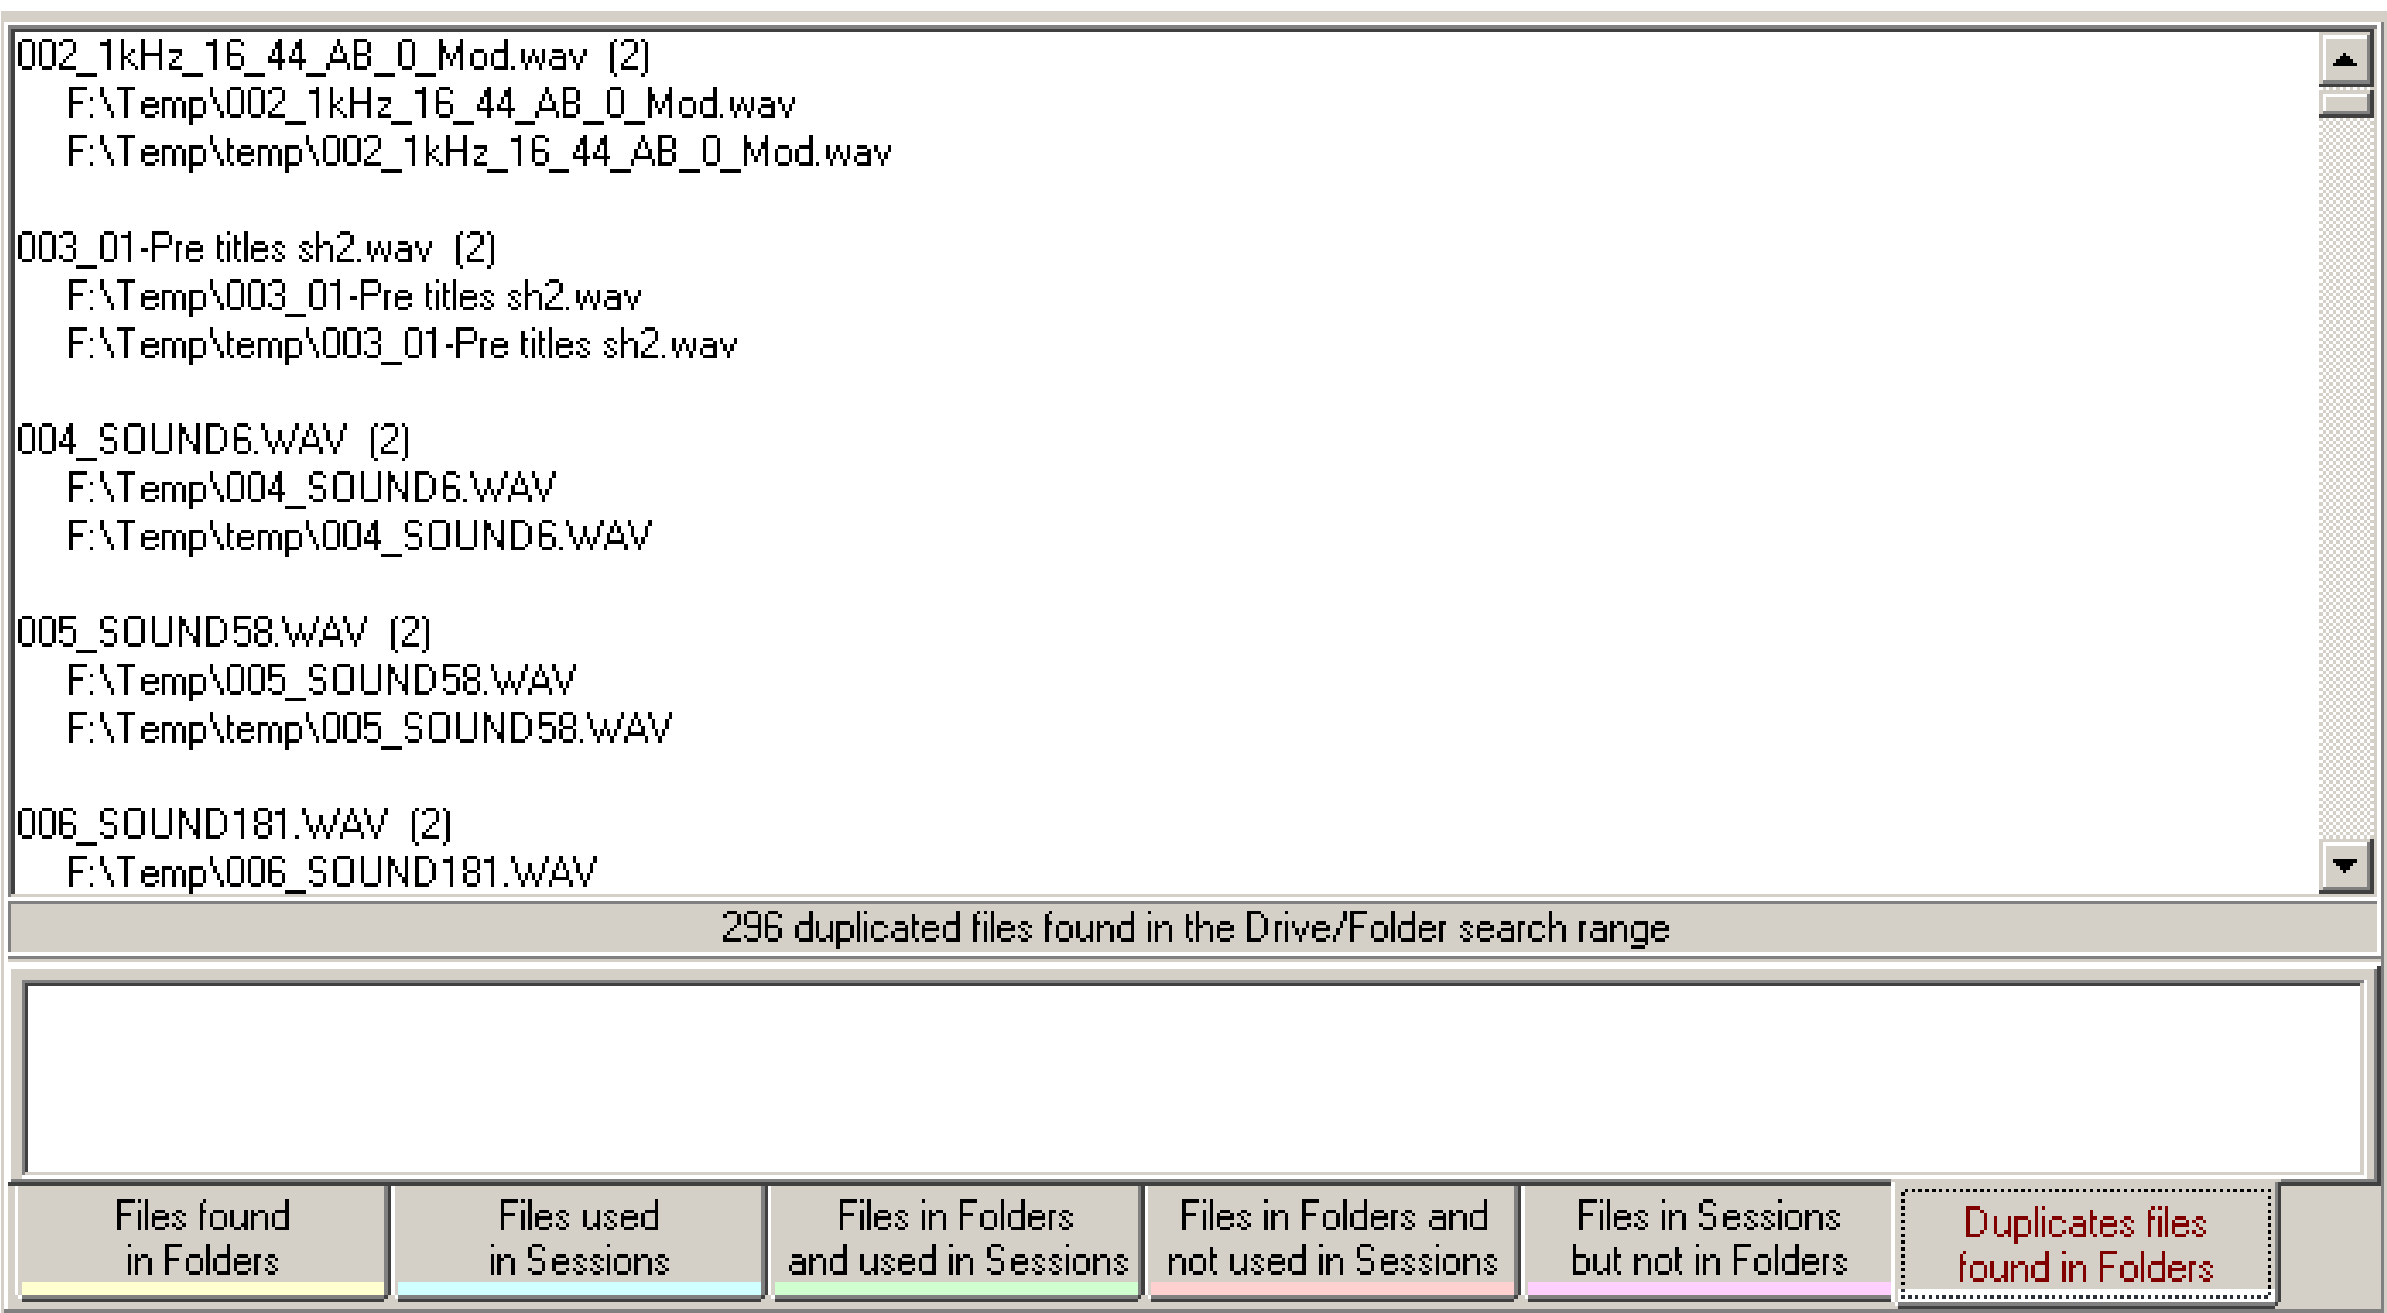

After selecting the destination folder and clicking OK, a further confirmation dialog will appear.

Followed by a progress window indicating the number of files moved

The final tab 'Duplicates', lists files in the search range that have the same name and file size.

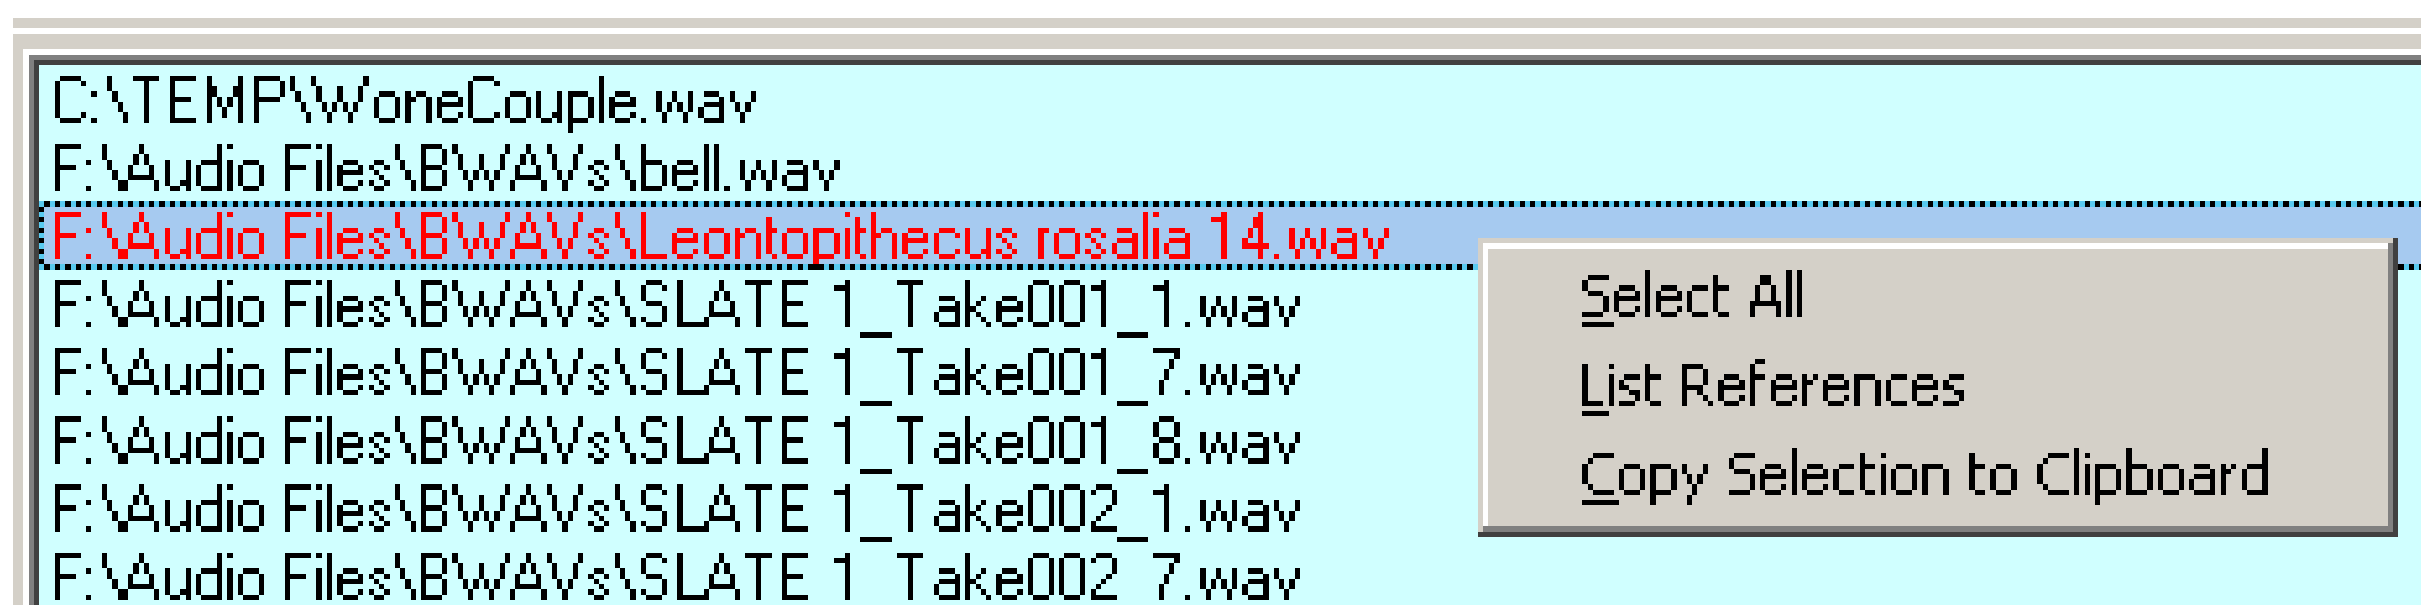

The results shown on the second tab 'Files Used in Sessions' may have some files drawn in red text as below

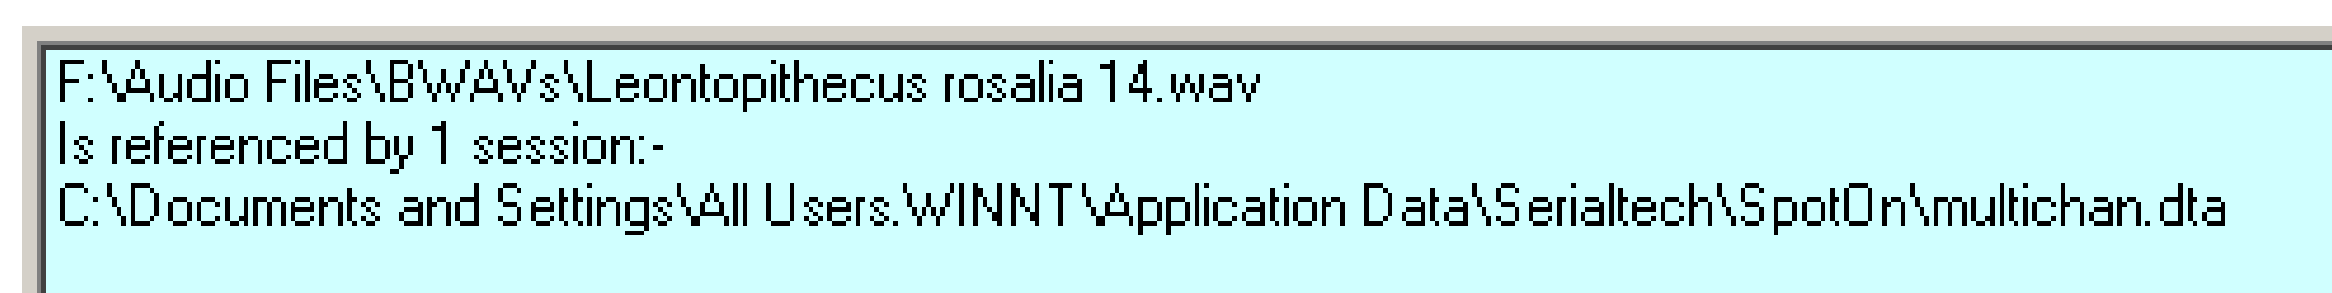

The files drawn in red text are those that cannot be found in the drive/folder search path because they have been moved, renamed or deleted.

The filenames indicate they should be found in the search path but are not present. These files would be listed as not found if this session containing the files was loaded into SpotOn.

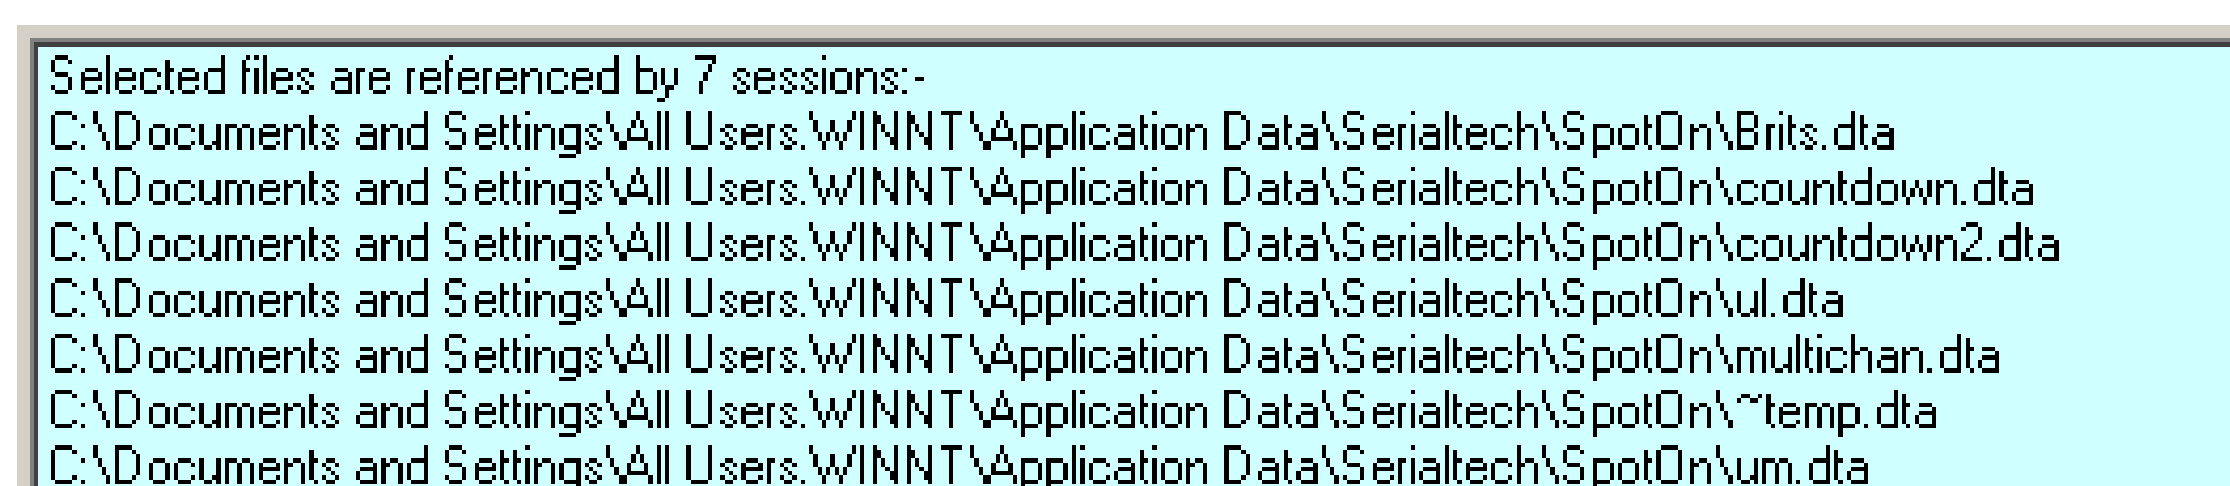

The right-click popup menu on this tab has an option to List References, this will list in the lower panel all the selected session files that use this file.

In this case the file is only used in one session 'multichan.dta'

If more than one session uses the file then they are listed as below

Menus

The file menu contains a Restore option, which allows files moved by the process described above to be returned to their original locations.

The moved files are recorded in *.saf files named with the date and time that the files were moved

Locate the *.saf file that refers to the files to be restored and click on Open, a confirmation dialog will appear showing the number of files involved.

The options menu allows the popup hints to be switched on/off, and to show or hide the coloured bars on the results page buttons

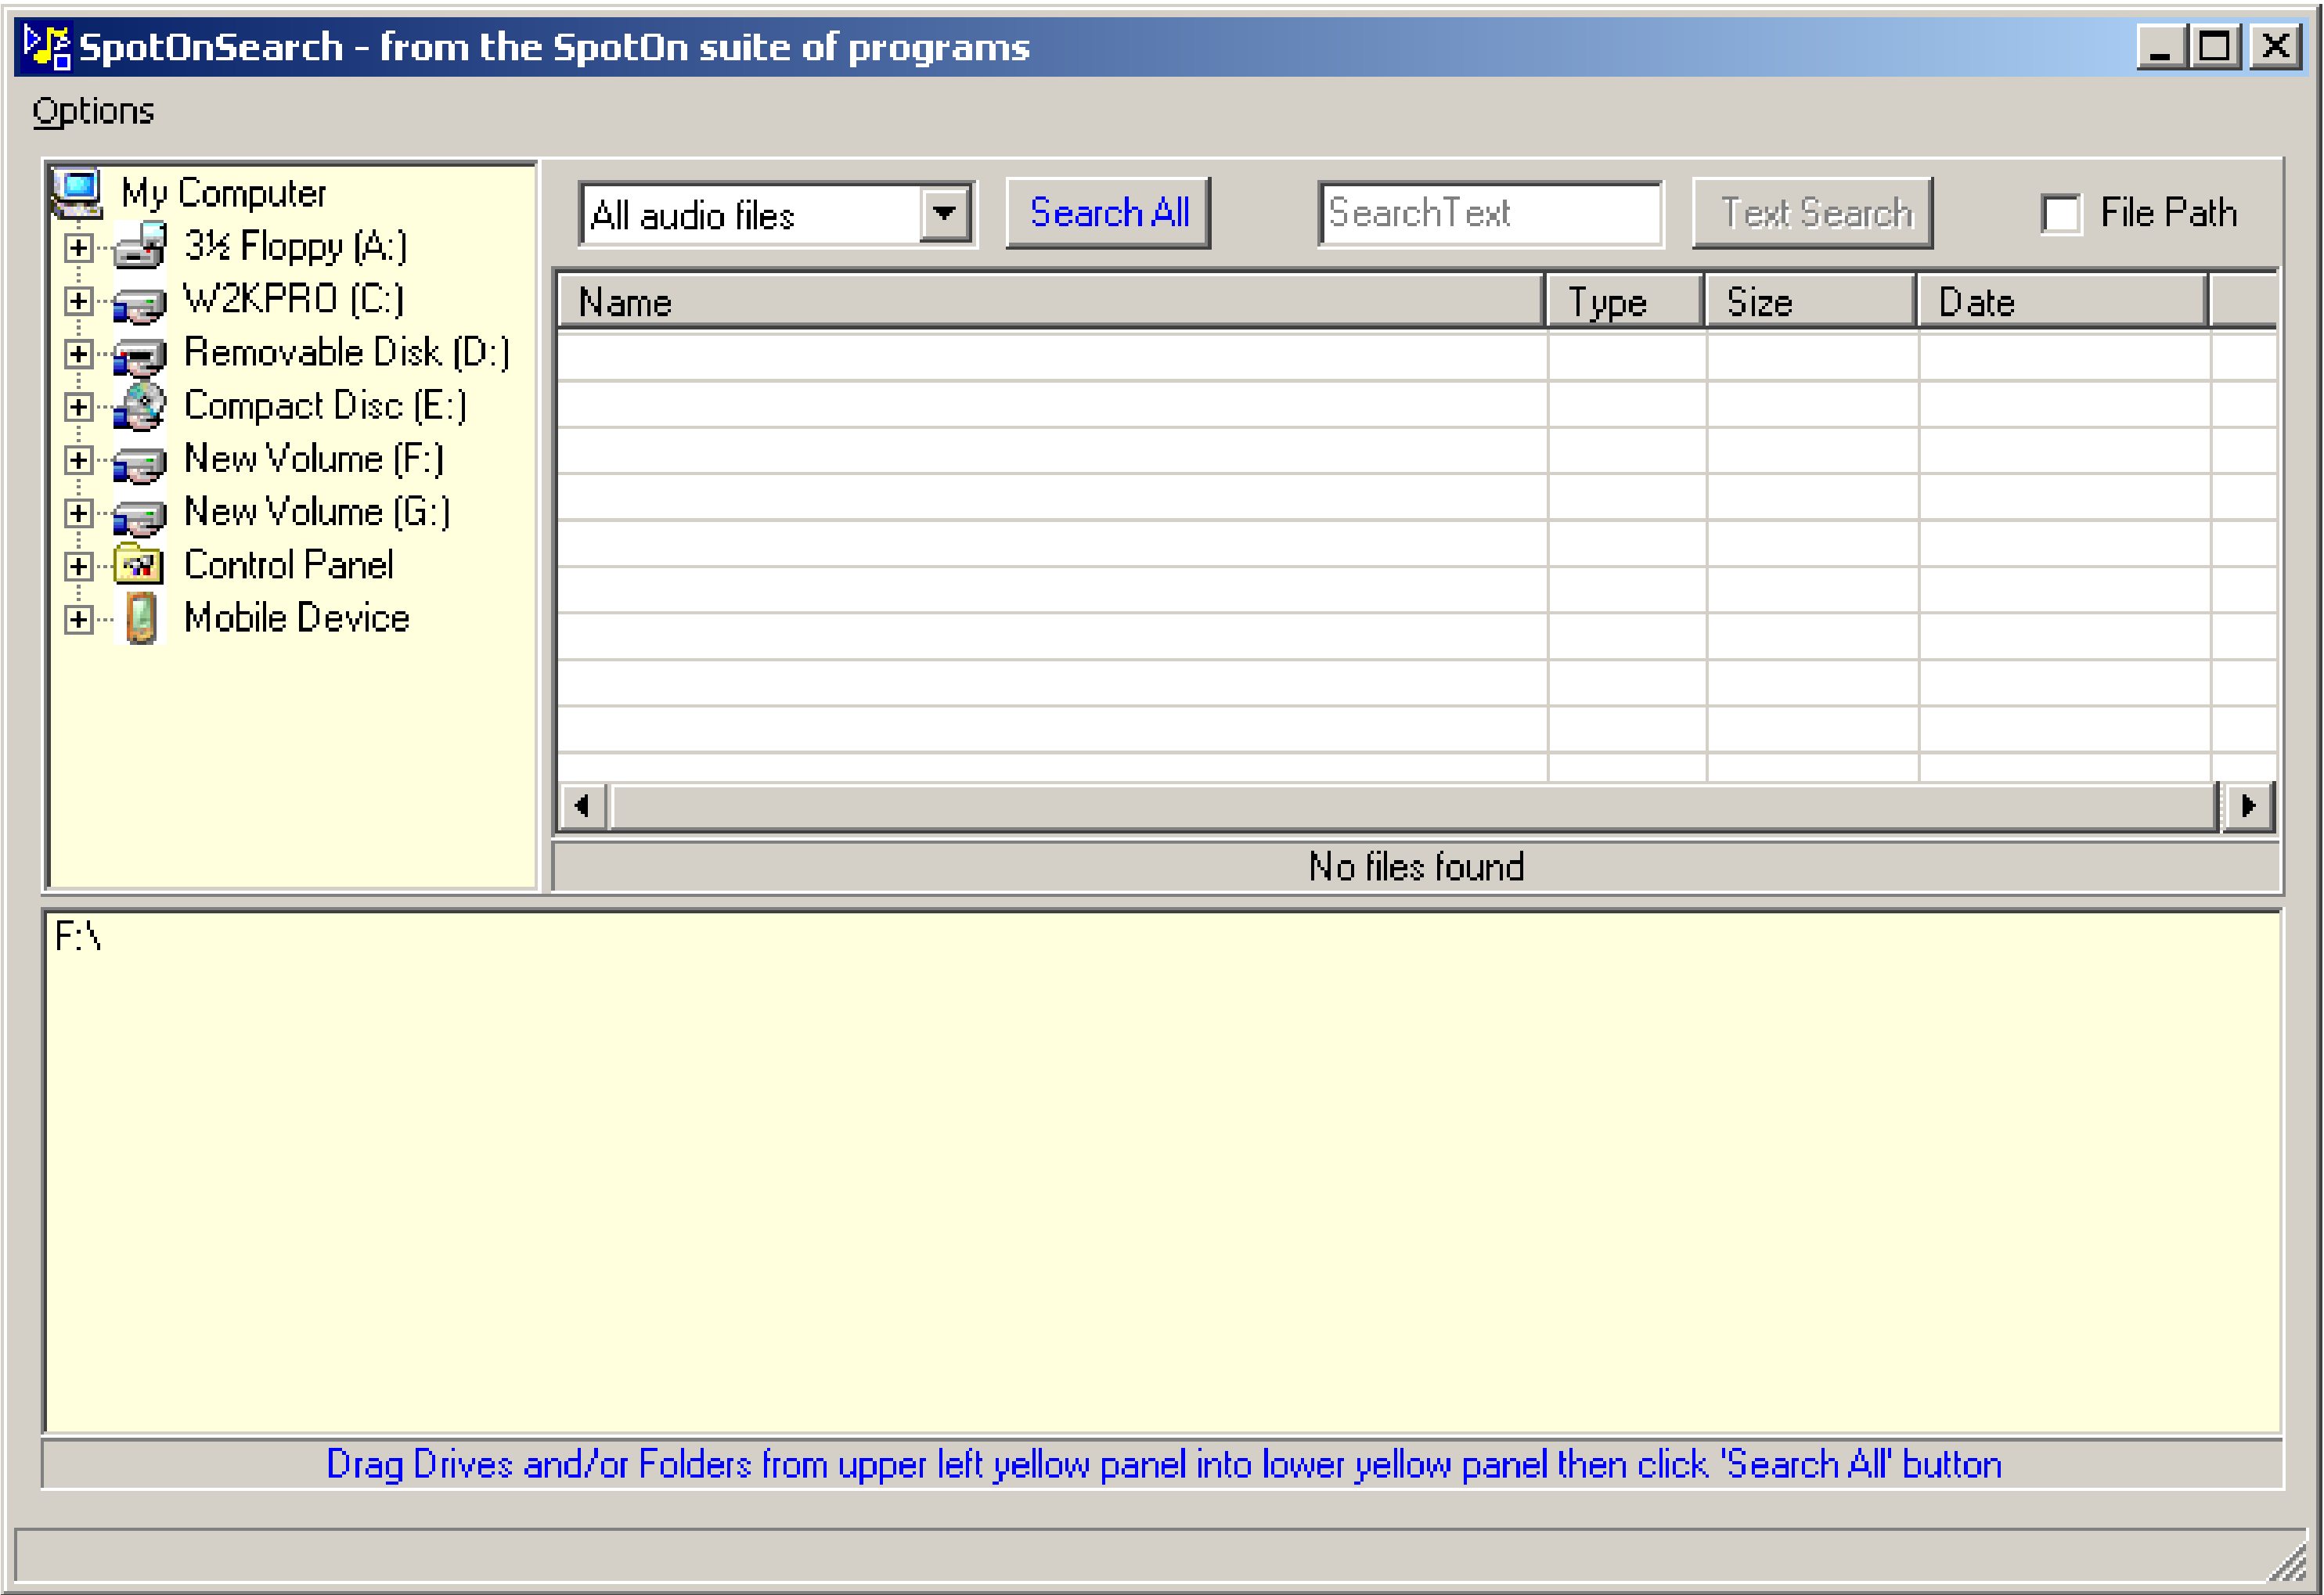

Button Colors On

Button Colors Off

SpotOnSearch

SpotOnSearch is a standalone utility to aid searching of discs for a variety of file types, the search range is specified by discs and/or folders, these can be selected in the upper left yellow panel and then drag and dropped in to the lower yellow panel as required.

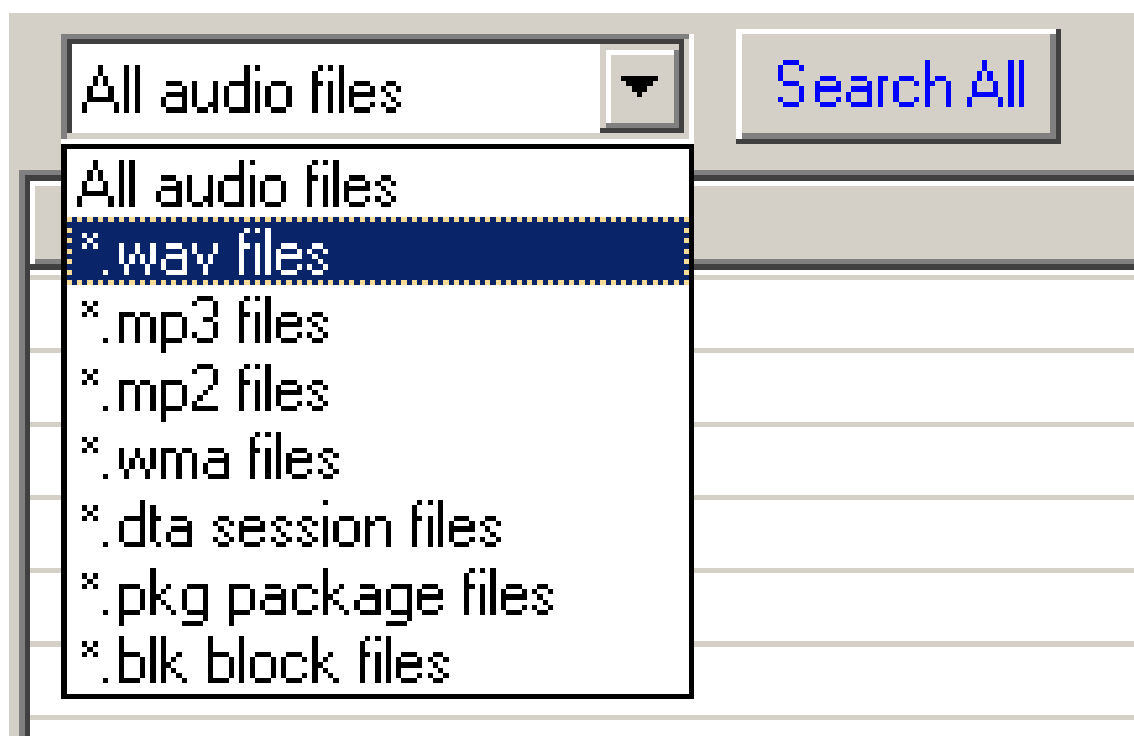

Items can be removed from the search range by using the right-click popup menu or pressing the delete key when an item is highlighted

When the search range is changed the 'Search All' button is enabled.

The Search All operation can list a specific file type and this is selected from the drop down list

Clicking the 'Search All' button starts a scan of all the selected disc paths, a progress box shows the number of files of the required type found vs the number of files scanned

On completion of the scan the files will be listed, the order of the files can be changed by clicking the column headers, below the results are shown with descending file size

Checking the 'File Path' box displays the full file path (truncated to fit the column size)

All audio files	Search All	SearchText	Text Search	<input checked="" type="checkbox"/> File Path
Name	Type	Size >	Date	
F:\...\SpotOn\Package Media\test85\STwain5xy_32x96	.wav	218 MB	14/11/05 20:56	
F:\...\Package Media\DD_Pkg75\034_Widor5Toccata_Mod	.wav	62.6 MB	26/09/05 17:44	
F:\Program Files\SpotOn\Local\Widor5Toccata	.wav	62.6 MB	05/06/05 09:07	
F:\...\SpotOn\Package Media\test85\Widor5Toccata	.wav	62.6 MB	30/10/05 10:32	
F:\Program Files\SpotOn\temp\Widor5Toccata	.wav	62.6 MB	22/09/05 07:14	
F:\Temp\Widor5Toccata	.wav	62.6 MB	22/09/05 07:41	

Alternate clicks on the column headers sorts the results in ascending/descending order, below the Size column header has been clicked and the results are now sorted by ascending file size

All audio files	Search All	SearchText	Text Search	<input type="checkbox"/> File Path
Name	Type	Size <	Date	
005_SOUND58	.wav	3.41 KB	12/02/05 22:03	
005_SOUND58	.wav	3.41 KB	12/02/05 21:56	
006_SOUND58	.wav	3.41 KB	12/02/05 21:14	
013_SOUND58	.wav	3.41 KB	20/02/05 12:26	
SOUND58	.wav	3.41 KB	20/02/05 12:26	
SOUND58	.wav	3.41 KB	12/02/05 21:00	
004_SOUND6	.wav	4.38 KB	12/02/05 22:03	

The text search box allows for a word to be found within the filename (the file path is excluded from the text search), clicking the Text Search button re-orders the list

Single file or multiple files can be selected with the usual Ctrl/Shift modifiers, the selection can then be drag and dropped onto a SpotOn button where they will be loaded onto consecutive buttons.

1712 files (11.6 GB) - Select file/s and Drag+Drop onto SpotOn - 5 files selected (21.0 MB)

SpotOnSearch has the facility to copy one or more files to a new location, shift+right-clicking on a highlighted file will display a popup menu

Clicking OK will offer a destination folder selection dialog, the default location will be that used by SpotOn to load WAV files.

The OK button will bring up a further confirmation prompt box

If a file being copied already exists in the destination folder the dialog below will be shown allowing the files to be selectively copied.

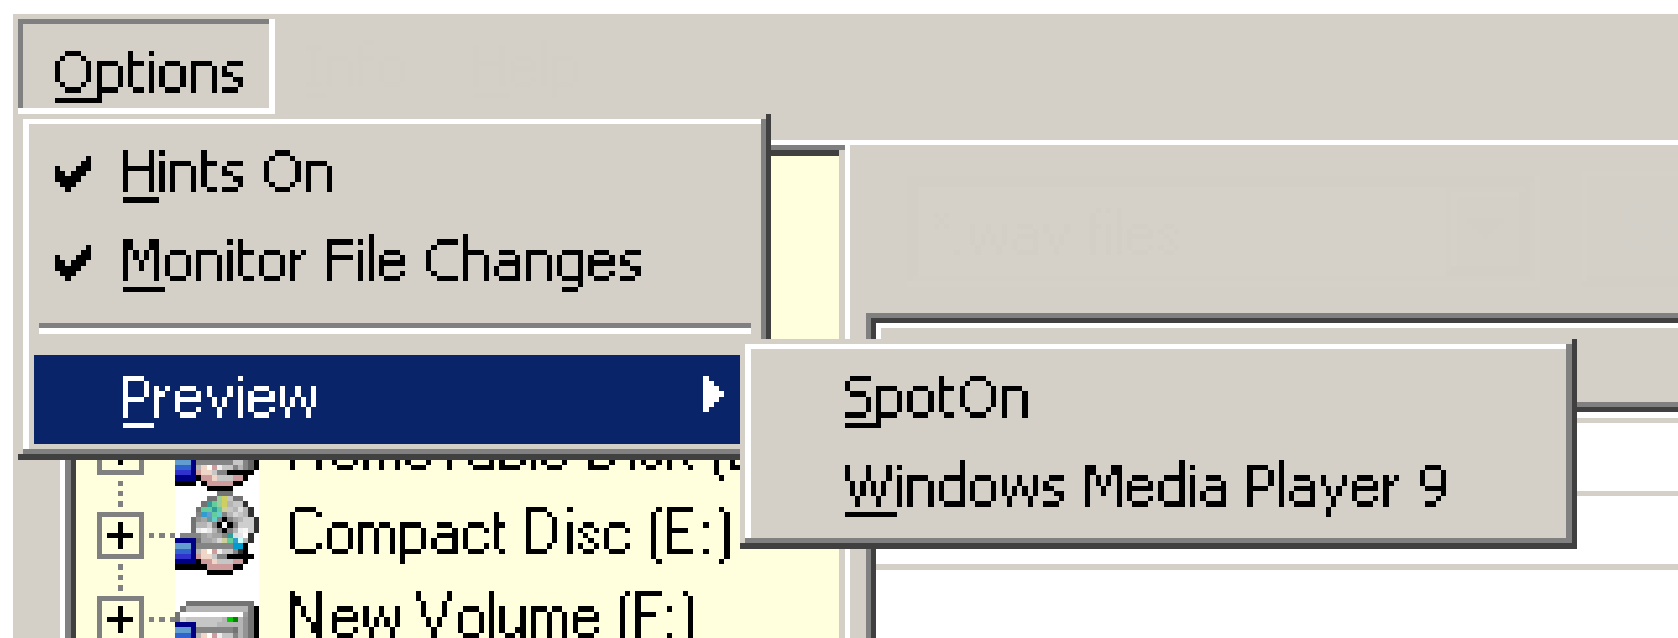

Options

HintsOn allows the popup hints to be enabled/disabled

Monitor File Changes enables a background check of changes to files in the range of folders selected, creation, deletion and renaming of files and folders will be detected and the search list updated.

Preview selects the method of track preview - either SpotOn, Microsoft Windows Media Player or none.

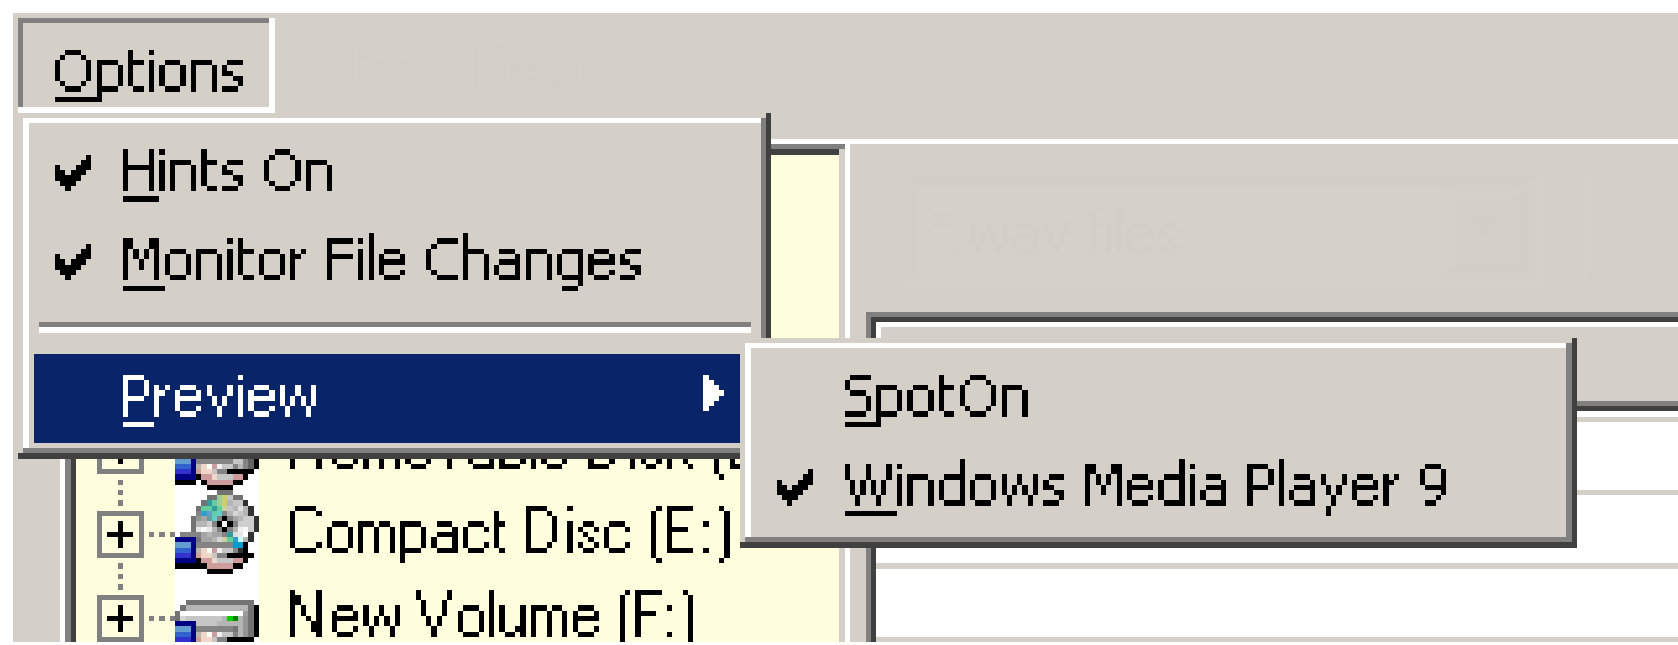

Preview Track -SpotOn

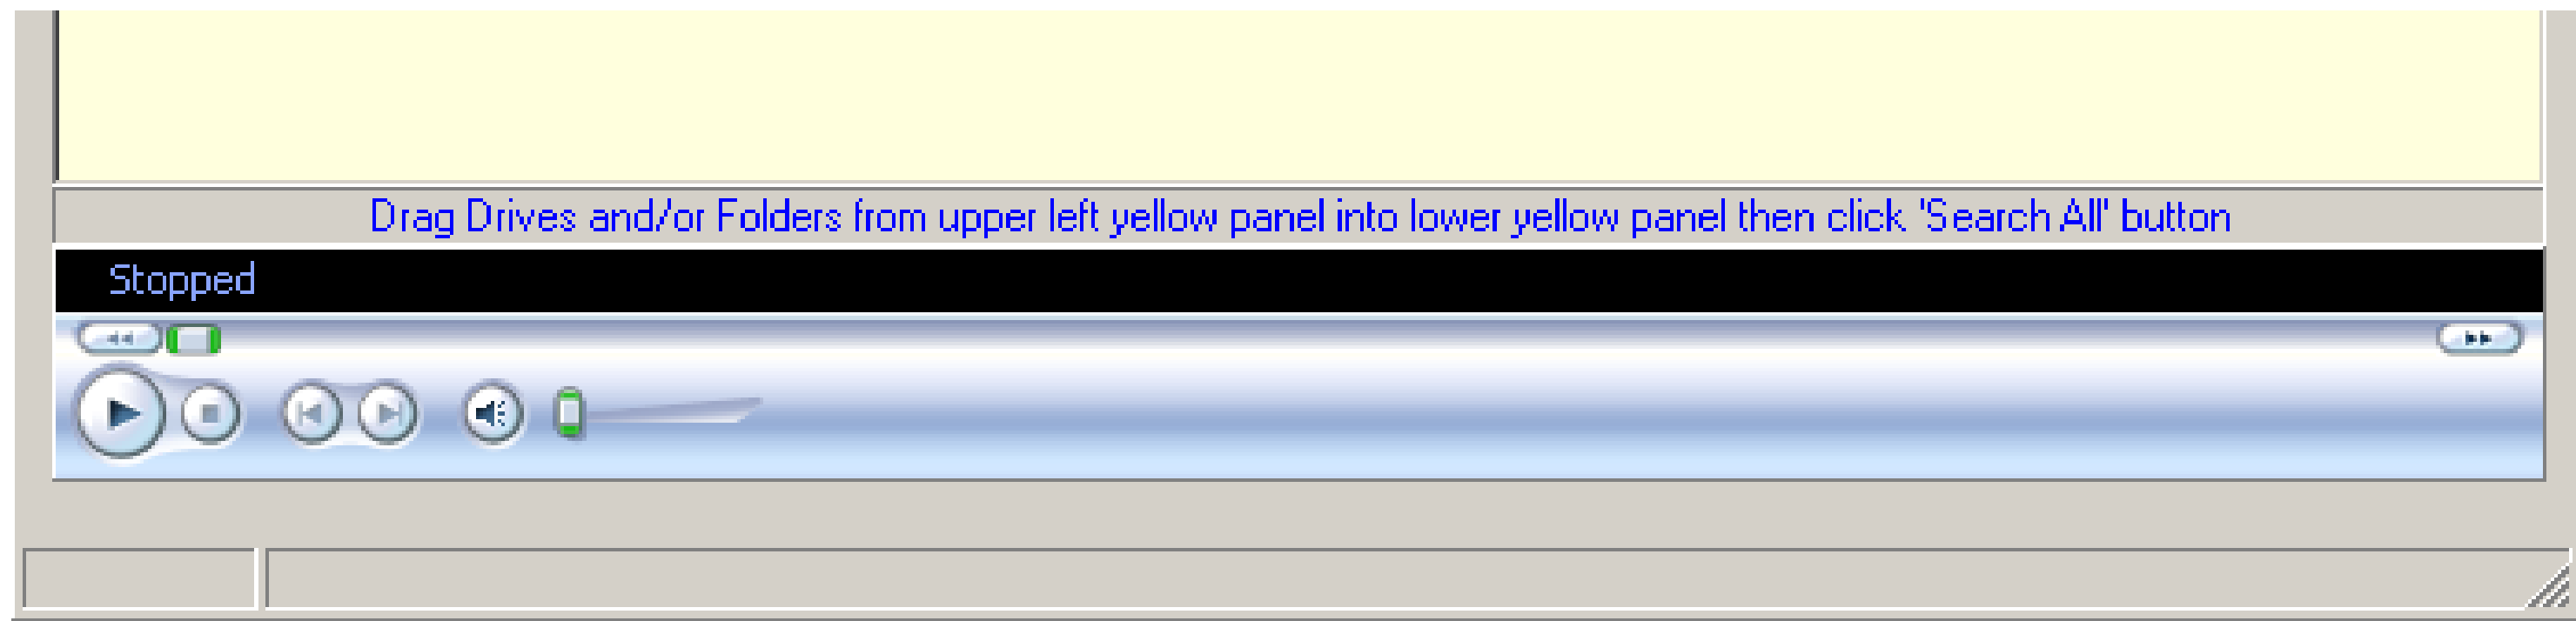

If SpotOnSearch was launched from the SpotOn file menu and SpotOn is selected as the preview destination, then the tracks can be previewed individually by double-clicking WAV files in the results list. So for example the entries for 'bell' and 'door bell' can be compared by double-clicking the names, right-clicking will stop the track as will closing the SpotOnSearch utility.

The previewed audio will be played out by SpotOn to the output that was selected as being the 'Preview Output' via Global|Preview Output Assignment.

Preview Track - Windows Media Player

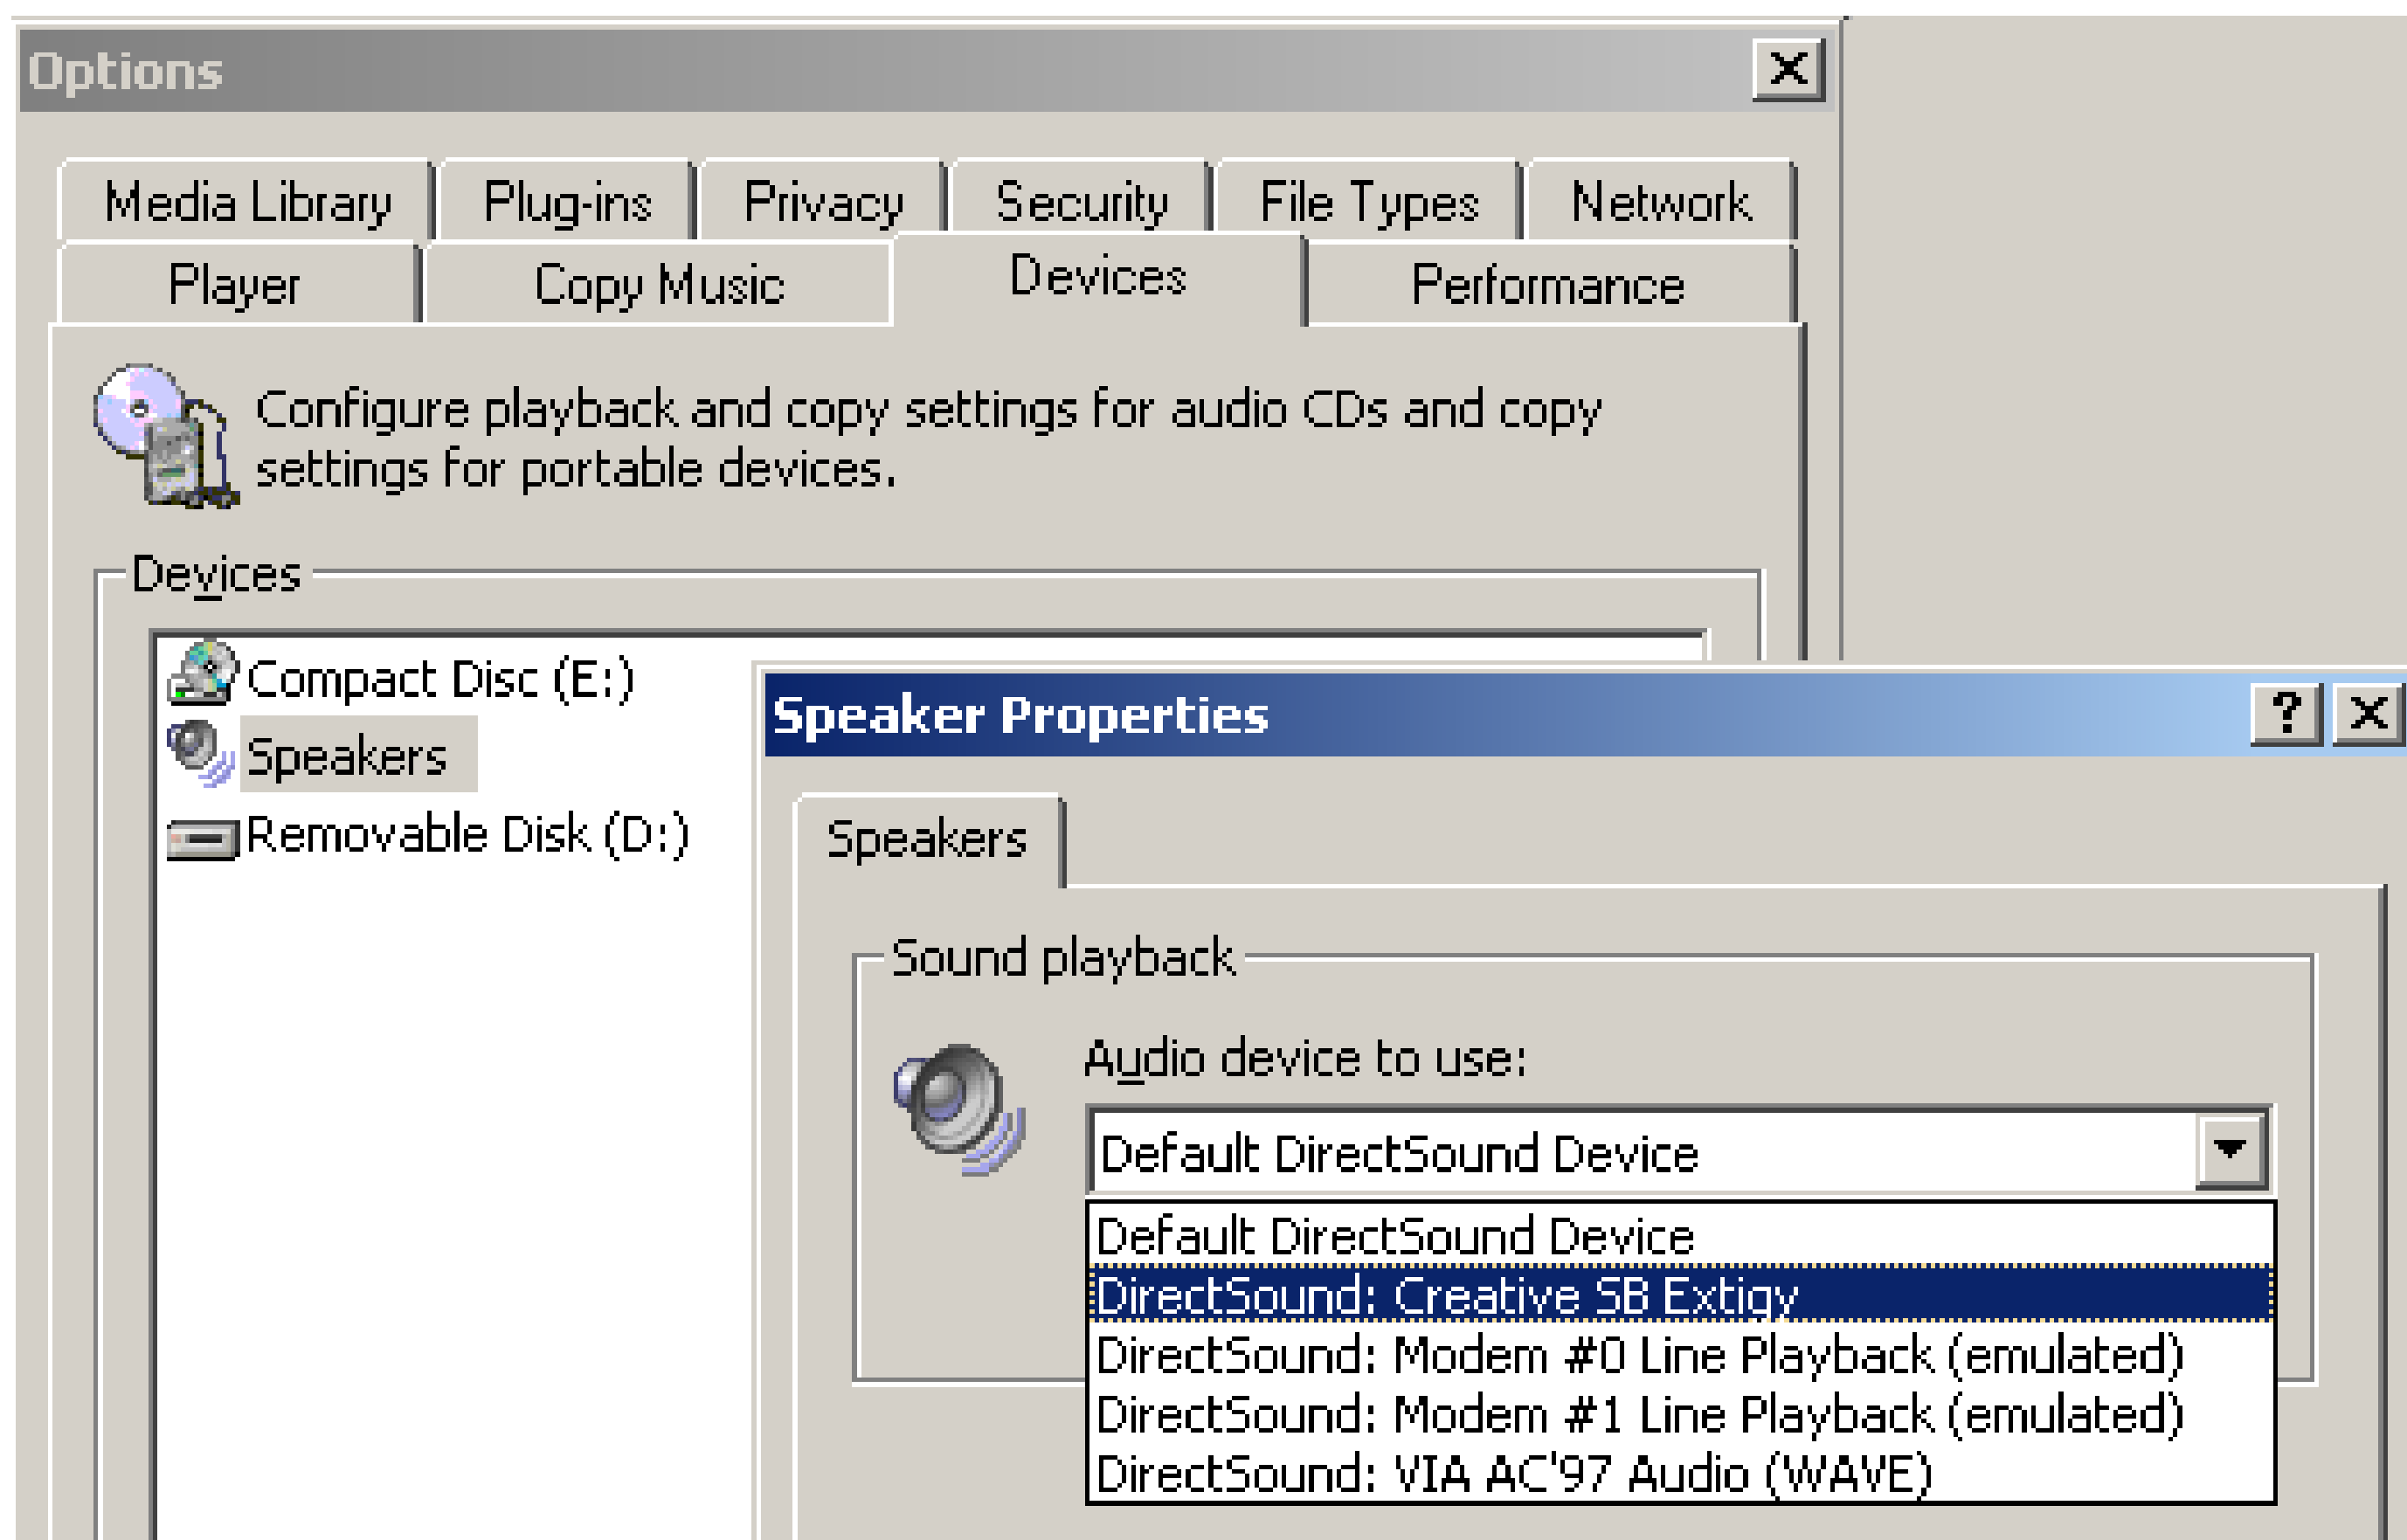

If the Windows Media Player (WMP) option was selected then the tracks can be previewed individually by double-clicking files in the results list. An embedded WMP appears at the bottom of the main window

So for example the entries for 'bell' and 'door bell' can be compared by double-clicking the names, right-clicking will stop the track as will closing the SpotOnSearch utility or deselecting WMP as the preview option.

The previewed audio will be played out by WMP to the output that was selected via WMP menu Tools|Options|Devices|Speakers|Properties

Info

The Info menu Item shows the last 1000 changes made to any files in the search paths irrespective of file type.

In the above example the file F:\Sting_441.wav has been renamed three times ending with Sting4_441.wav then set back to the original name.

The file is then moved to F:\New Folder and renamed to Sting2_441.wav

Finally the file F:\New Folder\Sting2_441.wav is copied to F:\New Folder\New Folder\ and then the copy deleted.

A log of the 1000 most recent changes is saved to disc when SpotOnSearch is closed.

Versions

Major releases shown in bold

v0.969	21/10/2012 Option In Place Conversion to save 24>32 bit conversions and decompressed files to source folder Global Properties page 4 was checking all outputs on exit not just leaving those already checked PBus bug message stack 32/64 bit integer conflict
v0.968	12/06/2012 Copying buttons caused MidiNoteOut to be copied to MidiStopOut Master Slave link name dropdown causing error on number >100
v0.967	01/05/2012 Accepts latest ProTools WAV format Bug in direct entry of Trim In/Out values fixed Provision to extract CD tracks direct to disc
v0.963	01/02/2012 Stop Slave triggers speed window slowdown to zero if speed window is open on stopping button ShowPlayedBtnsOn, ShowPlayedBtnsOff, ClearPlayedBtns added to Network Master/Slave control Network Play message was being sent when button Stopped so slave PC restarted button Panel Image and button colour copy using Ctrl+Alt+Shift left drag Floating timecode display window added Play Delay used on Master button triggered Slave on Click then again at end of Play Delay Once Play Delay option was disabled in session there was no method of re-enabling
v0.96	01/12/10 Stop on MouseUp option in Button Menu Stop Page on Play option in Button Menu Trim page bargraphs now respond to pan setting Palette selection added to Output colours dialog Trackname font can be set independently on each button Option to indicate buttons that have been played since the session was loaded Default Midi Out Velocity/Volume was 64 now 127 (maximum) All Stop button indicates when escape pressed Button WAV files can be copied to Windows Clipboard 5.1 surround sound pan Expand number of track channels Save pages as screen images to bmp or jpg files CD burner utility for *.cda and *.wav

Replay Gain Metadata displayed
DTMF tone decoder
Option to Burn Packages to CD/DVD
MicroFades for short FadeIn durations
Play Delay extended to operate on buttons however they are triggered
Session file font sizes corrupted by importing blocks based on a different font reference frame
Midi All Stop command will stop all tracks not just those triggered from Midi
Preferred WAV file editor saved in session file
Timecode Trigger list added
MicroFades for all FadeOut durations
Play Delay added to Paste Special
Status Primary buffer details shown in wrong order
MultiChannel channel mask not reset when changing outputs causing channel order to be incorrect
Fine Trim of In Point added to Trim In options
Hide all button text option added to aid display of button images
Telephone effects and filtered tracks loaded onto next available button take the original trim points
/HardwareMxr switch added to force soundcard hardware mixer to on - defaults to off
Mixdown of 5.1 tracks prior to burning to CD
Paste from Windows Clipboard
Merge timecode option not taking into account trimmed tracks
Output device order checked against last run - outputs repatched if possible
Option to save new output patching or treat it as temporary
Latest version of PackageConvertor added at end of each package file - for future use
24bit to 32bit conversion mono channel bug fixed
Windows 64 bit check added to status window
New Session now resets button colour and font sizes
5.1 mix down coefficients changed to ITU standard
Level options added to timecode generator
PlayDelay limit increased to 999s and shown in main window status bar hint
PlayDelay play button flash now on Trim and Audio windows
"Other pages playing " now always shown on tabs
Ctrl+F open/restore SpotOnSearch
iXML metadata decoder
Play Stack utility, Play group 24 fades out Play Stack tracks
AC3 and DTS decoders added
Load New Session on startup option
Utility filename clear menu option added
Click Track generator
CD Track ripping
Playlists reinserted to merged timecode file
More metadata fields added to Playout Logs
CD Track details lookup
Option to draw highlight rectangle/corners on buttons playing
Button colour on a per Genre basis
BWAV Description field into logas Notes field
I+O (In/Out) keyboard shortcuts in Trim window

Spacebar in trim window toggles Play from In/Stop
Button Fx being switched on after session load but no parameters set
Sample frequency button highlight on shift right click Play mode panel
PPM level meters
Multichannel fine trim
Autoload CD metadata
Virtual Playlist segments
Play/Stop - Play/Menu option now set by click on status panel
Fine Trim dialog features extended
Trap added for very long path names and filenames (not paths) truncated if too long
Fade out when Speed automatically slowed to zero improved
Set PC clock from external timecode
FTP client added to upload debug logs directly to web site
Trap to stop NetworkMidiOut being set when loading package onto another PC
Midi Channel selection now scrolls in loop and default is AnyChannel
Test to warn on opening Audition > v1.x whilst tracks playing
Log Window set to stay visible
Ignore Emulated Devices option added to cover use of WAVE/WDM Combo sound card drivers
Number of channels button highlight on control right click Play mode panel
Popup hints for long text added to Payout, Event and UDPScan grids
@ Loop command added to CUES message options
\$01 option added to LIST message to return numbers of tracks playing
Cascade Links Admin option to allow slaves to trigger masters
LinkDrag now resets link to be Play/Stop cancelling any existing VO/Pause/Pan
Play Slaves now permitted in Groups
Page Change UDP message being sent with MidiOut Off now fixed
Output Patching/Masking now covers 256 devices, **Masking for outputs > 16 will need to be reset**
LeftToBoth and RightToBoth properties swapped so not saved correctly in sessions
LeftToBoth and other mixdown options added to Render to New File option
Global properties page 4 set to reorder output devices
Multichannel files that failed to load into stereo version now listed in dialog
Fast IIR filters added to Effects window (44k/48k only)
Button gain setting shown in popup hint and status bar
Timecode Chase of AutoPlay buttons to external timecode
Timecode file generator sample rate now 48000Hz was 44100Hz
Timecode Biphase correction option
Midi Out devices not loaded correctly from sessions built with v0.951 and earlier
Click track BPM resolution extended
Global level meters

PanL/PanR added to status bar hint
 Status bar shows timecode in magenta if chase enabled
 Option to clear Editor/Search/CD Burner utilities on cancelling selection dialog
 Render Trimmed track to file fixed
 Highlight of bit depth
 Midi assignments not showing correct channel number when starting from 'Any'
 Midi loopback status shown in lower case instead of italics conflicting with UDP Midi
 SMPTE TC on/off option added to Int/Ext dialog with warning label if disabled
 Web version check every 7 days
 MIDI files can now be loaded onto buttons
 Advanced Editing option moved to Options menu from Engineering menu
 Repatching of multichannel tracks
 Delayed start time for Play Stack
 Render file fade law taking original button setting not current setting
 Force GPI Poll Check moved into Admin|Misc menu
 Global Properties default values changed
 Menu item locator added
 Remote support option added to Help menu
 Midi Note Out on button stop
 Timecode Triggers trigger time window changed

v0.952

19/02/08
 Trim window find start of audio, default level -40dB with Options menu user setting
 UDP/TCP command NOTE added to list Midi notes allocated to buttons
 PBus control added, GPI In status panel shows underline when PBus control selected
 Shift right-click on GPI In panel toggles PBus control on/off
 Multiple files loaded onto a range of buttons now sorted alphabetically before loading
 AutoPlay WAV preview now plays on Preview output
 Spectrum analysis (FFT) routine added to Trim window
 Internet Explorer version detection now recognises v7.0
 Trim window find end of audio, default -40dB with Options menu user setting
 Top+Tail track added to TrimIn menu
 Pause Masters added
 Play to In Point facility added to Trim window
 Bug fixed that caused Trim In/Out timecodes to add 1 frame when popups were accessed
 SpotOn_DLL added to package
 UDP/TCP Midi Note reply forced to be zero based channel numbering
 AltAppDataDir command line switch added
 SMPTE timecode GPI emulation option
 Error in saving value of Pan set in GainPan window fixed
 Option to colour buttons on a per output basis added
 Stop slaves now allowed in groups
 File read only access trapped in session and package save

routines

New folder for replacement wav file now saved in Locate File utility

Double-click track in SpotOnSearch to play out via SpotOn preview output

Double-Click track in Search window to play out via preview output

Matt Nicholls bug fixed - button losing attributes when output changed via right-click popup

Bug fixed that falsely triggered grouped PlayNext target when another grouped button played

Option to use Scroll Lock to focus application main window

Default Tab name option added to main window tab popup

Double-click on a blank button brings up load dialog

Alt+double-click on a blank button brings up Top/Tail load dialog

Alt+drag+drop from Windows Explorer Top/Tails track

Alt+drag+drop from search window will Top/Tail track

Export WAV files now has option to restrict range to buttons on the current page

Default Search Utility now set to SpotOnSearch

GPI assigned to a button now moved with button on cut and paste

Packages contain file format version now checked in package load for compatibility

Midi Out over Network implemented for UDP

Midi SetUp dialog has Midi Out over Networkenable checkbox

MidiOut status panel underlined when Network Midi Out selected

Help file now called directly allowing clean switching between SpotOn and the help file

Midi Out Auto fill added to Paste Special

"^" added to Midi CUES command list to stop page

Left/Right to Both , Mono and channel phase inversion options added

For 5.1 a mix down to stereo replaces the Mono option

Option to lock Session files by setting them to be Read-Only

Popup on playlist entry now has cue to Inoption if Playlist is disabled

Velocity data added to Midi Monitor listing

Stereo and MultiChannel bargraphs added to Trim window

Level bargraphs have A/B and M/S modes and LED style display

Resolution of level graph improved

Multiple Midi Out destinations now available

MP3 Decoding timeout period increased to use 30s as default

Timecode format options added to GPI setup window

Trim waveform cursor positional accuracy improved

FLAC (Free Lossless Audio Codec) and Ogg decoders added

DirectShow Filter property editor

Remote Trigger graphic added to button

Shift+right-click on GPI In panel displays nudgpopup to set GPI Ext timecode trigger

Ctrl+Shift+Left mouse down on active Master or Slave shows linked buttons

Ctrl+Shift+Left mouse drag/drop from active button will

set/remove up a new Play slave link
 Audio capture (SMPTE timecode) list limit of 15 devices removed
 EdgedBtnText now defaults to on
 LED bargraph style defaults to on
 SpotOnSearch forced to closing on exiting SpotOn
 When display set to 120dpi multi channel bargraphs corrupted
 Option for 'none' added to Preview output assign
 Output friendly names added to all windows when selected
 NarrowTrack numbers hard coded to true
 Floating Position bars added for ganged playout, position and size saved in session
 Spurious Save Session prompt when exiting fixed
 Skip PlayList item added to GPI emulation - replaces Pause on buttons with a PlayList
 Extended range of default fade out times
 Paste Special can be qualified by output assignment
 Timecode Generator utility added
 Merged Timecode files
 File copy option added to Statistics and Display dialogs
 Button Audio Effects (Echo/Flange)
 Button Filters (Telephone/Low Pass)
 AutoArmed GPIs defaults to on, individual GPI AutoArmed defaults to off

- v0.951 18/06/2007
 Registry fix for new security key (dongle) drivers
 AIFF file format and 24 bit WAV now supported
- v0.95 01/06/2007
 Row and column paged track number options
 Identical Play and Stop Midi notes now allowed
 If Midi play/stop note received when track playing it will stop track otherwise it will play track
 Display forced to top left of main monitor if screen size changed between sessions
 Preview track conflicts with cut/paste/swap/delete fixed
 AutoPlay added to Load track dialog
 Midi In/Out text on buttons and Paste Special dialog showing incorrect Midi Channel number
- 08/04/2007
 Security key (dongle) drivers updated
 Paste Special - Loop and Stop All options added
 Trim Edit enter timecode font size increased
 Loop mode can be changed to on whilst playing without stopping track
 Loop mode can be changed to off without stopping track, loop cancelled when track is stopped
 Button looped circle changed from dotted if loop set to off whilst playing
 Glits/BlitsM18 filename trapped as special file name and button gain forced to maximum
 StopAll and PlayNext modifiers now maintained if Cut+Pasted onto a blank button
 Soft Splash screen added as ini file option

v0.92

TCP interface added
Step to next button highlight added
Multi monitor form position saved when second monitor is on the RHS
MP3 decoder timeout was fixed at 15s now saved to in SpotOn.Ini file for manual adjustment
Floating Level bars added
Prompt for alternative location for uncompressed files
Use Friendly Names option not saved in Global Properties
Debug options moved to disabled section of Admin menu
Midi messages filtered to avoid duplicate actions
FastMidiMute function added to UnMute/Mute track instead of Play/Stop
Price Is Right Midi glitch fixed
Vista OS detected and compatibility checked
Multi-Monitor support for Right and Lower monitors
Long device names trapped in Output device assign long hint added
Remote and decompressed file location - option to maintain alternate location for duration of session
Double click on unassigned button directly brings up Load dialog
Midi channel numbering fixed as 1..16
Auto Armed Midi timecode GPIs option

v0.91

Changes made to UDP Scan dialog
Preview Track added
LIST and CUES UDP commands added
Wave and Master volume controls now trapped at >0.5dB from norm rather than absolute
VolumeCheck now Admin menu option
Location for saving remote files can now be selected per track defaults to Local File Folder
Set from next MIDI input option added to Midi SetUp and GPIMidi SetUp
x0 fade out glitch fixed
Locate File deleting StopAll and Playlist entries
Holding Shift+Alt in preparation for Track Pvw now shows left status panel yellow
Button being previewed has outer cross hatch rectangle
Playout logs now have output filtering
Playout log shows aX, bX etc for missed durations
Installation device order saved to ini file
Set from next MIDI input option added to GPIMidi SetUp
Win2000/WinXP timer bug fixed, Timer Adjust menu option added
madException handler added
Compressed debug files moved to Admin menu
Max number of event/playout/exception logs increased to 90 days
LimitLayout menu item hidden and forced to false
Step in gain level on fade out when Midi Velocity used with Stop Velocity>Start Velocity
Modified loop count being remembered on Copy/Swap

'-' removed from delimiter list in wordwrapping
Pause/UnPause logic changed to Play/Pause/UnPause
Preview mode Gain/Pan/Trim/Speed parameters added
Tracknames page has button coloured blocks in front of track names
Master/Slave summary 125..126 now reads 125,126

v0.90 28/07/2006
Button images saved into Packages
GPI pause/unpause action added
GPI range extended to 64
Locate file now auto-fills on 'modify session and select next button'
Web hyperlinks can be disabled via a menu option
Button colour saved separately in Btn Image and non-Btn Image modes to improve readability
Fade bug in trim window when centre-click cueing up and rehearsing out points
Autoload button images option to associate button image with an audio file
Button Regions introduced to manipulate rectangular regions of buttons
Drag and drop bmp/jpg from Windows Explorer
Wait box shown at start of search process whilst scanning links
Ctrl+F shortcut to File search
Btn popup position moved away from menu items avoid accidentally selecting Cut option
Left click + spacebar emulates centre click when not in Step to Next (touchscreen pause)
Global|Statistics offers facility to copy files from Local folder to a more relevant location
Playout log selection save to file option incorporates a column filter
Trimmed tracks can be rendered and saved as a new file

v0.89
Playout logs set to restart at midnight
GPI device present test added to allow GPI device to be unplugged when SpotOn is running
Compressed debug logs added to assist development
Event and Playout log right-click save selection not saving the correct lines
Free disc space check added to Package Save As
Multiple track moves in TrackNames dialog enabled
Search window list can be ordered order by alphanumeric or most recently used tracks
Button Images can be loaded from *.bmp and *.jpg files
Midi AllStop and AllNotesOff now only acts on buttons originally played via Midi note On
Custom button colours saved into session file
Pan position labelled 0..100
GPIs can be emulated by Hotkeys
WAV file load error caused by display field embedded in Audition 2.0 files now trapped

v0.88
Locate missing file action incorrectly reporting mismatched file

timestamps
 Main window Tab text now takes '^' as embedded line break
 Tabs text now split over 1,2 or 3 lines depending on tab height
 Package Viewer now lists session option settings
 Button track name text label now allows '&' character to be entered

 infile o/p entries on save
 Playout logs not being saved on exit if <5min elapsed since las
 button played - fixed
 On refreshing tracks if track has a modified comment, button
 comments are updated
 Multiple lines allowed in comment field
 Recursive Invalid Date Encode error - fixed

v0.85

18/10/2005
 Browse Folder option added to Display/Hotkey local filename
 right-click options
 WMA, MP2 and MPEG file decoding enabled
 UnPausing short tracks playing mute - fixed
 GPI stop action added
 Highlight of buttons on a specific output added
 StartUp message if audio output levels are not set to 0dB
 Volume menu moved to Engineering
 Default sample frequency changed to 48kHz
 Search window resizable
 Playout log file save conflict - fixed
 Updated security drivers incorporated
 Commented or Copyrighted WAV files are shown in blue text in
 search window
 Refresh Tracks resaves link with new attributes
 (comment/copyright)
 Paste special now has auto increment of midi in notes
 Buzzer group timeout count can be cleared by playing any
 button on Group 25
 Play group 25 is now shown as 25! in play group selection
 windows
 Buzzer timeout options changed to include an infinite (10m)
 value
 Switching GPI Off/On will clear Buzzer Timeout
 Session Analyser added

v0.81

XML version of Playout logs added
Page Stop button added with menu option to show/not show
Page tabs have two lines of non-intelligently word wrapped text on medium and large sized tabs
Voice over depth range changed to have finer steps
Ctrl+Right click brings up Hotkey selector, duplicate hotkeys automatically deleted
Pressing DEL key in Hotkey selector accepted to delete current assignment
Button GPI icons now switch with GPI enabled checkboxes
JoyStickID defining GPI input saved per machine not per session, will ignore settings in any session loaded
Audio window Playlist has Cue name column reduced to show more notes text
Double-click on VO depth label resets VO level to default
Locked Midi removed from swap, copy and paste operations
Locked Hotkey removed from swap, copy and paste operations
Package Converter now covers v80 and v81 files

v0.80

29/06/2005

Features: -

AdminPassword command line switch now shows both Engineering and Admin menus at StartUp
PlayNext locked to button
Preparation (/Prep) mode added - 16 output devices in total and status bar shown in yellow
WAV header test reports file details on unrecognised file types
Midi Velocity=0 trapped to convert into Note Off if option selected
Web link to release notes added
User Forum added
StopAllOnPlay locked to button
Supported Modes analyser added
Voice Over mode added to master/slave links
File|New Session special file added ~NewSession.dta
Speaker position in multi channel mode added to Audio window
Output device assign can now set output speaker format
Button highlight now shows MidiIn/HotKeys in yellow
PlayDelay setting added to Gain Pan dialog

Advanced Edit reminder dialog only shows twice after being set true
Repeated pressing of Grouped btn caused btn with long fades to have the fades restarted
XP ghosting fix applied
Changing Fade out time in Audio dialog stopped track
'Quatermass' bug
Drag and Drop files not working on unassigned buttons
MP3 silence bug
Voice Over fade up step missing
Search dialog causing error if opened repeatedly
Session notes not displayed on loading package

Package version check added to prevent packages being loaded by older versions of SpotOn

v0.75

23/01/2005

Play-click debounce added 0..250mS

EnableSearchMenu, HintsOn, UseMenuIcons, UseUDPMidi now stored per session - will need to be reset after updating
+ added to Midi in icon when both Play and Stop notes are assigned

Button icons added over Hotkey/Midi text not underneath as before

v0.74

GPI display expanded to 16

Now button added to GPI PC Clock time entry

Unplugging GPI device stops polling until rescanned

Rescan of GPI devices added to GPI setup window

Prompt dialog added to load package sequence asking to save extracted session as new session

GPI icon diamonds have + in centre if more than one GPI assigned to button

Session/Package version numbers added to event log

NumLock on option in engineering menu

HotKey summary added for alpha/qwerty and numeric

Tab height options renamed Small, Medium, Large

Link number in Master/Slave dialog not selected on display - now selected

v0.73

Pause indicated by dashed square on button

Folder locations added to Status window

Option to skip muted buttons on step to next

Centre mouse button pauses track if option selected

Midi over UDP rejecting some Midi note combinations - fixed

v0.72

GPI triggering from PC clock and Midi timecode

Loopback Midi enabled with Midi In On

Recent Session/Package list not reading first item fixed

Scroll wheel disabled on floating speed bar

Master/Slave dialog opens with first unused link selected

Play next now triggers Master/Slaves functions previously disabled in v0.45

Master link allowed on Grouped button

Button number label width increased to include

Master/Slave/Group indicators

Step to Next skipping over muted buttons removed

Status bar text shows Midi out in italics when loopback enabled

ShadedButtons property replaced by (edgewidth>0)

v0.71

Audio output level settings shown in SetUp menu

Blank buttons ignored in Step To Next mode

Delete HotKey Duplicates option added

Sound mixer mute/gain settings added to SetUp menu

Duplicate destination filenames extracted from package trapped

Page layout extended to 16 columns x 10 rows, was 10 x 8
 Hotkey paged mode not working on button 1
 Advanced Editing option added allowing direct editing of files
 No fade out on short clips had disabled Play Next fixed
 Ctrl+R shortcut to Refresh tracks
 Lock colour to button in Properties dialog
 Page 1 selected when new session loaded
 Full playlist enabled when refreshing a track that did not have
 a playlist but now does
 Hotkey and Midi In text available simultaneously if both
 present Hotkey takes preference
 GPI Pause and UnPause added
 Midi GPI emulation of GPI instead of just "Step to Next"
 Stop on GPI Off removed from acting on Un/Pause command
 Link slaves stopping when master button stopped manually
 fixed
 Midi Loopback added looping outgoing midi message directly to
 input
 GPI In can be enabled when no JoyStick selected
 GPI status panel colour still brown when no JoyStick seleted
 but can be activated
 Master/Slave Play and Stop ticks not mutually exclusive
 Links Play/Stop entries now show red cross when group
 selected
 Links can be sorted in master button order
 NumLock state not set on start up
 Warning message added when Try Remote Filename option
 selected
 File menu session/package file entries masked with Try Remote
 Filename
 Button time @ prefix now responds to floating speed bar
 settings
 MouseWheel activated on floating SpeedBar
 Fill run of buttons with same file
 Clear Session and Package history lists
 Pause in Playlists inhibited

v0.70

17/11/2004
 Session Notes added to Info menu
 Start with blank session moved to Options menu

v0.69

Fade out disabled on short clips (<1s)
 Rehearsal of last xx seconds added to trim window
 Status bar height adjustable via Display menu
 Out point rehearsal now available from Trim window

v0.68

HotKeys now not included in Button "Swap" function if either
 button has the HotKey Locked
 Menu option to restore session from BackUp files
 Main menu item Search can be disabled in Options menu
 File timestamps set to use UTC instead of local time

v0.67

Short items at beginning of playlist do not loop automatically
Temporary changes to playlist loop counts allowed

v0.66

abc.MP3 load overwriting existing abc.WAV unique filename
now used
Full playlist now not inherited during copy when copied file had
been edited and had no playlist
*.MP3 copies now stored in "Local" files folder

v0.65

10/10/2004
Save As updates title bar filename
File timestamp trapped when reloading buttons with same
filename
Functions (Hotkeys/Links/Midi...) that are disabled now shown
in function setup dialog
Midi In Play/Stop now have separate selectors
Message boxes in loading of Mini Packages clarified

v0.64

BackUp and Playout log file locations now user defined
WAV file preview added to Load dialog
Shift+Ctrl+right-click now shows popup group selection

v0.63

2GB limit in Package load/save progress windows removed
Destination button color retained on copy
Destination button output device retained on copy
Variable speed range increased 1%..400%
Minimum variable speed now engineering option
Playlist viewer columns resizable
Gain Pan timecode shows ~ ~:xx:xx on tracks longer then 1
minute

v0.62

Internal change to stop very short clips inadvertently looping
Option to load a blank session on start up added
Page tab height adjustable to ease use on touchscreens

v0.61

Skip playlist item improved
Button Color retained on load

v0.60

18/07/2004
Menu Icons
Settings saved across multiple user LogOns

v0.59

Output Assignment scope now selectable
Play Groups available increased to 25

v0.58

Diagnostic Web Server
Output port mapping
Status window resizable
Midi timestamp in playout logs

v0.57

	Buffer initialised with silence Buzzer Groups added
v0.56	Midi alternative to hotkey button text Midi/Hotkey overlapped modes separated MidiIn in italics if Midi over UDP is enabled Log file page rewritten with circular buffer CueUp centre click copied to shift+ (left or right) click Recent Session and Package lists Ganged and Paged options for Midi In and HotKeys
